nucleogenesis. The original synthesis of the chemical elements resulting from a huge explosion of undifferentiated energy that astrophysicists believe initiated the universe approximately 20 billion years ago, at least 7 billion years before the formation of the Milky Way galaxy (the so-called big bang theory). Information obtained with radiotelescopes indicates that temperatures were so inconceivably high in this continuum of radiation that the elementary particles that were undoubtedly present were unable to combine. As the continuum expanded rapidly after the original eruption, it cooled within a few minutes to the point where protons and electrons could unite to form hydrogen. After further cooling to 10°C, thermonuclear fusion of hydrogen to helium occurred in a matter of seconds. But no more complex combinations took place in the young universe for several million years, until the shrinking cores of giant stars, many times the mass of the sun, raised their internal temperatures to 10⁸°C, high enough to fuse helium nuclei to form carbon. The heavier elements were eventually synthesized during explosions of supernovae, which produced temperatures in the range of 600 × 10⁶°C. Thus, the sequence of creation of the elements is believed to be hydrogen and helium, then after a few million years came carbon, oxygen, magnesium, silicon, sulfur, and iron; after yet another interval, the heavy metals were formed in another round of stellar explosions. All this occurred over a period of 5–7 billion years. See fusion; astrochemistry; life; origin.

nucleoid. Region in prokaryotes where the DNA is concentrated. Unlike a nucleus, it is not bound by a membrane.

nucleolar organizing region. A part of the chromosome containing rRNA genes.

nucleolus. A densely staining structure in the nucleus of eukaryotic cells in interphase. Contains the machinery involved in rRNA synthesis and ribosome formation.

nucleon. General name applied to neutrons and protons, the essential constituents of atomic nuclei; also used as a class name for fundamental particles of that mass. The study of subatomic particles is often called nucleonics.

nucleophile. An ion or molecule that donates a pair of electrons to an atomic nucleus to form a

covalent bond; the nucleus that accepts the electrons is called an electrophile. This occurs, for example, in the formation of acids and bases according to the Lewis concept, as well as in covalent carbon bonding in organic compounds.

See Lewis base; donor.

nucleoplasm. The aqueous portion of a cell's contents enclosed by the nuclear membrane; also called the nuclear matrix.

nucleoprotein. A type of protein universally present in the nuclei and the surrounding cytoplasm of living cells. A nucleoprotein is composed of a protein, which is rich in basic amino acids, and a nucleic acid. The nucleic acid portions can be isolated and used in medical and biochemical research. See deoxyribonucleic acid; chromatin; virus.

nucleoside. A compound of importance in physiological and medical research, obtained during partial decomposition (hydrolysis) of nucleic acids and containing a purine or pyrimidine base linked to either *d*-ribose, forming ribosides, or *d*-deoxyribose, forming deoxyribosides. They are nucleotides minus the phosphorus group.

See adenosine; cytidine; guanosine; uridine.

nucleoside diphosphate kinase. An enzyme that catalyzes the transfer of the terminal phosphate of a nucleoside 5'-triphosphate (most often ATP) to a nucleoside 5'-diphosphate (GDP, for example.)

nucleoside diphosphate sugar. An activated form of a sugar molecule used in the enzymatic synthesis of polysaccharides and sugar derivatives. The base depends on the sugar; for example, UDP-glucose but GDP-fucose.

nucleoside monophosphate kinase. An enzyme that catalyzes the transfer of the terminal phosphate of ATP to a nucleoside 5'-monophosphate.

nucleosome. Structural unit for packaging DNA into chromatin. A nucleosome consists of a DNA strand wound around an octameric histone core.

nucleotide. A fundamental unit of nucleic acids; some are important coenzymes. The four nucleotides found in nucleic acids are phosphate monoesters of nucleosides, adenylic acid, guanylic acid, uridylic acid, and cytidylic acid. Great progress has been made in determining the nucleotide sequence in fundamental materials, such as yeast genes.

The term is also applied to compounds not found in nucleic acids and that contain substances other than the usual purines and pyrimidines. Such compounds are modified vitamins and function as coenzymes; examples are riboflavin phosphate (flavin mononucleotide), flavin adenine nucleotide, nicotinamide adenine dinucleotides, nicotine adenine dinucleotide phosphate, and coenzyme A. The nucleotides

inosine-5'-monophosphate and guanosine-5'-monophosphate are used as flavor potentiators.

nucleus. (1) The positively charged central mass of an atom, it contains essentially the total mass in the form of protons and neutrons. The nucleus of the hydrogen atom consists of one proton, while that of uranium is composed of 92 protons and 146 neutrons.

(2) The central portion of a living cell, consisting primarily of nucleoplasm in which chromatin is dispersed. It is enclosed by a membrane that separates it from the surrounding cytoplasm. All the most important functions of the cell, including the mechanics of division (mitosis) and the programming of the genetic code, take place in the nucleus. See gene; chromosome.

(3) The characteristic structure of a group of chemical compounds, e.g., the benzene nucleus.

(4) Any small particle that can serve as the basis for crystal growth (see nucleation).

Note: The multiple meanings of *nucleus* and *resonance* can be a source of confusion, especially when these terms are closely associated, as in nuclear magnetic resonance and resonance of a molecular nucleus. In the first of these expressions, *nucleus* is used in sense (1) under nucleus and *resonance* in sense (2) under resonance. In the second expression, *nucleus* is used in sense (3) under nucleus and *resonance* in sense (1) under resonance.

nuclide. A particular species of atom, characterized by the mass, the charge (number of protons), and the energy content of its nucleus. A radionuclide is a radioactive nuclide. Example: carbon-14 is a radionuclide of carbon.

See isotope.

“Nuclon” [PPG]. TM for a polycarbonate thermoplastic resin.

Properties: High impact resistance not appreciably reduced by temperature fluctuations, good dimensional stability, or good electrical resistance. Naturally transparent, of light-straw color.

Use: Engineering plastic for *hard-service* parts and components.

“Nucrel” [DuPont]. TM for an ethylene-methacrylic acid copolymer resin available for use in conventional extrusion coating, coextrusion coating, and extrusion laminating equipment designed to process polyethylene resins. Higher melt flow index results in fewer resin leaks.

Use: Packaging foil containing shampoos, toothpaste, towlettes, and miscellaneous food pouches.

nuisance particulate. Fine particles (dusts) that are not very toxic in low concentrations. Among them are clay, calcium carbonate, emery, glass fiber, silicon carbide, gypsum, starch, Portland cement, marble, and titanium dioxide.

See dust, industrial.

Nujol. Former TM for a mineral oil used to prepare mulls for infrared analysis.

numerals. For their use and meaning in chemical names see Geneva System; benzene; chemical nomenclature.

“Nuroz” [Reichhold]. TM for a polymerized wood rosin.

Use: Adhesives, gloss oils, paper label coatings, oleoresinous varnishes, solder flux, spirit varnishes, waxed paper and hot melt compounds, synthetic resins.

Nusselt number. A value used in heat-transfer studies and calculations to compare heat losses by conduction from various shaped objects under various conditions. It is combined into a single number that is the function of the actual heat loss (Q), the temperature difference (ΔT) between the body and its surroundings, the size (d) and shape of the body, and the thermal conductivity (k) of the fluid surrounding the object, in the equation $Nu = Qd/\Delta Tk$.

“Nutrasweet” [Reichhold]. See “Aspartame.”

“NuTriene” [Eastman]. TM for a nutraceutical supplement. A mixture of naturally occurring tocotrienols and tocopherols are extracted and concentrated from rice bran oil, a common cooking oil in Asia.

Use: Suitable for incorporation into soft gelatin capsules or liquid emulsions.

nutrient. Any element or compound that is essential to the life and growth of plants or animals, either as such or as transformed by chemical or enzymatic reactions. In plants, nutrients include numerous mineral elements, as well as nitrogen, carbon dioxide, and water. In animals and humans, the primary nutrients are the proteins, carbohydrates, and fats obtained from plants, either directly or indirectly, supplemented by vitamins and minerals. Water and oxygen are included in this definition. All told, there are 43 basic nutrients.

See food.

nutrient solution. A water solution of minerals and their salts necessary for plant growth that is used instead of soil, the plants being supported by mechanical means. Such solutions contain combined nitrogen, potassium, phosphorus, calcium, sulfur, and magnesium, together with traces of iron, boron, zinc, and copper. They are extensively used for commercial growing of flowers and vegetables, particularly on islands, and also to some extent for house plants.

nutrification. Addition of nutrients to a food to replace those lost in processing (restoration), to provide nutrients that are not normally present in the

food (fortification), or to bring the food into conformity with a specific standard for that food.

“**Nutrifos**” [*Solutia*]. (sodium phosphate).
CAS: 7601-54-9. TM for food-grade phosphate.
Use: Curing meat products; washing fruits and vegetables.

“**Nutriphos STP**” [*Solutia*]. TM for sodium phosphate.
CAS: 7601-54-9.
Grade: Powders.
Use: To cure ham and related meat products and in washing fruits and vegetables.

nutrition. The effects of nutrients on living organisms and the biochemical mechanisms involved in bringing them about; also, the subdivision of biochemistry that deals specifically with these effects. In plant nutrition the essential requirements are carbon dioxide and water, from which the plant forms carbohydrates by photosynthesis; nitrogen, which is essential for the synthesis of proteins by the plant, with the aid of nitrogen-fixing bacteria; as well as phosphorus, calcium, potassium, and a number of trace elements (micronutrients). Besides proteins and carbohydrates, plants also synthesize vitamins and various fats and oils. Thus they provide a basis for human nutrition, both directly (grain and other vegetables) and indirectly (meats and dairy products), though the conversion to protein values for human nutrition is only approximately 10% for meats.

Human diet requires proteins (milk, eggs, fish, and some vegetables), carbohydrates (plants), fats (oils) from both plants and animals, minerals from milk and meats, salt (chloride), vitamins from green vegetables and citrus fruits, and water. Micronutrients are furnished by seafood, cereals, vegetables, and fruit.

Human digestive processes involve primarily the hydrolysis of complex carbohydrates to simple sugars, of proteins to a mixture of amino acids, and of fats to glycerol and higher fatty acids. Hydrolysis is catalyzed by various enzymes in the saliva and digestive tract. The end products of digestion are absorbed across a semipermeable membrane in the intestine and thus enter the bloodstream, unusable products being eliminated. The efficiency of digestion plus absorption is approximately 92% for protein, 95% for fat, and 98% for carbohydrates. See metabolism; digestion (1); plant (1); nutrient; RDA.

“**Nuts & Bolts 434**” [*Hernon*]. TM for a medium strength thread locking adhesive, offering 80 lbs breakaway torque.

nut shells. In a fine-ground state, the shells of coconuts and other nuts are a source of decolorizing carbon; the pits of peaches and similar fruits have been used for gas-adsorbent carbon.

NW acid. Abbreviation for Neville-Winter acid.

Nylander’s reagent. Basic solution of bismuth subnitrate and Rochelle salt.
Use: To detect glucose in urine.

nylidrin hydrochloride. (*p*-hydroxy- α -[1-(1-methyl-3-phenyl-propylamino)-ethyl]benzyl alcohol hydrochloride). C₁₉H₂₅O₂N•HCl.

Properties: White, crystals or powder, odorless; tasteless. Slightly soluble in water and alcohol; very slightly soluble in chloroform, ether; pH of 1% solution is between 4.5 and 6.5.

Grade: NF.

Use: Medicine (treatment of heart disease).

nylon.

CAS: 63428-83-1. (C₆H₁₁NO)_n. Generic name for a family of polyamide polymers characterized by the presence of the amide group —CONH. By far the most important are nylon 66 (75% of U.S. consumption) and nylon 6 (25% of U.S. consumption). Except for slight difference in melting points, the properties of the two forms are almost identical, though their chemical derivations are quite different. Other types are nylons 4, 9, 11, and 12 (see Grade).

Properties: Crystals, thermoplastic polymers. May be extruded as monofilaments over a wide dimensional range. Filaments are oriented by cold-drawing. Tensile strength (high tenacity) up to 8 g/denier (approximately 100,000 psi); d 1.14; mp (66) 264C, (6) 223C; low water absorption. Good electrical resistance but accumulates static charges. Highly elastic, with rather high percentage of delayed recovery at low strain values; low permanent elongation; moisture absorption 4% at 65% R.H. Wet strength approximately 90% of dry strength. Can be dyed with ionic and nonionic dyestuffs. Attacked by mineral acids but resistant to alkalis and cold abrasion; soluble in hot phenols, cresols, and formic acid; insoluble in most organic solvents; difficult to ignite, self-extinguishing, melts forming beads; resistant to attack by moths, carpet beetles, etc.; compatible with wool and cotton, increases wear and crease resistance in 30% blends with natural fibers; rods and blanks are machinable.

Available forms: Monofilaments, yarns, bristles, molding powders, rods, bars, sheets. Microcrystalline nylon is now available.

Grade: Nylon 66 is a condensation product of adipic acid and hexamethylenediamine developed by Carothers in 1935. Adipic acid is obtained by catalytic oxidation of cyclohexane. Nylon 6 is a polymer of caprolactam, originated by I. G. Farbenindustrie in 1940. Nylon 4 is based on butyrolactam (2-pyrrolidone); its tenacity, abrasion resistance, and melting point are said to be about the same as for the 6 and 66 grades. It has excellent dyeability. Nylon 610 (TM “Tynex”) is obtained by condensation of sebacic acid and hexamethylenediamine, and nylon 11 (TM “Rilsan”) from castor bean oil (developed in France). Nylon 12 (also called “Rilsan” 12) is made

from butadiene, also by a French process involving photonitrosation of cyclododecane by actinic light from mercury lamps. Its properties are similar to those of nylon 11. Nylon 9 can be made from 9-aminononanoic acid, present in soybean oil. It has properties specifically desired in metal coatings and electrical parts; higher electrical resistance than 6 and 66 absorbs less moisture and has better distortion resistance.

Use: Tire cord; hosiery; wearing apparel component; bristles for toothbrushes, hairbrushes, paint brushes (nylon 610); cordage and towlines for gliders; fish nets and lines; tennis rackets; rugs and carpets; molded products; turf for athletic fields; parachutes; composites; sails; automotive upholstery; film; gears and bearings; wire insulation; surgical sutures; artificial blood vessels; metal coating; pen tips; osmotic membranes; fuel tanks for automobiles.

See polyamide; aramid

Note: Not all nylons are polyamide resins, nor are all polyamide resins nylons, e.g., "Versamide". One class of polyamide resins distinct from nylons is derived from ethylenediamine; they may be liquids

or low-melting solids and have lower molecular weight than nylons. Another class, called aramids, is aromatic in nature.

nymph. In aquatic insects, the larval stage.

"Nytal 2K" [Vanderbilt]. TM for an epoxy heavy duty tank lining.

nytril. Generic name for a manufactured fiber containing at least 85% of a long-chain polymer of vinylidene dinitrile, $-\text{CH}_2\text{C}(\text{CH})_2-$, where the vinylidene dinitrile content is no less than every other unit in the polymer chain (Federal Trade Commission).

Properties: Soft, resilient fabric is obtained; easy to clean, does not pill, resists wrinkling and retains shape after pressing.

Use: Furlike pile fabrics, sweaters, yarns, blended fabrics for coats and suits.

"NZ" [Kenrich]. TM for a prefix for a series of neoalkoxy zirconates.

O

O. Symbol for oxygen; the molecular formula is O_2 .

o-. (o-). Abbreviation for ortho-.

oakum. Hemp fiber impregnated with tar or pitch.
Use: Caulking.

Obermayer's reagent. Ferric chloride in concentrated hydrochloric acid (4 g $FeCl_3$ in 1 L concentrated HCl).
Use: Determining indoxyl in urine.

OC. Abbreviation of oxygen consumed.

Occupational Safety and Health

Administration. (OSHA). A federal agency responsible for establishing and enforcing standards for exposure of workers to harmful materials in industrial atmospheres, and other matters affecting the health and well-being of industrial personnel. A number of OSHA regulations and proposals have been controversial. Its main office is 200 Constitution Avenue, N.W., Washington, D.C. 20210.
Website: <http://www.osha.gov>.

ocean thermal energy conversion.

(OTEC). Utilization of ocean temperature differentials between solar-heated surface water and cold deep water as a source of electric power. In tropical areas such differences amount to 35–40F. A pilot installation now operating near Hawaii utilizes a closed ammonia cycle as a working fluid, highly efficient titanium heat exchangers, and a polyethylene pipe 2000 feet long and 22 inches inside diameter to handle the huge volume of cold water required. Alternate uses for such a system, such as electrolysis of water, ammonia production, and desalination, are envisaged. There has been active interest in the possibilities of this energy source in France from the time of d'Arsonval (1885) that continues especially in Japan and Hawaii. Ongoing research indicates that OTEC may be harder to commercialize than once projected.

ocean water. (seawater). A uniform solution of essentially constant composition containing 96.5% water and 3.5% ionized salts, associated compounds, elements, and ionic complexes. Na^+ and Cl^- are completely ionized, but $MgSO_4$ and $AuCl$ remain in bound form. Dissolved gases, e.g., oxygen and nitrogen are also present.

Composition: More than 60 elements, by far the most important of which are (in tons/cubic mile): chlorine 89,500,000; sodium 49,500,000; magnesium 6,400,000; sulfur 4,200,000; calcium

1,900,000; potassium 1,800,000; bromine 306,000; carbon 132,000. Other elements present include (tons/cubic mile): copper 14, indium 47, silver 1, lead 0.1, gold 0.02. Total solids content/cubic mile is 166 million tons.

Properties: Colorless liquid; bitter taste; faint odor (depending on organic impurities). D 1.02, pH 7.8–8.2, fp $-2.78C$, bp 101.1C. Average temperature about 5C.

Hazard: Ingestion of substantial amounts will create bodily chloride imbalance with harmful effects.

Use: Source of magnesium, bromine, sodium chloride, and fresh water; source of hydrogen.

“Ocenol” [Du Pont]. TM for technical grades of oleyl alcohol rich in cetyl and unsaturated alcohols, used as antifoam agents.

ocher. Any of various colored earthy powders consisting essentially of hydrated ferric oxides mixed with clay, sand, etc. Some grades are calcined (burnt ocher). The colors are yellow, brown, or red. Noncombustible.

Use: Paint pigments, cosmetics, theatrical makeup. See umber; sienna.

ocimene. (2,6-dimethyl-1,5,7-octatriene).

CAS: 29714-87-2.

$CH_2=C(CH_3)(CH_2)_3CH=C(CH_3)CH=CH_2$. Mixture of isomers. A terpene obtained from sweet basil oil, bp 81C (30 mm Hg), insoluble in water, soluble in alcohol, d 0.8031 (15C). Combustible.

Use: Flavors and perfumes.

ocotea oil.

CAS: 68917-09-9. A volatile oil derived from *Ocotea cymbarum* used for its safrole content for the manufacture of heliotropin.

octabenzene.

CAS: 1843-05-6. $C_{21}H_{26}O_3$.

Properties: Colorless crystals. Mp 45C.

Use: UV absorber, especially for polyethylene.

octabromobiphenyl ether.

CAS: 32536-52-0. mf: $C_{12}H_2Br_8O$.

Hazard: Moderately toxic by inhalation and skin contact. Low toxicity by ingestion.

octachloronaphthalene.

 (Halowax 1051).

CAS: 2234-13-1. $C_{10}Cl_8$.

Properties: Pale-yellow, waxy solid. Mw 403.74, sp g 2.00, mp 192C, bp 440C. Insoluble in water; slightly soluble in alcohol; soluble in benzene and chloroform.

Hazard: Toxic by inhalation and skin contact. TLV:

0.1 mg/m³; STEL: 0.3 mg/m³. Toxic by skin absorption.

Use: Fireproofing and waterproofing in cable insulation and lubricant additive.

(z,z)-3,13-octadecadien-1-ol acetate.

CAS: 53120-27-7. mf: C₂₀H₃₆O₂.

Hazard: Low toxicity by ingestion.

Source: Natural product.

n-octadecane. C₁₈H₃₈ or CH₃(CH₂)₁₆CH₃.

Properties: Colorless liquid. D 0.7767 (28/4C), bp 318C, mp 28.0C, refr index 1.4369 (28C), flash p 200F (93C). Soluble in alcohol, acetone, ether, petroleum, and coal tar hydrocarbons; insoluble in water. Combustible.

Use: Solvents, organic synthesis, calibration.

n-octadecanoic acid. See stearic acid.

octadecadienoic acid. See linoleic acid.

octadecaneuropeptide diazepam-binding inhibitor (33-50).

CAS: 95237-86-8. mf: C₈₁H₁₃₈N₂₄O₂₉.

Hazard: A poison.

octadecanoic acid, ammonium salt. See ammonium stearate.

octadecanoic acid, calcium salt. See calcium stearate.

octadecanoic acid, lithium salt. See lithium stearate.

1,12-octadecanediol. See 1,12-hydroxystearyl alcohol.

1-octadecanol. See stearyl alcohol.

n-octadecanoyl chloride. See stearyl chloride.

octadecatrienol. See linolenyl alcohol.

α,α'-(9-octadecenylimino)di-2,1-ethanediy)bis(ω-hydroxy-poly(oxy-1,2-ethanediy)).

CAS: 58253-49-9. mf: (C₂H₄O)_n(C₂H₄O)_nC₂₂H₄₅NO₂

Hazard: A severe eye irritant.

9-octadecen-1,12-diol. See ricinoleyl alcohol.

1-octadecene. C₁₈H₃₆ or CH₃(CH₂)₁₅CH=CH₂.

Properties: Colorless liquid. D 0.7884 (20/4C), refr index 1.4456 (20C), bp 180C (15 mm Hg), flash p 200F (93C). Soluble in alcohol, acetone, ether, petroleum, and coal tar solvents; insoluble in water. Combustible.

Grade: 95% min purity.

Use: Organic synthesis, surfactants.

octadecene-octadecadieneamine. See oleyl-linoleylamine.

cis-9-octadecenoic acid. See oleic acid.

trans-9-octadecenoic acid. See elaidic acid.

octadecenol. See oleyl alcohol.

cis-9-octadecenoyl chloride. See oleoyl chloride.

octadecenyl aldehyde. (oleyl aldehyde).

C₁₇H₃₅CHO.

Properties: Liquid. Bp 167C (20 mm Hg), refr index 1.4620 (25C), d 0.847 (25C).

Hazard: Flammable, moderate fire risk. Irritant to skin and mucous membranes.

Use: Intermediate for vulcanization accelerators, rubber antioxidants, synthetic drying oils, and pesticides.

octadecyl alcohol. See stearyl alcohol.

octadecyldimethylbenzylammonium

chloride. C₁₈H₃₇(CH₃)₂(C₆H₅CH₂)NCl. A quaternary ammonium salt.

Properties: White, crystalline powder. Soluble in water, chloroform, benzene, acetone, xylene.

octadecyl isocyanate. A straight-chain, saturated monoisocyanate consisting principally of a mixture of C₁₈ and C₁₆ alkyls, CH₃(CH₂)₁₆CH₂NCO, and CH₃(CH₂)₁₄CH₂NCO.

Properties: Colorless, slightly cloudy liquid at room temperature. Fp 10–20C (2 mm Hg), flash p 355F (179C) (OC). Combustible.

Hazard: By inhalation, irritant to skin.

Use: Intermediate in synthesis, water-repellent textiles, paper, and other surfaces.

octadecyl mercaptan. See stearyl mercaptan; thiol.

octadecyltrichlorosilane. (trichlorooctadecylsilane). C₁₈H₃₇SiCl₃.

Properties: Water-white liquid; pungent odor. D 0.984 (25C), refr index 1.4580 (25C), bp 380C, flash p 193F (89.4C). Soluble in benzene, ethyl ether, heptane, and perchloroethylene. Combustible.

Hazard: Strong irritant to skin and mucous membranes.

Use: Intermediate for silicones.

octafluoro-2-butene. (perfluoro-2-butene).

CAS: 360-89-4. CF₃CF=CF₃.

Properties: Colorless, gas or liquid. D (liquid) (at bp) 1.5297 g/cc, bp 1.2C, fp –136 to –134C, sp vol 2.7 cu ft/lb (70F, 1 atm). Nonflammable.

Grade: 95%.

Use: Organic intermediate, fluorocarbon polymers.

octafluoro-*sec*-butene. (octafluoroisobutene; octafluoroisobutylene; perfluoroisobutylene).

CAS: 382-21-8. C₄F₈.

Properties: A gas at room temp. Mw 200.04, d 1.592 (0C), bp 5–6C (740 mm).

Hazard: A poison by inhalation. A skin, eye, and mucous membrane irritant. TLV: ceiling of 0.01 ppm.

octafluorocyclobutane.

CAS: 115-25-3. C₄F₈.

Properties: Colorless gas. Fp –41C, bp –6C. Non-flammable.

Use: Refrigerant, heat-transfer agent.

octafluoroisobutene. See octafluoro-*sec*-butene.

octafluoroisobutylene. See octafluoro-*sec*-butene.

octafluoropropane. (perfluoropropane). C₃F₈.

Properties: Colorless, gas. D 1.29, bp –36.7C, fp –160C, sp vol 2.02 cu ft/lb (21C), 1 atm).

Derivation: Electrofluorination of various organic compounds.

Grade: 98% min purity. Nonflammable.

Use: Refrigerant (when combined with chlorofluoro-hydrocarbons); gaseous insulator, especially for radar wave guides.

octahydro-(1,2,4,5)tetrazino(1,2-a)(1,2,4,5)tetrazine.

CAS: 1743-13-1. mf: C₄H₂N₆.

Hazard: A poison by ingestion and inhalation.

octakis(2-hydroxypropyl)sucrose.

Properties: Viscous, straw-colored liquid. D 1.170 (70/20C), refr index 1.485 (25C), pour p 38C, flash p 485F (251C). Soluble in water, methanol, and ether. Combustible.

Use: Crosslinking agent for urethane foams; plasticizer for cellulose, glue, starch, and many resins.

octamethylcyclotetrasiloxane.

CAS: 556-67-2. C₈H₂₄O₄Si₄.

Properties: Smooth, viscous liquid. Bp 175C, mp 17C, d 0.95, refr index 1.4.

Derivation: Hydrolysis of dimethyldichlorosilane.

Use: Silicone oils and related products.

octamethyl pyrophosphoramidate. See schradan.

octamethylsilanetetramine.

CAS: 1624-01-7. mf: C₈H₂₄N₄Si.

Hazard: A poison by ingestion and skin contact. A severe eye irritant.

octamethyltrisiloxane. C₈H₂₄O₂Si₃.

Properties: Colorless liquid. Bp 151C, d 0.820, fp –80C. Soluble in light hydrocarbons.

Use: Silicone oils, antifoam agent in lubricating oils.

“Octamine” [Uniroyal]. TM for a reaction product of diphenylamine and diisobutylene.

Properties: Light-brown, granular, waxy solid. D 0.99, mp 75–85C, good storage stability. Soluble in gasoline, benzene, ethylene dichloride, and acetone; insoluble in water.

Use: Rubber antioxidant.

1-octanal. (*n*-octyl aldehyde; aldehyde C-8; caprylic aldehyde).

CAS: 124-13-0. (CH₃CH₂)₆CHO.

Properties: Colorless liquid; strong fruity odor. D 0.820–0.830, refr index 1.418–1.425, bp 163C, flash p 125F (51.6C) (CC). Soluble in 70% alcohol and mineral oil; insoluble in glycerol. Combustible.

Grade: Technical, FCC.

Hazard: Moderate fire risk.

Use: Perfumery, flavors.

***n*-octane.**

CAS: 111-65-9. CH₃(CH₂)₆CH₃.

Properties: Colorless liquid. D 0.7026 (20/4C), refr index 1.39745 (20C), bp 125.6C, fp –56.798C, flash p 56F (13.3), autoign temp 428F (220C). Soluble in alcohol and acetone; insoluble in water.

Grade: 95%, 99% research.

Hazard: Flammable, dangerous fire risk. TLV: 300 ppm; STEL 375 ppm.

Use: Solvent, organic synthesis, calibrations, azeotropic distillations.

1,8-octanedicarboxylic acid. See sebacic acid.

octanedioic acid. See suberic acid.

octane number. A number indicating the anti-knock properties of an automotive fuel mixture under standard test conditions. Pure normal heptane (a very high-knocking fuel) is arbitrarily assigned an octane number of zero, while 2,2,4-trimethylpentane, or isooctane (a branched-chain paraffin), is assigned 100. Thus, a rating of 80 for a given fuel indicates that its degree of knocking in a standard test engine is that of a mixture of 80 parts isooctane and 20 parts *n*-heptane.

Octane ratings as high as 115 have been obtained by addition of tetraethyllead to isooctane. Premium leaded gasolines have a research octane rating of about 100, but this value drops to 85–90 for unleaded gasolines, though it may be improved by addition of methyl-*tert*-butyl ether. The octane rating scale ends at 125, and any higher figure is meaningless. Research octane numbers are those obtained under test or *laboratory* conditions; they generally run about ten points higher than the so-called motor octane numbers, which represent actual road operating conditions.

1-octanesulfonyl fluoride.CAS: 40630-63-5. mf: C₈H₇FO₂S.**Hazard:** A mild skin and eye irritant.**octanoic acid.** (octylic acid; octoic acid; caprylic acid).CAS: 124-07-2. CH₃(CH₂)₆COOH.**Properties:** Colorless, oily liquid; slight odor; rancid taste. D 0.9105 (20/4C), mp 16C, bp 237.9C, 147.9 (30 mm Hg), refr index 1.4278 (20C), flash p 270F (132C). Slightly soluble in water; soluble in alcohol and ether. Combustible.**Derivation:** By saponification and subsequent distillation of coconut oil.**Method of purification:** Crystallization or rectification.**Grade:** Technical, 99%, FCC.**Use:** Synthesis of various dyes, drugs, perfumes, antiseptics, and fungicides; ore separations; synthetic flavors.**octanol.** See octyl alcohol.**2-octanone.** See methyl hexyl ketone.**octanoyl chloride.** (capryloyl chloride; sometimes called caprylyl chloride). CH₃(CH₂)₆COCl.**Properties:** Water-white to straw-colored liquid; pungent odor. Fp -70C, distillation range 183–212C, d 0.9576 (15.5/15.5C), refr index 1.4357 (20C), flash p 180F (82.2C). Miscible with most common solvents; reacts with alcohol and water. Combustible.**Hazard:** Irritant to eyes and skin.**Use:** Organic synthesis.**trans-2-octen-1-ol.** mf: C₈H₁₄O.**Properties:** Slightly yellow liquid; green odor. D: 0.830–0.850, refr index: 1.421–1.424. Sol in alc, fixed oils; sltly sol in water.**Use:** Food additive.**1-octene.** (1-octylene; 1-caprylene). C₈H₁₆ or CH₃(CH₂)₅CH=CH₂.**Properties:** Colorless liquid. D 0.7160 (20/4C), bp 121.27C, fp -102.4C, refr index 1.4088 (20C), flash p 70F (21.1C) (TOC). Soluble in alcohol, acetone, ether, petroleum, and coal tar solvents; insoluble in water.**Grade:** 95%, 99% research.**Hazard:** Flammable, dangerous fire risk.**Use:** Organic synthesis, plasticizer, surfactants.**2-octene.** C₈H₁₆ or CH₃(CH₂)₄CH=CHCH₃. Both *cis* and *trans* forms exist.**Properties:** Colorless liquid. D (*cis*) 0.7243, (*trans*) 0.7199, (commercial) 0.7185–0.7200 (20.4C); bp (*cis*) 125.6C, (*trans*) 125.0C, (commercial) 124–127C; fp -94.04C; refr index (*cis*) 1.4150, (*trans*) 1.4132, (commercial) 1.4120–1.4145 (20C); flash p (mixed isomers) 70F (21.2C) (TOC). Soluble

in alcohol, acetone, ether, petroleum, and coal tar solvents; insoluble in water.

Grade: 95, 99 mole %.**Hazard:** Flammable, dangerous fire risk.**Use:** Organic synthesis, lubricants.**cis-3-octen-1-ol.** mf: C₈H₁₆O.**Properties:** White to yellowish liquid; musty, mushroom odor. D: 0.830–0.850, refr index: 1.440. Insol in water.**Use:** Food additive.**1-octen-3-yl acetate.** mf: C₁₀H₁₈O₂.**Properties:** Colorless liquid; metallic, mushroom odor. D: 0.865–0.886, refr index: 1.414–1.434 @ 25°. Sol in fixed oils; insol in water, propylene glycol.**Use:** Food additive.**1-octen-3-yl butyrate.** mf: C₁₂H₂₂O₂.**Properties:** Colorless liquid; metallic, mushroom odor. D: 0.859–0.880, refr index: 1.416–1.437 @ 25°. Sol in alc, fixed oils; sltly sol in propylene glycol; insol in water.**Use:** Food additive.**octocrilene.**CAS: 6197-30-4. mf: C₂₄H₂₇NO₂.**Hazard:** Low toxicity by ingestion.**octoic acid.** An eight-carbon acid, usually designates caprylic acid.**octopirox.** See piroctone olamine.**octyl.** The general name describing all eight-carbon radicals having the formula C₈H₁₇, often used interchangeably for the 2-ethylhexyl isomer.***n*-octyl acetate.** (acetate C-8; caprylyl acetate).CAS: 103-09-3. CH₃COO(CH₂)₇CH₃.**Properties:** Colorless liquid, floral-fruity odor, slightly soluble in water, soluble in alcohol and most other organic liquids, d 0.865–0.869, flash p 180F (82.2C) (OC), refr index 1.419–1.422, bp 199C. Combustible.**Use:** Perfumery, flavors, solvent.**sec-*n*-octyl alcohol.** (2-*n*-octanol; methyl hexyl carbinol). CH₃(CH₂)₅CH₂OCH₃. Frequently called capryl alcohol.**Properties:** Colorless, oily liquid; refractive; aromatic odor. D 0.825 (15C), bp 178–179C, fp -38C, refr index 1.437 (20C), flash p 140F (60C). Miscible with alcohol, ether; slightly soluble in water. Combustible.**Derivation:** By distilling sodium ricinoleate with an excess of sodium hydroxide.**Grade:** Technical 92–99%, pure.**Use:** Solvent, manufacture of plasticizers, wetting agents, foam-control agents, hydraulic oils, petrole-

um additives, perfume intermediates, masking of industrial odors.

n-octyl alcohol, primary. (1-*n*-octanol; alcohol C-8; heptyl carbinol).

CAS: 111-87-5. $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{OH}$. In industrial practice, the term *octyl alcohol* has been used for both 1-octanol and 2-ethylhexanol. The latter is also sometimes called isoctanol. The term *capryl alcohol* has been used for both 1-octanol and 2-octanol. It therefore seems preferable to designate the normal primary alcohol as 1-*n*-octanol.

Properties: Colorless liquid; penetrating aromatic odor. D 0.826 (20C), bp 194–195C, 108.7C (30 mm Hg), refr index 1.430 (20C), fp –16C, flash p 178F (81.1C). Miscible with alcohol, chloroform, mineral oil; immiscible with water and glycerol. Combustible.

Derivation: By reduction of caprylic acid.

Grade: Technical, CP, pure, perfume, FCC.

Use: Perfumery, cosmetics, organic synthesis, solvent manufacture of high-boiling esters, antifoaming agent, flavoring agent.

octyl aldehyde. See octanal and 2-ethylhexaldehyde.

octylamine. $\text{CH}_3(\text{CH}_2)_7\text{NH}_2$.

Properties: Water-white liquid; amine odor. Boiling range 170–179C, d 0.779 (20/20C), refr index 1.431 (20C), flash p 140F (60C). Combustible.

tert-octylamine. $(\text{CH}_3)_3\text{CCH}_2\text{C}(\text{CH}_3)_2\text{NH}_2$.

Properties: Colorless liquid; amine odor. Bp 137–143C, d 0.771 (25C), refr index 1.423 (25C), flash p 92F (33.3C) (OC). Insoluble in water; soluble in common organic solvents, especially petroleum hydrocarbons.

Hazard: Flammable, moderate fire risk. Skin irritant.

Use: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

octylammonium methylarsonate.

CAS: 6379-37-9. mf: $\text{C}_8\text{H}_{19}\text{N}\cdot\text{CH}_3\text{AsO}_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

n-octylbicycloheptene dicarboximide. (*n*-(2-ethylhexyl)-bicyclo(2,2,1)-5-heptene-2,3-dicarboximide). $\text{C}_8\text{H}_{17}\text{NC}_6\text{H}_8\text{O}_2$.

Properties: Liquid. Bp 158C (2 mm Hg), d 1.05 (18C), refr index 1.505 (20C). Miscible with most organic solvents and oils. Combustible.

Derivation: From maleic anhydride, cyclopentadiene, and 2-ethylhexylamine.

Hazard: By ingestion and skin absorption.

Use: Insecticide and pesticide synergist.

n-octyl bromide. (capryl bromide; caprylic bromide).

CAS: 111-83-1. $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{Br}$.

Properties: Colorless liquid. D 1.118 (15C), bp

202C, fp –55C, refr index 1.4503 (25C). Miscible with alcohol and ether; immiscible with water.

Grade: Technical.

Use: Synthesis of quaternary ammonium compounds, organometallics, vinyl stabilizers.

octyl carbinol. See nonyl alcohol.

n-octyl chloride. $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. D 0.8697 (25/15.5C), refr index 1.4288 (25C), fp –62C, bp 181.6C, flash p 158F (70C). Soluble in most organic solvents. Combustible.

Use: Chemical intermediate, manufacture of organometallics.

n-octyl-*n*-decyl adipate. (NODA).

Properties: Liquid; mild odor. D 0.92–0.98 (20/20C), fp –50C, boiling range 220–254C (4 mm Hg), refr index 1.447. Combustible.

Use: Low-temperature plasticizer.

See “Staflex Noda” [Bayer].

n-octyl-*n*-decyl alcohol. A blend of alcohols; available in tank cars and trucks. Combustible.

Use: Intermediate for plasticizers.

n-octyl-*n*-decyl phthalate.

CAS: 119-07-3. $\text{C}_{26}\text{H}_{42}\text{O}_4$.

Properties: Clear liquid; mild characteristic odor. D 0.972–0.976 (20/20C), fp –40C, boiling range 232–267C (4 mm Hg), refr index 1.482 (25C), flash p 455F (235C). Combustible.

Use: Plasticizer for vinyl resins.

octyl 2,4-dichlorophenoxyacetate.

CAS: 1928-44-5. mf: $\text{C}_{16}\text{H}_{22}\text{Cl}_2\text{O}_3$.

Hazard: Moderately toxic by ingestion and skin contact.

Use: Agricultural chemical.

octylene. See octene.

octylene glycol titanate.

Properties: Light-yellow solid.

Derivation: Reaction of butyl titanate with octylene glycol.

Use: Cross-linking agent, surface-active agent.

See titanium chelate.

octylene oxide.

Mixed $\text{CH}_3(\text{CH}_2)_5\text{CHCH}_2\text{O}$

and $\text{CH}_3(\text{CH}_2)_4\text{CHCH}(\text{CH}_3)\text{O}$. D (liquid) 0.830 (25C).

Combustible.

Use: Organic intermediate, epoxy resins.

octyl formate.

CAS: 112-32-3. $\text{C}_8\text{H}_{17}\text{OOCH}$.

Properties: Colorless liquid; fruity odor. D 0.869–0.872 (25C), refr index 1.4180–1.4200 (20C). Soluble in mineral oil; practically insoluble in glycerol, 1 mL dissolves in 5 mL of 70% alcohol. Combustible.

Grade: FCC.

Use: Flavoring agent.

octylic acid. See caprylic acid.

2-octyl iodide. (caprylic iodide; secondary capryl iodide). $\text{CH}_3(\text{CH}_2)_5\text{CHICH}_2$.

Properties: Oily liquid. D 1.318 (18C), bp 210C (decomposes).

Hazard: By ingestion and inhalation. Keep away from light and air.

Use: Organic synthesis.

octylmagnesium chloride. $\text{C}_8\text{H}_{17}\text{MgCl}$. A Grignard reagent available in tetrahydrofuran solution.

n-octyl mercaptan. $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: Water-white liquid; mild odor. Bp 199C, d 0.8395 (25/4C), refr index 1.4497 (25C), flash p 115F (46.1C) (OC). Combustible.

Hazard: Moderate fire risk.

Use: Polymerization conditioner, synthesis.

tert-octyl mercaptan. $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: Colorless liquid. Boiling range 154–166C, d 0.848 (15.5C), refr index 1.454 (20C), flash p 105F (40.5C). Combustible.

Grade: 95%.

Hazard: Moderate fire risk.

Use: Polymer modification, lubricant additive.

n-octyl methacrylate. $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_8\text{H}_{17}$.

Properties: Water-insoluble, colorless liquid. Polymerizes to a resin if unstabilized.

octyl peroxide. (caprylyl peroxide).

Properties: Straw-colored liquid; sharp odor. Immiscible with water.

Hazard: Dangerous fire risk, strong oxidizing agent.

octyl phenol. (diisobutyl phenol).

$\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{OH}$. Probably a mixture of isomers.

Properties: White flakes. Mp 72–74C, d 0.89 (90C), bp 280–302C, hydroxyl coefficient 259–275. Insoluble in hot and cold water; limited solubility in alkalis; soluble in 1:1 mixture of methanol and 50% aqueous potassium hydroxide, also in alcohol, acetone, fixed oils. Combustible.

Derivation: (*p*-*tert*-isomer) Catalytic alkylation of phenol with olefins.

Use: Nonionic surfactants, plasticizers, antioxidants, fuel oil stabilizer, intermediate for resins, fungicides, bactericides, dyestuffs, adhesives, rubber chemicals.

4-octylphenol.

CAS: 1806-26-4. mf: $\text{C}_{14}\text{H}_{22}\text{O}$.

Hazard: A reproductive hazard.

***p*-tert-octylphenoxy polyethoxyethanol.**

CAS: 9002-93-1.

$(\text{CH}_3)_3\text{CCH}_2\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{O}(\text{CH}_2\text{CH}_2\text{O})_x\text{H}$. Anhydrous liquid mixture of mono-*p*-(1,1,3,3-tetramethylbutyl)phenyl esters of polyethylene glycols in which x varies from 5 to 15.

Properties: Yellow, viscous liquid; faint odor; bitter taste. D 1.060, refr index 1.489 (25C). Soluble in water, alcohol, acetone, benzene, toluene; insoluble in hexane; pH 7–9. Combustible.

Grade: NF.

Use: Food packaging, probably as a plasticizer for films.

***p*-octylphenyl salicylate.**

$\text{C}_6\text{H}_4\text{OHCOOC}_8\text{H}_{17}$.

Properties: White solid. Mp 72–74C, bulk d 5.6 lb/gal (20C). Soluble in hexane, benzene, acetone, and ethanol; insoluble in water.

Use: Prevents photooxidation in polyethylene and polypropylene.

octyl phosphate. See trioctyl phosphate.

n-octyl sulfoxide isosafrole. See sulfoxide.

octyl trichlorosilane. (trichlorooctylsilane).

CAS: 5283-66-9. $\text{C}_8\text{H}_{17}\text{SiCl}_3$.

Properties: Water-white liquid; pungent irritating odor. Fumes readily in moist air to evolve corrosive vapors.

Hazard: Moderate fire risk in contact with oxidizing materials. Toxic by ingestion and inhalation, strong irritant to skin and mucous membranes.

Use: Intermediate for silicones.

octyltrichlorostannane.

CAS: 3091-25-6. mf: $\text{C}_8\text{H}_{17}\text{Cl}_3\text{Sn}$.

Hazard: Mildly toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

octyltris(2-ethylhexyloxycarbonylmethylthio)stannane.

CAS: 27107-89-7. mf: $\text{C}_{38}\text{H}_{74}\text{O}_6\text{S}_3\text{Sn}$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

odor. An important property of many substances, manifested by a physiological sensation caused by contact of their molecules with the olfactory nervous system. Odor and flavor are closely related, and both are profoundly affected by submicrogram amounts of volatile compounds. Attempts to correlate odor with chemical structure have produced no definitive results. Objective measurement techniques involving chromatography are under development. Even potent odors must be present in a concentration of 1.7×10^7 molecules/cc to be detected. It has been

authentically stated that the nose is 100 times as sensitive in detection of threshold odor values as the best analytical apparatus.

Many compounds have a characteristic odor that is an effective means of identification. Toxic and noxious gases have distinctive odors often utilized for warning purposes. An important exception is carbon monoxide, which is almost odorless. The penetrating, banana-like odor of amyl acetate has been used in mine rescue work. Among the most powerful unpleasant odors are those of organic sulfur compounds, especially ethyl mercaptan (skunk). Organic substances having a pleasant odor are broadly designated as aromatic, regardless of chemical nature. The cyclic aromatic (benzene) series of hydrocarbons was so named for this reason. Most essential oils have a pleasant odor and are the basis of perfumes and fragrances. Odor research, including evaluation by test panels, is conducted at the Olfactronics and Odor Sciences Center at Illinois Institute of Technology, Chicago.

odorant. A substance having a distinctive, sometimes unpleasant odor that is deliberately added to essentially odorless materials to provide warning of their presence. For example, mercaptan derivatives may be added to natural gas for this purpose. In a broad sense, perfumes are odorants that are added to cosmetics, toilet goods, etc., largely for consumer appeal.

See odor; deodorant; perfume; fragrance.

odorless light petroleum hydrocarbons.

Properties: Liquid; faint odor. Bp: 300–650°.

Use: Coating agent; defoamer; float; food additive; froth-flotation cleaning; insecticide formulations component.

odor masking. Addition of a substance with strong odor to obtain a less-offensive effect without changing the composition of the original odorous substance.

ODPN. Abbreviation for β,β' -oxydipropionitrile.

Oenanthic acid. See *n*-heptanoic acid.

oenology. See enology.

“OFA” [Epi-Products]. TM for chemical foaming agent for additives.

Use: To create foam or tiny bubbles in plastic to make products lighter and use less resin.

oil. The word *oil* is applied to a wide range of substances that are quite different in chemical nature. Oils derived from animals or from plant seeds or nuts are chemically identical with fats, the only difference being one of consistency at room temperature. They are composed largely of glycerides of the fatty acids, chiefly oleic, palmitic, stearic, and linolenic. As a rule the more hydrogen the molecule

contains, the thicker the oil becomes. Petroleum (rock oil) is a hydrocarbon mixture comprising hundreds of chemical compounds. It is thought to be derived from the remains of tiny sea animals laid down in past geologic ages. Following is a classification of oils by type and function.

- I. Mineral
 1. Petroleum
 - (a) Aliphatic or wax base (Pennsylvania)
 - (b) Aromatic or asphalt base (California)
 - (c) Mixed-base (midcontinent of U.S.)
 2. Petroleum derived
 - (a) Lubricants: engine oil, machine oil, cutting oil
 - (b) Medicinal: refined paraffin oil
- II. Vegetable (chiefly from seeds or nuts)
 1. Drying (linseed, tung, oiticica)
 2. Semidrying (soybean, cottonseed)
 3. Nondrying (castor, coconut)
 4. Inedible soap stocks (palm, coconut)
- III. Animal
 1. These usually occur as fats (tallow lard, stearic acid). The liquid types include fish oils, fish-liver oils, oleic acid, sperm oil, etc. They usually have a high fatty acid content.
- IV. Essential
 1. Complex volatile liquids derived from flowers, stems, and leaves, and often the entire plant. They contain terpenes (pinene, dipentene, etc.) and are used chiefly for perfumery and flavorings. Usually resinous products are admixed with them. Turpentine is a highly resinous essential oil.
- V. Edible

Derived from fruits or seeds of plants and used chiefly in foodstuffs (margarine, etc.). Most common are corn, coconut, soybean, olive, cottonseed, and safflower. They have varying degrees of saturation.
- oil black.** A carbon black made from oil, usually an aromatic-type petroleum oil.
See furnace black.
- oil blue.** Violet-blue copper sulfide pigment used in varnishes.
- oil cake.** The residue obtained after the expression of vegetable oils from oil-bearing seeds, used as cattle feed and fertilizer. When ground they are known as meal.
See cottonseed cake and meal; peanut oil meal.
- oil gas.** A gas made by the reaction of steam at high temperature on gas oil or similar fractions of petroleum, or by high-temperature cracking of gas oil. One typical analysis is heating value 554 Btu/ft³, illuminants 4.2%, carbon monoxide 10.4%, hydrogen 47.6%, methane 27.0%, carbon dioxide 4.6%,

oxygen 0.4%, nitrogen 5.8%, autoign temp 637F (336C).

Hazard: Flammable, dangerous fire and explosion risk. Toxic by inhalation.

oiliness. That property of a lubricant that causes a difference in coefficient of friction when all the known factors except the lubricant itself are the same. This concept is also expressed by the term *lubricity*.

oil of bitter almond. See almond oil.

oil of cinnamon, ceylon. See cinnamon leaf oil.

oil of cubeb. See cubeb oil.

oil of garlic. See garlic oil.

oil of jasmine.

CAS: 8022-96-6.

Hazard: Low toxicity by ingestion.

Source: Natural product.

oil of lime oil, coldpressed.

Properties: Expressed from the peel of *Citrus aurantifolia* Swingle (Mexican type) or *Citrus latifolia* (Tahitian type). Yellow to brown-green liquid. Sol in fixed oils, mineral oil; insol glycerin, propylene glycol.

Use: Food additive.

oil of mirbane. See nitrobenzene.

oil of muscatel. See clary oil.

oil of vitriol. See sulfuric acid.

oil of wintergreen. See methyl salicylate.

oil sands. (tar sands). Porous sandstone structures occurring on the surface and to depths of 100 m or more in certain localities; they contain a high proportion of bitumen composed chiefly of asphaltenes and maltha, together with substantial percentage of sulfur and heavy metals. Its viscosity is about midway between that of crude oil and soft asphalt. The largest deposit in North America is in the Athabasca region of Alberta; there are smaller ones in the western U.S. Venezuela and Trinidad have large deposits. The Athabasca sands have been successfully mined and have made a substantial contribution to Canadian energy resources over the past decade.

oil shale. Extensive sedimentary rock deposits in the mountains of Colorado, Utah, and Wyoming contain a high percentage of kerogen, which can be separated from the shale either by heating in retorts (surface mining) or by direct combustion in situ in interior excavations. The deposits range in thickness

from 10 to 800 ft and yield from 25 to 30 gal oil/ton shale. Only 33% of the oil content is recoverable by present techniques.

See shale oil; kerogen.

oil varnish. See varnish.

oil, vulcanized. See factice.

oil white. One of several mixtures of lithopone and white lead or zinc white. It may also contain gypsum, magnesia, whiting, or silica.

Use: White-lead substitute.

ointment. (salve). A semisolid pharmaceutical preparation based on a fatty material such as lanolin and often containing petrolatum or zinc oxide together with specific medication for relief of rashes and other forms of dermatitis.

oitica oil.

Derivation: By expression from the seeds of the Brazilian oitica tree, *Licania rigida*.

Chief constituents: Glycerides of α -licanic acid (4-keto-9,11,13-octadecatrienoic acid).

Use: Drying oil in paints, varnishes, etc.

“Okerin” [Astor]. TM for rubber waxes and paraffin products.

Available forms: Flake, prill, or slab.

Use: To provide controlled migration for ozone protection of rubber.

-ol. A suffix indicating that one or more hydroxyl groups (OH) are present in an organic compound, e.g., alcohol, phenol, menthol. Thiol is an exception, the oxygen of the OH group being replaced by sulfur. There are a few other exceptions among the essential oils, e.g., eucalyptol.

Olah, George A. (1927–). Born in Hungary, now an American citizen, he won the Nobel Prize for chemistry in 1994 for his work with carbocations. These are positively charged hydrocarbons with lifetimes on the order of microseconds. Olah developed methods of studying carbocations with different physical techniques, changing the direction of this field. He received a Ph.D. from the Technical University of Budapest in 1949.

olanzapine. See zyprexa.

olealkonium chloride.

CAS: 37139-99-4. mf: $C_{27}H_{48}N \cdot Cl$.

Hazard: A severe skin and eye irritant.

oleamide. *cis*- $CH_3(CH_2)_7CH:CH(CH_2)_7CONH_2$.

Properties: Ivory-colored powder. Mp 72C, d 0.94. Combustible.

Grade: Refined.

Use: Slip agent for extrusion of polyethylene, wax additive, ink additive.

oleandomycin.CAS: 3922-90-5. mf: C₃₅H₆₁NO₁₂.**Hazard:** Low toxicity by ingestion.**oleate.** Salt made up of a metal or alkaloid with oleic acid. It is used for external medications and in soaps and paints.**olefin.** (alkene). A class of unsaturated aliphatic hydrocarbons having one or more double bonds, obtained by cracking naphtha or other petroleum fractions at high temperatures (1500–1700F). Those containing one double bond are called alkenes, and those with two are called alkadienes, or diolefins. They are named after the corresponding paraffins by adding *-ene* or *-ylene* to the stem. α -olefins are particularly reactive because the double bond is on the first carbon. Examples are 1-octene and 1-octadecene, which are used as the starting point for medium-biodegradable surfactants. Other olefins (ethylene, propylene, etc.) are starting points for certain manufactured fibers.

See diolefin.

olefin fiber. Synthetic long-chain polymer fiber composed of at least 85% by weight of ethylene, propylene, or other crystalline polyolefins.**oleic acid.** (*cis*-9-octadecenoic acid; red oil).CAS: 112-80-1. CH₃(CH₂)₇CH:CH(CH₂)₇COOH. A monounsaturated fatty acid, it is a component of almost all natural fats, as well as tall oil. Most oleic acid is derived from animal tallow or vegetable oils.**Properties:** (Commercial grades) Yellow to red oily liquid; lardlike odor, darkens on exposure to air. Insoluble in water; soluble in alcohol, ether, and most organic solvents, fixed and volatile oils. Solvent for other oils, fatty acids and oil-soluble materials. (Purified grades) Water-white liquid. D 0.895 (20/4C), fp 4C, bp 286C (100 mm Hg), 225C (10 mm Hg), refr index 1.4599 (20C), acid value 196–204, iodine value 83–103, saponification value 196–206, flash p 372 (189C), Combustible.**Derivation:** The free fatty acid is obtained from the glyceride by hydrolysis, steam distillation, and separation by crystallization or solvent extraction. Filtration from the press cake results in the oleic acid of commerce (red oil), which is purified and bleached for specific uses.**Grade:** Variety of technical grades, grade free from chick edema factor, USP, FCC, 99+%. A purified technical oleic acid containing 90% or more oleic, 4% maximum linoleic, and 6% maximum saturated acids is available.**Use:** Soap base, manufacture of oleates, ointments, cosmetics, polishing compounds, lubricants, ore flotation, intermediate, surface coatings, food-grade additives.**oleic acid diethanolamide.**CAS: 93-83-4. mf: C₂₂H₄₃NO₃.**Hazard:** A poison by ingestion. A moderate skin irritant.**olein.** (triolein; glyceryl trioleate).C₁₇H₃₃COO)₃C₃H₅. The triglyceride of oleic acid, occurring in most fats and oils. It constitutes 70–80% of olive oil.**Properties:** Yellow, oily liquid. D 0.915, mp –4 to –5C. Soluble in chloroform, ether, carbon tetrachloride; slightly soluble in alcohol. Combustible.**Impurities:** Stearin, linolein.**Derivation:** Refined natural oils.**Use:** Textile lubricants.**oleoresin.** Any of a number of mixtures of essential oils and resins characteristic of the tree or plant from which they are derived. Most types are semi-solid and tacky at room temperature, becoming soft and sticky at high temperatures. They have various distinctive odors.

See balsam; rosin.

oleoyl chloride. (*cis*-9-octadecenoyl chloride).CH₃(CH₂)₇CH:CH(CH₂)₇COCl.**Properties:** Liquid. Bp 175–180C (3 mm Hg). Soluble in hydrocarbons and ethers; reacts slowly with water. Combustible.**Use:** Chemical intermediate.***n*-oleoylsarcosine.**C₁₇H₃₃C(O)N(CH₃)CH₂COOH.**Properties:** Amber liquid. D 0.955 (20/20C), refr index 1.4703 (20C), 95% pure. Combustible.**Use:** Surfactants.**oleum.** The Latin word for oil, applied to fuming sulfuric acid. (Sulfuric acid was originally called oil of vitriol.)**oleyl alcohol.** (octadecenol).CAS: 143-28-2. CH₃(CH₂)₇CH:CH(CH₂)₇CH₂OH.**Properties:** Clear, viscous liquid at room temperature. Iodine value 88, cloud p –6.6C, bp 333C, fp –75C, d 0.84. Combustible.**Impurities:** Linoleyl, myristyl, and cetyl alcohols.**Derivation:** Reduction of oleic acid, occurs in fish and marine mammal oils.**Grade:** Technical, commercial (80–90% pure).**Use:** Surfactants, metal cutting oils, printing inks, textile finishing, antifoam agent, plasticizer.**oleyl aldehyde.** See octadecenyl aldehyde.**oleylhydroxamic acid.** C₁₇H₃₃CONH₂O.**Properties:** Waxy solid, off-white color. D 0.897 (70/25C). Insoluble in water; soluble in aqueous potassium hydroxide and organic solvents.**oleyl-linoleylamine.** (octadecene-octadecadieneamine).**Properties:** Highly unsaturated primary amine. D

0.83, mp 19C, bp 198–209C, amine no. 200–210, iodine value 90 min. Soluble in many organic solvents; insoluble in water.

Use: Organic intermediate.

oleyl methyl tauride. See sodium-*N*-methyl-*N*-oleoyl taurate.

olibanum oil.

CAS: 8050-07-5.

Properties: Distilled from a gum from the trees *Boswellia carterii* and other *Boswellia* species (Fam. *Burseraceae*). Pale liquid; pleasant balsamic odor. D: 0.862–0.889, refr index: 1.465–1.482 @ 20°. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol.

Hazard: A skin irritant.

Use: Food additive.

“Oligga-Fiber” [Cargill]. TM for inulin recognized for its nutritional and functional benefits in food.

Use: For softer, long shelf life.

oligo-. A prefix meaning “a few” or “very little.”

oligodynamic. Literally, active in small amounts. In technical literature, the term describes the sterilizing or purifying action of a substance, e.g., silver.

oligogenic. A phenotypic trait produced by two or more genes working together.
See polygenic disorder.

oligomer. A polymer molecule consisting of only a few monomer units (dimer, trimer, tetramer).

oligomeric protein. A multisubunit protein having two or more polypeptide chains.

oligomycin C.

CAS: 11052-72-5. mf: $C_{28}H_{46}O_6$.

Hazard: A poison.

Source: Natural product.

oligonucleotide. A molecule usually composed of 25 or fewer nucleotides; used as a DNA synthesis primer.
See nucleotide.

oligopeptide. A peptide made up of not more than 10 amino acids.

oligosaccharide. A carbohydrate containing from two to ten simple sugars linked together (e.g., sucrose, composed of dextrose and fructose). Beyond ten they are called polysaccharides.

olive oil.

CAS: 8001-25-0.

Properties: Pale yellow or greenish-yellow liquid;

slight odor and taste. D 0.910–0.918, saponification value 188–196, iodine value 77–88, flash p 437F (225C), cloud p –6.6 to –1.1C. A nondrying oil. Soluble in ether, chloroform, and carbon disulfide; sparingly soluble in alcohol. Combustible.

Use: Salad dressings and other foods; ointments, liniments, etc.; Castile soap, special textile soaps; lubricant; sulfonated oils; cosmetics.

olivetol. (5-pentylresorcinol). $CH_3(CH_2)_4C_6H_3-1,3-(OH)_2$. Store under nitrogen.

Properties: Off-white solid. Mw 180.25, mp 42–44, flash p above 110C.

Hazard: Skin irritant; combustible.

Use: Pharmaceutical intermediate.

olivine. (chrysolite). $(Mg,Fe)_2SiO_4$. Natural magnesium-iron silicate, found in igneous and metamorphic rocks, meteorites, and blast furnace slags. A complete series exists from Fe_2SiO_4 to Mg_2SiO_4 .

Grade: Crude, 20 mesh, 100 mesh.

Use: Refractories, cements.

“Omadine” [Olin]. TM for a series of derivatives of pyridinethione (such as 1-hydroxy-2-pyridinethione, $C_5H_4NOH(S)$) having bactericide-fungicide properties.

Use: Cosmetics, textiles, cutting oils, coolant systems, vinyl films, and rubber products.

OMC. Abbreviation of oxidized microcrystalline waxes.

“Omega Gold” [Omega]. TM for an omega 3 rich ground flax seed, premix supplement.

Use: To improve swine health, gestation, lactation, and breeding.

“Omega Horseshine” [Omega]. TM for an omega 3 stabilized flax supplement.

Use: To maintain healthy coat, solid hooves, and long life.

“Omega Ultra Egg” [Omega]. TM for an omega 3 rich stabilized flax seed premix.

Use: Food supplement for laying hens.

OMPA. Abbreviation for octamethyl pyrophosphoramide.
See schradan.

ONB. Abbreviation for *o*-nitrobiphenyl.

oncogen. Any substance that will cause either benign or malignant tumors in test animals. EPA pesticide regulations use this term instead of *tumorigenic* and *carcinogenic*.

oncogene. A gene of cellular or viral origin that causes cells to exhibit rapid, uncontrolled proliferation. See also proto-oncogene.

one-step resin. See A-stage resin.

Onsager, Lars. (1903–1976). A Norwegian chemist who won the Nobel Prize for chemistry in 1968. He studied and wrote on the theory of electrolytic conduction and theory of dielectrics. He also worked with superfluids and crystal statistics and reciprocal relations in irreversible processes. After receiving his doctorate in Norway, he came to the U.S. and became a citizen.

“Onyx Classica” [ALCOA]. $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$. TM for a filler; flame-retardant in the premium products of the synthetic marble industry.

Properties: Exceptionally high purity, whiteness, and particle size consistency.

opacity. The optical density of material, usually a pigment; the opposite of transparency. A colorant or paint of high opacity is said to have good hiding power or covering power, by which is meant its ability to conceal another tint or shade over which it is applied. Apparatus for measuring opacity is available.

OPDN. Abbreviation for β, β -oxydipropionitrile.

open reading frame. (ORF). The sequence of DNA or RNA located between the start-code sequence (initiation codon) and the stop-code sequence (termination codon).

open system. A system that exchanges matter and energy with its surroundings.

operation. See unit operation.

operations research. The use of statistical and other mathematical methods for studying and evaluating the best procedures to be used for carrying out a particular operation and all functions associated with it.

operator. Biology - A region of DNA that interacts with a regulatory protein to control the expression of a gene or group of genes.

operon. A unit of genetic expression in prokaryotes consisting of one or more related genes, and the operator and promoter sequences that regulate their transcription.

OPG. Abbreviation for oxypolygelatin.

opium. A mixture of alkaloids.

Derivation: The air-dried, milky exudate obtained from the unripe capsules of *Papaver somniferum*.

Available forms: Deodorized, granulated, powdered.

Hazard: A habituating narcotic; importation and sale restricted by law in U.S.

Use: Source of morphine.

“Oppanol” [BASF]. TM for a series of polyisobutylenes, varying from oily liquids through highly viscous materials to rubberlike solids according to degree of polymerization.

Oppenauer oxidation. The aluminum alkoxide-catalyzed oxidation of a secondary alcohol to the corresponding ketone (the reverse of the Meerwein-Ponndorf-Verley reduction).

“Optanol drops” [Lagap]. TM for liquid drug.

Use: For treatment of symptoms of allergic conjunctivitis.

optical activity. See optical rotation.

optical bleach. See brightening agent.

optical brightener. (optical bleach; colorless dye; fluorescent brightener). A colorless, fluorescent, organic compound that absorbs UV light and emits it as visible blue light. The blue light masks the undesirable yellow of textiles, paper, detergents, and plastics. Some examples are derivatives of 4,4'-diaminostilbene-2,2'-disulfonic acid, coumarin derivatives such as 4-methyl-7-diethylaminocoumarin.

optical crystal. A comparatively large crystal, either natural or synthetic, used for infrared and ultraviolet optics, piezoelectric effects, and short-wave radiation detection. Examples are sodium chloride, potassium iodide, silver chloride, calcium fluoride, and (for scintillation counters) such organic materials as anthracene, naphthalene, stilbene, and terphenyl.

optical fiber. See fiber, optical.

optical glass. See glass, optical.

optical isomer. Either of two kinds of optically active three-dimensional isomers (stereoisomers). One kind is represented by mirror-image structures called enantiomers that result from the presence of one or more asymmetric carbon atoms in the compound (glyceraldehyde, lactic acid, sugars, tartaric acid, amino acids). The other kind is exemplified by diastereoisomers, which are not mirror images. These occur in compounds having two or more asymmetric carbon atoms; thus, such compounds have 2_n optical isomers, where n is the number of asymmetric carbon atoms.

See enantiomer; diastereoisomer; optical rotation; asymmetry.

optical microscope. (light microscope). A magnifying lens system that utilizes light in the visible wavelength range of the electromagnetic spectrum (5000 Å). A convex glass lens bends or focuses light waves because of the difference in

density between glass and air. Invented in 1590 by the Janssen brothers and later improved by van Leeuwenhoek, the compound microscope has three lenses: a condenser lens, which concentrates the incident light; an objective lens, which gives an enlarged reverse image of the specimen; and a projector lens, which further enlarges the image and returns it to normal position. Its maximum resolving power is 0.5 micron, compared with 100 microns for the human eye. The compound microscope is particularly useful in studying bacteria and other microorganisms in their natural state without interfering with their behavior. It has been of untold benefit to biologists and bacteriologists and also has innumerable uses in chemical and metallurgical research, as well as in forensic chemistry.

See resolving power; electron microscope; ultramicroscope; field-ion microscope; van Leeuwenhoek, Anton.

optical rotation. The change of direction of the plane of polarized light to either the right or the left as it passes through a molecule containing one or more asymmetric carbon atoms, e.g., sugars. The direction of rotation, if to the right, is indicated by either a plus sign (+) or a *d*-; if to the left, by a minus sign (-) or an *l*-. Molecules having a right-handed configuration (D) usually are dextrorotatory, D(+), though they may be levorotatory, D(-); those having a left-handed configuration (L) are usually levorotatory, L(-), but may be dextrorotatory, D(+). Compounds having this property are said to be optically active and are isomeric. The amount of rotation varies with the compound but is the same for any two isomers, though in opposite directions.

See optical isomer; nicol.

optical spectroscopy. See spectroscopy; absorption spectroscopy; emission spectroscopy.

"Optidose 2000" [Mid South]. TM for a carboxylic sulfonated copolymer.

Use: For water treatment and traceable scale inhibitor for phosphates and zinc.

optimax.

CAS: 62602-94-2.

mf: $C_{11}H_{12}N_2O_2 \bullet C_8H_{11}NO_2 \bullet C_6H_8O_6 \bullet CIH$.

Hazard: Human systemic effects.

"Optimer" [Nalco]. TM for flocculating chemicals.

Use: Dewatering of sludge.

"Optimum" [American International].

TM for guanidine hydrochloride and guanidine thiocyanate.

Available forms: Solid.

Grade: Bio-tech.

optimum pH. The characteristic pH at which an enzyme has maximal catalytic activity.

optrode. A component of fiber-optical analytical systems that is analogous to an electrode. Its function is to couple the laser beam to the sample solution being analyzed. There are three types: cuvette, sapphire ball, and membrane.

"Oracle, 4E Dicamba Herbicide" [Agrisel].

TM for a broad spectrum control for turf weeds.

oral contraceptive. See antifertility agent.

orange III. See methyl orange.

orange IV. See tropaeolin 00.

orange B.

CAS: 15139-76-1. mf: $C_{22}H_{16}N_4Na_2O_9S_2$.

Properties: Dull orange crystals.

Use: Food additive.

orange cadmium. See cadmium sulfide.

orange mineral. A red lead oxide pigment made in a furnace by roasting lead carbonate or sublimed litharge; it is a very bright orange but has low tinting strength.

Properties: Fine powder, -325 mesh. D 9.0, contains 95.5% red lead (Pb_3O_4).

Use: Pigment in printing inks and primers.

orange oil, bitter, coldpressed.

Properties: Oil expressed from the peel of *Citrus aurantium L. Osbeck* (Fam. *Rutaceae*). Pale yellow to yellow-brown liquid; characteristic orange odor and bitter taste. D: 0.845-0.851, refr index: 1.472 @ 20°. Misc in abs alc, in 1 vol glacial acetic acid; sol in fixed oils, mineral oil; insol in glycerin.

Use: Food additive.

orange oil, distilled.

Properties: From steam distillation of fresh peel of *Citrus sinensis L. Osbeck* (Fam. *Rutaceae*). Colorless to pale yellow liquid; odor of fresh orange peel. Sol in fixed oils, mineral oil, alc; insol in glycerin, propylene glycol.

Use: Food additive.

orange peel. A term used in the paint industry to refer to a roughened film surface caused by too rapid drying.

orange peel oil. See citrus peel oils.

orange seed oil. See citrus seed oils.

orange toner. A diazo dyestuff coupled to dia-cetoacetic acid anhydride. It contains no sulfonic or carboxylic groups.

Use: Printing inks.

"Orasol" [Novartis]. TM for solvent dyes for transparent coatings, inks, and plastics.

orbital. The area in space about an atom or molecule in which the probability of finding an electron is greatest.

orbital electron. Electron remaining with high degree of probability in the immediate neighborhood of a nucleus where it occupies a quantized orbital.

orbital theory. The quantum theory of matter applied to the nature and behavior of the electron either in a single atom (atomic orbital) or combined atoms (molecular orbital). A combination of Schrodinger's wave mechanics and Heisenberg's uncertainty principle, the orbital theory was formulated in 1926. It has yielded a better understanding of the electron and its critical part in chemical bonding than is possible with Newtonian mechanics. In simple language, the orbital theory considers the electron not as a particle but as a three-dimensional wave that can exist at several energy levels; its exact location and position in the "shell" (which in most elements is a group of orbitals) cannot be precisely determined but only predicted by the laws of mathematical probability. The orbital levels and the movement of electrons within them are expressed by wave functions and quantum numbers. The probability that an electron will be found in a given volume (i.e., the square of the one-electron wave function) is called the orbital of that electron, and the shape of the orbital is defined by surfaces of constant probability (i.e., spheres and elliptically shaped doughnuts). The electron orbital, described in terms of probability, is like a cloud, with indefinite boundaries. The energy state of each electron is given by four quantum numbers that describe its principal level, its angular momentum, its magnetic moment, and its spin. This concept has exerted a profound effect on modern ideas about chemical bonding, transition metal complexes, semiconductors, and solid-state physics.

orcin. (dihydroxytoluene; methylresorcinol; orcinol).

CAS: 504-15-4. $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})_2$.

Properties: White, crystalline prisms becoming red in air; intensely sweet, unpleasant taste. D 1.2895, mp (anhydrous) 107C, (hydrated) 56C; bp 287–290C. Soluble in water, alcohol, and ether.

Derivation: By fermentation of various species of lichens (roccella) and extraction.

Use: Reagent for certain carbohydrates (beet sugar, lignin, pentoses, etc.).

order of magnitude. A range of values applied to numbers, distances, dimensions, etc., that

begins at any value and extends to 10 times that value; e.g., 2 is of the same order of magnitude as any number between itself and 20; and 5 miles is of the same order of magnitude as any distance between 5 and 50 miles. The expression usually applies to extremely large or extremely small units, i.e., the size ranges of atoms, molecules, colloidal particles, etc., or astronomical distances.

ore. An aggregate of valuable minerals and gangue from which one or more metals can be extracted at a profit.

ore flotation. See flotation.

organelle. A portion of a cell having specific functions, distinctive chemical constituents, and characteristic morphology; it is a unit subsystem of a cell. Examples are mitochondria and chromosomes. Organelles are often closely associated with enzymes. The lysosome (an enzyme-bearing organelle) has been synthesized.

organic chemistry. A major branch of chemistry that embraces all compounds of carbon except such binary compounds as the carbon oxides, carbides, carbon disulfide, etc.; such ternary compounds as the metallic cyanides, metallic carbonyls, phosgene (COCl_2), carbonyl sulfide (COS), etc.; and the metallic carbonates, such as calcium carbonate and sodium carbonate. The total number of organic compounds is indeterminate, but some 6,000,000 have been identified and named. These fall into several structural groups as follows:

- I. Aliphatic (straight chain)
 1. Hydrocarbons (petroleum and coal derived)
 - (a) Paraffins or alkanes (saturated) ($\text{C}_n\text{H}_{2n+2}$) methane and homologs; halogen-substituted derivatives, e.g., fluorocarbons
 - (b) Olefins (unsaturated)
 - (1) Alkenes (one double bond) (C_nH_{2n}) ethylene and homologs
 - (2) Alkadienes (two double bonds) ($\text{C}_n\text{H}_{2n-2}$) butadiene, allene
 - (c) Acetylenes or alkynes (triple bond)
 2. Alcohols (ROH): methanol and homologs
 3. Ethers (ROR): methyl ether and homologs
 4. Aldehydes (RCHO): formaldehyde, acetaldehyde
 5. Ketones (RCOR): acetone, methylethylketone
 6. Carboxylic acids (RCOOH)
 7. Carbohydrates ($\text{C}_n\text{H}_{2n}\text{O}_n$)
 - (a) Sugars: glucose, fructose, sucrose, gums
 - (b) Starches: wheat, corn, potato
 - (c) Cellulose: cotton, plant fibers
- II. Cyclic (closed ring)
 1. Alicyclic hydrocarbons (properties similar to aliphatics)
 - (a) Cycloparaffins (naphthenes) (saturated): cyclohexane, cyclopentane, etc.

- (b) Cycloolefins (unsaturated): cyclopentadiene, cyclooctatetraene
- (c) Cycloacetylenes (triple bond)
- 2. Aromatic hydrocarbons (arenes): unsaturated compounds; hexagonal ring structure; single and multiple fused rings
 - (a) Benzene group (1 ring)
 - (b) Naphthalene group (2 rings)
 - (c) Anthracene group (3 rings)
 - (d) Polycyclic group (steroids, sterols)
- 3. Heterocyclic: unsaturated; usually pentagonal rings containing at least one other element besides carbon
 - (a) Pyrroles
 - (b) Furans
 - (c) Thiazoles
 - (d) Porphyrins
- III. Combinations of aliphatic and cyclic structures
 - 1. Terpene hydrocarbons
 - 2. Amino acids (some are aliphatic and others combinations)
 - 3. Proteins and nucleic acids (coiled or helical formations)
- IV. Organometallic compounds
- V. Synthetic high polymers, including silicones

Important areas of organic chemistry include polymerization, hydrogenation, isomerization, fermentation, photochemistry, and stereochemistry. There is no sharp dividing line between organic and inorganic chemistry; the two often tend to overlap. See inorganic chemistry.

“Organiclear” [Standard]. (methylene bithiocyanate).

CAS: 6317-18-6. TM for wood preservative.

Use: To stop wood rot, termite attack, mildew, and decay.

organoborane. A compound composed of an unsaturated organic group and a borane obtained by the hydroboration reaction. Such compounds are useful catalytic reagents in organic syntheses of some complexity, e.g., *cis*- or *trans*-olefins, optically pure alcohols, alkanes, and ketones. Prostaglandins and insect pheromones have been synthesized by this means. A particularly versatile example is triphenylboron, $B(C_6H_5)_3$.

See hydroboration; carborane; borane.

organoclay. (organopolysilicate). A clay such as kaolin or montmorillonite, to which organic structures have been chemically bonded; since the surfaces of the clay particles, which have a lattice-like arrangement, are negatively charged, they are capable of binding organic radicals. When this type of structure is in turn reacted with a monomer such as styrene, a complex known as a polyorganosilicate graft polymer results.

organoleptic. A term widely used to describe consumer testing procedures for food products, perfumes, wines, and the like in which samples of various products, flavors, etc. are submitted to groups or panels. Such tests are a valuable aid in determining the acceptance of the products and thus may be viewed as a marketing technique. They also serve psychological purposes and are an important means of evaluating the subjective aspects of taste, odor, color, and related factors. The physical and chemical characteristics of foods are stimuli for the eye, ear, skin, nose, and mouth, whose receptors initiate impulses that travel to the brain, where perception occurs.

organometallic compound. An organic compound composed of a metal attached directly to carbon (RM); such compounds have been prepared of practically all the metals, as well as with such nonmetals as silicon and phosphorus. Metallic salts (soaps) of organic acids are excluded. Examples are diethylzinc (the first known organometallic), Grignard compounds such as methyl magnesium iodide (CH_3MgI), and metallic alkyls such as butyllithium (C_4H_9Li), tetraethyllead, triethyl aluminum, tetrabutyl titanate, sodium methylate, copper phthalocyanine, and metallocenes. Some are highly toxic or flammable; others are coordination compounds. Reactive and moderately reactive organometallic compounds will react with all functional groups; two major types of reaction in which they are involved are oxidation and cleavage by acids. Probably the most important organometallic reactions are those involving addition to an unsaturated linkage. Many of them are powerful catalysts and form useful coordination complexes.

See catalysis; metallocene; coordination compound.

organophosphorus compound. Any organic compound containing phosphorus as a constituent. These fall into several groups, chief of which are the following: (1) phospholipids, or phosphatides, which are widely distributed in nature in the form of lecithin, certain proteins, and nucleic acids; (2) esters of phosphinic and phosphonic acids, used as plasticizers, insecticides, resin modifiers, and flame-retardants; (3) pyrophosphates, e.g., tetraethyl pyrophosphate, which are the basis for a broad group of cholinesterase inhibitors used as insecticides; (4) phosphoric esters of glycerol, glycol, sorbitol, etc., which are components of fertilizers. While many of these compounds play an important part in animal metabolism, those in group (3) are toxic and should be handled with extreme care.

organopolysilicate. See organoclay.

organosilane. See organosilicon.

organosilicon. An organic compound in which silicon is bonded to carbon (organosilane). Such compounds were first made by Friedel and Crafts in

1863. Silicon was found to have a remarkable chemical similarity to carbon, which it can replace in organic compounds. The silicon-carbon bond is about as strong as the carbon-carbon bond, and compounds containing them are similar in properties to all-carbon compounds. Organosilicon oxides (organosiloxanes or silicones) were discovered by F. S. Kipping in England in 1900; he found that Grignard reagents would react with silicon tetrachloride to form silicon-carbon-bonded polymers of both ring and chain types. These were named silicones because of the similarity of their empirical formula (R_2SiO) to that of ketones (R_2CO).

An organosilicon compound (tetramesityldisilene) containing a silicon to silicon double bond has been synthesized. It is a crystalline solid, mp 176C, and has reactive properties similar to olefins. Compounds of this type are called silylenes. See silycone.

organosol. Colloidal dispersion of any insoluble material in an organic liquid; specifically the finely divided or colloidal dispersion of a synthetic resin in plasticizer in which dispersion the volatile content exceeds 5% of the total.

See plastisol.

organotin compounds. A family of alkyl tin compounds widely used as stabilizers for plastics, especially rigid vinyl polymers used as piping, construction aids, and cellular structures. Some have catalytic properties. They include butyl tin trichloride, dibutyltin oxide, etc., and various methyltin compounds. They are both liquids and solids.

Hazard: All are highly toxic. TLV: 0.1 mg/m³. See dibutyltin-.

origanum oil. An essential oil used in pharmacy and as a flavoring.

origin. Biology: The nucleotide sequence or site in DNA where DNA replication is initiated.

“Orlon” [Du Pont]. TM for a copolymer containing at least 85% acrylonitrile. Available in various types of staple and tow.

Properties: Tensile strength (psi) 32,000–39,000, d 1.14–1.17, break elongation 20–28%, moisture regain 1.5% (21.2C, 65% RH), softens at 235C, soluble in butyrolactone (hot), dimethyl formamide (hot), ethylene carbonate (hot), resistant to mineral acids, fair to good resistance to weak alkalis. Insoluble in alcohol, acetone, benzene, carbon tetrachloride, and petroleum ether; soluble in dimethyl sulfide, maleic anhydride, ethylene carbonate, nitriles, and nitrophenols.

Hazard: Combustible, burns freely and rapidly.

Use: In apparel, usually blended with wool or other fibers.

ormetoprim.

Properties: White, tasteless, odorless powder.

Use: Drug (veterinary); food additive.

Orn. Abbreviation for ornithine.

ornithine. (2,5-diaminovaleric acid).

$NH_3(CH_2)_3CH(NH_2)COOH$. A nonessential amino acid produced by the body and important in protein metabolism.

Properties: (L(+)-ornithine.) Crystals from alcohol-ether. Mp 140C. Soluble in water and alcohol. (DL-ornithine) Crystals from water. Slightly soluble in alcohol.

Derivation: Isolated from proteins after hydrolysis with alkali.

Use: Biochemical research; medicine.

ORNL. Abbreviation for Oak Ridge National Laboratory.

orosomucoid. An old term for α -1-acid glycoprotein

“Orotan” TV [Rohm & Haas]. TM for a synthetic tanning agent with attributes of vegetable tannins. Dark-red, viscous solution; 31% tannin. Imparts high degree of tannage, strength, fullness, and solidity to leather. Solubilizing, penetrating, and bleaching agent.

orotic acid. (uracil-6-carboxylic acid; 6-carboxyuracil).

CAS: 65-86-1. $C_4N_2H_3(O)_2COOH$. Occurs in cow's milk and has also been isolated from certain strains of molds (*Neurospora*). A growth factor for certain microorganisms.

Properties: Crystals. Mp 345–346C.

Use: Biochemical research, especially the biosynthesis of nucleic acids.

orpiment. Obsolete name for arsenic trisulfide.

orris root oil.

Properties: From steam distillation of peeled, dried, aged rhizomes of *Iris pallida* L. (Fam. *Iridaceae*). Light yellow to brown solid at room temp. Mp: 38–50°. Sol in fixed oils, mineral oil, propylene glycol; insol in glycerin.

Use: Food additive.

orthamine. See *o*-phenylenediamine.

ortho- (*o*-). A prefix meaning “straight ahead.” Compare with meta- (*m*-) meaning “beyond,” para- (*p*-) meaning “opposite.” These prefixes are used in organic chemistry in naming disubstitution products derived from benzene in which the substituent atoms or radicals are located in certain definite positions on the benzene ring. This is illustrated in the diagram, where A and B represent the substituent atoms or groups. When attached to adjoining carbon atoms, B is in the *o*- position in respect to A (also called the 1,2-position). If B is located on the third carbon

atom in respect to A, it is in the *m*- position (also called 1,3-); when B is attached to the opposite carbon atom, it is in the *p*- position (1,4).

In organic compounds, these prefixes usually appear in italics (often abbreviated *o*-, *m*-, and *p*-) and are ignored in alphabetizing.

In inorganic chemistry, the prefix *ortho* designates the most highly hydrated acid, or its salt, to contrast with the *meta*, or less hydrated acid or salt. For example, H_3PO_4 is orthophosphoric acid and HPO_3 is metaphosphoric acid. These are considered in alphabetizing.

orthoarsenic acid. See arsenic acid.

orthoboric acid. See boric acid.

“Orthochrom” [Rohm & Haas]. TM for pigmented plasticized nitrocellulose lacquers and thinners. They produce durable, washable, flexible, colored lacquer finishes of good lightfastness.

Use: Finishing of belt, garment, upholstery, and other leathers.

“Orthoclear” [Rohm & Haas]. TM for permanently plasticized nitrocellulose binders and lacquers in various solvents. They produce clear, durable, flexible finishes.

Use: Top-coat finishes for glazing or high-gloss leather coatings.

orthoform. See methyl-*m*-amino-*p*-hydroxybenzoate.

“Ortholite” [Rohm & Haas]. TM for clear and pigmented vinyl lacquers, binders, and solvents. They produce finishes of outstanding abrasion resistance and low-temperature flexibility.

Use: Finishes on upholstery, automotive, luggage, and case leathers.

orthosilicic acid. See silicic acid (ortho).

oryzalin.

CAS: 19044-88-3. mf: $\text{C}_{12}\text{H}_{18}\text{N}_4\text{O}_6\text{S}$.

Hazard: Low toxicity by ingestion and skin contact.

Use: Food additive; herbicide; agricultural chemical.

Os. Symbol for osmium.

oscillometry. Electrode measurement of oscillation-frequency changes to detect the progress of a titration of electrolyte solutions.

-ose. A suffix indicating a carbohydrate compound or polymer, usually a simple or complex sugar, e.g., sucrose, fructose, glucose, maltose, etc., and also cellulose, cellobiose, amylose (starch).

OSHA. Abbreviation for Occupational Safety and Health Administration.

osmic acid. (osmium tetroxide; perosmic acid anhydride; perosmic oxide).

CAS: 20816-12-0. OsO_4 .

Properties: A colorless dimorphic compound with both crystalline and amorphous forms; pungent, disagreeable odor. D 4.90, mp 40C, bp 130C. Soluble in water, alcohol, and ether.

Derivation: By heating powdered osmium in air, or by treating it with nitric acid, aqua regia, or chlorine.

Hazard: Toxic by inhalation; strong irritant to eyes and mucous membranes. TLV: 0.0002 ppm; STEL 0.0006 ppm (Os).

Use: Microscopic staining, photography, oxidation catalyst in organic synthesis.

osmiridium. See iridosmine.

osmium.

CAS: 7440-04-2. Os. Metallic element having atomic number 76, in group VIII of the periodic table, aw 190.2, valences of 2, 3, 4, 6, 8; seven stable isotopes.

Properties: Hard white metal of the platinum group. D 22.5, mp 3000C, bp 5500C, it has the highest specific gravity and melting point of the platinum metals, metallurgically unworkable. On heating in air gives off poisonous fumes of osmium tetroxide. Insoluble in acids and aqua regia; attacked by fused alkalis.

Occurrence: Tasmania, South Africa, the former U.S.S.R., Canada.

Derivation: Occurs with platinum, from which it is recovered during the purification process. Also occurs with iridium as a natural alloy, iridosmine.

Hazard: Highly toxic; irritant to skin.

Use: Hardener for iridium and platinum, pen points, instrument pivots, catalyst.

osmium ammonium chloride. See ammonium hexachloroosmate.

osmium chloride. (osmium dichloride; osmous chloride). OsCl_2 .

Properties: Dark-green needles. Hygroscopic. Keep away from air. Soluble in alcohol, ether; insoluble in water.

osmium dichloride. See osmium chloride.

osmium sodium chloride. See sodium hexachloroosmate.

osmium tetroxide. See osmic acid.

osmocaine.

CAS: 532-77-4. mf: $C_{16}H_{23}NO_2$.

Hazard: Human systemic effects.

osmocene. (dicyclopentadienylosmium).

$(C_5H_5)_2Os$.

Properties: Stable, white solid. Mp 229–230C.

Use: Intermediate, high-temperature applications, derivatives used as UV-radiation absorber.

See metallocene.

osmometry. The measurement of osmotic pressure.

osmosis. Passage of a pure liquid (usually water) into a solution (e.g., of sugar and water) through a membrane that is permeable to the pure water but not to the sugar in the solution. This passage can also occur when the two phases consist of solutions of different concentration. The membrane is called semipermeable when the molecules of the solvent, but not those of the solute, can penetrate it. This pushing of water through a membrane into a solution results from the greater tendency of water molecules to escape from water than from a solution. The term *osmosis* is usually restricted to movement through a solid or liquid barrier that prevents the phases from mixing rapidly. In test apparatuses parchment or collodion membranes are used; in plants and animals the cell wall acts as a diffusion barrier. The pressure exerted by osmosis is substantial and accounts for the elevation of sap from root systems to the tops of trees. Osmosis is considered an essential characteristic of growth.

Reverse osmosis is used as a method of desalting seawater, recovering wastewater from paper mill operations, pollution control, industrial water treatment, chemical separations, and food processing. This method involves application of pressure to the surface of a saline solution, thus forcing pure water to pass from the solution through a membrane that is too dense to permit passage of sodium and chlorine ions. Hollow fibers of cellulose acetate or nylon are used as membranes, since their large surface area offers more efficient separation. See dialysis; membrane; diffusion; desalination.

osmious chloride. See osmium chloride.

Ostromyslenskii (Ostromisslenskii)

reaction. Dehydrogenation of ethanol over copper-containing catalysts and conversion of the acetaldehyde ethanol mixture to butadiene by passage at high temperature over silica gel containing a small amount of tantalum oxide.

Ostwald ripening. Refers to the process of solution of smaller crystals and growth of larger crystals.

Ostwald, Wilhelm. (1853–1932). A German chemist who won the Nobel Prize for chemistry in 1909. He was considered to be a founder of modern physical chemistry. His work involved research in catalysis, the rates of chemical reactions, equilibrium, and conductivity of organic acids. He was an admirer of Mach and did not readily accept the atomic theory. He was educated at the University of Dorpat.

osutidine.

CAS: 140695-21-2. mf: $C_{19}H_{28}N_4O_5S_2$.

Hazard: Low toxicity by ingestion.

OTEC. See Ocean Thermal Energy Conversion.

otto. See attar.

Otto Fuel II.

CAS: 106602-80-6. A torpedo fuel that is easy to handle, has a non-explosive classification and a low fire hazard. Developed by Otto Reitlinger at the Indian Head Division Naval Surface Warfare Center during the 1960s.

ouricury wax. A vegetable wax exuded by the leaves of *Cocos coronapa* (South America).

Properties: Brown. Acid value 10, saponification value 80, d 0.970 (15C), mp 83C, foreign matter (dirt, etc.) sometimes 18%. Combustible.

Grade: Crude, refined.

Use: Substitute for carnauba wax.

-ous. A suffix, used in naming inorganic compounds, that indicates that the central element is present in its lower oxidation state. For example, in ferrous chloride ($FeCl_2$), the iron atom is in its lower oxidation state of +2, equivalent to its valence; in an ionized state it would have two positive charges (Fe^{2+}). (A recommended change in this system of nomenclature is to use the common name of the element [iron] together with a Roman numeral showing the oxidation number; thus, ferrous chloride would be iron(II) chloride.)

outgassing. The removal of gas from a metal by heating at a temperature somewhat below melting, while maintaining a vacuum in the space around the metal. Usually done before melting but sometimes afterward.

Use: Manufacture of tubes and other vacuum devices.

outgroup. In a cladistic analysis, any taxon used to help resolve the polarity of characters, and which is hypothesized to be less closely related to each of

the taxa under consideration than any are to each other.

ovalbumin. See albumin, egg.

oven. A heated chamber of varying sizes used for removing moisture from industrial products before or during processing, for example, finely divided solids, food products, tobacco, textiles, wood, etc. Laboratory sizes are used for testing the effect of heat exposure on such materials as rubber, plastics, fibers, paints, etc., as well as for sterilization, drying electronic components, and curing encapsulation compounds.

overlapping clones. See genomic library.

ovex. (generic name for *p*-chlorophenyl-*p*-chlorobenzenesulfonate).

CAS: 80-33-1. $C_{12}H_4OSO_2C_6H_4Cl$.

Properties: White, crystalline solid. Mp 86.5C. Insoluble in water; soluble in acetone and aromatic solvents.

Use: Insecticide and acaricide.

ovicide. A type of pesticide that kills the eggs of insects.

“Ovral” [Wyeth-Ayerst]. TM for an oral contraceptive containing norgestrel, a synthetic progestogen. Contains 0.05 mg norgestrel and 0.05 mg ethinyl estradiol.

oxa-. Prefix indicating the presence of oxygen in a heterocyclic ring.

6-oxa-5,7-disilaundecane-1,11-diamine, 5,5,7,7-tetramethyl-

CAS: 3663-42-1. mf: $C_{12}H_{32}NOSi_2$.

Hazard: A severe eye irritant.

“OXAF” [Uniroyal]. TM for the zinc salt of 2-mercaptobenzothiazole ($Zn(SCNSC_6H_4)_2$).

Properties: White to pale-yellow powder. D 1.63, melting range decomposes without melting when heated to 200C or over, excellent storage stability. Slightly soluble in ethylene dichloride and acetone; insoluble in water, benzol, and gasoline. Available in pelletized form.

Use: Rubber accelerator, especially latex foam sponge, wire insulation, air-cured footwear, drug-gist sundries, and specialties.

oxalatoplatinum.

CAS: 61825-94-3. mf: $C_8H_{14}N_2O_4Pt$.

Properties: IDLH 4 mg/m³ (as Pt).

Hazard: A poison.

oxalic acid.

CAS: 144-62-7. $HOOC(=O)OH \cdot 2H_2O$.

Properties: Transparent, colorless crystals. Mp 187C for anhydrous form, 101.5C for dihydrate.

Derivation: Occurs naturally in many plants (wood sorrel, rhubarb, spinach) and can be made by alkali extraction of sawdust. Now manufactured by reaction of carbon monoxide and sodium hydroxide or of sodium formate with sodium hydroxide, followed by distillation of the resulting dihydrate crystals.

Grade: Technical (crystals and powder), CP.

Hazard: Toxic by inhalation and ingestion, strong irritant. TLV: 1 mg/m³; STEL 2 mg/m³.

Use: Automobile radiator cleanser, general metal and equipment cleaning, purifying agent and intermediate for many compounds, leather tanning, catalyst, laboratory reagent, stripping agent for permanent press resins, bleaching of textiles, rare-earth processing, printing and dyeing auxiliary.

oxalomolybdic acid. $[MoO_3(C_3O_4)]_2H_2$. A water-soluble, crystalline compound used in invisible inks.

oxalonitrile. See cyanogen.

oxalyl chloride. (ethanedioyl chloride).

CAS: 79-37-8. $(COCl)_2$.

Properties: Colorless liquid; if cooled to -12C, solidifies to a white, crystalline mass; gives off carbon monoxide on heating. Bp 64C, fp -12C, d 1.43. Decomposed by water and alkaline solutions. Soluble in ether, benzene, chloroform.

Derivation: Interaction of oxalic acid and phosphorus pentachloride.

Hazard: Toxic by inhalation and ingestion.

Use: Military poison gas, chlorinating agent in organic synthesis.

oxamic acid. (aminoxooacetic acid). $H_2NCO-CO_2H$.

Properties: Crystalline powder. Mw 89.05, mp 210C. Sparingly soluble in water.

Use: In medical diagnostic manufacture.

oxamide.

CAS: 471-46-5. $NH_2COCONH_2$.

Properties: White, odorless powder. Mp 419C (decomposes). Probably the highest melting organic compound; slightly soluble in water; very slightly soluble in alcohol and ether; not hygroscopic; decomposes to ammonia and carbonic acid.

Use: Stabilizer for nitrocellulose preparations, possible substitute for urea as fertilizer.

oxammonium. See hydroxylamine.

“Oxanal” [Novartis]. TM for dyes for coloring anodized aluminum.

1,2-oxathrolane. See propane sultone.

oxazole.

$\overline{\text{OCH:NCH:CH}}$. A five-membered heterocyclic compound valuable for its derivatives. The dihydro forms, 2- and 4-oxazoline, are the parents of increasingly useful commercial compounds, e.g., surface-active agents, detergents, etc.; 2-oxazoline is

oxazoline wax. A series of synthetic waxes having the oxazoline structure. They can be made to fairly exact specifications and are miscible with most natural and synthetic waxes (and can be applied to the same uses).

See oxazole.

1h,3h,5h-oxazolo(3,4-c)oxazole-7a(7h)-methanol.

CAS: 6542-37-6. mf: $\text{C}_6\text{H}_{11}\text{NO}_3$.

Hazard: A poison by ingestion.

oxetane. (trimethylene oxide).

CAS: 503-30-0.

$\overline{\text{CH}_2\text{OCH}_2\text{CH}_2}$. An oxetane group ($=\text{COCH}_2\text{C}=\text{}$) is one kind of epoxy group.

See "Penton" [*Aqualon*].

oxethazine hydrochloride. See emoren.

oxidase. An enzyme whose activity results in the transfer of electrons on the substrate; an oxidizing enzyme.

oxidation. The term *oxidation* originally meant a reaction in which oxygen combines chemically with another substance, but its usage has long been broadened to include any reaction in which electrons are transferred. Oxidation and reduction always occur simultaneously (redox reactions), and the substance that gains electrons is termed the oxidizing agent. For example, cupric ion is the oxidizing agent in the following reaction: $\text{Fe (metal)} + \text{Cu}^{2+} \rightarrow \text{Fe}^{2+} + \text{Cu (metal)}$. Here, two electrons (negative charges) are transferred from the iron atom to the copper atom; thus, the iron becomes positively charged (is oxidized) by loss of two electrons, while the copper receives the two electrons and becomes neutral (is reduced). Electrons may also be displaced within the molecule without being completely transferred from it. Such partial loss of electrons likewise constitutes oxidation in its broader sense and leads to the application of the term to a large number of processes that at first sight might not be considered oxidations. Reaction of a hydrocarbon with a halogen, e.g., $\text{CH}_4 + 2\text{Cl} \rightarrow \text{CH}_3\text{Cl} + \text{HCl}$, involves partial oxidation of the methane; halogen addition to a double bond is regarded as an oxidation.

Dehydrogenation is also a form of oxidation, when two hydrogen atoms, each having one electron, are removed from a hydrogen-containing organic com-

pound by a catalytic reaction with air or oxygen, as in oxidation of alcohols to aldehydes. See dehydrogenation.

oxidation number. The number of electrons that must be added to or subtracted from an atom in a combined state to convert it to the elemental form; i.e., in barium chloride (BaCl_2), the oxidation number of barium is +2 and of chlorine is -1. Many elements can exist in more than one oxidation state. See valence.

oxidation-reduction indicator. A substance that has a color in the oxidized form different from that of the reduced form and can be reversibly oxidized and reduced. Thus, if diphenylamine is present in a ferrous sulfate solution to which potassium dichromate is being added, a violet color appears with the first drop of excess dichromate.

See indicator.

oxidative coupling. A polymerization technique for certain types of linear high polymers. Oxidation of 2,6-dimethylphenol with an amine complex of a copper salt as catalyst forms a polyether, with splitting off of water. The product is soluble in aromatic and chlorinated hydrocarbons; insoluble in alcohols, ketones, and aliphatics. It is thermoplastic and unaffected by acids, bases, and detergents. It has a very broad useful temperature range (from -170 to +190C). It is also dimensionally stable and has good electrical resistance. Oxidative coupling of diacetylenes and dithiols also yields promising polymers.

oxidative phosphorylation. The enzymatic phosphorylation of ADP coupled to electron transfer from a substrate to molecular oxygen.

oxide. A mineral in which metallic atoms are bonded to oxygen atoms.

3-oxido 17- α -ethynyl 17- β -hydroxy estradiol-4,9,11-triene.

CAS: 19636-23-8. mf: $\text{C}_{20}\text{H}_{23}\text{NO}_2$.

Hazard: A poison by ingestion.

Use: Hormone.

oxidimethiin.

CAS: 55290-64-7. mf: $\text{C}_6\text{H}_{10}\text{O}_4\text{S}_2$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation and skin contact.

Use: Agricultural chemical.

oxidizing material. Any compound that spontaneously evolves oxygen either at room temperature or under slight heating. The term includes such chemicals as peroxides, chlorates, perchlorates, nitrates, and permanganates. These can react vigorously at ambient temperatures when stored near or in contact with reducing materials such as cellulose and other organic compounds. Storage areas should be well ventilated and kept as cool as possible.

oxine. See 8-hydroxyquinoline.

oxirane.

CAS: 75-21-8. H_2COC_2 . A synonym for ethylene oxide. An oxirane group is one having the structure

and is one kind of epoxy group. See ethylene oxide.

Oxirane process. A method of making ethylene glycol by catalytic oxidation of ethylene to the diacetate, which is then hydrolyzed to ethylene glycol.

oxirene. (oxacyclopropene). An organic intermediate containing four !GKp electrons, reported to result from oxidation of acetylene.

oxochlorpromazine.

CAS: 4337-86-4. mf: $\text{C}_{17}\text{H}_{19}\text{ClN}_2\text{O}_2\text{S}$.

Hazard: A poison.

8-oxocoptisine.

CAS: 19716-61-1. mf: $\text{C}_{19}\text{H}_{13}\text{NO}_5$.

Hazard: A poison by ingestion.

2-oxohexamethylenimine. See caprolactam.

“Oxone” [Du Pont]. TM for an acidic, white, granular, free-flowing solid containing the active ingredient potassium peroxymonosulfate; readily soluble in water; 1% solution has pH of 2–3; minimum active oxygen content 4.5%; strong oxidizing agent.

Hazard: Fire risk in contact with organic materials.

Use: Manufacture of dry laundry bleaches, detergent-bleach washing compound, scouring powders, plastic dishware cleaners, and metal cleaners; hair-wave neutralizers, pharmaceuticals; general oxidizing reactions.

oxonium ion. See hydronium ion.

2-oxopentanedioic acid. See α -ketoglutaric acid.

4-oxopentanoic acid. See levulinic acid.

2-oxo-2-(phenylamino)ethyl selenocyanate.

CAS: 63981-21-5. mf: $\text{C}_9\text{H}_8\text{N}_2\text{OSe}$.

Hazard: A poison by ingestion. TWA 0.2 mg(Se)/m³

Oxo process. Production of alcohols, aldehydes, and other oxygenated organic compounds by passage of olefin hydrocarbon vapors over cobalt catalysts in the presence of carbon monoxide and hydrogen. Aldehydes are formed as products, but in most cases these are hydrogenated at once to the

corresponding alcohol. Propylene produces normal and isobutyraldehyde; higher olefins produce a mixture of aldehydes containing one more carbon atom than the olefins; *n*-butyl, isobutyl, amyl, isoctyl, decyl, and tridecyl alcohols are produced in large quantities.

2-((1-oxo-2-propenyl)oxy)-*n,n,n*-trimethylethanaminium chloride.

CAS: 44992-01-0. mf: $\text{C}_8\text{H}_{16}\text{NO}_2\cdot\text{Cl}$.

Hazard: A severe eye irritant.

2-oxo-2-(1-pyrrolidinyl)ethyl-*n*-(((methylamino)carbonyl)oxy)ethanimidothioate.

CAS: 92065-85-5. mf: $\text{C}_{10}\text{H}_{17}\text{N}_3\text{O}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

oxosilane. See siloxane.

“Oxsol 100” [Occidental]. TM for a fluorinated toluene that is exempt from regulations as a VOC. Not an air toxic, ozone depleter, or suspected carcinogen.

Use: To clean metal, plates, electronics and glass. Dissolves resins in paint, coatings, inks, adhesives and other resin applications.

oxotremorine fumarate (2:3). See oxotremorine sesquifumarate.

oxotremorine sesquifumarate.

CAS: 17360-35-9. mf: $\text{C}_{12}\text{H}_{18}\text{N}_2\text{O}\cdot\frac{3}{2}\text{C}_4\text{H}_4\text{O}_4$.

Hazard: A poison.

5-oxo-2,4,8-trimethyl-6-oxa-3,9-dithia-2,4,7-triazadec-7-enoic acid, 2-(2-(2-methoxyethoxy) ethoxy)ethyl ester.

CAS: 64029-10-3. mf: $\text{C}_{14}\text{H}_{27}\text{N}_3\text{O}_7\text{S}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

5-oxo-2,4,8-trimethyl-6-oxa-3,9-dithia-2,4,7-triazadec-7-enoic acid, (1-methylethylidene)di-4,1-phenylene ester.

CAS: 79006-76-1. mf: $\text{C}_{29}\text{H}_{38}\text{N}_2\text{O}_8\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-oxo-2-(2,4,6-trimethylphenyl)-1*h*-inden-3-yl dodecanoate.

CAS: 53083-27-5. mf: $\text{C}_{30}\text{H}_{38}\text{O}_3$.

Hazard: Low toxicity by ingestion.

(4-oxovaleryloxy)triphenylstannane. See triphenyltin levulinate.

oxybenzoic acid. See hydroxybenzoic acid.

oxybenzone. (4-methoxy-2-hydroxybenzophenone).

CAS: 131-57-7. $\text{C}_{14}\text{H}_{12}\text{O}_3$.

Properties: Colorless crystals. Mp 65C. Soluble in common organic solvents.

Use: Sunscreen lotions.

p,p'-oxybis(benzenesulfonylhydrazide).

[(4,4'-oxybis(benzenesulfonyl)hydrazide)].

$H_2NNHSO_2C_6H_4OC_6H_4SO_2NHNH_2$.

Properties: Fine, white, crystalline powder; odorless. D 1.52, mp decomposes at 150–160C. Soluble in acetone; moderately soluble in ethanol and polyethylene glycols; insoluble in gasoline and water. Combustible.

Use: Blowing agent for sponge rubber and expanded plastics.

oxybis(dibutyl(2,4,5-trichlorophenoxy)tin).

CAS: 74007-80-0. mf: $C_{28}H_{40}Cl_6O_3Sn_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

oxybis(2,1-ethanedioxy-2,1-ethanediyl) 3-(dodecylthio)propanoate.

CAS: 64253-30-1. mf: $C_{38}H_{74}O_7S_2$.

Hazard: A reproductive hazard.

1,1'-(oxybis(methylenesulfonyl))bis(2-chloroethane).

CAS: 53061-10-2. mf: $C_6H_{12}Cl_2O_3S_2$.

Hazard: A poison by ingestion.

1,1'-oxybis(2,4,5-trichlorobenzene). See 2,2',4,4',5,5'-hexachlorodiphenyl ether.

“Oxy-Complete” [Premier]. TM for a high potency anti-oxidant composed of amino acids, enzymes, and nutrients.

Use: Food supplement.

oxydemetonmethyl. (generic for S-[2-(ethylsulfanyl)ethyl]-O,O-dimethylphosphorothioate). See O,O-dimethyl-S-2-(ethylsulfanyl)ethyl phosphorothioate.

n-oxydiethylene-2-benzothiazolesulfenamide. See 2-(morpholiniothio)benzothiazole.

1,1'-(oxydiethylene)bis(4-formylpyridinium bromide), dioxime.

CAS: 3852-72-0. mf: $C_{16}H_{20}N_4O_3 \bullet 2Br$.

Hazard: A poison.

β,β'-oxydipropionitrile. (ODPN).

CAS: 1656-48-0. $C_6H_8N_2O$.

Properties: Colorless liquid. Fp –26.3C, bp 120C (1 mm Hg), bp 155C (5 mm Hg), d 1.0405 (30C), viscosity 8.00 cP (30C), refr index 1.4392 (25C), flash p 180F (82.2C) (TOC); soluble in water. It is thermally unstable, yielding acrylonitrile and water at above 175C. Hydrolyzed by strong acids and bases, quite immiscible with paraffin hydrocarbons, but dissolves aromatics. Combustible.

Derivation: From acrylonitrile.

Hazard: Toxic by inhalation and ingestion.

Use: Solvent in fractional extraction.

oxyfluorfen.

CAS: 42874-03-3. mf: $C_{15}H_{11}ClF_3NO_4$.

Properties: Orange crystal solid. Sol in water and most solids.

Use: Food additive; herbicide.

oxygen.

CAS: 7782-44-7. O. Nonmetallic gaseous element of atomic number 8; group VIA of the periodic table, aw 15.9994, valence of 2, isotopes 16, 17, 18; molecular oxygen is O₂ and ozone O₃. Atmospheric oxygen is the result of photosynthesis. Oxygen was discovered by Priestley in England in 1774.

Properties: Colorless, diatomic gas; odorless; tasteless. Liquefiable at –183C to slightly bluish liquid, solidifiable at –218C. It constitutes 20% by volume of air at sea level, d (gas) 1.429 g/L (0C, 1 atm) (air = 1.29), d (gas): 1.10535 (air = 1.00), (liquid) d 1.14 (–183C). Soluble in water and alcohol. Oxygen is noncombustible, but actively supports combustion.

Derivation: Before 1971 the only commercial method for large-scale oxygen production was fractionation of liquefied air; this has largely been replaced by a process that utilizes ambient temperature separation by means of a pressure cycle in which molecular sieves of synthetic zeolite preferentially adsorb nitrogen from air, giving 95% oxygen and 5% argon. Electrolysis of water is used for small amounts and laboratory demonstration.

Grade: Low purity, high purity, USP.

Hazard: (Gaseous) Moderate fire risk as oxidizing agent; therapeutic overdoses can cause convulsions. (Liquid) May explode on contact with heat or oxidizable materials. Irritant to skin and tissue.

Use: Blast furnaces; copper smelting; steel production (basic oxygen converter process); manufacture of synthesis gas for production of ammonia, methyl alcohol, acetylene, etc.; oxidizer for liquid rocket propellants; resuscitation, heart stimulant; decompression chambers; spacecraft; chemical intermediate; to replace air in oxidation of municipal and industrial organic wastes; to counteract effect of eutrophication in lakes and reservoirs; coal gasification.

See ozone.

oxygen 18. (heavy oxygen). Oxygen isotope of aw 18. Occurs in proportion of 8 parts to 10,000 of ordinary oxygen in water, air, rocks, etc. The proportion may be increased by passing carbon dioxide gas repeatedly through a packed column down which water is passed. The carbon dioxide leaving the top of the tower is enriched in heavy oxygen, and the water leaving the bottom is depleted.

Use: Tracer experimentation.

See heavy water.

oxygenases. Enzymes that catalyze reactions in which oxygen is introduced into an acceptor mole-

cule.

See mixed-function oxidases.

“Oxygenated Hydrocarbons.” TM for a series of petroleum-derived oxidates composed primarily of organic acids and esters. Designated by TC or TX followed by a four-digit number, e.g., TC-5416, TC-6664.

Use: Corrosion inhibitors, surface-active components in wax emulsions, emulsifiable lubricants, plasticizer, intermediate, leather and cordage oils, lubricity agents and solubilizers.

oxygen balance. Oxygen content relative to the total oxygen required for oxidation of all carbon, hydrogen, and other easily oxidizable elements to carbon dioxide, water, etc.

oxygen cell. An electrolytic cell whose emf is due to a difference in oxygen concentration at one electrode compared with that at another electrode of the same material.

oxygen consumed. (OC; COD; DOC). A measure of the quantity of oxidizable components present in water. Since the carbon and hydrogen, but not the nitrogen, in organic matter are oxidized by chemical oxidants, the oxygen consumed is a measure only of the chemically oxidizable components and is dependent on the oxidant, structure of the organic compound, and manipulative procedure. Since this value does not differentiate stable from unstable organic matter, it does not necessarily correlate with the biochemical oxygen demand value. It is also known as chemical oxygen demand (COD) and dichromate oxygen consumed (DOC). See biochemical oxygen demand; dissolved oxygen.

oxygen debt. The extra oxygen (above the normal resting level) consumed in the recovery period after strenuous physical exertion due to the re-oxidation of lactate.

oxygen fluoride. (oxygen difluoride; fluorine monoxide).
CAS: 7783-41-7. OF₂.

Properties: An unstable, colorless gas. Fp -224C, bp -145C. Slightly soluble in water and alcohol. Suggested as oxidizer for rocket propellants.

Hazard: Explodes on contact with water, air, and reducing agents. Corrosive to tissue. TLV: ceiling 0.05 ppm.

oxygen sink. A reservoir consisting of a chemical element or compound that combines readily with oxygen and thus removes it from the atmosphere. During the early part of Precambrian time, sulfur, iron, and other elements and compounds served as important oxygen sinks, preventing oxygen from accumulating in the atmosphere.

oxyhemoglobin. See hemoglobin.

oxyl process. A method for directly producing higher alcohols by catalytically reducing carbon monoxide with hydrogen.

oxyluminescence. See chemiluminescence.

oxymethurea. (1,3-bis(hydroxymethyl)urea).

CAS: 140-95-4. (HOCH₂NH)₂CO.

Properties: Crystalline solid. Mp 137C. Soluble in water, ethanol and methanol.

Use: Textile auxiliary (crease- and shrinkproofing agent for cotton), photographic developers, anti-septic.

oxymethylene. See formaldehyde.

β-oxynaphthoic acid. See 3-hydroxy-2-naphthoic acid.

oxyneurine. See betaine.

n-oxynicotine. See nicotine-*n'*-oxide.

oxypendyl hydrochloride.

CAS: 17297-82-4. mf: C₂₀H₂₆N₄OS•2ClH.

Hazard: Moderately toxic by ingestion.

oxyphosphorane. One of a class of compounds derived from trialkyl phosphites and *o*-quinones. Their molecules have a five-atom ring

OCCOP(OR)₃ in which the two carbon atoms are part of an aromatic ring. They react by liberating a phosphate ester.

oxypolygelatin. (OPG). A purified gelatin treated with glyoxal, followed by oxidation with hydrogen peroxide. A possible plasma substitute.

oxyquinoline. See 8-hydroxyquinoline.

oxysonium iodide. See hydroxythiospasmin.

oxystearin.

CAS: 8028-45-3.

Properties: Mixture of the glycerides of partially oxidized stearic and other fatty acids. Tan to light brown waxy solid; bland taste. Refr index: 1.465. Sol in ether, solvent hexane, chloroform.

Hazard: Low toxicity.

Use: Food additive.

oxytetracycline.

CAS: 79-57-2. C₂₂H₂₄N₂O₉•2H₂O. An antibiotic obtained by fermentation from *Streptomyces rimosus*, an actinomycete. Its chemical structure is that of a modified naphthacene molecule having six asymmetrical centers. It has been synthesized.

Properties: Dull-yellow crystalline powder; odorless; slightly bitter. Mp 179-182C (decom-

poses). Soluble in acids and alkalis; very slightly soluble in acetone, alcohol, chloroform, and water; practically insoluble in ether; stable in air; affected by sunlight; deteriorates in solutions with pH less than 2; destroyed rapidly by alkali hydroxide solutions; pH (saturated solution) 6.115.

Grade: NF.

Use: Medicine (antibiotic). Inhibitor of lethal yellowing in coconut palm trees; feed additive; the hydrochloride is TM "Terramycin" [Pfizer].

oxythioquinox. (6-methyl-2,3-quinoxalinedithiol cyclic carbonate).

CAS: 2439-01-2.

Properties: Mp 172C. Insoluble in water.

Use: Acaricide for tree fruits.

oxytocin. (α -hypophamine).

CAS: 50-56-6. $C_{43}H_{66}N_{12}O_{12}S_2$. A hormone secreted by the posterior lobe of the pituitary gland. Its chief action is stimulation of the contraction of the smooth muscle of the uterus. It contains eight different amino acids. In 1955 du Vigneaud elucidated its amino acid sequence, the first such determination ever made; it may be represented:

It is available as a solution for injection (oxytocin injection, USP).

oyster shells. Shells of *Ostrea virginica*, taken from the Gulf of Mexico coast in Texas and Louisiana and from Chesapeake Bay. Average analysis: CaCO_3 93–97%, MgCO_3 1%, silica 0.5–2.0%, SO_4 (as CaSO_4) 0.3–0.4%, also miscellaneous substances.

Use: Source of lime, drilling muds, road beds, poultry and cattle feeds.

ozalid. Copying process that gives positive prints (dark on white).

ozocerite. (mineral wax; fossil wax; ozokerite).

Properties: Waxlike, hydrocarbon mixture; yellow-brown to black or green, translucent when pure and having a greasy feel. D 0.85–0.95, mp 55–110C (usually 70C). Soluble in light petroleum hydrocarbons, benzene, turpentine, kerosene, ether, carbon disulfide; slightly soluble in alcohol; insoluble in water. Combustible.

Occurrence: Utah, Australia, near the Caspian Sea.

Method of purification: Filtration.

Grade: Technical.

Use: Electric insulation, rubber products, paints, leather polish, lithographic and printing inks, elec-

trotypers' wax, carbon paper, source of ceresin, floor polishes, impregnating furniture and parquet floor lumber, lubricating compositions, grease crayons, sizing and glossing paper, waxed paper, cosmetics, ointments, matrices for galvanoplastic work, textile sizings, waxed cloth, substitute for carnauba and beeswax.

ozone.

CAS: 10028-15-6. O_3 . An allotropic form of oxygen.

Properties: Unstable blue gas; pungent odor. Liquefiable at -12C , more active oxidizing agent than oxygen. Contributes to formation of photochemical smog; deterioration of rubber is accelerated by traces of ozone. Bp -112C , fp -192C , d (liquid) 1.6, more soluble in water than oxygen. Inhibits penetration of UV rays through the earth's atmosphere.

Occurrence: Formed locally in air from lightning, in stratosphere by UV radiation. Also occurs in automobile engines and by electrolysis of alkaline perchlorate solutions. Commercial mixtures containing up to 2% ozone are produced by electronic irradiation of air. It is usually manufactured on the spot because it is too expensive to ship. Tonnage quantities are used.

Hazard: Dangerous fire and explosion risk in contact with organic materials. Toxic by inhalation, strong irritant. TLV: ceiling of 0.1 ppm; STEL 0.3 ppm. EPA standard for ambient air is 0.12 ppm.

Use: Purification of drinking water; industrial waste treatment; deodorization of air and sewage gases; bleaching waxes, oils, wet paper, and textiles; production of peroxides, bactericide. Oxidizing agent in several chemical processes (acids, aldehydes, ketones from unsaturated fatty acids), steroid hormones, removal of chlorine from nitric acid, oxidation of phenols and cyanides.

Note: Depletion of the ozone layer in the stratosphere, which acts as a shield against penetration of UV light in the sun's rays, is believed to be caused by light-induced chlorofluorocarbon decomposition resulting from increased use of halocarbon aerosol propellants. Their manufacture and use were prohibited in 1979, except for a few specialized items.

ozonide. A product of ozonolysis.

ozonolysis. (1) Oxidation of an organic material, i.e., tall oil, oleic acid, safflower oil, cyclic olefins, carbon treatment, peracetic acid production by means of ozone. (2) The use of ozone as a tool in analytical chemistry to locate double bonds in organic compounds and a similar use in synthetic organic chemistry for preparing new compounds. Under proper conditions, ozone attaches itself at the double bond of an unsaturated compound to form an ozonide. Since many ozonides are explosive, it is customary to decompose them in solution and deal with the final product.

See ozone.

P

P. Symbol for phosphorus.

p- (p-). Abbreviation for para-

PA. Abbreviation for phthalic anhydride and for polyamide.

Pa. Symbol for protactinium.

Paal-Knorr pyrrole synthesis. Formation of pyrroles by heating 1,4-dicarbonyl compounds with ammonia or primary amines in a sealed tube.

Paar turbidimeter. A visual-extinction device for measurement of solution turbidity. The length of the column of liquid suspension is adjusted until the light filament can no longer be seen. See nephelometry.

PABA. Abbreviation for *p*-aminobenzoic acid.

PABA sodium. See sodium-*p*-aminobenzoate.

PAC. See P1-derived artificial chromosome.

“Pace” [Olin]. TM for water-treatment chemicals and particularly chlorinated organic compounds.

Use: Swimming-pool chlorination.

packaging. The operation of placing materials in suitable containers or protective covering for purposes of storage, distribution, and sale. Some packages act merely as containers, but others protect perishable materials (especially foodstuffs) from environmental damage, contamination, and biological deterioration; in this respect the critical factor is exclusion of moisture vapor, bacteria, and oxygen. Some packages perform both functions simultaneously. Common packaging materials are:

(for nonperishable products)	(for perishable products)
wooden boxes, kegs, barrels	glass bottles
fiber drums	“tin” cans
glass bottles (perfumes, pharmaceuticals)	plastic film
polyvinyl chloride bottles (detergents)	cellophane (tobacco)
aluminum tubes (toothpaste)	polypropylene
paperboard cartons	polyvinylidene chloride
	polyethylene
	paraffin-coated paper and board

polyethylene film (textiles)

aluminum cans (beer, soft drinks)

ceramic jars (cosmetic creams)

steel cylinders

(gases)

packing. (1) A collar or gasket used to seal mechanical devices to prevent leakage of oil or water; often made of specially compounded rubber or a flexible plastic. (2) The operation of placing solid materials or objects in shipping containers in such a way as to secure maximum space economy and freedom from damage by vibration or impact. Barriers of paperboard, foamed plastic, or glass fiber are widely used. (3) An inert material used in distillation columns to baffle the downward flow of countercurrent liquid; it may be glass fiber or beads, metal tubes called Raschig rings, metal chains, or specially shaped devices of various kinds (saddles, helices, rings, etc.).

See tower, distillation.

paclitaxel. (taxol; 5- β ,20-epoxy-1,2- α ,4,7- β ,10- β ,13- α -hexahydroxy-tax-11-en-9-one 4,10-diacetate 2-benzoate 13-ester with (2*r*,3*s*)-*n*-benzoyl-3-phenylisoserine). C₄₇H₅₁NO₁₄. CAS: 33069-62-4.

Properties: Needles from aq methanol. Mw 853.99, mp 213–216C (decomp). Extracted from the bark of Pacific yew tree, *Taxus brevifolia*.

Use: Treatment of ovarian cancer.

See taxol.

paclobutrazol. See trimmit.

padan. [*S,S'*(2-dimethylaminotrimethyl-enebisthiocarbamate)].

CAS: 15263-52-2. C₇H₁₅O₂N₂S₂Cl.

Hazard: Toxic by ingestion.

Use: Insecticide.

PAHA. See *p*-aminohippuric acid.

paint. A uniformly dispersed mixture having a viscosity ranging from a thin liquid to a semisolid paste and consisting of (1) a drying oil, synthetic resin, or other film-forming component, called the binder; (2) a solvent or thinner; and (3) an organic or inorganic pigment. The binder and the solvent are collectively called the vehicle. Paints are used (1) to protect a surface from corrosion, oxidation, or other type of deterioration, and (2) to provide decorative effects.

Hazard: Flammable, dangerous fire risk (except water based). Toxic if vapors are inhaled over a long period. The lead content of household paints is limited to 0.5%.

See paint; emulsion; vehicle; protective coating; anti-fouling paint.

paint, emulsion. (latex paint). A paint composed of two dispersions: (1) dry powders (colorants, fillers, extenders) and (2) resin. The former is obtained by milling the dry ingredients into water. The resin dispersion is either a latex formed by emulsion polymerization or a resin in emulsion form. The two dispersions are blended to produce an emulsion paint. Surfactants and protective colloids are necessary to stabilize the product. Emulsion paints are characterized by the fact that the binder is in a water-dispersed form, whereas in a solvent paint it is in soluble form. The principal latex paints are styrene-butadiene, polyvinyl acetate, and acrylic resins. Percentage composition may be 25–30% dry ingredients, 40% latex, and 20–30% water, plus stabilizers. The unique properties of emulsion paints are ease of application, absence of disagreeable odor, and nonflammability. They can be used on both interior and exterior surfaces.

paint, inorganic. A potassium silicate-based, corrosion-resistant coating designed for use on bridges and other metalwork subject to marine environments.

paint, metallic. A paint in which the primary pigment is a finely divided metal dispersed in the vehicle. Most common is aluminum paint, but other metals are also used.

paint remover. (varnish remover). A mixture in liquid or paste form containing volatile solvents and nonvolatile components that retard evaporation of the solvent, thereby prolonging its action. Typical solvents are methanol, denatured ethanol, methylene chloride, toluene, benzene, and ethyl acetate. Paraffin is often used as the retarder. Caustic removers contain sodium phosphate, sodium silicate, caustic soda, or the like.

paint, water-based. See paint, emulsion.

“Palacet” [BASF]. TM for a series of organic pigments used for dyeing and printing on acetate, nylon, and polyester fibers.

“Palatin” [BASF]. TM for metallized acid dyestuffs approaching the fastness of chrome colors.

palindrome. Biology: A segment of duplex DNA in which the base sequences of the two strands is the same from each end of the strands.

palconic acid. An alkali-soluble extract of redwood bark dust. A mixture of partially methylated phenolic acids.

palladium.

CAS: 7440-05-3. Pd. Metallic element of atomic number 46, aw 106.4, valences of 2, 3, 4, group VIII of the periodic table; there are 6 stable isotopes.

Properties: Silver-white, ductile metal that does not tarnish in air. It is the least noble (most reactive) of the platinum group. Absorbs up to 800 times its own volume of hydrogen. Attacked by hot, concentrated nitric acid and boiling sulfuric acid, soluble in aqua regia and fused alkalis, insoluble in organic acids, good electrical conductor. D 12.0, mp 1554C, bp 2800C, Mohs hardness 4.8, Brinell 61, Vickers (annealed) 41. Noncombustible, except as dust.

Occurrence: Siberia, Ural Mountains (the former U.S.S.R.), Ontario, South Africa.

Derivation: In ores with platinum, gold, copper, etc. Concentrated ores are dissolved in aqua regia; after gold and platinum are removed by chemical treatment, palladium is precipitated by ammonia, followed by hydrochloric acid. After further purification treatment, ignition yields palladium metal.

Available forms: Wire, leaf, powder, single crystals.

Grade: CP (99.99%), technical (99.0%).

Use: Alloys for electrical relays and switching systems in telecommunication equipment, catalyst for reforming cracked petroleum fractions and hydrogenation, metallizing ceramics, “white” gold in jewelry, resistance wires, hydrogen valves (in hydrogen separation equipment), aircraft spark plugs, protective coatings.

palladium chloride. (palladous chloride; palladium dichloride).

CAS: 7647-10-1. (1) PdCl₂. (2) PdCl₂•2H₂O.

Properties: Dark brown, deliquescent powder or crystals. (1) D 4.0 (18C), mp 675C (decomposes). Soluble in water, hydrochloric acid, alcohol, and acetone.

Derivation: By solution of palladium in aqua regia and evaporation.

Grade: Technical, reagent.

Use: Analytical chemistry, “electroless” coatings for metals, photography, leak detection in gas lines, indelible inks, catalyst.

palladium diacetate.

CAS: 3375-31-3. (CH₃COO)₂Pd.

Properties: Reddish-brown, crystalline solid. Decomposes at 200C. Insoluble in water and alcohols; soluble in acetone, chloroform, acetonitrile.

Derivation: Reaction of palladium nitrate or palladium sponge with glacial acetic acid.

Use: Catalyst for organic reactions.

palladium iodide. (palladous iodide). PdI₂.

Properties: Black powder. D 6.003 (18C). Soluble in a solution of potassium iodide; insoluble in alcohol, water, and ether; decomposes at 350C.

palladium monoxide. See palladium oxide.

palladium nitrate. (palladous nitrate).

Pd(NO₃)₂.

Properties: Brown salt, deliquescent, decomposed by heat. Soluble in water with turbidity; soluble in dilute nitric acid.

Hazard: Oxidizing agent, may react with organic materials.

Use: Analytical reagent, catalyst.

palladium oxide. (palladium monoxide).

PdO.

Properties: Black-green or amber solid. D 8.70 (20C), mp 750C (decomposes). Soluble in dilute acids.

Derivation: Careful ignition of the nitrate or prolonged heating of the finely divided metal at 800C.

Use: Reduction catalyst in organic synthesis.

palladium potassium chloride. (palladous potassium chloride; potassium palladium chloride). PdCl₂•2KCl.

Properties: Reddish-brown crystals. D 2.67, mp 524C. Soluble in water; slightly soluble in hot alcohol.

Use: Reagent for carbon monoxide determination.

palladium sodium chloride. (palladous sodium chloride; sodium palladium chloride).

NaPdCl₂•3H₂O.

Properties: Brown salt. Hygroscopic, soluble in alcohol and water.

Use: Analysis (testing for carbon monoxide, ethylene, illuminating gas, iodine).

“Palladon” [LaMotte]. TM for *p*-nitrosodimethylaniline used in the colorimetric determination of palladium and platinum.

palladous chloride. See palladium chloride.

palladous iodide. See palladium iodide.

palladous nitrate. See palladium nitrate.

palladous potassium chloride. See palladium potassium chloride.

palladous sodium chloride. See palladium sodium chloride.

pallet. A low platform of wood or metal used for transportation or temporary storage of materials or semifinished products, it stands on supports that are high enough to permit handling by forklift trucks.

palmarosa oil. (geranium oil, Turkish).

CAS: 8014-19-5. A light-yellow essential oil consisting chiefly of geraniol; optically active.

Use: Source of geraniol; perfumes and flavors.

palm butter. See palm oil.

“Palmetto” [Olin]. TM for agricultural dusting sulfur.

Use: Insecticide and fungicide.

palmitamide.

Properties: Semisynthetic compound derived from palm oil.

Use: Food additive; packaging material release agent.

palmitic acid. (hexadecanoic acid; cetyllic acid).

CAS: 57-10-3. CH₃(CH₂)₁₄COOH. A saturated fatty acid, it occurs in natural fats and oils, tall oil, and most commercial-grade stearic acid.

Properties: White crystals. D 0.8414 (80/4C), mp 62.9, bp 351.5C, 271.5C (100 mm Hg), 139.0C (1 mm Hg), refr index 1.4309 (70C). Soluble in hot alcohol and ether; insoluble in water. Combustible.

Derivation: From spermaceti by saponification and from palm oil, hydrolysis of natural fats.

Method of purification: Crystallization.

Grade: Technical, 99.8%, FCC.

Use: Manufacture of metallic palmitates, soaps, lubricating oils, waterproofing, food-grade additives.

palmitic acid amide. See palmitamide.

palmitic acid cetyl ester. See cetin.

palmitin. See tripalmitin.

palmitoleic acid. (*cis*-9-hexadecenoic acid).

CH₃(CH₂)₅CH:CH(CH₂)₇COOH. An unsaturated fatty acid found in nearly every fat, especially in marine oils (15–20%).

Properties: Colorless liquid. Mp 1.0C, bp 140–141C (5 mm Hg). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Purified product 99%.

Use: Organic synthesis, chromatographic standard.

palmitoyl chloride. (hexadecanoyl chloride; palmityl chloride, so-called). CH₃(CH₂)₁₄COCl.

Properties: Colorless liquid. Mp 11–12C, bp 194.5C (17 mm Hg). Soluble in ether, decomposes in water or alcohol.

palmityl alcohol. See cetyl alcohol.

palmityltrimethylammonium chloride.

See hexadecyltrimethylammonium chloride.

palm kernel oil (unhydrogenated).

Properties: From the kernal of the fruit of the oil palm *Elaeis guineensis*. A fatty solid; characteristic sweet nutty flavor.

Use: Food additive.

palm nut cake. (palm cake). The cakes formed in the press when the palm nut kernels are expressed to obtain the oil. Contains various useful constituents, such as unexpressed oil, carbohydrates, proteins, and salts. Typical analysis: proteins 30.4%, fats 8.4%, fiber 41.0%, water 9.5%, ash 10.6%.

Use: Cattle-food, fertilizer ingredient.

palm oil.

Properties: Yellow-brown, buttery, edible solid at room temperature. D 0.952, mp 30C, iodine number 13.5, saponification number 247.6. Soluble in alcohol, ether, chloroform, carbon disulfide. Combustible.

Occurrence: Oil palms are native to several countries in central Africa and are extensively cultivated in Malaysia, which is its chief commercial source. It is also produced in Indonesia.

Use: Soap manufacture, pharmacy, food shortening, cutting-tool lubricant, hot-dipped tin coating, terne plating, cosmetics, softener in rubber processing, cotton-goods finishing, substitute for tallow as mold-release agent.

palm oil (unhydrogenated).

Properties: From the pulp of the fruit of the oil palm *Elaeis guineensis*. A deep orange-red fatty semisolid @ 21–27°; characteristic sweet nutty flavor.

Use: Food additive.

2-PAM. Abbreviation for 2-pyridine aldoxime methiodide.

“Pamak” [Aqualon]. TM for various tall oil products including a series of tall oil fatty acids and distilled tall oils containing varying percentages of rosin acids. “Pamak” TP and WTP are residues from fractionation of crude tall oil in the manufacture of tall oil fatty acids.

pamaquine naphthoate. $C_{42}H_{45}N_3O_7$.

Properties: Yellow to orange-yellow; odorless; almost tasteless powder. Insoluble in water; soluble in alcohol and acetone.

Use: Medicine (antimalarial).

“Pamolyn” [Eastman Chemical China].

TM for a low odor oleic acid.

pancreatin. A mixture of enzymes, principally pancreatic amylase, trypsin, and pancreatic lipase. Obtained from the pancreas of hog or ox.

Properties: Cream-colored amorphous powder; characteristic odor. Acts upon starch and proteins. Soluble in water; insoluble in alcohol. It changes protein into proteoses and derived substances, and starch into dextrins and sugars. Its greatest activity is in neutral or slightly alkaline media.

Derivation: Pancreas gland is extracted by macerating with chloroform, water, dilute boric acid, glycerol, or alcohol; filtered; and evaporated.

Grade: NF.

Use: Preparation of so-called predigested protein nutrients, in bating compounds of leather; to remove starch and protein sizings from textiles.

Paneth technique. Method demonstrating the existence of free radicals (e.g., methyl) or atoms, which is based on the removal of a metallic “mirror” by a stream of gas containing the radicals. The reaction products can be collected and assayed.

“Pano-drench” [Morton]. TM for a liquid soil-treatment concentrate containing 0.6% cyano(methylmercuri)-guanidine.

Hazard: Toxic by ingestion.

“Pan-o-lite” [Solutia]. TM for monobasic calcium phosphate.

Use: Food chemical used in waffle, pancake, and cake mixes.

pantethine.

CAS: 16816-67-4. $C_{22}H_{42}N_4O_8S_2$. The disulfide form of *N*-pantothenylothioethanolamine. *Lactobacillus bulgaricus* growth factor (LBF). A fragment of coenzyme A, a pantothenic acid derivative.

Use: Biochemical research.

panthenol. USAN for pantothenol.

pantocaine. (4-butylaminobenzoic-β-dimethylaminoethyl ester hydrochloride).

$C_{14}H_{19}NHCOOCH_2CH_2N(CH_3)_2 \cdot HCl$.

Use: Local anesthetic.

pantolactone. (2,4-dihydroxy-3,3-dimethylbutyric acid; γ-lactone).

$HC(OH)C(CH_3)_2CH_2OCO$.

Properties: Crystals. D 1.180 (20/20C), mp 79.2C. Soluble in water.

Grade: 80% aqueous solution.

Use: Preparation of pantothenic acid.

pantothenic acid. [*N*-(2-4-dihydroxy-3,3-dimethylbutyryl)-β-alanine].

A member of the vitamin-B complex; it is a component of coenzyme A and may be considered a β -alanine derivative with a peptide linkage. It is involved in the release of energy from carbohydrate utilization and is necessary for synthesis and degradation of fatty acids, sterols, and steroid hormones; it also functions in the formation of porphyrins. It occurs in all living cells and tissues. The natural product is dextrorotatory [D(+)] and is the only form having vitamin activity.

Properties: Viscous, hygroscopic liquid. Soluble in water, ethyl acetate, glacial acetic acid; insoluble in benzene.

Source: (Food sources) Liver, kidney, yeast, crude molasses, milk, whole-grain cereals, rice. (Commercial sources): Produced synthetically from 2,4-dihydroxy-3,3-dimethylbutyric acid and β -alanine. See calcium pantothenate.

pantothenol. (D(+)-pantothenyl alcohol; pantothenol).

CAS: 81-13-0.

$\text{HOCH}_2\text{C}(\text{CH}_3)_2\text{CHOHCONH}(\text{CH}_2)_2\text{CH}_2\text{OH}$. The alcohol corresponding to pantothenic acid, with vitamin activity.

Properties: Viscous liquid. Specific rotation +28.36 to 30.7 degrees in water (c = 5); refr index 1.497 (20C). Soluble in water, ethanol, methanol.

Use: Biochemical research, food additive and dietary supplement.

papain. (papayotin).

CAS: 9001-73-4.

Properties: White or gray, powder. Slightly hygroscopic; partially soluble in water and glycerol; insoluble in common organic solvents. The most thermostable enzyme known. Digests proteins.

Derivation: Obtained as dried and purified latex of *Carica papaya*.

Grade: Technical, purified. Technical grade is susceptible to decomposition in storage.

Use: Meat tenderizer, other food industries (mainly to prevent protein haze on chilling beer), tobacco, pharmaceutical, cosmetic, leather, textiles.

papaverine. (6,7-di-methoxy-1-veratryloquinoline).

CAS: 58-74-2. $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{C}_9\text{H}_4\text{N}(\text{OCH}_2)_2$. An alkaloid.

Properties: White, crystalline powder. Mp 147C. Soluble in chloroform, hot benzene, aniline, glacial acetic acid, and acetone; slightly soluble in alcohol and ether; insoluble in water.

Derivation: From opium or by synthesis.

Hazard: Toxic narcotic.

Use: A vasodilator used for treatment of hypertension (also as the hydrochloride which is soluble in water).

paper. A semisynthetic product made by chemically processing cellulosic fibers. A wide variety of sources have been used for specialty papers (flax, bagasse, esparto, straw, papyrus, bamboo, jute, and others), but by far the largest quantity is made from softwoods (coniferous trees), such as spruce, hemlock, pine, etc.; some is also made from such hardwoods as poplar, oak, etc., as well as from synthetic fibers. Papermaking technology involves the following basic steps: (1) chipping or other subdivision of the logs (see groundwood); (2) manufacture of chemical or semichemical pulp by digestion in acidic or alkaline solutions, which separates the cellulose from the lignin (see pulp, paper); (3) beating the pulp to break down the fibers and permit proper bonding when the sheet is formed; (4) addition of starches, resins, clays, and pigments to the liquid stock (or "furnish"); (5) formation of the sheet continuously on a fourdrinier machine, where the water is screened out and the sheet dried by passing over a series of heated drums; (6) high-speed calendering for brightness and finish; (7) coating either by machine application or (for heavy finishes) by brushes. Further information can be obtained from the Technical Association of the Pulp and Paper Industry or from the Institute of Paper Chemistry, Appleton, WI.

See Appendix II for history of the industry.

paper chromatography. (PC). A micro type of chromatography. A drop of the liquid to be investigated is placed near one end of a strip of paper. This end is immersed in solvent, which travels down the paper and selectively distributes the materials present in the original drop. Comparison with known substances makes identification possible.

paper, coated. A paper that is covered on one or both sides with a suspension of clays, starches, casein, rosin, wax, or combinations of these to serve special purposes. Machine-coated paper is required for standard book printing; the rather light coating is applied by any of several devices (air knife, trailing blade, or roll coater). Heavier coatings are applied by means of brushes or spreading devices. These are required for high-grade printing of magazines, art books, etc., where excellent photographic reproduction is essential. Special-purpose coatings as for packaging are applied in a separate operation.

paper, synthetic. Paper or paperlike material made from polyolefin; polypropylene is usually selected. A paper made from styrene copolymer fibers has been developed to production stage in Japan. Plastic-coated cellulosic papers are available for children's books, posters, and similar applications.

"Papi" [Pfizer]. TM for a series of methylene diphenyl diisocyanate urethane polymers. Average viscosity 250 cP at 25C.

Use: One-shot rigid urethane foams.

“Papi” 50. 50% solution in monochlorobenzene.

Use: Adhesives (rubber to metals and synthetic fabrics), coating intermediate.

“Papi” 94. Lightcolored polymer.

Use: Foam seating and packaging.

paprika.

Properties: Ground dried pod of mild capsicum *Capsicum annuum* L.

Use: Food additive.

paprika oleoresin.

Properties: Derived from organic solvent extraction of ground dried pod of mild capsicum *Capsicum annuum* L.

Use: Food additive.

para-. (*p-*). A prefix.

See ortho-.

“Parabens” [Napp]. TM for the methyl, propyl, butyl, and ethyl esters of *p*-hydroxybenzoic acid. Antimicrobial agents for foods and pharmaceuticals. Approved by FDA as GRAS. See GRAS.

paracasein. See casein.

paracetaldehyde. See paraldehyde.

“Paracol” [Aqualon]. TM for a series of wax and wax-rosin emulsions produced from paraffin waxes, microcrystalline waxes, or combinations of these waxes with rosin.

Use: Impart water resistance to paper and allied materials.

“Paracril” [Uniroyal]. TM for a group of synthetic rubbers of the Buna-N or nitrile type, produced by the copolymerization of butadiene and acrylonitrile. Resist deterioration by aliphatic hydrocarbon, mineral and vegetable oils and animal fats and oils, and are particularly resistant to petroleum products. “Paracril” is also used as a plasticizer for vinyls and other thermoplastic and thermosetting resins.

“Paradene” [Neville]. TM for low-priced, dark, thermoplastic, coal tar resins (coumarone-indene) available in low to high softening-point ranges.

Use: Rubber compounding.

paradigm. In biochemistry, an experimental model held to be true.

paraffin. (1) Also called alkane. A class of aliphatic hydrocarbons characterized by a straight or branched carbon chain; generic formula C_nH_{2n+2} . Their physical form varies with increasing molecular weight from gases (methane) to waxy solids.

They occur principally in Pennsylvania and midcontinent petroleum. (2) Paraffin wax.

paraffin, chlorinated. A paraffin oil or wax in which some of the hydrogen atoms have been replaced by chlorine atoms. Nonflammable.

Use: High-pressure lubricants, as flame retardants in plastics and textiles, as plasticizer for polyvinyl chloride in polyethylene sealants, and in detergents.

paraffin oil. An oil either pressed or dry-distilled from paraffin distillate. Liquid petrolatum is also known as paraffin oil. Combustible.

Grade: By viscosity and color.

Use: Floor treatment, lubricant.

paraffin distillate. A distilled petroleum fraction that when cooled consists of a mixture of crystalline wax and oil.

paraffin wax. (paraffin scale; paraffin).

CAS: 8002-74-2.

Properties: White, translucent solid; tasteless; odorless. Consisting of a mixture of solid hydrocarbons of high molecular weight, e.g., $C_{36}H_{74}$. D 0.880–0.915, mp 47–65C, flash p 390F (198C), autoign temp 473F (245C). Soluble in benzene, ligroin, warm alcohol, chloroform, turpentine, carbon disulfide, and olive oil; insoluble in water and acids. Combustible.

Grade: Yellow crude scale, white scale, refined wax, ASTM, NF. Also graded by melting point in F and color. The higher-melting grades are more expensive.

Hazard: Many waxes contain carcinogens. TLV: 2 mg/m³.

Use: Candles; paper coating; protective sealant for food products, beverages, etc.; glass-cleaning preparations; hot-melt carpet backing; biodegradable mulch (hot melt-coated paper); impregnating matches; lubricants; crayons; surgery; stoppers for acid bottles; electrical insulation; floor polishes; cosmetics; photography; antifrothing agent in sugar refining; packing tobacco products; protecting rubber products from sun-cracking; chewing-gum base (to ASTM specifications).

“Parafint.” TM for a polymethylene wax. It is white, odorless, and has congealing point of 96C. Available in flaked form. Approved by FDA.

“Para-Flux” [Hall]. TM for a series of petroleum-based plasticizers for natural and synthetic rubbers.

paraformaldehyde. (paraform).

CAS: 30525-89-4. $HO(CH_2O)_nH$. A polymer of formaldehyde in which *n* equals 8 to 100. Not to be confused with the trimer, symtrioxane.

Properties: White solid; slight odor of formaldehyde. Melting range 120–170C, flash p 160F (71C) (CC), autoign temp 572F (300C). Insoluble in alco-

hol and ether; soluble in strong alkali solution. The higher polymers are insoluble in water Combustible.
Derivation: By evaporating an aqueous solution of formaldehyde.

Available forms: Flake, powder.

Grade: Bags, carlots.

Hazard: Toxic by ingestion.

Use: Fungicides; bactericides; disinfectants; adhesives; hardener and waterproofing agent for gelatin; contraceptive creams.

paraldehyde. (2,4,6-trimethyl-1,3,5-trioxane).
 CAS: 123-63-7. $C_6H_{12}O_3$. A cyclic polymer (trimer) of acetaldehyde. A depressant drug; may be addictive.

Properties: Colorless liquid; disagreeable taste; agreeable odor. D 0.9960 (20/20C), bp 124.5C, mp 12.6C, vap press 25.3 mm Hg (20C), flash p 96F (35.5C) (TOC), sp heat 0.434, refr index 1.40–1.42 (20C), bulk d 8.27 lb/gal (20C), autoign temp 460F (237C). Decomposes on standing; stable toward alkalis but slowly decomposed to acetaldehyde when treated with a trace of mineral acid; miscible with most organic solvents and volatile oils; soluble in water.

Derivation: Action of hydrochloric acid and sulfuric acid upon acetaldehyde.

Grade: Technical, USP.

Hazard: Flammable, moderate fire risk. Toxic by ingestion.

Use: Substitute for acetaldehyde; rubber accelerators; rubber antioxidants; synthetic organic chemicals; dyestuff intermediates; solvent for fats, oils, waxes, gums, resins; leather; solvent mixture for cellulose derivatives; sedative (hypnotic).

paralytic shellfish poisoning. See red tide.

paramagnetic analytical methods. Analysis of fluid mixtures by measurement of the paramagnetic susceptibilities of materials when exposed to a magnetic field.

See electron paramagnetic resonance; magnetochemistry.

paranitraniline. See *p*-nitroaniline.

paranitraniline red. See para red.

para-oxon. (diethyl para-nitrophenyl phosphate).

CAS: 311-45-5. $(C_2H_5O)_2P(O)OC_6H_4NO_2$. Generic name for the oxygen analog of parathion.

Properties: Odorless, reddish-yellow oil. Bp 148–151C (1 mm Hg), d 1.269 (25/25C), refr index 1.5060 (25C). Slightly soluble in water; soluble in most organic solvents. Decomposes rapidly in alkaline solutions.

Hazard: Poison by ingestion, inhalation, and skin absorption; cholinesterase inhibitor; use may be restricted.

Use: Insecticide.

paraphyletic. Term applied to a group of organisms which include the most recent common ancestor of all of its members, but not all of the descendants of that most recent common ancestor.

"Paraplex" [Hall]. TM for polymeric plasticizers for polymers and resinous coatings. Primarily polyesters, but some are epoxidized oils that impart heat and light stability as well as plasticization. Supplied as viscous liquids in a range of molecular weights all at 100% solids. Compatible with polyvinyl chloride, polyvinyl butyral, cellulose, and other high polymers and elastomers.

Use: Calendered sheet and film; extruded and molded items; electrical wire insulation; coatings for wood, metal, fabrics, and paper.

paraquat. (generic name for 1,1'-dimethyl-4,4'-bipyridinium salt).

CAS: 4685-14-7. $[CH_3(C_5H_4N)_2CH_3] \bullet 2CH_3SO_4$.

Properties: Yellow solid. Soluble in water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; use is restricted. TLV: 0.1 mg/m³.

Use: A widely used non-selective herbicide that kills all green plant tissue it contacts, especially grasses and weeds. Has been used to kill marijuana crops.

paraquat dibromide.

CAS: 3240-78-6. mf: $C_{12}H_{14}N_2 \bullet 2Br$.

Hazard: Human systemic effects.

Use: Agricultural chemical.

paraquat dichloride. (1,1'-dimethyl-4,4'-bipyridinium dichloride).

CAS: 1910-42-5. $C_{12}H_{14}N_2 \bullet 2Cl$.

Properties: Yellow solid. Very air-sensitive needles from MeOH/Me₂CO. Mp 300°C (decomp), mw 257.18. Very soluble in water; slightly soluble MeOH, EtOH. Insoluble in nonpolar solvents.

Hazard: A poison. TLV: 0.1 mg/m³.

Use: Herbicide.

paraquat dihydride. (1,1'-dimethyl-4,4'-bipyridinium dihydrate; dipyriddyldihydrate).

CAS: 4685-14-7. $C_{12}H_{14}N_2 \bullet 2H_2O$.

Properties: Mw 222.32.

Hazard: A poison. TLV: 0.1 mg/m³.

Use: Herbicide.

para red. (paranitraniline red).

$C_{10}H_6(OH)NNC_6H_4NO_2$. A pigment formed by coupling diazotized *p*-nitroaniline with β-naphthol. The term is also used to refer to a group of lakes based on this dye.

See para toner.

"Para Resin" 2457 [Hall]. TM for a petroleum-base resin.

Use: Plasticizer and softener for rubbers.

pararosaniline. (CI 42500).

CAS: 569-61-9. $\text{HOC}(\text{C}_6\text{H}_4\text{NH}_2)_3$. A triphenylmethane dye. Component of fuchsins.

Properties: Colorless to red crystals. Mp 205C. Soluble in alcohol; very slightly soluble in water and ether. Combustible.

Use: Dye (usually as the hydrochloride).

pararosolic acid. See aurin.

parathion. (generic name for *O,O*-diethyl-*O,p*-nitrophenyl phosphorothioate; ethyl parathion; *O,O*-diethyl-*p*-nitrophenyl thiophosphate; AATP).

CAS: 56-38-2. $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_4\text{NO}_2$.

Properties: Deep brown to yellow liquid; usually has faint odor. Refr index 1.5367 (25C), *d* 1.26 (25/4C), bp 375C, fp 6C, vap press 0.003 mm Hg (24C). Very slightly soluble in water (20 ppm); completely soluble in esters, alcohols, ketones, ethers, aromatic hydrocarbons, animal and vegetable oils; insoluble in petroleum ether, kerosene, spray oils; stable in distilled water and in acid solution; hydrolyzed in the presence of alkaline materials; slow decomposition in air.

Grade: Technical grade is 95% pure. Also supplied diluted with inert carriers of various types, and in various proportions.

Derivation: From sodium ethylate, thiophosphoryl chloride, and sodium *p*-nitrophenate.

Hazard: Highly toxic by skin contact, inhalation, or ingestion; cholinesterase inhibitor. Repeated exposure may, without symptoms, be increasingly hazardous. Fatalities have resulted from its accidental use; use may be restricted. TLV: 0.1 mg/m³. Toxic by skin absorption.

Use: Insecticide and acaricide.

See methyl parathion.

para toner. An insoluble red pigment derived from β -naphthol and *p*-nitroaniline. The former is sometimes partly replaced by mono-acid F, 2-naphthol-7-sulfonic acid. By varying the conditions of temperature and acid concentration, different shades may be obtained.

Use: Paint and printing-ink pigments, making para lakes.

“Parco” [Occidental]. TM for phosphoric acid and phosphate compounds for dissolving rust from the surface of metal.

“Parcolene” [Occidental]. TM for chemicals for treating metal surfaces to remove extraneous matter and/or condition the surface before other finishing operations.

paregoric. Contains a derivative of opium that is habituating on continued use. Its use is restricted by the FDA.

Use: Medicine, especially for digestive disorders.

“Parez” [Cytec]. TM for a series of melamine-formaldehyde and urea-formaldehyde resins, designed for use in papermaking.

Paris green. See copper acetoarsenite.

parison. (1) An unformed mass of molten glass from which finished products are manufactured. (2) An extruded tube of plastic from which toys and similar items are made by blow molding.

Paris white. See whiting.

Parkes process. A standard process for the separation of silver from lead. From 1 to 2% molten zinc is added to the lead-silver mixture, heated to above the melting point of zinc. A scum containing most of the silver and zinc forms on the surface; this is separated and the silver recovered. The separation of silver is not complete, and the process is repeated several times.

paromomycin sulfate. $\text{C}_{23}\text{H}_{47}\text{N}_5\text{O}_{18}\text{S}$. Antibiotic from a strain of *Streptomyces*.

Properties: Creamy white powder; odorless; hygroscopic. Soluble in water; insoluble in chloroform and ether.

Grade: ND.

Use: Medicine (antimicrobial).

parsimony. Refers to a rule used to choose among possible cladograms which states that the cladogram implying the least number of changes in character states is the best.

partial pressure. The pressure due to one of the several components of a gaseous or vapor mixture. In general this pressure cannot be measured directly but is obtained by analysis of the gas or vapor and calculated by use of Dalton's law.

See Raoult's law.

particle. Any discrete unit of material structure; the particulate basis of matter is a fundamental concept of science. The size ranges of particles may be summarized as follows: (1) Subatomic: protons, neutrons, electrons, deuterons, etc. These are collectively called fundamental particles. (2) Molecular: includes atoms and molecules with size ranging from a few angstroms to half a micron. (3) Colloidal: includes macromolecules, micelles, and ultrafine particles such as carbon black, resolved via electron microscope, with size ranges from 1 millimicron up to lower limit of the optical microscope (1 micron). (4) Microscopic: units that can be resolved by an optical microscope (includes bacteria). (5) Macroscopic: all particles that can be resolved by the naked eye.

See fundamental particle; particle size.

particle accelerator. A device in which the speed of charged subatomic particles (protons, elec-

trons) and heavier particles (deuterons, alpha particles) can be greatly increased by application of electric fields of varying intensity, often in conjunction with magnetic fields. It is possible to accelerate electrons and protons to speeds approaching the speed of light if sufficiently high voltage is used. Straight-line (linear) accelerators are used for protons, and doughnut-shaped betatrons for electrons; other types are the Van de Graaf electrostatic generator, the synchrotron, and the cyclotron. Before the development of nuclear reactors, the cyclotron was used to accelerate deuterons for use in bombarding stable nuclei to produce neutrons for inducing artificial radioactivity, fission, and formation of synthetic (transuranic) elements.

See betatron; cyclotron.

particle size. This term refers chiefly to the solid particles of which industrial materials are composed (carbon black, zinc oxide, clays, pigments, and the like). The smaller the particle, the greater will be the total exposed surface area of a given mass. Activity is a direct function of surface area; i.e., the finer a substance is, the more efficiently it will react, both chemically and physically. A colloidal pigment is a more effective colorant than a coarse one because of the greater surface area of its particles. A pound of channel carbon black has a surface area of 18 acres, which largely accounts for its powerful reinforcing effect in rubber. Thus, ultrafine grinding of powders is of utmost importance in such products as paints, cement, plastics, rubber, dyes, pharmaceuticals, printing inks, and numerous others.

See particle; surface chemistry; colloid chemistry; sedimentation.

particulate matter. Solid or liquid matter that is dispersed in a gas, or insoluble solid matter dispersed in a liquid, that gives a heterogeneous mixture.

parting agent. See adherent.

partition chromatography. The method of chromatography in which equilibrium is established between two liquid phases, one of which is held in the form of a gel.

See liquid chromatography.

partition coefficient. A constant that expresses the ratio in which a given solute will be partitioned or distributed between two given immiscible liquids at equilibrium, or between a solvent and adsorbant.

partition function. An equation giving the distribution of molecules in different energy states in a system. Symmetry effects on reaction rates arise when a reaction requires overlap between two lobes of the orbitals on each of two reagents: if the algebraic signs of the wave functions in the facing lobes do not match, bond formation between those orbitals is prohibited.

parylene. Generic name for thermoplastic film polymers based on *p*-xylylene and made by vapor-phase polymerization.

Derivation: *p*-xylylene, $\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2$, is heated with steam at 950C to produce the cyclic dimer di-*p*-xylylene, a solid that can be separated in pure form. The dimer is then pyrolyzed at 550C to produce monomer vapor of *p*-xylylene, $\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2$, which is then cooled below 50C and condenses on the desired object as a polymer having the repeating structure $-(\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2-)_n$, with *n* about 5000 and molecular weights of about 500,000. The polymer is used as a protective coating. Films as thin as 500 Å to 5 mils are obtained.

Use: Thin coatings of high purity and uniformity on almost any substrate that will resist a high vacuum, as paper, fabric, polyethylene and polystyrene film, ceramics, metals, many solid chemicals; electronic miniaturization systems; capacitors; thin film circuits.

"Parzate" [Du Pont]. TM for a series of fungicides. "Parzate" liquid is a solution containing 22% nabam to be combined with zinc sulfate in the spray tank. "Parzate" carbon is a wettable powder containing 75% zineb. "Parzate" D is a finely divided powder containing 85% zineb.

Hazard: Irritant to skin and mucous membranes.

PAS. Abbreviation for *p*-aminosalicylic acid. See 4-aminosalicylic acid.

Paschen series. One of the hydrogen spectral series in the infrared region.

PAS sodium. See sodium-*p*-aminosalicylate.

Passerini reaction. Formation of 2-acyloxy amides on treatment of an isonitrile with a carboxylic acid and an aldehyde or ketone.

passive transport. Transport of a molecule across a membrane, down a concentration gradient which does not require the input of energy.

passivity. A property shown by iron, chromium, and related metals involving loss of their normal chemical activity in an electrochemical system or in a corrosive environment after treatment with strong oxidizing agents, like nitric acid, and when oxygen is evolved upon them during electrolysis, forming an oxide coating.

paste. (1) An adhesive composition of semisolid consistency, usually water dispersible. The common pastes are based on starch, dextrin, or latex often, with the addition of gums, glues, and antioxidants. They are widely employed for the adhesion of paper and paperboard. (2) More generally, a soft, viscous mass of solids dispersed in a liquid. For example, paste resins are finely divided resins mixed with plasticizers to form fluid or semifluid mixtures,

without the use of low-boiling solvents or water emulsions.

paste solder. A paste (2) containing flux, cleaner, tinning agent, and powdered metallic solder.

pasteurization. Heat treatment of milk, fruit juices, canned meats, egg products, etc. for the purpose of killing or inactivating disease-causing organisms. For milk, the minimum exposure is 62C for 30 min or 72C for 15 sec, the latter being called flash pasteurization. Although this treatment kills all pathogenic bacteria and also inactivates enzymes that cause deterioration of the milk, the shelf life is limited. To prolong storage life, temperatures of 80–88C for 20–40 sec must be used. Complete sterilization requires ultrahigh pasteurization at from 94C for 3 sec to 150C for 1 sec. In-can heating at 116C for 12 min and 130C for 3 min is also employed for maximum stability and long storage life. Some meat products are pasteurized by α -radiation.

Pasteur, Louis. (1822–1895). A French chemist and bacteriologist who made three notable contributions to science: (1) As a result of extensive study of fermentation, which led him to conclude that it is caused by infective bacteria, he extended the work of Jenner on smallpox serum made from cowpox (1775) to development of the concept of immunizing serums and the antibody-antigen relationship (1880). Pasteur was the first to inoculate for rabies and anthrax, and suggested the term *vaccination* (from Latin *vaccus* for “cow”) in recognition of Jenner’s achievement. (2) Initiation of the practice of heat-treating wine, and later milk and other food products, to kill or inactivate toxic microorganisms, especially the tuberculosis bacillus. (3) Discovery of the optical properties of tartaric acid, present in wine residues, which laid the basis for modern knowledge of optical isomers (right- and left-handed molecular structure), a phenomenon now often called chirality. See pasteurization; optical isomer.

“Pastewiz” [Axel]. TM for polymer paste release agent.

Use: Hand application.

PAT. Abbreviation for polyaminotriazole.

patchouli oil. A yellow to brownish essential oil used in perfumery and flavoring. It is strongly levorotatory.

patentability. The qualifications for obtaining a patent on an invention or chemical process. These are (1) the invention must not have been published in any country or in public use in the U.S., in either case for more than 1 year before the date of filing the application; (2) it must not have been known in the U.S. before date of invention by the applicant; (3) it must not be obvious to an expert in the art; (4) it must be useful for a purpose not immoral and not injuri-

ous to the public welfare; (5) it must fall within the five statutory classes on which patents may be granted, i.e., (a) composition of matter, (b) process of manufacture or treatment, (c) machine, (d) design (ornamental appearance), or (e) a plant produced asexually. Special regulations relate to atomic energy developments and subjects directly affecting national security (Robert Calvert).

Note: In 1980, the Supreme Court in a landmark decision upheld the patentability of synthetic bacteria created by recombinant DNA techniques.

patent alum. See aluminum sulfate.

patent leather. Fashion leather used chiefly for formal shoes, bags, etc. characterized by a high, glossy finish applied as the final step in processing. The finish greatly reduces the poromeric nature of the leather.

Paterno-Buchi reaction. Formation of oxetanes by photochemical cycloaddition of carbonyl compounds to olefins.

pathfinder element. An element present in small proportions less than 1%, generally metallic in nature, associated with ore deposits at the time of formation. Mapping of the concentration variation of the selected element serves to locate the main ore deposit. Examples are zinc as the pathfinder for lead, copper, and silver ores, and molybdenum associated with copper deposits.

pathway. A sequence of reactions, usually of a biochemical nature, in which more-complex substances are converted to simple end products, as in the degradation of the components of foods to carbon dioxide and water. Its course is determined largely by preferential factors involving coenzymes and other catalysts. An example is the TCA cycle, which is the common pathway in the degradation of foodstuffs and cell constituents to carbon dioxide and water.

patina. Various used to refer to an ornamental and/or corrosion-resisting film on the surface of copper, copper alloys, including bronzes, and also sometimes iron and other metals. Such a film is formed by exposure to the air or by a suitable chemical treatment.

patronite. A mixture of vanadium-bearing substances with the formula VS_4 found in Peru.

Pattinson process. Process for the removal of silver from lead. The silver-lead mixture is melted in one of a series of pots and allowed to cool slowly. The lead, that is free from silver or poorer in silver, separates out as crystals, which are removed, leaving the silver-rich lead in the molten state. From a number of such operations in series, a lead rich in silver is obtained, collected, and the silver recov-

ered.
See Parkes process.

“Patvag” [EMS-Grilon]. TM for solutions for bonding, coating, and sealing components in auto production.

Pauli exclusion principle. A fundamental generalization concerning the energy relationships of electrons within the atom, namely that no two electrons in the same atom have the same value for all four quantum numbers; corollary to this is the fact that only two electrons can occupy the same orbital, in which case they have opposite spins, i.e., $+1/2$ and $-1/2$. This principle has an important bearing on the sequence of elements in the periodic table and on the limiting numbers of electrons in the shells (2 in the first, 8 in the second, 18 in the third, 32 in the fourth, etc.).

See quantum number; shell; orbital theory.

Pauling, Linus. (1901–1994). An American chemist and physicist who won the Nobel Prize for chemistry in 1954. By using X-ray diffraction analysis he determined the crystal structure of molecules. He made significant progress in the study of chemical bonds and discovered the atomic structure of many proteins including hemoglobin. He is known to the masses for his advocacy of vitamin C. Pauling was also a recipient of the Nobel peace prize in 1962.

Paulson Tower. See absorption tower.

Pavy’s solution. Modified Fehling’s solution having enough ammonium hydroxide to redissolve any precipitated copper oxide.

Pb. Symbol for lead.

PBAA. Abbreviation for polybutadieneacrylic acid copolymer.

PBD. See 1,3,4-phenylbiphenyloxadiazole.

PBI. See polybenzimidazole.

PBPB. Abbreviation for pyridinium bromide perbromide.

PCB. Abbreviation for polychlorinated biphenyl.

PCC. See premature chromosome condensation.

PCE. Abbreviation for pyrometric cone equivalent, a scale of melting or fusion points of refractory materials, based on comparison with the temperature at which pyrometric cones melt.

PCNB. Abbreviation for pentachloronitrobenzene.

PCP. (1) Abbreviation for pentachlorophenol. (2) Abbreviation for phenylcyclidene hydrochloride.

PCR. See polymerase chain reaction.

PCTFE. Abbreviation for polychlorotrifluoroethylene.

See chlorotrifluoroethylene resin.

pcu. Abbreviation for pound centigrade unit, the amount of heat needed to raise 1 lb of water from 15 to 16C.

See chu.

Pd. Symbol for palladium.

P1-derived artificial chromosome. (PAC).

One type of vector used to clone DNA fragments (100- to 300-kb insert size; average, 150 kb) in *Escherichia coli* cells. Based on bacteriophage (a virus) P1 genome.

See cloning vector.

PDB. Abbreviation for *p*-dichlorobenzene.

PDMS. See polydimethylsiloxane.

PE. Abbreviation for pentaerythritol and polyethylene.

“Peacock” [Pfafu]. (tallow oil). TM for acidless tallow.

Use: Metalworking, lubricants, additives, soaps, cleaning compounds, mold releases, animal feed supplements, inks, and pigments.

peacock blue. (α,α -bis[*N*-ethyl-*N*-(4-sulfobenzyl)aminophenyl]- α -hydroxy-*o*-toluenesulfonic acid sodium salt).

CAS: 2650-18-2.

$\text{HSOC}_6\text{H}_4\text{COH}[\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)\text{CH}_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}]_2$. A blue organic pigment used especially in inks for multicolor printing. It is a lake of acid glaucine blue dye on alumina hydrate and is prepared from aniline, ethanol, benzyl chloride, *o*-chlorobenzaldehyde, sulfuric acid, and sodium bisulfite. *Note:* The term *peacock blue* is sometimes applied to other pigments of similar color, such as Prussian blue, that have been treated with phosphotungstic acid.

peanut cake. The press cake resulting from the extraction of oil from the peanut.

See peanut oil meal.

peanut oil. (arachis oil; groundnut oil).

CAS: 8002-03-7. A fixed, nondrying oil.

Properties: Yellow to greenish-yellow. D 0.912–0.920 (25C), solidifying $p-5$ to $+3C$, saponification value 186–194, iodine number 88–98, refr index 1.4625–1.4645 (40C), flash p 540F (282C), autoign temp 883F (472C). Soluble in ether, petroleum ether, carbon disulfide, and chloroform; insoluble

ble in alkalis, but saponified by alkali hydroxides with formation of soaps; insoluble in water; slightly soluble in alcohol. Combustible.

Use: Substitute for olive oil and other edible oils, both hydrogenated and unhydrogenated; soaps; vehicle for medicines; salad oil; mayonnaise; margarine.

peanut oil meal. The crushed form of peanut cake resulting from the extraction of oil from the seed. Prepared with or without the shells, the oil meal of commerce contains between 39 and 45% crude protein and is sold on that basis. Typical analysis of 39% protein meal: 39.1% crude protein, 5.3% crude fiber, 34.3% nitrogen-free extract, 6.2% ether soluble (fats), 5.3% ash; total digestible nutrient 80%.

Use: Animal feeds, fertilizer ingredient.

pearl alum. See aluminum sulfate.

pearl ash. See potassium carbonate.

pearl essence. See nacreous pigment.

pearl pigment. See nacreous pigment.

pearl white. See bismuth oxychloride; bismuth subnitrate.

pear oil. See amyl acetate.

Pearson's solution. A dilute sodium arsenate solution containing 0.1% anhydrous sodium arsenate.

peat. Semicarbonized residue of plants formed in water-saturated environments (bogs and marshes). It occurs in surface layers 3–10 ft thick and has a water content of 85%. Before peat can be used for chemical or fuel purposes it must be field-dried to a water content of 30–40%. Since the dried product is susceptible to autoignition, storage conditions must minimize this risk. Peat is easily converted to hydrocarbons and is an excellent source of natural gas; when dry it can be used directly as a fuel. The U.S. has peat sources second only to those of the former U.S.S.R., located in Alaska, the north-central states, and Maine, where processing on a large scale is planned. Their total energy content is said to be equivalent to 240 billion barrels of petroleum. The peat can be gasified for production of methanol after mechanical dewatering. Experimental conversion studies have been under way for some time. Substantial quantities of oil, ammonia, and sulfur can be obtained as by-products.

pebble. A piece of gravel between 4 and 8 mm in size.

pebble mill. A jacketed steel cylinder rotating on a horizontal axis and containing flint or porcelain pebbles as the grinding medium. Its operation is

similar to that of a ball mill. It is used for grinding and mixing of dry chemicals, pigments, food products, and the like. Pebble mills are usually lined with alumina, buhrstone, or similar material to protect the walls from wear.

pebulate. (propyl ethyl-*n*-butylthiocarbamate).
CAS: 1114-71-2. C₁₀H₂₁NOS.

Properties: Colorless liquid. Bp 142C (20 mm Hg), d 0.945, refr index 1.47. Soluble in benzene, acetone, methanol, and xylene.

Hazard: Toxic by ingestion.

Use: Herbicide.

Pechmann pyrazole synthesis. Formation of pyrazoles from acetylenes and diazomethane. The analogous addition of diazoacetic esters to the triple bond yields pyrazolecarboxylic acid derivatives.

pectic acid. An acid derived from pectin by treating it with sodium hydroxide solution, washing with isopropyl alcohol, adding alcoholic hydrochloric acid, washing again with isopropyl alcohol, and drying.

Use: Acidulant in pharmaceuticals.

pectin. A high molecular weight hydrocolloidal substance (polyuronide) related to carbohydrates and found in varying proportions in fruits and plants. Pectin consists chiefly of partially methoxylated galacturonic acids joined in long chains.

Properties: White powder or syrupy concentration.

The most common characteristic of pectins is their property of jelling at room temperature, typically after addition of sugar and fruit juices in the preparation of jams or jellies. Soluble in water; insoluble in organic solvents.

Derivation: By dilute-acid extraction of the inner portion of the rind of citrus fruits, or of fruit pomaces, usually apple.

Method of purification: Following decolorization, the extracts are concentrated by evaporation or the pectins precipitated with alcohol or acetone.

Grade: Pure (NF) containing not less than 6.7% methoxy groups and not less than 74% galacturonic acid; 150-, 200-, 250-jelly grades, containing various diluents.

Use: Jellies, foods, cosmetics, drugs, protective colloids, emulsifying agents, dehydrating agents.

See gel.

pectinase. An enzyme present in most plants. It catalyzes the hydrolysis of pectin to sugar and galacturonic acid.

Use: Biochemical research, juice and jelly industry.

“Pectinol” [Rohm & Haas]. TM for formulated enzyme concentrate of fungal origin, with varying degrees of pectinase activity, that hydrolyzes pectic substances.

Use: Clarification of wines and fruit juices and processing of jellies.

pectin sugar. See *l*-arabinose.

Pedersen, Charles John. (1904–1989). Awarded Nobel Prize for Chemistry in 1987 for work in elucidating mechanisms of molecular recognition, which are fundamental to the enzymic catalysis, regulation, and transport. He reported that alkali metal ions could be bound by crown ethers into a more rigid, layered structure, in which the alkali metal ion was bound into the center of the ring. This field of study is called host-guest chemistry. An American born in Korea, Pedersen received an M.S. from M.I.T. in 1927.

pedigree. A family tree diagram that shows how a particular genetic trait or disease has been inherited. See inherit.

PEG. Abbreviation for polyethylene glycol.

"Pegospense Aldo" [Lonza]. TM for PEG, glyceryl, sorbitan, polysorbate esters, and fatty acid esters.

Grade: Liquid, bead, flake, food, Kosher, cosmetic, and industrial grades.

pelargonic acid. (*n*-nonoic acid; *n*-nonanoic acid; *n*-nonylic acid).

CAS: 112-05-0. $\text{CH}_3(\text{CH}_2)_7\text{COOH}$.

Properties: Colorless or yellowish oil; slight odor. D 0.9052 (20/4C), mp 12.5C, bp 255.6C, refr index 1.4322 (20C). Soluble in alcohol, ether, and organic solvents; almost insoluble in water. Combustible.

Derivation: By the oxidation of nonyl alcohol or nonyl aldehyde; by the oxidation of oleic acid, especially by ozone.

Grade: Technical, 99%.

Hazard: Strong skin irritant.

Use: Organic synthesis, lacquers, plastics, production of hydrotropic salts, pharmaceuticals, synthetic flavors and odors, flotation agent, esters for turbojet lubricants, vinyl plasticizer, gasoline additive.

pelargonic alcohol. See nonyl alcohol.

pelargonic aldehyde. See nonanal.

pelargonyl chloride. (*n*-nonanoyl chloride). $\text{CH}_3(\text{CH}_2)_7\text{COCl}$.

Properties: Bp 80–85C (5 mm Hg), min assay 97%. Soluble in hydrocarbons and ethers; decomposes in water.

Hazard: Skin irritant.

Use: Intermediate in organic synthesis.

pelargonyl peroxide. $(\text{C}_8\text{H}_{17}\text{COO})_2$.

Properties: Water-white liquid; faint odor. D 0.926 min (25/25C), mp 10C, refr index 1.443 min (25C).

Insoluble in water and glycerol; soluble in alcohol and hydrocarbons.

Hazard: Dangerous fire risk in contact with organic materials. Strong skin irritant and oxidizing agent.

Use: Initiator of polymerization reactions.

"Pelaspán" [Dow]. TM for a series of expandable polystyrenes in bead or pellet form. Each bead contains its own expanding agent, which is activated by heat.

Peligot's salt. See potassium chlorochromate.

pellagra. A disease caused by deficiency of niacin in the diet.

pellet. A small unit of a light, bulky material compressed into any of several shapes and sizes, usually either spherical or rectangular. The operation is performed on a pellet mill, which consists essentially of a pair of steel rollers around which rotates a circular perforated metal die. Material is fed into the chambers above and below the inner face of the die. As the die turns, in contact with the rollers, the latter also turns thus compressing the material and forcing it through the holes in the die at the point of tangency, where the extruded segment is sheared off by knives. Pelletizing is advantageous for fluffy particulates that are difficult to handle in loose form, e.g., carbon black, clays, plastic molding powders, etc. Binding materials called excipients are often used.

pelletierine. (β -2-(piperidyl) propionaldehyde).

CAS: 2858-66-4. $\text{C}_8\text{H}_{10}\text{N}(\text{CH}_2)_2\text{CHO}$.

Properties: Liquid alkaloid from the root of the pomegranate. D 0.988 (20/4C), bp 195C. Soluble in water, alcohol, ether, chloroform, benzene.

Use: Medicine (in form of its salts, sulfate, tannate, valerate).

Pellizzari reaction. Formation of substituted 1,2,4-triazoles by the condensation of amides and acyl hydrazines. When the acyl groups of the amide and acylhydrazine are different, interchange of acyl groups may occur, with formation of a mixture of triazoles.

Pelouze synthesis. Formation of nitriles from alkali cyanides by alkylation with alkyl sulfates or alkyl phosphates.

"Penacolite" [Indespec]. TM for resorcinol formaldehyde condensation resins.

Use: As adhesion promoters in tires and mechanical rubber products.

"Pen Cote Liquid Binder" [Penford].

TM for ready-to-use liquid coating binders.

Use: Enhances optical properties and improves water holding.

penetrance. The probability of a gene or genetic trait being expressed. (a) "Complete" penetrance means that the gene or genes for a trait are expressed in all the population who have the genes. (b) "Incomplete" penetrance means the genetic trait is expressed in only part of the population. The percent penetrance also may change with the age range of the population.

penetrant. Any agent used to increase the speed and ease with which a bath or liquid permeates a material being processed by effectively reducing the interfacial tension between the solid and liquid. Penetrants are widely used in the textile, tanning, and paper industries for improving dyeing, finishing, etc. operations. Sulfonated oils, soluble pine oils, and soaps are popular among the older penetrants, and the salts of sulfated higher alcohols are typical of the synthetic organics developed for this purpose. See wetting agent.

"Penford Gum" [Penford]. TM for hydroxyethyl ether derivatized corn starches.

"Penglo 65" [Reichhold]. TM for a pale maleic modified pentaerythritol ester of a special tall oil in mineral spirits.
Use: Paint and varnish.

penicillamine. (USAN; *d*,3-mercaptovaline).

CAS: 52-67-5. $(\text{CH}_3)_2\text{C}(\text{SH})\text{CH}(\text{NH}_2)\text{COOH}$.

Properties: Crystals. Decomposes at 178C.

Use: Medicine, as a chelate for copper, and in treatment of rheumatoid arthritis.

***l*-penicillamine.**

CAS: 1113-41-3. mf: $\text{C}_5\text{H}_{11}\text{NO}_2\text{S}$.

Hazard: A poison.

Use: Drug

penicillin.

CAS: 1406-05-9. $(\text{CH}_3)_2\text{C}_5\text{H}_7\text{NSO}(\text{COOH})\text{NHCOR}$ (bicyclic). A group of isomeric and closely related antibiotic compounds with outstanding antibacterial activity, obtained from the liquid filtrate of the molds *Penicillium notatum* and *Penicillium chrysogenum* or by a synthetic process that includes fermentation. Total synthesis of the penicillin molecule by J. C. Sheehan in 1957 was an outstanding achievement.

Derivation: The mold is grown in a nutrient solution such as corn steep liquor, lactose, or dextrose. After several days of cultivation the mold excretes penicillin into its liquid culture medium. This liquid is then filtered off, and the penicillin extracted and purified by countercurrent extraction with amyl acetate, adsorption on carbon, or other methods. Different varieties of penicillin are produced biosynthetically by adding the proper precursors to the nutrient solution.

Grade: Aluminum penicillin G, benzathine penicillin G, benzylpenicillin G, chlorprocaine penicillin O, hydrabramine penicillin V, phenoxymethylpeni-

cillin, potassium penicillin G, potassium α -phenoxymethylpenicillin, potassium phenoxymethylpenicillin, procaine penicillin G, sodium methicillin, sodium penicillin G.

Hazard: Strong allergen, reaction may be severe in susceptible people.

Use: Medicine (antibiotic).

penicillin V. See phenoxymethylpenicillin.

penicillinase. An enzyme that antagonizes the antibacterial action of penicillin. Such enzymes are found in many bacteria.

Use: Pharmaceutical, biological research.

See antagonist, structural.

"Penn Drake Petrosul" [Pennzoil]. TM for a variety of sodium sulfonates.

Properties: Mw 415-619.

Grade: Available as 50, 60, and 70% in mineral oil.

Available forms: Liquid.

Use: Surface-active agent used as solubilizers, emulsifiers, rust-preventive bases, and dispersants.

pennyroyal oil. (pulegium oil; hedeoma oil).

Yellow to reddish essential oil, strongly dextrorotatory.

Use: Manufacture of pulegone, flavoring alcoholic beverages, emmenagogue.

"Penros" [Reichhold]. TM for polymerized wood rosin.

Use: Adhesives, gloss oils, paper label coatings, oleoresinous varnishes, solder flux, spirit varnishes, waxed paper and hot-melt compounds, synthetic resins.

pentaborane.

CAS: 19624-22-7. B_5H_9 .

Properties: Colorless liquid; pungent odor. Fp -46.6C, bp 58C, d 0.61, vap press 6 mm Hg, decomposes at 150C, ignites spontaneously in air if impure, flash p 86F (30C) (OC). Hydrolyzes slowly in water.

Derivation: Hydrogenation of diborane.

Grade: Technical 95%, high purity 99%.

Hazard: Highly flammable, dangerous fire and explosion risk. Toxic by ingestion and inhalation, strong irritant. TLV: 0.005 ppm; STEL 0.013 ppm.

Use: Fuel for air-breathing engines, propellant.

pentabromodiphenyl ether.

CAS: 32534-81-9. mf: $\text{C}_{12}\text{H}_3\text{Br}_5\text{O}$.

Hazard: A poison by ingestion. Moderately toxic by

inhalation. Low toxicity by skin contact. A moderate skin irritant.

“Pentac” [Occidental]. TM for miticide whose active ingredient is bis(pentachloro-2,4-cyclopentadien-1-yl).

pentacarbonyl(piperidine)chromium.

CAS: 15710-39-1. mf: $C_{10}H_{11}CrNO_5$.

Hazard: A poison.

pentacene. (2,3,4,7-dibenzoanthracene).

CAS: 135-48-8. $C_{22}H_{14}$. Highly reactive aromatic compound consisting of five fused benzene rings.

Properties: Deep blue-violet solid. Sublimes at 290–300C, decomposes in air above 300C. Insoluble in water; slightly soluble in organic solvents.

Use: Suggested as organic photoconductor (instead of selenium) in copying systems.

2,2',4,5,6'-pentachlorodiphenyl ether. See 1,2,4-trichloro-5-(2,6-dichlorophenoxy)benzene.

pentachloroethane. (pentalin).

CAS: 76-01-7. $CHCl_2CCl_3$.

Properties: Dense, high-boiling, colorless liquid. D 1.685 (15/4C), bp 159.1C, fp –22C, refr index 1.503 (24C). Insoluble in water.

Derivation: By chlorination of trichloroethylene, obtained by a two-step process involving chlorination of acetylene to obtain tetrachloroethane, and removal of hydrogen chloride by action of alkali.

Hazard: Moderate fire and explosion risk. Toxic by inhalation and ingestion.

Use: As solvent for oil and grease in metal cleaning. Also used for separation of coal from impurities by density difference.

See tetrachloroethane.

pentachloronaphthalene.

CAS: 1321-64-8. $C_{10}H_3Cl_5$.

Properties: White powder.

Hazard: Action similar to chlorinated naphthalenes and chlorinated diphenyls. TLV: 0.5 mg/m³.

pentachloronitrobenzene. (PCNB).

CAS: 82-68-8. $C_6Cl_5NO_2$.

Properties: Cream crystals; musty odor. D 1.718 (25/4C), mp 142–145C, bp 328C (some decomposition). Practically insoluble in water; slightly soluble in alcohols; somewhat soluble in carbon disulfide, benzene, chloroform.

Derivation: By reacting pentachlorobenzene with fuming nitric acid.

Grade: Dust, emulsion concentrate, wettable powder.

Hazard: Skin irritant. TLV: TWA 0.5 mg/m³; Not Classifiable as a Human Carcinogen

Use: Intermediate, soil fungicide, slime prevention in industrial waters, herbicide.

pentachlorophenol. (PCP).

CAS: 87-86-5. C_6Cl_5OH .

Properties: White powder or crystals. Mp 190C, bp 310C with decomposition, d 1.978 (22/4C). Slightly soluble in water; soluble in dilute alkali, alcohol, ether, benzene.

Derivation: Chlorination of phenol.

Hazard: Toxic by ingestion, inhalation, and skin absorption; abuse may be fatal. TLV: 0.5 mg/m³; animal carcinogen. Toxic by skin absorption.

Use: Fungicide, bactericide, algicide, herbicide; as sodium pentachlorophenate, wood preservative (telephone poles, pilings, etc.).

pentachlorophenyl butyl ether. See butoxy-pentachlorobenzene.

(pentachlorophenyl)glycolonitrile.

CAS: 21727-09-3. mf: $C_8H_2Cl_5NO$.

Hazard: Moderately toxic by skin contact.

Use: Agricultural chemical.

“Pentacite” [Reichhold]. TM for pale-colored rosin ester gums and modified rosin esters used in coating vehicles and in chewing gums and some rubber adhesives.

pentadecane. $CH_3(CH_2)_{13}CH_3$.

Properties: Colorless liquid. D 0.776, bp 270.5C, mp 10C. Soluble in alcohol; insoluble in water. Combustible.

Grade: Technical.

Use: Organic synthesis.

n-pentadecanoic acid. (pentadecylic acid).

$CH_3(CH_2)_{13}COOH$. A saturated fatty acid normally not found in vegetable fats but made synthetically.

Properties: Colorless crystals. D 0.8423 (80/4C), mp 51.8–52.8C, bp 339.1C, 212C (16 mm Hg), refr index 1.4529 (60C). Insoluble in water; soluble in alcohols and ethers.

Grade: 99% pure.

Use: Organic synthesis, reference standard in gas chromatography.

pentadecanolide. (15-hydroxypentadecanoic acid lactone; pentadecalactone).

$CH_2(CH_2)_{13}C(O)O$.

Properties: Colorless liquid; strong musky odor. Congeals to white crystals at room temperature.

Minimum congealing p 36C, soluble in equal volume of 90% ethanol. Combustible.

Derivation: Angelica root oil.

Grade: 98% min.

Use: Perfumery.

pentadecenyl phenol. See “Cardanol.”

pentadecylic acid. See n-pentadecanoic acid.

1,3-pentadiene. See piperylene.

2,4-pentadienol. See 2,4-pentadien-1-ol.

2,4-pentadien-1-ol.

CAS: 4949-20-6. mf: C_5H_8O .

Hazard: A severe skin irritant.

pentaerythrite tetranitrate. Legal label name for pentaerythritol tetranitrate.

pentaerythritol. (PE; tetramethylolmethane; monopentaerythritol).

CAS: 115-77-5. $C(CH_2OH)_4$.

Properties: White, crystalline powder; readily esterified by common organic acids. Bp 276C (30 mm Hg), mp 262C, refr index 1.54–1.56 (20C), d 1.399 (25/4C). Unaffected when boiled with dilute caustic alkali. Soluble in water; slightly soluble in alcohol; insoluble in benzene, carbon tetrachloride, ether, and petroleum ether. Combustible.

Grade: Technical, nitration, CP. Technical grade is 88% monopentaerythritol and 12% dipentaerythritol.

Derivation: Reaction of acetaldehyde with an excess of formaldehyde in an alkaline medium.

Hazard: TLV: 10 mg/m³.

Use: Alkyd resins, rosin and tall oil esters, special varnishes, pharmaceuticals, plasticizers, insecticides, synthetic lubricants, explosives, paint swelling agents.

pentaerythritol ester of partially hydrogenated wood rosin.

Properties: Hard, amber-colored solid. Sol in acetone, benzene; insol in water.

Use: Food additive.

pentaerythritol ester of wood rosin.

Properties: Hard, amber-colored solid. Sol in acetone, benzene; insol in water.

Use: Food additive.

pentaerythritol tetraacetate.

CAS: 597-71-7. $C(CH_2OOCCH_3)_4$.

Properties: White, crystalline powder; extremely stable in sunlight. Mp 84C, bp 225C (30 mm Hg). Soluble in water, alcohol, and ether. Combustible.

Derivation: By the esterification of pentaerythritol with acetic acid.

Grade: Technical.

pentaerythritol tetrakis(diphenyl phosphite). (tet-

ra(diphenylphosphito)pentaerythritol).

$C[CH_2OP(OC_6H_5)_2]_4$. A low-melting, white, waxy solid with a slight phenolic odor, d 1.24 (25/15.5C), mp 30–60C, ref index 1.5823 (25C). Combustible.

Use: Ingredient in stabilizer systems for resins.

pentaerythritol tetra(3-mercaptopionate).

$C(CH_2OOCCH_2CH_2SH)_4$.

Properties: Liquid. D 1.28 (25C), refr index 1.5300 (25C). Insoluble in water, alcohol, and hexane; soluble in acetone and benzene. Combustible.

Use: Curing or cross-linking agents for polymers, especially epoxy resins, intermediate for stabilizers and antioxidants.

pentaerythritol tetranitrate. (PETN).

CAS: 78-11-5. $C(CH_2ONO_2)_4$.

Properties: White, crystalline material. D 1.75, mp 138–140C, decomposes above 150C. Very soluble in acetone, slightly soluble in alcohol and ether, insoluble in water.

Derivation: Esterification of pentaerythritol with nitric acid.

Hazard: Shock-sensitive explosive. Detonates at 210C.

Use: Demolition explosive, blasting caps, detonating compositions ("Primacord").

pentaerythritol tetrastearate.

$C(CH_2OOC C_{17}H_{35})_4$.

Properties: Hard, high-melting wax, ivory-colored. Essentially neutral, acid number 1, softening p 67C. Combustible.

Use: Polishes, coatings, textile finishes.

pentaerythritol tetrathiolglycolate.

$C(CH_2OOCCH_2SH)_4$.

Properties: Liquid. D 1.385 (25C), refr index 1.5499 (25C). Insoluble in water, alcohol, and hexane; partially soluble in benzene; soluble in acetone. Combustible.

Use: Curing or cross-linking agents for polymers, especially epoxy resins, intermediate for stabilizers and antioxidants.

pentaglycerine. See trimethylolethane.

2',3,4',5,7-pentahydroxyflavone. See morin.

pentalin. See pentachloroethane.

"Pentalyn" [Aqualon]. TM for a series of non-reactive and heat-reactive pentaerythritol esters of rosin. Available in solid and flake form in various grades.

Use: Varnishes, floor polishes, inks, and adhesives.

1,1,3,3,5-pentamethyl-4,6-dinitroindane.

CAS: 116-66-5. $C_{14}H_{18}N_2O_4$.

Properties: Pale-yellow crystals; musk-type odor. Mp min 132C. Slightly soluble in alcohol; soluble in diethyl phthalate.

Use: Perfumery.

pentamethylene. See cyclopentane.

pentamethyleneamine. See piperidine.

pentamethylene-1,1-bis(1-methylpyrrolidinium bitartrate). See pentolinium tartrate.

pentamethylenediamine. See cadaverine.

pentamethylene dibromide. (1,5-dibromopentane). $\text{BrCH}_2(\text{CH}_2)_3\text{CH}_2\text{Br}$.
Properties: Colorless, aromatic liquid. Fp -35°C , bp 224°C . Insoluble in water.

pentamethylene glycol. See 1,5-pentanediol.

pentamethylpararosaniline chloride. See methyl violet.

2,4,4,6,6-pentamethyl-2-phenylcyclotrisiloxane.

CAS: 17962-31-1. mf: $\text{C}_{11}\text{H}_{20}\text{O}_3\text{Si}_3$.

Hazard: A reproductive hazard.

pentanal. See *n*-valeraldehyde.

***n*-pentane.** (amyl hydride).

CAS: 109-66-0. $\text{CH}_3(\text{CH}_2)_4\text{CH}_3$.

Properties: Colorless liquid; pleasant odor. Fp -129.7°C , bp 36.074°C , refr index 1.35748 (20C), d 0.62624, flash p -40°F (-40°C), autoign temp 588°F (308C). Soluble in alcohol and most organic solvents; insoluble in water.

Derivation: Fractional distillation from petroleum, purified by rectification.

Grade: Pure, technical, commercial.

Hazard: Highly flammable, dangerous fire and explosion risk. Explosive limits 1.4–8% in air. Narcotic in high concentration. TLV: 600 ppm; STEL 750 ppm.

Use: Artificial ice manufacture, low-temperature thermometers, solvent extraction processes, blowing agent in plastics (e.g., expandable polystyrene), pesticide.

pentanedinitrile. See glutaronitrile.

pentanedioic acid. See glutaric acid.

pentanedioic acid anhydride. See glutaric anhydride.

1,5-pentanediol. (pentamethylene glycol).

CAS: 111-29-5. $\text{HOCH}_2(\text{CH}_2)_3\text{CH}_2\text{OH}$.

Properties: Viscous liquid. Bp 240°C , fp -15.6°C , d 0.9921 (20/20C), bulk d 8.2 lb/gal (20C), flash p 265°F (129C) (OC), autoign temp 633°F (334C). Miscible with water and alcohol Combustible.

Grade: Technical.

Use: Hydraulic fluid, lubricating-oil additive, antifreeze, plasticizer and polyester resin intermediate.

2,3-pentanedione. See acetyl propionyl.

2,4-pentanedione. See acetylacetone.

pentanethiol. (amyl mercaptan).

CAS: 110-66-7. $\text{C}_5\text{H}_{11}\text{SH}$. A mixture of isomers.

Properties: Water-white to light-yellow liquid; strong offensive odor. D 0.83–0.84 (20C), mercaptan content greater than 90.0%, initial bp above 104.0°C , final bp below 130°C , bulk d 6.99 lb/gal, flash p 65°F (18.3C) (OC). Insoluble in water; soluble in alcohol. These properties vary with proportions of isomers.

Derivation: Mixing amyl bromide and potassium hydrosulfide in alcohol.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation.

Use: Synthesis of organic sulfur compounds, chief constituent of odorant used in gas lines to locate leaks.

pentanoic acid. See *n*-valeric acid.

1-pentanol. See *n*-amyl alcohol, primary.

2-pentanol. (*sec-n*-amyl alcohol; *sec*-amyl alcohol, active; methyl propyl carbinol; 1-methylbutyl alcohol).

CAS: 6032-29-7. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OCH}_3$.

Properties: (Racemic form) Colorless liquid. Fp -75°C , bp 119.3°C , d 0.811 (20/20C), bulk d 6.75 lb/gal (20C), refr index 1.4041 (40.5C), flash p 105°F (40.5C) (OC), autoign temp 657°F (347C). Soluble in water; miscible with alcohol and ether. Combustible.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and hydrolysis of pentanes.

Hazard: Moderate fire risk. Irritant to eyes, nose, and throat.

Use: Solvent for paints and lacquers, pharmaceutical intermediate.

3-pentanol. (*sec-n*-amyl alcohol; 1-ethyl-1-propanol; diethyl carbinol).

CAS: 584-02-1. $\text{CH}_3\text{CH}_2\text{CHOHCH}_2\text{CH}_3$.

Properties: Colorless liquid. D 0.82 (20C), fp below -75°C , bp 115.6°C , bulk d 6.81 lb/gal, refr index 1.41 (20C), flash p 94°F (34.4C) (CC), autoign temp 650°F (343C). Soluble in alcohol and ether; slightly soluble in water.

Hazard: Moderate fire risk. Irritant to eyes, nose, and throat. TLV: 100 ppm; STEL 125 ppm

Use: Solvent, flotation agent, pharmaceuticals.

2-pentanone. See methyl propyl ketone.

3-pentanone. See diethyl ketone.

penta resin. Ester gum made from rosin and pentaerythritol.

pentasodium diethylenetriaminepentaacetate. $\text{C}_{14}\text{H}_{23}\text{N}_5\text{O}_{10}\cdot 5\text{Na}$. A sodium salt of diethylenetriaminepentaacetic acid.

Use: A chelating agent.

pentasodium triphosphate. See sodium triphosphate.

***n*-pentatriacontane.** $C_{35}H_{72}$ or $CH_3(CH_2)_{33}CH_3$.
Properties: Crystals. D 0.782 at 75C, bp 331C (15 mm Hg), mp 75C. Combustible.
Use: Organic synthesis.

pentazocine. (2-dimethylallyl-5,9-dimethyl-2'-hydroxy benzomorphan).
 CAS: 359-83-1. $C_{19}H_{27}NO$. A synthetic drug claimed to be as effective as morphine but without its addictive properties. Has a noncumulative effect. FDA approved.

pentazocine lactate.
 CAS: 17146-95-1. mf: $C_{19}H_{27}NO \cdot C_3H_5O_3$.
Hazard: A poison. A human skin irritant.

"Pentecat L" [AKZO]. TM for a 50% aqueous solution of lithium naphthenate.
Use: Alcoholysis catalyst in alkyd varnish cooking.

1-pentene. (α -*n*-amylene; propylene).
 $CH_3CH_2CH_2CH=CH_2$.
Properties: Colorless liquid. Fp $-165C$, bp 30C, d 0.6410 (20C), flash p 0F ($-17.7C$) (OC), autoign temp 523F (272C). Soluble in alcohol; insoluble in water.
Derivation: Natural gasoline.
Hazard: Flammable, dangerous fire risk. Toxic by ingestion, inhalation, and skin absorption.
Use: Organic synthesis, blending agent for high-octane motor fuel, pesticide formulations.

2-pentene. (β -*n*-amylene; *sym*-methylene-ethylene).
 CAS: 646-04-8. $CH_3CH_2CH=CHCH_3$. Mixed *cis*- and *trans*-isomers are available commercially. *cis*-isomer

Properties: Bp 37C, fp $-180C$, d 0.656 (20/4C), flash p 0F ($-17.7C$). Soluble in alcohol; insoluble in water.
Grade: Technical, 95.0 mole %. *trans*-isomer

Properties: Bp 36.4C, fp $-139C$, d 0.6482 (20C), flash p 0F ($-17.7C$). Soluble in alcohol; insoluble in water.
Derivation: Natural gasoline.
Hazard: Flammable, dangerous fire risk.
Use: Polymerization inhibitor, organic synthesis.

"Pentex" [Uniroyal]. TM for tetrabutylthiuram monosulfide.
Use: Rubber accelerator. When mixed with 87.5% clay, it is used for sponge rubbers and called "Pentex Flour."

"Pentite" [Occidental]. TM for tetra(diphenylphosphito)pentaerythritol.
 See pentaerythritol tetrakis(diphenylphosphite).

pentlandite. (Fe,Ni)S.
Properties: Light-bronze-yellow mineral, metallic luster, contains 35.57% nickel. Soluble in nitric acid, d 4.6–5, Mohs hardness 3.5–4.
Occurrence: Canada (Ontario), Norway.
Use: Nickel ore.

pentobarbital. (5-ethyl-5-(1-methylbutyl)barbituric acid).
 CAS: 76-74-4. $C_{11}H_{18}O_3N_2$.
 See barbiturate.

pentolinium tartrate. (pentamethylene-1,1-bis(1-methylpyrrolidinium) bitartrate).
 CAS: 52-62-0. $C_{23}H_{42}N_2O_{12}$.
Properties: White- to light-cream-colored, crystalline powder. Slightly soluble in alcohol; insoluble in ether, chloroform; very soluble in water; pH of 1% solution in water is 3.0–4.0, decomposes 203C.
Use: Medicine (antihypertensive).

pentolite. A high explosive consisting of equal parts of pentaerythritol tetranitrate and trinitrotoluene.
Hazard: Dangerous, explodes on shock or heating.

"Penton" [Aqualon].
 $(CH_2Cl)_2CCH_2OCH_2$. TM for a thermoplastic resin derived from 3,3-bis(chloromethyl)oxetane. A chlorinated polyether.

Properties: A linear polymer extremely resistant to chemicals and to thermal degradation at molding and extrusion temperature, d 1.4, self-extinguishing, dimensionally stable, very low water absorption, outstanding chemical resistance. Natural, black, or olive-green molding powder. Finely divided powder for coatings.
Use: Solid and lined valves, pumps, pipe, and fittings; monofilament for filter supports and column packing.

pentosan. A complex carbohydrate (hemicellulose) present with the cellulose in many woody plant tissues, particularly cereal straws and brans, characterized by hydrolysis to give five-carbon atom sugars (pentoses). Thus the pentosan xylan yields the sugar xylose ($HOH_2C \cdot CHOH \cdot CHOH \cdot CHOH \cdot CHO$) that is dehydrated with sulfuric acid to yield furfural ($C_5H_4O_2$).

pentose. General term for sugars with five carbon atoms per molecule.

pentose phosphate pathway. A pathway involved in the oxidation of glucose, and a source of reducing equivalents (NADPH) and pentoses for biosynthetic processes; present in most organisms. Also called the phosphogluconate pathway, pentose phosphate shunt, or hexose monophosphate shunt.

“Pentothal” [Abbott]. TM for sodium thiopental, a barbiturate.
See thiopental sodium.

pentyl. Synonym for the amyl group, C₅H₁₁-.

pentyl acetate. See amyl acetate.

pentylamine. See *n*-amylamine.

α-pentylcinnamaldehyde. See α-amylcin-namic aldehyde.

***p*-tert-pentylphenol.** (*p*-*tert*-amylphenol).
CAS: 80-46-6. C₁₁H₁₅OH.

Properties: Crystalline solid. Mp 95C, bp 261C, d 0.962 (20/4C). Insoluble in water; soluble in organic solvents.

Derivation: Condensation of *tert*-pentanol with phenol with aluminum chloride catalyst.

Use: Pesticide intermediate, oil-soluble resin manufacture, may be useful as germicide and fumigant.

6-(pentylthio)purine.
CAS: 5443-89-0. mf: C₁₀H₁₄N₄S.

Hazard: A reproductive hazard.

1-(4-pentynloxy)-4-phenoxybenzene.

CAS: 42873-80-3. mf: C₁₇H₁₆O₂.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

Penzold’s reagent. Solution of diazobenzosulfonic acid and potassium hydroxide.

Use: Testing for sugar in urine.

“Pepha-Ctive” [Centerchem].

Properties: Clear yellowish liquid. TM for an algae extract.

Use: In cosmetics to protect the mitochondria and increases the ATP levels of skin cells leading to enhancement of cell turnovers.

peppermint oil. Essential oil with strong aromatic odor and taste, levorotatory, chief component is menthol.

Use: To flavor mouthwashes, chewing gum, liqueurs, toothpastes; source of menthol.

pepsin. (pepsinum).

Properties: A digestive enzyme of gastric juice. White or yellowish-white powder or lustrous trans-

parent or translucent scales; should have no odor; converts proteins into albumoses and peptones; soluble in water; insoluble in alcohol, chloroform, and ether.

Derivation: From the glandular layer of fresh hog stomachs.

Grade: Technical, NF.

Use: Medicine (digestive ferment); substitute for rennet in cheese making.

pepsinogen. An inactive precursor of pepsin.

peptide. See polypeptide.

peptidase. An enzyme that hydrolyzes a peptide bond.

See protease.

peptide bond. A planar, amide linkage between the α-amino group of one amino acid and the α-carboxyl group of another, with the elimination of a molecule of water.

peptide finger-printing. See peptide mapping.

peptide mapping. (peptide finger-printing).

The characteristic pattern of fragments formed by the separation of a mixture of peptides resulting from hydrolysis of a protein or peptide..

peptidoglycan. A major component of bacterial cell walls consisting of parallel heteropolysaccharides cross-linked by short peptides.

“PeptiSelect” [Fluka]. TM for a series of high-quality peptides that have been specially selected.

peptization. Stabilization of hydrophobic colloidal solutions by addition of electrolytes that provide the necessary electric double layer of ionic charges around each particle. Such electrolytes are known as peptizing agents. The ions of the electrolyte are strongly adsorbed on the particle surfaces. Stable solutions of nonionizing substances acquire a charge in contact with water by preferential adsorption of the hydroxyl ions, which may be considered peptizing agents. The term is also loosely applied to the softening or liquefaction of one substance by trace quantities of another, analogous to the digestion of a protein by an enzyme (pepsin).

peptone.

Properties: (1) From albumin: white or pale-yellow amorphous powder. (2) From meat: light-brown amorphous powder. (3) From milk: light-brown powder. Soluble in water, insoluble in alcohol or ether.

Derivation: (1) By digestion of egg albumin by pepsin and a small quantity of dilute hydrochloric acid at 38–40C (body temperature). (2) By digestion of

red meat with pancreatin at body temperature. (3)
By digestion of casein.

Grade: Technical, reagent.

Use: Preparation of nutrient media in bacteriology; nutrient.

"Peptrix" [Crowley]. TM for a rubber peptizer.

Use: For rubber reclaiming and processing.

per-. A prefix signifying complete or extreme and specifically denoting: (1) a compound containing an element in its highest state of oxidation, as perchloric acid; (2) presence of the peroxy group, $-O-O-$, as peracetic and perchromic acids; (3) exhaustive substitution or addition, as perchloroethylene.

peracetic acid. (peroxyacetic acid).

CAS: 79-21-0. CH_3COOOH .

Properties: Colorless liquid; strong odor. Bp 105C, fp $-30C$, d 1.15 (20C), flash p 105F (40.5C) (OC). Soluble in water, alcohol, sulfuric acid; strong oxidizing agent.

Derivation: (1) Oxidation of acetaldehyde, (2) reaction of acetic acid and hydrogen peroxide with sulfuric acid catalyst.

Grade: Technical, 40% soluble in acetic acid.

Hazard: Oxidizing material, dangerous in contact with organic materials, explodes at 110C. Strong irritant.

Use: Bleaching textiles, paper, oils, waxes, starch; polymerization catalyst; bactericide and fungicide, especially in food processing; epoxidation of fatty acid esters and epoxy resin precursors; reagent in making caprolactam, synthetic glycerol.

per-acids. Derivatives of hydrogen peroxide, the molecules of which contain one or more directly linked pairs of oxygen atoms, $-O-O-$. Examples are persulfuric, perchromic, peracetic acids. Permanganic, perchloric, and periodic acids are not peracids in this sense.

See per-(2); per-(1).

"Perapret" [BASF]. TM for finishing agents and binders (polymer dispersions), additives for wash-and-wear finishing.

perbenzoic acid. See benzoyl hydroperoxide.

perbromobiphenyl.

CAS: 13654-09-6. mf: $C_{12}Br_{10}$.

Hazard: Confirmed Human Carcinogen.

percarbamide. See urea peroxide.

perchloric acid.

CAS: 7601-90-3. $HClO_4$.

Properties: Colorless, fuming, hygroscopic liquid, unstable in concentrated form. D 1.764, bp 19C (11 mm Hg), fp $-112C$, evolves heat on combination with water. Commercial aqueous solutions contain 65–70% $HClO_4$.

Derivation: By distilling potassium perchlorate with strong sulfuric acid (96%) under reduced pressure in an oil bath at 140–190C.

Method of purification: Rectification.

Grade: Technical, CP.

Hazard: Strong oxidizing agent, will ignite vigorously in contact with organic materials, or detonate by shock or heat. Toxic by ingestion and inhalation, strong irritant.

Use: Analytical chemistry, catalyst, manufacture of various esters, ingredient of electrolytic bath in deposition of lead, electropolishing, explosives.

perchlorobenzene. See hexachlorobenzene.

perchlorocyclopentadiene. See hexachlorocyclopentadiene.

perchloro-2-cyclopentenone. See 2,3,4,4,5,5-hexachloro-2-cyclopenten-1-one.

perchloroethane. See hexachloroethane.

perchloroethylene. (tetrachloroethylene).

CAS: 127-18-4. $Cl_2C:CCl_2$.

Properties: Colorless liquid; etherlike odor. Extremely stable, resists hydrolysis. D 1.625 (20/20C), bp 121C, fp $-22.4C$, bulk d 13.46 lb/gal (26C), refr index 1.5029 (25C), flash p none. Miscible with alcohol, ether, and oils; insoluble in water. Nonflammable.

Derivation: (1) By chlorination of hydrocarbons and pyrolysis of the carbon tetrachloride also formed, (2) from acetylene and chlorine via trichloroethylene.

Method of purification: Distillation.

Grade: Purified, technical, USP, as tetrachloroethylene, spectrophotometric.

Hazard: Irritant to eyes and skin. TLV: 50 ppm; STEL 200 ppm.

Use: Dry-cleaning solvent, vapor-degreasing solvent, drying agent for metals and certain other solids, vermifuge, heat-transfer medium, manufacture of fluorocarbons.

perchloromethane. See carbon tetrachloride.

perchloromethyl mercaptan. Legal label name for trichloromethylsulfenyl chloride.

perchloropentacyclodecane.

CAS: 2385-85-5. $C_{10}Cl_{12}$.

Properties: White, crystalline solid. Mp (sealed tube) 485C. Nonflammable.

Use: Fire-retardant additive in elastomeric resin systems.

perchloropropylene. See hexachloropropylene.

perchloryl fluoride.

CAS: 7616-94-6. $ClFO_3$.

Properties: Colorless, noncorrosive gas or liquid; sweet odor. Fp -146°C , bp -46.8°C , d (liquid) 1.434 (20C). Nonflammable but supports combustion.

Hazard: Dangerous in contact with organic materials, strong oxidizing agent. Toxic by inhalation. TLV: 3 ppm; STEL 6 ppm.

Use: Oxidant in rocket fuels, oxidizing and fluorinating agent in chemical reactions.

perchromic acid. Probably $(\text{HO})_4\text{Cr}(\text{OOH})_3$.

Properties: Unstable acid formed when a solution of chromic acid is added to hydrogen peroxide; forms deep-blue crystals below -15°C ; the blue color can be extracted from solutions by ether; decomposes in acid solution to form chromic salts and in alkaline solution to form chromates; the blue color can be used as a test for chloride or chromate.

Hazard: Irritant.

“Peregal” [International Specialty]. TM for a series of textile chemicals. One of which is ST, a polymeric dye complexing agent.

perfect gas. See gas.

perfluidone.

CAS: 37924-13-3. $\text{C}_{14}\text{H}_{12}\text{F}_3\text{NO}_4\text{S}_2$. A preemergence herbicide.

perfluoro-2-butene. Legal label name for octafluoro-2-butene.

perfluoro(2-butoxypropyl vinyl ether).

CAS: 115659-47-7. mf: $\text{C}_9\text{H}_{18}\text{O}_2$.

Hazard: Moderately toxic by ingestion. A severe eye irritant.

perfluorobutyric acid. See heptafluorobutyric acid.

perfluorocarbon compound. A fluorocarbon in which the hydrogen directly attached to the carbon atoms is completely replaced by fluorine.

perfluorocyclobutane. See octafluorocyclobutane.

perfluorodimethylcyclobutane. An inert fluorocarbon liquid.

Properties: Bp 45°C , stable to 260°C .

Use: Evaporative coolant for electronic equipment.

perfluoroethylene. See tetrafluoroethylene.

perfluoroisobutylene. See octafluoro-*sec*-butene.

perfluorooctanesulfonic acid.

CAS: 1763-23-1. mf: $\text{C}_8\text{HF}_{17}\text{O}_3\text{S}$.

Hazard: A poison by ingestion. A reproductive hazard.

Use: Agricultural chemical.

***n*-perfluorooctanesulfonyl-*n*-methylcarbamoyl ((nonadecaethoxy) butoxy)butyl ether.**

CAS: 52032-20-9. mf: $(\text{C}_2\text{H}_4\text{O})_n\text{-C}_{14}\text{H}_{12}\text{F}_{17}\text{NO}_4\text{S}$.

Hazard: Moderately toxic by ingestion.

perfluoropropane. Legal label name (Air) for octafluoropropane.

perfluoropropene. See hexafluoropropylene.

performic acid. (peroxyformic acid).

CAS: 107-32-4. HCOOOH .

Properties: Colorless liquid. Miscible with water, alcohol, ether; soluble in benzene, chloroform; solutions are unstable.

Derivation: Mixture of formic acid, peroxide, and sulfuric acid is allowed to interact for two hours and then distilled.

Grade: 90% solution.

Hazard: Explodes when shocked or heated or in contact with reducing materials, metals, and metallic oxides. Strong irritant and oxidizing agent.

Use: Oxidation, epoxidation, and hydroxylation reactions.

perfume. A blend of pleasantly odorous substances (usually liquids) obtained from the essential oils of flowers, leaves, fruit, roots, or wood of a wide variety of plants, either by steam distillation or solvent extraction. Flower oils (rose, jasmine) are extracted with a nonpolar solvent to give a waxy mixture called a concrete; the wax is then removed by a second solvent (an alcohol), which is then in turn removed to form an absolute. It is necessary that all the solvent be eliminated to obtain the finest perfumes. The center of this industry has long been in Grasse, France. Perfume materials are also derived from animal sources (musk, ambergris) and from resinous extracts (terpenes and balsams); they are also made synthetically. Cologne and toilet water are weak alcoholic solutions (5% or less) of perfumes. Fine perfumes may contain as many as 30 ingredients, and their blending is an art rather than a science. The largest volume use of perfumes is in soaps, lotions, shaving creams, and cosmetics. See fragrance; odorant.

perhydrosqualene. See squalane.

peri acid. (1-naphthylamine-8-sulfonic acid).

Properties: White needles. Slightly soluble in water.

Derivation: Nitration of naphthalene- α -sulfonic acid followed by reduction with iron and crystallization of the sodium salt.

Use: Azo dye intermediate, production of Chicago acid.

periclase. MgO. A natural or calcined magnesium oxide used as a lining and maintenance material for basic oxygen steelmaking furnaces and other refractories.

“Periclase” [Martin Marietta]. TM for a high purity dead burned magnesium oxide.

perilla oil.

Properties: Light-yellow drying oil. D 0.932–0.945, saponification value 191–193, iodine value 187–202, refr index 1.4841. Soluble in alcohol, ether, chloroform, and carbon disulfide. Combustible. Subject to spontaneous heating.

Derivation: From the seeds of *Perilla ocimoides*, grown commonly in Japan and Korea. Chief constituents: Linoleic and linolenic acids.

Use: Substitute for linseed oil, edible oil in Asia, manufacture of varnishes.

perindopril erbumine. See perindopril *tert*-butylamine.

perindopril *tert*-butylamine.

CAS: 107133-36-8. mf: C₁₉H₃₂N₂O₅•C₄H₁₁N.

Hazard: Moderately toxic by ingestion.

periodic acid.

CAS: 13444-71-8. HIO₄•2H₂O.

Properties: White crystals. Mp 122C, decomposes at 130C, loses 2H₂O at 100C. Soluble in water, alcohol; slightly soluble in ether.

Derivation: By the interaction of iodine and concentrated perchloric acid, by low-temperature electrolytic oxidation of concentrated iodic acid.

Method of purification: Crystallization.

Hazard: Dangerous in contact with organic materials. Irritant and oxidizing material.

Use: Oxidizing agent, increasing wet strength of paper, photographic paper.

periodic law. Originally stated in recognition of an empirical periodic variation of physical and chemical properties of the elements with atomic weight, this law is now understood to be based fundamentally on atomic number and atomic structure. A modern statement is: The electronic configurations of the atoms of the elements vary periodically with their atomic number. Consequently, all properties of the elements that depend on their atomic structure (electronic configuration) tend also to change with increasing atomic number in a periodic manner.

periodic table. An arrangement of the chemical elements by symbol in a geometric pattern designed to represent the periodic law by aligning the elements in periods so that the corresponding parts of the several periods are adjacent. When the elements are aligned in order of increasing atomic number, they constitute a succession of period, each begin-

▲ Actinide series

Note: Atomic masses shown here are the 1983 IUPAC values (maximum of six significant figures). a Symbols based on IUPAC systematic names.

ning with an alkali metal (one electron in the outermost principal quantum level) and ending with an element of the helium family, helium, neon, argon, krypton, xenon, and radon (each having eight electrons in the outermost principal quantum level, except for helium, which is limited to two). Each helium family element is followed directly in atomic number by an alkali metal, which begins a new period.

The advantage of placing each successive period so that it is adjacent to the preceding period in its corresponding parts is that similar elements are thus brought together in groups. For example, the alkali metals that begin each period have similar properties that correspond to their atomic structure, each having one outermost shell electron. In a periodic table, the elements exhibit a steady trend in properties from the beginning of each period, where they are metals, to the end, where they are nonmetals. Within each group the elements are quite similar. A given element can be predicted, on the basis of its position in a periodic table, to resemble the other elements of its group and be intermediate in properties between its adjacent neighbors within its period. The chief function of a periodic table is to serve as a fundamental framework for the systematic organization of chemistry (R. T. Sanderson). See Mendeleev, D. I.

Note: Dr. Glenn T. Seaborg predicted the existence of synthetic superheavy elements 107–168 on the basis of theoretical calculations. Numbers 122–153 he called "superactinides."

peripheral proteins. Proteins that are loosely or reversibly bound to a membrane by hydrogen bonds or electrostatic forces which can be easily released from the membrane. Contrast with integral proteins.

peritectic system. (transition type system; unstable compound system; hidden maximum system). Constitution-temperature system or diagram in which there is a binary compound unstable in contact with a melt of its own composition.

peritectic temperature. Temperature in a peritectic system at which there is equilibrium between the solid and the remaining melt, the composition of which conforms to the peritectic point, at which the temperature line meets the liquids curve.

"Perkalink" [Akzo].

CAS: 101-37-1. TM for triallyl cyanurate coagent. Use: Coagent for peroxide cross-linking of PE, EVA, and EPDM.

Perkin alicyclic synthesis. Synthesis of alicyclic compounds from α,β -GKW-dihaloalkanes and compounds containing active methylene groups in the presence of sodium ethoxide.

Perkin reaction. Formation of α,β -unsaturated carboxylic acids by aldol condensation of aromatic aldehydes and acid anhydrides in the presence of an alkali salt of the acid.

Perkin rearrangement. Formation of benzofuran-2-carboxylic acids and benzofurans by heating 3-halocoumarins with alkali.

Perkin, Sir William Henry. (1838–1907).

An English chemist who was the first to make a synthetic dyestuff (1856). He studied under Hofmann at the Royal College of London. Perkin's first dye was called mauveine, but he proceeded to synthesize alizarin and coumarin, the first synthetic perfume. In 1907 he was awarded the first Perkin Medal, which has ever since been awarded by the American Division of the Society of Chemical Industry for distinguished work in chemistry. Notwithstanding the fact that Perkin patented and manufactured mauve dye in England, the center of the synthetic dye industry shifted to Germany, where it remained until 1914.

See Hofmann, August Wilhelm.

Perkow reaction. Formation of enol phosphates on treatment of α -halocarbonyl compounds with trialkyl phosphites.

perlite.

CAS: 93763-70-3. Eutectic between ferrite and cementite (steelmaking).

Properties: Average density of 0.13. Expands when finely ground and heated. Natural glass, amorphous mineral consisting of fused sodium potassium aluminum silicate, containing <1% quartz.

Hazard: Slightly toxic by ingestion. A nuisance dust. TLV: TWA (nuisance particulate) 10 mg/m³ of total dust; not classifiable as a human carcinogen (when toxic impurities are not present, e.g., quartz <1%)

Use: Filter aid, food additive.

"Permacore" [Phillips]. TM for high-density polyethylene pipe.

Use: Underground sewer systems, manholes, industrial, and municipal.

permafil. A mixture in which the liquid undergoes complete polymerization and hardens without the necessity of any evaporation. Anaerobic permafiles harden out of contact with air.

"Permalloy." TM for an alloy containing 78.5% nickel and 21.5% iron. It has high magnetic permeability and electrical resistivity.

Use: Transocean submarine cables.

"Permalume G" [ATOTECH]. TM for a semibright nickel electroplating process. The plating bath contains nickel sulfate, nickel chloride, boric acid, and organic addition agents.

permalux. See dicatichol borate 1,3-di(*o*-tolyl)guanidine salt.

“Permalux” [Du Pont]. TM for a di-*o*-tolylguanidine salt of dicatichol borate.
(HOC₆H₄O)₂B•HNC(NHC₆H₄CH₃)₂.

Properties: Light-grayish-brown powder. D 1.27, fp>165C.

Use: Rubber antioxidant, vulcanization of neoprene.

permanent magnet. A magnet whose magnetic properties are not affected by removing it from an external magnetic field.

Permanent Orange. See dinitraniline orange.

permanent-press resin. (durable-press resin). A thermosetting resin used as a textile impregnant or fiber coating to impart crease resistance and permanent hot-creasing to suitings, dress fabrics, etc. Chemicals such as formaldehyde and maleic anhydride are the basis of these products. The resin is “cured” after the fabric has been tailored into a garment. A permanent-press fabric that requires no resin has been developed (a blend of polyester with cotton or rayon).

Permanent Red 2B Amine. See 4-amino-2-chlorotoluene-5-sulfonic acid.

permanent set. (permanent elongation). The extent to which vulcanized rubber and other elastomeric materials are permanently deformed after extension to break. In general it varies in the range of 5–10% of the original length, depending on the formulation and state of cure.
See elasticity.

permanent white. BaSO₄. Precipitated barium sulfate.

“Permasep” [Du Pont]. TM for a method of desalinating water by reverse osmosis using membranes composed of hollow nylon fibers that provide maximum membrane surface.
See osmosis.

permenorm. Nickel-iron alloy produced by magnetic annealing and drastic cold reduction and used for mechanical rectifiers and low-frequency amplifiers. This alloy has a rectangular hysteresis loop that eliminates arcing at the contacts of mechanical rectifiers, as well as other desirable properties.

permethrin. [(3-phenoxyphenyl)methyl-3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate].
CAS: 52645-53-1.

Use: Insecticide, nematocide, acaricide.

permissible explosive. See explosive, permissible.

“Perone” [Du Pont]. TM for HOOH, 30, 35, and 50% solutions by weight.
See hydrogen peroxide.

perovskite. A natural or synthetic crystalline mineral composed of calcium dioxide and titanium dioxide. The natural material was discovered in Russia in about 1850; the synthetic type can be so made as to incorporate particles of catalysts (platinum or palladium), that are protected by the crystalline structure from contamination by lead and other poisons, thus permitting use of leaded gasoline in cars equipped with emission-control devices.

peroxidase. An enzyme found in most plant cells and some animal cells, that promotes the oxidation of various substrates, such as phenols, aromatic amines, etc., by means of hydrogen peroxide.

peroxide. (1) Any compound containing a bivalent O–O group, i.e., the oxygen atoms are univalent. Such compounds release atomic (nascent) oxygen readily. Thus they are strong oxidizing agents, and fire hazards when in contact with combustible materials, especially under high-temperature conditions. The chief industrial uses of peroxides are as oxidizing agents, bleaching agents, and initiators of polymerization. (2) Hydrogen peroxide.

peroxisome. Membrane-bounded organelle in the cytoplasm of eukaryotic cells functioning in the destruction of proteins and characterized by peroxide-forming enzymes.

peroxisomicin A2.
CAS: 156768-16-0. mf: C₃₀H₂₆O₈.
Hazard: A poison by ingestion.
Source: Natural product.

peroxisomicine A2. See peroxisomicin Aa2.

peroxyacetic acid. See peracetic acid.

peroxybenzoyl nitrate. A component of photochemical smog.
Hazard: More than 200 times as irritating to the eyes as formaldehyde. A concentration of 0.02 ppm causes moderate to severe conjunctival irritation.
See smog.

peroxyformic acid. See performic acid.

peroxysulfuric acid. See Caro’s acid.

perphenazine.
CAS: 58-39-9. C₂₁H₂₆ClN₃OS.
Properties: Crystals, sensitive to light. Mp 97–100C. Insoluble in water; soluble in ethanol and acetone.
Grade: ND.

Use: Medicine.

perrhenic acid. HReO_4 . Exists only in solution, commercially available as aqueous syrup. Strong, very stable, monobasic acid; extremely soluble in water and organic solvents.

Perrin rule. Ions of charge opposite to that of a diaphragm have by far the greatest effect, on endosmosis. The higher their valence (of opposite sign) the greater the reduction of electroosmotic flow.

“Persistol” [BASF]. TM for agents for the wash-proof water-repellent finishing of textiles of natural and synthetic fibrous materials and fiber mixes.

perstoff See trichloromethylchloroformate.

persulfuric acid. See Caro's acid.

“Perthane” [Rohm & Haas]. TM for an agricultural insecticide based on 1,1-dichloro-2,2-bis(*p*-ethylphenyl)ethane. Supplied as a wettable powder or emulsifiable concentration.

Peru balsam. See balsam.

Perutz, Max F. (1914–2002). An Austrian molecular biologist who was a recipient of the Nobel Prize for chemistry in 1962 along with Kendrew. His work was concerned with crystalline protein structure, particularly the molecular structure of hemoglobin and myoglobin. nicotinamide adenine dinucleotide was educated in England and Austria.

PES. Abbreviation for photoelectron spectroscopy.

pesticide. Any substance, organic or inorganic, used to destroy or inhibit the action of plant or animal pests; the term thus includes insecticides, herbicides, rodenticides, miticides, etc. See methyl parathion. Virtually all pesticides are toxic to humans to some degree. They vary in biodegradability. The use of more-toxic types, especially DDT, has been restricted. Microencapsulated controlled-release forms are available. See insecticide; biocide.

petalite. (lithium aluminum silicate).

Properties: Colorless, white, gray, or occasionally pink mineral, white streak, vitreous luster. Resembles spodumene in appearance. Contains up to 4.9% lithia, sometimes with partial replacement by sodium or less often by potassium. Insoluble in acids, d 2.39–2.46, Mohs hardness 6–6.5.

Occurrence: U.S. (Massachusetts, Maine); Sweden.

Use: Source of lithium salts, in ceramics and glass.

Peterson reaction (olefination). Reaction of α -silylated carbanions with carbonyl compounds, yielding β -hydroxyl-alkyl silanes, which undergo instantaneous elimination to afford olefins.

petitgrain oil. See neroli oil.

petitgrain oil, Paraguay type.

Properties: From steam distillation of the leaves of *Citrus aurantium* L. subspecies *amara*. Yellow to brown liquid; harsh bitter odor. D : 0.878–0.889, refr index: 1.455 @ 20°. Sol in fixed oils, mineral oil, propylene glycol; insol in glycerin.

Use: Food additive.

PETN. Abbreviation for pentaerythritol tetranitrate.

“Petra” [General Electric]. TM for a PET (polyethylene terephthalate) resin.

Use: Injection molding.

“Petrac Crude Glyceride” [Ferro]. TM for glycerol.

“Petrac Vyn-Eze” [Ferro]. TM for stearamide of commercial stearic acid.

“Petrac Wax” [Ferro]. TM for paraffin and polyethylene wax.

Petrenko-Kritschenko piperidone synthesis.

Formation of piperidones by cyclization from two moles of aldehyde and one mole each of acetonedicarboxylic ester and of ammonia or a primary amine. Used widely in synthesis of tropane derivatives.

petri dish. A small concave glass plate having an easily removable cover, used for the culture of bacteria. Named after its inventor, a German biologist.

petrochemical. An organic compound for which petroleum or natural gas is the ultimate raw material. Thus, cracking of petroleum produces ethylene, which is converted to ethylene glycol, the latter being a typical petrochemical. The term is also applied to substances such as ammonia, because the hydrogen used to form the ammonia is derived from natural gas. Thus, synthetic fertilizers are considered to be petrochemicals. At least 175 substances are designated as petrochemicals including many paraffin, olefin, naphthene, and aromatic hydrocarbons (methane, ethane, propane, ethylene, propylene, butenes, cyclohexane, benzene, toluene, naphthalene, etc.) and their derivatives, even though some of their commercial production is from sources other than petroleum. The percentage of total hydrocarbon consumption represented by petrochemicals is steadily increasing; some authorities maintain that petroleum is too valuable to be used

for fuel and that it should be conserved for future petrochemical development.

petrolatum. A semisolid or liquid mixture of hydrocarbons derived by distillation of paraffin-base petroleum fractions. The solid form (mineral jelly) may be either water-white or pale yellow. Its chief uses are in mild ointments, cosmetics, softener in rubber mixtures and food processing (release agent in bakery products, dehydrated fruits and vegetables), protective coating (raw fruits and vegetables), and defoaming agent (beet sugar, yeast). The liquid form (white mineral oil) is used as a laxative, textile lubricant, and dispersing agent. There are three grades of both solid and liquid types with various specifications (USP, NF, and FCC). See ointment.

petrolatum wax. A microcrystalline wax containing hydrocarbons from $C_{33}H_{70}$ to $C_{43}H_{88}$. Solidifying range 71–83°C. See wax, microcrystalline.

petrolenes. (malthenes). Portions of bituminous substances soluble in hexane.

petroleum. (crude oil). A highly complex mixture of paraffinic, cycloparaffinic (naphthenic), and aromatic hydrocarbons, containing a low percentage of sulfur and trace amounts of nitrogen and oxygen compounds. Said to have originated from both plant and animal sources 10–20 million years ago. The most important petroleum fractions, obtained by cracking or distillation, are various hydrocarbon gases (butane, ethane, propane), naphtha of several grades, gasoline, kerosene, fuel oils, gas oil, lubricating oils, paraffin wax, and asphalt. From the hydrocarbon gases, ethylene, butylene, and propylene are obtained; these are important industrial intermediates, being the source of alcohols, ethylene glycols, and monomers for a wide range of plastics, elastomers, and pharmaceuticals. Benzene, phenol, toluene, and xylene can be made from petroleum, and hundreds of other products, including biosynthetically produced proteins, are petroleum derived. About 5% of the petroleum consumed in the U.S. is used as feedstocks by the chemical industries.

Occurrence: At present, half of the world's proven resources are in the Middle East and North Africa, the other half being divided among the U.S. (including Alaska), Canada, Venezuela, the former U.S.S.R., the North Sea area, Indonesia, Mexico, Romania, and Australia.

Properties: Viscous, dark-brown liquid; unpleasant odor. D 0.78–0.97, flash p 20–90°F.

Hazard: Flammable, moderate fire risk. Toxic by ingestion, local skin irritant. For further information refer to The American Petroleum Institute.

See natural gas; petrochemical

petroleum benzin. A special grade of ligroin.

petroleum coke. See coke.

petroleum ether. This term is used synonymously with petroleum naphtha. It is also sometimes used as a synonym for ligroin or petroleum spirits. It is technically a misnomer, because it is not an ether in the chemical sense. For details about specified distillation ranges and other distinctive properties, consult ASTM and API specifications. See naphtha (1).

petroleum gas, liquefied. See liquefied petroleum gas.

petroleum jelly. See petrolatum

petroleum naphtha. See naphtha (1).

petroleum spirits. In Great Britain the term *petroleum spirits* refers to a volatile hydrocarbon mixture having a flash p 32F (0C).

Hazard: Highly flammable, dangerous fire risk. See naphtha (1a); spirits; petroleum ether.

petroleum, synthetic. See pyrolysis.

petroleum thinner. See naphtha (1a).

petroleum wax. A high molecular weight solid hydrocarbon derived from petroleum. There are three types: paraffin waxes, microcrystalline waxes, and petrolatum waxes. All are made mostly by solvent dewaxing, although pressing and sweating processes are still used.

“Petrolite” [Baker Petrolite]. TM for a hard grade of petroleum microcrystalline wax; a synthetic polymer; an oxidized hydrocarbon; a modified hydrocarbon; or a dispersion.

“Petromat” [Phillips]. TM for engineered nonwoven fabric.
Use: Paving repair.

“Petronates” [Crompton & Knowles]. TM for salts of petroleum sulfonic acids, varying in molecular weight and color.
Use: Emulsifying agents, dispersing agents, wetting agents, corrosion preventive.

“Petronauba” [Baker Petrolite]. TM for an oxidized hydrocarbon.

“Petrotac” [Phillips]. TM for engineered nonwoven fabric.
Use: Paving repair membranes.

“Petrothene” [Quantum]. TM for polypropylene resins for blown, cast, and water-quenched films, substrate coating, wire and cable coating, injection molding, blow molding, thermoforming, pipe extrusion, calendaring.

Available forms: Solid cubes and pellets in natural and black.

“Petrowet” R [Du Pont]. TM for a surface-active agent composed of saturated hydrocarbon sodium sulfonate. A wetting and penetrating agent effective in high concentration of electrolytes and acids, suitable for use in acidizing of oil wells.

pewter. Tin alloys with 5–15% tin, 0–3% copper, and 0–15% lead. White metal and Britannia metal are also of this general composition.

peyote. Root of cactus *Lophophora williamsii* (Mexico) known as an hallucinogen.

Pfau-Plattner azulene synthesis. Formation of azulenes by ring enlargement of indanes on addition of diazoacetic ester, hydrolysis, dehydrogenation, and decarboxylation of the resulting acid.

PFGE. See pulsed field gel electrophoresis.

Pfitzinger reaction. Formation of quinoline-4-carboxylic acids by condensation of isatic acids from isatin with α -methylene carbonyl compounds; subsequent decarboxylation yields quinolines.

Pfitzner-Moffatt oxidation. Oxidation of alcohols to carbonyl derivatives with dimethyl sulfoxide and dicyclohexylcarbodiimide. The procedure is especially useful for the conversion of a primary alcohol to an aldehyde without further oxidation to the carboxylic acid.

PFOS. See perfluorooctanesulfonic acid.

PF resins. Abbreviation for phenol-formaldehyde resins.

PG. Abbreviation for polypropylene glycol.

PGA. Abbreviation for pteroylglutamic acid. See folic acid.

PGB. See podophyllotoxin 4-*o*-glucoside.

PGDN. See propylene glycol dinitrate.

pH. pH is a value taken to represent the acidity or alkalinity of an aqueous solution; it is defined as the logarithm of the reciprocal of the hydrogen-ion concentration of a solution:

$$\text{pH} = \log_{10} \frac{1}{[\text{H}^+]}$$

The pH scale is designed to conveniently characterize the acidity of aqueous acid-base systems. Pure water is the standard used for the pH scale. Under ordinary conditions water molecules dissociate into

the ions H^+ and OH^- , with recombination at such a rate that with very pure water at 22C there is a concentration of oppositely charged ions of 1/10,000,000, or 10^{-7} , mole per liter. This is commonly expressed by saying that pure water has a pH of 7, which means that its concentration of hydrogen ions is expressed by the exponent 7, without its minus sign.

When acids or hydroxyl-containing bases are in water solution they ionize more or less completely, furnishing varying concentrations of H^+ and OH^- ions, respectively, to the solution. Strong acids and bases ionize much more completely than weak acids and bases; thus strong acids give solutions of pH 1–3, while solutions of weak acids have a pH of 6. Strong bases give solutions of pH 12 or 13, while weak bases give solutions of pH 8. Because the pH scale is logarithmic, the intervals are exponential and thus represent far greater differences in concentration than the values themselves seem to indicate (see table).

	pH Value	Ratio of H^+ or OH^- Concentration to That of Pure Water at 22C
Acid side (excess of H^+ ions)	1	1,000,000
	2	100,000
	3	10,000
	4	1,000
	5	100
	6	10
Neutrality	7	1
Alkaline side (excess of OH^- ions)	8	10
	9	100
	10	1,000
	11	10,000
	12	100,000
	13	1,000,000
	Liquid	pH Value
	Pure water	7
	Seawater	7.8–8.2
	Electroplating bath	6.5–5
	0.01 N HCl	2
	0.1 N HCl	1.08
	0.1 N H_2SO_4	1.17
	0.01 N NaOH	12
	0.1 N acetic acid	3
	0.1 N NH_4OH	11
	Gastric juices	1.7
	Urine	5–7
	Blood	7.3–7.5
	Milk	6.5–7
	Soil (optimum for crops)	6–7

In acid-base titrations, changes in pH can be detected by indicators such as methyl orange, phenolphthalein, etc. Litmus paper can also be used as a

rough indication of acidity or alkalinity. In carrying out titrations, the end point signaled by an indicator does not always correspond to a neutral pH (7). pH control is of critical importance in a large number of industrial operations such as water purification, chrome tanning process for leather, in preservation of food products, in electroplating baths, dyeing, agriculture, and numerous other instances. See acid; base.

phage. A virus for which the natural host is a bacterial cell. See bacteriophage.

phagemid. A type of plasmid which carries within its sequence a bacteriophage replication origin. When the host bacterium is infected with "helper" phage, the phagemid is replicated along with the phage DNA and packaged into phage capsids.

phaltan. See folpet.

pharaoh's serpent eggs. (mercuric thiocyanate). $(\text{NCS})_2\text{Hg}$. Swells when heated.

pharmaceutical. A broad term that includes not only all types of drugs and medicinal and curative products but also ancillary products such as tonics, dietary supplements, vitamins, deodorants, and the like. See drug.

pharmacogenomics. The study of the interaction of an individual's genetic makeup and response to a drug.

"Pharmolin" [Engelhard]. (kaolin clay). TM for aluminum silicate.

Use: For various internal and external pharmaceutical compositions used in antidiarrheal medications.

phase. (1) One of the three states or conditions in which substances can exist, i.e., solid, liquid, or gas (vapor). The condition depends primarily on the concentration of atoms of molecules; solids are the most dense, gases the least, and liquids occupy the intermediate position. Solids are normally crystals, liquids are amorphous, and gases are without structure.

See matter. (2) A physically distinct and mechanically separable portion of a dispersion or solution. Phases may be solid, liquid, or gaseous (vapor). In any mixture or solution the major component is called the continuous or external phase and the minor component the dispersed or internal phase. The latter may or may not be uniformly dispersed in the continuous phase.

See colloid chemistry; solution.

phase rule. Propounded by J. Willard Gibbs in 1877, the phase rule is a general system of equations of the form $F = C - P + 2$ stating the boundaries of

thermodynamic equilibrium in a system of chemical reactants. The number of degrees of freedom (F) allowed in a given heterogeneous system may be examined by analysis or observation and plotted on a graph by proper choice of the components (C), the phases (P), and the independently variable factors of temperature and pressure. The principles of the phase rule apply to all multicomponent systems, including solvent blends, glass, alloys, and plastics.

phase transition. Abrupt change in physical properties as temperature is changed continuously. Water freezing at 0C for instance.

Phe. Abbreviation for phenylalanine.

α -phellandrene. (4-isopropyl-1-methyl-1,5-cyclohexadiene). CAS: 99-83-2.

$\text{CH}_2\text{C}:\text{CHCH}_2\text{CH}[\text{CH}(\text{CH}_3)_2]\text{CH}:\text{CH}$. A monocyclic terpene occurring as (1) *d*- and (2) *l*-optical isomers. **Properties:** Colorless oil. Insoluble in water; soluble in ether. (1) D 0.8463 (25C), bp 66–68C (16 mm Hg), refr index 1.4777; (2) d 0.8324 (20C), bp 58–59C (16 mm Hg), refr index 1.4724. Combustible.

Derivation: (1) Found in ginger oil, Ceylon, and Seychelles cinnamon oil. (2) Found in eucalyptus oil.

Hazard: Toxic by ingestion and skin absorption; strong irritant.

Use: Flavoring, perfumery.

β -phellandrene. (4-isopropyl-1-methylene-2-cyclohexene).

$\text{CH}_2\text{C}:\text{CH}:\text{CHCH}[\text{CH}(\text{CH}_3)_2]\text{CH}_2\text{CH}_2$. A monocyclic terpene occurring as (1) *d*- and (2) *l*-optical isomers. **Properties:** (1) Mobile oil; pleasant odor; burning taste. D 0.8520 (20C), bp 171–172C, refr index 1.4788; (2) mobile oil, d 0.8497 (15C), bp 178–179, flash p (TCC) 120F (48.9C), refr index 1.4800. Both are insoluble in water and alcohol; soluble in ether. Combustible.

phen-. A prefix indicating phenol and benzene derivatives.

phenacaine hydrochloride. (*N,N'*-bis(*p*-ethoxyphenyl)acetamide hydrochloride). $\text{C}_{18}\text{H}_{22}\text{O}_3\text{N}_2 \cdot \text{HCl} \cdot \text{H}_2\text{O}$.

Properties: Small, white crystals; odorless; faintly bitter taste. Incompatible with alkalis, mp 190C. Soluble in alcohol, boiling water, and chloroform; less so in cold water; insoluble in ether.

Grade: NF, technical.

Hazard: Toxic by ingestion.

Use: Medicine (topical anesthetic).

phenacetin. USP name for acetophenetidin.

phenacyl chloride. See chloroacetophenone.

phenacyl fluoride. See fluoroacetophenone.

phenanthraquinone. See phenanthrenequinone.

phenanthrene.

CAS: 85-01-8. $C_{14}H_{10}$.

Properties: Colorless, shining crystals. D 1.063, mp 100.35C, bp 340C. Soluble in alcohol, ether, benzene, carbon disulfide, and acetic acid; insoluble in water. Combustible.

Derivation: Fractional distillation of high-boiling coal tar oils with subsequent recrystallization from alcohol.

Hazard: A carcinogen.

Use: Dyestuffs, explosives, synthesis of drugs, biochemical research, manufacturing phenanthrenequinone.

phenanthrenequinone. (not phenanthraquinone).

CAS: 84-11-7. $C_{14}H_8O_2$.

Properties: Yellow-orange, needlelike crystals. D 1.4045, mp 206–207C, bp sublimes above 360C. Soluble in sulfuric acid, benzene, glacial acetic acid and hot alcohol; insoluble in water.

Derivation: By oxidation of a boiling solution of phenanthrene in glacial acetic acid with chromic acid, extraction in sodium disulfite, precipitation by means of hydrochloric acid, and recrystallization.

Use: Organic synthesis, dyes.

1,10-phenanthroline. (4,5-phenanthroline; *o*-phenanthroline).

CAS: 66-71-7. $C_{12}H_8N_2 \cdot H_2O$. A heterocyclic compound.

Properties: White, crystalline powder. Mp 93–94C, anhydrous 117C. Slightly soluble in water; soluble in alcohol, benzene, and acetone.

Derivation: Heating *o*-phenylenediamine with glycerol, nitrobenzene, and concentrated sulfuric acid; also from 8-aminquinoline.

Use: Forms a complex compound with ferrous ions used as an indicator; drier in coatings industry.

phenarsazine chloride. See diphenylamine-chloroarsine.

phenazine. (azophenylene).

CAS: 92-82-0. $C_6H_4N_2C_6H_4$. A tricyclic compound.

Properties: Yellow crystals. Mp 170–171C, bp above 360C. Very slightly soluble in water; partially soluble in alcohol and ether. Combustible.

Use: Organic synthesis, manufacturing of dyes, larvicide.

phenethicillin. See potassium- α -phenoxyethyl penicillin.

phenethyl acetate. See 2-phenylethyl acetate.

phenethyl alcohol. (phenylethyl alcohol; 2-phenylethanol; benzyl carbinol).

CAS: 60-12-8. $C_8H_9CH_2CH_2OH$.

Properties: Colorless liquid; floral odor; sharp burning taste. D 1.017–1.020 (25C), refr index 1.5310–1.5340 (20C), fp –27C, bp 219C, flash p 216F (102C). Soluble in 50% alcohol; soluble 1 part in 50 parts of water; soluble in fixed oils, alcohol, and glycerol; slightly soluble in mineral oil. Combustible.

Derivation: (1) By reduction of phenylacetic ethyl ester by sodium in absolute alcohol. (2) By the action of ethylene oxide on phenylmagnesium bromide and subsequent hydrolysis. (3) Component of many essential oils.

Grade: Technical, NF, FCC.

Use: Organic synthesis, synthetic rose oil, soaps, flavors, antibacterial, preservative.

sec-phenethyl alcohol. See α -methylbenzyl alcohol.

phenethylamine. See 2-phenylethylamine.

phenethyl anthranilate. See 2-phenylethyl anthranilate.

phenethyl isobutyrate. See 2-phenylethyl isobutyrate.

phenethyl phenylacetate. See 2-phenylethyl phenylacetate.

phenethyl propionate. See 2-phenylethyl propionate.

phenethyl salicylate. See 2-phenylethyl salicylate.

***o*-phenetidine.** (2-aminophenetole).

CAS: 94-70-2. $NH_2C_6H_4OC_2H_5$.

Properties: Oily liquid, rapidly becomes brown on exposure to light or air. Solidifies at about –20C, bp 228–230C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Reduction of *o*-nitrophenetole with iron filings and hydrochloric acid.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Manufacture of dyes, laboratory reagent.

***p*-phenetidine.** (4-aminophenetole).

CAS: 156-43-4. $NH_2C_6H_4OC_2H_5$.

Properties: Colorless, oily liquid; becomes red to brown on exposure to air and light. D 1.0613 (15C), mp 2–4C, bp 253–255C. Insoluble in water; soluble in alcohol. Combustible.

Derivation: Ethylating *p*-nitrophenol with ethyl sulfate or chloride in the presence of sodium hydroxide, followed by reduction with iron filings and hydrochloric acid.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Dyestuffs intermediate, pharmaceuticals, laboratory reagent.

phenetole. (phenyl ethyl ether).

CAS: 103-73-1. $C_8H_{10}O$.

Properties: Colorless, oily liquid. Bp 172C, fp –30C, d 0.967 (20/4C). Insoluble in water; soluble in alcohol and ether. Combustible.

phenetsal. See *p*-acetylaminophenyl salicylate.

“Phenex” [Hall]. TM for α -ethyl- β -propylacrylaniline.

Use: Accelerator for natural and synthetic rubber and latexes.

phenic acid See phenol.

“Phenidone B” [Charkit]. TM for 4-methyl-1-phenyl-3-pyrazolidone.

Use: Photographic developer.

phenindione. (2-phenyl-1,3-indanedione).

CAS: 83-12-5. $C_{15}H_{10}O_2$.

Properties: Pale-yellow crystals; practically odorless. Insoluble in water; soluble in methanol, alcohol, ether, acetone, benzene; solutions in alkalies are red; in concentrated sulfuric acid blue.

Use: Medicine (blood anticoagulant).

pheniramine maleate. (prophenpyridamine maleate; 1-phenyl-1-(2-pyridyl)-3-di-methylaminopropane maleate).

CAS: 132-20-7. $C_{16}H_{20}N_2 \cdot C_4H_4O_4$.

Properties: White, crystalline powder; faint amine-like odor. Mp 104–108C. Very soluble in alcohol and water; slightly soluble in benzene and ether, 1% solution has pH between 4.5 and 5.5.

Grade: NF.

Use: Medicine (antihistamine).

“Phenlam” [Huntsman]. TM for a line of phenolic resins.

Use: To provide high strength, fire and heat resistance at low weight plastics.

“Phenmad” [Mallinckrodt]. TM for a 10% phenylmercuric acetate aqueous solution.

Use: Turf fungicide.

Hazard: Highly toxic.

phenobarbital. (phenylbarbital; phenylethylmalonylurea; 5-ethyl-5-phenylbarbituric acid).

CAS: 50-06-6. $C_{12}H_{12}N_2O_3$.

Properties: White, shining, crystalline powder; odorless; stable. Mp 174–178C. Soluble in alcohol, ether, chloroform, alkali hydroxides, alkali carbonate solutions; sparingly soluble in water.

Derivation: Condensation of phenylethylmalonic acid derivatives and urea.

Grade: USP.

Hazard: May have damaging side effects.

See barbiturate.

Use: Medicine (sedative), laboratory reagent. Also available as the sodium salt, which has good water solubility.

pheno black ep. See apomine black gx.

phenocoll hydrochloride. (aminoacetophenetidide hydrochloride; glycocoll-*p*-phenetidine hydrochloride). $C_9H_9O_2N_2 \cdot HCl$.

Properties: Fine, white, crystalline powder. Mp 95C. Soluble in water and warm alcohol; slightly soluble in chloroform, ether, and benzene.

Derivation: By the action of aminoacetic acid upon phenetidine and acidifying.

Use: Medicine (analgesic).

phenocopy. A trait not caused by inheritance of a gene which appears to be identical to a genetic trait.

phenol. (1) A class of aromatic organic compounds in which one or more hydroxy groups are attached directly to the benzene ring. Examples are phenol itself (benzophenol), the cresols, xylenols, resorcinol, naphthols. Though technically alcohols, their properties are quite different.

(2) Phenol (carbolic acid; phenylic acid; benzophenol; hydroxybenzene).

CAS: 108-95-2. C_6H_5OH .

Properties: White, crystalline mass that turns pink or red if not perfectly pure or if under influence of light; absorbs water from the air and liquefies; distinctive odor; sharp burning taste. When in very weak solution it has a sweetish taste. D 1.07, mp 42.5–43C, bp 182C, flash p 172.4F (78C) (CC), autoign temp 1319F (715C). Soluble in alcohol, water, ether, chloroform, glycerol, carbon disulfide, petrolatum, fixed or volatile oils, and alkalies. Combustible.

Derivation: Most of the phenol in the U.S. is made by the oxidation of cumene, yielding acetone as a by-

product. The first step in the reaction yields cumene hydroperoxide, which decomposes with dilute sulfuric acid to the primary products, plus acetophenone and phenyl dimethyl carbinol. Several other benzene-based processes have been used in the past; derivation from benzoic acid is also possible.

Method of purification: Rectification.

Grade: Fused, crystals, or liquid, all as technical (82, 90, and 95%, other components mostly cresols), CP, and USP.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant to tissue. TLV: 5 ppm; not classifiable as a human carcinogen. Toxic by skin absorption.

Use: Phenolic resins, epoxy resins (bisphenol-A), nylon-6 (caprolactam), 2,4-D, selective solvent for refining lubricating oils, adipic acid, salicylic acid, phenolphthalein, pentachlorophenol, acetophenetidin, picric acid, germicidal paints, pharmaceuticals, laboratory reagent, dyes and indicators, slimicide, biocide, general disinfectant.

Note: High-boiling phenols are mixtures containing predominantly *m*-substituted alkyl phenols. Their boiling points range from 238 to 288°C; they set to a glass at -30°C.

phenolate process. A process for removing hydrogen sulfide from gas by the use of sodium phenolate, which reacts with the hydrogen sulfide to give sodium hydrosulfide and phenol. This can be reversed by steam heat to regenerate the sodium phenolate.

phenol, camphorated.

CAS: 8002-06-0. mf: $C_{10}H_{16}O \cdot C_6H_6O$.

Hazard: Moderately toxic by ingestion. Human systemic effects.

phenol coefficient. In determining the effectiveness of a disinfectant using phenol as a standard of comparison, the phenol coefficient is a value obtained by dividing the highest dilution of the test disinfectant by the highest dilution of phenol that sterilizes a given culture of bacteria under standard conditions of time and temperature.

See disinfectant.

phenoldisulfonic acid. $C_6H_4O_2S_2$.

Properties: Deliquescent crystals. Mp 90°C. Decomposes above 100°C; soluble in water and alcohol.

Use: Manufacture of dye intermediates.

phenol-formaldehyde resin. The first synthetic thermosetting polymer; the reaction product of phenol with aqueous 37–50% formaldehyde at 50–100°C, with basic catalyst, discovered by Baekeland in 1907 and trademarked "Bakelite" in 1911. Polymerization is of the condensation type, proceeding through three stages. With an acid catalyst novolak resins, which are thermoplastic, are produced.

Properties: Gray to black, hard, infusible solid when

cured, resistant to moisture, solvents, and heat up to 200°C, dimensionally stable, good electrical resistance, sound and noise absorbent, decomposed by oxidizing acids, fair resistance to alkalis. Cannot be successfully colored. Noncombustible.

Use: Molded and cast articles, bonding powders, ion exchange, laminating and impregnating, plywood and glass-fiber composites, ablative coatings for aerospace use, binder for oil-well sands, paint and baked enamel coatings, thermal and acoustic insulation, brake linings, clutch facings, shell molds, chemical equipment, machine and instrument housings, chemical-resistant mortars, machine parts, electrical devices.

See A-stage resin; B-stage resin; C-stage resin; novolak; Baekeland, L. H.; phenolic resin.

phenol-furfural resin. A phenolic resin that has a somewhat sharper transition than phenol-formaldehyde from the soft, thermoplastic stage to the cured, infusible state and can be fabricated by injection molding since it has little tendency to harden before curing conditions are reached.

phenolic. See phenolic molding compound.

phenolic acids. Aromatic acids having one or more hydroxyl groups on the benzene ring.

phenolic molding compound. (phenolic).

Thermosetting compound composed essentially of phenol-formaldehyde resin alone or intimately mixed with fillers, pigments, or dyes.

phenolic resin. Any of several types of synthetic thermosetting resin obtained by the condensation of phenol or substituted phenols with aldehydes such as formaldehyde, acetaldehyde, and furfural. Phenol-formaldehyde resins are typical and constitute the chief class of phenolics.

phenolics. Designation for phenol-formaldehyde resins and plastics.

phenolphthalein. (3,3-bis(*p*-hydroxyphenyl)phthalide).

CAS: 77-09-8. $(C_6H_4OH)_2C_2O_2C_6H_4$ (an approximation).

Properties: Pale-yellow powder; forms an almost colorless solution in neutral or acid solution, pink to deep red in presence of alkali, but colorless in the presence of large amounts of alkali. D 1.2765, mp 261°C. Soluble in alcohol, ether, and alkalis; insoluble in water.

Derivation: Interaction of phenol and phthalic anhydride in sulfuric acid.

Grade: Technical, pure reagent, NF.

Use: Acid-base indicator, laboratory reagent, medicine (laxative).

phenol red. See phenolsulfonephthalein.

phenolsulfonephthalein. (phenol red).

CAS: 143-74-8. $(C_6H_4OH)_2COSO_2C_6H_4$ (an approximation).

Properties: Bright- to dark-red, crystalline powder; stable in air. Slightly soluble in water, alcohol, and acetone; almost insoluble in chloroform and ether; soluble in alkali hydroxides and carbonates.

Derivation: Reaction of phenol with *o*-sulfobenzoic acid anhydride. Differs from phenolphthalein in containing an SO_2 group in place of a CO group.

Grade: Technical, reagent, USP. The USP spelling is *phenolsulfonphthalein*.

Use: Acid-base indicator, diagnostic reagent in medicine, laboratory reagent.

phenolsulfonic acid. (sulfocarboic acid).

$HOC_6H_4SO_3H$.

Properties: Yellowish liquid, becoming brown on exposure to air. A mixture of *o*- and *p*-phenolsulfonic acids; soluble in water and alcohol.

Derivation: Action of sulfuric acid on phenol.

Grade: Technical, reagent.

Hazard: Irritant to skin and tissue.

Use: Water analysis, laboratory reagent, electroplated tin coating baths, manufacture of intermediates and dyes, pharmaceuticals.

phenol trinitrate. See picric acid.**phenosafranin.** (3,7-diamino-5-phenylphenazinium chloride; CI 50200). $C_{18}H_{15}ClN_4$.

Properties: Green, acicular crystals. Soluble in water and alcohol; solutions have purple to red color.

Use: Staining tissues for microscopy.

phenothiazine. (thiodiphenylamine).

CAS: 92-84-2. $C_{12}H_9NS$.

Properties: Grayish-green to greenish-yellow powder, granules, or flakes; tasteless; slight odor. Mp 175–185C, bp 371C, sublimes 130C (1 mm Hg). Insoluble in water; soluble in benzene, ether, hot acetic acid.

Derivation: By reaction of diphenylamine and sulfur in the presence of an oxidizing catalyst.

Grade: Technical, NF.

Hazard: Toxic by ingestion and inhalation, absorbed by skin. TLV: 5 mg/m³. Toxic by skin absorption.

Use: Insecticide, manufacture of dyes, parent compound for chlorpromazine and related antipsychotic drugs, polymerization inhibitor, antioxidant.

phenothrin. [(3-phenoxyphenyl)methyl-2,2-dimethyl-3-(2-methyl-1-propenyl)-cyclopropane carboxylate].

Use: Insecticide.

phenotype. The physical characteristics of an organism or the presence of a disease that may or may not be genetic.

See genotype.

phenoxyacetic acid.

CAS: 122-59-8. $C_6H_5OCH_2COOH$.

Properties: Light-tan powder. Bp 285C, mp 98C. Soluble in ether, water, alcohol, carbon disulfide, glacial acetic acid. Combustible.

Use: Intermediate for dyes, pharmaceuticals, pesticides, other organics, fungicides, flavoring, laboratory reagent, precursor in antibiotic fermentations, (especially penicillin V).

***o*-phenoxybenzoic acid.**

CAS: 2243-42-7. mf: $C_{13}H_{10}O_3$.

Hazard: A poison.

***p*-phenoxybenzoic acid.**

CAS: 2215-77-2. mf: $C_{13}H_{10}O_3$.

Hazard: A poison.

2-phenoxy-4h-1,3,2-benzodioxaphosphorin 2-oxide. See saligenin cyclic phenyl phosphate.**3'-phenoxybenzyl α -ethyl-4-methoxyphenylacetate.**

CAS: 51629-13-1. mf: $C_{24}H_{24}O_4$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -ethylphenylacetate.

CAS: 51628-37-6. mf: $C_{25}H_{22}O_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -isopropenyl-4-methoxyphenylacetate.

CAS: 51629-15-3. mf: $C_{25}H_{24}O_4$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -isopropenyl-4-methylphenylacetate.

CAS: 51629-54-0. mf: $C_{25}H_{24}O_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -isopropyl-4-chlorophenylacetate.

CAS: 51629-48-2. mf: $C_{24}H_{21}ClO_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -isopropyl-4-methoxyphenylacetate.

CAS: 51628-95-6. mf: $C_{25}H_{26}O_4$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-phenoxybenzyl α -isopropyl-4-methylphenylacetate.

CAS: 51629-37-9. mf: $C_{25}H_{26}O_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

phenoxydihydroxypropane. See phenoxypropanediol.

2-phenoxyethanol. See ethylene glycol monophenyl ether.

α -phenoxyethylpenicillin. See penicillin.

5'-phenoxyfurfuryl α -isopropyl-4-methoxyphenylacetate.

CAS: 51628-96-7. mf: $C_{23}H_{24}O_5$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

phenoxymethylpenicillin. (penicillin V).

$C_{16}H_{18}N_2O_5$.

Properties: White, odorless, crystalline powder.

Very slightly soluble in water; soluble in alcohol and acetone; insoluble in fixed oils, pH of saturated solution is 2.5–4.0, decomposes at 120C.

Grade: NF.

Use: Medicine (antibiotic for oral use). Available also as potassium salt.

(3-phenoxyphenyl)methyl 4-chloro- α -(1-methylethyl)benzeneacetate.

CAS: 51630-33-2. mf: $C_{24}H_{25}ClO_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(3-phenoxyphenyl)methyl α -ethyl-4-methylbenzeneacetate.

CAS: 51630-04-7. mf: $C_{24}H_{24}O_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

phenoxypropanediol. (1-phenoxypropanediol-2,3). $C_6H_5OCH_2CHOHCH_2OH$.

Properties: White, crystalline solid. Mp 53C, bp 150–155C (4 mm Hg). Soluble in water, alcohol, glycerol, carbon tetrachloride, warm benzene; insoluble in gasoline. Combustible.

Derivation: Phenol and glycerol.

Use: Plasticizer, resins, lacquers.

1-phenoxy-2-propanol.

CAS: 770-35-4. mf: $C_9H_{12}O_2$.

Hazard: Moderately toxic by ingestion and skin contact.

phenoxypropylene oxide.

CAS: 122-60-1.

$C_6H_5OCH_2CHCH_2O$.

Properties: Practically colorless liquid; characteristic odor. D 1.1110 (20/20C), bp 244.2C, vap press less than 0.1 mm Hg (20C), fp 2.8C, viscosity 6.93 cP (20C). Very slightly soluble in water.

phenoxy resin. A high molecular weight thermoplastic copolymer of bisphenol A and epichloro-

hydrin having the basic molecular structure $-[OC_6H_4C(CH_3)_2C_6H_4OCH_2CH(OH)CH_2]_n-$ (n is about 100). It uses the same raw materials as epoxy resins but contains no epoxy groups. It may be cured by reacting with polyisocyanates, anhydrides, or other cross-linking agent capable of reacting with hydroxyl groups.

The ductility of phenoxy resins resembles that of metals. They are transparent and also characterized by low mold shrinkage, good dimensional stability, and moderately good resistance to temperature and corrosion. Phenoxy resins are soluble in methyl ethyl ketone and have been used for coatings and adhesives. A typical injection-molded specimen has a tensile strength of 9000 psi, heat distortion point 86.6C at 264 psi load, and d 1.18.

They may be extruded or blow molded. Parts may be thermally formed and heat or solvent welded. Some applications are blow-molded containers, pipe, ventilating ducts, and molded parts.

phenoxytriethylstannane. See triethyltin phenoxide.

phenyl. The univalent C_6H_5 group derived from benzene and characteristic of phenol and other derivatives.

phenylacetaldehyde. (α -toluic aldehyde).

CAS: 122-78-1. $C_6H_5CH_2CHO$.

Properties: Colorless liquid; strong hyacinth-like odor. D 1.023–1.030 (25C), fp $-10C$, bp 193–194C, refr index 1.520–1.530, becomes more viscous on aging. Soluble in 2 parts of 80% alcohol; soluble in ether and most fixed oils; slightly soluble in water. Combustible.

Derivation: From phenyl- α -chloroacetic acid, by action of alkalis, oxidation of phenylethyl alcohol.

Grade: Technical, 50% soluble in benzyl alcohol, FCC.

Use: Perfumes, flavoring, laboratory reagent.

phenylacetaldehyde dimethylacetal. (α -tolyl aldehyde dimethyl acetal).

CAS: 101-48-4. $C_6H_5CH_2CH(OCH_3)_2$.

Properties: Colorless liquid; strong odor. More stable than phenylacetaldehyde; not known to cause discoloration. D 1.000–1.004 (25/25C), refr index 1.493–1.496 (20C), flash p 191F (88.3C) (TCC). Soluble in 2 parts of 70% alcohol. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavoring, laboratory reagent.

phenylacetamide. (α -toluamide).

CAS: 103-81-1. $C_6H_5CH_2CONH_2$.

Properties: White crystals. Bp 280–290C (decomposes), mp 156–160C. Soluble in hot water and alcohol; slightly soluble in cold water and ether. Combustible.

Derivation: From acetophenone or styrene by Willgerodt reaction, dehydration of ammonium phenyl acetate.

Use: Organic synthesis, pharmaceuticals, penicillin G precursor, laboratory reagent.

N-phenylacetamide. See acetanilide.

phenyl acetate. (acetylphenol).
CAS: 122-79-2. $C_6H_5OOCCH_3$.

Properties: Water-white liquid. D 1.073 (25/25C), bp 195–196C, flash p 176F (80C). Soluble in alcohol and ether; almost insoluble in water. Combustible.

Derivation: (1) From phenol and acetyl chloride. (2) By heating triphenyl phosphate with potassium acetate and alcohol.

Use: Solvent, organic synthesis, laboratory reagent.

phenylacetic acid. (α -toluic acid).
CAS: 103-82-2. $C_6H_5CH_2COOH$.

Properties: Shiny, white plate crystals; floral odor. D 1.0809, fp 76–78C, bp 262C. Soluble in alcohol, ether and hot water. Combustible.

Derivation: From benzyl cyanide refluxed with dilute hydrochloric acid.

Grade: Technical, FCC.

Use: Perfume, precursor in manufacture of penicillin G, fungicide, flavoring, laboratory reagent.

phenylacetonitrile. See benzyl cyanide.

α -phenylacetophenone. See deoxybenzoin.

phenylacetyl chloride. $C_6H_5CH_2COCl$.

Properties: Colorless liquid. Refr index 1.5320 (20C).

Hazard: Strong irritant.

Use: Acylating agent, including manufacture of esters for flavors; laboratory reagent.

phenyl α -acid. (phenyl-2-amino-8-naphthol-6-sulfonic acid). $HOC_{10}H_5(NHC_6H_5)(SO_3H)$.

Properties: Gray crystals. Soluble in alkali. Combustible.

Derivation: From α -acid and aniline (condensation with heat).

Use: Azo dye manufacture.

β -phenylacrylic acid. See cinnamic acid.

phenylacrylyl chloride. See cinnamoyl chloride.

phenylalanine. (α -amino- β -phenylpropionic acid).

CAS: 63-91-2. $C_6H_5CH_2CH(NH_2)COOH$. An essential amino acid.

Properties: (L(-)-phenylalanine) Plates and leaflets from concentrated aqueous solutions, hydrated needles from dilute aqueous solutions, decomposes at 283C. Soluble in water; slightly soluble in methanol and ethanol. (D(+)-phenylalanine) Leaflets from water, decomposes 285C. Soluble in water; slightly soluble in methanol. (DL-phenylalanine) Leaflets or prisms from water or alcohol; sweet tasting. Decomposes 318–320C. Soluble in water.

Source: (L(-))-Phenylalanine is isolated commercially from proteins (ovalbumin, lactalbumin, zein, and fibrin). DL-Phenylalanine is synthesized from α -acetaminocinnamic acid.

Grade: Technical, FCC.

Use: (L isomer) Medicine and nutrition, essential ingredients of Aspartame. Available commercially as DL-dihydroxyphenylalanine and as DL-phenylalanine.

phenylallylic alcohol. See cinnamic alcohol.

d-phenylalanyl-l-phenylalanyl-l-phenylalanyl-l-tryptophyl-l-lysyl-l-threonyl-l-phenylalanyl-l-threoninamide

CAS: 133073-82-2. mf: $C_{61}H_{75}N_{11}O_{10}$.

Hazard: A poison.

d-phenylalanyl-l-phenylalanyl-l-tyrosyl-d-tryptophyl-l-lysyl-l-valyl-l-phenylalanyl-3-(2-naphthalenyl)-d-alaninamide.

CAS: 150155-61-6. mf: $C_{71}H_{81}N_{11}O_9$.

Hazard: A poison.

phenylamine. See aniline.

1-phenyl-3-aminobutane.

CAS: 22374-89-6. mf: $C_{10}H_{15}N$.

Hazard: Moderately toxic by ingestion.

1-phenyl-2-aminopropane. See amphetamine.

N-phenylaniline. See diphenylamine.

o-phenylaniline. See o-aminobiphenyl.

phenylarsonic acid.

CAS: 98-05-5. $C_6H_5AsO(OH)_2$.

Properties: Crystalline powder. Mp 160C with decomposition. Soluble in water and alcohol; insoluble in chloroform.

Method of purification: Reaction of the diazonium salt and sodium arsenite.

Hazard: Toxic by ingestion.

Use: Analytical reagent for tin.

phenylazoaniline. See aminoazobenzene.

1-(phenylazo)-2-naphthylamine. See yellow AB.

***p*-(phenylazo)phenyl isocyanide.**CAS: 22287-69-0. mf: C₁₃H₉N₃.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**phenylbarbital.** See phenobarbital.**phenylbenzamide.** See benzanilide.**phenylbenzamide.** See (3ar,9bs)-*n*-(4-(8-cyano-1,3a,4,9b-tetrahydro-3h.**1,3,4-phenylbiphenyloxadiazole.** (PBD; phenylbiphenyloxadiazole). Properties: Yellow, oily liquid; slight odor. Mp 6C, bp 318C (decomposes), d 1.24. Insoluble in water; soluble in organic solvents.

Use: Fungicide, disinfectant.

1-phenyl-3-chloropropane. See phenylpropyl chloride.

phenyl cyanide. See benzonitrile.

phenylcyclidene hydrochloride. (PCP).
C₁₇H₂₅N•HCl.

Properties: White crystals. Mp 243C.

Hazard: Toxic by ingestion and inhalation. A psychotropic drug that may cause serious mental disorders.

Use: Veterinary anesthetic (manufacture legally restricted to 5 kg annually).

phenylcyclohexane. (cyclohexylbenzene).
CAS: 827-52-1. C₆H₅C₆H₁₁.

Properties: Colorless, oily liquid; pleasant odor. D 0.938 (25/25C), mp 5C, bp 237.5C, refr index 1.523 (25C), flash p 210F (98C). Insoluble in water, glycerol; very soluble in alcohol, acetone, benzene, carbon tetrachloride, castor oil, hexane, xylene. Combustible.

Use: High-boiling solvent, penetrating agent, intermediate, laboratory reagent.

2-phenylcyclohexanol.

HOCH(CH₂)₄CH(C₆H₅).

Properties: Colorless to pale-straw-colored liquid. Pour p -18C, bp 276-281C, d 1.033 (25/25C), refr index 1.536 (25C), flash p 280F (137C). Very slightly soluble in water; soluble in methanol, ether. Combustible.

Use: Solvent, intermediate.

N-phenyl-N'-cyclohexyl-p-phenylenediamine.
C₆H₅HNC₆H₄NHC₆H₁₁.

Properties: Gray-violet powder. D 1.16, mp 103-107C. Soluble in acetone, benzene, MEK, ethyl acetate, ethylene dichloride; insoluble in water.

Use: Antioxidant-antiozonant for elastomers.

phenyldichloroarsine.

CAS: 696-28-6. C₆H₅AsCl₂.

Properties: Liquid, microcrystalline mass at the fp, decomposed by water. D 1.654 (20C), bp 255-257C, fp -20C, vap tension 0.014 mm Hg (15C), volatility 404 mg/m³ (20C), coefficient of thermal expansion 0.00073. Soluble in alcohol, benzene, and ether; insoluble in water.

Derivation: Arsenic trichloride and phenylmercuric chloride are heated together at 100C.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes, skin, and tissue.

Use: Lachrymator poison gas, solvent for diphenylcyanoarsine.

phenyldidecyl phosphite. C₆H₅OP(OC₁₀H₂₁)₂.

Properties: Nearly water-white liquid; odor of alcohol. D 0.940 (25/15.5C), mp 0C, refr index 1.4785 (25C), flash p 425F (218C) (COC). Combustible.

Use: Chemical intermediate, antioxidant, ingredient in stabilizer systems for resins.

phenyl diethanolamine.

CAS: 120-07-0. C₆H₅N(C₂H₄OH)₂.

Properties: Colorless liquid. Mp 58C, bp 190C (1 mm Hg), vap press <0.01 mm Hg (20C), bulk d 10.0 lb/gal (20C), d 1.1203 at 60/20C, viscosity 1.19 cP (20C), flash p 375F (190C) (OC). Slightly soluble in water; soluble in ethanol and acetone. Combustible.

Grade: Technical.

Use: Organic synthesis, dyestuff, laboratory reagent.

phenyl diglycol carbonate. [diethyl glycol bis(phenyl carbonate)]. (C₆H₅OOCOC(CH₂)₂O).

Properties: Colorless solid. D 1.23 (20/4C), mp 40C, bp 225-229C, refr index 1.525 (20C), evaporation rate 0.026 mg/sq cm/hr at 100C. Insoluble in water (very stable to hydrolysis); widely soluble in organic solvents; compatible with many resins and plastics. Combustible.

Use: Plasticizer.

N-phenyl-N'-(1,3-dimethyl butyl)-p-phenylenediamine. C₆H₅HNC₆H₄NHC₆H₁₃.

Properties: Dark-violet, staining, low-melting solid. Mp 50C, d 1.07.

Use: Antiozonant, antioxidant, and polymer stabilizer.

3-phenyl-1,1-dimethylurea. See fenuron.

1,1'-(p-phenylenebis(carbonylmethyl))di-3-picolinium dibromide.

CAS: 63868-81-5. mf: C₂₂H₂₂N₂O₂•2Br.

Hazard: A poison.

m-phenylenebis(methylamine). See *m*-xylylene- α,α' -diamine.

4,4'-(1,4-phenylene-bis(1-methyl ethylidene))bis(aniline). See bisaniline-*p*.

m-phenylenediamine. (*m*-diaminobenzene).

CAS: 108-45-2. C₆H₄(NH₂)₂.

Properties: Colorless needles becoming red in air, usually in the form of the stable hydrochloride. D 1.1389, mp 63C, bp 282-287C. Soluble in alcohol, ether, and water.

Derivation: Reduction of *m*-dinitrobenzene or nitroaniline with iron and hydrochloric acid; purified by crystallization.

Grade: Technical, 99% min purity.

Hazard: Toxic by ingestion and inhalation, strong

irritant to skin. TLV: TWA 0.1 mg/m³; Not Classifiable as a Human Carcinogen.

Use: Dyestuff manufacture, detection of nitrite, textile developing agent, laboratory reagent, vulcanizing agent, ion-exchange resins, block polymers, corrosion inhibitors, photography.

***o*-phenylenediamine.** (orthamine; *o*-diaminobenzene).

CAS: 95-54-5. C₆H₄(NH₂)₂.

Properties: Colorless, monoclinic crystals; darkens in air. Mp range 102–104C, bp 252–258C. Soluble in alcohol, ether, and chloroform.

Derivation: Reduction of *o*-dinitrobenzene or nitroaniline with iron and hydrochloric acid.

Method of purification: Crystallization.

Grade: Technical, 99.0% min purity.

Hazard: TLV: TWA 0.1 mg/m³; Animal Carcinogen.

Use: Manufacture of dyes, photographic developing agent, organic synthesis, laboratory reagent.

***p*-phenylenediamine.** (*p*-diaminobenzene).

CAS: 106-50-3. C₆H₄(NH₂)₂.

Properties: White to light-purple crystals (oxidizes on standing in air to purple and black). Mp 147C, bp 267C; flash p 312F (155C). Soluble in alcohol, ether and 100 parts water; affected by light. Combustible.

Derivation: Reduction of *p*-dinitrobenzene or nitroaniline with iron and hydrochloric acid.

Method of purification: Crystallization.

Grade: Technical, 99% min purity.

Hazard: Toxic by ingestion and inhalation, strong irritant to skin. TLV: (vapor) 0.1 mg/m³; not classifiable as a human carcinogen. Toxic by skin absorption.

Use: Azo dye intermediate, photographic developing agent, photochemical measurements, intermediate in manufacture of antioxidants and accelerators for rubber, synthetic fibers, laboratory reagent, dyeing hair and fur.

2,3-phenylenepyrene. See indeno(1,2,3-cd)pyrene.

phenylethane. See ethylbenzene.

2-phenylethanol. See phenethyl alcohol.

phenylethanolamine.

CAS: 7568-93-6. C₆H₅NHCH₂CH₂OH.

Properties: Yellow crystals. Mp 56C, bp 157C (17 mm Hg). Soluble in water.

Use: Short-stopping agent for SBR, intermediate, wax hardener.

phenyl ether. See diphenyl oxide.

2-phenylethyl acetate. (phenethyl acetate).

CAS: 103-45-7. C₆H₅CH₂CH₂OOCCH₃. (Not the same as *sec*-phenylethyl acetate.)

Properties: Colorless liquid; peachlike odor. D

1.030–1.034, refr index 1.497–1.501 (20C), bp 226C, flash p 230F (110C). Soluble in alcohol, ether, and most fixed oils. Combustible.

Derivation: (1) Interaction of ethyl acetate and aluminumphenyl ethylate. (2) Interaction of acetic anhydride and phenylethyl alcohol in the presence of sodium acetate.

Grade: Technical, FCC.

Use: Perfumery, laboratory reagent.

***sec*-phenylethyl acetate.** See α -methylbenzyl acetate.

phenylethylacetic acid. (2-phenylbutyric acid). C₂H₅CHC₆H₅COOH.

Properties: White crystals; aromatic odor. Mp 41.0C (min). Insoluble in water; soluble in alcohol, ketones, and esters. Combustible.

Use: Organic synthesis, lab reagent.

2-phenylethyl alcohol. See phenethyl alcohol.

2-phenylethylamine. (phenethylamine; 1-amino-2-phenylethane).

CAS: 64-04-0. C₆H₅C₂NH₂.

Properties: Liquid; fishy odor. Absorbs carbon dioxide from the air, strong base. D 0.9640, bp 194.5C. Soluble in water, alcohol, and ether. Combustible.

Derivation: From phenylethyl alcohol and ammonia under pressure.

Grade: Technical, scintillation.

Hazard: Toxic by ingestion, skin irritant.

Use: Organic synthesis, lab reagent, scintillation counter (CO₂ absorber).

2-phenylethyl anthranilate. (phenethyl anthranilate).

CAS: 133-18-6. H₂NC₆H₄COOC₂H₄C₆H₅.

Properties: Colorless liquid that yellows with age; odor of grape and orange. D 1.14 (25/25C). Combustible.

Use: Perfumes, flavoring.

phenylethyl carbinol. See phenylpropyl alcohol.

phenylethylene. See styrene.

phenylethylene glycol. See styrene glycol.

***N*-phenylethylethanolamine.**

C₆H₅N(C₂H₅)C₂H₄OH.

Properties: Solid. Mp 37.2C, bp 268C (740 mm Hg), d 1.04 (20/20C), flash p 270F (132C) (COC). Very slightly soluble in water; soluble in alcohol, acetone, benzene. Combustible.

Use: Solvents, chemical intermediates, preparation of dyes for acetate rayons, laboratory reagent.

phenyl ethyl ether. See phenetole.

2-phenylethyl isobutyrate. (phenethyl isobutyrate).

CAS: 103-48-0. $(\text{CH}_3)_2\text{CHCOOC}_2\text{H}_4\text{C}_6\text{H}_5$.

Properties: Colorless liquid; pleasant odor. D 0.988 (25/25C), refr index 1.488 (20C). Soluble in alcohol and ether. Combustible.

Use: Perfumes, flavoring.

phenylethylmalonylurea. See phenobarbital.

2-phenylethyl mercaptan. $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{SH}$.

Properties: Liquid. Boiling range 193–225C, unpleasant odor, d 1.0264 (15.5C), refr index 1.5582 (20C), flash p 160F (71.1C). Combustible.

Use: Organic synthesis, laboratory reagent.

2-phenylethyl phenylacetate. (phenethyl phenylacetate).

CAS: 102-20-5. $\text{C}_6\text{H}_5(\text{CH}_2)_2\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: White crystals; hyacinth odor. D 1.080–1.082, congealing p 27C. Combustible.

Use: Perfumery, flavors.

2-phenylethyl propionate. (phenethyl propionate).

CAS: 120-45-6. $\text{C}_6\text{H}_5\text{COOC}_2\text{H}_4\text{C}_6\text{H}_5$.

Properties: Synthetic, colorless liquid; flower-fruit odor. D 1.012 (25/25C). Miscible with alcohols and ether. Combustible.

Use: Perfumes, flavors.

2-phenylethyl salicylate. (phenethyl salicylate). $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{OOC}_2\text{H}_4\text{OH}$.

Properties: White crystals; faint aromatic odor. Congealing point 41.5C. Soluble in 14 parts of 95% alcohol. Combustible.

Use: Flavors.

phenyl ferrocenyl ketone. See benzoylferrocene.

phenyl fluoride. See fluorobenzene.

phenyl fluoromethyl ketone. See fluoracetophenone.

phenylformamide. See formanilide.

phenylformic acid. See benzoic acid.

phenyl glycidyl ether. (1,2-epoxy-3-phenoxypropane; PGE).

CAS: 122-60-1. $\text{H}_2\text{COCHCH}_2\text{OC}_6\text{H}_5$.

Properties: Colorless liquid. D 1.11, bp 245C, mp 3.5C.

Hazard: Toxic by skin absorption, moderate irritant to eyes and skin. TLV: 1 ppm; animal carcinogen. Toxic by skin absorption.

phenylglycol. See styrene glycol.

phenylglycolic acid. See mandelic acid.

phenylhydrazine.

CAS: 100-63-0. $\text{C}_6\text{H}_5\text{NHNH}_2$.

Properties: Colorless liquid, becomes red-brown on exposure to air. D 1.0978, mp 19.35C, bp 243.5C with decomposition, flash p 192F (88.9C) (CC), autoign temp 345F (173C). Soluble in alcohol, ether, chloroform, benzene, and dilute acids; slightly soluble in water. Also available as the hydrochloride. Combustible.

Derivation: Reduction of diazotized aniline, followed by reaction with sodium hydroxide.

Grade: Commercial, CP, reagent.

Hazard: Toxic by inhalation, ingestion, and skin absorption; attacks red blood cells. A carcinogen. TLV: 0.1 ppm; animal carcinogen. Toxic by skin absorption.

Use: Analytical chemistry (reagent for detecting aldehydes, sugars, etc.), organic synthesis (intermediates, dyestuffs, pharmaceuticals). The hydrochloride is a strong reducing agent.

α -phenylhydroxyacetic acid. See mandelic acid.

phenylic acid. See phenol.

***n*-(3-phenylimino-1-propenyl)aniline hydrochloride.**

CAS: 28140-60-5. mf: $\text{C}_{15}\text{H}_{14}\text{N}_2 \cdot \text{ClH}$.

Hazard: Moderately toxic by ingestion and skin contact.

phenylindan dicarboxylic acid. See 1,1,3-trimethyl-5-carboxy-3-(*p*-carboxyphenyl)indan.

phenyl isocyanate. (phenyl carbimide; carbamil).

CAS: 103-71-9. $\text{C}_6\text{H}_5\text{N:C:O}$.

Properties: Liquid. Bp 165C, fp –30C, d 1.095 (20/4C), refr index 1.53684 (19.6C), flash p 132F (55.5C) (TOC). Decomposes in water and alcohol; very soluble in ether. Combustible.

Hazard: Moderate fire risk. Strong irritant, a lachrymator.

Use: Reagent for identifying alcohols and amines, intermediate.

phenyl isothiocyanate. See phenyl mustard oil.

phenyl J acid. (phenyl-2-amino-5-naphthol-7-sulfonic acid). $\text{HOC}_{10}\text{H}_7(\text{NHC}_6\text{H}_5)(\text{SO}_3\text{H})$.

Properties: Slate-colored crystals. Soluble in alkali. Combustible.

Derivation: From hydrogen acid and aniline (condensation with heat).

Hazard: Toxic by ingestion.

Use: Azo dye manufacturing.

phenyllead trilaureate.

CAS: 3268-27-7. mf: $\text{C}_{42}\text{H}_{74}\text{O}_6\text{Pb}$.

Hazard: A poison.

phenyllithium. C_6H_5Li . Available in a 20% by weight solution of a 70:30 volume percentage benzene-ether mixture.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

phenylmagnesium bromide. C_6H_5MgBr . A Grignard reagent available as a solution in ether, d 1.14.

Derivation: From magnesium and bromobenzene.

Hazard: Dangerous fire risk, solution highly flammable.

Use: Arylating agent in organic synthesis.

phenylmagnesium chloride. C_6H_5MgCl . Available dissolved in tetrahydrofuran.

Hazard: Dangerous fire risk, solution highly flammable.

Use: Grignard reagent, organic synthesis.

phenyl mercaptan.

CAS: 108-98-5. C_6H_5SH .

Properties: Water-white liquid; offensive odor. Oxidizes on exposure to air; supplied under nitrogen atmosphere. D 1.080 (15.5/15.5C), refr index 1.5815 (25C), fp $-15C$, bp 169C. Insoluble in water; very soluble in aromatic and aliphatic hydrocarbons.

Hazard: Store out of contact with air and acids. Toxic by inhalation. TLV: 0.5 ppm.

Use: Chemical intermediate, mosquito larvicide.

phenylmercuric acetate.

CAS: 62-38-4. $C_6H_5HgOCOCH_3$.

Properties: White to cream prisms. Mp 148–150C. Slightly soluble in water; soluble in alcohol, benzene, and glacial acetic acid; slightly volatile at ordinary temperatures.

Derivation: Action of heat on benzene and mercuric acetate.

Grade: CP, technical, commercial.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant.

Use: Fungicide; herbicide; "mildewcide" for paints; "slimicide" in paper mills.

phenylmercuric benzoate.

$C_6H_5HgOOC C_6H_5$.

Properties: Crystals. Mp 94C (min).

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Bactericide, fungicide, alcohol denaturant.

phenylmercuric borate.

CAS: 102-98-7. $(C_6H_5Hg)_2HBO_3$.

Properties: White, crystalline powder. Mp 120–130C. Slightly soluble in water; soluble in alcohol.

Derivation: Reaction of phenylmercuric acetate with boric acid.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Fungicide, bactericide.

phenylmercuric chloride.

CAS: 100-56-1. C_6H_5HgCl .

Properties: White, satiny crystals. Mp 251C. Insoluble in water; slightly soluble in hot alcohol; soluble in benzene, ether, pyridine.

Derivation: Reaction of phenylmercuric acetate and sodium chloride.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Antiseptic, fungicide, germicide.

phenylmercuric hydroxide.

CAS: 100-57-2. C_6H_5HgOH .

Properties: Fine white to cream crystals. Mp 197–205C. Slightly soluble in water; soluble in acetic acid and alcohol.

Grade: Technical, pure.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Manufacture of phenylmercuric salts, fungicide, and germicide. Principal compound in manufacturing organic mercury derivatives, denaturant for alcohol.

phenylmercuric lactate.

CAS: 122-64-5. $C_6H_5HgOOCCHOHCH_3$.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Bactericide, fungicide.

phenylmercuric naphthenate. Prepared by interaction of phenylmercuric acetate and naphthenic acid, producing a colored solution.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Wood preservative, mildew-proofing agent.

phenylmercuric nitrate (basic).

CAS: 8003-05-2. $C_6H_5HgNO_3 \cdot C_6H_5HgOH$.

Properties: Fine white crystals or grayish powder. Mercury content 63–65% (theoretical 63.2%), melting range 175–185C with decomposition, ash 0.1% max. Very slightly soluble in water and alcohol; insoluble in ether, moderately soluble in glycerol.

Grade: NF.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Germicide, fungicide.

phenylmercuric oleate.

$C_6H_5HgOOC(CH_2)_7CH:CHC_8H_{17}$.

Properties: White, crystalline powder. Mp 45C. Insoluble in water; soluble in organic solvents and some oils.

Derivation: Reaction of phenylmercuric acetate with oleic acid.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Mildew-proofing agent for paints, fungicide, and germicide.

phenylmercuric propionate.CAS: 103-27-5. $C_6H_5HgOCOCH_2CH_3$.**Properties:** Technical grade, white to off-white wax-like free-flowing powder. Mp 65–70C, stable to 200C for short periods, 57% min mercury content.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Fungicide and bactericide for paints and industrial finishes.**phenylmercuric salicylate.** $C_6H_4(OH)(COOHgC_6H_5)$.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Seed disinfectant.**phenylmercuriethanolammonium acetate.** $[(HOCH_2CH_2)NH_2(C_6H_5Hg)]OOCCH_3$.**Properties:** White, crystalline solid. Soluble in water.**Derivation:** Reaction of phenylmercuric acetate with monoethanolamine.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Insecticide and fungicide, may not be used on food crops.**phenylmercuritriethanolammonium lactate.** $[\text{tris}(2\text{-hydroxyethyl})(\text{phenylmercuri})\text{ammonium lactate}]$.CAS: 23319-66-6. $[(HOCH_2CH_2)_3NHgC_6H_5]OOCCHOHCH_3$.**Properties:** White, crystalline solid. Soluble in water.**Derivation:** Reaction of phenylmercuric acetate with triethanolamine and lactic acid.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Turf fungicide and eradicator fungicide for fruit trees.**phenylmercury formamide.** $HCONHHgC_6H_5$.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Seed disinfectant.**phenylmercury urea.**CAS: 2279-64-3. $C_6H_5HgNHCONH_2$.**Hazard:** Toxic by ingestion, inhalation, and skin absorption.**Use:** Disinfectant and fungicide for seed treatment.**phenylmethane.** See toluene.**phenylmethanol.** See benzyl alcohol.***n*-((phenylmethoxy)carbonyl)-*o*-(phenylmethyl)-*l*-seryl-*l*-tryptophyl-*l*-seryl-*l*-tyrosyl-2,3,4,5,6-pentamethyl-*dl*-phenylalanyl-*l*-leucyl-*l*-arginyl-*n*-ethyl-*l*-prolinamide monoacetate (salt),****dihydrate.**CAS: 70601-60-4. mf: $C_{74}H_{97}N_{13}O_{13} \cdot C_2H_4O_2 \cdot 2H_2O$.**Hazard:** A reproductive hazard.**Use:** Hormone.***n*-((phenylmethoxy)carbonyl)-*o*-(phenylmethyl)-*l*-seryl-*l*-tryptophyl-*l*-seryl-*l*-tyrosyl-2,3,4,5,6-pentamethyl-*dl*-phenylalanyl-*l*-leucyl-*l*-arginyl-*n*-ethyl-*l*-prolinamide, monoacetate (salt), hydrate.**CAS: 70601-54-6. mf: $C_{74}H_{97}N_{13}O_{13} \cdot C_2H_4O_2 \cdot H_2O$.**Hazard:** A reproductive hazard.**Use:** Hormone.**phenylmethyl acetate.** See benzyl acetate.***d*-1-phenyl-2-methylaminopropan.**CAS: 537-46-2. mf: $C_{10}H_{15}N$.**Hazard:** A poison. Human systemic effects reported.**phenylmethylcarbinol.** See α -methylbenzyl alcohol.**phenylmethylcarbinyl acetate.** See α -methylbenzyl acetate.***N*-phenylmethylethanolamine.** $C_6H_5N(CH_3)C_2H_4OH$.**Properties:** Liquid. Sets to a glass at -30C, bp 192C (100 mm Hg), d 1.0661 (20/20C), flash p 280F (137C) (COC). Slightly soluble in water. Combustible.**Use:** Chemical intermediate, solvent for dyes for acetate fibers.**(5-(phenylmethyl)-3-furanyl)methyl 4-chloro- α -ethylbenzeneacetate.**CAS: 51630-12-7. mf: $C_{22}H_{21}ClO_3$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**phenyl methyl ketone.** See acetophenone.**1-phenyl-3-methyl-5-pyrazolone.** See 3-methyl-1-phenyl-2-pyrazolin-5-one.**phenyl α -methylstyryl ketone.** See dypnone.***N*-phenylmorpholine.** $C_6H_5NCH_2CH_2OCH_2CH_2$.**Properties:** White solid. Bp 268C, mp 57C, vap press <0.1 mm Hg (20C), flash p 220F (104C), d 1.06 (57/20C). Soluble in water. Combustible.**Grade:** Technical.**Hazard:** Toxic by ingestion and skin absorption.
Use: Chemical intermediate for dyestuffs, rubber accelerators, corrosion inhibitors, and photographic developers; insecticide.

phenyl mustard oil. (thiocarbanil; phenyl isothiocyanate; phenylthiocarbonylimide). C_6H_5NCS .

Properties: Pale-yellow or colorless liquid; penetrating, irritating odor. D 1.1382, fp $-21C$, bp $221C$. Readily volatilized with steam; soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: (1) By action of concentrated hydrochloric acid and sulfocarbanilide, (2) by reaction of thiophosgene with aniline.

Hazard: Toxic by ingestion and inhalation, irritant to tissue.

Use: Medicine, organic synthesis.

2-phenyl-1,8-naphthalimide. See 2-phenylbenzo(de)isoquinoline-1,3-dione.

N-phenyl- α -naphthylamine.

CAS: 90-30-2. $C_{10}H_7NHC_6H_5$.

Properties: Crystallizes in prisms, white to slightly yellowish. Mp $62C$, bp $335C$ (260 mm Hg). Soluble in alcohol, ether, and benzene. Combustible.

Derivation: From α -naphthylamine and aniline. Purified by distillation.

Use: Dyes and other organic chemicals, rubber antioxidant.

N-phenyl- β -naphthylamine. (2-naphthylphenylamine).

CAS: 135-88-6. $C_{10}H_7NHC_6H_5$.

Properties: Light-gray powder. Mp $107C$, bp $395C$, d 1.24. Insoluble in water; soluble in alcohol, acetone, benzene. Combustible.

Hazard: TLV: Not Classifiable as a Human Carcinogen.

Use: Rubber antioxidant, lubricant, inhibitor (butadiene).

N-phenyl-1-naphthylamine-8-sulfonic acid.

(N-phenyl peri acid). $C_{16}H_{13}NO_3S$.

Properties: Greenish-gray needles. Insoluble in water; soluble in alcohol.

Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with aniline.

Grade: Technical, mostly as sodium salt.

Use: Azo dyes.

phenylneopentyl phosphite.

Properties: Water-white liquid. Mp $19C$, bp $138-140C$ (10 mm Hg), refr index 1.517 (25C), d 1.135 (25/15C).

Use: Chemical intermediate.

1-phenylnonane. See nonylbenzene.

4-phenyl-6h-1,3,5-oxathiazine.

CAS: 58955-84-3. mf: C_9H_9NOS .

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-phenylpentane. See *n*-amylbenzene.

2-phenylpentane. See *sec*-amylbenzene.

phenyl phenacyl ketone.

CAS: 120-46-7. mf: $C_{15}H_{12}O_2$.

Hazard: Moderately toxic by ingestion.

***o*-phenylphenol.** (*o*-hydroxydiphenyl; *o*-x-enol).

CAS: 90-43-7. $C_6H_5C_6H_4OH$.

Properties: Nearly white or light-buff crystals. Mp $56-58C$, bp $280-284C$, d 1.217 (25/25C), flash p 255F (124C). Soluble in alcohol; sodium hydroxide solution; insoluble in water. Combustible.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressures.

Hazard: Toxic by ingestion.

Use: Intermediate for dyes, germicides, fungicides, rubber chemicals, laboratory reagents, food packaging.

***p*-phenylphenol.** (*p*-hydroxydiphenyl; *p*-x-enol).

CAS: 92-69-3. $C_6H_5C_6H_4OH$.

Properties: Nearly white crystals. Mp $164-165$, bp $308C$, flash p 330F (165.5C). Soluble in alcohol, alkalies, and most organic solvents; insoluble in water. Combustible.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressures.

Hazard: Toxic by ingestion.

Use: Intermediate for dyes and resins, rubber chemicals, laboratory reagent, fungicide.

N-phenyl-*p*-phenylenediamine. See *p*-aminodiphenylamine.

phenylphosphine. (fenyfosfin; phosphiniline).

CAS: 638-21-1. $C_6H_5PH_2$.

Properties: Foul-smelling liquid. Mw 110.10, bp $160-161C$, d 1.001 (15 mm). Insoluble in water; soluble in alkali; very soluble in alcohol and ether.

Hazard: Poison by inhalation. TLV: ceiling of 0.05 ppm. Ignites spontaneously in air.

phenylphosphinic acid. See benzenephosphinic acid.

phenylphosphonic acid. See benzenephosphonic acid.

phenyl phthalate. $C_6H_4(COOC_6H_5)_2$.

Properties: White crystals. Mp $70C$, bp 255 (14 mm Hg), d 1.57. Soluble in ketones; insoluble in water.

Use: Plasticizer in nitrocellulose lacquers.

N-phenylpiperazine.

CAS: 92-54-6.

Properties: Pale-yellow oil. D 1.0621 (20/4C), bp 286.5C, 156–157C (10 mm Hg), mp 18.8C, flash p 285F (140.5C). Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Intermediate for pharmaceuticals, anthelmintics, surface-active agents, synthetic fibers.

phenylpropane. See *n*-propylbenzene.

2-phenyl-1,3-propanediol dicarbamate.
See felbamate.

3-phenyl-1-propanol. See phenylpropyl alcohol.

phenylpropanolamine hydrochloride. See propadrine hydrochloride.

1-phenylpropanone-1. See propiophenone.

3-phenylpropenal. See cinnamic aldehyde.

3-phenylpropenoic acid. See cinnamic acid.

3-phenylpropenol. See cinnamic alcohol.

1-(α -phenyl)-propenylveratrole. See benzyl isoeugenol.

3-phenylpropionaldehyde. See phenylpropyl aldehyde.

2-phenylpropionaldehyde dimethyl acetal.
mf: $\text{C}_{11}\text{H}_{16}\text{O}_2$.
Properties: Colorless to sltly yellow liquid; mushroom odor. D: 0.989–0.994, refr index: 1.492–1.497. Sol in alc, ether; insol in water.
Use: Food additive.

3-phenylpropionic acid. See hydrocinnamic acid.

phenylpropyl acetate. (hydrocinnamyl acetate).
CAS: 122-72-5. $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{OOCCH}_3$.
Properties: White crystals. D 1.012–1.016, refr index 1.497. Soluble in 70% alcohol. Combustible.
Use: Perfumery, flavoring, laboratory reagent.

phenylpropyl alcohol. (hydrocinnamic alcohol; 3-phenyl-1-propanol; phenylethyl carbinol).
CAS: 122-97-4. $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$.
Properties: Colorless liquid; floral odor. Bp 219C, d 0.998–1.000, refr index 1.524–1.528 (20C). Soluble in 70% alcohol; insoluble in water. Combustible.
Grade: Technical, FCC.
Use: Perfumery, flavoring, laboratory reagent.

phenylpropyl aldehyde. (3-phenylpropionaldehyde; hydrocinnamic aldehyde).
CAS: 104-53-0. $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CHO}$.

Properties: Colorless liquid; floral odor. D 1.010–1.020, refr index 1.520–1.532. Soluble in 50% alcohol. Combustible.

Grade: Chlorine free.

Use: Perfumery, flavors.

2-phenylpropylamine.
CAS: 582-22-9. mf: $\text{C}_9\text{H}_{13}\text{N}$.

Hazard: Moderately toxic by ingestion.

phenylpropyl chloride. (hydrocinnamyl chloride; 1-phenyl-3-chloropropane).
 $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{Cl}$.

Properties: Colorless to pale-yellow liquid. Bp 219–220C, d 1.056 (25/4C), refr index 1.5220 (20C). Combustible.

Use: Organic synthesis, laboratory reagent.

3-phenyl-*n*-(4-propylcyclohexyl)-2-propenamide.
CAS: 315706-78-6. mf: $\text{C}_{18}\text{H}_{25}\text{NO}$.

Hazard: A poison by ingestion.

α -(1-phenyl-1h-pyrazol-4-yl)-1-piperidinebutanol.
CAS: 296269-52-8. mf: $\text{C}_{18}\text{H}_{25}\text{N}_3\text{O}$.

Hazard: A poison by ingestion.

4-phenylpropylpyridine. $\text{C}_6\text{H}_5(\text{CH}_2)_3\text{C}_5\text{H}_4\text{N}$.
Properties: Colorless liquid. Bp 322C. Soluble in organic solvents.
Use: Heat-transfer agent, chemical intermediate.

α -(1-phenyl-5-propyl-1h-pyrazol-4-yl)-1-piperidinebutanol.
CAS: 296269-55-1. mf: $\text{C}_{21}\text{H}_{31}\text{N}_3\text{O}$.

Hazard: A poison.

1-phenyl-3-pyrazolidone.

Properties: Crystals. Mp 121C. Soluble in water. Combustible.

Use: Photographic developer, laboratory reagent.

phenyl salicylate. (salol).
CAS: 118-55-8. $\text{C}_6\text{H}_4\text{OHCOOC}_6\text{H}_5$.
Properties: White, crystalline powder; faint aromatic odor and taste. D 1.2614, mp 41.9C, bp 172–173C, absorbs light, especially at 290–330 μ . Soluble in alcohol, ether, chloroform, benzene, and fixed or volatile oils; sparingly soluble in water. Combustible.

Derivation: Heating salicylic acid and phenol with phosphorus pentachloride or other dehydrating agent.

Grade: NF, granular powder.

Hazard: Toxic by ingestion.

Use: Medicine, preservative, UV absorber in plastics, waxes, polishes, laboratory reagent.

phenyl saligenin phosphate. See saligenin cyclic phenyl phosphate.

phenylstearic acid. An organic fatty acid having a high degree of fluidity and no definite melting point. Pour point is -26C .

Use: Lubricant stabilizer; its potential uses include corrosion inhibitor, plasticizer, and textile auxiliary. Phenylstearic acid and its quaternary and ethoxylated derivatives are used in synthetic latices, as mineral oil emulsifiers, and in invert systems.

phenylsulfanilic acid. $\text{C}_7\text{H}_7\text{NO}_3\text{S}$.

Properties: White plates turning blue in light. Soluble in water and alcohol. Decomposes above 200C .
Use: Indicator, colorimetry, determination of nitrates.

phenylsulfohydrazide. $\text{C}_6\text{H}_5\text{SO}_2\text{NHNH}_2$.

Properties: Colorless crystals. Decomposes at 100C , evolving nitrogen.
Use: Blowing agent for cellular rubber and plastics.

phenylsulfonic acid. See benzenesulfonic acid.

4-phenyl-1,4-thiazane.

Properties: White powder. Mp $108\text{--}111\text{C}$. Soluble in hot toluene.

Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.

phenylthiocarbonimide. See phenyl mustard oil.

phenyl thiocyanate. See thiocyanic acid, phenyl ester.

phenyl tolyl ketone. (methylbenzophenone). $\text{C}_{14}\text{H}_{12}\text{O}$.

Properties: (*o*-) Viscous liquid. Mp below -18C , bp 309C . (*p*-) Colorless crystals. Mp 59C , bp 311C . Soluble in alcohol, benzene, and common organic solvents.

Derivation: (*o*-) Benzene and *o*-toluic acid chloride (aluminum chloride catalyst); (*p*-) benzoyl peroxide + toluene (aluminum chloride catalyst).

Use: Perfume additive (fixative).

phenyltrichlorosilane.

Properties: Colorless liquid. Bp 201C , d 1.321 ($25/25\text{C}$), refr index 1.5240 (25C), flash p 185F (85C) (COC). Soluble in benzene, ether, perchloroethy-

lene; readily hydrolyzed by moisture with liberation of hydrogen chloride. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride, reaction of benzene with trichlorosilane.

Hazard: Strong irritant to tissue.

Use: Intermediate for silicones, laboratory reagent.

1-phenyltridecane. See tridecylbenzene.

phenyltrimethoxysilane.

Properties: Liquid. D 1.063 (25C), refr index 1.4710 (25C), bp 211C . Soluble in acetone, benzene, perchloroethylene, methanol. Combustible.

Use: In polymers to be applied to powders, glass, paper, and fabrics.

phenylurethane. See ethyl phenylcarbamate.

phenyl valerate. $\text{C}_4\text{H}_9\text{COOC}_6\text{H}_5$.

Properties: Colorless liquid. Slightly soluble in water; soluble in alcohol and ether.

Use: Flavors and odorants.

pheromone. A group of organic compounds, produced by insects, that function as communication means and sex attractants. Synthetic pheromones have been used experimentally to control insect pests by disrupting their mating behavior, e.g., 4-methyl-3-heptanone. Pheromones have also been synthesized by use of organoborane reactions. See phoromone.

phlogiston. The hypothetical principle of fire used for the explanation of the phenomena of oxidation and reduction before Lavoisier's discoveries. See Lavoisier, Antoine Laurent.

phloroglucinol. (phloroglucine; 1,3,5-trihydroxybenzene).

Properties: White to yellowish crystals; odorless. Mp $212\text{--}217\text{C}$ if rapidly heated, $200\text{--}209\text{C}$ if slowly heated; bp sublimes with decomposition. Soluble in alcohol, ether, pyridine, and in 100 parts water.

Derivation: By fusion of resorcinol with caustic soda, by reduction of trinitrobenzene.

Use: Analytical chemistry (reagent for pentoses and with vanillin for determining the presence of free hydrogen chloride), decalcifying agent for bones, preparation of pharmaceuticals and dyes, resins, preservative for cut flowers, textile dyeing and printing.

phorate. (generic name for *O,O*-diethyl-*S*-[(ethylthio)methyl]phosphorodithioate).

Properties: Liquid. Bp $118\text{--}120\text{C}$ (0.8 mm Hg). Insoluble in water; miscible with carbon tetrachloride, dioxane, xylene.

Hazard: Toxic by skin contact, inhalation, or inges-

tion. Rapidly absorbed through skin. Repeated inhalation or skin contact may, without symptoms, progressively increase susceptibility. Use may be restricted. A cholinesterase inhibitor. TLV: 0.5 mg/m³. Toxic by skin absorption.

Use: Insecticide.

phorbol. (4,9,12-β-13,20-pentahydroxy-1,6-tigliadiene-3-ol).

CAS: 17673-25-5. The parent alcohol of tumor-producing compounds in croton oil.

Use: Biochemical and medical research.

phoromone. (7-ethyl-5-methyl-6,8-dioxabicyclo[3.2.1]-octane). Product excreted by bark beetles that acts as sex attractant. It has been isolated and synthesized for possible use in protection of forest timber.

phorone. (diisopropylidene acetone).

CAS: 504-20-1. (CH₃)₂CCHCOCHC(CH₃)₂.

Properties: Yellow liquid or yellowish-green prisms. D 0.8791 (20/20C), bp 197.9C, fp 28.0C, vap press 0.38 mm Hg (20C), flash p 185F (85C), bulk d 7.3 lb/gal (20C). Slightly soluble in water; soluble in alcohol. Combustible.

Use: Solvent for nitrocellulose, coating compositions, stains, intermediate (organic synthesis).

phosalone.

CAS: 2310-17-0. C₁₂H₁₅ClNO₂PS₂.

Properties: Colorless crystals. Mp 48C. Soluble in alcohols and aromatic solvents; insoluble in water and aliphatic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide, molluscicide.

“Phos-chek P-30 and P-40” [Solutia].

TM for ammonium polyphosphate.

Grade: Regular and fine white powder.

Use: Phosphorus-based catalyst in organic and latex-based fire-retardant intumescent paints, mastics, and polymers.

“Phosdrin” [Shell]. TM for a mixture containing more than 60% of the α isomer of 2-(CH₃O)₂P(O)OC(CH₃):CHCOOCH₃ (generic name mevinphos) and less than 40% of insecticidally active related compounds. It is 100% active.

See mevinphos.

“Phosflake” [PPG]. TM for a uniform blend of caustic soda and trisodium phosphate prepared in flake form, especially for bottle-washing use.

phosgene. (carbonyl chloride; carbon oxychloride; chloroformyl chloride).

CAS: 75-44-5. COCl₂.

Properties: Liquid or easily liquefied gas, colorless to light yellow; odor varies from strong and stifling when concentrated to haylike in dilute form. D 1.392 (19/4C), fp -128C, bp 8.2C, sp vol 3.9 cu ft/lb

(21.1C). Slightly soluble in water and slowly hydrolyzed by it; soluble in benzene and toluene. Non-combustible.

Derivation: By passing a mixture of carbon monoxide and chlorine over activated carbon.

Hazard: Very toxic via inhalation, strong irritant to eyes. TLV: 0.1 ppm.

Use: Organic synthesis, especially of isocyanates, polyurethane and polycarbonate resins, carbamates, organic carbonates, and chloroformates; pesticides; herbicides; dye manufacture.

phosmet.

CAS: 732-11-6. C₁₁H₁₂NO₄PS₂. A dimethyl ester of phosphorodithioic acid.

Properties: Colorless crystals. Mp 72C. Partially soluble in water; decomposes on heating.

Hazard: Toxic by ingestion, may inhibit cholinesterase.

Use: Acaricide, insecticide.

phosphamidon. (2-chloro-2-diethylcarbamoyl-1-methylvinyl dimethyl phosphate).

CAS: 13171-21-6.

(CH₃O)₂P(O)OC(CH₃):C(Cl)C(O)N(C₂H₅)₂.

Properties: Colorless liquid. Bp 162C (1.5 mm Hg). Soluble in water and organic solvents.

Hazard: Toxic by ingestion, inhalation, skin absorption; cholinesterase inhibitor; use may be restricted.

Use: Insecticide.

cis-phosphamidon.

CAS: 23783-98-4. mf: C₁₀H₁₉ClNO₃P.

Hazard: A poison by ingestion and skin contact.

phosphatase, alkaline. An enzyme excreted into the bile by the liver and found in the blood. It is concerned with bone formation, probably being produced by osteoblasts. It hydrolyzes phosphoric acid esters at pH 7–8, liberating phosphate ions.

Use: Biochemical research.

phosphate, condensed. A phosphorus compound with two or more phosphorus atoms in the molecule. Examples are polyphosphates, pyrophosphates.

See polyphosphoric acid.

phosphate glass. A type of glass containing phosphorus pentoxide. Aluminum-metaphosphate is frequently the basic material. Such glasses have properties not attainable in silicate glasses, e.g., resistance to hydrogen fluoride.

phosphate rock. (phosphorite). A natural rock consisting largely of calcium phosphate and used as a raw material for manufacture of phosphate fertilizers, phosphoric acid, phosphorus, and animal feeds. Recovery of uranium from the manufacture of phosphoric acid and other phosphate chemicals is expected to become an important source of this metal. Phosphate rock is the primary source of superphosph-

hate, prepared by treatment of the pulverized rock with sulfuric acid (superphosphate having 16–18% P_2O_5) or by acidifying with phosphoric acid (triple superphosphate having 40–48% P_2O_5). Nitric acid is sometimes used, i.e., nitrophosphate. Defluorinated phosphate rock is the source of phosphate used in animal feeds and feed concentrations. Important deposits are in the U.S. (Florida, North Carolina, Tennessee, California, Wyoming, Montana, Utah, Idaho), North Africa (Morocco, Libya, Algeria), the former U.S.S.R., and various islands in the Pacific.

phosphate slag. Glassy calcium silicate, by-product of electric furnace phosphorus manufacture. **Properties:** Lumps, loose bulk d 85 lb/ft³.

phosphatide. See phospholipid.

phosphatidyl choline. See lecithin.

phosphatidyl ethanolamine. See cephalin.

phosphatidyl serine. See cephalin.

phosphazene. (phosphonitrile). A ring or chain polymer that contains alternating phosphorus and nitrogen atoms with two substituents on each phosphorus atom. Characteristic structures are cyclic trimers, cyclic tetramers, and high polymers. The substituent can be any of a wide variety of organic groups, halogen, amino, etc. Most cyclic trimers are crystalline, solids, organosoluble, and stable to weather conditions; the high polymers (polyphosphazenes) are elastomeric or thermoplastic. A copolymer of phosphazene and styrene has been investigated for use as a flame-retardant.

phosphinate. A derivative of the hypothetical phosphinic acid, $H_2P(O)OH$.

phosphine. (hydrogen phosphide).
CAS: 7803-51-2. PH_3 .

Properties: Colorless gas; disagreeable, garliclike odor. D 1.185, fp $-133.5C$, bp $-85C$, autoign temp 100F (37.7C). Soluble in alcohol, ether, and cuprous chloride solution; slightly soluble in cold water. Insoluble in hot water.

Derivation: By action of freshly formed hydrogen or of caustic potash on phosphorus.

Hazard: Spontaneously flammable. Toxic by inhalation, strong irritant. TLV: 0.3 ppm; STEL 1 ppm.

Use: Organic preparations, phosphonium halides, doping agent for n-type semiconductors, polymerization initiator, condensation catalyst. *Note:* A synthetic dye, chrysaniline yellow, is sometimes called phosphine.

phosphinidynetrismethanol. See tris(hydroxymethyl)phosphine.

phosphite. Salt of phosphorous acid, as in sodium phosphite.

phosphocysteamine. See s-(2-aminoethyl) phosphorothioate.

phosphodiesterase. An enzyme that cleaves hydrolytically the carboxy- and phosphoesters of phosphatides (phospholipids).

phosphodiester linkage. A chemical grouping that contains two alcohols esterified to one molecule of phosphoric acid, which thus serves as a bridge between them.

phosphogluconate pathway. An oxidative pathway beginning with glucose-6-phosphate and leading to ribose and NADPH. Also called the pentose phosphate pathway or hexose monophosphate shunt.

2-phosphoglyceric acid.

$HOCH_2CH[OPO(OH)_2]COOH$. An intermediate in the metabolism of carbohydrates in biological systems.

See enolase.

phosphoglyceride. See phospholipid.

phospholipid. (phosphatide). A group of lipid compounds that yield on hydrolysis phosphoric acid, an alcohol, fatty acid, and nitrogenous base. They are widely distributed in nature and include such substances as lecithin, cephalin, and sphingomyelin.

phosphomolybdate. See heteromolybdate.

phosphomolybdenic acid, sodium salt.

See sodium molybdophosphate.

phosphomolybdic acid. (phospho-12-molybdic acid; PMA; 12-molybdophosphoric acid).
 $H_3PMo_{12}O_{40} \cdot xH_2O$.

Properties: Yellowish crystals. D 3.15 g/cc, mp 78–90C, strong oxidizing agent in aqueous solution, strong acid in free acid form. Soluble in water, alcohol, and ether.

Grade: Technical, CP, reagent.

Hazard: (Solution) May ignite combustible materials.

Use: Reagent for alkaloids; pigments; catalyst; fixing agent in photography; additive in plating processes; imparts water resistance to plastics, adhesives, and cement.

phosphomolybdic pigment. (molybdenum lake). A pigment made by precipitating a basic organic dye with phosphomolybdic acid or a mixture of phosphomolybdic and phosphotungstic acids.

See phosphotungstic pigment.

phosphonic acid, benzyl-, dibutyl ester.

See benzylphosphonic acid dibutyl ester.

phosphonitrile. See phosphazene.

phosphonium iodide. (iodophosphonium).
PH₄I.

Properties: Colorless or slightly yellowish crystals. D 2.86, mp 18.5C, sublimes at 61.8C, bp 80C. Decomposed by water or alcohol evolving highly toxic phosphine.

Derivation: Hydrolysis of phosphorus tetraiodide and white phosphorus.

Hazard: Rapid heating can cause detonation. Toxic by ingestion.

2-phosphonobutanetricarbonic acid pentamethyl ester.

CAS: 37971-35-0. mf: C₁₂H₂₁O₉P.

Hazard: A moderate eye irritant.

3-phosphonopropanoic acid.

CAS: 5962-42-5. mf: C₃H₇O₃P.

Hazard: Low toxicity by ingestion. A severe eye irritant.

phosphonosuccinic acid tetramethyl ester.

CAS: 2788-26-3. mf: C₈H₁₅O₇P.

Hazard: A moderate eye irritant.

9-((2-phosphonylmethoxy)-ethyl)guanine.

CAS: 114088-58-3. mf: C₉H₁₂N₅O₃P.

Hazard: A severe skin irritant.

phosphor. (fluor). A substance, either organic or inorganic, liquid or crystals, that is capable of luminescence, i.e., of absorbing energy from sources such as X rays, cathode rays, UV radiations, and alpha particles, and emitting a portion of the energy in the UV, visible, or infrared. When the emission of the substance ceases immediately or in the order of 10⁻⁸ sec after excitation, the material is said to be fluorescent. Material that continues to emit light for a period after the removal of the exciting energy is said to be phosphorescent. The half-life of the afterglow varies with the substance and may range from 10⁻⁶ sec to days.

Use: Fluorescent light tubes; television, radar, and cathode ray tubes, instrument dials, scintillation counters.

See fluorescence; phosphorescence.

phosphor bronze. A tin bronze that has been deoxidized by the addition of up to 0.5% phosphorus. Relatively hard, strong, and corrosion resistant. Has good cold-work properties and high strength.

Grade: Grade A (5% tin), grade C (8% tin), grade D (10% tin), grade E (1.25% tin).

Use: Springs, electrical switches, contact fingers, chains, fourdrinier wire.

See brass; bronze.

phosphorescence. A type of luminescence in which the emission of radiation resulting from excitation of a crystalline or liquid material occurs *after*

excitation has ceased and may last from a fraction of a second to an hour or more. This phenomenon is characteristic of some organic compounds, as in the firefly, and also of a number of inorganic solid materials, both natural and synthetic.

Use: Industrially as phosphors.
See fluorescence.

phosphoric acid. (orthophosphoric acid).

CAS: 7664-38-2. H₃PO₄.

Properties: Colorless, odorless, sparkling liquid or transparent, crystalline solid, depending on concentration and temperature. At 20C the 50 and 75% strengths are mobile liquids, the 85% is of a syrupy consistency, and the 100% acid is in the form of crystals, d 1.834 (18C), mp 42.35C, loses 1/2 H₂O at 213C (to form pyrophosphoric acid), soluble in water and alcohol, corrosive to ferrous metals and alloys.

Derivation: (1) Action of sulfuric acid on pulverized phosphate rock; (2) action of hydrochloric acid on phosphate rock, with extraction by tributylphosphate; (3) by heating phosphate rock, coke, and silica in an electric furnace, burning the elemental phosphorus produced, and then hydrating the phosphoric oxide (furnace acid).

Grade: Agricultural, technical (50, 75, 85, 90, 100%), food (50, 75, 85%), NF (85–88%), FCC (75–85%). (Polyphosphoric acid is sometimes called 115% phosphoric acid.)

Hazard: Toxic by ingestion and inhalation, irritant to skin and eyes. TLV: 1 mg/m³; STEL 3 mg/m³.

Use: Fertilizers, soaps and detergents, inorganic phosphates, pickling and rust-proofing metals, pharmaceuticals, sugar refining, gelatin manufacture, water treatment, animal feeds, electropolishing, gasoline additive, conversion coatings for metals, catalyst for ethanol manufacture, lakes in cotton dyeing, yeasts, soil stabilizer, waxes and polishes, binder for ceramics, activated carbon, in foods and carbonated beverages as acidulant and sequestrant, laboratory reagent.

phosphoric acid, anhydrous. See phosphoric anhydride.

phosphoric acid, cyclohexyl diphenyl ester.
See cyclohexyl phenyl phosphate.

phosphoric acid, dibutyl phenyl ester.
See dibutyl phenyl phosphate.

phosphoric acid, meta-. (metaphosphoric acid; phosphoric acid, glacial). (HPO₃)_x.

Properties: Transparent, highly deliquescent, glassy mass. D 2.2–2.488. Soluble in water slowly forming the ortho-acid. Also soluble in alcohol. Noncombustible.

Derivation: By heating orthophosphoric acid to redness, by treating phosphorus pentoxide with a calculated quantity of water; by heating diammonium phosphate.

Grade: Technical, CP.

Use: Phosphorylating agent, dehydrating agent, dental cements, laboratory reagent.
See polyphosphoric acid.

phosphoric acid, trisodium salt, dodecahydrate. See sodium phosphate tribasic dodecahydrate.

phosphoric anhydride. (phosphorus pentoxide; phosphoric oxide; phosphoric acid, anhydrous). P_2O_5 .

Properties: Soft, white powder. Absorbs moisture from the air with avidity, forming meta-, pyro-, or ortho-phosphoric acid, depending on the amount of water absorbed and upon conditions of absorption. D 2.30, mp 340C, bp sublimates at 360C.

Derivation: By burning phosphorus in dry air.

Grade: Technical, nitrogen-complex coated (for slow solution).

Hazard: Reacts violently with water to evolve heat; dangerous fire risk. Keep tightly sealed or stoppered. Corrosive to skin and tissue.

Use: Preparation of phosphorus oxychloride and metaphosphoric acid, acrylate esters, surfactants, dehydrating agent, condensing agent in organic synthesis, sugar refining, laboratory reagent, fire extinguishing, special glasses.

phosphoric bromide. See phosphorus pentabromide.

phosphoric chloride. See phosphorus pentachloride.

phosphoric oxide. See phosphoric anhydride.

phosphoric perbromide. See phosphorus pentabromide.

phosphoric perchloride. See phosphorus pentachloride.

phosphoric sulfide. See phosphorus pentasulfide.

phosphorolysis. Cleavage of a compound with phosphate as the attacking group: analogous to hydrolysis.

phosphorous acid, ortho- (orthophosphorous acid; phosphonic acid).

CAS: 13598-36-2. H_3PO_3 .

Properties: White or yellowish, crystalline mass; very hygroscopic. Keep tightly sealed or stoppered, absorbs oxygen very readily with formation of orthophosphoric acid. D 1.651, bp 200C (decomposes) mp 70C. Soluble in alcohol and water.

Grade: Reagent, technical, 70%.

Use: Analysis (testing for mercury), chemical reducing agent, phosphite salts.

phosphorous acid, triallyl ester.

CAS: 102-84-1. mf: $C_9H_{15}O_3P$.

Hazard: A poison by ingestion and skin contact. A mild eye irritant.

phosphorus.

CAS: 7723-14-0. P. Nonmetallic element of atomic number 15, group VA of periodic table, aw 30.97376, valences of 1, 3, 4, 5; allotropes; white (or yellow), red, and black phosphorus. No stable isotopes, several artificial radioactive isotopes with mass numbers 29–34.

White phosphorus

Properties: Crystals, waxlike, transparent solid, metastable with respect to red phosphorus, an impurity present in white allotrope. Bp 280C, vap d corresponds to formula P_4 , mp 44.1C, d (solid 20C), 1.82 d (liquid 44.5C) 1.745, Mohs hardness 0.5. High electrical resistivity. Insoluble in water and alcohol; soluble in carbon disulfide, exhibits phosphorescence at room temperature. An essential dietary nutrient.

Derivation: (1) Produced in an electric furnace from phosphate rock, sand, and coke. The phosphorus vapor is driven off and condensed under water. (2) By reaction of phosphate rock with sulfuric acid, the resulting $CaSO_4$ being removed by filtration and the phosphoric acid concentrated by evaporation (wet process).

Grade: Technical 99.9%, electronic grade 99.9999%.

Occurrence: Occurs in nature in phosphate rock [impure $Ca_3(PO_4)_2$], apatite [$Ca_5(PO_4)_3F$], bones, teeth, organic compounds of living tissue, and as phosphorite nodules on the ocean floor.

Hazard: Ignites spontaneously in air at 86F (30C). Store under water and away from heat, dangerous fire risk. Toxic by ingestion and inhalation, skin contact causes burns. TLV: 0.1 mg/m³.

Use: Rodenticides, smoke screens, analytical chemistry.

Red phosphorus

Properties: Violet-red amorphous powder, obtained from white phosphorus by heating at 240C with catalyst, sublimates at 416C, d 2.34, autoign temp 500F (260C). High electrical resistivity. Much less reactive than white phosphorus. Insoluble in most solvents.

Hazard: Large quantities ignite spontaneously and on exposure to oxidizing materials. Reacts with oxygen and water vapor to evolve phosphine. Extinguish with foam or dry chemical (not water).

Use: Manufacture of phosphoric acid and other phosphorus compounds, phosphor bronzes, metallic phosphides, additive to semiconductors, electroluminescent coatings, safety matches, fertilizers.

Black phosphorus

Properties: Black solid resembling graphite. D 2.25–2.6. Obtained by heating white phosphorus under pressure. Insoluble in most solvents. Electrically conducting.

phosphorus-32. Radioactive phosphorus of mass number 32.

Properties: Half-life, 14.3 days; radiation β .

Derivation: Pile irradiation of potassium dihydrogen phosphate or sulfur and sulfur compounds.

Available forms: Phosphate ion in weak hydrochloric acid solution, solid potassium dihydrogen phosphate, P-32 sterile solution, in tagged compounds such as hexaethyltetraphosphate, ribonucleic acid, triphenylphosphine, etc.

Grade: USP as sodium phosphate P-32 solution.

Use: Biochemical radioactive tracer studies; medical treatment of leukemia, skin lesions, etc.; industrial measurements, e.g., tire tread wear, thickness of ink and paint films; lead detection.

phosphorus chloride. See phosphorus trichloride.

phosphorus heptasulfide. (tetraphosphorus heptasulfide).

CAS: 12037-82-0. P_4S_7 .

Properties: Light-yellow crystals. D 2.19, mp 310C, bp 523C. Slightly soluble in carbon disulfide.

Hazard: Flammable, dangerous fire risk.

phosphorus nitride. P_3N_5 .

Properties: Amorphous white solid. Insoluble in cold water; decomposes in hot water; soluble in common organic solvents. Nonhygroscopic and stable in air, decomposes at 800C.

Use: Doping semiconductors.

phosphorus oxybromide.

CAS: 7789-59-5. $POBr_3$.

Properties: Colorless crystals. D 2.82, mp 56C, bp 189C, decomposed by water. Soluble in ether and benzene; reacts strongly with organic matter.

Hazard: Strong irritant to skin and tissue, store in sealed glass containers.

Use: Chemical intermediate.

phosphorus oxychloride. (phosphoryl chloride).

CAS: 10025-87-3. $POCl_3$.

Properties: Colorless, fuming liquid; pungent odor. D 1.675 (20/20C), mp 1.2C, bp 107.2C, refr index 1.460 (25C). Decomposed by water and alcohol with evolution of heat.

Derivation: From phosphorus trichloride, phosphorus pentoxide, and chlorine.

Grade: Technical, 99.999+%.

Hazard: Toxic by inhalation and ingestion, strong irritant to skin and tissue. TLV: 0.1 ppm.

Use: Manufacture of cyclic and acyclic esters for plasticizers, gasoline additives, hydraulic fluids and organophosphorus compounds, chlorinating agent and catalyst, dopant for semiconductor-grade silicon, tricresyl phosphate, and fire-retarding agents.

phosphorus pentabromide. (phosphoric bromide; phosphoric perbromide).

CAS: 7789-69-7. PBr_5 .

Properties: Yellow, crystalline mass. Keep hermetically sealed!! Soluble in water (decomposes), carbon disulfide, carbon tetrachloride, benzene. Bp 106C (decomposes).

Grade: Technical.

Hazard: Corrosive to skin and tissue.

Use: Brominating agent.

phosphorus pentachloride. (phosphoric chloride; phosphoric perchloride).

CAS: 10026-13-8. PCl_5 .

Properties: Slightly yellow, crystalline mass; irritating odor; fuming in moist air. D 3.60, mp (under pressure) 148C, ordinarily sublimates at 160–165C. Soluble in carbon disulfide and carbon tetrachloride.

Derivation: By action of chlorine on phosphorus or phosphorus trichloride.

Grade: Technical, reagent.

Hazard: Flammable, reacts strongly with water; use carbon dioxide or dry chemical to extinguish. Store in tightly closed containers. Corrosive to eyes and skin. TLV: 0.85 mg/m³.

Use: Chlorinating and dehydrating agent, catalyst.

phosphorus pentafluoride.

CAS: 7647-19-0. PF_5 .

Properties: Colorless gas. Fumes strongly in air. Fp -94C, bp -84.8C. Decomposed by water. Available in small cylinders. Nonflammable.

Grade: 99%.

Hazard: Corrosive to eyes and skin. TLV: 2.5 mg(F)/m³.

Use: Polymerization catalyst.

phosphorus pentasulfide. (phosphoric sulfide; phosphorus persulfide; thiophosphoric anhydride).

CAS: 1314-80-3. P_5S_5 .

Properties: Light-yellow or greenish-yellow crystalline mass; odor similar to hydrogen sulfide. Keep in sealed containers. Very hygroscopic, burns in air forming P_2O_5 and SO_2 , decomposed by moist air. Mp 286–290C, bp 515C, d 2.03, vap press 1 mm Hg (300C), autoign temp 287F (141.6C). Soluble in solutions of alkali hydroxides and carbon disulfide.

Derivation: By reaction of phosphorus and sulfur.

Grade: Technical, distilled.

Hazard: Dangerous fire risk; ignites by friction; contact with water or acids liberates poisonous and flammable hydrogen sulfide. Toxic by inhalation, strong irritant. TLV: 1 mg/m³; STEL 3 mg/m³.

Use: Intermediate for lubricating oil additives, insecticides (chiefly parathion and malathion), flotation agents, safety matches, ignition compounds, sulfonation.

phosphorus pentoxide. See phosphoric anhydride.

phosphorus persulfide. See phosphorus pentasulfide.

phosphorus salt. See sodium ammonium phosphate.

phosphorus sesquisulfide. (tetraphosphorus trisulfide).
CAS: 1314-85-8. P_4S_3 .

Properties: Yellow, crystalline mass. D 2.00, mp 172C, bp 407.8C, autoign temp 212F (100C) (solution). Soluble in carbon disulfide; insoluble in cold water, decomposed by hot water.

Derivation: By gently heating phosphorus and sulfur.

Hazard: Dangerous fire risk, ignites by friction. An irritating poison.

Use: Organic synthesis, manufacture of matches.

phosphorus sulfide. See phosphorus trisulfide.

phosphorus tribromide.

CAS: 7789-60-8. PBr_3 .

Properties: Fuming, colorless liquid; penetrating odor. D 2.852 (15C), bp 175C; fp -40C. Soluble in acetone, alcohol, carbon disulfide, hydrogen sulfide, water (decomposes).

Hazard: Corrosive to skin and tissue, store in tightly closed containers.

Use: Analysis (testing for sugar and oxygen), catalyst, synthesis.

phosphorus trichloride. (phosphorus chloride).

CAS: 7719-12-2. PCl_3 .

Properties: Clear, colorless, fuming liquid. D 1.574, fp -111.8C, bp 76C. Decomposes rapidly in moist air; soluble in ether, benzene, carbon disulfide, and carbon tetrachloride.

Derivation: By passing a current of dry chlorine over gently heated phosphorus, which ignites. The trichloride admixed with some pentachloride distills over. A small amount of phosphorus is added, and the whole distilled.

Grade: Technical, 99.9%.

Hazard: Corrosive to skin and tissue, reacts with water to form hydrochloric acid, store in tightly closed containers. TLV: 0.2 ppm; STEL 0.5 ppm.

Use: Making phosphorus oxychloride, intermediate for organophosphorus pesticides, surfactants, phosphites (reaction with alcohols and phenols), gasoline additives, plasticizers, dyestuffs, chlorinating agent, catalyst, preparing rubber surfaces for electrodeposition of metal, ingredient of textile finishing agents.

phosphorus triiodide. PI_3 .

Properties: Red crystals. Mp 61C (decomposes), d 4.18. Hygroscopic; soluble in alcohol, carbon disulfide, water (decomposes).

Grade: Technical, reagent.

Hazard: Flammable, reacts with water. Irritating to skin and eyes.

Use: Organic synthesis.

phosphorus trisulfide. (phosphorus sulfide; tetraphosphorus hexasulfide; thiophosphorous anhydride).

CAS: 12165-69-4. P_2S_3 or P_4S_6 .

Properties: Grayish-yellow mass; tasteless; odorless. Bp 490C, mp 290C. Keep well stoppered. Decomposes in moist air; soluble in alcohol, carbon disulfide, ether.

Hazard: Flammable, highly dangerous fire risk, reacts with water.

Use: Organic chemistry (reagent).

phosphorylase. An enzyme, occurring in muscle and liver, that catalyzes the conversion of glycogen into glucose-1-phosphate.

phosphorylation. A reaction in which phosphorus combines with an organic compound, usually in the form of the trivalent phosphoryl group. It occurs naturally in cellular metabolism and is of particular importance in vitamin activity and enzyme formation. It is also used to produce a modified cellulose (P-cellulose) for cation exchange in chromatographic separations. Most often by enzymatic transfer of a phosphate group from ATP.

phosphorylation potential. The actual free-energy change of ATP (or other phosphate-containing molecule) hydrolysis under the nonstandard conditions within a cell.

phosphoryl chloride. See phosphorus oxychloride.

phosphotungstic acid. (phospho-12-tungstic acid; phosphowolframic acid; 12-tungstophosphoric acid).

CAS: 12067-99-1. $H_3PW_{12}O_{40} \cdot xH_2O$.

Properties: Yellowish-white solid. Mp (for $24H_2O$ of hydration) 89C. Soluble in water, acetone, and diethyl ether. Relatively insoluble in nonpolar organic solvents. Strong oxidizing agent in aqueous solution; strong acid in the free acid form.

Derivation: Addition of phosphates to sodium tungstate in the presence of hydrochloric acid.

Grade: Reagent, technical.

Hazard: Strong irritant to skin and eyes.

Use: Reagent in analytical chemistry and biology; manufacture of organic pigments; additive in plating industry; imparts water resistance to plastics, adhesives, and cement; catalyst for organic reactions; photographic fixing agent; textile antistatic agent.

phosphotungstic acid, sodium salt. See sodium-12-tungstophosphate.

phospho-tungstic-phosphomolybdic acid.

See Bessonoff's reagent.

phosphotungstic pigment. (tungsten lake).

A green or blue pigment manufactured by precipitating basic dyestuffs such as malachite green or Victoria blue with solutions of phosphotungstic acid, phosphomolybdic acid, or a mixture of both.

See phosphomolybdic pigment.

Use: Printing inks, paper, paints, and enamels.

photocatalysis. Refers to the increase in the speed of, or facilitation of, a reaction by exposure to light or light waves of a definite frequency.

photochemical equivalent law. Each molecule entering into reaction has to be excited by the absorption of one quantum of radiation.

photochemical reaction center. The part of a photosynthetic complex where the energy of an absorbed photon causes charge separation, initiating electron transfer.

photochemical yield. Refers to quantum efficiency of a reaction.
See quantum efficiency.

photochemistry. The branch of chemistry concerned with the effect of absorption of radiant energy (light) in inducing or modifying chemical changes. Photosynthesis is the most important example of a photochemical reaction; others are the photosensitization of solids, applied in photography, photocells, photovoltaic cells, and the formation of visual pigments; photochemical decomposition (photolysis), photo-induced polymerization, oxidation, and ionization; fluorescence and phosphorescence; and the reaction of chlorine with organic compounds. Free-radical chain mechanisms are usually involved.

See free radical.

photochromism. The ability of a transparent material to darken reversibly when exposed to light. Plastics can be made light-sensitive by certain aromatic organic nitro compounds such as 2-(2,4-dinitrobenzyl)pyridine. Such chemicals are compatible with most transparent plastics and are either blended with the base resin or applied as coatings. See glass, photochromic.

photodecomposition. See photolysis; photochemistry.

photoelectric colorimeter. An analytical device used to measure the comparative intensity of color in solutions using photoelectric detectors.

photo-glycin. See *p*-hydroxyphenylglycine.

photographic chemistry. In photographic films and papers the sensitive surface usually consists of microscopic grains of a silver halide, suspended in gelatin. Exposure to light renders the halide particles susceptible to reduction to metallic silver by developing agents containing a reducing agent, as well as an accelerator, preservative, and restrainer. The accelerator increases the activity of the reducing agent (due principally to ionization of the phenolic agents to their active form) and is usually an alkaline compound. The preservative, usually sodium sulfite, minimizes air oxidation. The restrainer helps to prevent "fog" (reduction of silver halide grains that have not been exposed to light) and is almost always potassium bromide.

Color sensitizers are dyes added to silver halide emulsions to broaden their response to various wavelengths. Unsensitized emulsions are most responsive in the blue region of the spectrum and thus do not correctly represent the light spectrum striking them. Widely used sensitizers include the cyanine dyes, the merocyanines, the benzoxazoles, and the benzothiazoles. Cryptocyanine sensitizes the extreme red and infrared.

In color photography diethyl-*p*-phenylenediamine is an important developer because its oxidation product readily couples with a large number of phenol and reactive methylene compounds to form indophenol and indoaniline dyes, which are the basis of most of the current color processes. See holography.

photographic grade. A chemical in which impurities known to be photographically harmful are limited to safe levels and inert impurities are restricted to levels that will not reduce the required assay strength.

photoionization. (atomic photoelectric effect). Refers to the removal of one or more electrons from an atom or molecule by absorption of a photon of visible or ultraviolet light.

photolysis. Decomposition of a compound into simpler units as a result of absorbing one or more quanta of radiation; examples are splitting of hydrogen iodide by the reaction $2HI + h\nu \rightarrow H_2 + I_2$; and of ketene ($H_2C=CO$) into CO and carbene (methylene) ($=CH_2$). Photodecomposition may also occur with aldehydes, ketones, azo compounds, and organometallic compounds. Continuous generation of hydrogen by photolysis of water has been achieved using platinum catalyst in conjunction with ruthenium and rhodium. Similarly, hydrogen can be split from H_2S by photolysis with cadmium sulfide as catalyst, aided by ruthenium dioxide. See flash photolysis; photochemistry.

photometric analysis. Chemical analysis by means of absorption or emission of radiation, primarily in the near UV, visible, and infrared portions of the electromagnetic spectrum. It includes such

techniques as spectrophotometry, spectrochemical analysis, Raman spectroscopy, colorimetry, and fluorescence measurements. See spectroscopy.

photon. The unit (quantum) of electromagnetic radiation. Light waves, γ rays, X rays, etc. consist of photons. Photons are discrete concentrations of energy that seem to have no rest mass and move at the speed of light. Their nature can be described only in mathematical terms. Photons are emitted when electrons move from one energy state to another, as in an excited atom. See radiation.

photophor. See calcium phosphide.

photophosphorylation. The enzymatic formation of ATP from ADP coupled to the light-dependent transfer of electrons from water in photosynthetic cells.

photopolymer. A polymer or plastic so made that it undergoes a change on exposure to light. Such materials can be used for printing and lithography plates, photographic prints, and microfilm copying. The light may cause further polymerization or cross-linking, or it may cause degradation. One application involves the use of esters of polyvinyl alcohol that cross-link and so become insoluble, whereas unexposed portions of the material remain soluble.

photoreduction. The light-induced reduction of NADP in photosynthetic cells.

photosensitive glass. Certain clear silicate glass containing ingredients capable of forming permanent photographic images when subjected to action of X rays or ultraviolet light and subsequent heat treatment.

photosynthesis. The utilization of sunlight by plants and bacteria to convert two inorganic substances (carbon dioxide and water) into carbohydrates. Chlorophyll acts as the energy converter in this reaction, which is perhaps the most important on earth. The generalized reaction is $6\text{CO}_2 + 6\text{H}_2\text{O} + 672 \text{ kcal} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. The significance of this process lies in the conversion of energy from radiant to chemical form. The chemical energy that a green plant stores by photosynthesis provides the total energy requirement of the plant. Directly or indirectly plants supply the primary organic nutrient for most other living organisms. Most fossil fuels are storehouses of the radiant energy transformed by photosynthesis in earlier geologic eras. Photosynthesis is the principal source of atmospheric oxygen. At least two-thirds of the total photosynthetic activity of the earth takes place in the oceans. Its exact chemical mechanism is extremely complex. Essential features are the reduction of carbon dioxide and the utilization of the hydrogen of water

to form carbohydrates, with oxygen being liberated; the nucleotides nicotinamide and adenosine triphosphate are involved in this conversion. Sugar (sucrose) is formed in the cytoplasm surrounding the chloroplasts. Photosynthesis has been shown to be substantially inhibited by air pollution to the extent of 20% in rural locations and 33% in urban areas. See algae.

photosystem. In photosynthetic cells, a functional set of light-absorbing pigments and their reaction center.

phototroph. An organism that can use the energy of light to synthesize its own fuels from simple molecules such as carbon dioxide, oxygen, and water. Contrast with chemotroph.

photovoltaic cell. See solar cell.

phthalamide.

CAS: 88-96-0. $\text{C}_6\text{H}_4(\text{CONH}_2)_2$. The double acid amide of phthalic acid.

Properties: Colorless crystals. Mp 220C (decomposes into phthalamide and ammonia). Very slightly soluble in water and alcohol, insoluble in ether.

Derivation: By stirring phthalamide with cold concentrated ammonia solution; by the reaction of phthalyl chloride and ammonia; or from the addition of ammonia to phthalic anhydride under pressure.

Use: Intermediate in organic synthesis, laboratory reagent.

phthalic acid. (*o*-phthalic acid; *o*-benzene dicarboxylic acid).

CAS: 88-99-3. $\text{C}_6\text{H}_4(\text{COOH})_2$.

Properties: Colorless crystals. D 1.585, mp decomposes at 191C. Soluble in alcohol; sparingly soluble in water and ether.

Derivation: Catalytic oxidation of *o*-toluic acid and oxidation of xylene.

Grade: Technical, reagent.

Use: Dyes, phenolphthalein, phthalamide, anthranilic acid, synthetic perfumes, laboratory reagent.

***p*-phthalic acid.** See terephthalic acid.

phthalic acid, diisononyl ester.

CAS: 28553-12-0. mf: $\text{C}_{26}\text{H}_{42}\text{O}_4$.

Hazard: Questionable carcinogen. A reproductive hazard.

phthalic anhydride.

CAS: 85-44-9. $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$.

Properties: White, crystalline needles; mild odor. Sublimes below boiling point; d 1.527 (4C), mp

131.16C, bp 285C, flash p 305F (151.6C) (CC), autoign temp 1083F (583C). Soluble in alcohol, carbon disulfide, and hot water. Combustible.

Derivation: Catalytic oxidation of naphthalene.

Method of purification: Sublimation.

Grade: Pure, technical.

Hazard: Skin irritant. TLV: 1 ppm; not classifiable as a human carcinogen.

Use: Alkyd resins, plasticizers, hardener for resins, polyesters, synthesis of phenolphthalein and other phthaleins, many other dyes, chlorinated products, pharmaceutical intermediates, insecticides, diethyl phthalate, dimethyl phthalate, laboratory reagent.

phthalimide.

CAS: 85-41-6. $C_6H_4(CO)_2NH$.

Properties: White, crystalline leaflets. Mp 233–238C, bp (sublimes). Slightly soluble in water; insoluble in benzene; soluble in boiling alcohol or acetic acid and in aqueous alkalis. Combustible.

Derivation: By dissolving phthalic anhydride in ammonium hydroxide, evaporating to dryness, and using the residue.

Use: Synthetic indigo via anthranilic acid, fungicide, organic synthesis, laboratory reagent.

phthalocyanine. Any of a group of benzoporphyrins that have strong pigmenting power, forming a family of dyes. The basic structure of the molecule comprises four isoindole groups, $(C_6H_4)C_2N$, joined by four nitrogen atoms.

Four commercially important modifications are (1) metal-free phthalocyanine, $(C_6H_4C_2N)_4N_4$, having a blue-green color (structure shown below); (2) copper phthalocyanine, in which a copper atom is held by secondary valences of the isoindole nitrogen atoms (see Pigment Blue 15); (3) chlorinated copper phthalocyanine, green, in which 15–16 hydrogen atoms are replaced by chlorine (see Pigment Green 7); and (4) sulfonated copper phthalocyanine, water

soluble, green, in which two hydrogen atoms are replaced by HSO_3 groups.

Use: Decorative enamels, automotive finishes, and similar applications where lightfastness and chemical stability are required.

phthalocyaninesulfonic acid, cobalt complexes.

See cobalt phthalocyaninesulfonate.

***m*-phthalodinitrile.** (isophthalodinitrile; IPM; *m*-dicyanobenzene; 1,3-dicyanobenzene; 1,3-benzenedicarbonitrile).

CAS: 626-17-5. $C_6H_4N_2$.

Properties: Needles. Mw 128.14, mp 141C, bp sublimes. Slightly soluble in water; insoluble in ether, acetone, hot ligroin, very soluble in alc, benzene, and chloroform.

Hazard: TLV: 5 mg/m³.

Use: Intermediate.

phthalonitrile. (*o*-dicyanobenzene).

CAS: 91-15-6. $C_6H_4(CN)_2$.

Properties: Buff-colored crystals. Mp 138C. Insoluble in water; soluble in acetone and benzene. Combustible.

Derivation: Vapor-phase reaction of ammonia and phthalic anhydride over alumina catalyst at high temperature.

Hazard: Toxic by ingestion.

Use: Intermediate in organic synthesis (especially pigments and dyes), base material for high-temperature lubricants and coatings, insecticide.

phthaloyl chloride. (phthaloyl dichloride; phthalyl chloride). $C_6H_4(COCl)_2$.

Properties: Colorless, oily liquid. Mp 16C, bp 277C, refr index 1.568 (20C). Decomposed by water or alcohol; soluble in ether. Combustible.

Derivation: By the action of phosphorus pentachloride on phthalic anhydride.

Hazard: Irritating by inhalation and skin contact.

Use: Chemical intermediate, especially for plasticizers and resins; laboratory reagent.

See isophthaloyl chloride.

***n*-phthalyl-*dl*-glutamin.**

CAS: 3343-29-1. mf: $C_{13}H_{12}N_2O_5$.

Hazard: A reproductive hazard.

phycocolloid. One of several carbohydrate polymers (polysaccharides) occurring in algae (seaweed). They are hydrophilic colloids having a tendency to absorb water, with swelling, and to form gels of varying strength and consistency. The chief types of phycocolloid are carrageenan from Irish moss, algin from brown algae, and agar from red algae. They contain complex galactose and mannose sugars and are sometimes considered seaweed mucilages.

phylanthoside.CAS: 63166-73-4. mf: $C_{40}H_{52}O_{17}$.**Hazard:** A poison.

phylogenetics. Field of biology that deals with the relationships between organisms. It includes the discovery of these relationships, and the study of the causes behind this pattern.

phylogeny. The evolutionary relationships among organisms; the patterns of lineage branching produced by the true evolutionary history of the organisms being considered.

physical chemistry. Application of the concepts and laws of physics to chemical phenomena in order to describe in quantitative (mathematical) terms a vast amount of empirical (observational) information. A selection of only the most important concepts of physical chemistry would include the electron wave equation and the quantum mechanical interpretation of atomic and molecular structure, the study of the subatomic fundamental particles of matter, application of thermodynamics to heats of formation of compounds and the heats of chemical reaction, the theory of rate processes and chemical equilibria, orbital theory and chemical bonding, surface chemistry (including catalysis and finely divided particles) the principles of electrochemistry and ionization. Although physical chemistry is closely related to both inorganic and organic chemistry, it is considered a separate discipline.

physical constants. Measured values of properties expressible in strictly physical terms; for the purpose of chemistry, they concern characteristics of chemical substances, such as atomic weight, vapor density, etc.

physical map. A map of the locations of identifiable landmarks on DNA (e.g., restriction-enzyme cutting sites, genes), regardless of inheritance. Distance is measured in base pairs. For the human genome, the lowest-resolution physical map is the banding patterns on the 24 different chromosomes; the highest-resolution map is the complete nucleotide sequence of the chromosomes.

physiological salt solution. A solution of sodium chloride and water (0.9%) that is identical with the concentration found in the body. Also called isotonic salt solution.

Use: Medicine to replace acute loss of water as from burns, etc.

physostigmine. (eserine; calabarine).

CAS: 57-47-6. $C_{15}H_{21}O_2N_3$. An alkaloid.

Properties: Colorless or pinkish crystals. Mp 86–87C and 105–106C (unstable and stable forms), specific rotation –119 to –121 degrees. Slightly soluble in water; soluble in alcohol and dilute acids.

Derivation: By solvent extraction from the seeds of *Physostigma venenosum*.

Grade: USP.**Hazard:** Toxic by ingestion.**Use:** Medicine (anticholinesterase). Available as the salicylate and sulfate.

phytane. (2,6,10,14-tetramethylhexadecane).

$C_{20}H_{42}$. A hydrocarbon found in rock specimens 2.5–3 billion years old. Known to be synthesized only by living organisms (is a derivative of chlorophyll) and to withstand heat and pressure, so helps to date the existence of life on earth.

See pristane.

phytic acid. (inositolhexaphosphoric acid).

CAS: 83-86-3. $C_6H_6[OPO(OH)_2]_6$. Occurs in nature in the seeds of many cereal grains, generally as the insoluble calcium-magnesium salt. It inhibits absorption of calcium in the intestine.

Properties: White to pale-yellow liquid; odorless; acid taste. D 1.58, bulk d 13.1 lb/gal. Soluble in water and alcohol, pH less than 1.0 (in 1% solution).

Derivation: From corn steep liquor.**Grade:** Technical (as a 70% solution).

Use: Chelation of heavy metals in processing of animal fats and vegetable oils, rust inhibitor, preparation of phytate salts, metal cleaning, treatment of hard water, nutrient.

phytochemistry. That branch of chemistry dealing with (1) plant growth and metabolism and (2) plant products. The former includes the absorption of inorganic nutrients (nitrogen, phosphorus, potassium, carbon dioxide, water, etc.) to form sugars, starches, proteins, fats, vitamins, etc. and is closely associated with photosynthesis. Plant products comprise a vast group of natural materials and chemicals; besides those used directly as foods, these include alkaloids, cellulose, lignin, dyes, glucosides, essential oils, resins, gums, tannins, rubbers, terpene hydrocarbons, and glycerides (fats and oils). Some of these are basic raw materials for industry (paper, pharmaceuticals, food, paint, perfume, flavoring, leather, rubber); there are also many miscible plant products such as drugs, poisons, and pigments. Phytochemistry also embraces the study of plant hormones or growth regulators (auxin, gibberellin, synthetic types).

phytol.

CAS: 150-86-7. $C_{20}H_{40}O$. An alcohol obtained by the decomposition of chlorophyll.

Properties: Odorless liquid. BP 202–204C (10 mm Hg), d 0.8478 (25/4C). Soluble in the common organic solvents; insoluble in water. Combustible.

Use: Synthesis of vitamins E and K.

phytonadione. (2-methyl-3-phytyl-1,4-naphthoquinone; vitamin K_1). $CH_3C_{10}H_7O_2C_{20}H_{39}$.

Properties: Clear, yellow, viscous liquid; odorless. D 0.967 (25/25C), refr index 1.5230–1.5252 (25C),

stable in air. Protect from sunlight!! Insoluble in water; soluble in benzene, chloroform, and vegetable oils; slightly soluble in alcohol.

Derivation: Synthetically from 2-methyl-1,4-naphthoquinone and phytol.

Grade: USP.

Use: Food supplement.

phytosterol. Sterol alcohols from plants.

See sterol.

pi bond. A covalent bond formed between atoms by electrons moving in orbitals that extend above and below the plane of an organic molecule containing double bonds. A double bond consists of one pi and one sigma bond, and a triple bond consists of one sigma and two pi bonds.

See metallocene; orbital theory.

pibutidine hydrochloride.

CAS: 126463-66-9. mf: $C_{19}H_{24}N_4O_3 \cdot ClH$.

Hazard: Moderately toxic by ingestion. A reproductive hazard.

pickle alum. See aluminum sulfate.

pickle liquor. A waste solution of metal salts resulting from the cleaning of metals with acids.

pickling. (1) Removal of scale, oxides, and other impurities from metal surfaces by immersion in an inorganic acid, usually sulfuric, hydrochloric, or phosphoric. Rate of scale removal varies inversely with concentration and temperature; the usual concentration is 15% at or above 100C. The rate is also increased by electrolysis. (2) A method of food preservation involving use of salt, sugar, spices, and organic acids (acetic). (3) Preserving or preparing hides for tanning by immersion in a 6–12% salt solution, together with enough acid to maintain pH at 2.5 or less.

pictoram. (4-amino-3,5,6-trichloropicolinic acid).

CAS: 1918-02-1. $C_6H_3Cl_3N_2O_2$.

Properties: Crystalline solid. Mp 218C.

Hazard: Toxic by ingestion and inhalation. Use has been restricted. TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Herbicide and defoliant.

pico- Prefix meaning 10⁻¹² unit (symbol = p); e.g., 1 pg = 1 picogram = 10⁻¹² gram.

picrocurie. One trillionth (10⁻¹²) of a curie. A standard measure of the intensity of radiation.

α-picoline. (2-methylpyridine; 2-picoline).

CAS: 109-06-8.

$C_5H_4N(CH_3)$ or $NC(CH_3)CHCHCH$.

Properties: Colorless liquid; strong unpleasant odor. D 0.952, bp 129C, fp -69.9C, refr index 1.4957 (20C), miscible with water and alcohol, flash p 102F (39C) (OC), autoign temp 1000F (537C). Combustible.

Derivation: From cyclohexylamine plus ammonia and zinc chloride, also from coal tar and bone oil.

Hazard: Moderate fire risk. Irritant.

Use: Organic intermediate for pharmaceuticals, dyes, rubber chemicals, solvent, source for vinyl pyridine, laboratory reagent.

β-picoline. (3-methylpyridine; 3-picoline).

CAS: 108-99-6.

Properties: Colorless liquid; unpleasant odor. Bp 143.5C, fp -18.3C, d 0.9613 (15/4C), refr index 1.5060 (20C). Soluble in water, alcohol, and ether. Combustible.

Derivation: From cyclohexylamine plus ammonia and zinc chloride, also from coal tar and bone oil.

Hazard: Moderate fire risk. Irritant.

Use: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides, preparation of nicotinic acid and nicotinic acid amide, water-proofing agents, laboratory reagent.

γ-picoline. (4-methylpyridine; 4-picoline).

CAS: 108-89-4.

$NCHCHC(CH_3)CHCH$.

Properties: Colorless, moderately volatile liquid. D 0.957 (15/4C), bp 144.9C, refr index 1.5050 (20C), mp 3.8C. Soluble in water, alcohol, and ether. Flash p 134F (56.6C) (OC). Combustible.

Derivation: From cyclohexylamine plus ammonia and zinc chloride, also from coal tar and bone oil.

Hazard: Moderate fire risk. Irritant.

Use: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, pesticides and water-proofing agents, laboratory reagent, making isoniazid, catalyst, curing agent.

picoline-N-oxide. (2-picoline-N-oxide).

$N(O)C(CH_3)CHCHCHCH$.

Properties: Crystals. Mp (2-isomer) 49.5C, (3-isomer) 40.5C, (4-isomer) 186.3C. Very soluble in water. Combustible.

Use: Organic synthesis.

4-picolyamine. $(CH_2NH_2)CHCHNCHCH$. A heterocyclic compound, pyridine derivative, highly reactive, strong base. Combustible.

Use: Manufacture of polyamides, epoxy curing agents, carbinols, and amine polyols.

picramic acid. (picraminic acid; 2-amino-4,6-dinitrophenol; dinitroaminophenol).
CAS: 96-91-3. $C_6H_2(NO_2)_2(NH_2)OH$.

Properties: Red crystals. Mp 168C. Soluble in alcohol, benzene, glacial acetic acid, aniline, and ether; sparingly soluble in water.

Derivation: By partial reduction of picric acid.

Hazard: May explode when shocked or heated, dangerous fire risk.

Use: Azo dyes, reagent for albumin.

picramide. Legal label name (Air) for trinitroaniline.

picraminic acid. See picramic acid.

picric acid. (picronitric acid; trinitrophenol; nitroanthanic acid; carbazotic acid; phenoltrinitrate).

CAS: 88-89-1. $C_6H_2(NO_2)_3OH$.

Properties: Yellow crystals; very bitter taste. D 1.767, mp 122C, explodes at 300C. Soluble in water, alcohol, chloroform, benzene, and ether.

Derivation: Nitration of phenolsulfonic acid, obtained by heating phenol with concentrated sulfuric acid.

Grade: Technical paste, pure paste.

Hazard: Severe explosion risk when shocked or heated, especially reactive with metals or metallic salts. Toxic by skin absorption. TLV: 0.1 mg/m³.

Use: Explosives, matches, electric batteries, etching copper, mordant in textile dyeing, reagent, picrates.

picrolonic acid. (3-methyl-4-nitro-1-(*p*-nitrophenyl)-5-pyrazolone).

$NO_2C_6H_4NNC(CH_3)C(NO_2)COH$.

Properties: Yellow leaflets. Mp 116–117C, decomposes 125C. Slightly soluble in water; soluble in alcohol.

Use: Reagent for alkaloid identifications; tryptophan and phenylalanine; detection and estimation of calcium.

picronitric acid. See picric acid.

picropodophyllotoxin.

CAS: 477-47-4. mf: $C_{22}H_{22}O_8$.

Hazard: A poison.

Source: Natural product.

picrotoxin. (cocculin).

CAS: 124-87-8. $C_{30}H_{34}O_{13}$. A glucoside.

Properties: Flexible, shining, prismatic crystals or microcrystalline powder; odorless; very bitter taste. Stable in air; affected by light. Mp 200C. Soluble in boiling water, boiling alcohol, dilute acids, and alkalis; sparingly soluble in ether and chloroform.

Derivation: Derived from the fruit of *Anamirta paniculata* or *Cocculus indicus*, fishberries.

Hazard: Toxic in overdose.

Use: Medicine, as CNS stimulant and antidote for barbiturate poisoning.

picryl chloride. (2-chloro-1,3,5-trinitrobenzene). $C_6H_2(NO_2)_3Cl$.

Hazard: Severe explosion and fire risk. A high explosive.

Pictet-Gams isoquinoline synthesis. Formation of isoquinolines by cyclization of acylated aminomethyl phenyl carbinols or their ethers with phosphorus pentoxide in toluene or xylene.

Pictet-Hubert reaction. Phenanthridine cyclization by dehydrative ring closure of acyl-*o*-aminobiphenyls on heating with zinc chloride at 250–300C or with phosphorus oxychloride in boiling nitrobenzene.

Pictet-Spengler isoquinoline synthesis.

Formation of tetrahydroisoquinoline derivatives by condensation of β -arylethylamines with carbonyl compounds and cyclization of the Schiff bases formed.

“Pictol” [Mallinckrodt]. TM for monomethyl-*p*-aminophenol sulfate, a photo developer.

PIDA. Abbreviation for phenylindane dicarboxylic acid.

See 1,1,3-trimethyl-5-carboxy-3-(*p*-carboxyphenyl)indane.

Pidgeon process. (ferrosilicon process; silicothermic process). Process for the production of high-purity magnesium metal from dolomite or magnesium oxide by reduction with ferrosilicon at 1150C under high vacuum.

piezochemistry. Study of reactions occurring at very high pressures, e.g., in the interior of the earth's crust.

piezoelectricity. Electric energy created by application of pressure to ceramics or plastics. Devices utilizing this phenomenon are gas flame igniters, ultrasonic welding tools, and sonar navigation aids.

pig iron. Product of blast-furnace reduction of iron oxide in the presence of limestone. About half the ore is converted to iron. Average analysis is 1% silicon, 0.03% sulfur, 0.27% phosphorus, 2.4% manganese, 4.6% carbon, balance iron. Pig iron is the basic raw material for steel and cast iron. In metal terminology a "pig" is a bar or ingot of cooled metal.

See iron.

pigment. Any substance, usually in the form of a dry powder, that imparts color to another substance or mixture. Most pigments are insoluble in organic solvents and water; exceptions are the natural organic pigments, such as chlorophyll, which are generally organosoluble. To qualify as a pigment, a material must have positive colorant value. This definition excludes whitening, barytes, clays, and talc.

See fillers.

Some pigments (zinc oxide, carbon black) are also reinforcing agents, but the two terms are not synonymous; in the parlance of the paint and rubber industries these distinctions are not always observed. Pigments may be classified as follows:

I. Inorganic

- (a) Metallic oxides (iron, titanium, zinc, cobalt, chromium)
- (b) Metal powder suspensions (gold, aluminum)
- (c) Earth colors (siennas, ochers, umbers)
- (d) Lead chromates
- (e) Carbon black

II. Organic

- (a) Animal (rhodopsin, melanin)
- (b) Vegetable (chlorophyll, xanthophyll, indigo, flavone, carotene)

See pigment, plant

- (c) Synthetic (phthalocyanine, lithos, toluidine, para red, toners, lakes, etc.)

See dye, natural; dye, synthetic.

Pigment Blue 15. (CI 74160). $C_{32}H_{16}N_8Cu$. A bright-blue copper phthalocyanine pigment.

Derivation: By heating phthalonitrile with cuprous chloride.

Use: In paints, alkyd resin enamels, printing inks, lacquers, rubber, resins, papers, tinplate printing, colored chalks, and pencils.

See phthalocyanine.

Pigment Blue 19. (CI 42750A).

$C_{32}H_{28}N_2O_4SNa$. A bright-blue to bright-reddish-navy triphenylmethane pigment.

Use: Coloring for candles.

Pigment Blue 24. (CI 42090).

$C_{37}H_{34}N_2O_9S_3Na_2$. A bright-greenish-blue triaryl-methane pigment.

Use: Printing inks, especially for tinplate printing; rubber; plastics; artist colors; lacquers.

Pigment E. See barium potassium chromate.

Pigment Green 7. (CI 74260).

$C_{32}O_{11}N_8Cl_{15-16}Cu$. A bright-green chlorinated copper phthalocyanine pigment.

Derivation: Heating copper phthalocyanine in sulfur dichloride under pressure.

Use: Paints, printing inks, lacquers, leather and book cloth, paper surfacing, chalks, colored pencils.

pigment, plant. Any of a large number of organic natural colorants produced by living plants, with the exception of fungi and lichens.

They may be classified into three groups:

- (1) The chlorophylls (types a, b, and c): Green color; they are magnesium-containing porphyrins and are technically considered to be microcrystalline waxes
- (2) The carotenoids: yellow and orange colors
 - (a) Carotene (straight-chain hydrocarbon)
 - (b) Xanthophyll (straight-chain hydrocarbon containing two oxygen atoms)
- (3) The flavanoids: red, yellow, blue, orange, ivory colors; they are oxygen-containing heterocyclic compounds
 - (a) Catechins
 - (b) Flavones, flavanols, anthocyanins
 - (c) Flavonones and leucoanthocyanidins
 - (d) Flavonols

Some of these pigments can be made synthetically. They have limited use as textile colorants and pharmaceutical products.

pigment, precipitated. See lake.

pigment volume concentration. See PVC (2).

Pigment Yellow 12. (CI 21090).

CAS: 6358-85-6. $C_{32}H_{26}Cl_2N_6O_4$. A yellow diazo pigment.

Method of purification: Condensation of 3,3'-dichlorobenzidine di-diazotate with acetoacetanilide.

Use: Printing inks, lacquers resistant to heat and solvents, in rubber and resins, in paper coloring, textile printing.

See diazotization.

"Pilate" Fast Dyes [BASF]. TM for 1:1 metal complex dyes for dyeing and printing textiles of animal fibers and union materials of wool and nylon fibers.

pilchard oil. An oil expressed from the pilchard fish, a member of the herring family.

Properties: Pale-yellow liquid, deposits stearin on long standing. D 0.931-0.933, saponification value 186-189.6, refr index 1.4751 (40C). Combustible.

Use: Potash soft soap, paints.

pill press. A press for making small compacts in powder metallurgy.

pilot plant. A trial assembly of small-scale reaction and processing equipment that is the intermediate stage between laboratory experiment and full-scale operation in the production of a new product. The functions of this stage are (1) to furnish chemical engineers with design data needed to construct a large-scale plant, (2) to resolve the many problems inherent in conversion from batch to continuous production, (3) to eliminate the differences that accompany change from constant laboratory conditions to a less closely controlled environment, and (4) to provide management with a basis for cost evaluation and estimation of the capital requirements of the new product. Because the size of the pilot plant varies with the nature of the product, it must be determined on an individual basis.

Piloty-Robinson synthesis. Formation of pyroles by heating azines of enolizable ketones with acid catalysts, usually zinc chloride or hydrochloric acid.

pilsicainide hydrochloride hemihydrate.
CAS: 88069-49-2. mf: $C_{17}H_{24}N_2O \cdot ClH \cdot 1/2H_2O$.
Hazard: A poison by ingestion.

***l*-pimaric acid.** (levopimaric acid). $C_{20}H_{30}O_2$.
Properties: Solid. Mp 150C, optical rotation ($[a]_{20}^D$) -280 degrees ($c = 0.7$ in alcohol). Soluble in most organic solvents; insoluble in water. Combustible.
Derivation: From pine gum.
Use: Resins.
See maleo-pimaric acid.

pinelic acid. (1,7-heptanedioic acid).
CAS: 111-16-0. $OOC[CH_2]_5COOH$.
Properties: Crystals. Mp 105–106C. Slightly soluble in water; soluble in alcohol and ether; nearly insoluble in cold benzene. Combustible.
Use: Biochemical research, polymers, plasticizers.

pinelic ketone. See cyclohexanone.

pinacoid. Crystal form that consists of exactly two parallel faces.

pinacolone. (pinacolone; methyl-*t*-butyl ketone; 3,3-dimethyl-2-butanone).
CAS: 75-97-8. $CH_3COC(CH_3)_3$.
Properties: Bp 106C, refr index 1.3964 (20C), d 0.801, flash p 75F (23C).

Pinacol rearrangement. Acid-catalyzed rearrangement of vicinal glycols to aldehydes and ketones.

pinacolone. (pinacolone; methyl-*t*-butyl ketone; 3,3-dimethyl-2-butanone).
CAS: 75-97-8. $CH_3COC(CH_3)_3$.

Properties: Bp 106C, refr index 1.3964 (20C), d 0.801, flash p 75F (23C).

pindone. Coined name for 2-pivaloyl-1,3-indandione.

α -pinene. $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine.

Properties: Colorless, transparent liquid; terpene odor. D 0.8620–0.8645 (15.5/15.5C), refr index 1.4655–1.4670 (20C), boiling range 95% between 156 and 160C, fp -40C, flash p 90F (32.3C) (TCC), occurs in *d*-, *l*-, and racemic forms. Insoluble in water; soluble in alcohol, chloroform, and ether.
Hazard: Flammable, moderate fire risk. Skin irritant.
Use: Solvent for protective coatings, polishes, and waxes; synthesis of camphene, camphor, geraniol, terpin hydrate, terpineol, synthetic pine oil, terpene esters and ethers, lubricating oil additives, flavoring odorant.

β -pinene. (nopinene). $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine.

Properties: Colorless, transparent liquid; terpene odor. Insoluble in water; soluble in alcohol, chloroform, and ether. D 0.8740–0.8770 (15.5/15.5C), refr index 1.4775–1.4790 (20C), boiling range 95% between 164 and 169C, flash p 117F (47.2C), levorotatory. Combustible.
Hazard: Fire risk.

Use: Polyterpene resins, substitute for α -pinene, intermediate for perfumes and flavorings.

pinene hydrochloride. See bornyl chloride.

pine oil.
Properties: Colorless to light amber liquid; strong, piny odor. D 0.927–0.940, refr index 1.4780–1.4820 (20C), distilling range 200–225C, flash p 172F (77.7C) (CC). Miscible with alcohol. Combustible. Chief constituents: Tertiary and secondary terpene alcohols.

Derivation: From the wood of *Pinus palustris* by extraction and fractionation or by steam distillation; also from turpentine.

Use: Odorant, disinfectant, penetrant, wetting agent, preservative (textile and paper industries), laboratory reagent, fragrances.

pine tar.
Properties: Sticky, viscous, dark-brown to black liquid or semisolid; strong odor; sharp taste. Translucent in thin layers, hardens with aging. D 1.03–1.07, boiling range 240–400C, flash p 130F (54.4C) (CC). Soluble in alcohol, acetone, fixed and volatile oils, and in sodium hydroxide solution; slightly soluble in water. Combustible. Chief constituents: Complex phenols, turpentine, rosin, toluene, xylene, and other hydrocarbons.

Derivation: By destructive distillation of pine wood, especially *Pinus palustris*.

Grade: Kiln burnt, retort, NF.

Hazard: Fire risk, subject to spontaneous heating.

Use: Ore flotation, roofing compositions, paints and varnishes, softener in plastics and rubber processing, tar soaps, deKhotinsky cement, asphaltic compositions, marine preservative, medicine (cough syrups), laboratory reagent.

pine tar oil. See tar oil; wood.

pine tar pitch. The residue after distillation of practically all the volatile oils from pine tar. Similar to coal-tar pitch.

pinhole. (1) A small hole in electrical insulating tape caused by failure of the rubber coating to penetrate the fabric. The acceptable number of pinholes per unit area is subject to specification. (2) In paints, the presence of pimples or tiny holes in a coating.

Pinner reaction. Formation of imino esters (alkyl imidates) by addition of dry hydrogen chloride to a mixture of a nitrile and an alcohol. Treatment of alkyl imidates with ammonia or primary or secondary amines affords amidines, while treatment with alcohols yields ortho-esters.

Pinner triazine synthesis. Preparation of 2-hydroxy-4,6-diaryl-*s*-triazines by reaction of aryl amidines and phosgene.

pinocarveol. See 1-octen-3-yl acetate.

"Pinova" [Hercules, Ltd.] TM for a pale wood rosin derivative

Use: For adhesives, flavor, and construction applications.

pintsch gas. See oil gas.

pipicoline. See 2-methylpiperidine.

piperalin. [3-(2-methylpiperidino)propyl-3,4-dichlorobenzoate].

CAS: 3478-94-2. $\text{CH}_3\text{C}_2\text{H}_9\text{N}(\text{CH}_2)_5\text{OC}(\text{O})\text{C}_6\text{H}_3\text{Cl}_2$.

Properties: Amber liquid. Bp 156–157°C (0.2 mm Hg). Slightly soluble in water; miscible with paraffin hydrocarbon, aromatic hydrocarbon, and chlorinated hydrocarbon solvents.

Use: Fungicide.

piperazine. (diethylenediamine; pyrazine hexahydride; piperazidine).

CAS: 110-85-0.

$\text{NHCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$.

Properties: Colorless, deliquescent, transparent, needlelike crystals that absorb carbon dioxide from the air. Mp 104–107°C, bp 145°C, flash p 190°F (87.7°C). Soluble in water, alcohol, glycerol, and glycols. Combustible.

Derivation: Treatment of ethylene bromide or chloride with alcoholic ammonia at 100°C.

Use: Corrosion inhibitor, anthelmintic, insecticide, accelerator for curing polychloroprene.

piperazine dihydrochloride.

CAS: 142-64-3. $\text{C}_4\text{H}_{10}\text{N}_2 \cdot 2\text{HCl}$.

Properties: White needles. Soluble in water.

Available forms: The monochloride, $\text{C}_4\text{H}_{10}\text{N}_2 \cdot \text{HCl}$, is commercially available.

Hazard: TLV: 5 mg/m³.

Use: Fibers, insecticides, pharmaceuticals.

piperazine hexahydrate. $\text{C}_4\text{H}_{10}\text{N}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals. Mp 44°C, bp 125°C. Soluble in water and alcohol.

Use: Fibers, insecticides, pharmaceuticals, laboratory reagent, anthelmintic.

piperidine. (hexahydropyridine; pentamethylenamine).

CAS: 110-89-4.

$\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{NH}$. Completely saturated ring compound.

Properties: Colorless liquid; odor of pepper. D 0.862, bp 106°C, fp –7 to –9°C. Soluble in water, alcohol, and benzene; strong base. Combustible.

Derivation: By electrolytic reduction of pyridine.

Grade: 95 and 98% pure.

Hazard: Toxic by ingestion, strong irritant.

Use: Solvent and intermediate, curing agent for rubber and epoxy resins, catalyst for condensation reactions, ingredient in oils and fuels, complexing agent.

piperidinepentacarbonylchromium. See pentacarbonyl(piperidine)chromium.

piperidine pentamethylene

dithiocarbamate. ("Pippip"). $\text{C}_{11}\text{H}_{22}\text{N}_2\text{S}_2$.

Properties: White powder.

Hazard: Toxic by ingestion, strong irritant to eyes and skin.

Use: Ultraaccelerator for rubber.

9-(piperidinoamino)acridine.

CAS: 28846-40-4. mf: $\text{C}_{18}\text{H}_{19}\text{N}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-piperidinoethanol. (*n*-2-hydroxyethylpiperidine). $\text{C}_5\text{H}_{10}\text{NCH}_2\text{OH}$.

Properties: Colorless liquid. D 0.972–0.974 (20/4°C), bp 115–117°C (45 mm Hg), refr index 1.478–1.480 (20°C). Miscible with water and most organic solvents.

Use: Intermediate.

piperocaine hydrochloride. (3-(2-methylpiperidyl)propyl benzoate hydrochloride).

CAS: 533-28-8. $\text{C}_{16}\text{H}_{23}\text{NO}_2 \cdot \text{HCl}$.

Properties: White, crystalline powder; odorless; bitter taste. Stable in air. Mp 172–175C. Solution (1 in 10) acid to litmus; soluble in water, alcohol, and chloroform; almost insoluble in ether and fixed oils.
Use: Medicine (local anesthetic).

piperonal. (heliotropin; piperonyl aldehyde; 3,4-methylenedioxybenzaldehyde).

CAS: 120-57-0. $C_8H_8(CH_2)OOCHO$ (bicyclic).

Properties: White, shining crystals; turns red-brown on exposure to light; floral odor. Mp 35.5–37C, bp 263C. Soluble in alcohol and ether; slightly soluble in water and glycerol. Combustible.

Derivation: By oxidation of isosafrole.

Grade: Technical, FCC.

Use: Perfumery, suntan preparations, mosquito repellent, laboratory reagent, flavoring.

piperonyl butoxide. (generic name for α -[2-(2-butoxyethoxy)-ethoxy]-4,5-(methylenedioxy)-2-propyltoluene).

CAS: 51-03-6.
 $C_{13}H_{18}O_4$

Properties: Light-brown liquid; mild odor. D 1.06 (25C), refr index 1.50 (20C), bp 180C (1 mm Hg), flash p 340F (171C). Insoluble in water; soluble in alcohol, benzene, petroleum hydrocarbons. Combustible.

Use: Synergist in insecticides in combination with pyrethrins in oil solutions, emulsions, powders, or aerosols.

piperonyl cyclonene. (generic name for a mixture of 3-alkyl-6-carbomethoxy-5-(3,4-methylenedioxyphenyl)-2-cyclohexen-1-one and 3-alkyl-5-(3,4-methylenedioxyphenyl)-2-cyclohexen-1-one).

$(CH_2O)_2C_6H_3CHCH_2C(O)CH:CRCH_2$. R is usually C_6H_{13} .

Properties: Red liquid. Insoluble in water, oils, and refrigerant 12. Flash p 290F (143C). Combustible.

Use: Synergist in insecticides in combination with rotenone, pyrethrins, or rotenone-pyrethrin mixture in oil solutions, emulsions, or powders.

“Pipersin.” TM for a substitute for oleoresin of black pepper. Officially recognized by USDA Meat Inspection Division for use under its supervision.

piperylene. (1,3-pentadiene).

$CH_2:CHCH:CHCH_2$, *cis*- and *trans*- forms.

Properties: Colorless liquid. D 0.693 (60/60F), fp (*cis*) –141C, (*trans*) –87C; bp (*cis*) 44C, (*trans*) 42C; refr index (*cis*) 1.43634 (20C), (*trans*) 1.43008 (20C); flash p (mix) –20F (–28.8C). Insoluble in water; soluble in alcohol and ether.

Hazard: Highly flammable, dangerous fire risk.

Use: Polymers, maleic anhydride adducts, intermediate.

pipette. (pipet). A slender glass tube open at both ends and having an expanded area at or near the center designed to contain a specific volume of liquid, e.g., 5 ml. Liquid is drawn into the tube by oral or, for the sake of safety, some other form of suction.
Use: Transferring measured volumes of liquid from one container to another.

pirfloxacin. See 6-fluoro-7-(1-pyrrolyl)-1-ethyl-1,4-dihydro-4-oxo-3.

Piria reaction. Formation of arylsulfamic acids or sulfonation products or both by refluxing aromatic nitro compounds with a metal sulfite and boiling the mixture with dilute acid to yield the amines and sulfamic acids.

piroctone olamine.

CAS: 68890-66-4. mf: $C_{14}H_{23}NO_2 \cdot C_2H_7NO$.

Hazard: Low toxicity by ingestion. A reproductive hazard.

“Piror” [Dow]. TM for high-performance microbicides based on glutaraldehyde.

Use: Papermaking, industrial-process and cooling water systems, and industrial preservatives.

See glutaraldehyde.

pitch. (1) A carbonaceous, tacky residue resulting from distillation of coal tar, petroleum, pine tar, and fatty acids. Some types, such as glance pitch, occur naturally. They are used chiefly as sealants, roofing compounds, and wood preservatives. Synthetic carbon fibers are made from petroleum pitch. (2) In papermakers' terminology, a mixture of calcium carbonate, calcium soaps from wood components, and miscellaneous residues from materials used in paper manufacture. Pitch of this type is a production nuisance that requires close control. (3) The degree of slope of an inclined plane as in a screw or auger, as measured by the distance between the flights or threads.

pitchblende. A massive variety of uraninite or uranium oxide found in metallic veins. Contains 55–75% UO_2 , up to 30% UO_3 , usually a little water, and varying amounts of other elements. Thorium and the rare earths are generally absent.

Properties: Black color, brownish-black streak, pitchy to dull luster. Mohs hardness 5.5, d 6.5–8.5.

Occurrence: Canada, Colorado, Europe, Zaire.

Hazard: Radioactive material.

Use: Most important ore of uranium, original source of radium.

“Pittclor” [PPG].

CAS: 7778-54-3. TM for calcium hypochlorite.

Use: Water sanitizer.

pituitrin. (coluitrin; hypophysin; pitilobin).

Use: Antidiuretic hormone.

Pitzer equation. Equation for the approximation of data for heats of vaporization for organic and simple inorganic compounds. It is derived from temperature and reduced temperature relationships.

pivalic acid. See trimethylacetic acid.

pivalic acid, sodium salt. See sodium 2,2-dimethylpropanoate.

2-pivaloyl-1,3-indandione. (pivalyl-1,3-indandione; pindone).

CAS: 83-26-1. $C_9H_8O_4C(O)C(CH_3)_2$.

Properties: Bright-yellow powder or crystals. Mp 109C. Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by inhalation and ingestion; inhibits blood clotting. TLV: 0.1 mg/m³.

Use: Rodenticide, insecticide, pharmaceutical intermediate.

“Pizazz” [Century Foods]. TM for a firm and uniform cheese.

Use: Minimizes fines when shredded and reduces loss.

pK. A measure of the completeness of an incomplete chemical reaction. It is defined as the negative logarithm (to the base 10) of the equilibrium constant, K, for the reaction in question. The pK is most frequently used to express the extent of dissociation or the strength of weak acids (particularly fatty acids), amino acids, and complex ions or similar species. The weaker an electrolyte, the larger is its pK. Thus, at 25C for sulfuric acid (strong acid), pK is about -3.0; acetic acid (weak acid), pK = 4.76; boric acid (very weak acid) pK = 9.24. In a solution of a weak acid, if the concentration of undissociated acid is equal to the concentration of the anion of the acid, the pK will be equal to the pH.

Plait point. Composition conditions in which the three coexisting phases of partially soluble components of a three-phase liquid system approach each other in composition.
See triple point.

Planck’s constant. (*h*). A constant that when multiplied by the frequency of radiation gives the quantity of energy contained in one quantum. Equal to $6.626176(36) \times 10^{-19}$ JHz⁻¹.

planetology, chemical. See chemical planetology.

plankton. Microscopic plant and animal life that floats in the oceans or in lake waters.

plant. (1) Any large-scale manufacturing unit including pipelines, reaction equipment, machinery, etc.

(2) A broad group of vegetable organisms comprised of all types of vegetation that contain chlorophyll (algae, mosses, grasses, vegetables, trees, etc. but excluding fungi). Their metabolic processes are vital to the maintenance of life on earth and result in the following products: (1) oxygen (from respiration), (2) carbohydrates (from photosynthesis), (3) amino acids and proteins (from nitrates and nitrogen-fixing bacteria), (4) fats and oils, (5) vitamins, (6) natural fibers, (7) coal, (8) various other substances of value such as alkaloid drugs, rubber, etc.
See photosynthesis; phytochemistry.

plant growth regulator. An organic compound either natural or synthetic that modifies or controls one or more specific physiological processes within the plant. If the compound is produced by the plant it is called a plant hormone, e.g., auxin, which regulates the growth of longitudinal cells involved in bending of the stem one way or another. Substances applied externally also bring about modifications such as improved rooting of cuttings, increased rate of ripening (ethylene), and easier scission (separation of fruit from stem). A large number of chemicals tend to increase the yield of certain plants such as sugarcane, corn, etc. All these, as well as plant-produced hormones, are included in the term *plant growth regulator*.

See dinitrobutylphenol; kinin; gibberellin; abscisic acid.

plant location. Selection of a site for a new chemical or process industry plant. The problem has been compounded in recent years by the increasing number of environmental regulations and energy shortage. Among the more important considerations are (1) accessibility of essential materials, including water; (2) transportation of finished product (rail, air, truck, barge); (3) reliability of fuel and power supply; (4) liquid and solid waste-disposal restrictions; (5) commuting distance for employees in view of gasoline consumption; (6) availability of housing for employees; (7) state and local regulations (zoning, hazardous chemicals, building codes); (8) availability of qualified labor; (9) taxation; (10) weather factors (temperature range, severe storms, floods, etc.); (11) expansion possibilities.

“Plas-Chek” [Ferro]. TM for plasticizers.

“Plasdone” [International Specialty]. TM for the pharmaceutical grade of polyvinylpyrrolidone.

Use: Tablet binding and coating agent, detoxicant and demulcent lubricant in ophthalmic preparations, film-forming agent in medical aerosols.

plasma. (1) The portion of the blood remaining after removal of the white and red cells and the platelets; it differs from serum in that it contains fibrinogen, which induces clotting by conversion into fibrin by activity of the enzyme thrombin. Plas-

ma is made up of more than 40 proteins and also contains acids, lipids, and metal ions. It is an amber, opalescent solution in which the proteins are in colloidal suspension and the solutes (electrolytes and nonelectrolytes) are either emulsified or in true solution. The proteins can be separated from each other and from the other solutes by ultrafiltration, ultracentrifugation, electrophoresis, and immunochemical techniques.

(2) Two kinds of plasma are recognized by physicists, namely, a particle plasma and a reactor plasma. A particle plasma is a neutral mixture of positively and negatively charged particles interacting with an electromagnetic field, which dominates their motion. Temperatures of 10,000 to 15,000C can be reached. Such plasma, formed by sudden energy releases can be utilized as an energy source, as in magnetohydrodynamics. Reactor plasmas, on the other hand, are composed of positively charged ions of hydrogen isotopes (deuterium, tritium); the electric charge is the controlling factor. These are used in nuclear fusion devices, where temperatures of 74,000,000C have been attained and still higher temperatures are expected. These plasmas also respond to electromagnetic forces that are used to confine them. See magnetohydrodynamics; fusion; tokamak.

plasmalogen. A phospholipid with an alkenyl ether substituent on the C-1 of glycerol.

plasma membrane. Outer membrane of a cell, sometimes called the cell membrane.

plasma proteins. The proteins present in blood plasma—albumin, antibodies, etc.

plasma volume expander. A substance used to partially or wholly replace blood plasma in treatment of the injured. Most important are gelatin, polyvinylpyrrolidone, and dextran.

plasmid. A strand or fragment of genetic material existing outside the chromosomes in certain types of bacteria. R-type plasmids, which are present in *E. coli*, impart resistance to antibiotics in organisms that are exposed to them. The plasmids can be transferred from animals to humans, as well as to other, harmful bacteria that also become resistant to antibiotics. Feeding of traces of antibiotics to animals is believed to promote the growth of *E. coli* and, thus, to produce strains of pathogenic bacteria that are not amenable to antibiotic treatment. For this reason FDA has recommended elimination of certain antibiotics from animal feeds, e.g., penicillin, oxytetracycline, and chlortetracycline. Synthetic plasmids have been used successfully in recombinant DNA research.

plasmin. See fibrinolysin.

plasminogen activator (human tissue-type protein moiety reduced), *n*-(*n*2-(*n*-glycyl-*l*-alanyl)-*l*-arginyl)-, glycoform.

See silteplase.

plasmogamy. A process of fusion of the cytoplasm of two cells; the first step in syngamy.

plasmoguin. (pamaquine; plasmochin; 8-dimethylamino-isoamyl-6-methoxyquinoline).

$C_{19}H_{28}N_2O$.

Properties: Yellow powder. Mw 300.2. Insoluble in water.

Use: Antimalarial.

“Plastacele” [Du Pont]. TM for cellulose acetate flake, a fine white powder used for molding powders, films, sheets, rods, and tubes.

plaster of Paris. See calcium sulfate.

“Plasthall” [Hall]. TM for a broad range of monomeric and polymeric plasticizers used in polymers and elastomers. Types include adipates, glutarates, trimellitates, azelates, sebacates, and tallates.

plastic. (1) Capable of being shaped or molded with or without the application of heat. Soft waxes and moist clay are good examples of this property. See plasticity.

(2) A high polymer, usually synthetic, combined with other ingredients, such as curatives, fillers, reinforcing agents, colorants, plasticizers, etc.; the mixture can be formed or molded under heat and pressure in its raw state and machined to high dimensional accuracy, trimmed, and finished in its hardened state. The thermoplastic type can be resoftened to its original condition by heat; the thermosetting type cannot.

Plastics in general (including all forms) are sensitive to high temperatures, among the more resistant being fluorocarbon resins, nylon, phenolics, polyimides, and silicones, though even these soften or melt above 260C. Other types (cellulosics, polyethylene, acrylic polymers, polystyrene) are combustible when exposed to flame for a short time and still others (polyurethane) burn with evolution of toxic fumes.

Engineering plastics are those to which standard metal engineering equations can be applied; they are capable of sustaining high loads and stresses and are machinable and dimensionally stable. They are used in construction, as machine parts, automobile components, etc. Among the more important are nylon, acetals, polycarbonates, ABS resins, PPO/styrene, and polybutylene terephthalate.

Fibers, films, and bristles are examples of extruded forms. Plastics may be shaped by either compression molding (direct pressure on solid material in a hydraulic press) or injection molding (injection of a measured amount of material into a mold in liquid form). The latter process is most generally used, and

articles of considerable size can be produced. Because of their dielectric properties, plastics are essential components of electrical and electronic equipment (especially for use within the human body).

Plastics can be made into flexible and rigid foams by use of a blowing agent; these foams are light and strong, and the rigid type is machinable. They are collectively called cellular plastics. Plastics can also be reinforced, usually with glass or metallic fibers, for added strength. They are laminated to paper, cloth, wood, etc. for many uses in the packaging, electrical, and furniture industries; they also can be metal-plated. Plastic pipe is widely used for underground transportation of gases and liquids over long distances and intraplant.

Several natural materials (waxes, clays, and asphalts) have rheological properties similar to synthetic products, but because they are not polymeric, are not considered true plastics. Certain proteins (casein, zein) are natural high polymers from which plastics are made (buttons and other small items), but they are of decreasing importance.

Plastics have permeated industrial technology. Not only have they replaced and improved upon many materials formerly used, but they also have made possible industrial and medical applications that would have been impracticable with older technologies. Their major application areas are (1) automobile bodies and components, boat hulls; (2) building and construction (siding, piping insulation, flooring); (3) packaging (vapor-proof barriers, display cartons, bottles, drum linings); (4) textiles (carpets, cordage, suiting, hosiery, drip-dry fabrics, etc.); (5) organic coatings (paint and varnish vehicles); (6) adhesives (plywood, reinforced plastics, laminated structures); (7) pipelines; (8) electrical and electronic components; (9) surgical implants; (10) miscellaneous (luggage, toys, tableware, brushes, furniture, etc.).

The Nobel Prize was awarded in 2000 for work on developing conducting plastics.

For additional information refer to The Society of the Plastics Industry. See polymer, high; cellular plastic; reinforced plastic; foam, plastic; plastic pipe. See Appendix III for a history of the industry.

plastic film. A thermoplastic film less than 0.022 cm (0.010 inch) in thickness.

plastic flow. A type of rheological behavior in which a given material shows no deformation until the applied stress reaches a critical value called the yield value. Most of the so-called plastics do not exhibit plastic flow. Common putty is an example of a material having plastic flow.

plastic foam. See foam, plastic; cellular plastic.

plasticity. A rheological property of solid or semisolid materials expressed as the degree to which they will flow or deform under applied stress and retain the shape so induced, either permanently or for a definite time interval. It may be considered the reverse of elasticity. Application of heat and/or special additives is usually required for optimum results.

See thermoplastic; plasticizer.

plasticizer. An organic compound added to a high polymer both to facilitate processing and to increase the flexibility and toughness of the final product by internal modification (solvation) of the polymer molecule. The latter is held together by secondary valence bonds; the plasticizer replaces some of these with plasticizer-to-polymer bonds, thus aiding movement of the polymer chain segments. Plasticizers are classed as primary (high compatibility) and secondary (limited compatibility). Polyvinyl chloride and cellulose esters are the largest consumers of plasticizers; they are also used in rubber processing. Among the more important plasticizers are nonvolatile organic liquids and low-melting solids (e.g., phthalate, adipate, and sebacate esters), polyols such as ethylene glycol and its derivatives, tricresyl phosphate, castor oil, etc. Camphor was used in the original modification of nitrocellulose to "Celluloid."

See plastisol; softener.

plastic pipe. Tubes, cylinders, conduits, and continuous length piping made (1) from thermoplastic polymers unreinforced (polyethylene, polyvinyl chloride, ABS polymers, polypropylene) or (2) from thermosetting polymers (polyesters, phenolics, epoxies) blended with 60–80% of such reinforcing materials as chopped asbestos or glass fibers to increase strength. The latter type is a reinforced plastic. In general the properties of plastic tubing or pipe are those of the polymers that comprise it. Most have good resistance to chemicals, corrosion, weathering, etc., combined with flexibility, light weight, and high strength. They are combustible but generally slow burning. The reinforced type is widely used as underground conduit for transportation of gases and fluids, including city water services, sewage disposal systems, etc. Its use in buildings is subject to local building codes.

plastic, reinforced. See reinforced plastic.

plastid. Any of several pigmented cytoplasmic organelles found in plant cells and other organisms having various physiological functions, such as the synthesis and storage of food.

plastisol. A dispersion of finely divided resin in a plasticizer. A typical composition is 100 parts resin and 50 parts plasticizer, forming a paste that gels when heated to 150C as a result of solvation of the resin particles by the plasticizer. If a volatile solvent

is included, the plastisol is called an organosol. Plastisols are used for molding thermoplastic resins, chiefly polyvinyl chloride.
See plasticizer.

“Plastisol Ink” [Jinicolor]. TM for all-purpose ink for printing on cotton and polyester fabric.

plate column. Distillation column consisting of a number of perforated, equally spaced, horizontal plates on which a layer of liquid is maintained.

plate efficiency. (1) The number of theoretical plates that are divided by the number of plates actually used in a tower. (2) Overall plate efficiency refers to the number of equilibrium states necessary for a given separation, divided by the number of actual plates required.

platelet. (thrombocyte). A proteinaceous cellular structure occurring in blood in the amount of $150\text{--}500 \times 10^3$ units/mm³. Platelets range from 2 to 4 μm in diameter and contain no nuclei. They are rich in amine compounds, which constrict the blood vessels at the site of an injury, to which the platelets adhere; on dissolution they release thromboplastin, which initiates the coagulation mechanism.
See blood; fibrinogen; thrombin.

platen. A vertically movable plate (deck) of a compression molding press.
See hydraulic press.

platforming. The process in which octane ratings of gasoline are raised by dehydrogenating naphthenes to aromatics, cracking high-boiling paraffins, and isomerizing paraffins to form products of greater chain branching. Desulfurization also takes place in this process.

platinic. Refers to compounds containing tetravalent platinum.

platinic ammonium chloride. See ammonium hexachloroplatinate.

platinic chloride. See chloroplatinic acid, platinum chloride.

platinic oxide. See platinum dioxide.

platinic sal ammoniac. See ammonium hexachloroplatinate.

platinic sodium chloride. See sodium chloroplatinate.

platinic sulfate. See platinum sulfate.

platinous ammonium chloride. See ammonium chloroplatinate.

platinous chloride. See platinum dichloride.

platinous iodide. See platinum iodide.

platinum.

CAS: 7440-06-4. Pt. Metallic element of atomic number 78, group VIII of the periodic table, aw 195.09, valences of 2, 4. There are five stable isotopes.

Properties: Silvery, white, ductile metal. D 21.45, mp 1769C, bp 3827C. Brinell hardness 97, annealed (Vickers) 42. Insoluble in mineral and organic acids. Soluble in aqua regia; attacked by fused alkalis. Does not corrode or tarnish; heated platinum absorbs large volumes of hydrogen. It is also a strong complexing agent. As a catalyst it is abnormally sensitive to poisons.

Occurrence: Canada (Ontario), South Africa, the former U.S.S.R., Alaska. Usually mixed with ores of copper, nickel, etc.

Derivation: By dissolving the ore concentrate in aqua regia, precipitating the platinum by ammonium chloride as ammonium hexachloroplatinate, igniting the precipitate to form platinum sponge. This is then melted in an oxyhydrogen flame or in an electric furnace.

Available forms: Powder (platinum black), single crystals, wire (2 by 0.05–0.005 inches diameter); special composition for electronics, metallizing, and decorating ceramics and metals.

Grade: Physically pure (99.99%), chemically pure (99.9%), crucible platinum (99.5%), commercial (99.0%).

Hazard: Flammable in powdered form. Soluble salts are highly toxic by inhalation. TLV: 1 mg/m³; (soluble salts as Pt) 0.002 mg/m³.

Use: Catalyst (nitric acid, sulfuric acid, high-octane gasoline, automobile exhaust gas converters), laboratory ware, spinnerettes for rayon and glass fiber manufacture, jewelry, dentistry, electrical contacts, thermocouples, surgical wire, bushings, electroplating, electric furnace windings, chemical reaction vessels, permanent magnets.

platinum ammonium chloride. See ammonium hexachloroplatinate; ammonium chloroplatinate.

platinum barium cyanide. See barium cyanoplatinite.

platinum black. Finely divided metallic platinum.

Properties: Black powder, exhibits a metallic luster when rubbed. Soluble in aqua regia, d 15.8–17.6 (apparent).

Derivation: Reduction of solution of a platinum salt with zinc or magnesium.

Hazard: Flammable when dispersed in air.

Use: Catalyst; to absorb gases (hydrogen, oxygen, etc.) that it again liberates at red heat; gas ignition apparatus.

platinum chloride. (platinum tetrachloride; platonic chloride).
CAS: 10025-65-7. (1) PtCl_4 ; (2) $\text{PtCl}_4 \cdot 5\text{H}_2\text{O}$. The platinum chloride of commerce is usually chloroplatinic acid.

Properties: (1) Brown solid, (2) red crystals. Soluble in water and alcohol; (1) d 4.30 (25°C), decomposes at 370°C; (2) d 2.43, mp loses $4\text{H}_2\text{O}$ at 100°C.

Derivation: By solution of platinum in aqua regia and evaporation.

Hazard: TLV: 0.002 mg(Pt)/m³.

Use: See chloroplatinic acid.

platinum-cobalt alloy. A 76.7 platinum/23.3 cobalt alloy forms a more powerful permanent magnet than any other known.

platinum dichloride. (platinous chloride).
 PtCl_2 .

Properties: Greenish-gray powder that forms double salts with the chlorides of the alkali metals. D 5.87, mp decomposes at red heat, yielding platinum. Soluble in hydrochloric acid and ammonium hydroxide; insoluble in water.

Derivation: (1) By heating platinum sponge in the presence of dry chlorine; (2) by heating chloroplatinic acid to 200°C.

Use: Platinum salts.

platinum dioxide. (platonic oxide). PtO_2 .

Properties: Black powder. Soluble in concentrated acids and dilute solutions of potassium hydroxide.

Derivation: Reaction of platonic chloride with excess sodium hydroxide.

Use: Hydrogenation catalyst (forms platinum black when reduced by hydrogen).

platinum iodide. (platinous iodide; platinum diiodide). PtI_2 .

Properties: Heavy black powder. D 6.4, mp 300–350°C (decomposes) Slightly soluble in hydriodic acid; insoluble in alkalis and water.

platinum-iridium alloy. The most important platinum alloy. Commercial alloys contain 1–30% iridium. As the iridium is increased, the hardness of the alloy increases, along with the resistance to chemical attack. The melting point of platinum is raised by the addition of iridium.

Use: Jewelry (“medium” platinum is 95% platinum, 5% iridium; and “hard” platinum is 90% platinum, 10% iridium), electrical contacts (10–25% iridium), fuse wire (10–20% iridium), hypodermic needles (20–30% iridium), and in general where high corrosion resistance is needed.

See iridium.

platinum-lithium. LiPt_2 . Brittle solid, nonreactive with water, made by direct combination at 540°C. If the lithium and platinum are combined at 200°C, the product can be decomposed by water,

hydrolyzing and dissolving the lithium and leaving unusually active platinum catalyst.

platinum metal. Any of a group of six metals, all members of group VIII of the periodic table: ruthenium, rhodium, palladium, osmium, iridium, and platinum. All of these are also transition metals.

platinum potassium chloride. See potassium chloroplatinate.

platinum-rhodium alloys. Alloys containing up to 40% rhodium. Such alloys are harder than platinum but not as hard as the corresponding platinum-iridium alloys. The addition of rhodium to platinum increases the resistance to attack by aqua regia. The melting points of the alloys are higher than those of platinum.

Use: Catalyst in nitric acid production, high-temperature vessels, furnace resistors, thermocouples and resistance thermometers, spinnerette nozzles, components of gas-turbine aircraft engines.

platinum sodium chloride. See sodium chloroplatinate.

platinum sponge.

Properties: Grayish-black, porous mass of finely divided platinum. Soluble in aqua regia.

Derivation: By ignition of ammonium hexachloroplatinate or other salts.

Use: Catalyst.

See platinum black.

platinum sulfate. (platonic sulfate). $\text{Pt}(\text{SO}_4)_2$.

Properties: Greenish-black mass. Hygroscopic; soluble in acids (dilute), alcohol, ether, water.

Hazard: Toxic by inhalation. TLV: 0.002 mg(Pt)/m³.

Use: Analysis (microtesting for bromine, chlorine, iodine).

platinum tetrachloride. See platinum chloride.

platiphillin.

CAS: 480-78-4. mf: $\text{C}_{18}\text{H}_{22}\text{NO}_5$.

Hazard: Moderately toxic by ingestion.

pleated sheet. The side-by-side, hydrogen-bonded arrangement of polypeptide chains in the extended conformation.

pleiotropy. One gene that causes many different physical traits, such as multiple disease symptoms.

“Plenlizer” [Ajinomoto]. TM for a line of plastic resin stabilizers.

plesiomorphy. A primitive character state for the taxa under consideration.

“Plexiglas” [Rohm & Haas]. TM for thermoplastic poly(methyl methacrylate)-type polymers. Available in bead or granular form and sheets.
Use: Manufacture of lenses, ornaments, letters for signs, aircraft canopies and windows, light diffusers, industrial and architectural glazing, chalkboards, boat windshields, and similar products.

“Plexol” [Rohm & Haas]. TM for synthetic lubricants and additives for petroleum oils. Most grades are diesters of dibasic acids; some are polyesters or polyether alcohols. The ester lubricants have very low freezing points, high flash points, little change of viscosity with temperature.

Use: Aircraft-engine lubricants, hydraulic systems, instrument oils, petroleum-base lubricant formulation.

“Plictran” [Dow]. TM for cyhexatin.

pliofilm. Former TM for rubber hydrochloride as transparent base.

“Pliotec” [Eliokem]. TM for a unique water borne resin.

Use: For masonry, concrete, and anti-corrosion coatings.

“Pliotone” [Eliokem]. TM for resins.

Use: In xerographic devices from PCs to high speed lasers, color copies, and latest digital multifunction machines.

“Pliovic” [Goodyear]. TM for homopolymers, vinyl dispersion resin, plastisol, and organosol compounds.

Use: For coatings of rainwear, automotive filters, wall coverings, awnings, flooring, glove dipping, and laminating.

plow. A scraping device of various contours used for dislodging sediment or “mud” accumulated at the bottom of clarifying and thickening tanks. It is activated by a rotating arm that moves it circumferentially around the tank riding close to the bottom; it thus transfers the sedimented material from the periphery to the center of the tank where it is discharged into a hopper. Plows are also used in mixing equipment of the Muller type, where they serve to continuously rake the material being mixed into the path of the Muller wheels.

plumb-. (plumbo-). Containing combined lead.

plumbago. Refers to graphite.

plumbate. A compound containing the negative group, PbO_3^- .

plumbic. The designation for lead compounds in which the lead is tetravalent.

plumbic acid, anhydrous. See lead dioxide.

plumbo-. See plumb-.

plumboplumbic oxide. See lead oxide, red.

plumbous. Refers to lead compounds in which the lead has a valence of two.

plumbous oxide. See litharge.

plumbous sulfide. See lead sulfide.

plumbum. The Latin name for lead, hence the symbol Pb and the names plumbic and plumbous.

“Pluracol” [BASF]. TM for a series of organic compounds used in hydraulic brake and other functional fluids, chemical intermediates, urethane foams, elastomers, and coatings.

“Plurafac” [BASF]. TM for a series of 100% active, nonionic biodegradable surfactants of straight-chain, primary aliphatic oxyethylated alcohols. Available in liquid, paste, flake, and solid form.

Use: Range from light-duty hand dishwashing formulations to heavy-duty industrial detergents, rinse aids, metal cleaners, etc.

pluripotency. The potential of a cell to develop into more than one type of mature cell, depending on environment.

“Pluronic” [BASF]. TM for a nonionic series of 28 related difunctional block-polymers terminating in primary hydroxyl groups with molecular weights ranging from 1,000 to more than 15,000. They are polyoxyalkylene derivatives of propylene glycol. Available in liquid, paste, flake powder, and cast-solid forms.

Use: Defoaming agents, emulsifying and demulsifying agents, binders, stabilizers, dispersing agents, wetting agents, rinse aids, and chemical intermediates.

plutonium. Pu. Synthetic radioactive metallic element with atomic number 94, first prepared in 1941, aw 239.11, valences of 3, 4, 5, 6; there are 15 isotopes (from 232 to 246), 6 allotropic forms. Plutonium-239 (half-life 24,360 years) is produced in a nuclear reactor by neutron bombardment of the non-fissionable isotope ^{238}U . Plutonium is readily fissionable with both slow and fast neutrons and can be used for either nuclear weapons or electric power production. The critical mass of pure ^{239}Pu is 10 lb. One lb reactor-grade material contains a heat energy equivalent of 10^6 kilowatt hours. Weapons-grade plutonium contains up to 7% ^{240}Pu ; though reactor-grade plutonium is somewhat less pure, it can be used for weapons. The Safeguards Manual of the

International Atomic Energy Agency states: “Plutonium of any grade, in either metal, oxide, or nitrate form, can be put in a form suitable for the manufacture of explosive devices in a matter of a few days or weeks.”

According to Glenn T. Seaborg, “in breeder reactors it is possible to create more new plutonium from U-238 than that consumed in sustaining the fission chain reaction. Because of this, plutonium is the key to unlocking the enormous energy reserves in the nonfissionable U-238.” Reactor fuels containing plutonium can be either liquid or solid; since plutonium forms low-melting alloys with a number of metals (gallium, bismuth, tin, iron, cobalt, and nickel), these are often used as liquid reactor fuels. Cerium also may be a component.

Hazard: The most radiotoxic of the elements and one of the most toxic substances known; dangerous ionizing radiation persists indefinitely; a powerful carcinogen. Must be handled by remote control and with adequate shielding.

See breeder.

“**Plyamule**” [Reichhold]. TM for a series of vinyl acetate homopolymers.

“**Plyamine**” [Reichhold]. TM for a group of liquid water-soluble urea-formaldehyde adhesive resins.

Use: Binders in the manufacture of plywood, furniture, wood-particle products, etc.

“**Plyophen**” [Reichhold]. TM for a water-soluble impregnating resin. Penetrates deeply and quickly into wood, canvas, asbestos, paper, and other laminating and molding stocks. Can be diluted as much as 8–10 parts water to 1 part resin for spraying glass fiber or rock wool.

plywood. A composite composed of thin wood veneers (with grains placed at right angles to each other) bonded with a synthetic resin, usually phenol-formaldehyde or resorcinol-formaldehyde. It is superior to metals in strength-to-weight ratio and has low thermal expansion, high heat capacity, and low water absorption.

See laminate; composite.

Pm. Symbol for promethium.

PMA. Abbreviation for phosphomolybdic acid and for pyromellitic acid.

PMDA. Abbreviation for pyromellitic dianhydride.

PMEG. See 9-((2-phosphonylmethoxy)-ethyl)guanidine.

PMHP. Abbreviation for *p*-methane hydroperoxide. A polymerization catalyst.

PMP. Abbreviation for 1-phenyl-3-methyl-5-pyrazolone.

PMTA. Abbreviation for a mixture of phosphomolybdic and phosphotungstic acids.

Use: Making pigments.

See phosphotungstic pigment.

pn. Abbreviation for propylenediamine, as used in formulas for coordination compounds.

See dien; en; py.

“**PNF**” [B. F. Goodrich]. TM for a special-purpose synthetic rubber, a phosphonitrilic fluoroclastomer, said to be flexible at –56C and serviceable up to 176C. Resistant to oils over a wide temperature range. Can be processed on standard equipment.

Po. Symbol for polonium.

podophyllotoxin 4-*o*-glucoside.

CAS: 16481-54-2. mf: C₂₈H₃₂O₁₃.

Hazard: Moderately toxic by ingestion.

POEMS. Abbreviation for polyoxyethylene monostearate.

POEOP. See polyoxyethyleneoxypropylene.

POF. See *dl*- α -lipoic acid.

poise. See centipoise.

poison. (1) Any substance that is harmful to living tissues when applied in relatively small doses. The most important factors involved in effective dosage are (a) quantity or concentration; (b) duration of exposure; (c) particle size or physical state of the substance; (d) its affinity for living tissue; (e) its solubility in tissue fluids; and (f) the sensitivity of the tissues or organs. Sharp distinction between poisons and nonpoisons is not always possible, because many variables must be taken into consideration in each case. Poisons are divided into four classes by the shipping regulatory agencies, as follows:

Poison A: A gas or liquid so toxic that an extremely small amount of the gas or the vapor formed by the liquid is dangerous to life.

Poison B: Less toxic liquids and solids that are hazardous either by contact with the body (skin absorption) or by ingestion.

Poison C: Liquids or solids that evolve toxic or strongly irritating fumes heated or when exposed to air (excluding class A poisons).

Poison D: Radioactive materials. See toxicity; toxic substances.

(2) In nuclear technology, any material with a high capture probability for neutrons that may divert an undesirable number of neutrons from the fission chain reaction.

(3) A substance that reduces or destroys the activity of a catalyst. Carbon monoxide and phosphorus,

arsenic, or sulfur compounds have this effect on the formation of ammonia from hydrogen and nitrogen gases and the gases, must be highly purified to avoid this. Another example is the poisoning of the platinum catalysts used in emission-control devices by organic lead compounds.

poison gas. A toxic or irritant gas or volatile liquid designed for use in chemical warfare or riot control. They vary in toxicity from nerve gases, which are lethal, to tear gases (lachrymators), which cause only temporary disability. See noxious gas; chemical warfare.

Polanyi, John C. (1929–). Awarded the Nobel Prize in chemistry in 1986 jointly with Herschbach and Lee. Herschbach reported that the energies of reactions of colliding beams of isolated alkali metal atoms and alkyl halide molecules appeared mostly as vibrational excited states of products. Polanyi characterized the excited states by the infrared light emitted by product molecules. His work also led to the development of lasers. Born in Germany, Polanyi studied in England and later became a Canadian citizen. Doctorate awarded by Manchester University, England, in 1952.

polar. Descriptive of a molecule in which the positive and negative electrical charges are permanently separated, as opposed to nonpolar molecules in which the charges coincide. Polar molecules ionize in solution and impart electrical conductivity. Water, alcohol, and sulfuric acid are polar in nature; most hydrocarbon liquids are not. Carboxyl and hydroxyl groups often exhibit an electric charge. The formation of emulsions and the action of detergents are dependent on this behavior. See dipole moment.

polar brilliant blue raw. See C.I. acid blue 80.

polarimeter. An instrument for measuring the amount by which the plane of polarization of plane-polarized light is rotated in passing through a medium (usually a liquid).

polarimetry. Measurement of the degrees and direction of the plane of polarized light as it passes through an optically active compound. It is used in the investigation of optical isomers, especially in analysis of sugars.

polarity of characters. The states of characters used in a cladistic analysis, either original or derived. Original characters are those acquired by an ancestor deeper in the phylogeny than the most recent common ancestor of the taxa under consideration. Derived characters are those acquired by the most recent common ancestor of the taxa under consideration.

polarization. In electrochemistry, the increase of solution resistance due to gas accumulation at the electrode or chemical depletion in part of the solution.

polarization concentration. The polarization in an electrolytic cell caused by changes in concentration of electrolyte surrounding the electrode.

polarization current. The reverse current produced by polarization on removal of external electromotive force.

polarized electrode, ideal. A system composed of a metal in contact with an electrolytic solution for which, at equilibrium, the concentration of every charged component is finite in one phase only.

polarized light. See nicol; polarimetry.

polar liquid. A liquid having a dipole moment, as alcohol.

polar molecule. (1) A molecule with a positive charge on one end and a negative charge on its other end. Its vector sum of its bond dipoles is not zero. (2) Molecule in which the electrons forming the valency bond are not symmetrically arranged.

polarogram. A record on a polarograph of a variation in current or current-voltage relation.

polarograph. A device for the automatic electroanalysis of a solution by means of the dropping mercury electrode.

polar solvent. Solvents containing hydroxyl or carbonyl groups, having high dielectric constant and strong polarity.

“Pollectron” [International Specialty]. TM for modified vinylpyrrolidone resins.

Properties: 40% active aqueous emulsion, stable to intense mechanical shear, freeze-thaw cycling. Compatible with other commercial latexes.

Use: Binding agents for wood, cotton, paper, glass fibers; stabilizer, opacifier and dyestuff; medium precoat for photosensitive papers. Adhesive for metal, glass, cotton, paper, and wood.

Polenske number. A measure of the insoluble volatile fatty acids in a sample of fat or oil. The number of cubic centimeters of 0.1 N alkali required to neutralize the water-insoluble volatile acids in a five-gram sample of fat or oil.

polish. (1) A solid powder or a liquid or semiliquid mixture that imparts smoothness, surface protection, or a decorative finish. The most widely used solid polishing agent is fine-ground red iron oxide (rouge), applied to the surface of plate glass, backs

of mirrors, and optical glass. A wide variety of liquid and pastelike polishes are based on vegetable waxes (carnauba and candelilla), combined with softeners, fillers, and pigments or emulsified in alcohol or other solvent. Furniture polishes often contain red oil, lemon oil, and petroleum solvent; most types of metal and wood polish contain organic solvents and, hence, are flammable liquids. Nail polishes are nitrocellulose lacquers, usually with amyl acetate solvent.

See electropolishing.

Hazard: May be flammable.

(2) The hard outer coating of cereal grains, especially rice, which is usually removed in processing. These coatings are rich in vitamin B₁. Their removal robs the cereal of much of its nutritive value.

“**Politol 711**” [Seidler]. TM for a PVC seam sealant.

Use: For joining PVC pipe.

pollucite. Cs₃Al₂Si₉O₂₆•H₂O. A natural cesium aluminum silicate found in pegmatites.

Properties: Colorless. Mohs hardness 6.5, d 2.9.

Use: Source of cesium, catalyst, fluxes, welding materials, ion propulsion, thermocouple units.

pollution. The introduction into any environment of substances that are not normally present therein and that are potentially toxic or otherwise objectionable. The most serious atmospheric contaminants have been (1) sulfur dioxide evolved from the fuels used in electric power production and industrial processing, and (2) automobile exhaust gases rich in carbon monoxide and tetraethyllead residues. The former is being alleviated by mandatory use of low-sulfur fuels and the latter by elimination of tetraethyllead from most gasoline and by use of catalytic converters.

Water pollution due to discharge of toxic chemical wastes is closely regulated by both the EPA and FDA. Such substances are defined in the 1972 amendment of the Federal Water Pollution Control Act as those “which will cause death, disease, cancer, or genetic malfunctions in any organisms with which they come into contact.” Substances added to water for purification purposes (chlorine, aluminum sulfate, etc.) are excluded from the category of pollutants. See Environmental Protection Agency; air pollution; water pollution.

polonium. Po. Radioactive element of atomic number 84, group VIA of the periodic table, aw 210, valences of 2, 4, 6. There are no stable isotopes. Polonium is a member of the uranium natural radioactive decay series, occurring naturally in uranium-bearing ores; it is produced artificially by bombarding bismuth with neutrons. It has been identified in cigarette smoke.

Properties: Similar to those of tellurium. Mp 254C, bp 962C, d 9.4. Dissolved by concentrated sulfuric

and nitric acids and aqua regia, and by dilute hydrochloric acid.

Hazard: Dangerous radioactive poison.

Use: Source of α-radiation and neutrons, instrument calibration, oil-well logging, moisture determination, power source.

See smoke (4).

Polonovski reaction. Demethylation of tertiary (or heterocyclic) amine *N*-oxides on treatment with acetyl chloride or acetic anhydride to give *N*-acylated secondary amines and formaldehyde, along with *O*-acylated aminophenols as a result of a side reaction.

poloxalene. See “Therabloat” [Pfizer].

poloxalene free-choice liquid type C feed. See “Purina Bloat Block” [Purina].

“**Poloxamer 331**” [Sciencelab].

Properties: Average molecular weight 3800. Colorless liquid. D: 1.02, refr index: 1.452. Very slightly soluble in water; soluble in alcohol; insoluble in propylene glycol, ethylene glycol.

Engineering plastics are those to which standard metal TM for a food additive.

poly-. A prefix signifying many. For example, a polymer is an aggregate formed by combination of a number of single molecules.

See polymer, high.

“**Polyac**” [Du Pont]. TM for a butyl rubber conditioner containing 25% poly-*p*-dinitrosobenzene [C₆H₄(NO)₂]_n, with an inert wax. Dark-brown, waxy pellets; d 0.96.

Use: Processing aid and accelerator of vulcanization for butyl rubber.

polyacetal. See acetal resin.

polyacetylene. A linear polymer of acetylene having alternate single and double bonds, developed in 1978. It is electrically conductive, but this property can be varied in either direction by appropriate doping either with electron acceptors (arsenic pentafluoride or a halogen) or with electron donors (lithium, sodium). Thus, it can be made to have a wide range of conductivity from insulators to *n*- or *p*-type semiconductors to strongly conductive forms. Polyacetylene can be made in both *cis* and *trans* modifications in the form of fibers and thin films, the conductivity of the fibers increasing with their degree of orientation. Films can be applied on glass or metal substrates. Though still in an experimental stage, these polymers have significant possibilities for industrial applications, e.g., in batteries. See cyclooctatetraene.

polyacrylamide. (CH₂CHCONH₂)_n. White solid, water-soluble high polymer.

Derivation: Polymerization of acrylamide with N,N' -methylene bisacrylamide.

Use: Thickening agent, suspending agent, additive to adhesives. Permissible food additive.

See acrylic resin.

polyacrylamide resins, modified. See modified polyacrylamide resins.

polyacrylate. See acrylic resin.

polyacrylic acid. See acrylic acid, methacrylic acid.

polyacrylonitrile. A polymer of acrylonitrile that is the basic material used in the manufacture of a number of synthetic fibers, e.g., "Orlon" and "Dy-nel." When combined with other materials it produces a hard resin having high solvent resistance

and high-temperature stability; from these are made such items as moldings, shoe soles, wall panels, and the like. See acrylonitrile; acrylic resin; acrylic fiber.

"Polyact" [Scott]. TM for a winemaking additive.

Use: For the treatment of oxidized must wine to prevent browning and pinking.

polyalcohol. See polyol.

polyallomer. A copolymer that has a uniform crystalline structure but a mixed chemical composition. It is prepared by anionic coordination catalysis using a Ziegler catalyst. The best-known polyallomer is a copolymer of propylene and ethylene; it has the stereoregular crystalline structure of the homopolymers of these resins but a variable chemical composition. Temperature range -40 to 99°C . The physical properties of polyallomers are generally intermediate between those of the homopolymers of the component resins but give a better balance of properties than blends of the homopolymers.

Use: Vacuum-formed, injection-molded, blow-molded, and extruded products; film; sheeting; wire cables.

polyamide. A high molecular weight polymer in which amide linkages ($-\text{CONH}-$) occur along the molecular chain. They may be either natural or synthetic. Important natural polyamides are casein, soybean and peanut proteins, and zein, the protein of corn, from all of which plastics, textile fibers, and adhesive compositions can be made. Synthetic polyamides are typified by the numerous varieties of nylon, though some, e.g., "Versamide", are quite

different from nylon.

See nylon; polypeptide; protein; aramid.

polyamine-methylene resin. A polyethylene polyamine methylene-substituted resin of diphenylol dimethylmethane and formaldehyde in basic form.

Properties: Light-amber, granular, free-flowing powder; appreciable odor. Insoluble in dilute acids and alkalis, alcohol, ether, and water.

Use: Medicine, ion-exchange resin, antacid.

polyaminotriazole. (PAT). A synthetic polymer made from sebamic acid and hydrazine, with small amounts of acetamide. Polyoctamethylene-amino-triazole is a specific example.

See monobasic.

polyA tail. After an mRNA is transcribed from a gene, the cell adds a stretch of A residues (typically 50-200) to its 3' end. It is thought that the presence of this "polyA tail" increases the stability of the mRNA (possibly by protecting it from nucleases). Note that not all mRNAs have a polyA tail; the histone mRNAs in particular do not.

polybenzimidazole. (PBI). $(\text{C}_7\text{H}_6\text{N}_2)_n$. A synthetic polymer designed for high-temperature space technology applications. Reputed to withstand temperature up to 260°C for 1000 hr.

Derivation: Condensation of diphenyl isophthalate and 3,3'-diaminobenzidine.

Use: Fibers, composites, adhesives (high adhesion to steel, titanium, beryllium, and aluminum alloys), coatings, ablative materials.

polyblend. A combination in any proportion of (1) two homopolymers (natural or synthetic), (2) a homopolymer and a copolymer, or (3) two copolymers. An example of (1) is rubber-polystyrene, of (2) is rubber and butadiene-styrene, and of (3) is a mixture of butadiene-acrylonitrile and isobutylene-isoprene. A polyblend is a mixture that is made after its components have been polymerized and thus is different from a copolymer, which is made by chemical combination of two monomers.

See homopolymer; copolymer; blend.

polybutadiene. A synthetic thermoplastic polymer made by polymerizing 1,3-butadiene with a stereospecific organometallic catalyst (butyl lithium), though other catalysts such as titanium tetrachloride and aluminum iodide may be used. The *cis*-isomer, which is similar to natural rubber, is used in tire treads due to its abrasion and crack resistance and low heat buildup. Large quantities are also used as blends in SBR. The *trans*-isomer resembles gutta-percha and has limited utility. Liquid polybutadiene, which is sodium catalyzed, has specialty uses as a coating resin. It is cured with organic peroxides. Combustible.

Hazard: (Liquid) By ingestion and inhalation; skin

irritant.

See polymer, stereospecific.

polybutene. See polybutylene.

polybutylene. (polybutene; polyisobutylene; polyisobutene). Any of several thermoplastic isotactic (stereoregular) polymers of isobutene of varying molecular weight; also polymers of butene-1 and butene-2. Butyl rubber is a type of polyisobutene to which has been added 2% of isoprene, which provides sulfur linkage sites for vulcanization. Isobutene can be homopolymerized to various degrees in chains containing from 10 to 1000 units, the viscosity increasing with molecular weight. Combustible. **Use:** Lubricating-oil additive, hot-melt adhesives, sealing tapes, special sealants, cable insulation, polymer modifier, viscosity index improvers, films, and coatings.

polybutylene terephthalate. An engineering plastic derived from 1,4-butanediol, it is a thermoplastic polyester with a broad spectrum of uses.

polycarbonate. $(\text{COOC}_6\text{H}_5\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_5\text{O})_n$. A synthetic thermoplastic resin derived from bisphenol A and phosgene, a linear polyester of carbonic acid. Can be formed from any dihydroxy compound and any carbonate diester, or by ester interchange. Polymerization may be in either aqueous emulsion or in nonaqueous solution.

Properties: Transparent (90% light transmission), noncorrosive, weather and ozone resistant, nontoxic, stain resistant, Combustible but self-extinguishing, low water absorption, high impact strength, heat resistant, high dielectric strength, dimensionally stable, soluble in chlorinated hydrocarbons and attacked by strong alkalis and aromatic hydrocarbons, stable to mineral acids, insoluble in aliphatic alcohols. Excellent for all molding methods, extrusion, thermoforming, etc.; easily fabricated by all methods including thermoforming and fluidized-bed coating.

Use: Molded products, solution-cast or extruded film, structural parts, tubes and piping, prosthetic devices, meter face plates, nonbreakable windows, streetlight globes, household appliances.

polycarboxylic acid. An organic acid containing two or more carboxyl (COOH) groups.

polychlor. General name for synthetic chlorinated hydrocarbons.

Use: Pesticides.

polychlorinated biphenyl. (PCB).

CAS: 1336-36-3. One of several aromatic compounds containing two benzene nuclei with two or more substituent chlorine atoms. They are colorless liquids with d 1.4–1.5. Because of their persistence, toxicity, and ecological damage via water pollution,

their manufacture was discontinued in the U.S. in 1976.

Hazard: Highly toxic.

polychloroprene. See neoprene.

polychlorotrifluoroethylene. (PCTFE).

See chlorotrifluoroethylene polymer.

polyclonal antibodies. A heterogeneous pool of antibodies produced in an animal by a number of different B lymphocytes in response to an antigen. Different antibodies in the pool recognize different epitopes of the antigen.

“Polyco” [Borden]. TM for a series of thermoplastic polymers in the form of water emulsions or solvent solutions, applied to vinyl acetate polymers and copolymers, butadiene-styrene copolymer latices, polystyrenes, vinyl and vinylidene chloride copolymers, acrylic copolymers, and water-soluble polyacrylates.

Use: Adhesives and coatings, in paint, leather, textiles, paper, cosmetics, and construction fields.

polycondensation. See condensation (1); polymerization.

polycoumarone resin. See coumarone-indene resin.

polycyclic. An organic compound having three or more aromatic nuclei in its ring structure, which may be the same or different, e.g., anthracene, naphthalene.

See polynuclear.

poly(1-4-cyclohexylenedimethylene) terephthalate.

A linear polyester film or fiber obtained by condensation of terephthalic acid with 1,4-cyclohexanedimethanol. It has good electrical resistivity and hydrolytic stability.

Use: Carpet fibers and chemically resistant films. See terephthalic acid.

“PolyDADMAC” [Cytec]. TM for liquid cationic polymers of differing molecular weights.

Use: As primary coagulents in liquid solid separation.

polydextrose.

CAS: 68424-04-4.

Properties: Off-white to light tan solid. Sol in water.

Use: Food additive.

polydextrose solution.

Properties: Clear, straw-colored liquid.

Use: Food additive.

poly-1,1-dihydroperfluorobutyl acrylate.

Properties: White, rubber-like polymer. D 1.5, begins to degrade at 148C, retains strength and elasto-

meric properties in contact with synthetic lubricants, solvents, hydraulic fluids, oils, etc. at temperatures in the range 148–204C. Has limited flexibility at temperatures below –17C. Nonflammable.

Use: O-rings, seals, gaskets, diaphragms, hose, sheets, and coatings for fabrics and other surfaces.

polydimethyldiphenylsiloxane.

CAS: 68083-14-7.

Hazard: Low toxicity by ingestion. A mild eye irritant.

polydimethylsiloxane. (PDMS). A silicone polymer developed for use as a dielectric coolant and in solar energy installations. It also may have a number of other uses. It is stated to be highly resistant to oxidation and biodegradation by microorganisms. It is degradable when exposed to a soil environment by chemical reaction with clays and water, by which it is decomposed to silicic acid, carbon dioxide, and water.

poly-*p*-dinitrosobenzene. See “Polyac” [*Du Pont*].

“Polydril” [*Dow*]. TM for a synthetic water-soluble polymer.

Use: Flocculating agent in the oil industry.

polyelectrolyte. A high-polymer substance, either natural (protein, gum arabic) or synthetic (polyethyleneimine, polyacrylic acid salts), containing ionic constituents; may be either cationic or anionic. The former type is widely used for industrial applications. Water solutions of both types are electrically conducting; some are effective in concentrations as low as 1 ppm. In a given polyelectrolyte, ions of one sign are attached to the polymer chain, while those of opposite sign are free to diffuse into the solution. Major uses are flocculation of solids (especially dissolved phosphates) in potable water, dispersion of clays in oil-well drilling muds, soil conditioning, antistatic agents, and treatment of paper-mill wastewater. Ion-exchange resins are cross-linked (stabilized) polyelectrolytes.

See flocculant; “Purifloc” [*Dow*]; “Cat-Floc” [*Nalco*].

polyene. Any unsaturated aliphatic or alicyclic compound containing more than four carbon atoms in the chain and having at least two double bonds. Examples are pentadiene, cyclooctatriene.

polyester fiber. Generic name for a manufactured fiber (either as staple or continuous filament) in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85% by weight of an ester of a dihydric alcohol and terephthalic acid (Federal Trade Commission).

See “Dacron” [*Du Pont*]; polyethylene terephthalate.

Properties: Strength (staple) 2.2–4.0 g/denier; (con-

tinuous filament) up to 9.5 g denier, mp 264C, water absorption 0.5%. Nonflammable.

Use: Tire fabric, seat belts, reinforcement of rubber hose for seawater cooling systems, as blend in clothing fabrics, fire-hose jackets.

polyester film. Continuously extruded polyester sheet of various thicknesses, especially useful in electrical equipment because of its high resistivity. Its tensile strength of 25,000 psi is much greater than that of other plastic films. Sensitized polyester film is used in magnetic tapes, in the photocopying technique known as reprography.

polyester resin. Any of a group of synthetic resins, which are polycondensation products of dicarboxylic acids with dihydroxy alcohols. They are thus a special type of alkyd resin but, unlike other types, are not usually modified with fatty acids or drying oils. The outstanding characteristics of these resins is their ability, when catalyzed, to cure or harden at room temperature under little or no pressure. Most polyesters now produced contain ethylenic unsaturation, generally introduced by unsaturated acids. The unsaturated polyesters are usually cross-linked through their double bonds with a compatible monomer, also containing ethylenic unsaturation, and thus become thermosetting. Flame resistance is imparted by using either acid or glycol ingredients having a high content of halogens, e.g., HET acid.

The principal unsaturated acids used are maleic and fumaric. Saturated acids, usually phthalic and adipic, may also be included. The function of these acids is to reduce the amount of unsaturation in the final resin, making it tougher and more flexible. The acid anhydrides are often used if available and applicable. The dihydroxy alcohols most generally used are ethylene, propylene, diethylene, and dipropylene glycols. Styrene and diallyl phthalate are the most common cross-linking agents. Polyesters are resistant to corrosion, chemicals, solvents, etc.

Available forms: Sheets, powder, chips.

Use: Reinforced plastics; automotive parts; boat hulls; foams; encapsulation of electrical equipment; protective coatings; ducts, flues, and other structural applications; low-pressure laminates; magnetic tapes; piping; bottles; nonwoven disposable filters; low-temperature mortars.

See alkyd resin; polyester fiber.

polyethenoid. Characterizing an aliphatic compound having more than one ethene group –CH=CH–. Linoleic acid is a polyethenoid fatty acid.

polyether. A polymer in which the repeating unit contains a C=O bond derived from aldehydes or epoxides or similar materials.

polyether, chlorinated. A highly crystalline material that is 46% chlorine. Outstanding corrosion

resistance. Good electrical resistance. Readily processed and fabricated.

Use: Fluid-bed coating, tank linings, piping, valves, laboratory equipment, chemical processing equipment.

polyether, cyclic. See crown ether.

polyether foam. A polyurethane foam, either rigid or flexible, made by use of a polyether as distinct from a polyester or other resin component.

Hazard: As for polyurethane.

polyether glycol. A compound with a structural skeleton such as HO-C-C-O-C-C-O-C-C-O-C-C-OH. The length of the chain can vary widely, and the number of consecutive carbon atoms may be greater than two. Examples are polyethylene glycol and polypropylene glycol.

polyethylene.

CAS: 9002-88-4. $(-H_2C-CH_2-)_n$.

Chlorosulfonated. See "Hypalon" [Du Pont].

Cross-linked (XLPE).

Properties: Thermoplastic white solid, high-temperature-resistant, excellent resistance to chemicals and to creep, high impact and tensile strength, high electrical resistivity, insoluble in organic solvents, does not stress-crack. Combustible.

Derivation: (1) By irradiating linear polyethylene with electron beam or γ -radiation, cross-linking taking place through a primary valence bond, as shown.

(2) By chemical cross-linking agent such as an organic peroxide (e.g., benzoyl peroxide). All grades of polyethylene and most copolymers can be chemically cross-linked.

Use: Wire and cable coatings and insulation (low-density grades), pipe and molded fittings (high-density grades). Special types having low electrical resistivity can be made; these can be regarded as semiconductors.

Note: In molding cross-linked polyethylene, the desired part must be formed before cross-linking is initiated, because material will not change its shape after cross-linking. The variations in composition

and wide range of properties approach the ideal of a universal material more closely than most polymers.

Density

The density of polyethylene and other thermoplastic polymers is affected by the shape and spacing of the molecular chains; low-density materials have highly branched and widely spaced chains, whereas high-density materials have comparatively straight and closely aligned chains. Polymers of the latter type are called linear. The physical properties are markedly affected by increasing density.

Low density (branched chain)

Properties: Crystallinity 50–60%, d 0.915, mp 240F, tensile strength 1,500 psi, impact strength above 10 ft-lb/inch/notch, thermal expansion 17×10^{-5} inch/inch/C. Soluble in organic solvents above 200F; insoluble at room temperature.

Derivation: (1) Ethylene is polymerized in a free-radical-initiated liquid-phase reaction at 1500 atm (22,000 psi) and 375F with oxygen as catalyst (usually from peroxides). (2) A much more effective and cheaper process uses pressures of only 100–300 psi at less than 212F; the catalyst is undisclosed and reaction is vapor phase.

Use: Packaging film (especially for food products), paper coating, liners for drums and other shipping containers, wire and cable coating, toys, cordage, refuse and waste bags, chewing-gum base, squeeze bottles, electrical insulation.

High density (linear)

Properties: Crystallinity 90%. D 0.95, mp 275F, tensile strength 4000 psi, impact strength 8 ft-lb/

inch notch, high electrical resistivity, film is gas-permeable, hydrophobic, does not resist nitric acid.

Derivation: Ethylene polymerized by Ziegler catalysts at 1–100 atm (15–1500 psi) at from room temperature to 200F. Catalyst is a metal alkyl, e.g., triethylaluminum plus a metallic salt ($TiCl_4$) dissolved in a hydrocarbon solvent. A vapor-phase modification of this process was developed in 1965. Another method uses such metallic catalysts as Cr_2O_3 at 100–500 psi with solvents such as cyclohexane or xylene.

Use: Blow-molded products, injection-molded

items, film and sheet, piping, fibers, gasoline and oil containers.

Note: Ethylene may be copolymerized with varying percentages of other materials, e.g., 2-butene or acrylic acid; a crystalline product results from copolymerization of ethylene and propylene. When butadiene is added to the copolymer blend, a vulcanizable elastomer is obtained.

Low molecular weight

Properties: Molecular weight 2000–5000. Translucent white solids, excellent electrical resistance, abrasion resistant, resistant to water and most chemicals, d 0.92. Slightly soluble in turpentine, petroleum naphtha, xylene, and toluene at room temperature; soluble in xylene, toluene, trichloroethylene, turpentine, and mineral oils at 82.2°C; practically insoluble in water; slightly soluble in methyl acetate, acetone, and ethanol up to the boiling points of these solvents. Available as emulsified and nonemulsified forms. Combustible.

Use: Mold-release agent for rubber and plastics, paper and container coatings, liquid polishes, and textile finishing agents.

polyethylene glycol. (PEG;

poly(oxyethylene); polyglycol; polyether glycol). CAS: 25322-68-3. Any of several condensation polymers of ethylene glycol with the general formula $\text{HOCH}_2(\text{CH}_2\text{OCH}_2)_n\text{CH}_2\text{OH}$ or $\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$. Average molecular weights range from 200 to 6000. Properties vary with molecular weight.

Properties: Clear, colorless, viscous liquids to waxy solids; odorless. Soluble or miscible with water and for the most part with alcohol and other organic solvents, heat-stable; inert to many chemical agents. Do not hydrolyze or deteriorate. Have low vapor pressure. Combustible.

Derivation: By condensation of ethylene glycol or of ethylene oxide and water.

Use: Chemical intermediates (lower molecular weight varieties), plasticizers, softeners and humectants, ointments, polishes, paper coating, mold lubricants, bases for cosmetics and pharmaceuticals, solvents, binders, metal and rubber processing, permissible additives to foods and animal feed, laboratory reagent.

See "Carbowax" [*Union Carbowax*].

polyethylene glycol chloride.

$\text{H}(\text{OCH}_2\text{CH}_2)_n\text{Cl}$. Any of a group of polymers, usually colorless liquids with very low vapor pressure at room temperature. Mw from 100 to 600. Miscible with water, d for a low molecular weight polymer is 1.18 (20C), for a high molecular weight polymer 1.14 (10C). The former sets to a glass at -90°C, the latter sets to a waxlike solid at 20C. Combustible.

Use: Solvents for cleaning, extracting, and dewaxing.

polyethylene glycol 400, dichloride.

CAS: 27252-69-3. mf: $(\text{C}_2\text{H}_4\text{O})_n \text{C}_4\text{H}_8\text{Cl}_2\text{O}$

Hazard: A severe eye irritant.

polyethylene glycol ester. A mono- or di-ester resulting from the interaction of an organic acid with one or both of the glycol ends of the polyethylene glycol polymer. These are also called polyoxyethylene esters, polyglycol esters, or a coined generic name.

polyethylene imine.

CAS: 26913-06-4. $(\text{CH}_2\text{CH}_2\text{NH})_n$. A synthetic polymer that is a highly viscous, hygroscopic liquid when anhydrous; completely miscible with water and lower alcohols; insoluble in benzene. Reactive toward cellulose. Combustible.

Use: Adhesive and anchoring agent for paper and cellophane, dewatering agent and wet strength improver in paper manufacture, fixative, leveling agent in textile fibers, antiblocking agent on plastic films, flocculating agent, ion-exchange resins, complexing agents, disinfectant for textiles and skins, photographic chemistry, absorbent for carbon dioxide, water purification, polyelectrolyte.

polyethylene glycol lauryl thioether.

CAS: 9014-89-5. mf: $(\text{C}_2\text{H}_4\text{O})_n\text{C}_{14}\text{H}_{30}\text{OS}$

Hazard: A severe skin and eye irritant.

polyethylene glycol mono(2-(dodecylthio)ethyl)ether. See polyethylene glycol lauryl thioether.

polyethylene oxide. A plastic reported to be dimensionally stable at high and low temperatures and designed as a substitute for phenolics.

polyethylene oxide sorbitan fatty acid esters. See polysorbate.

polyethylene terephthalate.

CAS: 25038-59-9. $(\text{C}_{10}\text{H}_8\text{O}_4)_n$. A thermoplastic polyester formed from ethylene glycol by direct esterification or by catalyzed ester exchange between ethylene glycol and dimethyl terephthalate. Offered as oriented film or fiber. It melts at 265°C; tenacity is 2.2–4 g/denier as staple and up to 9.0 g/denier as continuous filament; d 1.38. It has good electrical resistance and low moisture absorption. Resists combustion and is self-extinguishing.

Use: Blended with cotton, for wash-and-wear fabrics; blended with wool, for worsteds and suitings; packaging films, recording tapes, soft-drink bottles.

polyethylene thiuram sulfide.

Derivation: Oxidation of diammonium ethylene bis-dithiocarbamate with calcium hypochlorite.

Grade: 50% vegetable powder, 95% technical powder.

Use: Fungicide.

polyformaldehyde. See *p*-formaldehyde.

polyformaldehyde resin. See acetal resin.

polyforming. The combined thermal reforming and polymerization processes in gasoline products.

Polyform process. The process of producing high-octane gasoline from formerly waste refinery gases and petroleum naphtha.

polyfunctional system. A system in which one of the reactants is at least trifunctional and the others are at least bifunctional.

polyfurfuryl alcohol. See furfuryl alcohol.

“Poly-G” [Hall]. TM for a series of polyethylene glycols, polypropylene glycols, and polyoxypropylene adducts of glycerol. G200, 300, 400, and 600 are liquid polyethylene glycols; G1000, 1500, GB-1530, and BG-2000 are waxy polyethylene glycols. The number indicates the molecular weight. G420P, 1020P, 2020P are propylene oxide condensation polymers of propylene glycol. G1030PG, 3030PG, 4030PG are propylene oxide condensation polymers of glycerol.

“Polygard” [Uniroyal]. TM for a mixture of alkylated aryl phosphites.

Properties: Clear amber liquid. D 0.99. Soluble in acetone, alcohol, benzene, carbon tetrachloride, solvent naphtha, and ligroin; insoluble in water, but can hydrolyze.

Use: Nondiscoloring stabilizer for rubber and plastics.

polygenic disorder. Genetic disorder resulting from the combined action of alleles of more than one gene (e.g., heart disease, diabetes, and some cancers). Although such disorders are inherited, they depend on the simultaneous presence of several alleles; thus the hereditary patterns usually are more complex than those of single-gene disorders. See single-gene disorder.

polyglycerate (60). See ethoxylated mono- and diglycerides.

polyglycerol. One of several mixtures of ethers of glycerol with itself, ranging from diglycerol to triacontaglycerol. Some examples are (1) diglycerol, possibly $(\text{CH}_2\text{OHCH}_2\text{OCH}_2)_n$, mw 166, a liquid with four $-\text{OH}$ groups, viscosity of 287 cs at 65.5C; (2) hexaglycerol, mw 462, a liquid with eight $-\text{OH}$ groups, viscosity 1671 cs at 65.5C; (3) decaglycerol, mw 758, a liquid with 12 $-\text{OH}$ groups, viscosity 3199 cs.

Properties: Viscous liquids to solids. Soluble in water, alcohol, and other polar solvents. Act as humectants much like glycerol but have progressively higher molecular weight and boiling point. Combustible.

Derivation: Glycerol is heated with an alkaline catalyst (200–275C) at normal or reduced pressure. A

stream of inert gas may be used to blanket the reaction and help remove the water of reaction.

Use: Surface-active agents, emulsifiers, plasticizers, adhesives, lubricants, and other compounds used for both edible and industrial applications.

polyglycerol ester. One of several partial or complete esters of saturated and unsaturated fatty acids with a variety of derivatives of polyglycerols ranging from diglycerol to triacontaglycerol. Prepared by (1) direct esterification and (2) transesterification reactions. Combustible.

Some examples of (1): decaglycerol monostearate, semisolid, d 1.04, mp 51.9C; decaglycerol monooleate, viscous liquid, d 1.13, mp around 0C; decaglycerol hexaoleate, liquid, d 0.97, mp -17.7C .

Examples of (2): triglycerol monolinoleate, viscosity 322 cP (75.5C); triglycerol trilinoleate, viscosity 30.1 cP (75.5C).

Use: Lubricants, plasticizers, paint and varnish vehicles, gelling agents, urethane intermediates, adhesives, cross-linking agents, humectants, textile fiber finishes, functional fluids, surface-active agents, dispersants and emulsifiers in foods, pharmaceuticals, cosmetic preparations.

polyglycerol esters of fatty acids.

Properties: Yellow to amber oily viscous liquids; light tan to brown soft solids; tan to brown waxy solids. Dispersible in water; sol in org solvs and oils.

Use: Food additive.

polyglycol. See polyethylene glycol.

polyglycol amine H-163.

Properties: Colorless liquid. D 1.0556, bp (decomposes), fp 14.5C, bulk d 8.8 lb/gal, flash p 295F (146C). Soluble in water. Combustible.

polyglycol distearate. (polyethylene glycol distearate).

CAS: 9005-08-7. $\text{C}_{17}\text{H}_{35}\text{COO}(\text{CH}_2\text{CH}_2\text{O})_n\text{OCC}_{17}\text{H}_{35}$. Distearate ester of polyglycol.

Properties: A soft, off-white solid. D 1.04 (50C), mp 43C, pH of 10% dispersion 7.26, saponification number variable. Soluble in chlorinated solvents, light esters, and acetone; slightly soluble in alcohols, insoluble in glycols, hydrocarbons, and vegetable oils. Combustible.

Use: Plasticizer for various resins, component of grinding and polishing pastes to promote easy removal in water.

“Polygriptex.” TM for an adhesive especially designed for bonding polyethylene sheeting to porous surfaces, used in making polyethylene-lined bags and multiwall kraft bags. Has good adhesion to waxed surfaces. Available in viscosities from 300 to 20,000 cP.

polyhalite. $2\text{CaSO}_4 \cdot \text{MgSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$. A naturally occurring potash salt found in Germany, Texas, and New Mexico.

Use: Source of potash for fertilizer.

polyhexamethylenedipamide. Same as nylon 66.

polyhexamethylene sebacamide. Same as nylon 610.

polyhydric alcohol. See polyol.

polyimide. Any of a group of high polymers that have an imide group ($-\text{CONHCO}-$) in the polymer chain.

Properties: Tensile strength 13,500 psi, d 1.42, water absorption 0.3% (24 h at 77K), heat distortion point above 260C, dielectric constant at 2000 mc 3.2, and coefficient of linear expansion 28.4×10^{-6} inch/inch/foot. High-temperature stability (up to 370C), excellent frictional characteristics, good wear resistance at high temperatures, resists radiation, exhibits low outgassing in high vacuum, resistant to organic materials at quite high temperatures, not resistant to strong alkalis and to long exposure to steam. Flame retardant.

Use: High-temperature coatings, laminates and composites for aerospace vehicles, ablative materials, oil sealants and retainers, adhesives, semiconductors, valve seats, bearings, insulation for cables, printed circuits, magnetic tapes (high- and low-temperature-resistant), flame-resistant fibers, binders in abrasive wheels.

polyindene resin. See coumarone-indene resin.

polyisobutene. See polybutylene.

polyisobutylene. See polybutylene.

polyisocyanurate. See isocyanurate.

polyisoprene. $(\text{C}_5\text{H}_8)_n$. The major component of natural rubber, also made synthetically. Forms are stereospecific *cis*-1,4- and *trans*-1,4-polyisoprene. Both can be produced synthetically by the effect of heat and pressure on isoprene in the presence of stereospecific catalysts. Natural rubber is *cis*-1,4-; synthetic *cis*-1,4- is sometimes called synthetic natural rubber. *trans*-1,4-polyisoprene resembles gut-tapercha. Polyisoprene is thermoplastic until mixed with sulfur and vulcanized. Supports combustion. See rubber, natural; rubber, synthetic; catalyst, stereospecific.

polylinker. A short, usually synthetic fragment of DNA containing recognition sequences for several restriction endonucleases employed to insert DNA into plasmids.

"Polylite" [Reichhold]. TM for a group of 100% reactive alkyd resins, dissolved in styrene and other monomers. Highly diversified applications both alone and in combination with such materials as fibrous glass. This group also includes resins for use with diisocyanate to form rigid or flexible polyurethane foams.

polymaleic acid.

CAS: 26099-09-2.

Use: Food additive.

polymaleic acid, sodium salt.

Use: Food additive.

"POLYMEKON" [Baker Petrolite]. TM for a dispersion

polymer. A macromolecule formed by the chemical union of five or more identical combining units called monomers. In most cases the number of monomers is quite large (3500 for pure cellulose) and often is not precisely known. In synthetic polymers this number can be controlled to a predetermined extent, e.g., by short-stopping agents. (Combinations of two, three, or four monomers are called, respectively, dimers, trimers, and tetramers and are known collectively as oligomers.) A partial list of polymers by type is as follows:

- I. Inorganic: siloxane, sulfur chains, black phosphorus, boron-nitrogen, silicones
- II. Organic
 1. Natural
 - (a) Polysaccharides: starch, cellulose, pectin, seaweed gums (agar, etc.), vegetable gums (arabic, etc.).
 - (b) Polypeptides (proteins): casein, albumin, globulin, keratin, insulin, DNA
 - (c) Hydrocarbons: rubber and gutta-percha (polyisoprene)
 2. Synthetic
 - (a) Thermoplastic: elastomers (unvulcanized), nylon, polyvinyl chloride, polyethylene (linear), polystyrene, polypropylene, fluorocarbon resins, polyurethane, acrylate resins
 - (b) Thermosetting: elastomers (vulcanized), polyethylene (cross-linked), phenolics, alkyds, polyesters
 3. Semisynthetic: cellulose (rayon, methylcellulose, cellulose acetate), modified starches (starch acetate, etc.)

polymer, addition. See addition polymer.

polymerase. An enzyme which links individual nucleotides together into a long strand, using another strand as a template. There are two general types of polymerase: DNA polymerases (which synthesize DNA) and RNA polymerase (which make RNA).

polymerase chain reaction (PCR). A method for amplifying a DNA base sequence using a heat-stable polymerase and two 20-base primers, one complementary to the (+) strand at one end of the sequence to be amplified and one complementary to the (-) strand at the other end. Because the newly synthesized DNA strands can subsequently serve as additional templates for the same primer sequences, successive rounds of primer annealing, strand elongation, and dissociation produce rapid and highly specific amplification of the desired sequence. PCR also can be used to detect the existence of the defined sequence in a DNA sample.

polymerase, DNA or RNA. Enzyme that catalyzes the synthesis of nucleic acids on preexisting nucleic acid templates, assembling RNA from ribonucleotides or DNA from deoxyribonucleotides.

polymer, atactic. See atactic.

polymer, block. See block polymer.

polymer, condensation. A polymer formed by a condensation reaction.

polymer, coordination. A polymer made by organic addition, neither free radical nor ionic, using an organometallic catalyst.

polymer, electroconductive. A polymer or elastomer made electrically conductive by incorporation of a substantial percentage of a suitable metal powder (e.g., aluminum) or acetylene carbon black; the proportion used must be high enough to permit the particles to be in contact with one another in the mixture. Polyelectrolytes such as ion-exchange resins, salts of polyacrylic acid, and sulfonated polystyrene are electroconductive in the presence of water. Pyrolysis of polyacrylonitrile makes it electrically conductive without impairment of its structure. Polyacetylene and a few related polymers are made conductive by various doping agents such as arsenic pentafluoride and iodine.
See polyacetylene.

polymer eutactic. A tactic polymer completely devoid of any structural disorder along its chain.

polymer, graft. See graft polymer.

polymer, high. An organic macromolecule composed of a large number of monomers. The molecular weight may range from 5000 into the millions (for some polypeptides). Natural high polymers are exemplified by cellulose $(C_6H_{10}O)_n$ and rubber $(C_5H_8)_n$. Proteins are natural high-polymer combinations of amino acid monomers. The dividing line between low and high polymers is considered to be in the neighborhood of 5000 to 6000 mw.

Synthetic high polymers (or "synthetic resins") include a wide variety of materials having properties ranging from hard and brittle to soft and elastic. Addition of such modifying agents as fillers, colorants, etc. yields an almost infinite number of products collectively called plastics. High polymers are the primary constituents of synthetic fibers, coating materials (paints and varnishes), adhesives, sealants, etc. Polymers having special elastic properties are called rubbers, or elastomers.

Synthetic polymers in general can be classified: (1) by thermal behavior, i.e., thermoplastic and thermosetting; (2) by chemical nature, i.e., amino, alkyd, acrylic, vinyl, phenolic, cellulosic, epoxy, urethane, siloxane, etc.; and (3) by molecular structure, i.e., atactic, stereospecific, linear, cross-linked, block, graft, ladder, etc. Copolymers are products made by combining two or more polymers in one reaction (styrene-butadiene). See cross-linking; block polymer; epitaxy; homopolymer; plastics.

polymer, homo-. A polymer consisting of only one repeated monomer.

polymer, inorganic. A polymer in which the main chain contains no carbon atoms and in which behavior similar to that of an organic polymer can be developed, i.e., covalent bonding and cross-linking, as in silicone polymers. Here the element silicon replaces carbon in the straight chain; substituent groups are often present, forming highly useful polymers. Other inorganic high polymers are black phosphorus, boron, and sulfur, all of which can form polymeric structures under special conditions. At present these have little or no commercial significance.

Note: Some authorities consider silicone resins to be semiorganic, since their substituent groups are composed of methyl groups.

polymer, isotactic. A type of polymer structure in which groups of atoms that are not part of the backbone structure are located either all above or all below the atoms in the backbone chain, when the latter are all in one plane.
See polymer, stereospecific.

polymerization. A chemical reaction, usually carried out with a catalyst, heat, or light, and often under high pressure, in which a large number of relatively simple molecules combine to form a chainlike macromolecule. The combining units are called monomers, e.g., styrene is the monomer for polystyrene. The linear chains can be combined (cross-linked) by addition of appropriate chemicals.

The polymerization reaction occurs spontaneously in nature; industrially it is performed by subjecting unsaturated or otherwise reactive substances to conditions that will bring about combination. This may occur by *addition*, in which free radicals are the initiating agents that react with the double bond of the monomer by adding to it on one side, at the same time producing a new free electron on the other.

$$R\bullet + CH_2=CHX \rightarrow R-CH_2-\dot{C}HX$$

By this mechanism the chain becomes self-propagating. Polymerization may also occur by condensation, involving the splitting out of water molecules by two reacting monomers, and by so-called oxidative coupling. The degree of polymerization (DP) is the number of monomer units in an average polymer unit of a given sample.

Polymerization techniques may be (1) in the gas phase at high pressures and temperatures (200C), (2) in solution at normal pressure and temperatures from -70 to +70C, (3) bulk or batch polymerization at normal pressure at 150C, (4) in suspension at normal pressure at 60-80C, (5) in emulsion form at normal pressure at -20 to +60C (used for copolymers). Catalysts of the peroxide type are necessary with some of these methods.

Note: Polymerization, like its handmaiden, catalysis, has long been one of the most complex and productive areas of chemical research; from year to year new materials and reaction mechanisms are constantly being explored, sometimes with only marginal success. But it need only be recalled that such now commonplace materials as polyethylene, polycarbonate, nylon, neoprene, epoxies, acrylics, to mention only a few, as well as block, graft, and stereospecific polymers, have resulted from continuous and intensive research by many brilliant chemists over the last 60 years, and this research continues undiminished.

See free radical; cross-linking.

polymer, ladder. See ladder polymer.

polymer, low. A polymer composed of comparatively few monomer units and having a molecular weight from 300 to 5000.

polymer, natural. See polymer.

polymer, stereoblock. See stereoblock polymer.

polymer, stereospecific. (stereoregular). A polymer whose molecular structure has a definite spatial arrangement, i.e., a fixed position in geometrical space for the constituent atoms and atomic groups comprising the molecular chain, rather than the random and varying arrangement that characterizes an amorphous polymer. Achievement of this specific steric (three-dimensional) structure (also called tacticity) requires use of special catalysts such as those developed by Ziegler and Natta about 1950. Such polymers are wholly or partially crystalline.

Synthetic natural rubber, *cis*-polyisoprene, is an example of a stereospecific polymer made possible by this means. There are five types of stereospecific (or stereoregular) structures: *cis*, *trans*, isotactic, syndiotactic, and tritactic.

See catalyst; stereospecific.

polymer, syndiotactic. See syndiotactic polymer.

polymer, synthetic. See polymer.

polymer, water-soluble. Any substance of high molecular weight that swells or dissolves in water at normal temperature. These fall into several groups, including natural, semisynthetic, and synthetic products. Their common property of water solubility makes them valuable for a wide variety of applications as thickeners, adhesives, coatings, food additives, textile sizing, etc.

See specific entries. (1) *Natural*. This type is principally composed of gums, which are complex carbohydrates of the sugar group. They occur as exudations of hardened sap on the bark of various tropical species of trees. All are strongly hydrophilic. Examples are arabic, tragacanth, karaya.

(2) *Semisynthetic*. This group (sometimes called water-soluble resins) includes such chemically treated natural polymers as carboxymethylcellulose, methylcellulose, and other cellulose ethers, as well as various kinds of modified starches (ethers and acetates).

(3) *Synthetic*. The principal members of this class are polyvinyl alcohol, ethylene oxide polymers, polyvinyl pyrrolidone, polyethyleneimine.

polymethacrylate resin. See acrylic resin; methyl methacrylate.

polymethylbenzene. See durene; pseudocumene. Durene and pseudocumene are two members of this group with some commercial production and use.

polymethylene polyphenylisocyanate. A polymer of diphenylmethane-4,4'-diisocyanate.

polymethylene wax. See wax, polymethylene.

poly-4-methylpentene-1.

Properties: High resistance to all chemicals except carbon tetrachloride and cyclohexane. Excellent heat resistance, high clarity and light transmittance. Temperature limit 170C, d 0.83.

Use: Laboratory ware (beakers, graduates, etc.); electronic and hospital equipment; food packaging, especially types subject to high temperature such as trays for TV dinners, etc.; light reflectors.

poly(methyl vinyl ether). See polyvinyl methyl ether.

polymorphic. Describing a protein for which amino acid sequence variants exist in a population of organisms, but the variations do not destroy the protein's function. For example, antibodies which contain variable and hypervariable sites.

polymorphism. See allotropy.

polymyxin.

CAS: 1406-11-7. Generic term for a series of antibiotic substances produced by strains of *Bacillus polymyxa*. Various polymyxins are differentiated by the letters A, B, C, D, and E. All are active against certain Gram-negative bacteria. Polymyxin B is most used.

Properties: All are basic polypeptides. Soluble in water; the hydrochlorides are soluble in water and methanol, insoluble in ether, acetone, chlorinated solvents, and hydrocarbons. Permissible food additives.

Use: Medicine (antibiotic), beer production.

polymyxin E sulfate.

CAS: 1264-72-8. mf: $C_{45}H_{85}N_{13}O_{10} \cdot H_2O_4S$.

Hazard: A poison by ingestion.

"Poly-N" [Solutia]. (ammonium polyphosphate). TM for chemical used as a phosphorus-based catalyst in organic as well as latex-based products.

Use: Fire-retardant intumescent paints, mastics, and polymers.

polynuclear. Descriptive of an aromatic compound containing three or more closed rings, usually of the benzenoid type, e.g., sterols.

See polycyclic; nucleus (3).

polyol. A polyhydric alcohol, i.e., one containing three or more hydroxyl groups. Those having three hydroxyl groups (trihydric) are glycerols; those with more than three are called sugar alcohols, with general formula $CH_2OH(CHOH)_nCH_2OH$, where n may be from 2 to 5. These react with aldehydes and ketones to form acetals and ketals.

See alcohol; glycerol.

polyolefin. A class or group name for thermoplastic polymers derived from simple olefins; among the more important are polyethylene, polypropylene, polybutenes, polyisoprene, and their copolymers. Many are produced in the form of fibers. This group comprises the largest tonnage of all thermoplastics produced.

polyorganosilicate graft polymer. An organoclay to which a monomer or an active polymer has been chemically bonded, often by the use of ionizing radiation. An example is the bonding of styrene to a polysilicate containing vinyl radicals, resulting in the growth of polystyrene chains from the surface of the silicate. Such complexes are stable to organic

solvents. They have considerable use potential in the ion-exchange field, as ablative agents, reinforcing agents, and hydraulic fluids.

See organoclay; graft polymer.

"Polyox" [Dow]. TM for a series of water-soluble ethylene oxide polymers with molecular weights in the 100,000 to several million range.

Use: Textile warp size, paper coatings, detergents, hair spray, toothpastes, water-soluble packaging film, adhesives.

polyoxadiazole. A polymer of oxadiazole, cyclic C_2N_2O , prepared by cyclodehydration (ring formation from a chain with subsequent loss of water) of polyisophthalic hydrazide. Because of its high temperature tolerance (above 398C), fibers made from it may be useful for space vehicles.

polyoxamide. A nylon-type material made from oxalic acid and diamines.

polyoxetane. See oxetane; "Penton" [Aqualon].

polyoxyethylated (C9-C10) alkyl thioether.

CAS: 9004-83-5. mf: $(C_2H_4O)_n C_{14}H_{30}OS$

Hazard: A severe skin and eye irritant.

polyoxyethylated (4) isodecyl alcohol.

CAS: 61827-42-7. mf: $(C_2H_4O)_n C_{10}H_{22}O$

Hazard: A severe skin and eye irritant.

polyoxyethylated (6) isodecyl alcohol.

CAS: 26183-52-8. mf: $(C_2H_4O)_n C_{10}H_{22}O$

Hazard: A moderate skin and severe eye irritant.

polyoxyethylated oleyl amine.

CAS: 58253-49-9. mf: $(C_2H_4O)_n (C_2H_4O)_n C_{22}H_{45}NO_2$

Hazard: A severe eye irritant.

polyoxyethylene. See polyethylene glycol.

polyoxyethylene(4)docyl alcohol phosphate potassium salt.

CAS: 68070-99-5.

Hazard: A severe eye irritant.

polyoxyethylene fatty acid ester. See polysorbate.

polyoxyethylene lauryl ether phosphate.

CAS: 39464-66-9. mf: $(C_2H_4O)_n C_{12}H_{26}O \cdot xH_3O_4P$

Hazard: Low toxicity by ingestion and skin contact. A severe skin and eye irritant.

polyoxyethylene (40) monostearate. (polyethylene glycol stearate).

CAS: 9004-99-3. A mixture of the mono- and distearate esters of mixed polyoxyethylene diols and corresponding free glycols. The monostearate can

be represented as $H(OCH_2CH_2)_nOCOC_{17}H_{35}$ (n is about 40).

Properties: Waxy, light-tan solid; nearly odorless. Congealing range 39–45°C. Soluble in water, alcohol, ether, and acetone; insoluble in mineral and vegetable oils.

Grade: USP.

Use: Ointments, emulsifier, surfactant, food additive. See polysorbate.

polyoxyethyleneoxypropylene. (POEOP). A polymer of ethylene and propylene glycols (ethylene oxide propylene oxide).

Use: Solvent.

polyoxyethylene (8) stearate.

CAS: 9004-99-3. A mixture of the mono- and diesters of stearic acid and mixed polyoxyethylene diols having an average polymer length of 7.5 oxyethylene units.

Properties: Cream-colored, soft, waxy, or pasty solid at 25°C; faint, fatty odor; slightly bitter, fatty taste. Soluble in toluene, acetone, ether, and ethanol.

Use: Emulsifier in bakery products.

See polysorbate.

polyoxymethylene. Any of several polymers of formaldehyde and trioxane.

See acetal resin.

polyoxypropylene diamine. (POPDA). Any of six high molecular weight amines of low viscosity and vapor pressure, high primary amine content, and light color.

Use: As cross-linking agents in epoxy coatings, imparting high flexibility and adhesion at low temperatures. Other possible uses are in polyamide and polyurethane coatings, adhesives, elastomers and foams, as intermediates for textile and paper treatment, and viscosity-index improvers in lubricating oils.

polyoxypropylene ester. See polypropylene glycol ester.

polyoxypropylene-glycerol adduct. One of several condensation polymers of propylene oxide and glycerol with molecular weights in the range 1000 to 4000. Clear, stable, almost colorless, non-corrosive liquids.

Use: Similar to those of polypropylene glycol.

polypeptide. (peptide). The class of compounds composed of acid units chemically bound together with amide linkages ($-\text{CONH}-$) with elimination of water. A polypeptide is thus a polymer of amino acids. The chain of amino acids (less than 100) are linked by peptide bonds. A segment of such a chain is as follows:

The sequence of amino acids in the chain is of critical importance in the biological functioning of the protein, and its determination is one of the most difficult problems in molecular biology. The chains may be relatively straight, or they may be coiled or helical. In the case of certain types of polypeptides, such as the keratins, they are cross-linked by the disulfide bonds of cystine. Linear polypeptides can be regarded as proteins. Synthesis of a 20-amino acid polypeptide that induces formation of antibodies for foot and mouth disease was announced in 1982. It is the first vaccine to be synthesized. See protein; polyamide; keratin.

polyphenylene triazole.

$[-C_6H_4-C_2N_3(C_6H_5)-]_n$. A polymer stated to be serviceable up to 260°C for films, coatings, adhesives, and lamination.

“Polyphos” [Olin]. TM for a water-soluble glassy sodium phosphate of standardized composition, $(Na_{12}P_{10}O_{31})_n$, analyzing 63.5% P_2O_5 (ratio of $Na_2O:P_2O_5$ is 1.2:1). It is closely similar to a sodium hexametaphosphate and sodium tetrakisphosphate; frequently the three names are used interchangeably.

Grade: Ground, walnut-size to pea-size lumps.

Use: Boiler water compounds, detergents, textiles, leather tanning, photographic film developing, deflocculation of clays, flotation and desliming of minerals, dispersion of pigments, paper processing, industrial and municipal water treatment.

polyphosphazene. See phosphazene.

polyphosphoric acid. $H_{2n}P_nO_{3n+1}$, for $n > 1$. Any of a series of strong acids, from pyrophosphoric acid, $H_4P_2O_7$ ($n = 2$), through metaphosphoric acid (large values of n).

Properties: Viscous, water-white liquid. Water soluble. Does not crystallize on standing; hygroscopic. The commercial acid is a mixture of orthophosphoric acid with pyrophosphoric, triphosphoric, and higher acids and is sold on the basis of its calculated content of H_3PO_4 , e.g., 115%. Superphosphoric acid is a similar mixture sold at 105% H_3PO_4 . These acids revert slowly to orthophosphoric acid on dilution with water.

Hazard: Toxic by ingestion; strong irritant.

Use: Dehydrating, catalytic, and sequestering agents, for metal treating; many applications where a concentrated monooxidizing acid is needed; laboratory reagent.

See phosphoric acid.

polyphyletic. Term applied to a group of organisms which does not include the most recent com-

mon ancestor of those organisms; the ancestor does not possess the character shared by members of the group.

polypropylene.

CAS: 9003-07-0. $(C_3H_5)_n$. A synthetic, crystalline, thermoplastic polymer with molecular weight of 40,000 or more.

Note: Low molecular weight polymers are also known that are amorphous in structure and used as gasoline additives, detergent intermediates, greases, sealants, and lubricating oil additives. Also available as a high melting wax.

Derivation: Polymerization of propylene with a stereospecific catalyst such as aluminum alkyl.

Properties: Translucent, white solid. D 0.90, mp 168–171C, tensile strength 5000 psi, flexural strength 7,000 psi, usable up to 121C. Insoluble in cold organic solvents; softened by hot solvents. Maintains strength after repeated flexing. Degraded by heat and light unless protected by antioxidants. Readily colored; good electrical resistance; low water absorption and moisture permeability; poor impact strength below –9.4C; not attacked by fungi or bacteria; resists strong acids and alkalis up to 60C, but is attacked by chlorine, fuming nitric acid, and other strong oxidizing agents. Combustible, but slow-burning. Fair abrasion and good heat resistance if properly modified. Can be chrome-plated, injection- and blow molded, and extruded.

Available forms: (Molding powder) Extruded sheet, cast film (1–10 mils), textile staple and continuous filament yarn, fibers with diameters from 0.05 to 1 μ m, and fiber webs down to 2 microns thick, low-density foam.

Use: Packaging film; molded parts for automobiles, appliances, housewares, etc.; wire and cable coating; food container closures; coated and laminated products; bottles; artificial grass and turfs; plastic pipe; wearing apparel (acid-dyed); fish nets; surgical casts; strapping; synthetic paper; reinforced plastics; nonwoven disposable filters.

polypropylenebenzene. See dodecylbenzene.

polypropylene, chlorinated. White, odorless, nonflammable powder. A film-forming polymer used in coatings, inks, adhesives, and paper coatings.

polypropylene glycol. (PG). $HO(C_3H_6O)_nH$. One of a group of compounds comparable to polyethylene glycols but more oil soluble and substantially less water soluble. Classified by molecular weight as 425, 1025, 2025. Nonvolatile, noncorrosive liquids; lower molecular weight members are soluble in water. Solvents for vegetable oils, waxes, resins. Combustible.

Use: Hydraulic fluids, rubber lubricants, antifoam agents, intermediates in urethane foams, adhesives, coatings, elastomers, plasticizers, paint formulations, laboratory reagent.

polypropylene glycol ester. Exactly analogous to polyethylene glycol ester.

polypropylene glycol monobutyl ether.

See butoxy polypropylene glycol.

polypropyleneimine. Polymeric form of propyleneimine. Available in 50% aqueous solution.
Use: Textile, paper, and rubber industries.

polypropylene oxide. $(C_3H_6O)_n$. A derivative of propylene.

Use: Intermediate for urethane foams.

polypyrrolidone. Synonym for nylon 4.

“Polyrad” [Aqualon]. TM for reaction products of “Amine D” and ethylene oxide.

Grade: Various grades that differ in chain length of polyoxyethylene units and free amine content. Vary in viscosity at 25C from 0.5 to 24.8 cP.

Use: Corrosion inhibitors and detergents in petroleum processing equipment, wetting and emulsifying agents, inhibiting hydrogen chloride.

“Polyram” [FMC]. TM for a wettable powder.

Hazard: Toxic by ingestion and inhalation.

Use: Fungicide, approved for many vegetables.

polyribosome. (polysome). A complex of an mRNA molecule and many ribosomes.

polyrotaxanes. Hooplike molecules threaded as “rotors” on a linear polymer “axle.” Up to 40 α -cyclodextrin (rotor) molecules have been threaded on a poly(iminooligomethylene) (hub) chain.

polysaccharide. A combination of nine or more monosaccharides, linked together by glycosidic bonds. Examples: starch, cellulose, glycogen.
See carbohydrate; phycocolloid.

polysiloxane. See siloxane.

“Poly-Solv” [Olin]. TM for a series of glycol ether solvents for paints, varnishes, dry-cleaning soaps, cutting oils, insecticides.

polysome. See polyribosome.

polysorbate. (USAN for a polyoxyethylene fatty acid ester). One of a group of nonionic surfactants obtained by esterification of sorbitol with one or three molecules of a fatty acid (stearic, lauric, oleic, palmitic) under conditions that cause splitting out of water from the sorbitol, leaving sorbitan. About 20 moles of ethylene oxide per mole of sorbitol are used in the condensation to effect water solution.

Properties: Lemon to amber, oily liquids; faint odor; bitter taste. D 1.1. Most types are soluble in water, alcohol, and ethyl acetate. Combustible.

Grade: Polysorbate 20 (polyoxyethylene (20) sorbitan monolaurate). Polysorbate 60 (polyoxyethylene (20) sorbitan monostearate). Polysorbate 80 (polyoxyethylene (20) sorbitan monooleate). Polysorbate 65 (polyoxyethylene (20) sorbitan tristearate).

Use: Surfactant, emulsifying agent, dispersing agents, shortenings and baked goods, pharmaceuticals, flavoring agents, foaming and defoaming agents.

See sorbitan fatty acid ester.

polysorbate 65.

Properties: Tan, waxy solid; faint odor, bitter taste. Sol in mineral oil, vegetable oil, mineral spirits, acetone, ether, dioxane, alc, methanol; dispersible in water, carbon tetrachloride.

Use: Food additive.

polystyrene.

CAS: 9003-53-6. $(C_6H_5CHCH_2)_n$. Polymerized styrene, a thermoplastic synthetic resin of variable molecular weight depending on degree of polymerization.

Properties: Transparent, hard solid. High strength and impact resistance; excellent electrical and thermal insulator. Attacked by hydrocarbon solvents but resists organic acids, alkalis, and alcohols. Not recommended for outdoor use; unmodified polymer yellows when exposed to light, but light-stable modified grades are available. Easily colored, molded, and fabricated. Copolymerization with butadiene and acrylonitrile and blending with rubber or glass fiber increase impact strength and heat resistance; autoign temp 800F. Combustible.

Derivation: Polymerization of styrene by free radicals with peroxide initiator.

Available forms: Sheet, plates, rods, rigid foam, expandable beads or spheres.

Hazard: As for foam, plastic.

Use: Packaging, refrigerator doors, air-conditioner cases, containers and molded household wares, machine housings, electrical equipment, toys, clock and radio cabinets. Foam: Thermal insulations, light construction (as in boats, etc.), ice buckets, water coolers, fillers in shipping containers, furniture construction. Spheres: Radiator leak stopper.

See "Styron" [Dow]; "Styrofoam" [Dow].

polysulfide elastomer.

A synthetic polymer in either solid or liquid form obtained by the reaction of sodium polysulfide with organic dichlorides such as dichlorodiethyl formal, alone or mixed with ethylene dichloride. Outstanding for resistance to oils and solvents and for impermeability to gases. They have poor tensile strength and abrasion resistance but are resilient and have excellent low-temperature flexibility. Some grades have fairly strong odor, which is not objectionable in most applications. Sealant grades are furnished in two parts that cure at room temperature when blended.

Use: Gasoline and oil-loading hose, sealants and adhesive compositions, binder in solid rocket propel-

lants, gaskets, paint spray hose.

See "Thiokol."

polysulfone. A synthetic thermoplastic polymer.

Properties: Hard, rigid, transparent solid. Tensile strength 10,000 psi, d 1.24, flexural strength 15,000 psi, good electrical resistance, minimum creep, low expansion coefficient. Soluble in aromatic hydrocarbons, ketones, and chlorinated hydrocarbons; resistant to corrosive acids and alkalis, heat, oxidation, detergents, oils, and alcohols. Dimensionally stable over temperature range -100 to $+148C$; tends to absorb moisture, readily processed and fabricated. Combustible but self-extinguishing.

Derivation: Condensation of bisphenol A and dichlorophenyl sulfone.

Use: Power-tool housings, electrical equipment, extruded pipe and sheet, automotive components, electronic parts, appliances, computer components, base matrix for stereotype printing plates.

polyterpene resin.

A class of thermoplastic resins or viscous liquids of amber color, obtained by polymerization of turpentine in the presence of catalysts such as aluminum chloride or mineral acids. The resins consist essentially of polymers of α - or β -pinene and are soluble in most organic solvents.

Use: Paints, rubber plasticizers, curing concrete, impregnating paper, adhesives, hot-melt coatings, pressure-sensitive tapes.

See pinene.

polytetrafluoroethylene. (PTFE; TFE; "Teflon").

CAS: 9002-84-0. $(C_2F_4)_n$. A polymer of tetrafluoroethylene; it is essentially a straight chain of the repeating unit $[-CF_2-CF_2-]_n$. Soft and waxy with a milk-white color; it can be molded by powder metallurgy techniques involving mixing with a diluent, that is subsequently removed, and sintering at 371C.

Properties: Highly resistant to oxidation and action of chemicals including strong acids, alkalis, oxidizing agents; resistant to nuclear radiation and UV rays, ozone, and weather; halogenated solvents at high temperatures and pressures have some adverse effect. Retains useful properties up to 287C and is strong and tough. Low coefficient of friction (0.05) and antistick properties; excellent resistance to electricity; coefficient of thermal expansion greater than other plastics and metals. Nonflammable.

Available forms: Extrusion and molding powders, aqueous dispersion, film, multifilament fiber.

Hazard: Evolves toxic fumes on heating.

Use: Gaskets, liners, seals, flexible hose; ablative coatings for rockets and space vehicles; chemical process equipment; coatings in aerospace; coaxial spacers; insulators; wire coating and tape in electrical and electronic fields; bearings; seals; piston rings; antistick coatings for cooking vessels, felts, packings, and bearings.

See "Teflon" [Du Pont] "Halon" [Allied Signal].

polythene. (generic name for polyethylene). No longer current terminology in the U.S. but still used in England.

polythiadiazole. $[-C_6H_4-C_2N_2S-]_n$. A polymer made from polyoxathiahydrazide. Can be converted to fibers; stated to retain properties to 398C and to have resistance to thermal degradation such that it retains 60 or 70% of original tenacity after 32 hr at 398C.

polythiazyl. $(SN)_n$. An experimental polymer of sulfur nitride with covalent linkages said to have the optical and electrical properties characteristic of metals. Thin films are reported to exhibit epitaxial growth.

polytrifluorochloroethylene resin. See chlorotrifluoroethylene resin.

polyunsaturated fat. A fat or oil based at least partly on fatty acids having two or more double bonds per molecule, such as linoleic and linolenic acids. Examples are corn oil and safflower oil. **Use:** Margarine and dietary foods, salad dressings, etc.

polyurethane. CAS: 9009-54-5. A thermoplastic polymer (which can be made thermosetting) produced by the condensation reaction of a polyisocyanate and a hydroxyl-containing material, e.g., a polyol derived from propylene oxide or trichlorobutylene oxide. The basic polymer unit is formed as follows: $R_1NCO + R_2OH \rightarrow R_1NHCOOR_2$.

Fiber

Properties: High elastic modulus, good electrical resistance, highly moisture-proof, crystalline structure. Combustible.

Derivation: Reaction of hexamethylene diisocyanate and 1,4-butanediol.

Use: Chiefly in so-called spandex fibers for girdles and other textile structures requiring exceptional elasticity, bristles for brushes, etc.

Coatings

Properties: Excellent hardness, gloss, flexibility, abrasion resistance, and adhesion; resistant to impact, weathering, acids, and alkalis; attacked by aromatic and chlorinated solvents. Applied by brush, spray, or dipping. Combustible.

Derivation: Formed from "prepolymers" containing isocyanate groups (toluene and 4,4'-diphenylmethane diisocyanates) and hydroxyl-containing materials such as polyols and drying oils.

Use: Baked coatings, two-component formulations, wire coatings, tank linings, maintenance paints, masonry coating.

Elastomers

Properties: Good resistance to abrasion, weathering, and organic solvents, tend to harden and become brittle at low temperatures. Combustible.

Derivation: Reaction of polyisocyanates with linear

polyesters or polyethers containing hydroxyl groups.

Use: Sealants and caulking agents; adhesives; films and linings; shoe uppers and heels; encapsulation of electronic parts; binders for rocket propellants; abrasive wheels and other mechanical items; automobile bumpers, fenders, and other components.

Foams

Properties: Both flexible and rigid foams are available. Density varies from 2 to 50 lb/ft³, thermal conductivity as low as 0.11 Btu/hr/sq ft/F/in, excellent insulators. Combustible unless protected by effective thermal barrier.

Hazard: Evolves toxic fumes on ignition.

See foam, plastic.

Derivation: A polyether such as polypropylene glycol is treated with a diisocyanate in the presence of some water and a catalyst (amines, tin soaps, organic tin compounds). As the polymer forms, the water reacts with the isocyanate groups to cause cross-linking and also produces carbon dioxide, which causes foaming. In other cases, trifluoromethane or similar volatile material may be used as a blowing agent.

Flexible foams are based on polyoxypropylenediols of 2000 molecular weight and triols up to 4000 molecular weight. Rigid foams are based on polyethers made from sorbitol, methyl glucoside, or sucrose.

Use: (Flexible) Furniture, mattresses, laminates and linings, flooring leveling, seat cushions and other automotive accessories, carpet underlays, upholstery, absorbent of crude oil spills on seawater. (Rigid) Furniture; packaging and packing; building insulation; marine flotation; automobile components; cigarette filters; light structures (as boat hulls); soundproofing; salvaging operations; ship building (for buoyancy); transportation insulation for box cars, refrigerated cars, tank and hopper cars, trucks, and trailers (claimed to be twice as effective as glass fiber); insulation for storage tanks, ships' holds, and pipelines; automobile bumpers.

polyvinyl acetal. One of the family of vinyl resins resulting from the condensation of polyvinyl alcohol with an aldehyde; acetaldehyde, formaldehyde, and butyraldehyde are commonly used. The three main groups are polyvinyl acetal itself, polyvinyl formal, and polyvinyl butyral. These are all thermoplastic and can be processed by extruding, molding, coating, and casting. They are used chiefly in adhesives, paints and lacquers, and films. Polyvinyl butyral is used in sheet form as an interlayer in safety glass and shatter-resistant protection in aircraft.

polyvinyl acetate. (PVAc).

CAS: 9003-20-7. $[-\text{CH}_2\text{CH}(\text{OOCCH}_3)-]_n$. A thermoplastic high polymer.

Properties: Colorless transparent solid; odorless. D 1.19 (15C). Insoluble in water, gasoline, oils, and fats; soluble in low molecular weight alcohols, esters, benzene, and chlorinated hydrocarbons. Resistant to weathering. Combustible.

Derivation: Polymerization of vinyl acetate with peroxide catalysts.

Use: Latex water paints; adhesives for paper, wood, glass, metals, and porcelain; intermediate for conversion to polyvinyl alcohol and acetals; sealant; shatterproof photographic bulbs; paper coating and paperboard; bookbinding; textile finishing; nonwoven fabric binder; component of lacquers, inks, and plastic wood; strengthening agent for cements.

polyvinyl alcohol. (PVA; PVOH).

CAS: 9002-89-5. $(-\text{CH}_2\text{CHOH}-)_n$. A water-soluble synthetic polymer made by alcoholysis of polyvinyl acetate.

Properties: White- to cream-colored powder. D 1.27–1.31, refr index 1.49–1.53. Properties depend on degree of polymerization and the percentage of alcoholysis, both of which are controllable in processing. Water solubility increases as molecular weight decreases; strength, elongation, tear resistance, and flexibility improve with increasing molecular weight. Tensile strength up to 22,000 psi; decomposes at 200C. PVA has high impermeability to gases, is unaffected by oils, greases, and petroleum hydrocarbons. Attacked by acids and alkalis. It forms films by evaporation from water solution. Combustible.

Grade: Super high viscosity (mw 250,000–300,000), high viscosity (mw 170,000–220,000), medium viscosity (mw 120,000–150,000), low viscosity (mw 25,000–35,000).

Use: Textile warp and yarn size, laminating adhesives, molding powders, binder for cosmetic preparations, ceramics, leather, cloth, nonwoven fabrics and paper, paper coatings, grease-proofing paper, emulsifying agent, thickener and stabilizer, photosensitive films, cements and mortars, intermediate for other polyvinyls, imitation sponges, printing inks (glass).

polyvinylbenzyltrimethyl ammonium chloride.

An electrically conductive polymer.

Use: To increase the conductivity of papers.

polyvinyl butyral. See polyvinyl acetal.**polyvinyl carbazole.**

A brown thermoplastic resin obtained by the reaction of acetylene with carbazole. It softens at 150C, and has excellent dielectric properties, good heat, and chemical stability but poor mechanical strength.

Use: Substitute for mica in electrical equipment and as an impregnant for paper capacitors.

polyvinyl chloride. (PVC).

CAS: 9002-86-2. $(-\text{H}_2\text{CCHCl}-)_n$. A synthetic thermoplastic polymer.

Properties: White powder or colorless granules. Resistant to weathering and moisture; dimensionally stable; good dielectric properties; resistant to most acids, fats, petroleum hydrocarbons, and fungus. Readily compounded into flexible and rigid forms by use of plasticizers, stabilizers, fillers, and other modifiers. Easily colored and processed by blow molding, extrusion, calendaring, fluid-bed coating, etc. Available as film, sheet, fiber, and foam.

Derivation: Polymerization of vinyl chloride by free radicals with peroxide initiator. May be copolymerized with up to 15% of other vinyls.

Hazard: Decomposes at 148C, evolving toxic fumes of hydrogen chloride.

See vinyl chloride.

Use: Piping and conduits of all kinds; siding; gutters; window and door frames; officially approved for use in interior piping, plumbing, and other construction uses. Raincoats, toys, gaskets, garden hose, electrical insulation, shoes, magnetic tape, film and sheeting, containers for toiletries, cosmetics, household chemicals, fibers for athletic supports, sealant liners for ponds and reservoirs, adhesive and bonding agent, plastisols and organosols, tennis court surfaces, flooring, coating for paper and textiles, wire and cable protection, base for synthetic turf, phonograph records, fuel in pyrotechnic devices.

Note: Use of PVC in rigid and semirigid food containers such as bottles, boxes, etc., is under restriction by FDA as well as in coatings for fresh citrus fruits. Its use in thinner items such as films and package coatings is permissible. Possibility of migration of vinyl chloride monomer into food products is the critical factor; this tends to increase with the thickness of the material.

polyvinyl chloride-acetate.

CAS: 34149-92-3. $(-\text{C}_2\text{H}_4\text{O}\cdot\text{C}_2\text{H}_3\text{Cl}-)_n$. A vinyl chloride and vinyl acetate copolymer that is more flexible than polyvinyl chloride. The copolymer usually contains 85–97% of the chloride. It generally has similar properties and uses as polyvinyl chloride.

polyvinyl dichloride. (PVDC). A chlorinated polyvinyl chloride. Has high strength and superior chemical resistance over a broad temperature range. Combustible but self-extinguishing.

Use: Pipe and fittings for hot corrosive materials up to 100C. Immune to solvation or direct attack by inorganic reagents, aliphatic hydrocarbons, and alcohols.

polyvinyl ether. See polyvinyl ethyl ether; polyvinyl isobutyl ether; polyvinyl methyl ether; polyvinyl methyl ether-maleic anhydride.

polyvinyl ethyl ether. (PVE; polyvinyl ether). $[-\text{CH}(\text{OC}_2\text{H}_5)\text{CH}_2-]_n$.

Properties: Viscous gum to rubbery solid, depending on molecular weight. Colorless when pure. D 0.97 (20C), refr index 1.45 (25C). Insoluble in water; soluble in nearly all organic solvents; stable toward dilute and concentrated alkalis and dilute acids. Compatible with a limited number of commercial resins, including rosin derivatives and some phenolics.

Derivation: Polymerization of vinyl ethyl ether.

Use: Pressure-sensitive tape, to improve adhesion to porous surfaces, cellophane, cellulose acetate, and vinyl sheet.

polyvinyl fluoride. $(-H_2CCHF-)_n$. Polymer of vinyl fluoride. In film form it is characterized by superior resistance to weather, high strength, high dielectric constant, low permeability to air and water, as well as oil, chemical solvent, and stain resistance.

Hazard: Not recommended for food packaging; evolves toxic fumes on heating.

Use: Protective material for outdoor use, packaging, electrical equipment.

polyvinyl formal. See polyvinyl acetal.

polyvinylidene chloride. (saran). A stereoregular, thermoplastic polymer.

Properties: Tasteless, odorless, abrasion resistant, low vapor transmission, impermeable to flavor, highly inert to chemical attack. Softened by chlorinated hydrocarbons, soluble in cyclohexanone and dioxane. Combustible but self-extinguishing.

Derivation: Polymerization of vinylidene chloride or copolymerization of vinylidene chloride with lesser amounts of other unsaturated compounds.

Available forms: Extruded and molded products, oriented fibers, films.

Use: Packaging of food products; specially meats and poultry, insecticide-impregnated multiwall paper bags; tapes for chemical processing equipment; seat covers; upholstery; fibers; bristles; latex coatings. See saran fiber; "Cryovac."

polyvinylidene fluoride. $(-H_2C=CF_2-)_n$. A thermoplastic fluorocarbon polymer suitable for compression and injection molding and extrusion.

Properties: Crystals. Mp 171C, thermally stable from -62 to +148C; combustible, self-extinguishing and nondripping. Tensile strength 7,000 psi at 25C, yield stress 5,500 psi, elongation 300%, compression strength 10,000 psi, thermal conductivity 1.05 Btu/hr/sq ft/F/in, water absorption 0.04% in 24 hr, d 1.76, refr index 1.42. Resistant to oxidative degradation, electricity, acids, alkalis, oxidizers, halogens; somewhat soluble in dimethylacetamide, attacked by hot concentrated sulfuric acid or *n*-butylamine.

Available forms: Powder, pellets, solution, and dispersion.

Use: Insulation for high-temperature wire; tank linings; chemical tanks and tubing; protective paints and coatings with exceptional resistance (30 years)

to weathering and UV; valve and impeller parts; shrinkage tubing to encapsulate resistors, diodes, and soldered joints; sealant.

See fluorocarbon polymer.

polyvinyl isobutyl ether. (PVI; polyvinyl ether). $[-CH(OCH_2CH(CH_3)CH_2-)]_n$.

Properties: White, opaque elastomer or viscous liquid depending on molecular weight; almost odorless. D 0.91-0.93 (20C), refr index 1.45-1.46 (25C). Insoluble in water, ethanol, and acetone; soluble in most other organic solvents; stable toward dilute and concentrated alkalis and dilute acids. Compatible with a limited number of commercial resins, including rosin derivatives and some phenolics. Combustible.

Derivation: Polymerization of vinyl isobutyl ether by peroxides or acid catalysts.

Grade: As 100% material in three molecular weight ranges.

Use: Adhesives, waxes, tackifiers, plasticizers, surface coatings, laminating agents, cable filling compositions, lubricating oils.

polyvinyl methyl ether. (PVM).

$(-CH_2CHOCH_3-)_n$. A nonionic polymer of high molecular weight.

Properties: Colorless (when pure), tacky liquid. D 1.05, refr index 1.47, solidifies near 0C. Soluble in water at 32C above which it precipitates from water but redissolves on cooling. Soluble in most organic solvents except aliphatic hydrocarbons. Compatible with rubber latexes, rosin derivatives, and some phenolics. Combustible.

Derivation: Polymerization of vinyl methyl ether with peroxides or acid catalysts.

Use: Pressure-sensitive and hot-melt adhesives, bonding of paper to polyethylene, laminating adhesive, tackifier and plasticizer for coatings, heat sensitizer for rubber latex, pigment binder in textile finishing and printing inks, protective colloid in emulsions.

polyvinyl methyl ether-maleic anhydride.

(PVM/MA).

$[-CH_2CHOCH_3CHCOOCOCH-]_n$. Water-soluble copolymer of vinyl methyl ether and maleic anhydride

Use: Protective colloid, dispersing agent, thickener, binder, adhesive and size in coatings, detergents, emulsions, paper, textiles, leather, latex, rust preventive, foam stabilizer.

polyvinylpyrrolidone.

Properties: White, hygroscopic powder; faint bland odor. Insol in water.

Use: Food additive.

poly-2-vinylpyridine. $(-CH(C_5H_4N)-CH_2-)_n$.

A vinyl-type polymer suggested for use as a photographic dye mordant, tablet coating material, anti-static for textiles and paper, and textile dye receptor.

polyvinylpyrrolidone. (PVP).CAS: 9003-39-8. (C₆H₉NO)_n.**Properties:** White, free-flowing, amorphous powder or aqueous solution. D 1.23–1.29, bulk d 15lb/ft³, hygroscopic. Soluble in water and organic solvents; compatible with wide range of hydrophilic and hydrophobic resins.**Grade:** Various molecular weight: 10,000, 40,000, 160,000, 360,000.**Use:** Pharmaceuticals; blood plasma expander; cast films adherent to glass, metals, and plastics; complexing agent; detoxification of chemicals such as dyes, iodine, phenol, and poisonous drugs. Tabletting, photographic emulsions, cosmetics (hair sprays, shampoos, hand creams, skin lotions), dentifrices, dye-stripping, textile finishes, protective colloid, detergents, adhesives, beer and wine clarification.**polyvinyl resin.** (vinyl plastic). Any of a series of polymers (resins) derived by polymerization or copolymerization of vinyl monomers (CH₂=CH-) including vinyl chloride and acetate, vinylidene chloride, methyl acrylate and methacrylate, acrylonitrile, styrene, the vinyl ethers, and numerous others. Specifically, polyvinyl chloride, acetate, alcohol, etc. and copolymers or closely related materials. See vinyl; polyvinyl.**“POLYWAX”** [*Baker Petrolite*]. TM for polyethylene.**Pomeranz-Fritsch reaction.** Formation of isoquinolines by the acid-catalyzed cyclization of benzalaminoacetals prepared from aromatic aldehydes and aminoacetal.**Ponceau 3R.** (3-hydroxy-4-[2,4,5-(trimethylphenyl)azo]-2,7-naphthalenedisulfonic acid, disodium salt; CI 16155). CAS: 3564-09-8.(CH₃)₃C₆H₂NNC₁₀H₄(OH)(SO₃)₂•2Na. A water-soluble red dye.**Properties:** Dark-red powder. Soluble in water and acids to form a cherry-red solution; slightly soluble in alcohol; insoluble in alkalis.**Hazard:** Prohibited by FDA for use in foods, drugs, cosmetics.**Use:** Dyeing wool; biological stain.**“Ponolith”** [*Du Pont*]. TM for a type of highly dispersed pigments used primarily for the coloring and tinting of paper.**pontianak.** A type of Manila resin that is semi-fossil, hard, and soluble in oils and hydrocarbons.**Use:** Adhesives; paints, varnishes, and lacquers. See copal resin.**pony.** A small unit of equipment used for laboratory or plant experimental work.**Ponzio reaction.** Formation of dinitrophenylmethanes from benzaldoximes by oxidation with nitrogen dioxide in ether.**POPDA.** See polyoxypropylene diamine.**Pople, John A.** (1925–2004). A British citizen awarded the Nobel Prize in chemistry in 1998, jointly with Walter Kohn, for pioneering contributions in developing methods that can be used for theoretical studies of the properties of molecules and the chemical processes in which they are involved. He performed his research at Northwestern University, Evanston, Illinois.**POPOP.** Abbreviation for phenyl-oxazolyl-phenyloxazolyl-phenyl. See 1,4-bis[2-(5-phenyloxazolyl)]benzene.**population genetics.** The study of variation in genes among a group of individuals.**porcelain.** (potassium aluminum silicate). (4K₂O•Al₂O₃•3SiO₂). A mixture of clays, quartz, and feldspar usually containing at least 25% alumina. Ball and china clays are ordinarily used. A slip or slurry is formed with water to form a plastic, moldable mass, which is then glazed and fired to a hard, smooth solid.**Properties:** High impact strength, impermeable to liquids and gases, resistant to chemicals except hydrogen fluoride and hot, strong caustic solutions, usable up to 1093C but subject to heat shock. D 2.41, Mohs hardness 6–7, compression strength 100,000 psi.**Grade:** Chemical and electrical.**Use:** Reaction vessels, spark plugs, electrical resistors, electron tubes, corrosion-resistant equipment, ball mills and grinders, food-processing equipment, piping, valves, pumps, tower packing, laboratory ware.

See ceramics; porcelain enamel; porcelain, zircon.

porcelain enamel. A substantially vitreous inorganic coating bonded to metal by fusion above 426C (ASTM). Composed of various blends of low-sodium frit, clay, feldspar, and other silicates; ground in a ball mill; and sprayed onto a metal surface (steel, iron, or aluminum), to which it bonds firmly after firing, giving a glasslike fire-polished surface.**Properties:** High hardness, abrasion, and chemical resistance except to hydrogen fluoride and hot strong caustic; low expansion coefficient. Corrosion resistant, stable to heat-shock, easy to clean and decontaminate.**Use:** Chemical reaction equipment, light reflectors, laboratory bench tops, storage tanks and containers, high temperature process equipment, seawater treatment and marine engine parts, glazing frit. See porcelain; glaze.

porcelain, zircon. ($ZrO_2 \bullet SiO_2$). A special high-temperature porcelain used for spark plugs and furnace trays because of its high mechanical strength and heat-shock resistance. Usable up to 1700C. High dielectric strength but rather lower power factor at high frequencies.

pore. (1) A minute cavity in epidermal tissue as in skin, leaves, or leather, having a capillary channel to the surface that permits transport of water vapor from within outward but not the reverse. (2) A void or interstice between particles of a solid such as sand minerals or powdered metals, that permits passage of liquids or gases through the material in either direction. In some structures, such as gaseous diffusion barriers and molecular sieves, the pores are of molecular dimensions, i.e., 4–10 Å units. Such microporous structures are useful for filtration and molecular separation purposes in various industrial operations. (3) A cell in a spongy structure made by gas formation (foamed plastic) that absorbs water on immersion but releases it when stressed. See membrane, semipermeable; molecular sieve.

“Porocel” [Engelhard]. TM for an activated bauxite. Supplied in various standard meshes, moisture contents, and regular low iron and low silica grade.

Use: Absorbent catalysts.

poromeric. A term coined to describe the microporosity, air permeability, and water and abrasion resistance of natural and synthetic leather. The pores decrease in diameter from the inner surface to the outer and thus permit air and water vapor to leave the material while excluding water from the outside. Polyester-reinforced urethane resins have poromeric properties, and vinyl resins have been used as leather substitutes with some success, primarily for shoe uppers.

porphyrin. Any of several physiologically active nitrogenous compounds occurring widely in nature. The parent structure is comprised of four pyrrole rings, shown as I, II, III, and IV in the diagram below, together with four nitrogen atoms and two replaceable hydrogens, for which various metal atoms can be readily substituted. A metal-free porphyrin molecule has the structure:

Porphyrins of this type have been made synthetically by passing an electric current through a mixture of ammonia, methane, and water vapor. Biochemists believe that this phenomenon may account for the original formation of chlorophyll and other porphyrins that have been essential factors in the origin of life.

The most important porphyrin derivatives are characterized by a central metal atom; hemin is the iron-containing porphyrin essential to mammalian blood, and chlorophyll is the magnesium-containing porphyrin that catalyzes photosynthesis. Other derivatives of importance are cytochromes, which function in cellular metabolism, and the phthalocyanine group of dyes.

porpoise oil. (dolphin oil).

Properties: Pale-yellow liquid. D 0.926–0.929, saponification value 290, iodine value 10–30. Soluble in ether, chloroform, benzene, and carbon disulfide; the refined jaw and head oil has uniquely low pour point and high lubricity and is highly resistant to gumming, oxidation, and evaporation.

Use: Lubricant for watches and precision instruments.

“Porta-Pig” [Reactor]. TM for lead-lined mobile cart.

Use: Carrying radioactive materials.

Porter, George. (1920–2002). An English chemist who won the Nobel Prize for chemistry in 1967 with Eigen and Norrish. His research concerned fast chemical reactions and the chemistry of photosynthesis. He was educated at Cambridge University and taught there before going on to other posts.

Portland cement. See cement, Portland.

“Positek” [Nalco]. TM for retention and draining program.

Use: Papermaking.

positive cooperativity. A phenomenon of some multisubunit enzymes or proteins in which binding of a ligand or substrate to one subunit facilitates binding of a second ligand or substrate to another subunit.

positional cloning. A technique used to identify genes, usually those that are associated with diseases, based on their location on a chromosome.

positron. An antiparticle whose mass and spin are the same as those of an electron but whose electric charge is positive. Positrons can be made in a linear particle accelerator for use in physical research.

See antiparticle.

post-transcriptional processing. The enzymatic processing of an hnRNA, producing functional mRNA, tRNA, or rRNA molecules.

post-transcriptional regulation. Any process occurring after transcription which affects the amount of protein a gene produces. Includes RNA processing efficiency, RNA stability, translation efficiency, protein stability. For example, the rapid degradation of an mRNA will reduce the amount of protein arising from it. Increasing the rate at which an mRNA is translated will increase the amount of protein product.

post-translational modification. Enzymatic processing of a polypeptide chain after translation from its mRNA. Examples are enzymatic cleavage, phosphorylation or sulfation, and oligosaccharide addition.

post-translational processing. The reactions which alter a protein's covalent structure, such as phosphorylation, glycosylation, or proteolytic cleavage.

potasan. (4-methyl-7-hydroxycoumarin diethoxythiophosphate; hymecromone-*O,O*-diethylphosphorothioate).

CAS: 299-45-6. $C_{14}H_{17}O_5PS$.

Properties: Acicular crystals. Mp 38C, bp 210C (1 mm Hg) (decomposes), d 1.26, refr index 1.567. Soluble in common organic solvents; almost insoluble in water.

Hazard: Toxic by ingestion, cholinesterase inhibitor.

Use: Insecticide.

potash. See potassium carbonate.

potash alum. See aluminum potassium sulfate.

potash, caustic. See potassium hydroxide.

potash chrome alum. See chromium potassium sulfate.

potash feldspar. See feldspar.

potash magnesia double salt. A material containing potassium carbonate, magnesium sulfate, a low proportion of chloride, and 20–30% K_2O .
Use: Fertilizer.

potash, sulfurated. (potassium, sulfurated). A mixture composed chiefly of potassium polysulfides and potassium thiosulfate, containing not less than 12.8% sulfur in combination as sulfide.

Properties: Liver-brown when freshly made changing to a greenish-yellow; odor of hydrogen sulfide; bitter, acrid, and alkaline taste; decomposes upon exposure to air, soluble in water leaving a residue.

Grade: USP.

Use: Medicine; decorative color effects on brass, bronze, and nickel.

potassium.

CAS: 7440-09-7. K. Metallic element of atomic number 19, group IA of the periodic table, an alkali metal, aw 39.098, valence of 1. Potassium-40 is a naturally occurring radioactive isotope. There are also two stable isotopes. The synthetic isotope, potassium-42, is used in tracer studies, primarily in medicine. An essential element in plant growth and in animal and human nutrition; occurs in all soils.

Properties: Soft, silvery metal. Rapidly oxidized in moist air. D 0.862, mp 63C, bp 770C. Soluble in liquid ammonia, aniline, mercury, and sodium.

Derivation: Ores and deposits in Stassfurt (Germany), Carlsbad (New Mexico), Saskatchewan (Canada), Searles Lake (California), Great Salt Lake (Utah), Yorkshire (England), Ural Mountains (the former U.S.S.R.), Israel, and eastern Mediterranean area. The most important ores are carnallite, sylvite, and polyhalite. Thermochemical distillation of potassium chloride with sodium is the chief U.S. method of production.

Grade: Technical, 99.95% pure.

Hazard: Dangerous fire risk, reacts with moisture to form potassium hydroxide and hydrogen. The reaction evolves much heat, causing the potassium to melt and spatter. It also ignites the hydrogen. Burning potassium is difficult to extinguish; dry powdered soda ash or graphite or a special mixture of dry chemicals is recommended. It can ignite spontaneously in moist air. Moderate explosion risk by chemical reaction. Potassium metal will form the peroxide and the superoxide at room temperature even when stored under mineral oil; may explode violently when handled or cut. Oxide-coated potassium should be destroyed by burning. Store in inert atmospheres, such as argon or nitrogen, under liquids that are oxygen free, such as toluene or kerosene, or in glass capsules that have been filled under vacuum or inert atmosphere.

Use: Preparation of potassium peroxide, heat-exchange alloys (see NaK); laboratory reagent; seeding of combustion gases in magnetohydrodynamic generators; component of fertilizers (as potassium chloride).

potassium abietate. $KO_2CC_{19}H_{29}$. Water-soluble soap resulting from action of rosin on potassium hydroxide.

potassium acetate.

CAS: 127-08-2. $KC_2H_3O_2$.

Properties: White, crystalline, deliquescent powder; saline taste. Mp 292, d 1.57 (25C). Soluble in water and alcohol; insoluble in ether; solutions alkaline to litmus but not to phenolphthalein. Combustible.

Derivation: By the action of acetic acid on potassium carbonate.

Grade: Pure, pure fused, CP, NF reagent.

Use: Dehydrating agent, textile conditioner, reagent in analytical chemistry, medicine, cacodylic derivatives, crystal glass, synthetic flavors.

potassium acid carbonate. See potassium bicarbonate.

potassium acid fluoride. See potassium bifluoride.

potassium acid oxalate. See potassium binoxalate.

potassium acid phosphate. See potassium phosphate, monobasic.

potassium acid saccharate.
HOOC(CHOH)₄COOK.

Properties: Light, off-white powder, pH of solution 3.5. Slightly soluble in cold water; soluble in hot water, acid, or alkaline solutions. Combustible.

Use: Chelating agent, rubber formulations, metal plating, soaps, and detergents.

potassium acid sulfate. See potassium bisulfate.

potassium acid sulfate, anhydrous. See potassium pyrosulfate.

potassium acid sulfite. See potassium bisulfite.

potassium acid tartrate. See potassium bitartrate.

potassium alginate. (potassium polymannuronate). (C₆H₇O₆K)_n. Hydrophilic colloid having a molecular weight of 32,000–250,000.

Properties: Occurs in filamentous, grainy, granular, and powdered forms. It is colorless or slightly yellow and may have a slight characteristic smell and taste. Slowly soluble in water, forming a viscous solution; insoluble in alcohol.

Grade: Technical, FCC.

Use: Thickening agent and stabilizer in dairy products, canned fruits, and sausage casings; emulsifier. See alginic acid.

potassium alum. See aluminum potassium sulfate.

potassium aluminate. K₂Al₂O₆•3H₂O.

Properties: Hard crystals, lustrous. Soluble in water with hydrolysis to form strongly alkaline solution; insoluble in alcohol.

Derivation: By fusing potassium hydroxide with aluminum oxide.

Grade: Technical.

Use: Dyeing, printing (mordant); lakes, paper sizing.

potassium aluminosilicate. See feldspar.

potassium aluminum fluoride. K₃AlF₆.

Properties: White powder. Slightly soluble in water.

Derivation: Aluminum fluoride, ammonium fluoride, and potassium chloride.

Hazard: Toxic by ingestion and inhalation, strong irritant. TLV: 2.5 mg(F)/m³.

Use: Insecticide.

potassium aluminum sulfate. See aluminum potassium sulfate.

potassium-*p*-aminobenzoate. C₇H₆KNO₂.

Properties: Colorless crystals. Soluble in water; partially soluble in alcohol; insoluble in ether.

Use: Condensation catalyst, mainly for polyglycol ether polymers.

potassium antimonyl tartrate. See antimony potassium tartrate.

potassium argentocyanide. See silver potassium cyanide.

potassium arsenate. (Macquer's salt).

CAS: 7784-41-0. KH₂AsO₄.

Properties: Colorless crystals. D 2.867, mp 288C. Soluble in water; insoluble in alcohol.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Manufacture of fly paper, insecticidal preparations, preserving hides, printing textiles.

potassium arsenite. (potassium metaarsenite).

CAS: 10124-50-2. KH(AsO₂)₂•H₂O.

Properties: White powder. Hygroscopic; decomposes slowly in air. Variable composition. Keep well stoppered. Soluble in water; slightly soluble in alcohol.

Grade: Technical, reagent.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Reducing agent in silvering mirrors.

potassium asulam.

CAS: 14089-43-1. mf: C₈H₆N₂O₄S•K.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

potassium aurate. KAuO₄•3H₂O.

Properties: Yellow crystals. Soluble in water and alcohol.

Derivation: Gold oxide dissolved in potassium hydroxide solution.

Use: To prepare other gold compounds.

potassium beryllium fluoride. See beryllium potassium fluoride.

potassium bicarbonate. (potassium acid carbonate; baking soda).

CAS: 298-14-6. KHCO₃.

Properties: Colorless, transparent crystals or white powder; odorless; slightly alkaline, salty taste. D 2.17, mp decomposes between 100 and 120C, refr index 1.482. Soluble in water and potassium carbonate solution; insoluble in alcohol.

Derivation: By passing carbon dioxide into a solution of potassium carbonate in water.

Grade: Commercial, highest purity, USP, reagent, FCC.

Use: Baking powders, soft drinks, medicine (antacid), manufacture of pure potassium carbonate, fire-extinguishing agent, low-pH liquid detergents, laboratory reagent, food additive.

potassium bichromate. See potassium dichromate.

potassium bifluoride. (potassium acid fluoride; potassium hydrogen fluoride).

CAS: 7789-29-9. KHF_2 .

Properties: Colorless crystals. D 2.37, mp 238C. Decomposed by heat; soluble in alcohol (dilute) and water; insoluble in alcohol (absolute).

Grade: Technical.

Hazard: Corrosive to tissue. TLV: 2.5 mg(F)/m³.

Use: Etching glass, flux in silver solders, alkylation catalyst, electrolyte in fluorine production.

potassium binoxalate. (potassium acid oxalate; acid potassium oxalate; sorrel salt).

CAS: 127-95-7. $\text{KHC}_2\text{O}_4 \cdot 1/2\text{H}_2\text{O}$.

Properties: White crystals; bitter, sharp taste; somewhat hygroscopic. D (anhydrous salt) 2.088. Decomposes when heated. Soluble in water; insoluble in alcohol.

Derivation: Neutral potassium oxalate and oxalic acid are dissolved in water and crystallized.

Hazard: Toxic by ingestion.

Use: Removing ink stains, scouring metals, cleaning wood, photography, laboratory reagent, mordant.

potassium biphtalate. See potassium hydrogen phthalate.

potassium bisulfate. (acid potassium sulfate; potassium hydrogen sulfate; potassium acid sulfate).

CAS: 7646-93-7. KHSO_4 .

Properties: Colorless crystals. The fused salt is deliquescent. D 2.245, mp 195 (decomposes). Soluble in water yielding a solution with acid reaction, decomposes in alcohol.

Derivation: Heating potassium sulfate with sulfuric acid.

Use: Conversion of wine lees and tartrates into potassium bitartrate, flux, manufacture of mixed fertilizers, methyl acetate, ethyl acetate, laboratory reagent.

potassium bisulfide. See potassium hydrosulfide.

potassium bisulfite. (potassium acid sulfite; potassium hydrogen sulfite). KHSO_3 .

Properties: White, crystalline powder; sulfur dioxide odor. Mp decomposes at 190C. Soluble in water; insoluble in alcohol.

Derivation: Sulfur dioxide is passed through a solution of potassium carbonate until no more carbon dioxide is given off; the solution is concentrated and allowed to crystallize.

Grade: Commercial, reagent, medicinal.

Use: Reduction of various organic compounds; purification of aldehydes and ketones, iodine, sodium hydrosulfite; antiseptic; source of sulfurous acid, particularly in brewing; analytical chemistry; tanning; bleaching straw and textile fibers; chemical preservative in foods (except meats and other sources of vitamin B₁).

potassium bitartrate. (cream of tartar; potassium acid tartrate).

CAS: 868-14-4. $\text{KHC}_4\text{H}_4\text{O}_6$.

Properties: White crystals or powder; pleasant, slightly acid taste. D 1.984 (18C). Soluble in boiling water; insoluble in alcohol.

Derivation: From wine lees by extraction with water and crystallization.

Grade: Technical, NF, FCC.

Use: Baking powder, preparation of other tartrates, medicine, galvanic tinning of metals, food additive.

potassium borate. See potassium tetraborate.

potassium borofluoride. See potassium fluoroborate.

potassium borohydride.

CAS: 13762-51-1. KBH_4 .

Properties: White, crystalline powder. D 1.18, stable in moist and dry air, stable in vacuum to 500C, decomposed by acids with evolution of hydrogen. Partially soluble in water and ammonia; insoluble in ethers and hydrocarbons.

Derivation: By reaction of sodium borohydride and potassium hydroxide.

Grade: Technical, powder, pellets.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion.

Use: Source of hydrogen; reducing agent for aldehydes, ketones, and acid chlorides; foaming agent for plastics.

potassium bromate.

CAS: 7758-01-2. KBrO_3 .

Properties: White crystals or crystalline powder. D 3.27, mp (decomposes) 370C, strong oxidizing agent. Soluble in boiling water.

Derivation: By passing bromine into a solution of potassium hydroxide.

Grade: Pure, CP, FCC.

Hazard: Dangerous fire risk in contact with organic materials, strong irritant.

Use: Laboratory reagent, oxidizing agent, perma-

ment-wave compounds, maturing agent in flour, dough conditioner, food additive.

Note: Food additive uses restricted as to proportions used.

potassium bromide.

CAS: 7758-02-3. KBr.

Properties: White, crystalline granules or powder; pungent, strong, bitter, saline taste; somewhat hygroscopic. D 2.749, mp 730C, bp 1435C. Soluble in water and glycerol; slightly soluble in alcohol and ether.

Derivation: Solutions of iron bromide and potassium carbonate are mixed and heated, the solution filtered and concentrated, and the bromide crystallized out.

Grade: Technical, CP, NF, reagent, single crystals.

Hazard: Toxic by ingestion and inhalation.

Use: Photography (gelatin bromide papers and plates), process engraving and lithography, special soaps, spectroscopy, infrared transmission, laboratory reagent.

potassium-tert-butoxide. See potassium-tert-butylate.

potassium-tert-butylate. (potassium-tert-butoxide). $(\text{CH}_3)_3\text{COK}$. White, hygroscopic powder; a strong organic base.

Hazard: Flammable. May cause severe caustic tissue burns.

potassium carbonate. (potash; pearl ash).

CAS: 584-08-7. (1) K_2CO_3 . (2) $\text{K}_2\text{CO}_3 \cdot 1.5\text{H}_2\text{O}$.

Properties: White, deliquescent, granular, translucent powder; alkaline reaction. (1) D 2.428 (19C), mp 891C, bp decomposes. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: (1) Engel-Precht process uses magnesium oxide, potassium chloride, and carbon dioxide, separating the Engels salt ($\text{MgCO}_3 \cdot \text{KHCO}_3 \cdot 4\text{H}_2\text{O}$). Decomposition leaves potassium bicarbonate in solution, which can be processed to potassium carbonate. (2) Alkyl amines or ion-exchange resins can be used with potassium chloride and carbon dioxide to yield potassium bicarbonate, which is calcined to the carbonate. This is analogous to the Solvay process for sodium carbonate.

Grade: Crystals; technical; reagent; calcined 80–85%, 85–90%, 90–95%, 96–98%; hydrated 80–85%; FCC.

Hazard: Solutions irritating to tissue.

Use: Special glasses (optical and color TV tubes), potassium silicate, dehydrating agent, pigments, printing inks, laboratory reagent, soft soaps, raw wool washing, general-purpose food additive.

potassium chlorate.

CAS: 3811-04-9. KClO_3 .

Properties: Transparent, colorless crystals or white powder; cooling, saline taste. D 2.337, mp 368C, bp decomposes at 400C giving off oxygen gas. Soluble in boiling water.

Derivation: (1) By electrolyzing a hot concentrated alkaline solution of potassium chloride. Preferably (2) by interaction of solutions of potassium chloride and sodium chlorate or calcium chlorate.

Hazard: Forms explosive mixture with combustible materials (sulfur, sugar, etc.); strong oxidizing agent.

Use: Oxidizing agent, explosives, matches, source of oxygen, textile printing, pyrotechnics, percussion caps, disinfectant, bleaching.

potassium chloraurate. See potassium gold chloride.

potassium chloride.

CAS: 7447-40-7. KCl.

Properties: Colorless or white crystals; strong saline taste. D 1.987, mp 772C. Soluble in water; slightly soluble in alcohol; insoluble in ether and acetone. Occurs naturally as sylvite. Noncombustible.

Derivation: (1) Mined from sylvite deposits in New Mexico and Saskatchewan, purified by fractional crystallization or flotation; (2) extracted from salt lake brines and purified by recrystallization.

Grade: Chemical (99.5 and 99.9%); agricultural grades sold as 60–62%, 48–52%, and 22% K_2O ; single crystals; USP; FCC.

Use: Fertilizer, source of potassium salts, pharmaceutical preparations, photography, spectroscopy, plant nutrient, salt substitute, lab reagent, buffer solutions, food additive.

potassium chlorochromate. (Peligot's salt). KClCrO_3 .

Properties: Red crystals. D 2.497. Liberates chlorine on heating. Soluble in water.

Hazard: Toxic by ingestion and inhalation.

Use: Oxidizing agent.

potassium chloroiridate. See iridium potassium chloride.

potassium chloroplatinate. (platinum potassium chloride; potassium platinichloride).

CAS: 16921-30-5. K_2PtCl_6 .

Properties: Small, orange-yellow crystals or powder. Decomposes when heated (250C), d 3.499 (24C). Insoluble in alcohol; very slightly soluble in water.

Derivation: Adding platinum chloride to a solution of potassium salt and crystallizing.

Hazard: Toxic by ingestion and inhalation.

Use: Photography, laboratory reagent.

potassium chromate. (potassium chromate, yellow; neutral potassium chromate).

CAS: 7789-00-6. K_2CrO_4 .

Properties: Yellow crystals. D 2.7319, mp 971C. Soluble in water; insoluble in alcohol.

Derivation: Roasting powdered chromite with potash and limestone, treating the cinder with hot potassium sulfate solution, and leaching.

Grade: Technical, reagent.

Hazard: Toxic by ingestion and inhalation.

Use: Reagent in analytical chemistry, aniline black, textile mordant, enamels, chromate pigments, inks.

potassium chromate, red. See potassium dichromate.

potassium chromium sulfate. See chromium potassium sulfate.

potassium citrate.

CAS: 866-84-2. $K_3C_6H_5O_7 \cdot H_2O$.

Properties: Colorless or white crystals or powder; cooling, saline taste; odorless; deliquescent. D 1.98, loses H_2O at 180C, decomposes at 230C. Soluble in water and glycerol; almost insoluble in alcohol.

Derivation: Action of citric acid on potassium carbonate.

Grade: Technical, CP, NF, FCC.

Use: Medicine (antacid), sequestrant, stabilizer, buffer in foods.

potassium cobaltinitrite. See cobalt potassium nitrite.

potassium columbate. Obsolete name for potassium niobate.

potassium copper cyanide. (copper potassium cyanide; potassium cuprocyanide).

CAS: 13682-73-0. $C_2CuN_2 \cdot K$.

Properties: White, crystalline double salt of copper cyanide and potassium cyanide; copper content min 25.8%; free potassium cyanide 1.25–3.0%.

Hazard: Highly toxic. TLV: 5 mg(CN)/m³.

Use: For preparing and maintaining cyanide copper plating baths based on potassium cyanide.

potassium copper ferrocyanide. See copper potassium ferrocyanide.

potassium cupric ferrocyanide. See copper potassium ferrocyanide.

potassium cuprocyanide. Legal label name (Air) for potassium copper cyanide.

potassium cyanate.

CAS: 590-28-3. KOCN.

Properties: Colorless crystals. D 2.05, decomposes at 700–900C. Soluble in water; insoluble in alcohol.

Derivation: Heating potassium cyanide with lead oxide.

Use: Herbicide, manufacture of organic chemicals and drugs, treatment of sickle-cell anemia.

potassium cyanide.

CAS: 151-50-8. KCN.

Properties: White, amorphous, deliquescent lumps or crystalline mass; faint odor of bitter almonds. D

1.52 (16C), mp 634C. Soluble in water, alcohol, and glycerol.

Derivation: Absorption of hydrogen cyanide in potassium hydroxide.

Grade: Commercial, pure, solution, reagent.

Hazard: A poison as absorbed by skin. TLV: 5 mg(CN)/m³.

Use: Extraction of gold and silver from ores, reagent in analytical chemistry, insecticide, fumigant, electroplating.

potassium cyanoargentate. See silver potassium cyanide.

potassium cyanoaurite. See potassium gold cyanide.

potassium cyclamate. See sodium cyclamate.

potassium di-*n*-butyl dithiocarbamate.

$(C_4H_9)_2NCSSK$. A 50% aqueous solution in a straw-colored liquid, d 1.08–1.12.

Use: Ultraaccelerator for natural and synthetic latexes.

potassium dichloroisocyanurate. (dichloroisocyanuric acid potassium salt; potassium troclosene; troclosene potassium).

CAS: 2244-21-5. $C_3HCl_2N_3O_3 \cdot K$. A cyclic compound.

Properties: White, slightly hygroscopic, crystalline powder or granules. mw 237.07, mp 250C (decomp). Loose bulk d (approximate) (powder) 37 lb/cu ft, (granular) 64 lb/cu ft. Active ingredient 59% available chlorine; decomposes at 240C.

Hazard: Moderately toxic by ingestion. Dangerous fire risk in contact with organic materials. A strong oxidizing agent.

Use: Household dry bleaches, dishwashing compounds, scouring powders, detergent sanitizers; replacement for calcium hypochlorite; agriculture. See dichloroisocyanuric acid.

potassium 5-(2,4-dichlorophenoxy)-2-nitrobenzoate.

CAS: 53775-55-6. mf: $C_{13}H_7Cl_2NO_5 \cdot K$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact. A mild skin irritant.

potassium dichromate. (potassium bichromate; red potassium chromate).

CAS: 7778-50-9. $K_2Cr_2O_7$.

Properties: Bright, yellowish-red, transparent crystals; bitter, metallic taste. Mp 396C, d 2.676 (25C), bp decomposes at 500C. Soluble in water, insoluble in alcohol.

Derivation: Reaction of potassium chloride and sodium dichromate.

Grade: Commercial; highest purity; highest purity fused; reagent.

Hazard: Toxic by ingestion and inhalation. Danger-

ous fire risk in contact with organic materials. Strong oxidizing agent.

Use: Oxidizing agent (chemicals, dyes, intermediates); analytical reagent; brass pickling compositions; electroplating; pyrotechnics; explosives; safety matches; textiles; dyeing and printing; chrome glues and adhesives; chrome tanning leather; wood stains; poison fly paper; process engraving and lithography; synthetic perfumes; chrome alum manufacture; pigments; alloys, ceramic products; depolarizer in dry cell batteries; bleaching fats and waxes.

potassium dihydrogen phosphate. See potassium phosphate, monobasic.

potassium dimethyldithiocarbamate. See sodium dimethyldithiocarbamate.

potassium dinitrotetrachloroplatinate.

CAS: 53403-68-2. mf: $\text{Cl}_4\text{K}_2\text{N}_2\text{O}_4\text{Pt}$.

Hazard: A poison. TWA 0.002 mg(Pt)/m³

potassium diphosphate. See potassium phosphate, monobasic.

potassium dithionate. (potassium hyposulfate). $\text{K}_2\text{S}_2\text{O}_6$.

Properties: Colorless crystals. D 2.27. Soluble in water; insoluble in alcohol.

Use: Analytical reagent.

potassium endothall. (dipotassium salt of endothall). The water solution is an amber liquid used as a contact herbicide.

potassium ethyldithiocarbonate. See potassium xanthate.

potassium ethylxanthate. See potassium xanthate.

potassium ethylxanthogenate. See potassium xanthate.

potassium feldspar. (feldspar). $(\text{K}_2\text{O} \cdot 3\text{SiO}_2) + (\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2)$. "Potassium" feldspar is usually the pink variety of feldspar.

potassium ferric oxalate.

$\text{K}_3\text{Fe}(\text{C}_2\text{O}_4)_3 \cdot 3\text{H}_2\text{O}$.

Properties: Monoclinic green crystals. Loses $3\text{H}_2\text{O}$ at 100C, decomposes at 230C. Soluble in water and acetic acid; incompatible with alkali and ammonia, since these react to precipitate ferric hydroxide.

Use: Photography and blueprinting.

potassium ferricyanide. (red prussiate of potash; red potassium prussiate).

CAS: 13746-66-2. $\text{K}_3\text{Fe}(\text{CN})_6$.

Properties: Bright-red, lustrous crystals or powder.

D 1.85 (25C). Soluble in water; slightly soluble in alcohol.

Derivation: Chlorine is passed into a solution of potassium ferrocyanide, the ferricyanide separating out.

Grade: Pure crystals, pure powder, reagent, technical.

Hazard: Decomposes on strong heating to evolve highly toxic fumes, but the compound itself has low toxicity.

Use: Tempering steel, etching liquid, production of pigments, electroplating, sensitive coatings on blueprint paper, fertilizer compositions, laboratory reagent.

potassium ferrocyanide. (yellow prussiate of potash; yellow potassium prussiate).

CAS: 13943-58-3. $\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$.

Properties: Lemon-yellow crystals or powder; mild saline taste. D 1.853 (17C), loses its water of crystallization when heated to 70C, bp (decomposes). Effloresces on exposure to air; soluble in water; insoluble in alcohol.

Derivation: From nitrogenous waste products, iron filings, and potassium carbonate.

Grade: Technical, CP.

Hazard: It evolves highly toxic fumes on heating to red heat, but the compound itself has low toxicity.

Use: Potassium cyanide and ferricyanide, dry colors, tempering steel, dyeing, explosives, process engraving and lithography, laboratory reagent.

potassium fluoroborate. (potassium borofluoride). KBF_4 .

Properties: Colorless crystals. D 2.498 (20C), decomposes at 350C. Very slightly soluble in water; insoluble in alcohol, ether, alkalies.

Derivation: By the reaction of boric acid, hydrogen fluoride, and potassium hydroxide.

Hazard: Toxic by ingestion.

Use: Sand-casting of aluminum and magnesium; grinding aid in resinoid grinding wheels; flux for soldering and brazing; electrochemical processes; and chemical research.

potassium fluoride.

CAS: 7789-23-3. (1) KF; (2) $\text{KF} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline, deliquescent powder; sharp saline taste. D (1) 2.48, (2) 2.454; mp (1) 846C; bp 1505C. Soluble in water and hydrogen fluoride, insoluble in alcohol.

Derivation: Neutralizing hydrogen fluoride with potassium carbonate.

Grade: Technical, free of arsenic, CP.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Etching glass, preservative, insecticide, solder flux, fluorination reactions.

potassium fluosilicate. (potassium silicofluoride).

CAS: 16871-90-2. K_2SiF_6 .

Properties: White, odorless, crystalline powder. D 3.0. Slightly soluble in water; soluble in hydrochloric acid.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Vitreous enamel frits, synthetic mica, metallurgy of aluminum and magnesium, ceramics, insecticide, opalescent glass.

potassium fluotantalate. See tantalum potassium fluoride.

potassium fluozirconate. See zirconium potassium fluoride.

potassium germanium fluoride. See germanium potassium fluoride.

potassium gibberellate. C₁₉H₂₁KO₆

Properties: White crystalline powder, odorless. De-liquescence, sol in water, alc, acetone. A salt of gibberellic acid.

Use: Promote and control development of malt in grain.

potassium gluconate.

CAS: 299-27-4. KC₆H₁₁O₇.

Properties: Fine, white, crystalline powder; odorless; salty tasting. Mp 180C (decomposes). Soluble in water; insoluble in alcohol and benzene.

Derivation: Reaction of potassium hydroxide or carbonate with gluconic acid.

Grade: Pharmaceutical.

Use: Medicine (vitamin tablets).

potassium glutamate. (monopotassium-L-glutamate).

CAS: 19473-49-5.

KOOC(CH₂)₂CH(NH₂)COOH•H₂O.

Properties: White, free-flowing, hygroscopic powder; practically odorless. Freely soluble in water; slightly soluble in alcohol, pH of a 2% solution 6.9–7.1.

Grade: FCC.

Use: Flavor enhancer, salt substitute.

potassium glycerophosphate. (potassium glycerinophosphate).

CAS: 1319-69-3. K₂C₃H₅O₂•H₂PO₄•3H₂O.

Properties: Pale-yellow viscous mass or liquid (75% aqueous solution); acidic taste. Soluble in alcohol; miscible with water.

Derivation: Glycerol and phosphorus pentoxide or metaphosphoric acid are mixed, warmed, and exactly neutralized with potassium carbonate, then warmed and concentrated.

Grade: Technical, 50 or 75% solution, FCC (syrup or solution).

Use: Food additive and dietary supplement.

potassium gold chloride. (potassium aurichloride; potassium chloraurate; gold potassium chloride). KAuCl₄•2H₂O.

Properties: Yellow crystals. Soluble in water, alcohol, and ether.

Derivation: Neutralizing chloroauric acid with potassium carbonate.

Use: Photography, painting porcelain and glass, medicine.

potassium gold cyanide. (potassium cyanaurite; gold potassium cyanide). KAu(CN)₂.

Properties: White, crystalline powder. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: Action of hydrogen cyanide on potassium aurate.

Hazard: Highly toxic. TLV: 5 mg(CN)/m³.

Use: Electroplating.

potassium guaiacol sulfonate.

C₆H₃OCH₃OHSO₃K•1/2H₂O.

Properties: White powder or crystals, gradually turns pink on exposure to air and light; bitter taste, afterward becoming sweetish; odorless. Contains 60% guaiacol; soluble in water; sparingly soluble in alcohol.

Grade: NF.

Use: Medicine (expectorant), laboratory reagent.

potassium-2,4-hexadienoate. See potassium sorbate.

potassium hexafluorophosphate. KPF₆.

Properties: Solid. Mp 575C, bp (decomposes). Soluble in water.

Grade: 98–100%.

Hazard: Toxic by ingestion.

Use: Maintenance of fluoride atmospheres, preparation of bactericides and fungicides, laboratory reagent.

potassium hexanitrocobaltate III. See cobalt potassium nitrite.

potassium hexyl xanthane. C₆H₁₃OCSSK.

Use: Flotation agent.

potassium hydrate. See potassium hydroxide.

potassium hydride. KH. Marketed as a semi-dispersion of gray powder in oil.

Properties: The solid decomposes on heating or in contact with moisture.

Hazard: Dangerous fire and explosion risk, evolves toxic and flammable gases on heating and on exposure to moisture.

Use: Organic condensations and alkylations. See hydride.

potassium hydrogen fluoride. See potassium bifluoride.

- potassium hydrogen phosphate.** See potassium hydrogen phosphate dibasic.
- potassium hydrogen phthalate.** (potassium biphthalate). $\text{HOOC}_6\text{H}_4\text{COOK}$.
Properties: Colorless crystals. D 1.636. Soluble in water.
Derivation: Potassium hydroxide and phthalic anhydride.
Grade: CP, analytical.
Use: Alkalimetric standard, buffering agent.
- potassium hydrosulfide.** (potassium sulfhydrate; potassium bisulfide). KHS .
Properties: White to yellow crystals; hydrogen sulfide odor. Forms the polysulfide when exposed to air. D 1.69, mp 455C. Hygroscopic; soluble in alcohol and water.
Grade: Technical.
Use: Separation of heavy metals.
- potassium hydroxide.** (caustic potash; potassium hydrate; lye).
CAS: 1310-58-3. KOH .
Properties: White, deliquescent pieces, lumps, sticks, pellets, or flakes having a crystalline fracture. D 2.044, mp 405C (varies with water content). Keep well stoppered, absorbs water and carbon dioxide from the air. Soluble in water, alcohol, glycerol; slightly soluble in ether.
Derivation: Electrolysis of concentrated potassium chloride solution.
Method of purification: Sulfur compounds are removed by the addition of potassium nitrate to the fused caustic. The purest form is obtained by solution in alcohol, filtration, and evaporation.
Grade: Commercial, ground, flake, fused (88–92%), purified by alcohol (sticks, lumps, and drops), reagent, highest purity, USP, liquid (45%), FCC.
Hazard: Toxic by ingestion and inhalation, strong caustic, handle with gloves or tongs, corrosive to tissue. TLV: ceiling 2 mg/m³.
Use: Soap manufacture, bleaching, manufacture of potassium carbonate and tetrapotassium pyrophosphate, electrolyte in alkaline storage batteries and some fuel cells, absorbent for carbon dioxide and hydrogen sulfide, dyestuffs, liquid fertilizers, food additive, herbicides, electroplating, mercerizing, paint removers, reagent.
- potassium hypophosphite.** (potassium hypophosphite, monobasic).
CAS: 7782-87-8. KH_2PO_2 .
Properties: White, opaque crystals or powder; pungent saline taste; very deliquescent. Soluble in water and alcohol; decomposed by heat.
Derivation: Interaction of calcium hypophosphite and potassium carbonate.
Hazard: Moderate fire risk, may explode if ground with chlorates, nitrates, or other strong oxidizing agents.
- potassium hyposulfate.** See potassium dithionate.
- potassium hyposulfite.** See potassium thiosulfate.
- potassium iodate.**
CAS: 7758-05-6. KIO_3 .
Properties: White, crystalline powder; odorless. D 3.9, mp 560C (partial decomposition). Soluble in water, sulfuric acid (dilute); insoluble in alcohol.
Grade: Technical, CP, FCC.
Use: Analysis (testing for zinc and arsenic), iodometry, reagent, feed additive, in foods as maturing agent and dough conditioner, medicine (topical antiseptic).
- potassium iodide.**
CAS: 7681-11-0. KI .
Properties: White crystals, granules, or powder; strong, bitter, saline taste. D 3.123, mp 686C, bp 1330C. Soluble in water, alcohol, acetone, and glycerol.
Grade: Reagent, USP, single crystals, FCC.
Use: Reagent in analytical chemistry, photographic emulsions (precipitating Ag), feed additive, spectroscopy, infrared transmission, scintillation, dietary supplement (up to 0.01% in table salt).
- potassium iridium chloride.** See iridium potassium chloride.
- potassium laurate.** $\text{KOOCC}_{11}\text{H}_{23}$.
Properties: Light-tan paste. Soluble in water and alcohol.
Use: Emulsifying agent, base for liquid soaps and shampoos.
- potassium linoleate.** $\text{KOOCC}_{17}\text{H}_{31}$.
Properties: Light-tan paste. Soluble in water.
Use: Emulsifying agent.
- potassium magnesium sulfate.**
 $\text{K}_2\text{SO}_4 \cdot 2\text{MgSO}_4$.
Properties: White, tetragonal crystals. D 2.829, mp 927.
Use: Fertilizer.
- potassium manganate.** K_2MnO_4 .
Properties: Dark-green powder or crystals. Mp 190C (decomposes). Soluble in potassium hydroxide solution and water; decomposes in acid solution.
Derivation: Fusion of pyrolusite with potassium hydroxide.
Grade: Technical.
Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.
Use: Bleaching skins, fibers, oils; disinfectants; mordant (wool); batteries; photography; printing; source of oxygen (dyeing); water purification; oxidizing agent.

potassium mercuric iodide. See mercuric potassium iodide.

potassium metaarsenite. See potassium arsenite.

potassium metabisulfite. (potassium pyrosulfite).
CAS: 16731-55-8. $K_2S_2O_5$.

Properties: White granules or powder; pungent sharp odor. D 2.3, decomposes at 150–190C, oxidizes in air and moisture to sulfate. Soluble in water; insoluble in alcohol.

Derivation: By heating potassium bisulfite until it loses water.

Grade: Technical, reagent, FCC.

Use: Antiseptic, reagent, source of sulfurous acid, brewing (cleaning casks and vats), winemaking (said to kill only undesirable yeasts and bacteria), food preservative, developing agent (photography), process engraving and lithography, dyeing, antioxidant, bleaching agent.

potassium, metallic, liquid alloy. A flammable mixture or alloy of potassium and another metal that is liquid at normal temperature.

potassium metaphosphate. (monopotassium metaphosphate). KPO_3 or $(KPO_3)_6$.
Properties: White powder. D 2.45. Soluble in dilute acids; slightly soluble in water.

potassium molybdate. K_2MoO_4 .

Properties: White, deliquescent, microcrystalline powder. D 2.91 (18C), mp 919C. Soluble in water; insoluble in alcohol.

Use: Reagent.

potassium monophosphate. See potassium phosphate, dibasic.

potassium naphthenate.

Properties: Gray paste. Soluble in water. Combustible.

Derivation: From naphthenic acids.

Use: Driers, emulsifying agents.

potassium nickel sulfate. See nickel potassium sulfate.

potassium nicotinate.

CAS: 16518-17-5. mf: $C_6H_4NO_2 \cdot K$.

Hazard: Low toxicity by ingestion.

potassium nitrate. (niter; nitre; saltpeter).

CAS: 7757-79-1. KNO_3 .

Properties: Transparent, colorless or white, crystalline powder or crystals; slightly hygroscopic; pungent, saline taste. D 2.1062, mp 337C, bp decomposes at 400C. Soluble in water and glycerol; slightly soluble in alcohol.

Grade: Commercial, CP, FCC.

Hazard: Dangerous fire and explosion risk when shocked or heated, or in contact with organic materials, strong oxidizing agent.

Use: Pyrotechnics, explosives, matches, specialty fertilizer, reagent, to modify burning properties of tobacco, glass manufacture, tempering steel, curing foods, oxidizer in solid rocket propellants.

potassium nitrite.

CAS: 7758-09-0. KNO_2 .

Properties: White or slightly yellowish prisms or sticks; deliquescent. D 1.915, bp explodes at 1,000F (537C), mp 440C (decomposition starts at 350C). Soluble in water; insoluble in alcohol.

Grade: CP, technical, reagent, FCC.

Hazard: Fire and explosion risk when shocked or heated, or in contact with organic materials, strong oxidizing agent.

Use: Analysis (testing for amino acids, cobalt, iodine, urea), food additive (curing agent).

potassium oleate.

CAS: 143-18-0. $C_{17}H_{33}COOK$.

Properties: Gray-tan paste. Soluble in water and alcohol. Combustible.

Use: Textile soaps, emulsifying agent.

potassium orthophosphate. See potassium phosphate, monobasic, dibasic or tribasic.

potassium orthotungstate. See potassium tungstate.

potassium osmate. (potassium perosmate).

$K_2OsO_4 \cdot 2H_2O$.

Properties: Violet crystals, hygroscopic. Soluble in water; insoluble in alcohol and ether.

Hazard: Toxic by ingestion and inhalation.

Use: Determination of nitrogenous matter in water.

potassium oxalate.

CAS: 583-52-8. $K_2C_2O_4 \cdot H_2O$.

Properties: Colorless, transparent crystals; odorless. D 2.08, decomposes when heated, efflorescent in warm dry air. Soluble in water.

Derivation: Potassium formate or carbonate mixed with a small quantity of oxalate and a slight excess of alkali is heated, the oxalate extracted with water and crystallized.

Grade: Technical, CP.

Hazard: Toxic by inhalation and ingestion.

Use: Reagent in analytical chemistry, source of oxalic acid, bleaching and cleaning, removing stains from textiles, photography.

potassium, oxalatoplatinate, dihydrate.

CAS: 14244-64-5. mf: $C_4K_2O_8Pt \cdot 2H_2O$.

Hazard: A poison. TWA 0.002 mg(Pt)/m³

potassium oxide. K_2O .

Properties: Gray, crystalline mass. D 2.32 (0C), de-

composes 350C. Soluble in water (forms potassium hydroxide); soluble in alcohol and ether.

Derivation: By heating potassium nitrate and metallic potassium

Hazard: Corrosive to tissue.

Use: Reagent and intermediate.

potassium oxyfluoniowate. See niobium potassium oxyfluoride.

potassium palladium chloride. See palladium potassium chloride.

potassium penicillin G. (benzylpenicillin potassium).

CAS: 113-98-4. $C_{16}H_{17}KN_2O_6S$.

Properties: Colorless or white crystals or powder; odorless. Mp 214–217C (decomposes), moderately hygroscopic. Solutions dextrorotatory. Relatively stable to air and light. Very soluble in water, saline, and dextrose solutions; moderately soluble in alcohol; pH of solution (30 mg/mL) is 5.0–7.5

Grade: USP.

Use: Medicine (antibiotic).

potassium penicillin V. See potassium phenoxymethylpenicillin.

potassium percarbonate. $K_2C_2O_6 \cdot H_2O$.

Properties: Granular, white mass. Mp 200–300C. Soluble in water (liberates oxygen). Keep away from light and moisture.

Grade: Technical.

Hazard: Strong irritant to tissue. Fire risk in contact with organic materials, strong oxidizing agent.

Use: Analysis (testing for cerium, chromium, vanadium, titanium), photography, textile printing.

potassium perchlorate.

CAS: 7778-74-7. $KClO_4$.

Properties: Colorless crystals or white, crystalline powder. Decomposed by concussion, organic matter, and agents subject to oxidation; more stable than potassium chlorate. D 2.524, mp 400C (decomposes) Soluble in water; insoluble in alcohol.

Grade: Technical, reagent, ordnance.

Hazard: Fire risk in contact with organic materials, strong oxidizing agent. Strong irritant.

Use: Explosives, oxidizing agent, photography, pyrotechnics and flares, reagent, oxidizer in solid rocket propellants.

potassium periodate.

CAS: 7790-21-8. KIO_4 .

Properties: Small, colorless crystals or white, granular powder. D 3.168, mp 582C, explodes at 1,076F (580C). Slightly soluble in water.

Grade: Technical, CP, reagent.

Hazard: Fire risk in contact with organic materials, strong oxidizing agent. Strong irritant to tissue.

Use: Analysis (oxidizing agent).

potassium permanganate.

CAS: 7722-64-7. $KMnO_4$.

Properties: Dark-purple crystals with blue metallic sheen; sweetish, astringent taste; odorless. D 2.7032, mp decomposes at 240C, oxidizing material. Soluble in water, acetone, and methanol; decomposed by alcohol.

Derivation: (1) By oxidation of the manganate in an alkaline electrolytic cell. (2) A hot solution of the manganate is treated with carbon dioxide; on cooling, the solution deposits crystals of the permanganate.

Grade: Technical, CP, USP.

Hazard: Dangerous fire and explosion risk in contact with organic materials, powerful oxidizing agent.

Use: Oxidizer, disinfectant, deodorizer, bleach, dye, tanning, radioactive decontamination of skin, reagent in analytical chemistry, medicine (antiseptic), manufacture of organic chemicals, air and water purification.

potassium perosmate. See potassium osmate.

potassium peroxide.

CAS: 17014-71-0. K_2O_2 .

Properties: Yellow, amorphous mass; decomposes in water evolving oxygen. Mp 490C.

Derivation: Oxidation of potassium in oxygen.

Hazard: Dangerous fire and explosion risk in contact with organic materials, strong oxidizing agent. Irritant to skin and tissue.

Use: Oxidizing agent, bleaching agent, oxygen-generating gas masks.

potassium peroxydisulfate. See potassium persulfate.

potassium peroxymonosulfate. See "Oxone."

potassium persulfate. (dipotassium persulfate; potassium peroxydisulfate).

CAS: 7727-21-1. $K_2S_2O_8$.

Properties: White crystals. D 2.477, mp decomposes below 100C. Soluble in water; insoluble in alcohol.

Derivation: By electrolysis of a saturated solution of potassium sulfate.

Hazard: Strong irritant and oxidizing agent. TLV: TWA 0.1 mg(S_2O_8)/m³ (Proposed: TWA 0.1 mg/m³). Fire risk in contact with organic materials.

Use: Bleaching, oxidizing agent, reducing agent in photography, antiseptic, soap manufacture, analytical reagent, polymerization promoter, pharmaceuticals, modification of starch, flour-maturing agent, desizing of textiles.

potassium α -phenoxyethylpenicillin. (potassium penicillin 152; potassium phenethicillin; phenethicillin). $KC_{17}H_{19}N_2O_5S$. Synthetically prepared, a mixture of two stereoisomers.

Properties: White, crystalline solid; moderately hy-

grosopic. Decomposes above 220C. Very soluble in water; resistant to acid decomposition. Produced by *N*-acylation of α -phenoxypropionic acid and *G*-aminopenicillanic acid (produced by fermentation using *Penicillium chrysogenum*).

Grade: NF.

Use: Antibiotic.

potassium phenoxymethylpenicillin. (potassium penicillin V).

CAS: 132-98-9. $\text{KC}_{16}\text{H}_{17}\text{N}_2\text{O}_5\text{S}$.

Properties: White, crystalline powder; odorless. Very soluble in water; slightly soluble in alcohol; insoluble in acetone.

Grade: USP.

Use: Antibiotic.

potassium phosphate, dibasic. (DKP; potassium hydrogen phosphate; potassium monophosphate; dipotassium orthophosphate).

K_2HPO_4 .

Properties: Hygroscopic, white crystals or powder. Very soluble in water. Converted to pyrophosphate by ignition.

Derivation: Action of phosphoric acid on potassium carbonate.

Grade: Commercial, pure, highest purity, NF, FCC.

Use: Buffer in antifreezes; ingredient of "instant" fertilizers; nutrient for penicillin culturing; humectant; in pharmaceuticals; foods as a buffer, sequestrant, and yeast food; and as a laboratory reagent.

potassium phosphate, monobasic. (MKP; potassium acid phosphate; potassium diphosphate; potassium orthophosphate; potassium dihydrogen phosphate).

KH_2PO_4 .

Properties: Colorless crystals. D 2.338, mp 253C. Acid in reaction; soluble in water; insoluble in alcohol.

Derivation: Action of phosphoric acid on potassium carbonate.

Grade: Technical, CP, FCC.

Use: Baking powder, nutrient solutions, yeast foods, buffer and sequestrant, lab reagent.

potassium phosphate, tribasic. (potassium phosphate, neutral; potassium phosphate normal; tripotassium orthophosphate; potassium phosphate, tertiary; tripotassium phosphate).

CAS: 7778-53-2. $\text{K}_3\text{PO}_4 \cdot \text{H}_2\text{O}$ or K_3PO_4 .

Properties: Granular, white powder; deliquescent. Mp (anhydrous) 1,340C, d (anhydrous) 2.564 (17C). Soluble in water giving strongly basic solution. Insoluble in alcohol.

Grade: Reagent, technical, FCC.

Use: Purification of gasoline, water softening, liquid soaps, fertilizer, in foods as an emulsifier, laboratory reagent.

potassium phosphite, monobasic. KH_2PO_3 .

Properties: White powder. Hygroscopic; soluble in

water; insoluble in alcohol; slowly oxidized by air to phosphate.

potassium platinichloride. See potassium chloroplatinate.

potassium polymetaphosphate. $(\text{KPO}_3)_n$.

The molecular weight may be as high as 500,000.

Properties: White powder; odorless. Insoluble in water; soluble in sodium salt solutions that may have high viscosity.

Derivation: Dehydration of monobasic potassium phosphate.

Grade: Technical, FCC.

Use: Fat emulsifier and moisture-retaining agent in foods.

See sodium metaphosphate.

potassium polysulfide. K_2S_n .

Properties: Crystals. Soluble in water and alcohol.

Hazard: Moderate fire risk. Toxic by ingestion, irritant to skin and eyes.

Use: Fungicide.

potassium prussiate, red. See potassium ferricyanide.

potassium prussiate, yellow. See potassium ferrocyanide.

potassium 3-pyridinecarboxylate. See potassium nicotinate.

potassium pyroantimonate.

$\text{K}_2\text{H}_2\text{SbO}_7 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline powder or granules. Slightly soluble in cold water; readily soluble in hot water; insoluble in alcohol.

Grade: Reagent, technical.

Use: Starch sizes and flame-retarding compounds.

potassium pyroborate. See potassium tetraborate.

potassium pyrophosphate. (TKPP; tetrapotassium pyrophosphate; potassium pyrophosphate, normal). $\text{K}_4\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals or white powder. Somewhat hygroscopic in air (deliquescent at a relative humidity of above 40–45%). Similar to tetrasodium pyrophosphate except for greater solubility. D 2.33, dehydrates at about 300C, mp 1,090C. Soluble in water; insoluble in alcohol.

Grade: Technical, 99.4%, 60% solution, FCC.

Use: Soap and detergent builder, sequestering agent, peptizing and dispersing agent.

potassium pyrosulfate. (potassium acid sulfate, anhydrous). $\text{K}_2\text{S}_2\text{O}_7$.

Properties: Colorless needles or white, crystalline powder or fused pieces. D 2.25 (25/4C), mp 325C. Soluble in water (converted to potassium bisulfate).

- Use:** Acid flux in analysis, laboratory reagent.
- potassium pyrosulfite.** See potassium metabisulfite.
- potassium rhodanide.** See potassium thiocyanate.
- potassium ricinoleate.** $C_{17}H_{32}OHCOOK$.
Properties: White paste. Soluble in water. Combustible.
Use: Emulsifying agent.
- potassium silicate.**
Properties: (Solid) Weight ratio $SiO_2:K_2O$ varies with grade from 2.1:1 to 2.5:1; colorless anhydrous lump, shattered or granular. Soluble in water at high temperature and pressure; insoluble in alcohol. (Solution) Colorless liquid, $B\acute{e}$ range 29–48 degrees.
Derivation: Supercooled melt of potassium carbonate and pure silica sand.
Use: (Solid) Manufacture of glass and refractory material, welding rods, high-temperature mortars, binder in carbon arc-light electrodes, detergents, catalyst, adhesives.
- potassium silicofluoride.** See potassium fluosilicate.
- potassium sodium carbonate.** See sodium potassium carbonate.
- potassium sodium ferricyanide.**
 $K_2NaFe(CN)_6$.
Properties: Red crystals, over 99% pure. Mp (decomposes); nonhygroscopic and stable. Easily soluble in water.
Derivation: From ferrocyanides.
Use: Blueprint paper and photography.
- potassium-sodium phosphate.** See sodium-potassium phosphate.
- potassium sodium tartrate.** (Rochelle salt; sodium potassium tartrate).
CAS: 304-59-6. $KNaC_4H_4O_6 \bullet 4H_2O$. It is salt of L(+)-tartaric acid.
Properties: Colorless, transparent, efflorescent crystals or white powder; cool, saline taste. Unstable above 225C, d 1.77, mp 70–80C. Soluble in water, insoluble in alcohol, loses water of crystallization at 140C.
Derivation: Potassium acid tartrate is dissolved in water, the solution saturated with sodium carbonate, concentrated after purification, and crystallized.
Grade: Highest purity, reagent, commercial crystals or powder, NF, FCC.
Use: Baking powders, medicine (cathartic), component of Fehling's solution, silvering mirrors.
- potassium sorbate.** (potassium-2,4-hexadienoate).
CAS: 590-00-1. $CH_3CH:CHCH:CHCOOK$.
Properties: White powder. Mp 270C (decomposes), d 1.36 (25/20C). Soluble in water (25C).
Grade: Technical, FCC.
Use: Bacteriostat and preservative in meats, sausage casings, wines, etc.
- potassium stannate.**
CAS: 12125-03-0. $K_2SnO_3 \bullet 3H_2O$.
Properties: White to light-tan crystals. D 3.197. Soluble in water; insoluble in alcohol.
Grade: Technical.
Hazard: Highly toxic. TLV: 2 mg(Sn)/m³.
Use: Textiles (dyeing and printing), alkaline tin-plating bath.
- potassium stearate.** (stearic acid potassium salt).
CAS: 593-29-3. $C_{17}H_{35}COOK$.
Properties: White, crystalline powder; slight odor of fat. Mw 322.57. Soluble in hot water and alcohol.
Grade: Commercial, contains considerable palmitate; FCC.
Use: Anticaking agent, binder, emulsifier, stabilizer for chewing gum, base for textile softeners.
- potassium strontium chlorate.** See strontium potassium chlorate.
- potassium styphnate.** $KC_6H_2N_3O_8 \bullet H_2O$.
Properties: Yellow prisms. Mp loses water at 120C.
Hazard: Explodes when shocked or heated.
Use: High explosive.
- potassium sulfate.**
CAS: 7778-80-5. K_2SO_4 .
Properties: Colorless or white, hard crystals or powder; bitter saline taste. D 2.66, mp 1,072C. Soluble in water; insoluble in alcohol.
Derivation: (1) By treatment of potassium chloride either with sulfuric acid or with sulfur dioxide, air, and water (Hargreaves process); (2) by fractional crystallization of a natural sulfate ore; (3) from salt-lake brines.
Grade: Highest purity medicinal, commercial, crude, CP, agricultural, reagent, technical.
Use: Reagent in analytical chemistry, medicine (cathartic), gypsum cements, fertilizer for chloride-sensitive crops such as tobacco and citrus, alum manufacture, glass manufacture, food additive.
- potassium sulfhydrate.** See potassium hydrosulfide.
- potassium sulfide.**
CAS: 1312-73-8. K_2S .
Properties: Red or yellow-red crystalline mass or fused solid. D 1.75 (20/4C), mp 910C. Deliquescent in air; soluble in water, alcohol, and glycerol; insoluble in ether.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, may ignite spontaneously, explosive in form of dust or powder.

Use: Reagent in analytical chemistry, depilatory, medicine.

potassium sulfite.

CAS: 10117-38-1. $K_2SO_3 \cdot 2H_2O$.

Properties: White crystals or powder. Soluble in water; sparingly soluble in alcohol; decomposes on heating and slowly oxidizes in air.

Grade: Technical, CP, FCC.

Use: Photographic developer, medicine (cathartic), food and wine preservative.

potassium sulfocarbonate. (potassium tri-thiocarbonate). K_2CS_3 .

Properties: Yellowish-red crystals. Very hygroscopic; soluble in alcohol and water.

Grade: Technical.

Hazard: Toxic by ingestion, strong irritant.

Use: Analysis (testing for cobalt, nickel), medicine, soil fumigant.

potassium sulfocyanate. See potassium thiocyanate.

potassium sulfocyanide. See potassium thiocyanate.

potassium tantalum fluoride. See tantalum potassium fluoride.

potassium tartrate. $K_2C_4H_4O_6 \cdot 1/2H_2O$.

Properties: Colorless, crystalline solid. D 1.98. Soluble in water; insoluble in alcohol; decomposed by heat (200–220C).

Grade: CP, technical.

Use: Manufacture of potassium salts, medicine (cathartic), lab reagent.

potassium tellurite. K_2TeO_3 .

Properties: Granular, white powder. Hygroscopic; decomposes at 460–470C. Soluble in water.

Use: Analysis (testing for bacteria).

potassium tetrathiocyanodi-ammonochromate. See Reinecke salt.

potassium tetroxalate. $KHC_2O_4 \cdot H_2C_2O_4$.

Properties: White crystals. Soluble in water; slightly soluble in alcohol.

Use: Metal polish, spot removal, analytical chemistry.

potassium thiocyanate. (potassium rhodanide; potassium sulfocyanate; potassium sulfocyanide).

CAS: 333-20-0. KCNS.

Properties: Colorless, transparent, deliquescent crystals; odorless; saline cooling taste. D 1.88, mp 173C, turns brown, green, blue when fused, white

again on cooling, bp decomposes at 500C. Soluble in water, alcohol, and acetone.

Derivation: By heating potassium cyanide with sulfur.

Grade: Commercial, pure, reagent, ACS.

Hazard: Toxic by ingestion.

Use: Reagent; manufacture of sulfocyanides, thioureas; printing and dyeing textiles; photographic restrainer and intensifier; synthetic dyestuffs; medicine (hypotensive).

potassium thiosulfate. (potassium hyposulfite).

CAS: 10294-66-3. $K_2S_2O_3$ (with varying proportions of water of crystallization).

Properties: Colorless crystals. Hygroscopic; soluble in water.

Grade: Technical, CP.

Use: Analytical reagent.

potassium titanate. K_2TiO_3 .

Properties: White salt. Hydrolyzes in water to give a strongly alkaline solution.

Derivation: From titanate acid and potassium hydroxide.

Use: See potassium titanate fiber.

potassium titanate fiber. Approximate composition $K_2O \cdot (TiO_2)_n$, where n is 4–7.

Properties: High refr index. Mp 1371C, can diffuse and reflect infrared radiation.

Use: Rockets, missiles, nuclear-powered applications as an insulator, especially for the range 1300–2100F.

potassium titanium fluoride. See titanium potassium fluoride.

potassium titanium oxalate. See titanium potassium oxalate.

potassium trichlorophenate. $Cl_3C_6H_2OH \cdot K$.

Offered as a solution containing 47% potassium trichlorophenate and 3% other potassium chlorophenates, d 1.3, fp –9C.

Use: Slime control agent for pulp and paper-mill systems.

potassium tripolyphosphate. (KTPP).

$K_5P_3O_{10}$.

Properties: White, crystalline solid. Mp 620–640C, d 2.54, loose bulk d 67 lb/cu/ft. Solubility in water (26C) more than 140 g/100 mL water.

Use: Water-treating compounds, cleaners, specialty fertilizers, sequestrant.

potassium trithiocarbonate. See potassium sulfocarbonate.

potassium troclosesene. See potassium dichloroisocyanurate.

potassium tungstate. (potassium orthotungstate; potassium wolframate). $K_2WO_6 \cdot 2H_2O$.

Properties: Heavy, crystalline powder. D 3.1, mp 921C, deliquescent, soluble in water, insoluble in alcohol.

potassium undecylenate.

Properties: Finely divided, white powder. Decomposes above 250C; limited solubility in most organic solvents; soluble in water.

Hazard: Toxic in high concentration.

Use: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

potassium wolframate. See potassium tungstate.

potassium xanthate. (potassium ethyldithiocarbonate; potassium xanthogenate; potassium ethyl xanthate; potassium ethylxanthogenate). CAS: 140-89-6. $KS_2COC_2H_5$.

Properties: Colorless or light-yellow crystals. D 1.558 (21.5C). Soluble in water and alcohol; insoluble in ether.

Derivation: Reaction of potassium ethylate and carbon disulfide.

Hazard: Toxic by ingestion.

Use: Fungicide for soil treatment, reagent in analytical chemistry.

potassium zinc iodide. (zinc potassium iodide). $ZnI_2 \cdot KI$.

Properties: Colorless crystals. Very hygroscopic.

Use: Analysis (testing for alkaloids).

potassium zinc sulfate. See zinc potassium sulfate.

potassium zirconium fluoride. See zirconium potassium fluoride.

potassium zirconium chloride. See zirconium potassium chloride.

potassium zirconium sulfate. See zirconium potassium sulfate.

potential energy. The energy associated with a configuration of particles, as distinct from their motions. In macroscopic terms, potential energy can be increased (for example) by stretching a spring or by lifting a mass against a gravitational force. In molecular systems, potential energy can be increased (for example) by stretching a bond or by separating molecules against a van der Waals attraction.

potential energy surface. The potential energy of a ground-state molecular system containing N atoms is a function of its geometry, defined by 3N spatial coordinates (a configuration space). If the energy is imagined as corresponding to a height in a

$3N + 1$ dimensional space, the resulting landscape of hills, hollows, and valleys is the potential energy surface.

potential well. In a potential energy surface, the region surrounding a local energy minimum. Typically taken to include at least those points in configuration space such that a path of steadily declining energy can be found that leads to the minimum in question, and such that no similar path can be found to any other minimum.

potentiator. A term used in the flavor and food industries to characterize a substance that intensifies the taste of a food product to a far greater extent than does an enhancer. The most important of these are the 5'-nucleotides. They are approved by FDA. Their effective concentration is measured in parts per billion, whereas that of an enhancer such as MSG is in parts per thousand. The effect is thought to be due to synergism. Potentiators do not add any taste of their own, but intensify the taste response to substances already present in the food. See enhancer; seasoning; flavor.

pot life. See adhesive working life.

potting compound. See encapsulation.

pour point. (1) The lowest temperature at which a liquid will flow when a test container is inverted. (2) The temperature at which an alloy is cast.

pour point depressant. An additive for lubricating and automotive oils that lowers the pour point (or increases the flow point) by 11.0C. The agents now generally used are polymerized higher esters of acrylic acid derivatives. They are most effective with low-viscosity oils.

powder. Any solid, dry material of extremely small particle size ranging down to colloidal dimensions, prepared either by comminuting larger units (mechanical grinding), combustion (carbon black, lampblack), or precipitation via a chemical reaction (calcium carbonate, etc.). Powders that are so fine that the particles cannot be detected by rubbing between thumb and forefinger are called impalpable. Typical materials used in powder form are cosmetics, inorganic pigments, metals, plastics (molding powders), dehydrated dairy products, pharmaceuticals, and explosives. Metal powders are used to make specialized equipment by sintering and pressing (powder metallurgy), as well as sprayed coatings and paint pigments (aluminum, bronze). Thermoplastic polymers in powder form are used in a technology known as powder molding, and thermosetting polymers are used in the sprayed coatings field for autos, machinery, and other industrial applications in which they have many advantages over sprayed solvent coatings.

See metal, powdered; carbon black; black powder.

powder of Algaroth. A mixture of SbOCl and Sb_2O_3 .

Use: To prepare tartar emetic.

powder metallurgy. See metal, powdered; sintering.

ppb. Abbreviation for parts per billion.

ppm. Abbreviation for parts per million.

Pr. (1) Symbol for praseodymium. (2) Informal abbreviation for propyl.

pralidoxime methiodide. See 2-pyridine aldoxime methiodide.

d,d-t80-prallethrin.

CAS: 23031-36-9. mf: $\text{C}_{19}\text{H}_{24}\text{O}_3$.

Hazard: A poison by ingestion and inhalation. Low toxicity by skin contact.

Prandtl number. For any substance, the ratio of the viscosity to the thermal conductivity. The lower the number, the higher the convection capacity of the substance. This ratio is important in heat and chemical engineering calculations.

praseodymia. See praseodymium oxide; rare earth.

praseodymium. Pr. Metallic element of atomic number 59, group IIIB of the periodic table, one of the rare earth elements of the lanthanide group, aw 140.9077, valences = 3, 4. No stable isotopes.

Properties: Yellowish metal, tarnishes easily (color of salts green). Paramagnetic, d 6.78–6.81, mp 930C, bp 3,200C, ignites to oxide (200–400C), liberates hydrogen from water. Soluble in dilute acids.

Source: Monazite, cerite, and allonite; also a fission product.

Derivation: Reduction of the trifluoride with an alkaline metal or by electrolysis of the fused halides.

Grade: Ingots, rods, sheets, 98.8–99.9+% pure.

Use: Praseodymium salts, ingredient of mischmetal, core material for carbon arcs, colorant in glazes and glasses, catalyst, phosphors, lasers.

See didymium.

praseodymium oxalate. $\text{Pr}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$. Green powder, insoluble in water, slightly soluble in acids.

Use: Ceramics.

praseodymium oxide. (praseodymia). Pr_2O_3 . Yellow-green powder, d 7.07, insoluble in water, soluble in acids, hygroscopic, absorbs carbon dioxide from air, purities to 99.8% oxide. Combustible.

Use: Glass and ceramic pigment, laboratory reagent.

prasterone. See DHEA.

PRE. See progesterone response element.

precipitant. Substance that causes precipitation of a solid from solution.

precipitate. (\downarrow , ppt). Small particles that have settled out of a liquid or gaseous suspension by gravity, or that result from a chemical reaction. Precipitated compounds, such as blanc fixe (barium sulfate), are prepared in this way, for example, by the reaction $\text{BaCl}_2 + \text{Na}_2\text{SO}_4 \rightarrow \text{NaCl} + \text{BaSO}_4$. In formulas, a downward vertical arrow, \downarrow , or “ppt” is sometimes used to indicate a precipitate. A class of organic pigments called lakes are made by precipitating an organic dye onto an inorganic substrate. Colloidal particles dispersed in a gas, as flue dust in industrial stacks, can be precipitated by introducing an electric charge opposite to that which sustains the particles

See Cottrell; sedimentation.

precipitator, electrostatic. See Cottrell; precipitate.

precision investment casting. See investment casting.

precursor. In biochemistry, an intermediate compound or molecular complex present in a living organism; when activated physiochemically it is converted to a specific functional substance. The prefix *pro-* is usually used to indicate that the compound in question is a precursor. Examples are ergosterol (pro-vitamin D_3), which is activated by UV radiation to vitamin D; carotene (pro-vitamin A), a precursor of vitamin A; prothrombin, which forms thrombin upon activation in the bloodclotting mechanism; and phenylacetic acid, a precursor in the biosynthesis of penicillin G.

prednisolone. ($\Delta^{1,4}$ -pregnadiene-11 β ,17 α ,21-triol-3,20-dione).

CAS: 50-24-8. $\text{C}_{21}\text{H}_{28}\text{O}_5$. Generic name for an analog of hydrocortisone.

Properties: White to practically white crystalline powder; odorless. Mp 235C with some decomposition. Very slightly soluble in water; soluble in alcohol, chloroform, acetone, methanol, dioxane.

Grade: USP.

Hazard: Causes sodium retention; may have side effects similar to cortisone.

Use: Medicine, also available as acetate.

prednisone. ($\Delta^{1,4}$ -pregnadiene-17 α ,21-diol-3,11,20-trione).

CAS: 53-03-2. $\text{C}_{21}\text{H}_{26}\text{O}_5$. Generic name for an analog of cortisone.

preferential. Descriptive of the selectivity of action, either chemical or physiochemical, exhibited by a substance when in contact with two other substances; it may be due either to chemical affinity or

to surface phenomena. An example of a preferential chemical combination is that of hemoglobin with carbon monoxide, with which it unites 200 times as readily as with oxygen when exposed to a mixture of the two. Such phenomena as adsorption, corrosion, and the wetting of dry powders by liquids are other examples.

Pregl, Fritz. (1869–1930). An Austrian chemist who won the Nobel Prize in 1923. He was also a medical doctor who worked in micromechanical analysis and developed determinations for hydrogen, carbon, nitrogen, and organic groups using microchemical methods. He was educated at Tübingen, Leipzig, and Berlin.

pregnenediol. (5β -pregnane- $3\alpha,20\alpha$ -diol). $C_{21}H_{36}O_2$. A steroid, the metabolic product of progesterone.

Properties: Crystallizes in plates from acetone. Mp 238°C , dextrorotatory in solutions. Sparingly soluble in organic solvents. Not precipitated by digitonin.

Derivation: Isolation from urine of pregnant women, cows, mares, and chimpanzees; by reduction of pregnenedione.

Use: Synthesis of progesterone, medically as a pregnancy test.

pregnenedione. See progesterone.

pregneninolone. See ethisterone.

4-pregnen-21-ol-3,20-dione. See deoxycorticosterone.

pregnenolone. (Δ^5 -pregnene- 3β -ol-20-one).

$C_{21}H_{32}O_2$. A steroid that is a biologically active hormone similar to progesterone and the adrenal steroid hormones. Also available as acetate salt.

Properties: Crystallizes in needles from dilute alcohol. Mp 193°C . Slightly soluble in acetone, petroleum ether, benzene, and carbon tetrachloride.

Derivation: From stigmasterol or other steroids.

Use: Medicine, biochemical research.

Prelog, Vladimir. (1906–1998). A Swiss organic chemist who won the Nobel Prize for chemistry in 1975 along with Cornforth for work on chemical synthesis of organic compounds. Although educated in Yugoslavia, he spent many years in Zurich.

premature chromosome condensation.

(PCC). A method of studying chromosomes in the interphase stage of the cell cycle.

premix molding. A mixture of plastic ingredients prepared in advance of the molding or extruding operation and stored in bags or bins until required. It is made by mixing the components (resin, filler, fibrous materials such as glass and necessary curatives) in a dough blender. Storage life may be from a

few days to a year or more, depending on formulation. Such mixtures are then calendered or extruded after warming to suitable temperature.

prenitene. (1,2,3,4-tetramethylbenzene; prenitol). $(\text{CH}_3)_4\text{C}_6\text{H}_2$.

Properties: Colorless liquid. D 0.901, bp 204°C , fp -7.7°C . Soluble in alcohol; insoluble in water.

prepolymer. An adduct or reaction intermediate of a polyol and a monomeric isocyanate, in which either component is in considerable excess of the other. A polymer of medium molecular weight having reactive hydroxyl and $-\text{NCO}$ groups.

Use: Preparation of polyurethane coatings and foams.

prepreg. A term used in the reinforced plastics field to mean the reinforcing material containing or combined with the full complement of resin before molding.

“Pre-San” [Mallinckrodt]. [*N*-(2-mercaptoethyl)benzenesulfonamide-*S*-(*O,O*-diisopropylphosphorodithioate)]. TM for a selective herbicide.

preservative. Any agent that prolongs the useful life of a material. Food products are preserved by (1) low temperature, (2) ionizing radiation (X and γ rays), (3) antioxidants, (4) fungicides, (5) aldehydes, (6) paints, and others.

Use: Antioxidants in lubricating oils, rubber, and plastics; fungicides on textiles; aldehydes on biological specimens; paints on wood and metals.

See protective coating; antioxidant; radiation, industrial.

press, hydraulic. See hydraulic press.

“Prestabilt Oil” V. TM for an anionic textile chemical consisting of purified sulfated castor-oil fatty acids.

Use: Dyeing assistant for cotton and wool fiber, in viscose manufacture, clarifying agent to prevent milkiness of the yarn, antistatic agent for acetate and polyacrylonitrile fibers.

“Pretested Agaroid RS-30” [TIC]. TM for a powder gelatin replacement.

Use: Allows complete hydration as a gelatin replacement in confection, dairy, and low fat applications.

“Preventol” [Solutia]. TM for a skin degerming agent.

Properties: White to grayish-white powder.

Use: Incorporation into bar soaps.

Prevost reaction. Hydroxylation of olefins with iodine and silver benzoate in an anhydrous solvent to give *trans*-glycols.

Priestly, Joseph. (1733–1804). Born near Leeds, England, Priestley originally planned to enter the ministry. As a youth he became interested in both physics and chemistry, and his research soon established his position as a scientist. He was elected to the Royal Society in 1766. He discovered nitrous oxide in 1772, but his greatest contribution to science was his discovery of oxygen in 1774. He emigrated from England to Northumberland, PA, where he lived from 1784 to his death. His research in America resulted in the discovery of carbon monoxide (1799).

Prigogine, Ilya. (1917–2003). A Belgian chemist who won the Nobel Prize for chemistry in 1977 for his contributions to nonequilibrium thermodynamics. He was educated at the University of Brussels. The Center for Statistical Mechanics and Thermodynamics at the University of Texas bears his name.

Prilezhaev (Prileschajew) reaction. Formation of epoxides by the reaction of alkenes with peracids.

prills. Small, round, or acicular aggregates of a material, usually a fertilizer, that are artificially prepared. In the explosives field, prills-and-oil consists of 94% coarse, porous ammonium nitrate prills and 6% fuel oil.
See explosives, high.

“Primacord.” TM for a detonating composition. See pentaerythritol tetranitrate.

“Primafloc” [Rohm & Haas]. TM for a series of organic polyelectrolyte products used for flocculating suspended solids in water, waste, and process streams.
See polyelectrolyte.

“Primal” [Rohm & Haas]. TM for aqueous dispersions of acrylic resins, supplied in various grades that differ in hardness and flexibility and produce finishes that are water insoluble, require no plasticizer for flexibility, are unimpaired by aging, and adhere tenaciously to leather and lacquer coats.

primary. (1) In reference to monohydric alcohols, amines, and a few related compounds, this term, together with *secondary* and *tertiary*, describes the molecular structure of isomeric or chemically similar individuals. Monohydric alcohols are based on the methanol group

in which three of the bonds of the methanol carbon may be attached either to hydrogen atoms or alkyl

groups. A primary alcohol has one alkyl group and two hydrogens,

except methanol, in which all three bonds are to hydrogen atoms. A secondary alcohol has two alkyl groups and one hydrogen, e.g.,

A tertiary alcohol has three alkyl groups, e.g.,

The three types can be readily identified by the number of hydrogen atoms attached to the central (methanol) carbon atom: if it is two or more, the alcohol is primary; if one, it is secondary; and if zero, it is tertiary. For example, $\text{CH}_3\text{CH}_2\text{OH}$ is primary; $(\text{CH}_3)_2\text{CH}_2\text{OH}$ is secondary; $(\text{CH}_3)_3\text{COH}$ is tertiary. Primary, secondary, and tertiary amines are formed from ammonia (NH_3) when one, two, or three hydrogen atoms, respectively, are replaced by alkyl groups.

These terms are also used to name salts of orthophosphoric acid (H_3PO_4) in which one, two, or three of the hydrogen atoms have been replaced by metal or radicals: NaH_2PO_4 is primary sodium phosphate, Na_2HPO_4 is secondary sodium phosphate. The same system of names is used for salts of other acids containing three replaceable hydrogen atoms.

(2) A type of battery that is irreversible in respect to power output; a voltaic cell. A secondary battery (storage battery) is reversible and can be recharged.

(3) In the terminology of minerals, *primary* (in the case of metals) refers to direct production from the ore; in the case of petroleum it refers to production from wells by direct means. This meaning contrasts with the term *secondary* that is used to denote recovery of metal from scrap and, for petroleum, recovery by means of special techniques such as flooding and hydraulic pressure.

primary azo dyes. Azo dyes derived from primary amines.

primary calcium phosphate. See calcium phosphate, monobasic.

primary structure. The sequence of amino acids and any interchain and intrachain disulfide bonds of a protein.

primary transcript. When a gene is transcribed in the nucleus, the initial product is the primary transcript—an RNA containing copies of all exons and introns. This primary transcript is then processed by the cell to remove the introns, to cleave off unwanted 3' sequence, and to polyadenylate the 5a end. The mature message thus formed is then exported to the cytoplasm for translation.

primase. An enzyme that synthesizes RNA oligonucleotides used as primers by DNA polymerases.

“Primene JM-T” [Rohm & Haas]. TM for a solvent composed of branched-chain primary amines containing from 18 to 22 carbon atoms.

primer. Short preexisting polynucleotide chain to which new deoxyribonucleotides can be added by DNA polymerase.

primer extension. This is a method used to determine how far the start of an mRNA is upstream from a fixed site.

“Primid” [EMS-Grilon]. TM for solutions for bonding, coating, and sealing components in auto production.

primuline dye. See thiazole dye.

principle. A constituent of a substance, especially one giving it some distinctive quality or effect.

Prins reaction. Acid-catalyzed addition of olefins to formaldehyde to give 1,3-diols, allylic alcohols, or *meta*-dioxanes.

printing ink. A viscous to semisolid suspension of finely divided pigment in a drying oil such as heat-bodied linseed oil. Alkyd, phenol-formaldehyde, or other synthetic resins are frequently used as binders; and cobalt, manganese, and lead soaps are added to catalyze the oxidative drying reaction. Some types of inks dry by evaporation of a volatile solvent rather than by oxidation and polymerization of a drying oil or resin. Use distribution is: offset 40%, gravure 23%, flexographic 18%, letterpress 9%, screen 4%, other 6%. For further information refer to National Printing Ink Institute, Lehigh University, Bethlehem, PA.

pristane. (2,6,10,14-tetramethylpentadecane; norphytane).
CAS: 1921-70-6. C₁₉H₄₀. Found in rock specimens 2.5–3 billion years old. It is known to be synthesized only by living organisms and to withstand heat and pressure; thus it serves to date the existence of life on earth.

Properties: Colorless, transparent, stable liquid; faintly odored. Bp 290C, fp –60C, d 0.775–0.795

(20C), refr index 1.435–1.440 (20C). Soluble in most organic solvents. Combustible.

Grade: 90% purity.

Use: Precision lubricant, chromatographic oil, anti-corrosive agent.

See phytane.

“Pristene” [UOP]. TM for natural tocopherols and herbal extracts.

Use: Vegetable oils, animal fats, flavors, spices, fragrances, confections, nuts, yeast, sausage, gum feeds, beverages, cereal, desserts, dehydrated potatoes, and cosmetics.

privacy. Genetics: the right of people to restrict access to their genetic information.

probe. Single-stranded DNA or RNA molecules of specific base sequence, labeled either radioactively or immunologically, that are used to detect the complementary base sequence by hybridization.

procaine acryloyl monomer.

CAS: 25252-96-4. mf: C₁₆H₂₂N₂O₃.

Hazard: A poison.

procaine hydrochloride. (procaine).

CAS: 51-05-8.

C₆H₅NH₂COOCH₂CH₂N(C₂H₅)₂•HCl.

Properties: Small, colorless crystals or white, crystalline powder; odorless; stable in air. Mp 153–156C. Soluble in water and in alcohol at 25C; slightly soluble in chloroform; almost insoluble in ether; solutions acid to litmus.

Derivation: (1) By heating chloroethyl-*p*-nitrobenzoic ester with diethylamine for 24 hours under pressure at 120C. The product is then reduced with tin and hydrochloric acid. (2) By condensation of ethylene chlorohydrin with diethylamine. The chloroethyl-diethylamine formed is heated with sodium-*p*-aminobenzoate.

Grade: USP.

Use: Medicine (local anesthetic).

procaine penicillin G.

CAS: 54-35-3. C₁₆H₁₈N₂O₄S•C₁₃H₂₀N₂O₂•H₂O.

Properties: White, fine crystals or powder; odorless; relatively stable to air and light; solutions dextrorotatory. Sparingly soluble in water; slightly soluble in alcohol; fairly soluble in chloroform.

Grade: USP.

Use: Antibiotic, animal feed additive.

proceroside.

CAS: 25323-74-4. mf: C₂₉H₄₀O₁₀.

Hazard: A poison.

Source: Natural product.

process. See unit process.

process industry. See chemical process industry.

processing. The reactions occurring in the nucleus which convert the primary RNA transcript to a mature mRNA. Processing reactions include capping, splicing and polyadenylation. The term can also refer to the processing of the protein product, including proteolytic cleavages, glycosylation, etc.

processivity. For any enzyme that catalyzes the synthesis of a biological polymer, the property of adding multiple subunits to the polymer without dissociating from the substrate.

prochiral molecule. A symmetric molecule that can react asymmetrically with an enzyme having an asymmetric active site, generating a chiral product. For example, fumarate converted to L-malate by fumarase.

“Prodox 121” [PMC]. (4- α -methylstyrylphenol). TM for intermediate.

Use: In fabric-finishing chemicals and antioxidants for plastics and rubber.

prodrug. A term applied in the pharmaceutical chemistry to a chemical compound that is converted into an active curative agent by metabolic processes within the body.
See precursor.

producer gas. A gas obtained by burning coal or coke with a restricted supply of air, or by passing air and steam through a bed of incandescent fuel under such conditions that the carbon dioxide formed is converted into carbon monoxide. The water vapor reacts to form carbon monoxide and hydrogen. Producer gas is cheap but has low Btu and is used where transportation is not required.

Hazard: Highly flammable and toxic. Explosive range 20–73% in air.

See water gas; synthesis gas.

profile. See soil.

progesterone. (Δ^4 -pregnene-3,20-dione).

CAS: 57-83-0. $C_{21}H_{30}O_2$. The female sex hormone secreted in the body by the corpus luteum, adrenal cortex, or placenta during pregnancy. It is important in the preparation of the uterus for pregnancy and for the maintenance of pregnancy. It exists in two crystalline forms (α - and β -) of equal physiological activity. Progesterone is believed to be the precursor of the adrenal steroid hormones.

Properties: White, crystalline powder; odorless and stable in air but sensitive to light. Mp (α form) 128–133C, (β form) 121C. Practically insoluble in water; soluble in alcohol, acetone, and dioxane; sparingly soluble in vegetable oils. The international unit (IU) of progestational activity is expressed as 1 mg of progesterone.

Derivation: Isolation from corpus luteum of pregnant sows, synthesis from other steroids such as stigmasterol.

Grade: NF.

Hazard: A carcinogen (OSHA).

Use: Oral contraceptive, lab reagent.

progesterone 16,17-acetonide.

CAS: 4968-09-6. mf: $C_{24}H_{34}O_4$.

Hazard: A reproductive hazard.

Use: Hormone.

progesterone response element. (PRE). A binding site in a promoter to which the activated progesterone receptor can bind. The progesterone receptor is essentially a transcription factor which is activated only in the presence of progesterone. The activated receptor will bind to a PRE, and transcription of the adjacent gene will be altered.
See: Response element.

proglyde dmm. See dipropylene glycol dimethyl ether.

proguanil. (chlorguanide; 1-*p*-chlorophenyl-5-isopropyl biguanide). An antimalarial drug said to be less toxic than others.

prokaryotic. Literally “before the nucleus”, the term applies to all bacteria and archaea. Prokaryotic cells have no internal membranes or cytoskeleton. Their DNA is circular, not linear.
See chromosome; eukaryote.

prolactin. See luteotropin.

prolamin. Any of a group of simple vegetable proteins, e.g., gliadin in wheat, zein in corn. When split by acids they give only amino acids.

prolan. (2-nitro-1,1-bis(*p*-chlorophenyl)propane).

CAS: 117-27-1. $C_{15}H_{13}Cl_2NO_2$.

Properties: Thick, oily liquid. Crystalline form melts at 80C. Hazard: Toxic by ingestion.

Use: Insecticide; when mixed with bulan, the insecticide known as dilan is formed.

See bulan; dilan.

proline. (2-pyrrolidinecarboxylic acid).

C_4H_7NCOOH . A nonessential amino acid found naturally in the L(-) form.

Properties: Colorless crystals. Soluble in water and alcohol; insoluble in ether; optically active. DL-proline: mp 205C with decomposition. D(+)-proline: mp 215–220C with decomposition. L(–)-proline: mp 220–222C with decomposition.

Derivation: Hydrolysis of protein, also synthetically and by recombinant DNA techniques.

Use: Biochemical and nutritional research, microbiological tests, culture media, dietary supplement, lab reagent. Available commercially as the L(–)-proline.

l-proline. mf: C₅H₉NO₂.

Properties: White crystals or crystalline powder; odorless with sweet taste. Very sol in water, alc; insol in ether.

Use: Food additive.

prolipin. A compound, sterile solution of protein obtained from nonpathogenic bacteria, various animal fats, and lipoids derived from bile.

promazine hydrochloride. (10-(3-dimethylaminopropyl)phenothiazine hydrochloride). C₁₇H₂₀N₂S•HCl. Isomeric with promethazine hydrochloride.

Properties: White to slightly yellow, hygroscopic powder; practically odorless. Oxidizes upon prolonged exposure to air and acquires a blue or pink color. Melts within a range of three degrees between 172 and 182C, pH of 5% solution between 4.2–5.2. Soluble in water and alcohol. Insoluble in benzene.

Grade: NF.

Use: Medicine (tranquilizer).

promecarb. (3-methyl-5-isopropyl-N-methylcarbamate).

CAS: 2631-37-0. C₁₂H₁₇NO₃.

Properties: Colorless, crystalline solid. Mp 87C. Insoluble in water; soluble in alcohol.

Hazard: Toxic by ingestion.

Use: Insecticide.

promethium. Pm. Radioactive rare-earth element, a member of the lanthanide series, atomic number 61, aw 147. The 145 isotope has a half-life of 18 years, the 147 half-life is 2.64 years; the latter is the only form available.

Properties: Silvery-white metal. Mp 1,160C, density 7.2.

Derivation: The 147 isotope is recovered from spent uranium fission products, also by reduction of the chloride or fluoride with an alkali metal.

Hazard: Strong radioactive poison, use requires shielding and glove boxes.

Use: (147 isotope) Nuclear auxiliary power generators, special semiconductor battery, luminescent paint for watch dials, X-ray source, source of β-rays

for thickness gauges, used with tungsten cermet for space power systems (withstands 2000C for 1000 hours). *Note:* Some 30 compounds are known, but may not be commercially available.

promoted electron. Electron forced to occupy a principal quantum level higher than that of its ground-state level.

promoter. (1) A substance that, when added in relatively small quantities to a catalyst, increases its activity, e.g., aluminum and potassium oxide are added as promoters to the iron catalyst used in facilitating a combination of hydrogen and nitrogen to form ammonia. (2) In ore flotation, a substance that provides the minerals to be floated with a water-repellent surface that will adhere to air bubbles. Such reagents are generally more or less selective toward minerals of certain classes. (3) /H The first few hundred nucleotides of DNA “upstream” (on the 5’ side) of a gene, which control the transcription of that gene. The promoter is part of the 5’ flanking DNA, i.e. it is not transcribed into RNA, but without the promoter, the gene is not functional.

pronucleus. The nucleus of a sperm or egg prior to fertilization. See nucleus; transgenic.

proof. The ethanol content of a liquid at 15.5C, stated as two times the percentage of ethanol by volume. One gallon of 95% alcohol is therefore equivalent to 1.9 gallons of proof alcohol. In the U.S., the alcohol tax is based on the number of proof gallons.

propachlor.

CAS: 1918-16-7. C₁₁H₁₄NOCl.

Properties: Tan powder. Mp 68C. Soluble in alcohol, benzene.

Use: Selective weed killer.

propadiene. See allene.

propadrine hydrochloride. (monhydrin, *dl*-norephedrine hydrochloride, phenylpropanolamine hydrochloride).

CAS: 154-41-6. mf: C₉H₁₃NO•ClH

Properties: A solid. Mw: 187.69, mp: 194C. Soluble in water.

Hazard: Poison by ingestion.

Use: Used as a raw material in cold and diet tablets.

“Propafilm” [ICI]. TM for coated polypropylene packaging films.

Use: A metalizable film used for packaging, barrier, and heat sealable films.

propanal. See propionaldehyde.

propane. (dimethylmethane).

CAS: 74-98-6. C₃H₈.

Properties: Colorless gas; natural-gas odor. Noncorrosive. Bp -42.5°C , fp -189.9°C , density of liquid 0.531 (0C), density of vapor 1.56 (0C), flash p -156°F (-105°C), autoign temp 874°F (467°C). Soluble in ether, alcohol; slightly soluble in water. An asphyxiant gas.

Grade: Technical, research (9.9%).

Derivation: From petroleum and natural gas.

Hazard: TLV: Asphyxiant (Proposed: TWA 2500 ppm). Flammable, dangerous fire risk, explosive limits in air 2.4–9.5%. For storage, see butane (note).

Use: Organic synthesis, household and industrial fuel, manufacture of ethylene, extractant, solvent, refrigerant, gas enricher, aerosol propellant, mixture for bubble chambers.

See butane (note).

1,3-propanediamine. See 1,3-diaminopropane.

1,2-propanediol. See 1,2-propylene glycol.

1,3-propanediol. See trimethylene glycol.

***n,n'*-(1,3-propanedioxysulfinyl)bis(2,3-dihydro-2,2-dimethylbenzofuranyl-7-methylcarbamate).**

CAS: 81861-90-7. mf: $\text{C}_{27}\text{H}_{34}\text{N}_2\text{O}_{10}\text{S}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

propane hydrate. See gas hydrate.

propanenitrile. See ethyl cyanide.

propane sultone. (1,2-oxathrolane; 2,2-dioxide; 3-hydroxy-1-propanesulphonic acid sultone; 1,3-propane sultone).

CAS: 1120-71-4. $\text{C}_3\text{H}_6\text{O}_3\text{S}$.

Properties: Liquid or white crystals. Mw 122.14, mp above 31.1°C (with a foul odor), bp 180°C . Soluble in water and organic solvents.

Hazard: TLV: animal carcinogen.

Use: Chemical intermediate for the production of fungicides, insecticides, cation-exchange resins, dyes, and vulcanization accelerators.

1,3-propane sultone. See propane sultone.

1-propanethiol. (*n*-propyl mercaptan).

CAS: 79869-58-2. $\text{C}_3\text{H}_7\text{SH}$.

Properties: Liquid; offensive-smelling. Boiling range $67\text{--}73^{\circ}\text{C}$, d 0.8408 (20/4C), refr index 1.4380 (20C), flash p -5°F (-20.5°C).

Grade: 95%.

Hazard: Highly flammable, dangerous fire risk.

Use: Chemical intermediate, herbicide.

***n,n',n''*-(1,2,3-propanetrioxysulfinyl)tris(2-isopropoxyphenylmethylcarbamate).**

CAS: 81862-23-9. mf: $\text{C}_{36}\text{H}_{47}\text{N}_3\text{O}_{15}\text{S}_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***n,n',n''*-(1,2,3-propanetrioxysulfinyl)tris(1-naphthyl methylcarbamate).**

CAS: 81862-20-6. mf: $\text{C}_{39}\text{H}_{35}\text{N}_3\text{O}_{12}\text{S}_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

propanil. (generic name for 3,4-dichloropropionanilide)

CAS: 709-98-8. $\text{Cl}_2\text{C}_6\text{H}_3\text{NHCOC}_2\text{H}_5$.

Properties: (Pure) Light-brown solid. Mp $85\text{--}89^{\circ}\text{C}$. (Technical) Liquid. Bp $91\text{--}91.5^{\circ}\text{C}$.

Hazard: Toxic by ingestion and inhalation.

Use: Postemergence herbicide, especially for rice culture; nematocide.

propanoic acid. See propionic acid.

1-propanol. See propyl alcohol.

2-propanol. See isopropyl alcohol.

propanolamine. See 2-amino-1-propanol; 3-amino-1-propanol.

2-propanol nitrate. See isopropyl nitrate.

2-propanolpyridine. $\text{C}_3\text{NH}_4\text{C}_3\text{H}_6\text{OH}$.

Properties: Colorless liquid. Bp 260.2°C , d 1.060 (25°C), refr index 1.5298 (20°C). Miscible with water at 20°C .

4-propanolpyridine. $\text{C}_3\text{NH}_4\text{C}_3\text{H}_6\text{OH}$.

Properties: Colorless liquid. Bp 289.0°C , fp 36.7°C , d 1.053 (40°C). Soluble in water.

2-propanone. See acetone.

2-propanone oxime. See acetoxime.

propanoyl chloride. See propionyl chloride.

propargite. (2-(*p*-*tert*-butylphenoxy)-cyclohexyl-2-propynylsulfite; dark oil).

CAS: 2312-35-8.

Properties: D 1.1 (25C). Insoluble in water.

Use: Acaricide for fruits, vegetables, row crops.

propargyl alcohol. (2-propyn-1-ol).

CAS: 107-19-7. $\text{HC}\equiv\text{CCH}_2\text{OH}$.

Properties: Colorless liquid; geranium-like odor. D 0.971, fp -48°C , bp 114°C , flash p 97°F (36°C) (OC). Soluble in water, alcohol, and ether; immiscible with aliphatic hydrocarbons.

Derivation: From acetylene by high-pressure synthesis.

Grade: Technical, 75% solution.

Hazard: Flammable, moderate fire risk. Toxic by ingestion, inhalation, and skin absorption. TLV: 1 ppm. Toxic by skin absorption.

Use: Chemical intermediate, corrosion inhibitor, lab reagent, solvent stabilizer, prevents hydrogen embrittlement of steel, soil fumigant.

propargyl bromide. (3-bromo-1-propyne).

CAS: 106-96-7. $\text{HC}\equiv\text{CCH}_2\text{Br}$.

Properties: Liquid, sharp odor. D 1.520, bp 88–90C, flash p 65F (18.3) (COC).

Derivation: From acetylene by high-pressure synthesis.

Hazard: Flammable, dangerous fire and explosion risk. Irritant.

Use: Chemical intermediate, soil fumigant.

propargyl chloride. (3-chloro-1-propyne).

$\text{HC}\equiv\text{CCH}_2\text{Cl}$.

Properties: Liquid. Fp –76.9C, bp 57.1, refr index 1.4310 (25C), flash p 90F (32C). Soluble in benzene, alcohol, carbon tetrachloride; insoluble in water.

Derivation: From acetylene by high-pressure synthesis.

Hazard: Flammable, moderate fire risk.

Use: Chemical intermediate, soil fumigant.

(n¹⁰)-propargyl-5,8-dideazafolic acid.

CAS: 76849-19-9. mf: $\text{C}_{24}\text{H}_{23}\text{N}_5\text{O}_6$.

Hazard: A poison.

5'-propargyl- α' -ethynyl-3'-furylmethyl α -ethylphenyl acetate.

CAS: 51715-75-4. mf: $\text{C}_{20}\text{H}_{18}\text{O}_5$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

propazine 80W.

CAS: 139-40-2. $\text{C}_9\text{H}_{16}\text{ClN}_5$. Generic name for a preemergence herbicide containing 80% 2-chloro-4,6-bis(isopropylamino)-s-triazine.

Use: Weed control in sorghum culture.

propellant. (1) A rocket fuel.

(2) A compressed gas used to expel the contents of containers in the form of aerosols. Chlorofluorocarbons were once widely used because of their non-flammability. The strong possibility that they contribute to depletion of the ozone layer of the upper atmosphere has resulted in prohibition of their use for this purpose. Other propellants used are hydrocarbon gases, such as butane and propane, carbon dioxide, and nitrous oxide. The materials dispersed include insecticides, shaving cream, whipping cream, and cosmetic preparations. See ozone (note).

2-propenal. See acrolein.

propene. See propylene.

propenenitrile. See acrylonitrile.

2-propene-nitrile, polymer with 1,3-butadiene, 3-carboxy-1-cyano-1-methylpropyl-terminated,2-hydroxy-3-((1-oxo-2-propenyl)oxy)propyl ester.

CAS: 68891-47-4. mf: $(\text{C}_4\text{H}_6\bullet\text{C}_3\text{H}_3\text{N})_x$

Hazard: A severe skin irritant.

2-propene-1-thiol. See allyl mercaptan.

propene-1,2,3-tricarboxylic acid. See acotic acid.

propenoic acid. See acrylic acid.

2-propen-1-ol. See allyl alcohol.

propenyl alcohol. See allyl alcohol.

2-propenylamine. See allylamine.

p-propenylanisole. See anethole.

α -propenyldichlorohydrin. See α -dichlorohydrin.

propenyl guaethol. (1-ethoxy-2-hydroxy-4-propenylbenzene). $\text{C}_2\text{H}_5\text{OC}_6\text{H}_3(\text{OH})(\text{C}_3\text{H}_5)$.

Properties: Free-flowing, white powder; odor and taste similar to vanilla, but much more powerful. Mp 85–86C. Very soluble in fats, edible solvents, and essential oils; very slightly soluble in water.

Use: Artificial vanilla flavoring, flavor enhancer.

propenyl guaiacol. See methyl isoeugenol.

2-propenyl hexanoate. See allyl caproate.

2-propenyl isothiocyanate. See allyl isothiocyanate.

propineb. (zinc-1,2-propylene-bisdithiocarbamate).

CAS: 12071-83-9. $\text{C}_5\text{H}_8\text{N}_2\text{S}_4\text{Zn}$.

Properties: Faintly yellow crystals or powder; becomes dark when heated. Decomposes in presence of strong acids or bases. Insoluble in most common solvents.

Hazard: Toxic by ingestion.

Use: Fungicide.

γ -propiobutyrolactone. See γ -heptalactone.

propiodal. (1,3-bis(trimethylamino)-2-propanol diiodide; iodisan; hexamethyldiaminoisopropanol diiodide). $[\text{CH}_2\text{N}(\text{CH}_3)_2]_2\text{CHOH}$.

Properties: White, crystalline solid. Mp 275C (decomposes), turns brown at 240C. Freely soluble in water; slightly soluble in alcohol; insoluble in ether and acetone.

Use: Medicine (iodine therapy).

β -propiolactone. (USAN) (BPL).

CAS: 57-57-8.

Properties: Colorless liquid; pungent odor. Bp 155C with rapid decomposition, fp -33.4C , refr index 1.4131 (20C), d 1.1450 (20/4C), flash p (OC) 167F (75C). Soluble in water; miscible with ethanol, acetone, ether, and chloroform at 25C; reacts with alcohol. Stable when stored in glass at refrigeration temperature (+5 to +10C). Combustible.

Derivation: Direct combination of ketene and form-aldehyde.

Hazard: Strong skin irritant, suspected human carcinogen, worker exposure should be minimized. TLV: 0.5 ppm; animal carcinogen.

Use: Organic synthesis, vapor sterilant, disinfectant.

propionaldehyde. (propanal; propyl aldehyde; propionic aldehyde).CAS: 123-38-6. $\text{C}_2\text{H}_5\text{CHO}$.

Properties: Water-white liquid; suffocating odor. Flash p 15F (-9.4C) (OC), bp 48.8C, fp -81C , d 0.807 (20.4C), refr index 1.364 (20C), autoign temp 405F (207C). Soluble in water and alcohol.

Derivation: (1) Oxidation of propyl alcohol with dichromate, (2) by passing propyl alcohol over copper at elevated temperatures.

Hazard: Flammable, dangerous fire risk, explosive limits in air 3.0–16%. Irritant.

Use: Manufacture of propionic acid, polyvinyl, and other plastics; synthesis of rubber chemicals; disinfectant; preservative.

propionamide nitrile. See cyanoacetamide.**propione.** See diethyl ketone.**propionic acid.** (methylacetic acid; propanoic acid).CAS: 79-09-4. $\text{CH}_3\text{CH}_2\text{CO}_2\text{H}$.

Properties: Colorless, oily liquid; rancid odor. D 0.9942 (20/4C), fp -20.8C , refr index 1.3862 (20C), bp 140.7C, flash p 130F (54.4C), autoign temp 955F (512C). Soluble in water, alcohol, chloroform, and ether. Combustible.

Derivation: By reaction of ethanol with carbon monoxide, using a boron trifluoride catalyst; also by the reaction of carbon monoxide with hydrogen and olefins or alcohols.

Method of purification: Rectification.

Grade: Technical, 99.0%, FCC.

Hazard: Moderate fire risk. Strong irritant. TLV: 10 ppm.

Use: Propionates, some of which are used as mold inhibitors in bread and fungicides in general; herbicides; preservative for grains and wood chips; emulsifying agents; solutions for electroplating nickel; perfume esters; artificial fruit flavors; pharmaceuticals; cellulose propionate plastics.

propionic aldehyde. See propionaldehyde.**propionic anhydride.**CAS: 123-62-6. $(\text{CH}_3\text{CH}_2\text{CO})_2\text{O}$.

Properties: Colorless liquid; pungent odor. Fp -45C , bp 167–169C, d 1.0119 (20C), vap press 1 mm Hg (20C), flash p 165F (73.9C) bulk d 8.4 lb/gal at 20C. Soluble in alcohol, ether, chloroform, and alkalis; decomposed by water. Combustible.

Hazard: Strong irritant to tissue.

Use: Esterifying agent for fats and oils; cellulose; dehydrating medium for nitrations and sulfonations; alkyl resins; dyestuffs; and pharmaceuticals.

propionitrile. See ethyl cyanide.**propionylbenzene.** See propiophenone.**propionyl chloride.** (propanoyl chloride).CAS: 79-03-8. $\text{CH}_3\text{CH}_2\text{COCl}$.

Properties: Colorless liquid; pungent odor. Fp -94C , bp 80C, d 1.065 (20/4C). Decomposes in water and alcohol.

Hazard: Strong irritant to skin.

Use: Chemical intermediate.

propionyl peroxide.CAS: 3248-28-0. $\text{C}_2\text{H}_5\text{C}(\text{O})\text{OOC}(\text{O})\text{C}_2\text{H}_5$. Available as a 25% solution in a high-boiling hydrocarbon, flash p 125F (51.6C).

Hazard: Strong oxidizing agent, may explode if shocked or heated.

Use: Initiator in polymerization reactions, such as the high-pressure polymerization of ethylene.

propiophenone. (ethyl phenyl ketone; propionylbenzene; 1-phenylpropanone-1).CAS: 93-55-0. $\text{C}_6\text{H}_5\text{COC}_2\text{H}_5$.

Properties: Colorless to light-amber liquid or crystals; strong persistent odor. D 1.012 (20/20C), refr index 1.527 (20C), congealing temp 17.5–21C, bp 218C, flash p 210F (99C) (TOC). Insoluble in water, ethylene glycol, glycerol; miscible with alcohol, ether, benzene, and toluene. Combustible.

Use: Fixative in perfumes, starting material for synthesis of ephedrine and other important pharmaceuticals and synthetic organic chemicals, lab reagent.

“Propi-Rhap” [Uniroyal]. TM for the 2-ethylhexyl ester of 2-(2,4-dichlorophenoxy)propionic acid.

Use: Herbicide.

propoxur. See *o*-isopropoxyphenyl-*N*-methyl carbamate.**“ProPoxy 300” [Unitex].** TM for a high strength two-component epoxy adhesive anchoring gel.**propoxyphene.** (α -(+)-4-dimethylamino-1,2-diphenyl-3-methyl-2-butanol propionate ester).

CAS: 469-62-5. $C_{22}H_{29}NO_2$. The α -diastereoisomers are optically active and are preferred for their greater pain-relieving ability. The drug has about the same analgesic effect as codeine. Abuse can cause addiction, and overdose can be fatal. Its use has been restricted by FDA.

2-(3-propoxyphenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-15-8. mf: $C_{20}H_{18}N_2O$.

Hazard: A reproductive hazard.

n-propoxypropanol. $C_6H_{14}O_2$.

Properties: Liquid. D 0.8865 (20/20C), bp 149.8C, fp $-80C$ (sets to glass below this), flash p 128F (53.3C). Soluble in water.

Hazard: Moderate fire risk.

Use: Solvent for water-based enamel.

proppant. A term coined by petroleum engineers to refer to agents such as sand, sintered bauxite, etc., that are used in hydraulic fracturing of oil wells; they are so called because they prop open the minute cracks in rock formations created by a hydraulic press.

See hydraulic fracturing.

propranolol. (1-(isopropylamino)-3-(1-naphthylloxy)-2-propanol).

CAS: 525-66-6. $C_{16}H_{21}NO_2$.

Properties: Colorless crystals. Mp 96C. Soluble in water and alcohol; insoluble in benzene and ether.

Hazard: Highly toxic.

Use: An adrenergic blocker used in treatment of hypertension and various forms of heart disease. Approved by FDA.

“Propulse” [Norben]. TM for a pea protein isolate.

Use: Gives a high level of functionality and nutrition in food and beverages where protein enrichment is required.

n-propyl acetate.

CAS: 109-60-4. $C_5H_{10}O_2$.

Properties: Colorless liquid; pleasant odor. D 0.887, flash p 58F (14.4C), boiling range 96.0–102.0C, bulk d 7.36 lb/gal, autoign temp 842F (450C), fp $-92C$. Slightly soluble in water; miscible with alcohols, ketones, esters, hydrocarbons.

Derivation: Interaction of acetic acid and *n*-propyl alcohol in the presence of sulfuric acid.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2–8%. TLV: 200 ppm; STEL 250 ppm.

Use: Flavoring agents, perfumery, solvent for nitrocellulose and other cellulose derivatives, natural and synthetic resins, lacquers, plastics, organic synthesis, lab reagent.

propyl acetone. See methyl butyl ketone.

propyl alcohol. (1-propanol; *n*-propyl alcohol).

CAS: 71-23-8. $CH_3CH_2CH_2OH$.

Properties: Colorless liquid; odor similar to ethanol. Bp 97.2C, fp $-127C$, d 0.804 (20/4C), flash p 77F (25C) (OC), autoign temp 700F (371C), refr index 1.385 (20C), viscosity 2.256 cP (20C). Soluble in water, alcohol, and ether.

Derivation: From oxidation of natural gas hydrocarbons, also from fusel oil.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 2–13%. Toxic by skin absorption. TLV: 200 ppm; STEL 250 ppm. Toxic by skin absorption.

Use: Organic synthesis and chemical intermediate; solvent for waxes, vegetable oils, natural and synthetic resins, cellulose esters and ethers; polishing compositions; brake fluids; solvent degreasing; antiseptic.

sec-propyl alcohol. See isopropyl alcohol.

propyl aldehyde. See propionaldehyde.

n-propylamine.

CAS: 107-10-8. $C_3H_7NH_2$.

Properties: Colorless liquid; amine odor. D 0.7182 (20C), bp 47.8C, vap press 248 mm Hg (20C), fp $-83C$, flash p $-35F$ ($-37.2C$), autoign temp 604F (317C). Soluble in water, alcohol, and ether.

Hazard: Highly flammable, dangerous fire risk, explosive limits in air 2–10%, use alcohol foam to extinguish. Strong irritant to skin and tissue.

Use: Intermediate, lab reagent.

n-propylbenzene. (1-phenylpropane).

CAS: 103-65-1. C_9H_{10} .

Properties: Colorless liquid. Bp 160C, fp $-100C$, d 0.862, flash p 86F (30C), refr index 1.49. Soluble in alcohol and ether; sparingly soluble in water.

Derivation: Reaction of benzylmagnesium chloride and diethyl sulfate.

Hazard: Flammable, moderate fire risk.

Use: Solvent for cellulose acetate, dyeing textiles.

n-propyl bromide. (1-bromopropane).

CAS: 106-94-5. C_3H_7Br .

Properties: Liquid. Mp $-110^{\circ}C$, bp $71^{\circ}C$, d: 1.35 @ $20^{\circ}4^{\circ}C$, mw 123.01, autoign temp $914^{\circ}F$, flash p $<22^{\circ}$, lower explosive level 4.6%.

Hazard: A flammable liquid.

Use: Solvent, organic synthesis, pharmaceuticals, intermediate.

propyl butyrate.CAS: 105-66-8. $C_7H_{14}O_2$ **Properties:** Colorless liquid. D 0.8789 (15C), bp 142.7C, fp -95.2C. Slightly soluble in water; soluble in alcohol and ether. Combustible.**Hazard:** Irritant to mucous membranes, narcotic in high concentration.**Use:** Solvent mixture for cellulose ethers.**propyl chloride.** (1-chloropropane).CAS: 540-54-5. $CH_3CH_2CH_2Cl$.**Properties:** Liquid. Fp -122.8C, bp 46.6C, refr index 1.3886 (20C), flash p 0F (-17.7C). Soluble in alcohol and ether; slightly soluble in water.**Hazard:** Highly flammable, dangerous fire risk, explosive limits in air 2.5-11%. Irritant and narcotic. See isopropyl chloride.**propyl chlorosulfonate.**CAS: 109-61-5. $CH_3CH_2CH_2OSO_2Cl$.**Properties:** Liquid. Bp 70-72C (20 mm Hg).**Derivation:** Interaction of *n*-propyl alcohol and sulfuric chloride.**Hazard:** Toxic by inhalation and ingestion, strong irritant to eyes.**Use:** Organic synthesis, military poison gas (lachrymator).***n*-propyl cyanide.** See *n*-butyronitrile.***n*-(4-propylcyclohexyl)benzamide.**CAS: 315706-70-8. mf: $C_{16}H_{23}NO$.**Hazard:** A poison by ingestion.***n*-(4-propylcyclohexyl)-4-morpholine-carboxamide.**CAS: 315706-81-1. mf: $C_{14}H_{26}N_2O_2$.**Hazard:** A poison by ingestion.***n*-(4-propylcyclohexyl)-3-(3,4,5-trimethoxyphenyl)-2-propenamide.**CAS: 315706-73-1. mf: $C_{21}H_{31}NO_4$.**Hazard:** A poison by ingestion.***n*-propyldiethanolamine.**CAS: 6735-35-9. mf: $C_7H_{17}NO_2$.**Hazard:** A poison by ingestion and skin contact. A severe eye irritant.**propyl-3,5-diiodo-4-oxo-1(4H)pyridineacetate.** See propyliodone.**propyldiphenylphosphine.**CAS: 7650-84-2. mf: $C_{15}H_{17}P$.**Hazard:** A poison by ingestion and skin contact. A mild skin irritant.**propylene.** (propene).CAS: 115-07-1. $CH_3CH=CH_2$.**Properties:** Colorless gas. Bp -47.7C, fp -185.2C, d (liquid) 0.5139 (20/4C), vap d (0C) (air = 1) 1.46, flash p -162F (-108C), autoign temp 927F (497C).

Soluble in alcohol and ether; slightly soluble in water.

Derivation: Catalytic and thermal cracking of ethylene with zeolite catalyst, from naphtha.**Grade:** 95%, 99%, and research.**Hazard:** TLV: Asphyxiant; Not Classifiable as a Human Carcinogen. Highly flammable, dangerous fire risk, explosive limits in air 2-11%.**Use:** Manufacture of isopropyl alcohol, polypropylene, synthetic glycerol, acrylonitrile, propylene oxide, heptene, cumene, polymer gasoline, acrylic acid, vinyl resins, oxo chemicals.**propylene carbonate.** $C_3H_6O_3$ or $OCOC(CH_3)_2O$.**Properties:** Colorless liquid; odorless. Fp -49.2C (easily supercooled). Bp 241.7C, d 1.2057 (20/4C), bulk d 10 lb/gal (20C), refr index 1.4209 (20C); flash p 270F (132C). Miscible with acetone, benzene, chloroform, ether, ethyl acetate; moderately soluble in water and carbon tetrachloride. Combustible.**Use:** Solvent extraction, plasticizer, organic synthesis, natural gas purification, synthetic fiber spinning solvent.**propylene chloride.** See propylene dichloride.**propylene chlorohydrin.** (chloro-isopropyl alcohol; 1-chloro-2-propanol).CAS: 78-89-7. $CH_2ClCH_2OCH_3$.**Properties:** Colorless liquid; mild, nonresidual odor. Bp 127.5C, vap press 4.9 mm Hg (20C), flash p 125F (51.6C) (CC), bulk d 9.3 lb/gal (20C), d 1.1128 (20/20C). Soluble in water and alcohol.**Grade:** Technical.**Hazard:** Moderate fire risk. Toxic by ingestion and skin absorption.**Use:** Organic synthesis (introducing hydroxypropyl group), manufacture of propylene oxide.**propylenediamine.** Legal label name for 1,2-diaminopropane.**propylene dichloride.** (1,2-dichloropropane; propylene chloride).CAS: 78-87-5. $CH_3CHClCH_2Cl$.**Properties:** Colorless, stable liquid; chloroform-like odor. Bp 96.3C, d 1.1583 (20/20C), bulk d 9.6 lb/gal (20C), refr index 1.4068 (20C), fp -80C, flash p 61F (16.1C), autoign temp 1,035F (557C). Soluble in water 0.26% by wt (20C); miscible with most common solvents.**Derivation:** Action of chlorine on propylene.**Grade:** Refined.**Hazard:** Flammable, dangerous fire risk, explosive limits in air 3.4-14.5%. Toxic by ingestion and inhalation. TLV: 75 ppm; STEL 110 ppm; not classifiable as a human carcinogen.

Use: Intermediate for perchloroethylene and carbon tetrachloride; lead scavenger for antiknock fluids; solvents for fats, oils, waxes, gums, and resins; solvent mixture for cellulose esters and ethers; scouring compounds; spotting agents; metal degreasing agents; soil fumigant for nematodes.

1,2-propylene glycol. (1,2-dihydroxypropane; 1,2-propanediol; methylene glycol; methyl glycol).

CAS: 57-55-6. $\text{CH}_3\text{CHOHCH}_2\text{OH}$.

Properties: Colorless, viscous, stable, hygroscopic liquid; practically odorless and tasteless. Miscible with water, alcohols, and many organic solvents. Bp 187.3C, fp -60C, d 1.0381 (20/20C), bulk d 8.64 lb/gal (20C), refr index 1.4293 (27C), surface tension 40.1 dynes/cm (25C), viscosity 0.581 cP (20C), vap press 0.07 mm Hg (20C), specific heat 0.590 cal/g (20C), latent heat of evaporation 168.6 cal/g at bp, flash p 210F (99C) (OC), autoign temp 780F (415C), heat of combustion 431.0 kg cal/mole. Combustible.

Derivation: By hydration of propylene oxide.

Method of purification: By distillation.

Grade: Refined, technical, USP, FCC, feed.

Use: Organic synthesis, especially polypropylene glycol and polyester resins; cellophane; antifreeze solution. Solvent for fats, oils, waxes, resins, flavoring extracts, perfumes, colors, soft-drink syrups, antioxidants. Hygroscopic agent; coolant in refrigeration systems; plasticizers; hydraulic fluids; bactericide; textile conditioners. In foods as solvent, wetting agent, humectant. Emulsifier; feed additive; anticaking agent; preservative (retards molds and fungi); cleansing creams; suntan lotions; pharmaceuticals; brake fluids; deicing fluids for airport runways; tobacco.

See polypropylene glycol.

1,3-propylene glycol. See trimethylene glycol.

propylene glycol alginate. (hydroxypropyl alginate). ($\text{C}_9\text{H}_{14}\text{O}_7$).

Properties: White powder; practically tasteless and odorless. Vary with degree of esterification. Soluble in water and dilute organic acids.

Grade: FCC.

Use: Stabilizer, thickener, emulsifier, food additive.

propylene glycol dinitrate. (PGDN).

CAS: 6423-43-4. $\text{C}_3\text{H}_6\text{N}_2\text{O}_6$.

Properties: Colorless liquid; unpleasant odor. Mw 166.09, d 1.232 g/ml at 25C, fp -27.7C, bp decomposes above 121C. Slightly soluble in water.

Hazard: Toxic by inhalation and skin contact. TLV: 0.05 ppm. Toxic by skin absorption.

Use: Torpedo propellant in Otto Fuel II.

propylene glycol distearate. See propylene glycol monostearate.

propylene glycol lactostearate.

Properties: Soft to hard waxy solid. Dispersible in hot water; moderately sol in hot isopropanol, benzene, chloroform, soybean oil.

Use: Food additive.

propylene glycol mono- and diesters.

Properties: Clear liquid or white to yellow beads or flakes; bland odor and taste. Insol in water; sol in alc, ethyl acetate, chloroform.

Use: Food additive.

propylene glycol monomethyl ether.

(polypropylene glycol methyl ether).

CAS: 107-98-2. $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OCH}_3$.

Properties: Colorless liquid. Fp -95C (sets to glass), bp 120.1C, d 0.9234 (20/20C) bulk d 7.65 lb/gal (25C), refr index 1.402 (25C), flash p 97F (36.1C). Soluble in water; methanol, ether.

Hazard: Flammable, moderate fire risk. TLV: 100 ppm; STEL 150 ppm

Use: Solvent for celluloses, acrylics, dyes, inks, stains; solvent-sealing of cellophane.

propylene glycol monoricinoleate.

$\text{C}_{17}\text{H}_{32}(\text{OH})\text{COOCH}_2\text{CH}_2\text{OCH}_3$.

Properties: Pale-yellow, moderately viscous, oily liquid; mild odor. D 0.960 (25/25C), saponification value 160, hydroxyl value 285, solidifies at -26C. Soluble in most organic solvents; insoluble in water. Combustible.

Derivation: Castor oil and propylene glycol.

Grade: Technical.

Use: Plasticizer, dye solvents, lubricant, cosmetics, urethane polymers, and hydraulic fluids.

propylene glycol monostearate. The FCC grade is a mixture of propylene glycol mono- and diesters of stearic and palmitic acids. White beads or flakes, bland odor and taste, insoluble in water, soluble in alcohol, ethyl acetate, chloroform and other chlorinated hydrocarbons. Combustible.

Use: Emulsifier, stabilizer.

propylene glycol phenyl ether.

$\text{C}_6\text{H}_5\text{OCH}_2\text{CHOHCH}_3$.

Properties: Colorless liquid. D 1.060-1.070 (25/25C), boiling range 5.95%, 237-242C, flash p 275F (135C). Combustible.

Use: High-boiling solvent, bactericidal agent, fixative for soaps and perfumes, intermediate for plasticizers.

propyleneimine. (2-methylaziridine; propyleneimine).

CAS: 75-55-8.

$\text{CH}_2\text{HCNHCH}_2$.

Properties: Water-white liquid. Bp 66-67C, d 0.8039-0.8070 (25/25C), 1.4094-1.4109 (25C). Soluble in water and most organic solvents.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion, inhalation, and skin absorption. A suspected carcinogen. TLV: 2 ppm; animal carcinogen. Toxic by skin absorption.

Use: Organic intermediate whose derivatives are used in the paper, textile, rubber, and pharmaceutical industries.

propylene oxide.

CAS: 75-56-9.

Properties: Colorless liquid; ethereal odor. D 0.8304 (20/20C) bp 33.9C, vap press 445 mm Hg (20C), flash p -35F (-37.2C), bulk d 6.9 lb/gal (20C), fp -104.4C. Partially soluble in water; soluble in alcohol and ether.

Derivation: (1) Chlorohydration of propylene followed by saponification with lime, (2) peroxidation of propylene, (3) epoxidation of propylene by a hydroperoxide complex with molybdenum catalyst.

Hazard: Highly flammable, dangerous fire risk, explosive limits in air 2-22%. An irritant. TLV: 20 ppm; animal carcinogen.

Use: Polyols for urethane foams, propylene glycols, surfactants and detergents, isopropanol amines, fumigant, synthetic lubricants, synthetic elastomer (homopolymer), solvent.

propylene oxide and ethylene oxide block polymer.

See poloxamer 331.

propylene phenoxetol.

See 1-phenoxy-2-propanol.

propyl formate.

CAS: 110-74-7. HCOOC₃H₇.

Properties: Liquid. D 0.9006 (20/4C), fp -92.9C, bp 81.3C, refr index 1.3769 (20C). Slightly soluble in water, miscible with alcohol and ether. Flash p 27F (-2.8C) (COC), autoign temp 851F (455C).

Hazard: Flammable, dangerous fire risk.

Use: Flavoring.

propylformic acid.

See butyric acid.

n-propyl furoate.

C₃H₇OCO₂C₃H₇.

Properties: Colorless, fragrant liquid; becomes yellow in light. D 1.0745 (25.9/4C), bp 210.9C (corrected), refr index 1.4737 (25.9C). Practically insoluble in water; soluble in alcohol and ether. Combustible.

Use: Flavoring.

propyl gallate.

CAS: 121-79-9. C₃H₇OOCC₆H₂(OH)₃.

Properties: Colorless crystals. Mp 150C. Almost insoluble in water; soluble in alcohol (50/50); somewhat soluble in oils.

Hazard: Use in foods restricted to 0.02% of fat content.

Use: Food preservative and antioxidant for animal fats and oils, flavoring, transformer oils.

propyl-*p*-hydroxybenzoate.

See propylparaben.

propyliodone.

(propyl-3,5-diiodo-4-oxo-1(4*H*)-pyridineacetate). I₂(O)C₃H₇NCH₂COOC₃H₇.

Properties: White, crystalline powder; odorless or nearly so. Mp 187-190C. Practically insoluble in water; soluble in acetone, alcohol, and ether.

Grade: USP.

Use: Medicine (radiopaque medium).

propyl isomer.

Generic name for dipropyl-5,6,7,8-tetrahydro-7-methylnaphtho[2,3-*d*]-1,3-dioxole-5,6-dicarboxylate.

CAS: 83-59-0. C₂₀H₂₆O₅.

Properties: Orange liquid. Insoluble in water; slightly soluble in oils; soluble in most organic solvents.

Use: Insecticide synergist.

propylmagnesium bromide.

C₃H₇MgBr.

Available as a solution in ether; a Grignard reagent.

Use: Alkylating agent in organic synthesis.

propylmalonic acid, diethyl ester.

(propyl diethyl malonate). C₃H₇CH(COOC₂H₅)₂.

Properties: Colorless liquid; fragrant odor. D 0.9860 (25C); bp 222C. Soluble in water; soluble in alcohols, ethers, esters, and ketones.

Use: Intermediate, tobacco flavoring.

n-propyl mercaptan.

Legal label name for 1-propanethiol.

2-*n*-propyl-4-methylpyrimidyl-6-*N,N*-dimethylcarbamate.

C₃H₇C₄HN₂(CH₃)₂OCN(CH₃)₂.

Properties: A liquid. Miscible with water and most organic solvents.

Use: Insecticide.

n-propyl nitrate.

(NPN).

CAS: 627-13-4. C₃H₇NO₃.

Properties: White to straw-colored liquid; ethereal odor. D 1.07 (20C), bp 110C, flash p 68F (20C), autoign temp 350F (176C), fp -100C, refr index 1.3975 (20C). Insoluble in water; soluble in alcohol and ether.

Grade: 96-98% pure.

Hazard: Flammable, severe fire and explosion risk, strong oxidizing material, explosive limits in air 2-100%. TLV: 25 ppm; STEL 40 ppm.

Use: Rocket fuel (monopropellant).

propylparaben.

(propyl-*p*-hydroxybenzoate).

CAS: 94-13-3. C₁₀H₁₂O₃.

Properties: Colorless crystals or white powder. Mp

95–98C. Slightly soluble in boiling water; soluble in alcohol, ether, and acetone.

Grade: USP, FCC.

Use: Food preservative, fungicide, mold control in sausage casings.

See “Parabens.”

propyl pelargonate. $C_3H_7OOC C_8H_{17}$.

Properties: Liquid. D 0.870 (15/15C), bp 237C. Insoluble in water; soluble in alcohol and most organic solvents. Combustible.

Use: Flavors and perfumes, bactericides and fungicides.

2-propyl-4-pentenoic acid. See 2-allylpentanoic acid.

propylpiperidine. See coniine.

1-propylpiperidine.

CAS: 5470-02-0. mf: $C_8H_{17}N$.

Hazard: A poison.

6-propylpiperonyl butyl diethylene glycol ether. See piperonyl butoxide.

***n*-propyl propionate.**

CAS: 106-36-5. $CH_3CH_2COOCH_2CH_2CH_3$.

Properties: Colorless liquid. Boiling range 122–124C, fp –76C, flash p 174F (78.9C) (OC), bulk d 7.31 lb/gal. Soluble in most organic solvents; slightly soluble in water. Combustible.

Grade: Technical.

Use: Solvent for nitrocellulose, paints, varnishes, lacquers, coating agents.

4-*n*-propylpyridine. $C_8H_{11}N$ or $C_3H_7C_5H_4N$.

Not to be confused with coniine (propylpiperidine).

Properties: Bp 188C.

Use: Intermediate.

5-(propylsulfonyl)-2-benzimidazolecarbamic acid methyl ester.

CAS: 75184-71-3. mf: $C_{12}H_{15}N_3O_4S$.

Hazard: A reproductive hazard.

2-propylthiazolidine.

CAS: 24050-10-0. mf: $C_6H_{13}NS$.

Hazard: A poison.

propylthiouracil. (6-propyl-2-thiouracil).

CAS: 51-52-5. $C_7H_{10}N_2OS$.

Properties: White, powdery, crystalline substance; starchlike in appearance and to touch; bitter taste. Mp 218–221C, sensitive to light. Very slightly soluble in water; sparingly soluble in alcohol; soluble in ammonia and alkali hydroxides.

Derivation: Condensation of β -oxocaproate with thiourea.

Grade: USP.

Use: Medicine (thyroid inhibitor).

***n*-propyltrichlorosilane.**

CAS: 141-57-1. $C_3H_7SiCl_3$.

Properties: Colorless liquid. Bp 12.5, d 1.195 (25/25C), refr index 1.4292 (25C), flash p 100F (37.7C) (COC). Readily hydrolyzed with liberation of hydrogen chloride.

Derivation: By Grignard reaction of silicon tetrachloride and propylmagnesium chloride.

Grade: Technical.

Hazard: Flammable, moderate fire risk. Strong irritant.

Use: Intermediate for silicones.

propyl xanthate. See xanthic acid.

propyne. See methylacetylene.

2-propyne-1-ol. See propargyl alcohol.

prostacycline. See prostaglandin.

prostaglandin. One of a group of physiologically active compounds derived from arachidonic acid, a 20-carbon fatty acid that occurs in glandular organs and the liver. It was named after the prostate gland, where it was originally found. Research on prostaglandins has been intense in recent years in view of their importance in various reproduction mechanisms and effects on blood pressure. They are believed to have significant relationships to a number of hormones; they also affect the nervous system, inhibit production of gastric juice, stimulate smooth muscles, and induce labor. They occur naturally in body tissues and biological fluids (especially semen). Both the chemical structure and metabolic functions of these compounds have been established with considerable accuracy, and several types have been synthesized; one pathway uses norbornadiene as a starting point followed by a ten-step sequence of conversions to a diol that serves as a precursor; another starts with cyclopentadiene, followed by hydroboration, yielding two intermediates from which prostaglandin can be derived. The most prolific source of prostaglandin intermediates (called syntons) is a marine organism called a gorgonian sea whip, which occurs in great numbers in coral reefs, especially in the Caribbean area. Harvesting of these has made the production of prostaglandins much less expensive. The occurrence of prostaglandin A_1 in yellow onions has been confirmed. Important derivatives of prostaglandins are prostacyclins and thromboxanes; a closely related group of compounds derived directly from arachidonic acid are the leukotrienes, which occur in white blood cells.

prosthetic group. A chemical grouping in which a metal ion is associated with a large molecule or molecular complex, e.g., coenzymes and metalloporphyrin complexes such as chlorophyll and heme. Such groups activate metabolic mechanisms such as phosphorylation, decarboxylation, etc., by coordination reactions with amino acids, proteins,

enzymes, and nucleic acids. The behavior of certain vitamins and other metabolites is due in part to prosthetic groups; catalysis is also involved.

protactinium. Pa. A radioactive element of atomic number 91, a member of the actinide series, aw 231.0359, valences = 4, 5; 13 unstable isotopes, two of which occur naturally. Protactinium is a constituent of all uranium ores, 340 milligrams being extracted from one ton. Protactinium may also be produced by irradiation of thorium-230. Purification is carried out by ion-exchange and solvent-extraction techniques. The longest lived isotope, Pa-231, decays by α -emission and has a half-life of 33,000 years. Protactinium may be precipitated as the double potassium fluoride, K_2PaF_7 , or the oxide, Pa_2O_5 . The metal may be prepared by reducing PaF_5 with barium or by heating PaI_3 in a vacuum. It is hard and white, melting near 1600C. It is too rare for commercial use. Forms several compounds with halogens. **Hazard:** Highly toxic, radioactive material.

protamines. Simplest proteins, without sulfur, molecular weights about 3000.

Properties: Water soluble, producing basic solutions.

protease. A proteolytic enzyme that weakens or breaks the peptide linkages in proteins. They include some of the more widely known enzymes such as pepsin, trypsin, ficin, bromelin, papain, and rennin. Being water soluble they solubilize proteins and are commercially used for meat tenderizers, bread baking, and digestive aids.

protective coating. A film or thin layer of metal glass or paint applied to a substrate primarily to inhibit corrosion, and secondarily for decorative purposes. Metals such as nickel, chromium, copper, and tin are electrodeposited on the base metal; paints may be sprayed or brushed on. Vitreous enamel coatings are also used; that require baking. Zinc coatings are applied by a continuous bath process in which a strip of ferrous metal is passed through molten zinc.

See galvanizing; terne plate; electroplating; paint; corrosion; cladding.

protective colloid. See colloid, protective.

protein. A complex, high polymer containing carbon, hydrogen, oxygen, nitrogen, and usually sulfur, and composed of chains of amino acids connected by peptide linkages ($-CO\bullet NH-$). Proteins occur in the cells of all living organisms and in biological fluids (blood plasma, protoplasm). They are synthesized by plants largely through the nitrogen-fixing ability of certain soil bacteria. Their molecular weight may be as high as 40 million (tobacco mosaic virus). They have many important functional forms: enzymes, hemoglobin, hormones, viruses, genes, antibodies, and nucleic acids. They also serve

as the basic component of connective tissue (collagen), hair (keratin), nails, feathers, skin, etc. Some have been synthesized in the lab.

The sequence of amino acids; in the polypeptide chain is of critical importance in genetics. Proteins can be hydrolyzed to their constituent amino acids and can be broken down into simpler forms by proteolytic enzymes. They form colloidal solutions, and behave chemically as both acids and bases simultaneously (amphoteric). They are denatured by changes in pH, and by heat, UV radiation, and many organic solvents.

Simple proteins contain only amino acids, conjugated proteins contain amino acids plus nucleic acids, carbohydrates, lipids, etc. On the basis of solubility, they can be classified as albumins (water soluble), globulins (insoluble in water but soluble in aqueous salt solutions), and prolamins (soluble in alcohol-water mixture but not in alcohol or water alone). A number of proteins have been synthesized, notably the hormone insulin. Proteins are an essential component of the diet, occurring chiefly in meat, eggs, milk, and fish. Edible proteins suitable for human food as well as cattle feed can be produced from microorganisms grown in carbonaceous or nitrogenous media to form yeastlike materials. Paraffinic hydrocarbons (methane) and petroleum-derived ethanol can be used as growth media for protein biosynthesis.

Industrial applications of proteins include plastics, adhesives, and fibers derived from casein and soybean protein, but these have been declining in recent years. Special forms in which proteins are commercially available include textured proteins for food products, and protein hydrolyzate and liquid predigested protein, both for medical use. See ribonuclease; deoxyribonucleic acid; nutrition; amino acid; protein, textured; protein, single-cell; polypeptide.

protein hydrolyzate. Solution of protein hydrolyzed into its constituent amino acids.

Grade: USP.

Use: Medicine and surgery. Usually administered by a stomach tube or intravenous injection.

protein kinases. Enzymes that phosphorylate certain amino acid residues (most often Ser, Thr, or Tyr) in specific proteins.

protein, single-cell. (SCP). A protein nutrient derived from bacteria or yeast by hydrocarbon fermentation or from fungi by fermentation on food-plant waste. A process developed in West Germany during the 1970s utilizes the bacterium *Methylobacterium clara* cultured in a mixture of methanol, ammonia, water, and air. The continuous fermentation process is followed by dewatering and spray drying. The product contains 70% protein, 10% nucleic acids, 8% fats, and 7% minerals; in this form it is suitable for animal feeds. A purified type (90% protein) is made by dissolving the product in an ammo-

nia-methanol mixture, followed by filtration to remove the fats, and then water-washing to extract the nucleic acids. The product may prove to be satisfactory for use in human foods. The presence of nucleic acids is undesirable, because they may lead to metabolic disorders such as gout. Commercial production awaits further testing.

protein, spun. See protein, textured.

protein targeting. The process by which newly synthesized proteins are sorted and transported to their proper locations in the cell.

protein, textured. A meat extender or substitute made from defatted soybean flour or similar protein, usually by an extrusion process. Some types are used to fortify cereals and other food products. The filaments produced by extrusion are designed to simulate the fibrous structure (texture) of meats. The term *spinning* is also used, and the products are often called spun proteins.

“Protek-Sorb” [Grace]. TM for a group of silica gels.

proteoglycan. A hybrid macromolecule consisting of a larger heteropolysaccharide joined to a smaller polypeptide, i.e., the polysaccharide is the major component.

proteolysis. The structural breakdown of proteins, usually by hydrolysis, as a result of the action of an enzyme, e.g., trypsin, pepsin, papain, etc.

proteolytic enzyme. See subtilisin.

proteome. Proteins expressed by a cell or organ at a particular time and under specific conditions.

proteomics. The study of the full set of proteins encoded by a genome.

prothrombin. The precursor of the enzyme thrombin, a proteinaceous component of blood plasma that is converted into thrombin by the blood-clotting mechanism when activated at the site of an open wound.
See coagulation.

“Protina” [Aqualon]. TM for line of products for cleaning, inhibiting corrosion, and coating copper, brass, or bronze artwork and statuary.

protocatechuic aldehyde, methyl ether.
See vanillin.

“Protolin” [Rohm & Haas]. TM for reducing agents based on zinc sulfoxylate and zinc formaldehyde sulfoxylate. Supplied as water-soluble, white powder.

Use: Stripping colors from fabrics, chemical synthesis.

protolytic catalysis. Catalysis in which acids, bases, or both act as catalysts by undergoing protolytic reactions.

proton. A fundamental unit of matter having a positive charge and a mass number of 1, equivalent to 1.67×10^{-24} gram. Its mass is 1837 times that of the negatively charged electron, but is almost identical with that of the uncharged neutron. Protons are constituents of all atomic nuclei, their number in each nucleus being the atomic number of the element. An atom of normal hydrogen contains one proton and one electron. A proton is identical with a hydrogen ion (H^+).

proton acceptor. The acceptor of a proton in an acid-base reaction: a Brønsted-Lowry base.

proton donor. The donor of a proton in an acid-base reaction: a Brønsted acid.

proton-motive force. The electrochemical potential inherent in a transmembrane H^+ concentration gradient. The proton gradient is used in oxidative phosphorylation and photophosphorylation to drive ATP synthesis.

proto-oncogene. A gene of cellular or viral origin, usually encoding a regulatory protein, that can be converted into an oncogene by mutation.

“Protopet” [Crompton & Knowles]. TM for petrolatum of medium consistency and ranging in color from pure white to amber, but meeting USP or NF purity requirements for petrolatum.

protoplasm. The total contents of the living cell, including both nucleus and cytoplasm. Predominantly a mixture of proteins, protoplasm is the physical basis of life. Most of its components are in the colloidal size range. This term is falling into disuse among modern biochemists.
See cell (1).

protopolygonatoside g.

CAS: 62601-71-2.

Hazard: A poison.

Source: Natural product.

protoveratrine. A substance isolated from the *Veratrum album* plant. It is a mixture of two alkaloids, designated protoveratrine A and protoveratrine B.

Use: Medicine to lower blood pressure.

provitamin. The precursor of a vitamin. Examples are carotene and ergosterol, which upon activation become vitamin A and vitamin D, respectively. See specific compounds.

proxifeine.

CAS: 65497-24-7. mf: $C_{13}H_{21}N_3O_3 \cdot ClH$.

Hazard: Moderately toxic.

Prussian blue.

The most common and best-known name for blue iron ferrocyanide (iron blue) pigments made by a variety of procedures.

See iron blue.

prussic acid. See hydrocyanic acid.

Pschorr reaction.

Synthesis of phenanthrene derivatives from diazotized α -aryl-omicron-amino-cinnamic acids by intramolecular arylation.

pseudo-

A prefix indicating false, similar or closely related.

pseudobufarenogin.

CAS: 17008-69-4. mf: $C_{24}H_{32}O_6$.

Hazard: A poison.

Source: Natural product.

pseudobutylene glycol. See 2,3-butylene glycol.

pseudocumene. (1,2,4-trimethylbenzene; *uns*-trimethylbenzene).

CAS: 95-63-6. $C_6H_3(CH_3)_3$.

Properties: Liquid. Fp $-43.91C$, bp $168.89C$, d 0.8758 ($20/4C$), refr index 1.5045 ($20C$), flash p $130F$ ($54.4C$). Insoluble in water; soluble in alcohol, benzene, and ether.

Derivation: From C_9 fraction of refinery reformat streams by fractional distillation.

Grade: 95%, 99%, and research.

Hazard: Moderate fire risk. Central nervous system depressant, irritant to mucous membranes. TLV: 25 ppm.

Use: Manufacture of trimellitic anhydride, dyes, pharmaceuticals, and pseudocumidine.

pseudocumidine. (2,4,5-trimethylaniline; 1,2,4-trimethyl-5-aminobenzene).

CAS: 137-17-7. $C_6H_2(CH_3)_3NH_2$.

Properties: White crystals. D 0.957 , mp $62C$, bp $236C$. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: From pseudocumene.

Use: Manufacture of dyes, organic synthesis.

pseudoextinction. The apparent disappearance of a taxon. In cases of pseudoextinction, this disap-

pearance is not due to the death of all members but to the evolution of novel features in one or more lineages, so that the new clades are not recognized as belonging to the paraphyletic ancestral group whose members have ceased to exist.

pseudogene.

A sequence of DNA similar to a gene but nonfunctional; probably the remnant of a once functional gene that accumulated mutations.

pseudoheptyl alcohol. See 2-ethylbutyl alcohol.

pseudoionone. (6,10-dimethyl-3,5,9-undecatriene-2-one).

CAS: 141-10-6.

$(CH_3)_2C:CH(CH_2)_2C(CH_3):CHCH:CHCOCH_3$.

Properties: Pale-yellow liquid. D 0.8984 ($20C$), bp $143-145C$ (12 mm Hg). Soluble in alcohol and ether. Combustible.

Use: Perfumery, cosmetics.

pseudopodia. Fingerlike extensions from an amoeboid cell; literally "false feet."

psi. Abbreviation for pounds per square inch.

psia. Abbreviation for pounds per square inch absolute.

psicain. Acid tartrate of *d*-psi-cocaine.

Use: Same as cocaine hydrochloride.

psig. Abbreviation for pounds per square inch gauge.

psilocin.

CAS: 520-53-6. $C_8H_5N(OH)C_2H_4N(CH_3)_2$. An indole derivative. An alkaloid from certain mushrooms; a hallucinogenic drug.

psilocybin.

CAS: 520-52-5. $C_8H_5N(OPO_3H_2)C_2H_4N(CH_3)_2$. An indole derivative. An alkaloid from certain mushrooms; hallucinogenic drug.

psilomelane. $BaMn_9O_{16}(OH)_4$. A natural oxide of variable composition. Calcium, nickel, cobalt, and copper frequently are present. The name sometimes refers to mixture of manganese minerals.

Properties: Black color, brownish-black streak, submetallic luster. Hardness 5-6, d 3.7-4.7.

Occurrence: The former U.S.S.R., India, South Africa, Cuba, U.S. (Arkansas, Virginia, Georgia).

Use: Important ore of manganese.

psychotropic drug. Any of a number of therapeutic agents that affect the behavior, emotional state, or mental functioning of psychologically disturbed persons. They are widely known as *tranquilizers*, but this term is no longer accepted as clinically accurate, because the minor tranquilizers (benzodi-

azepine and glycerol derivatives) act quite differently from the major tranquilizers. For this reason the latter are now classified as antipsychotics and antidepressants, and the term *antianxiety agent* is applied to the minor tranquilizers. Antipsychotic agents include phenothiazines (chlorpromazine), thioxanthenes, and butyrophenones; antidepressant agents are of two major types, namely, monoamine oxidase (MAO) inhibitors and several tricyclic compounds; antianxiety agents are glycerol derivatives (meprobamate) and benzodiazepine derivatives, e.g., oxazepam.

Pt. Symbol for platinum.

PTA. Abbreviation for phosphotungstic acid; also for purified terephthalic acid.

pteroylglutamic acid. See folic acid.

PTFE. Abbreviation for polytetrafluoroethylene.

“PTFE” [TRI MER]. TM for a plastic tank material with excellent thermal and electrical insulation.

Use: Coating plastic tanks.

PTMA. Abbreviation for a mixture of phosphotungstic and phosphomolybdic acids.

Use: Making pigments.

See phosphotungstic pigment.

ptomaine. A group of highly toxic substances (derivatives of ethers of polyhydric alcohols) resulting from the putrefaction or metabolic decomposition of animal proteins. Examples that have been isolated and prepared synthetically are cadaverine (1,5-diaminopentane), muscarine (hydroxyethyltrimethylammonium hydroxide), putrescine (tetraethylenediamine), and neurine (trimethylvinylammonium hydroxide).

Note: The term *ptomaine poisoning* is usually a misnomer for other types of food poisoning.

PTSA. Abbreviation for *p*-toluenesulfonamide.

ptyalin. A salivary amylase that acts upon α -1,4-glycosidic linkages, converting starch to various dextrans and maltose. It can act over a pH range of 4.0–9.0; optimum pH 5.6–6.5. It requires the presence of certain negative ions for activation; chlorides and bromides are the most effective.

Use: Biochemical research.

ptychodiscus brevis toxin. See brevetoxin.

Pu. Symbol for plutonium.

pug mill. A comminuting or granulating machine whose essential components are a shaft equipped with blades or arms with alloy-hardened tips rotating in a troughlike compartment.

Use: Grinding and amalgamating fertilizer ingredients, clay mixtures, cement components, and similar products.

pulegium oil. See pennyroyal oil.

pulegone. (1-isopropylidene-4-methyl-2-cyclohexanone).

CAS: 89-82-7. C₁₀H₁₆O. A ketone found in pennyroyal and hedeoma oil. Combustible.

Properties: Oily liquid; pleasant odor. D 0.9323 (20C), bp 221C, dextrorotatory, refr index 1.4894 (20C). Insoluble in water; soluble in alcohol and ether.

Use: Chemical intermediate, flavoring.

“Pullulan.” A biodegradable polysaccharide made by yeast fermentation, originally developed in Japan. Its adhesive and oxygen impermeable properties enable it to be used to coat pharmaceutical products. It is water soluble, odorless, and edible; these properties have led to its use admixed with foodstuffs for special-purpose applications. The mixture can be processed into a semirigid plastic sheet or film that can serve as an emergency food source. FDA approval is pending.

pulp, paper. Processed cellulosic fibers derived from hardwoods, softwoods, and other plants. There are two major types of pulp: (1) Ground wood or mechanical pulp, which is merely finely divided wood without purification and is made into newsprint, cheap manila papers, and nonpermanent tissues. (2) Chemical pulp, of which there are three kinds: (a) soda process pulp obtained from the digestion of wood chips (mostly poplar) by caustic soda; (b) sulfite process pulp (mostly spruce and other coniferous woods), obtained by digestion with a solution of magnesium, ammonium, or calcium disulfite containing free sulfur dioxide; and (c) sulfate process (kraft) pulp, in which sodium sulfate is added to the caustic liquors but is reduced by the carbon present to the sulfide, which becomes a digesting agent. Sulfite and sulfate pulps (chiefly from softwoods) compose the bulk of paper pulps. Sulfate pulps are known as kraft pulps because of their strength (“Kraft” is the German word for strength), and are used for wrapping, packaging, container board, etc. A relatively new process called holopulping replaces sodium sulfate with oxidants. A synthetic pulp based on polyolefins (styrene copolymer fibers) has been developed to the production stage in Japan.

See holopulping; paper; digestion.

“Pulsar 1 System” [Arch]. TM for a shock system for swimming pools.

Use: Simplifies water balance; safer than bleach or chlorine.

pulsed field gel electrophoresis. (PFGE).

A gel technique which allows size-separation of

very large fragments of DNA, in the range of hundreds of kb to thousands of kb. As in other gel electrophoresis techniques, populations of molecules migrate through the gel at a speed related to their size, producing discrete bands. In normal electrophoresis, DNA fragments greater than a certain size limit all migrate at the same rate through the gel. In PFGE, the electrophoretic voltage is applied alternately along two perpendicular axes, which forces even the larger DNA fragments to separate by size.

pultrusion. A technique for making certain products from glass-reinforced plastics, such as rods, electrical insulators, etc. It involves passage of continuous bundles of glass fiber that have been impregnated with liquid resin through an oven at the rate of 18 inches per minute at 140C (285F).

pumice. A highly-porous igneous rock, usually containing 67–75% SiO₂ and 10–20% Al₂O₃, with a glassy texture. Potassium, sodium, and calcium are generally present. Insoluble in water, not attacked by acids.

Occurrence: USA (Arizona, Oregon, California, Hawaii, New Mexico), Italy, New Zealand, Greece.
Grade: Lump, powdered (coarse, medium, and fine); NF, technical.

Use: Concrete aggregate, heat and sound insulation, filtration, finishing glass and plastics, road construction, scouring preparations, paint fillers, absorbents, support for catalysts, dental abrasive, adherent for uncured rubber products, possible substitute for asbestos, polishing agent for pedicures.

Pummerer rearrangement. Rearrangement of sulfoxides to α -acyloxythioethers in the presence acyclic anhydrides.

pumpdown time. The time needed to produce a certain vacuum.

punty. A solid or hollow iron rod 4–6 ft long, usually with an insulation covering on one end.
Use: By glass workers to remove molten material from the melt preparatory to shaping finished articles.

pupa. In metamorphosing insects, a stage between the larva and adult during which the organism undergoes major developmental changes.

Purdie (Irvine-Purdie) methylation. Exhaustive methylation of a methyl glycoside by repeated treatment with methyl iodide and silver oxide, followed by hydrolysis of the pentamethyl ether with dilute acid to yield the anomeric hydroxyl group.

Purex process. See reprocessing.

purification. Removal of extraneous materials (impurities) from a substance or mixture by one or more separation techniques. A pure substance is one in which no impurity can be detected by any experimental procedure. Though absolute purity is impossible to attain, a number of standard procedures exist for approaching it to the extent of 1 ppm of impurity or less. The following fractionation techniques are widely used: crystallization, precipitation, distillation, adsorption (various types of chromatography), extraction, electrophoresis, and thermal diffusion. See purity, chemical.

“Purified Plus” [Burdick and Jackson].

CAS: 67-56-1. TM for purified methanol.

Use: For chromatography, pesticide, residue analysis, spectrophotometry, and semiconductor wafer processing.

“Purifloc” [Dow]. TM for a polyelectrolyte.

Use: To flocculate solids in water and industrial waste treatment.

“Purina Bloat Block” [Purina]. (poloxalene free-choice liquid type C feed.)

CAS: 9003-11-6. mf:

HO(CH₂CH₂O)_n[CH(CH₃)CH₂O]_n(CH₂CH₂O)_nH

Properties: Liquid nonionic surfactant polymer. TM for a bloat preventing veterinary drug.

Use: Drug; food additive.

purine. (1) (imidazo(4,5-d)pyrimidine).

CAS: 120-73-0.

Properties: Colorless crystals. Mp 217C. Soluble in water, alcohol, toluene.

Derivation: Prepared from uric acid and regarded as the parent substance for compounds of the uric groups, many of which occur naturally in animal waste products.

Use: Organic synthesis, metabolism, and biochemical research.

(2) One of a number of basic compounds found in living matter and having a purine-type molecular structure. See adenine; base pair; guanine; hypoxanthine; xanthine; uric acid; caffeine; theobromine.

purity, chemical. A substance is said to be pure when its physical and chemical properties coincide with those previously established and recorded in the literature, and when no change in these properties occurs after application of the most selective fractionation techniques. In other words, purity exists when no impurity can be detected by any experimental procedure. There are a number of recognized

standards of purity.
See grade.

puromycin. (USAN).

CAS: 53-79-2. $C_{22}H_{29}N_7O_5$. An antibiotic that inhibits protein synthesis, prevents transfer of an amino acid from its carrier to the growing protein. Produced by *Streptomyces alboniger*, effective against bacteria, protozoa, parasitic worms, and cancerous tumors.

Properties: Crystals. Mp 176C.

Hazard: Toxic to living cells of all kinds.

purple of Cassius. See gold-tin purple.

purpurin. (1,2,4-trihydroxyanthraquinone; CI 58205).

CAS: 81-54-9. $C_{14}H_5O_2(OH)_3$.

Properties: Reddish needles. Mp 256C. Slightly soluble in hot water; soluble in alcohol and ether.

Derivation: Occurs as a glucoside in madder root. Made synthetically by oxidation of alizarin.

Use: Dye for cotton, stain for microscopy, reagent for boron determination, manufacture of acid and chrome dyes.

purpurin red. See anthrapurpurin.

putty. A mixture of whiting (chalk) with 12–18% of linseed oil, with or without white lead or other pigment. Containers must be airtight.

Use: Sealant, glass setting, caulking agent.

putty powder. A soft abrasive composed of tin oxide.

PVA. Abbreviation for polyvinyl alcohol.

PVAc. Abbreviation for polyvinyl acetate.

PVB. Abbreviation for polyvinyl butyral.

PVC. (1) Abbreviation for polyvinyl chloride. (2) Abbreviation for pigment volume concentration, a term used in paint technology to mean pigment volume divided by the sum of the pigment volume and the vehicle solids volume, multiplied by 100.

PVC, chlorinated. See polyvinyl dichloride.

PVDC. See polyvinyl dichloride.

PVE. Abbreviation for polyvinyl ethyl ether.

PVI. Abbreviation for polyvinylisobutyl ether.

PVM. Abbreviation for polyvinyl methyl ether.

PVM/MA. See polyvinyl methyl ether/maleic anhydride.

PVOH. Abbreviation for polyvinyl alcohol.

PVP. Abbreviation for polyvinylpyrrolidone.

PVPP. See polyvinylpolypyrrolidone.

PVT. Abbreviation for pressure-volume-temperature.

Use: Chemical engineering.

py. An abbreviation for pyridine.

Use: As in formulas for coordination compounds. See dien; *en*; *pn*.

pymetrozine. See 4,5-dihydro-6-methyl-4-((3-pyridinyl)methylene)amino)-1,2,4.

pyranose. A simple sugar structurally analogous to the six-membered pyran ring.

“Pyratex” [Uniroyal]. TM for a vinyl pyridine latex.

Properties: Total solids 40–42%, pH 10.4–11.5, d 0.96.

Use: To promote adhesion between rayon or nylon fibers and rubber, as in tire cord, belting, hose, etc.

pyrazine hexahydride. See piperazine.

pyrazole.

CAS: 288-13-1.

Properties: Off-white, crystalline solid; pyridine odor. Mp 68–70C, bp 186–188C. Soluble in water and alcohol.

Hazard: Toxic by ingestion and inhalation, irritant to skin and eyes.

Use: Chemical intermediate, stabilizer for halogenated solvents and lubricating oils.

pyrazoline.

Properties: Bp 144C.

Use: Organic synthesis.

pyrazolone dye. A dye whose molecules contain both the —N=N— and the =C=C= chromophore groups in their structure. These are acid dyes most used for silk and wool and to some extent for lakes. Tartrazine (CI 19140) is an important member of this group.
See dye.

“Pyre-ML” [Du Pont]. TM for polyimide coated fabrics and laminates.

Use: Class H electrical insulating materials.

pyrene.

CAS: 129-00-0. $C_{16}H_{10}$. A condensed ring hydrocarbon.

Properties: Colorless solid (tetracene impurities

give a yellow color), solutions have a slight blue fluorescence. Mp 156C, d 1.271 (23C), bp 404C. Insoluble in water; partially soluble in organic solvents.

Derivation: From coal tar.

Hazard: A carcinogen, absorbed by skin.

Use: Biochemical research.

pyrethrin I.

CAS: 8003-34-7. $C_{21}H_{28}O_5$. Pyrethrolone ester of chrysanthemummonocarboxylic acid. Most potent insecticidal ingredient of pyrethrum flowers.

Properties: Viscous liquid. Oxidizes readily in air. Insoluble in water; soluble in other common solvents. Incompatible with alkalis.

Hazard: Toxic by ingestion and inhalation.

Use: Household insecticide (flies, mosquitoes, garden insects, etc.), treatment of paper bags for shipping cereals, etc.

See cinerin I; cinerin II; pyrethrin II.

pyrethrin II. $C_{22}H_{28}O_5$. Pyrethrolone ester of chrysanthemumdicarboxylic acid. One of the four primary active insecticidal ingredients of pyrethrum flowers.

Properties: Similar to those of pyrethrin I.

See pyrethrin I; cinerin I; cinerin II.

pyrethroid.

CAS: 8003-34-7. Any of a group of insect growth regulators that act as neurotoxins, analogous to juvenile hormones, restricting the development of insect larvae. Thus they are especially effective against insects that are destructive in the adult stage. They are considered nontoxic to animals and humans. See juvenile hormone.

pyrethrum.

CAS: 8003-34-7.

Properties: Viscous liquid. Bp 170° (0.1 mm) decomposes. A natural insecticide obtained by extraction of chrysanthemum flowers native to Kenya, Ecuador, and Japan. The solvent used is a hydrocarbon of the kerosene type. Pyrethrum is also made synthetically. Not compatible with alkaline material. The chief constituents are pyrethrins I and II and cinerins I and II. These compounds are nonvolatile and very slightly soluble in water.

Hazard: Toxic by ingestion and inhalation. TLV: 5 mg/m³; not classifiable as a human carcinogen.

Use: Household insecticide (flies, mosquitoes, garden insects, etc.).

See allethrin.

“Pyrex Glass Brand No. 7740” [Corning].

TM for a borosilicate glass.

Properties: Linear coefficient of expansion 32×10^{-7} in/C, elasticity coefficient 6.230 kg/sq mm, hardness (scleroscope) 120, d 2.25, specific heat 0.20, refr index 1.474 dispersion 0.00738, light and heat transmission higher than the best plate glass, dielectric constant 4.5 (25C), upper working tem-

perature (mechanical considerations only): annealed, extreme limit 490C, normal service 230C, thermal stress resistance 53C, impact abrasion resistance 3.1, softening temperature 820C.

Use: Laboratory and pharmaceutical glassware and apparatus, electrochemical equipment, fiber manufacture, domestic ovenware apparatus, and equipment for many processes.

pyridine.

CAS: 110-86-1. $N(CH)_4CH$.

Properties: Slightly yellow or colorless liquid; nauseating odor; burning taste. Slightly alkaline in reaction. Soluble in water, alcohol, ether, benzene, ligroin, and fatty oils. D 0.987, fp -42.0C, bp 115.5C, flash p 68F (20C) (CC), autoign temp 900F (482C).

Derivation: (1) By coal carbonization and recovery both from coke-oven gases and the coal tar middle oil; (2) also synthetically from acetaldehyde and ammonia.

Grade: Technical, as 20C, 2C, etc., (meaning distillation range), medicinal, CP, spectrophotometric.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.8–12.4% Toxic by ingestion and inhalation. TLV: 5 ppm.

Use: Synthesis of vitamins and drugs, solvent water-proofing, rubber chemicals, denaturant for alcohol and antifreeze mixtures, dyeing assistant in textiles, fungicides.

2-pyridine aldoxime methiodide. (2-PAM).

CAS: 94-63-3. $C_5NH_2CHNOH \cdot ICH_3$.

Use: Antidote for cholinesterase-inhibiting pesticides of the parathion type because of its property of reactivating the cholinesterase by removal of phosphoryl groups. Also antidote for nerve gases.

pyridine-3-carboxylic acid. See niacin.

3-pyridine diazonium fluoborate. Intermediate in manufacture of 3-fluoropyridine.

Properties: Explodes when dry.

2,3-pyridinedicarboxylic acid. See quinolinic acid.

2,5-pyridinedicarboxylic acid. See isocinchomeric acid.

pyridine nucleotide. A nucleotide coenzyme containing the pyridine derivative nicotinamide: NAD(H) or NADP(H).

pyridine-*N*-oxide. (pyridine-1-oxide).

CAS: 694-59-7. C_5H_5NO .

Properties: Fp 67.0C. Soluble in water.

Hazard: Probably flammable and toxic.

Use: Intermediate.

pyridine polymer. A polymer or copolymer of methylvinylpyridine and vinylpyridine.

Use: Corrosion inhibitors and as intermediates for coatings and printing inks.

2-pyridinethiol-1-oxide. See 1-hydroxy-2-pyridine thione.

pyridinium bromide perbromide. (PBPB). $C_5H_6NBr \cdot Br_2$.

Properties: Red, prismatic crystals. Mp 135–137C (decomposes) with preliminary softening. The salt is stable in the dry state and can be used in glacial acetic acid, ethanol and related solvents. This compound has 45–50% available bromine.

Use: Brominating phenols and addition to double bonds; mono- and polybromination of ketones, including aliphatic, alicyclic, steroid, and amino carbonyls. Micro or semimicro quantitative analysis.

C3-pyridinylcarbonimidodithioic acid, *o*-(3,4-dimethylcyclohexyl) *s*-((4-(1,1-dimethylethyl) phenyl)methyl) ester.

CAS: 42754-20-1. mf: $C_{25}H_{34}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (2-chlorophenyl)methyl (2,4-dichlorophenyl)methyl ester.

CAS: 34763-31-0. mf: $C_{20}H_{15}Cl_3N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *o*-cyclohexyl *s*-((4-(1,1-dimethylethyl) phenyl)methyl) ester.

CAS: 42754-16-5. mf: $C_{23}H_{30}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *o*-cyclopentyl *s*-((4-(1,1-dimethylethyl) phenyl)methyl) ester.

CAS: 42754-15-4. mf: $C_{22}H_{28}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *o*-(2,5-dimethylcyclohexyl) *s*-((4-(1,1-dimethylethyl) phenyl)methyl) ester.

CAS: 42754-19-8. mf: $C_{25}H_{34}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *o*-(3,5-dimethylcyclohexyl) *s*-((4-(1,1-

dimethylethyl) phenyl)methyl) ester.

CAS: 42754-21-2. mf: $C_{25}H_{34}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, 1,1-dimethylethyl (4-(1,1-dimethylethyl) phenyl)methyl ester.

CAS: 51308-57-7. mf: $C_{21}H_{28}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (4-(1,1-dimethylethyl)phenyl)methyl 1-methylethyl ester.

CAS: 34763-49-0. mf: $C_{20}H_{26}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (4-(1,1-dimethylethyl)phenyl)methyl 1-methylpropyl ester.

CAS: 51308-56-6. mf: $C_{21}H_{28}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (4-(1,1-dimethylethyl)phenyl)methyl 2-methylpropyl ester.

CAS: 51308-55-5. mf: $C_{21}H_{28}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (4-(1,1-dimethylethyl)phenyl)methyl 1,1-dimethylpropyl ester.

CAS: 51379-05-6. mf: $C_{22}H_{30}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, (4-(1,1-dimethylethyl)phenyl)methyl 1-ethyl-1-methylpropyl ester.

CAS: 51308-59-9. mf: $C_{23}H_{32}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *s*-((4-(1,1-dimethylethyl)phenyl)methyl)-*o*-(1,2-dimethylpropyl) ester.

CAS: 51308-69-1. mf: $C_{22}H_{30}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidodithioic acid, *s*-((4-(1,1-dimethylethyl)phenyl)methyl)-*o*-(1-methylbutyl) ester.

CAS: 51308-68-0. mf: $C_{22}H_{30}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(3-methylbutyl) ester.

CAS: 51308-70-4. mf: C₂₂H₃₀N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(2-methylcyclohexyl) ester.

CAS: 42754-17-6. mf: C₂₄H₃₂N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(4-methylcyclohexyl) ester.

CAS: 42754-18-7. mf: C₂₄H₃₂N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(3-methylcyclohexyl) ester.

CAS: 42723-79-5. mf: C₂₄H₃₂N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(1-methylpropyl) ester.

CAS: 51308-66-8. mf: C₂₁H₂₈N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(2-methylpropyl) ester.

CAS: 51308-65-7. mf: C₂₁H₂₈N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridinylcarbonimidothioic acid, s-((4-(1,1-dimethylethyl)phenyl)methyl)-o-(3,3,5-trimethylcyclohexyl) ester.

CAS: 42754-22-3. mf: C₂₆H₃₆N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

pyridoxal hydrochloride.

CAS: 58-56-0. C₈H₉NO₃•HCl. An aldehyde derivative of pyridoxine, with vitamin B₆ activity.

Properties: Rhombic crystals. Mp 165C (decomposes). Soluble in water and 95% ethanol.

Use: Nutrition.

pyridoxal phosphate. (2-methyl-3-hydroxy-4-formyl-5-pyridylmethylphosphoric acid).

CAS: 54-47-7. CH₃C₅HN(OH)(CHO)CH₂PO₄H₂.

The coenzyme of amino acid metabolism that also is the active group of various decarboxylases and other types of enzymes. It is closely related to pyridoxine.

Derivation: Synthesized (1) through the action of adenosine triphosphate, or phosphorus oxychloride, on pyridoxal, and (2) by phosphorylation of pyridoxamine followed by oxidation with 100% H₃PO₄.

Use: Nutrition, biochemical research.

pyridoxine. (vitamin B₆; 3-hydroxy-4,5-dimethylol-2-methylpyridine).

CH₃C₅HN(OH)(CH₂OH)₂.

A group name designating the naturally occurring pyridine derivatives having vitamin B₆ activity. Essential for the dehydration and desulfhydration of amino acids and for the normal metabolism of tryptophan; appears to be related to fat metabolism. Pyridoxine is required in the nutrition of all species of animals.

Source: (Food) Vegetable fats, whole grain cereals, legumes, yeast, muscle meats, liver and fish. (Commercial) Synthetic pyridoxine, pyridoxal, and pyridoxamine are produced by a complex series of reactions from isoquinoline. Amounts are expressed in micrograms.

Use: Medicine, nutrition (available as pyridoxine hydrochloride).

pyridoxine tripalmitate.

CAS: 4372-46-7. mf: C₅₆H₁₀₁NO₆.

Hazard: Moderately toxic.

α-pyridylamine. See 2-aminopyridine.

β-pyridylamine. See 3-aminopyridine.

n-3-pyridyl-o-butyl-s-3,4-dichlorobenzyl imidothiocarbonate.

CAS: 34763-54-7. mf: C₁₇H₁₈Cl₂N₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-pyridylcarbinol. (3-pyridine methanol).

C₅H₄NCH₂OH.

Properties: Colorless liquid. Bp 266C, fp -6.5C, d 1.131 g/ml (20C), refr index 1.5455 (20C). Miscible with water at 20C; hygroscopic. Combustible.

Use: Intermediate.

pyrimidine. One of a group of basic compounds found in living matter. They may be isolated following complete hydrolysis of nucleic acids. They include uracil, thymine, cytosine, and methylcytosine. Thiamine is also a pyrimidine derivative. Other pyrimidines such as alloxan and thiouracil are important in medicine and biochemical research.

See: base pair; purine.

pyrimidine dimer. A covalently joined dimer of two adjacent pyrimidine residues in DNA, induced by absorption of UV light, usually derived from two adjacent thymines (a thymine dimer).

pyrimithate. $C_{11}H_{20}N_3O_3PS$. A diethyl ester of phosphoric acid.

Properties: Colorless liquid. D 1.16. Soluble in acetone, alcohol, and benzene; almost insoluble in water.

Hazard: Cholinesterase inhibitor.

Use: Acaricide, insecticide.

pyrite. (iron pyrite; fool's gold).

CAS: 12068-85-8. FeS_2 . Often mixed with small amounts of copper, arsenic, nickel, cobalt, gold, selenium.

Properties: Brass-yellow or brown, tarnished mineral, greenish or brownish-black streak, metallic luster. D 4.9–5.2, hardness 6–6.5.

Use: Manufacture of sulfur, sulfuric acid and sulfur dioxide, ferrous sulfate, cheap jewelry, recovery of metals.

See ferrous sulfide.

pyrite, magnetic. See pyrrhotite.

pyrithiamine. (neopyrithiamine).

$C_{14}H_{20}Br_2N_4O$. A thiamine antagonist.

Properties: Crystallizes from acetone. Mp 219C (decomposes). Soluble in water.

Derivation: Synthetically from the condensation of 2-methyl-3-(β -hydroxyethyl)pyridine with the pyrimidine moiety of thiamine.

Use: Biochemical research.

pyro- A prefix indicating formation by heat, specifically, an inorganic acid derived by loss of one molecule of water from two molecules of an orthoacid as pyrophosphoric acid.

pyroboric acid. (tetraboric acid). $H_2B_4P_7$. Vitreous or white powder, soluble in water and in alcohol.

“Pyrobrite” [ATOTECH]. TM for a bright-leveling, pyrophosphate copper electroplating process. The materials used are copper pyrophosphate trihydrate, potassium pyrophosphate, ammonium hydroxide, and addition agents.

pyrocatechol. (1,2-benzenediol; *o*-dihydroxybenzene; catechol).

CAS: 120-80-9. $C_6H_4(OH)_2$.

Properties: Colorless crystals, discolors to brown on exposure to air and light, especially when moist. D 1.371, mp 104C, bp 245C, sublimes, flash p 261 (127C) (CC). Soluble in water, alcohol, ether, benzene, and chloroform, also in pyridine and aqueous alkaline solutions. Combustible.

Derivation: (1) By fusion of *o*-phenolsulfonic acid

with caustic potash at 350C; (2) by heating guaiacol with hydriodic acid.

Grade: Technical, CP, resublimed.

Hazard: Strong irritant. TLV: 5 ppm; animal carcinogen. Toxic by skin absorption.

Use: Antiseptic, photography, dyestuffs, electroplating, specialty inks, antioxidants and light stabilizers, organic synthesis.

pyrocatechol dimethyl ether. See veratrole.

pyrocatechol methyl ester. See guaiacol.

pyrocellulose See guncotton.

“Pyroceram” Brand 9608 [Corning]. TM for a crystalline ceramic material made from glass by controlled nucleation.

Properties: Hard, brittle solid. D 2.5, softening temperature 1250C, specific heat 0.19 (25C), dielectric constant 6.54 (25C), flexural strength 14,000–23,000 psi, Knoop hardness 703 (100g).

Use: Telescope mirrors, special-purpose ceramic products, domestic dinnerware.

“Pyroceram” Brand Cement [Corning].

TM for powdered glasses that are thermosetting and utilized for sealing inorganic materials. The resultant seals are crystalline and have service temperatures in excess of the sealing temperatures.

pyrochlore. $NaCaNb_2O_6F$.

Properties: A complex oxide of sodium, calcium, and niobium. Tantalum, rare-earth metals, and other elements may be present. Color brown to black, light brown streak. Hardness 5–5.5, d 4.2–6.4.

Occurrence: Canada (Quebec), Brazil, Africa.

Use: Ore of niobium.

pyrochroite. See manganous hydroxide.

pyrogallol. (pyrogallic acid; 1,2,3-trihydroxybenzene).

CAS: 87-66-1. $C_6H_3(OH)_3$.

Properties: White, lustrous crystals; turn gray on exposure to light. D 1.463, mp 132.5, bp 309C. Soluble in water, alcohol, and ether. A solution of pyrogallol acquires a brown color on exposure to air. This absorption of oxygen and change of color take place rapidly when the solution is made alkaline.

Derivation: By heating gallic acid with three times its weight of water in an autoclave.

Hazard: Toxic by ingestion and skin absorption.

Use: Protective colloid in preparation of metallic colloidal solutions, photography, dyes, intermediates, synthetic drugs, medicine (antibacterial), process engraving, laboratory reagent, gas analysis (an oxygen absorber), reducing agent, antioxidant in lubricating oils.

pyrolan. (1-phenyl-3-methyl-5-pyrazolyl dimethylcarbamate).

CAS: 87-47-8. $C_{13}H_{15}N_3O_2$.

Properties: Crystalline solid. Mp 50C. Soluble in water and fats.

Hazard: Toxic by ingestion. Cholinesterase inhibitor.

Use: Insecticide.

pyroigneous acid. (wood vinegar; pyroigneous liquor).

Properties: Crude, yellow to red liquid. A mixture of materials from wood distillation. Crude product contains methanol, acetic acid, acetone, furfural, and various tars and related products. D 1.018–1.030. Miscible with water and alcohol.

Use: Smoking meats.

pyrolusite. (manganese dioxide, black).

MnO_2 .

Properties: Iron-black to dark steel-gray or bluish mineral; black or bluish-black streak; metallic or dull luster. D 4.73–4.86, Mohs hardness 2–2.5. Soluble in hydrochloric acid.

Occurrence: U.S. (Virginia, Georgia, Arkansas, Lake Superior region, Massachusetts, Vermont, New Mexico), Germany, Australia, India, Canada.

Use: Manganese ore. For many uses the ore and synthetic material are interchangeable, but pyrolusite is not usable for batteries.

See manganese dioxide.

pyrolysis. Transformation of a compound into one or more other substances by heat alone, i.e., without oxidation. It is thus similar to destructive distillation. Though the term implies decomposition into smaller fragments, pyrolytic change may also involve isomerization and formation of higher molecular weight compounds. Hydrocarbons are subject to pyrolysis, e.g., formation of carbon black and hydrogen from methane at 1300C and decomposition of gaseous alkanes at 500–600C. The latter is the basis of thermal cracking (pyrolysis gasoline). One application of pyrolysis is conversion of acetone into ketenes by decomposition at about 700C; the reaction is $CH_3COCH_3 \rightarrow H_2C=C=O + CH_4$. Pyrolysis of natural gas or methane at about 2000C and 100 mm Hg pressure produces a unique form of graphite. Synthetic crude oil can be made by pyrolysis of coal, followed by hydrogenation of the resulting tar. Large-scale pyrolysis of cellulosic wastes is being conducted for production of synthetic fuel oils and other products; the method is said to require only 30 minutes at about 537C (flash pyrolysis). See destructive distillation.

pyrolysis gasoline. See gasoline.

pyromellitic acid. (PMA; 1,2,4,5-benzenetetracarboxylic acid).

CAS: 89-05-4. $C_6H_2(COOH)_4$.

Properties: White powder. D 1.79, mp 257–265C,

bp (converts to dianhydride), bulk d 32 lb/cu ft. Absorbs moisture slowly if exposed to atmosphere. Soluble in alcohol, slightly soluble in water.

Grade: 99% purity.

Hazard: Skin irritant, may be carcinogenic.

Use: Intermediate for polyesters and polyamides used in electrical and nonfogging plasticizers, lubricants, and waxes.

pyromellitic dianhydride. (PMDA).

$C_6H_2(C_2O_3)_2$.

Properties: White powder. D 1.68, mp 286C, bp 397–400C, 305–310C (30 mm Hg) bulk d 21 lb/cu ft. Soluble in some organic solvents; hydrolyzes to the acid when exposed to moisture.

Derivation: Oxidation of durene, either in wet process by nitric acid or a dichromate, or as direct air oxidation with catalyst.

Grade: 98+% purity.

Hazard: Skin irritant.

Use: Curing agent for epoxy resins used in high-temperature laminates, molds, and coatings; cross-linking agent for epoxy plasticizers in vinyls, alkyd resins; intermediate for pyromellitic acid.

pyrometer. An instrument for measuring temperatures of 1800C or higher, for example, molten steels, hot springs, volcanoes, etc. There are three kinds: (1) thermocouples of the graphite to silicon carbide type; (2) optical, in which the indications depend on the brightness at some one wavelength of the hot body whose temperature is being measured; and (3) radiation, in which the indications depend on the radiance of a source of radiant energy. See thermocouple.

pyrometric cone. (Seeger cone). A small pyramid composed of a mixture of oxides that melt at known temperatures.

Use: To measure temperatures in autoclaves, curing ovens, etc., in the 100–3700F range.

pyromucamide. See furoamide.

pyromucic acid. See furoic acid.

pyromucic aldehyde. See furfural.

pyrophoric material. Any liquid or solid that will ignite spontaneously in air at about 130F (54.4C). Titanium dichloride and phosphorus are examples of pyrophoric solids, tributylaluminum and related compounds are pyrophoric liquids. Sodi-

um, butyllithium, and lithium hydride are spontaneously flammable in moist air because as they react exothermically with water. Such materials must be stored in an atmosphere of inert gas or under kerosene. Some alloys (barium, misch metal) are called pyrophoric because they spark when slight friction is applied.

Hazard: Dangerous fire risk near combustible materials.

Use: As tips on pocket lighters and similar devices.

pyrophosphatase. An inorganic pyrophosphatase.

pyrophosphoric acid. (diphosphoric acid).

Properties: A viscous, syrupy liquid that tends to solidify on long standing at room temperature. When diluted with water it is rapidly converted into orthophosphoric acid. Mp 54C. Soluble in water.

Derivation: By heating phosphoric acid at 250–260C. Further heating produces metaphosphoric acid.

Grade: Technical.

Use: Catalyst, manufacture of organic phosphate esters, metal treatment, stabilizer for organic peroxides.

See polyphosphoric acid.

pyrophyllite. (agalmatolite). $\text{Al}_2\text{Si}_4\text{O}_{10}(\text{OH})$. A natural hydrous aluminum silicate, found in metamorphic rocks.

Properties: White, green, gray, brown color; pearly to greasy luster, good micaceous cleavage. D 2.8–2.9, Mohs hardness 1–2. Similar to talc.

Occurrence: North Carolina, California, Newfoundland, Japan.

Use: Ceramics, insecticides, slate pencils, substitute for talc, extender in paints, wallboard, buffer in high-pressure equipment, permissible animal feed additive.

pyroracemic acid. See pyruvic acid.

pyrosulfuric acid. See sulfuric acid, fuming.

pyrosulfuryl chloride. (disulfuryl chloride).

Properties: Colorless, mobile, very refractive, fuming liquid. D 1.819, bp 146C, fp –38C, refr index 1.449 (19C).

Hazard: Decomposes violently with water to sulfuric acid and hydrochloric acid. Corrosive to tissue.

Use: Organic synthesis.

pyrotartaric acid. (methylsuccinic acid).

Properties: White or yellowish crystals. D 1.4105, mp 111–112C. Soluble in water, alcohol, and ether.

Derivation: By distilling tartaric acid.

Use: Organic synthesis.

pyrotartaric acid, normal. See glutaric acid.

pyrotechnics. The formulation and manufacture of fireworks, signal flares and military warning devices. The industry is professionally represented by the Pyrotechnic Guild International, Inc. The primary ingredients of pyrotechnic products are as follows: (1) Oxidizers: potassium nitrate, potassium chlorate, or potassium perchlorate; ammonium perchlorate; barium chlorate and nitrate; and strontium nitrate. (2) Fuels: aluminum, magnesium, antimony sulfate, dextrin, sulfur, and titanium. (3) Binders: dextrin and various polymers. Colored flames are produced by strontium compounds (red); barium compounds (green); copper carbonate, sulfate, and oxide (blue); sodium oxalate and cryolite (yellow); and magnesium, titanium, or aluminum (white). Black powder is used as propellant.

See chemiluminescence.

pyrovanadic acid. See vanadic acid.

“Pyrovatex” CP [Novartis]. TM for a fiber-reactive phosphone alkyl amide.

Properties: Odorless, nontoxic, nonirritating, stable to laundering and dry-cleaning. Reduces tear and tensile strengths, no effect on “hand.” Compatible with other finishing and proofing agents and pre-cured durable-press processes. From 25 to 35% by weight is required; imparts self-extinguishing properties to cotton.

Use: Flame-retardance of 100% cotton fabrics, such as those used for tenting, military uniforms, and draperies.

pyroxylin. See nitrocellulose.

pyrrhotite. (magnetic pyrites; pyrrhotine).

FeS. A natural iron sulfide. Frequently has a deficiency in iron. May contain small amounts of nickel, cobalt, manganese, and copper.

Properties: Brownish-bronze color, black streak, metallic luster. Slightly magnetic. Hardness 4. D 4.6.

Occurrence: Tennessee, Pennsylvania, Europe, Canada.

Use: Ore of iron, manufacture of sulfuric acid.

pyrrobutamine phosphate. (1-[4(*p*-chlorophenyl)-3-phenyl-2-butenyl]pyrrolidine diphosphate).

Properties: Cream to off-white powder; slight odor; bitter taste. Melting range 127–131C. Soluble in water; slightly soluble in alcohol; almost insoluble in chloroform and ether.

Grade: NF.

Use: Medicine (antihistamine).

pyrrole.

CAS: 109-97-7. Pyrrole is regarded as a resonance

hybrid and no one structure adequately represents it. The following is an approximation:

Properties: Yellowish or brown oil; burning, pungent taste; odor similar to chloroform. Readily polymerizes by the action of light and turns brown. Bp 130–131C, fp –24C, d 0.968 (20/4C), refr index 1.5091 (20C), flash p 102F (38.9C) (TCC). Soluble in alcohol, ether, dilute acids, and most organic chemicals; insoluble in water and dilute alkalis. Combustible.

Derivation: Fractional distillation of bone oil with sulfuric acid.

Method of purification: Conversion into the potassium compound (C₄H₄NK), washing with ether, and treatment with water, followed by drying and distillation.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Use: Manufacture of pharmaceuticals.

pyrrole-2,5-dione. See maleimide.

pyrrolidine.

CAS: 123-75-1. C₄H₉N.

Properties: Colorless to pale-yellow liquid; penetrating aminelike odor. D 0.8660 (20/20C), fp –60C, bp 87C, refr index 1.4425 (20C), flash p 37F (2.7C) (TCC). Soluble in water and alcohol.

Grade: 95% min purity.

Use: Intermediate for pharmaceuticals, fungicides, insecticides, rubber accelerators, citrus decay control, curing agent for epoxy resins, inhibitor.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion and inhalation.

2-pyrrolidinecarboxylic acid. See proline.

***l*-2-pyrrolidinecarboxylic acid.** See *l*-proline.

1-pyrrolidineethanol.

CAS: 2955-88-6. mf: C₆H₁₃NO.

Hazard: A reproductive hazard.

2-pyrrolidone. (2-pyrrolidinone; butyrolactam).

CAS: 616-45-5.

CH₂CH₂CH₂C(O)NH.

Properties: Light-yellow liquid. D 1.1, bp 245C, flash p 265F (129C). Soluble in water, ethanol, ethyl ether, chloroform, benzene, ethyl acetate, carbon disulfide. Noncorrosive. Combustible.

See polyvinylpyrrolidone.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Use: Plasticizer and coalescing agent for acrylic latexes in floor polishes, solvent for polymers, insecticides, polyhydroxylic alcohols, sugar, iodine, specialty inks, monomer for nylon-4.

pyrrone. An aromatic heterocyclic polymer derived from a cyclic dianhydride and an aromatic *o*-tetramine or a derivative. Stable to 482C.

Use: Films, coatings, adhesives, laminates, and moldings.

pyruvaldehyde. See pyruvic aldehyde.

pyruvic acid. (α-ketopropionic acid; acetylformic acid; pyroracemic acid).

CAS: 127-17-3. CH₃COCOOH. A fundamental intermediate in protein and carbohydrate metabolism in the cell.

Properties: Liquid; odor resembling acetic acid. D 1.2272 (20/4C), mp 13.6C, bp 165C. Miscible with water, ether, and alcohol.

Derivation: Dehydration of tartaric acid by distilling with potassium acid sulfate.

Use: Biochemical research.

pyruvic alcohol. See hydroxy-2-propanone.

pyruvic aldehyde. (pyruvaldehyde; methyl glyoxal). CH₃COHCO.

Properties: Supplied commercially as a 30% aqueous solution. D 1.20 (20/20C), bulk d 10 lb/gal (20C).

Use: Organic synthesis, as of complex chemical compounds such as pyrethrins, tanning leather, flavoring.

Q

“Qiana” [Du Pont]. TM for a nylon-type synthetic fiber with properties similar to silk.

Q-lure. See cue-lure.

quad. An energy unit that has come into use in recent years in predicting future energy requirements on a national basis. One quad equals 10^{15} Btu, which is the energy equivalent of 10^{12} cu ft natural gas, or 182 million barrels of oil, or 42 million tons of coal, or 293 billion kilowatt-hours of electricity.

quadruple point. The temperature at which four phases are in equilibrium, such as ice, saturated salt solution, water vapor, and salt.

quadrupole resonance. See nuclear quadrupole resonance.

qualitative analysis. See analytical chemistry.

quantitative analysis. See analytical chemistry.

quantization of energy. The assumption that the energy of a particle is not infinitely variable but can have any one of a definite set of values.

quantum dot. (Qdots). Nanometer sized semiconductor particles, made of cadmium selenide (CdSe), cadmium sulfide (CdS), or cadmium telluride (CdTe) with an inert polymer coating..

quantum efficiency. (photochemical yield). The number of electrons actually ejected per quantum of light absorbed.

quantum jump. See quantum transition.

quantum mechanics. Quantum mechanics describes a system of particles in terms of a wave function defined over the configuration space of the system. Although the concept of particles having distinct locations is implicit in the potential energy function that determines the wave function (e.g., of a ground-state system), the observable dynamics of the system cannot be described in terms of the motion of such particles from point to point. In describing the energies, distributions, and behaviors of electrons in nanometer-scale structures, quantum mechanical methods are necessary. Electron wave functions help determine the potential energy surface of a molecular system, which in turn is the basis for classical descriptions of molecular motion.

quantum number. The quantum is the basic unit of electromagnetic energy. It characterizes the wave properties of electrons, as distinct from their particulate properties. The quantum theory developed by Max Planck states that the energy associated with any quantum is proportional to the frequency of the radiation, that is e (energy) = $h!GKu$, where $!GKu$ is the frequency and h is a universal constant.

An electron has four quantum numbers that define its properties. These are as follows: (1) The principal quantum number is a constant that can be any positive integer ($n = 1, 2, 3 \dots$). It determines the principal energy level, or shell, of the electron, sometimes designated by letters such as K, L, or M, depending on the value of the principal quantum number. (2) The angular momentum constant l , also an integer, is related to n as $l = 0, 1, \dots, n-1$. Here again, letter designations are often used. In s electrons, $l = 0$; in p electrons, $l = 1$; in d electrons, $l = 2$; and in f electrons, $l = 3$. (3) The magnetic quantum number, m , is an integer related to l as: $m = -1, \dots, -1, 0, +1, \dots, +l$. (4) The spin quantum number is independent of the other three and has a value of either $+1/2$ or $-1/2$, depending on the direction of rotation of the electron on its axis in the atomic frame of reference. See orbital theory; electron; photon; radiation; Pauli exclusion principle.

quantum number, azimuthal. The quantum number specifying the angular momentum of an orbital electron.

quantum number, magnetic. The determinant of the component of angular momentum vector of an atomic electron or group of electrons along the externally applied magnetic field.

quantum number, radial. The radial motion quantum number that is an integer for any permitted stationary condition of a particle moving under the influence of a central field.

quantum state. (energy level). The energy state of an atom as determined by the frequencies of its characteristic spectral lines.

quantum transition. (quantum jump). The sharp change in an atom accompanied by emission or absorption of a quantum of radiant energy.

quantum yield. Number of photon-induced reactions of a specified type per photon absorbed.

quark. The smallest known bit of matter. Hypothetical entities carrying electrical charges of one-

third or two-thirds the normal unit. Light (300 MeV) hypothetical particles used to facilitate calculation of certain observables.

quartz.

CAS: 14808-60-7. SiO₂. Crystallized silicon dioxide (silica).

Properties: White to reddish color, luster vitreous. Mp 1713C, Mohs hardness 7, d 2.65. Insoluble in acids except hydrogen fluoride; only slightly attacked by solutions of caustic alkali. Piezoelectric and pyroelectric. Noncombustible.

Derivation: Synthetic crystals of good size and purity are grown by mass production methods under very carefully regulated conditions of temperature and concentration.

Hazard: Avoid inhalation of fine particles. TLV: (for respirable dust) 0.1 mg/m³.

Use: Electronic components; piezoelectric control in filters, oscillators, frequency standards, wave filters, radio and TV components; barrel-finishing abrasive.

See silica.

quartz, fused. Pure silica that has been melted to yield a glasslike material on cooling.

Use: For apparatus and equipment (such as vacuum tubes) where its high melting point, ability to withstand large and rapid temperature changes, chemical inertness and transparency (including UV radiation), and electrical resistance are valuable. Produced as fibers and fabrics for heat resistance, low expansion coefficient, and insulating value.

See glass.

quassia. (bitter ash; bitterwood).

Properties: White to bright-yellow chips or shavings; very bitter taste.

Derivation: The wood or bark of *Picrasma excelsa* or *Quassia amara*.

Use: Decoction or tincture as a fly poison, surrogate for hops, medicine (anthelmintic), hair lotion, flavoring, alcohol denaturant.

quaternary ammonium salt. A type of organic nitrogen compound in which the molecular structure includes a central nitrogen atom joined to four organic groups (the cation) and a negatively charged acid radical (the anion). The structure is indicated as:

Octadecyldimethylbenzyl ammonium chloride and hexamethonium chloride are examples. Pentavalent nitrogen ring compounds, such as lauryl pyridinium chloride, are also considered quaternary ammonium compounds. They are all cationic, surface-active

coordination compounds and tend to be adsorbed on surfaces.

Use: Disinfectant, cleanser and sterilizer, cosmetics (deodorants, dandruff removers, emulsion stabilizers), fungicides, mildew control, to increase affinity of dyes for film in photography, coating of pigment particles to improve dispersibility, to increase adhesion of road dressings and paints, antistatic additive, biocide.

See detergent, synthetic; coordination compound.

p-quaterphenyl. C₆H₅C₆H₄C₆H₄C₆H₅.

Properties: Crystals. Mp 316–318C, bp 428C (18 mm Hg).

Grade: Purified.

Use: As primary fluor or as wavelength shifter in soluble scintillators.

quebrachine. See yohimbine.

quebracho.

Properties: A wood-derived tannin, the most important tanning agent used in the American leather industry. Combustible.

Derivation: From *Aspidosperma quebracho* and *Quebracho lorentzi*, imported as logs from Argentina.

Grade: Liquid: 35–37% tannin. Solid: 65% tannin.

Use: Vegetable tanning, retanning of chrome-tanned upper leathers, dyeing, ore flotation, oil-well drilling fluids, flavoring.

Quelet reaction. Passage of dry hydrogen chloride through a solution in ligroin of a phenolic ether and an aliphatic aldehyde in the presence or absence of a dehydration catalyst to yield α-chloroalkyl derivatives by substitution in the *para* position to the ether group or in the *ortho* position in *para*-substituted phenolic ethers.

quench. In the terminology of metallurgy, quick cooling of metals or alloys by immersion in cold water or oil. This is an essential part of the tempering process, especially for steels. If the metal or alloy is in the liquid (molten) state and the quench time is extremely short (less than a second), the product will have an amorphous or glasslike structure, because no crystallization occurs.

See glass, metallic.

quercetin.

CAS: 117-39-5. C₁₅H₁₀O₇.

Properties: Yellow needles (dihydrate). Anhydrous form decomposes at 315C. Soluble in alcohol and glacial acetic acid; insoluble in water.

Derivation: Bark of fir trees, also synthetically.

Use: Medicine, reported formation of epoxy resins on mixing with epichlorohydrin.

quetiapine fumarate.

CAS: 111974-72-2. mf: C₄₂H₅₀N₆O₄S₂•C₄H₄O₄.

Hazard: Human systemic effects.

quick- Prefix meaning alive or active, as in quicksilver (mercury), quicklime (unslaked lime), quicksand, quick (the flesh beneath the fingernail).

“Quick-Dry Citrus Solvent” [Kinzua].

TM for a citrus based solvent.

Use: To replace VOC compounds in industrial products.

quicklime. See calcium oxide.

quicksilver. See mercury.

“Quilon” [Du Pont]. TM for a Werner-type chromium complex in isopropanol, 30% solution of stearatochromic chloride.

Use: Water repellent and sizing treatment of cellulosic materials, treatment of negatively charged surfaces, antiblocking agent, for insolubilizing various water-soluble or swellable coatings, improving grease-resistant coatings, treatment of feathers.

quinacridone. A lightfast pigment used in paints, printing inks, plastics, etc.

quinacridone magnet. See 2,9-dimethylquinacridone.

quinacrine dihydrochloride. (3-chloro-7-methoxy-9-(1-methyl-4-diethylamino-butylamino)acridine dihydrochloride).

CAS: 69-05-6. $C_{23}H_{30}ClN_3O \cdot 2HCl \cdot 2H_2O$.

Properties: Bright yellow, crystalline powder; odorless; bitter taste. Decomposes at 248–250C. Soluble in hot water; pH of 1% water solution 4.5.

Derivation: Organic synthesis.

Grade: USP.

Use: Drug.

quinaldine. (chinaldine; α -methylquinoline).

CAS: 91-63-4. $C_9H_9NCH_3$.

Properties: Colorless, oily liquid; odor of quinoline; darkens to reddish brown in air. Bp 246–247C, mp –2C, d 1.51. Soluble in alcohol, ether, and chloroform; insoluble in water.

Derivation: (1) By the treatment of aniline and paraldehyde with hydrochloric acid and heat; (2) from coal tar.

Hazard: Strong irritant to mucous membranes.

Use: Manufacture of dyes, pharmaceuticals, fine organic chemicals, acid-base indicators.

quinaphthol. (quinine- β -naphthol α -sulfonate). $C_{20}H_{24}N_2O_2 \cdot (OHC_{10}H_6 \cdot SO_3H)_2$.

Properties: Yellow crystalline powder, contains 42% quinine; bitter taste. Mp 185–186C. Moderately soluble in hot water or alcohol; insoluble in cold water.

Derivation: Interaction of quinine and β -naphthol-sulfonic acid.

Use: Medicine.

quinhydrone.

CAS: 106-34-3. $C_6H_4O_2 \cdot C_6H_4(OH)_2$.

Properties: Dark green crystals. Mp 171C, d 1.40. Slightly soluble in water; soluble in alcohol, ether, hot water, ammonia.

Derivation: Oxidation of hydroquinone with sodium dichromate.

Grade: Reagent, technical.

Hazard: Toxic by ingestion.

Use: Electrode for pH determination.

quinine.

CAS: 130-95-0. $C_{20}H_{24}N_2O_2 \cdot 3H_2O$. An alkaloid.

Properties: Bulky, white, amorphous powder or crystalline alkaloid; very bitter taste; odorless. Levorotatory. Soluble in alcohol, ether, chloroform, carbon disulfide, glycerol, alkalies, and acids (with formation of salts); very slightly soluble in water.

Derivation: Finely ground cinchona bark mixed with lime is extracted with hot, high-boiling paraffin oil. The solution is filtered, shaken with dilute sulfuric acid, and the latter neutralized while still hot with sodium carbonate; on cooling, quinine sulfate crystallizes out. The sulfate is then treated with ammonia, the alkaloid being obtained.

Source: Indonesia, Bolivia.

Hazard: Skin irritant, ingestion of pure substance adversely affects eyes.

Use: Medicine (antimalarial) as the alkaloid or as numerous salts and derivatives; flavoring in carbonated beverages.

quinine acid sulfate. See quinine.

quinine bisulfate. See quinine.

quinizarin. (1,4-dihydroxyanthraquinone; CI 58050). $C_{14}H_8O_2(OH)_2$.

Properties: Red or yellow-red crystals. Mp 194–195C. Soluble in hot water, alcohol, ether, benzene, potassium chloride, and sulfuric acid.

Use: Antioxidant in synthetic lubricants, dyes.

quinol. See hydroquinone.

quinoline. (chinoline).

CAS: 91-22-5. C_9H_7N . A basic heterocyclic nitrogenous compound occurring in coal tar and obtained from it, but more frequently by synthesis.

Properties: Highly refractive, colorless liquid; darkens with age; hygroscopic; peculiar odor. D 1.0899, fp -15°C , bp 238°C , autoign temp 896°F (480°C). Soluble in water, alcohol, ether, and carbon disulfide. Combustible.

Derivation: By treatment of aniline and nitrobenzene with glycerol and sulfuric acid and heat.

Use: Preserving anatomical specimens; manufacture of quinolinol sulfate; niacin and copper-8-quinolinolate; flavoring.

quinoline dye. See cyanine dye.

quinolinic acid.

CAS: 89-00-9. mf: $\text{C}_7\text{H}_5\text{NO}_4$.

Hazard: A poison by skin contact. Moderately toxic by ingestion. A mild skin irritant.

8-quinolinol. See 8-hydroxyquinoline.

(8-quinolinolato)tributylstannane. See tributyl(8-quinolinolato)tin.

quinomethionate. $\text{C}_{10}\text{H}_6\text{N}_2\text{OS}_2$.

Properties: Tan to yellow crystals. Mp 170°C . Soluble in benzene, toluene, and dioxane; insoluble in water.

Use: Fungicide, acaricide.

quinone. (1,4-benzoquinone; chinone).

CAS: 106-51-4. $\text{C}_6\text{H}_4\text{O}_2$.

Properties: Yellow crystals; irritant odor. D 1.307, mp 115.7°C , bp sublimes. Soluble in alcohol, ether, and alkalis; slightly soluble in hot water. Volatile with steam, being in part decomposed. Combustible.

Derivation: By oxidation of aniline with chromic acid, extraction with ether and distillation.

Hazard: Toxic by inhalation, strong irritant to skin and mucous membranes. TLV: 0.1 ppm.

Use: Manufacture of dyes and hydroquinone, fungi-

cides, analytical reagent, photography, oxidizing agent.

p-quinonedioxime. See "GMF."

quinone oxime dye. See nitroso dye.

quinoxaline. (1,4-benzodiazine; benzo-*p*-diazine). $\text{C}_8\text{H}_6\text{N}_2$ (bicyclic). An organic base.

Properties: Colorless, crystalline powder. Mp 30°C , bp 229°C . Soluble in water and organic solvents.

Use: Organic synthesis.

quinoxalinedithiol cyclic trithiocarbonate.

See thioquinox.

(2,3-quinoxalinyldithio)dimethyltin.

CAS: 73927-90-9. mf: $\text{C}_{10}\text{H}_{10}\text{N}_2\text{S}_2\text{Sn}$.

Hazard: A poison. TWA $0.1\text{ mg}(\text{Sn})/\text{m}^3$; STEL $0.2\text{ mg}/\text{m}^3$ (skin)

(2,3-quinoxalinyldithio)diphenyltin.

CAS: 73927-96-5. mf: $\text{C}_{20}\text{H}_{14}\text{N}_2\text{S}_2\text{Sn}$.

Hazard: A poison. TWA $0.1\text{ mg}(\text{Sn})/\text{m}^3$; STEL $0.2\text{ mg}(\text{Sn})/\text{m}^3$ (skin).

quinoxidine.

CAS: 10103-89-6. mf: $\text{C}_{14}\text{H}_{14}\text{N}_2\text{O}_6$.

Hazard: Moderately toxic by ingestion.

quinsol. $\text{C}_9\text{H}_6\text{NOSO}_3\text{K}\cdot\text{H}_2\text{O}$. Yellow, crystalline powder. Combustible.

Use: Fungicide.

quintozene. See pentachloronitrobenzene

quinuclidine.

CAS: 100-76-5. mf: $\text{C}_7\text{H}_{13}\text{N}$.

Hazard: A poison by ingestion and skin contact. Low toxicity by inhalation. A moderate skin and severe eye irritant.

"Quotane" [Glaxo-SmithKline]. TM for an ointment and lotion containing dimethisoquin hydrochloride.

R

R. (1) Symbol used to represent an organic group in a chemical formula, for example CH_3 , C_2H_5 , C_6H_5 , etc. (2) A free radical (\bullet , R Code: \bullet). (3) The gas constant, equal to $p_0 v_0 / 273\text{C}$. (4) Abbreviation of Rankine temperature scale.

Ra. Symbol for radium.

R-acid. (2-naphthol-3,6-disulfonic acid; β -naphtholdisulfonic acid).

Properties: Deliquescent, colorless needles. Soluble in water, alcohol, and ether.

Derivation: Sulfonation of β -naphthol. For details see Schaeffer acid.

Use: Azo dye intermediate. The disodium salt is used as a reagent in detection of nitrogen dioxide in the air.

2R acid. See RR acid.

racemate. (1) The mixture of two optically active components that neutralize the optical effect of each other. (2) Salt of racemic acid.

racemic mixture. A mixture of the D and L stereoisomers of an optically active compound.

racemic substance. A mixture of dextro- and levorotatory optically active isomers in equal amounts, the resulting mixture having no rotary power. These mixtures are prefixed by \bar{n} or *dl*-. See *dl*-.

racemization. Conversion, by heat or by chemical reaction (e.g., enolization) of an optically active compound into an optically inactive form in which half of the optically active substance becomes its mirror image (enantiomer). This change results in a mixture of equal quantities of dextro- and levorotatory isomers, as a result of which the compound does not rotate plane-polarized light to either right or left since the two opposite rotations cancel each other. This is sometimes referred to as external compensation, as opposed to the internal compensation exhibited by *meso*-compounds.

See *meso*-(1); tartaric acid.

racemomycin E.

CAS: 3484-68-2. mf: $\text{C}_{43}\text{H}_{82}\text{N}_{16}\text{O}_{12}$.

Hazard: A poison.

Source: Natural product.

racephedrine. (racemic ephedrine; *dl*-ephedrine). $\text{C}_{10}\text{H}_{15}\text{NO}$.

Properties: Crystals. Mp 79C. Soluble in water, alcohol, chloroform, and oils.

Derivation: Synthetic.

Use: Medicine (also as hydrochloride and sulfate). See ephedrine.

racking. Experimental cold-stretching of unvulcanized rubber, whose behavior under stress is unique among natural materials. A thin, narrow strip stretched at, for example, 500–600% at 0C will retain that extension indefinitely after release of stress as long as the low temperature persists. In this state it loses its elasticity and has virtually 100% permanent set. It also displays a crystalline X-ray pattern similar to that of a fiber, in contrast to the amorphous structure of the unstretched state. On exposure to room temperature it slowly retracts to its original length; higher temperature increases its rate of recovery. Tests made on racked rubber have shown that crude rubber can be exposed to any degree of low temperature for any length of time without impairment of its properties.

rad. That quantity of ionizing radiation that results in the absorption of 100 ergs of energy per gram of irradiated material, regardless of the source of the radiation. The federal radiation safety standard is 0.5 rem per person per year for nonoccupational exposure, and even this is considered too high by some authorities. Occupational exposure is set at 5 rem per year.

See rem.

radiation. Energy in the form of electromagnetic waves (also called radiant energy, or light). It is emitted from matter in the form of photons (quanta), each with an associated electromagnetic wave having frequency (ν) and wavelength (λ). The various forms of radiant energy are characterized by their wavelength, and together they compose the electromagnetic spectrum, the components of which are as follows: (1) cosmic rays (highest energy, shortest wavelength), (2) γ -rays from radioactive disintegration of atomic nuclei, (3) X-rays, (4) UV rays, (5) visible light rays, (6) infrared, (7) microwave, and (8) radio (Hertzian) and electric rays. All these are identical in every way except wavelength, those having the shortest wavelength being the most penetrating. They are not electrically charged and have no mass, their velocity of propagation is the same, all display the properties characteristic of light and have a dual nature (wave-like and corpuscular). In a

looser sense the term *radiation* also includes energy emitted in the form of particles that possess mass and may or may not be electrically charged, (i.e., α [positive] and β [negative]) and also neutrons. Beams of such particles may be considered as "rays." The charged particles may all be accelerated and the high energy imparted to "beams" in particle accelerators such as cyclotrons, betatrons, synchrotrons, and linear accelerators.

Radiation is used in medicine in the form of X-rays and radioactive isotopes; it is used in industry in many ways, e.g., as vitamin activator, sterilizing agent, and polymerization initiator; it is also the basis of all types of spectroscopic analysis.

radiation biochemistry. The study of substances having the ability to protect cells and body tissue against the deleterious effects of ionizing radiation. Because one of these effects is to deprive proteins of sulfhydryl (-SH) groups necessary for cell division, the injection of compounds rich in this radical (notably cysteine) has been successfully tried with laboratory animals. Thiourea has been found to protect DNA from depolymerization by X-rays; enzymes containing -SH groups inactivated by radiation are reactivated by addition of glutathione. Some of the other radiochemically induced reactions that adversely affect biochemical activity are (1) formation of hydrogen peroxide (a biological poison) by free radical mechanism; (2) denaturation of proteins; (3) change in substituent groups of amino acids; (4) oxidation of hemoglobin; (5) depolymerization of DNA.

See radiation, ionizing.

radiation curing. See radiation, industrial (6).

radiation, industrial. Chemical or physicochemical changes induced by exposure to various types and intensities of radiation. (1) Synthesis of ethyl bromide from hydrogen bromide and ethylene, using α -radiation from cobalt-60. (2) Cross-linking of such polymers as polystyrene and polyethylene with either β - or γ -radiation. (3) Vulcanization of rubber with ionizing radiation. (4) Polymerization of methyl methacrylate monomer with cobalt-60 as source of γ -rays. Free radical formation is involved in both cross-linking and polymerization reactions. This technique is also being applied in the textile finishing field for grafting and cross-linking fibers with chemical agents for durable-press fabrics. (5) Processing of various foods (cooking, drying, pasteurizing, etc.) by electromagnetic energy in the microwave region of the spectrum; preservation and sterilization of food products by ionizing radiation (γ - and X-rays). The dosage of radiation is strictly controlled, and FDA approval is required. Irradiation is also effective in inhibiting sprouting and preventing insect infestation of stored grains. (6) Curing or hardening of organic protective coatings (paints, inks) by exposure to infrared, UV, or elec-

tron-beam radiation. Required are a monomer or oligomer and a photoinitiator, which induces polymerization by free radical formation.

See "Electrocure."

radiation, ionizing. Extremely short-wavelength, highly energetic, penetrating rays of the following types: (1) γ -rays emitted by radioactive elements and isotopes (decay of atomic nuclei); (2) X-rays generated by sudden stoppage of fast-moving electrons; (3) subatomic charged particles (electrons, protons, deuterons) when accelerated in a cyclotron or betatron. The term is restricted to electromagnetic radiation at least as energetic as X-rays, and to charged particles of similar energies. Neutrons also may induce ionization.

Such radiation is strong enough to remove electrons from any atoms in its path, leading to the formation of free radicals. These short-lived but highly reactive particles initiate decomposition of many organic compounds. Thus ionizing radiation can cause mutations in DNA and in cell nuclei; adversely affect protein and amino acid mechanisms; impair or destroy body tissue; and attack bone marrow, the source of red blood cells. Exposure to ionizing radiation for even a short period is highly dangerous, and for an extended period may be lethal. The study of the chemical effects of such radiation is called radiation chemistry or (in the case of body reactions) radiation biochemistry. See radiation, industrial.

radiation hybrid. A hybrid cell containing small fragments of irradiated human chromosomes. Maps of irradiation sites on chromosomes for the human, rat, mouse, and other genomes provide important markers, allowing the construction of very precise STS maps indispensable to studying multifactorial diseases.

See sequence tagged site.

radical. (1) An ionic group having one or more charges, either positive or negative, e.g., OH^- , NH_4^+ , SO_4^{2-} .
(2) See free radical; group (2).

radioactive isotope. See radioisotope.

radioactive waste. Disposal of waste containing radioisotopes and of spent nuclear reactor fuel presents a serious problem for which there is as yet no completely satisfactory solution. Such wastes may remain radioactive for thousands of years and can constitute a long-term hazard that is restraining the development of nuclear-generated electric power. Safe disposal techniques are being intensively studied. Ocean dumping, practiced some years ago, is no longer permissible. Small amounts of low-level wastes containing radioisotopes can be diluted sufficiently with an inert material to reduce its activity to an acceptable point. High-level reactor wastes, for example, at Hanford, are stored in concrete tanks

lined with steel and buried under a foot of concrete and 5 or 6 ft of soil. Containers of compressed alumina (corundum) have been recommended, as this material remains impervious to water indefinitely. Storage in the form of calcine (granular solid) and in borosilicate glass is a promising possibility under active investigation. The DOE has recommended disposal in deep geologic formations, although the heat generated by the radioactivity could cause fracturing of the surrounding rock structures; this would admit water that would eventually rise to the surface after being contaminated. A test program involving storage in basalt is being conducted by DOE. Storage in salt formations is under serious consideration because they are self-sealing and free from water.

See waste control.

radioactivity. Natural or artificial nuclear transformation; discovered by Becquerel in 1895. The energy of the process is emitted in the form of α -, β -, or γ -rays. Thus radium-226 undergoes radioactive decay by the emission of an α -particle, and the new product is radon-222. The decay series terminates in lead-206. Radioactivity is not affected by the physical state or chemical combination of the element. The radioactivity of a nuclide is characterized by the nature of the radiations, their energy, and the half-life of the process, i.e., the time required for the activity to decrease to one-half of the original. Half-lives vary from microseconds to millions of years. Some radioactive elements occur in nature (radium, uranium). Radioactivity can be caused artificially in many stable elements by irradiation with neutrons in a nuclear reactor, or by charged particles from an accelerator.

Amounts of radioactive material are usually expressed in units of activity, the rate of radioactive decay. The accepted unit is the curie (Ci) and its metric multiples and fractions, the mega, kilo, milli-, and microcurie. A curie is 3.73×10^{10} disintegrations per sec. A common unit is millicurie per millimole. Packaging and shipment of radioactive materials, which are highly toxic, must be in accord with official requirements. Consult IATA and DOT shipping regulations for labeling and other instructions.

See rad; rem.

radiocarbon. See carbon-14; chemical dating.

radiochemistry. The subdivision of chemistry that deals with the properties and uses of radioactive materials in industry, biology, and medicine, including tracer research and radioactive waste disposal. See nuclear chemistry.

radiogenic. Refers to a material produced by radioactive decay. An example is the production of lead from uranium decay.

radioimmunoassay. A sensitive and quantitative method for detecting trace amounts of a biomol-

ecule, based on its capacity to displace a radioactive form of the molecule from combination with its specific antibody.

radioisotope. (radionuclide). An isotopic form of an element (either natural or artificial) that exhibits radioactivity. Radioisotopes are used as diagnostic and therapeutic agents in medicine, in biological tracer studies, and for many industrial purposes, from measurement of thickness to initiating polymerization. Artificial radioisotopes are made by neutron bombardment of stable isotopes in a nuclear reactor.

See tracer; isotope.

radium. Ra. Radioactive element of group IIA of the periodic table, atomic number 88, aw 226.0254, valence = 2. There are 14 radioactive isotopes but only radium-226 with half-life of 1620 years is usable. Discovered by the Curies in 1898.

Properties: Brilliant-white solid. Mp 700C, bp 1140C, d 5. Luminescent, turns black on exposure to air. Soluble in water with evolution of hydrogen; forms water-soluble compounds. Decays by emission of α -, β -, and γ -radiation. Bone-seeking when taken into the body.

Occurrence: Colorado, Canada, Zaire, France, the former U.S.S.R..

Derivation: Uranium ores (pitchblende and carnotite). The method used for isolating radium is similar to that developed by Mme. Curie and involves coprecipitation with barium and lead, chemical separation with hydrochloric acid, and further purification by repeated fractional crystallization. The metal is separated from its salts by electrolysis and subsequent distillation in hydrogen. Dry salts are stored in sealed glass tubes, opened regularly by experienced workers to relieve pressure. The tubes are kept in lead containers.

Hazard: Highly toxic, emits ionizing radiation. Lead shielding should be used in storage and handling, adequate protective clothing and remote control devices are essential. Destructive to living tissue.

Use: Medical treatment for malignant growths, industrial radiography, source of neutrons and radon.

radium bromide. RaBr₂.

Properties: White crystals, becoming yellow or pink, radioactive. D 5.79, mp 728C, sublimes at 900C. Soluble in water and alcohol.

Derivation: Freed from the ores as a bromide mixed with barium bromide.

Method of purification: Fractional crystallization.

Impurities: Barium salts.

Grade: Technical, pure. The purity is determined by the strength of the ionizing power of the salt, i.e., the extent to which it causes air to conduct electricity.

Hazard: As for radium.

Use: Medicine (cancer treatment), physical research.

radium carbonate. RaCO₃.

Properties: Amorphous radioactive powder; white

when pure, but sometimes yellow, orange, or pink due to impurities. Insoluble in water.

Available forms: Mixture with barium carbonate.

Hazard: As for radium.

radium chloride. RaCl_2 .

Properties: Yellowish-white crystals becoming yellow or pink on standing. Radioactive. Mp 1000C, d 4.91. Soluble in water and alcohol.

Derivation: Freed from the ores as a chloride mixed with barium chloride.

Method of purification: Fractional crystallization.

Grade: Technical, pure. The purity of radium salts is determined by the strength of their ionizing power, i.e., the extent to which they cause air to conduct electricity.

Hazard: As for radium.

Use: Medicine (cancer treatment), physical research.

radium sulfate. RaSO_4 .

Properties: White crystals when pure, but sometimes yellow, orange, or pink due to impurities. Radioactive. Insoluble in acids and water.

Hazard: As for radium.

radon.

CAS: 10043-92-2. Rn. Gaseous radioactive element. Atomic number 86; noble gas group of periodic table; aw 222; valences = 2, 4, (6); 18 radioactive isotopes, all short-lived. The radon-222 isotope has a half-life of 3.8 days, emits α -radiation.

Properties: Colorless gas. D 9.72 g/L (0C). Soluble in water. Can be condensed to a colorless, transparent liquid (bp -61.8C) and to an opaque, glowing solid. The heaviest gas known.

Derivation: Radioactive decay of radium. Radon is obtained by bubbling air through a radon salt solution and collecting the gas plus air.

Hazard: As for radium.

Use: Medicine (cancer treatment), tracer in leak detection, flow-rate measurement, radiography, chemical research.

raffinate. The portion of an oil that is not dissolved in solvent refining of lubricating oil.

raffinose.

CAS: 512-69-6. $\text{C}_{18}\text{H}_{32}\text{O}_{16} \cdot 5\text{H}_2\text{O}$. A trisaccharide composed of one molecule each of D(+)-galactose, D(+)-glucose, and D(-)-fructose.

Properties: White, crystalline powder; sweet taste. D 1.465, mp (anhydrous) 118–119C, bp decomposes at about 130C, optical rotation +104.5 degrees. Soluble in water; very slightly soluble in alcohol. Split by invertase to melibiose and saccharose. Combustible.

Derivation: Hydrolysis of cottonseed meal, from sugar beet concentrates.

Use: Bacteriology, preparation of other saccharides.

rainfall, induced. See nucleation.

Raman spectroscopy. An analytical technique discovered in 1928 by C. V. Raman, an Indian physicist who received the Nobel Prize in Physics.

See spectroscopy; photometric analysis.

Ramberg-Backlund reaction. Reaction of α -halo sulfones with strong bases to yield alkenes.

ramie. A natural fiber obtained from the stems of *Boehmeria nivea*, of the hemp family. High wet strength, absorbent but dries quickly, can be spun or woven. Wears well and has great rot and mildew resistance, tensile strength four times that of flax, elasticity 50% greater than flax.

Source: Taiwan, Egypt, Brazil, Florida.

Hazard: Combustible, not self-extinguishing.

Use: High-grade paper (Europe), fabrics (weaving apparel and car seat covers), stern-tube packing in ships, patching water mains (Great Britain).

“Ramrod” [Solutia]. TM for selective pre-emergence herbicide available as a wettable powder (contains 65% 2-chloro-*N*-isopropylacetanilide) and granular form (contains 20% 2-chloro-*N*-isopropylacetanilide).

Ramsay, Sir William. (1852–1916). A British chemist born in Scotland who received the Nobel Prize for chemistry in 1904. He participated in the discovery of helium, argon, neon, xenon, and krypton. Much of his work concerned investigations of inert gases. He was also known for studies in organic, physical, and inorganic chemistry. Ramsay was educated at the Universities of Glasgow, Heidelberg, and Tubingen, and was a Professor at the Universities of Bristol and London.

Ramsbottom coke test. A laboratory test for carbon residue in petroleum products.

random primed synthesis. If you have a DNA clone and you want to produce radioactive copies of it, one way is to denature it (separate the strands), then hybridize to that template a mixture of all possible 6-mer oligonucleotides. Those oligos will act as primers for the synthesis of labeled strands by DNA polymerase (in the presence of radiolabeled precursors).

Raney nickel.

Properties: Dark-gray powder or crystals, pyrophoric.

Derivation: By leaching the aluminum from an alloy of 50% aluminum–50% nickel with 25% caustic soda solution.

Hazard: Ignites spontaneous in air, store under alcohol or water, dangerous fire risk.

Use: Catalyst for hydrogenation.

ranitidine bismuth citrate.

CAS: 128345-62-0. mf: $\text{C}_{13}\text{H}_{22}\text{N}_4\text{O}_3\text{S} \cdot \text{C}_6\text{H}_5\text{BiO}_7$.

Hazard: A poison by ingestion.

Rankine. A scale of absolute temperature based on Fahrenheit degrees. Temperatures on the Rankine scale are 9/5 (or 1.8) times those on the Kelvin scale.

See absolute temperature.

Raoult's law. The vapor pressure of a substance in equilibrium with a solution containing the substance is equal to the product of the mole fraction of the substance in the solution and the vapor pressure of the pure substance at the temperature of the solution. The law is not applicable to most solutions, but is often approximately applicable to a mixture of closely similar substances, particularly the substance present in high concentration.

rapeseed. See canola.

rapeseed meal. The ground press-cake left from expression of rapeseed oil. Its major use is as an animal feed ingredient, but the presence of harmful glucosides, which may be goiter-inducing, limits its application for this purpose. Research efforts are being directed to removal of this constituent from meal produced in Canada. The meal also has some use as a fertilizer. If fed to animals, it should be blended with other feeds.

Properties: Pale yellow liquid. Sol in chloroform and ether.

rapeseed oil. A vegetable oil derived from rape by expression or solvent extraction; it is now produced chiefly in Canada. It is a viscous, brownish liquid, though when refined it is yellow. D 0.913–0.916, solidifies at 0C, flash p 325F (162C), autoign temp 836F (446C), subject to spontaneous heating. It is high in unsaturated acids, especially oleic, linoleic, and erucic.

Use: Edible oil for salad dressings, margarine, etc.; lubricant additive; substitute for soybean oil; soft soaps; blown oils.

“Rapi-Cure” [International Specialty].

TM for diluent for radiation curing.

rare earth. One of a group of 15 chemically related elements in group IIIB of the periodic table (lanthanide series). Their names and atomic numbers are as follows:

lanthanum	La	57
cerium	Ce	58
praseodymium	Pr	59
neodymium	Nd	60
promethium	Pm	61
samarium	Sm	62
europium	Eu	63
gadolinium	Gd	64
terbium	Tb	65
dysprosium	Dy	66
holmium	Ho	67
erbium	Er	68

thulium	Tm	69
ytterbium	Yb	70
lutetium	Lu	71

The elements 57–62 are known as the cerium subgroup, and 63–71 as the yttrium subgroup. Yttrium, atomic number 39, although not a rare-earth element, is found associated with the rare earths and is separated only with difficulty.

Source: Monazite, bastnasite, and related fluocarbonate minerals as well as minerals of the yttrium group. These ores contain varying percentages of rare-earth oxides, which are often loosely called rare earths. Rare earth elements also occur as fission products of uranium and plutonium.

Occurrence: (Monazite) India, Brazil, Florida, Carolinas, Australia, South Africa; (bastnasite) California.

See didymium.

rare-cutter enzyme. See restriction-enzyme cutting site.

rare gas. Any of the six gases composing the extreme right-hand group of the periodic table, namely helium, neon, argon, krypton, xenon, and radon. They are preferably called noble gases or (less accurately) inert gases. The first three have a valence of 0 and are truly inert, but the others can form compounds to a limited extent.

rare metal. A loose term for the less common metallic elements. They include the alkaline-earth metals (barium, calcium, and strontium), beryllium, bismuth, cadmium, cobalt, gallium, germanium, hafnium, indium, lithium, boron, silicon, manganese, molybdenum, rhenium, selenium, tantalum, niobium, tellurium, thallium, thorium, titanium, tungsten, uranium, vanadium, zirconium, and the rare earths.

“Rareox” [Grace]. TM for optical quality cerium oxide for high speed polishing.

Raschig phenol process. Commercial process for the production of phenol by the hydrolysis of chlorobenzene, produced by the chlorination of benzene with hydrochloric acid and air.

Raschig rings. Short sections of metal tubes.

Use: Packing in distillation towers.

See tower, distillation.

Rast method. The melting-point depression method often used for the determination of the molecular weight of organic compounds.

rate-limiting step. The slowest step in a metabolic pathway.

Raticate. TM for 5-(α -hydroxy- α -2-pyridylbenzyl)-7-(α)-2-pyridylbenzylidene-5-norbornene-2,3-

dicarboximide. A rodenticide specific for rats, supposedly nontoxic to other animals or to humans (U.S. Dept. of Agriculture).

rauwolfia. The powdered whole root of *Rauwolfia serpentina*, found in India and Indonesia. The plant is of value as a source of alkaloids, especially reserpine.

Properties: Light-tan to light-brown, bitter, fine, amorphous powder; slight aromatic odor. Sparingly soluble in alcohol; very slightly soluble in water.

Grade: NF.

Use: Medicine (antihypertensive agent).

raw material. (1) The basic material from which one or more useful products are derived, e.g., bauxite is the raw material for aluminum, wood for paper, rayon, etc.; petroleum for fuels and chemicals. (2) As commonly used, the term refers to any ingredient or component of a mixture or product before mixing and processing take place, e.g., fillers, colorants, antioxidants, etc.

See storage (1).

“Raykrome” [Rayonier]. (lignin sulfonate).

TM for binding and dispersing emulsifiers.

Use: In concrete water reduction, oil-well drilling, dye dispersing, and road stabilization.

γ-ray. See gamma ray.

rayon. Generic name for a semisynthetic fiber composed of regenerated cellulose as well as manufactured fibers composed of regenerated cellulose in which substituents have replaced not more than 15% of the hydrogen of the hydroxyl groups. Rayon was first made by denitration of cellulose nitrate fibers (Chardonnet process), but most rayon is made from wood pulp by the viscose process. “Regular” viscose tenacity = 2 g/denier; “high-tenacity” = 3–6 g/denier (tire cord). Elongation 15–30% (dry) and 20–40% (wet). Swells and weakens when wet. Moisture regain 11–13%, d 1.50.

Modified rayon is made principally of regenerated cellulose and contains nonregenerated cellulose fiber-forming material, for example, a fiber spun from viscose containing casein or other protein (ASTM). This greatly increases both dry and wet strength and also permits mercerization. Rayon is readily dyed by standard methods.

Hazard: Flammable, not self-extinguishing, moderate fire risk.

Use: Nonwoven fabrics, surgical dressings, mechanical rubber goods, coated fabrics, felts and blankets, blends with cotton for home furnishings, etc.

See cellophane; acetate fiber; viscose process.

rayon coning oil. An oil used to lubricate and reduce the static of yarns wound by a coning machine. Usually composed of mineral oils of low viscosity so compounded as to emulsify in water.

“Rayox.” TM for titanium dioxide.

Rb. Symbol for rubidium.

“RBR Revitalizer” [General Graphics].

TM for a liquid naphtha solvent blend.

RCFs. See refractory ceramic fibers.

R&D. Abbreviation for research and development, usually referring to the department or division of a company whose major responsibility is applied research and creative development of new products and processes.

RDA. Abbreviation for recommended dietary allowances of food requirements, including proteins, vitamins and minerals for infants, children, and adults, established by the Food and Nutrition Board of the National Academy of Sciences—National Research Council. They are revised periodically, particularly in reference to certain vitamins (C, B₁₂, and E) and proteins.

See USRDA.

RDGE. See resorcinol diglycidyl ether.

RDX. See cyclonite.

Re. Symbol for rhenium.

“ReAct 784” [Hernon]. TM for a two component, no mix, structural adhesive compound.

reaction, chemical. See chemical reaction.

reaction, fast. A chemical reaction that has a heat of activation far in excess of critical energy.

reaction, heterogeneous. A chemical reaction that takes place on the surfaces between various phases in a heterogeneous system.

reaction injection molding. See injection molding.

reaction, mechanism. The manner in which a chemical reaction proceeds, expressed in a series of chemical equations.

reaction, nuclear. See nuclear reaction.

reaction of first order. A chemical reaction in which the velocity of reaction at a given time depends strictly on the amount per unit volume of the reacting substance at the time, all other parameters staying the same.

reaction of second order. A chemical reaction in which the rate of reaction is in proportion to the product of the concentrations of two reacting materials.

reaction order. The total of all the orders with respect to various substances is called the total order or the order of the reaction. Also when a reaction has a rate that is in proportion to some power of the concentration of one of the reacting substances involved.

reaction product imaging. A beam of hydrogen atoms is crossed with a beam of cold deuterium (D) molecules. The ion images appearing on the detector are two-dimensional projections of the three-dimensional velocity distribution of the D atom products.

reaction step. The reaction where individual parts of the reaction series are identical in nature with the primary reaction but differ from it only in the order that they occur.

reaction velocity. The rate at which a chemical reaction takes place as measured by the rate of formation of the product or the rate of disappearance of reactants.

reactive atmosphere. An atmosphere which causes a change in composition of the material immersed in it.

reading frame. When mRNA is translated by the cell, the nucleotides are read three at a time. By starting at different positions, the groupings of three that are produced can be entirely different.

reagent. Any substance used in a reaction for the purpose of detecting, measuring, examining, or analyzing other substances. High purity and high sensitivity are essential requirements of lab reagents. Over 8000 reagent chemicals are commercially available.
See grade.

“Realox” [ALCOA]. Al_2O_3 TM for calcined aluminas.

Properties: High-purity, reactive alumina.

Use: In the production of high alumina ceramics and refractories.

rearrangement. A type of chemical reaction in which the atoms of a single compound recombine, usually under the influence of a catalyst, to form a new compound having the same molecular weight but different properties. Thus ammonium cyanate in solution will rearrange to form urea, in which the four hydrogen atoms are equally distributed between the two nitrogen atoms: $\text{NH}_4\text{OCN} \rightarrow (\text{NH}_2)_2\text{C}=\text{O}$. Many such rearrangements have been named for their discoverers, e.g., Beckmann rearrangement.
See Wohler.

Reaumur. A temperature scale in which 0 is the freezing point of water and 80 is its boiling point.

recessive gene. A gene which will be expressed only if there are 2 identical copies or, for a male, if one copy is present on the X chromosome.

recipe. A product formula.
Use: Food industry.

reciprocal translocation. When a pair of chromosomes exchange exactly the same length and area of DNA. Results in a shuffling of genes.

reclaiming. Recovery and reuse of scrap materials, either in low percentage in new product manufacture or in larger proportions in products in which the highest quality is not essential. Among the materials widely reclaimed in industry are aluminum, steel, paper, rubber, glass, crankcase oil, greases, etc. Solid materials are comminuted, the contaminants being removed with organic solvents or strong alkali solutions (paint from metals, ink from paper, fabric and metals from tires). In the case of cross-linked elastomers, more intensive solvent and heat treatment is necessary. The resulting product is used as an adulterant in low-quality items. Research on high-temperature conversion of scrap rubber to oil, with recovery of carbon black and metal inserts, indicates that substantial value may be obtained by this method. Devulcanization by means of microwave radiation is also under development. The term *reprocessing* refers specifically to the recovery of nuclear fuels from reactor waste.
See recycling; reprocessing.

recombinant clone. Clone containing recombinant DNA molecules.
See recombinant DNA technology.

recombinant DNA. See genetic engineering; biotechnology.

recombinant DNA molecules. A combination of DNA molecules of different origin that are joined using recombinant DNA technologies.

recombinant DNA technology. Procedure used to join together DNA segments in a cell-free system (an environment outside a cell or organism). Under appropriate conditions, a recombinant DNA molecule can enter a cell and replicate there, either autonomously or after it has become integrated into a cellular chromosome.

recombination. The process by which progeny derive a combination of genes different from that of either parent. In higher organisms, this can occur by crossing over.
See crossing over; mutation.

reconstitution. In food technology, restoration of a dehydrated food product to its original edible condition by adding water to it at the time of use. It is

also called *rehydration*.
See dehydration.

rectification. The enrichment or purification of the vapor during the distillation process by contact and interaction with a countercurrent stream of liquid condensed from the vapor.

See reflux.

“RectorSeal” [Rectorseal]. TM for a NSF certified pipe repair kit,

recycling. The practice of returning a portion of the reaction products to the start of the system, either for the purpose of more efficient conversion of unreacted components or to reuse auxiliary materials that remain unchanged during processing. In the petroleum refining industry, some of the product stream may be recycled and blended with the fresh input materials to obtain a product of maximum value. In some industries, processing wastes are recycled.

See reclaiming; reprocessing.

red acetate. See aluminum diacetate.

red algae. See algae, red.

red arsenic. See arsenic disulfide.

red brass. Copper-zinc (brass) alloys characterized by their red color and high copper content. The term is used for several different types of brass. One ASTM classification permits 2–8% zinc, tin less than zinc, and lead less than 0.5%. Other alloys referred to as red brass include those with 75–85% copper, up to 20% zinc, and usually very small amounts of lead and tin. In one alloy possessing good machining qualities, the lead content may be as high as 10%, the tin as high as 5%.

Red brasses are widely used for decorative purposes and in plumbing and piping because of their resistance to atmospheric corrosion and dezincification.

Red Dye No. 2. See amaranth; FD&C colors.

red glass. A soda-zinc glass containing a small amount of cadmium and 1% selenium. Red may also be obtained by using cuprous oxide or gold chloride, the latter usually in the form of purple of Cassius.

red iron oxide. See iron oxide, red.

red iron trioxide. See ferric oxide.

red lake C. One of a family of organic acid azo pigments prepared by coupling the diazonium salt of *o*-chloro-*m*-toluidine-*p*-sulfonic acid with β -naphthol. Both sodium and barium salts of the parent dye are used.

Use: Plastics, rubber products, printing inks.

red lead. See lead oxide, red.

red mud. A by-product sludge from aluminum ore processing; it contains 30–60% iron oxide. It may be used for steel making.

red ochre. See ochre.

red oil. A commercial grade of oleic acid comprising 70% oleic and 15% each of linoleic and stearic acids.

redox. Short form of the term *oxidation-reduction*, as in *redox reactions*, *redox conditions*, etc. See oxidation.

redox reaction. An oxidation-reduction reaction.

redox pair. An electron donor and its corresponding oxidized form; for example, NADH and NAD⁺.

red oxide. See iron oxide red.

red phosphorus. See phosphorus.

red tide. Yellow-to-reddish discoloration of seawater due to rapid multiplication of various species of plantlike microorganisms, called dinoflagellates, which occurs seasonally in areas of warm water, especially off the coast of Florida and occasionally as far north as New England. Some, though by no means all, of the species are poisonous. Concentration of these organisms (phytoplankton) may be as high as 10⁶ units/L. The shellfish are lethal to free-swimming fish. Shellfish are unharmed by them, but are able to store and concentrate the toxin which causes paralytic poisoning when they are eaten by humans. So potent is this poison that death may result from ingestion of milligram amounts.

reduced states. See corresponding states.

reductant. See reducing agent.

reducing agent. (reductant). The electron donor in a redox reaction.

reducing end. The end of a polysaccharide having a terminal sugar with a free anomeric carbon; the terminal residue can act as a reducing sugar during the portion of time it exists in the open-chain form.

reducing equivalent. A general term for an electron or an electron equivalent, usually in the form of a hydrogen atom or a hydride ion.

reducing sugar. A sugar in which the anomeric carbon is not involved in a glycosidic bond and can therefore undergo oxidation during the portion of time it exists in the open-chain form.

reduction. (1) The opposite of oxidation. Reduction may occur in the following ways: (a) acceptance of one or more electrons by an atom or ion, (b) removal of oxygen from a compound, (c) addition of hydrogen to a compound. (2) Size reduction of materials.

See (1) oxidation; (2) comminution.

“Reductone” [Olin]. TM for sodium hydrosulfite.

CAS: 7775-14-6.

Grade: Solution.

Use: Continuous vat dyeing and afterscouring; bleaching of clay, ground wood, and thermal mechanical pulp.

Reed reaction. Photochemical sulfonation of paraffins and cycloparaffins by sulfur dioxide and chlorine under irradiation with UV light.

refined mineral oil. See dormant oil.

refined bleached shellac. See shellac, bleached, wax-free.

refinery gas. A mixture of hydrocarbon gases (and often some sulfur compounds) produced in large-scale cracking and refining of petroleum. The usual components are hydrogen, methane, ethane, propane, butanes, pentanes, ethylene, propylene, butenes, pentenes, and small amounts of other components such as butadiene.

Use: Source of raw material for petrochemicals, high-octane gasoline, and organic synthesis of alcohols.

refining. Essentially a separation process whereby undesirable components are removed from various types of mixture to give a concentrated and purified product. Such separation may be effected (1) mechanically, by pressing, centrifuging, filtering, etc.; (2) by electrolysis; (3) by distillation, solvent extraction, or evaporation; and (4) by chemical reaction. One or more of these operations is applied to (1) food products, (2) petroleum, (3) lubricating oils, and (4) metals. As regards petroleum, refining is generally understood to include not only fractional distillation of crude oils to naphthas, low-octane gasoline, kerosene, fuel oil, and asphaltic residues, but also the processes involved in thermal and catalytic cracking (hydroforming, reforming, etc.) for production of high-octane gasoline.

reflux. In distillation processes in which a fractionating column is used, the term *reflux* refers to the liquid that has condensed from the rising vapor and been allowed to flow back down the column toward the still. As it does so, it comes into intimate contact with the rising vapor, resulting in improved separation of the components. The separation resulting from contact of the countercurrent streams of vapor and liquid is called rectification or fractionation.

Reformatskii reaction. Condensation of carbonyl compounds with organozinc derivatives of α -halo esters to yield β -hydroxy esters.

reforming. Decomposition (cracking) of hydrocarbon gases or low-octane petroleum fractions by heat and pressure, either without a catalyst (thermoforming) or with a specific catalyst (molybdenum, platinum). The latter method is the more efficient and is used almost exclusively in the U.S. The chief cracking reactions are (1) dehydrogenation of cyclohexanes to aromatic hydrocarbons; (2) dehydrocyclization of certain paraffins to aromatics; (3) isomerization, i.e., conversion of straight-chain to branched-chain structures, as octane to isooctane. These result in substantial increase in octane number. Steam reforming of natural gas is an important method of producing hydrogen by the reaction $\text{CH}_4 + \text{H}_2\text{O} \rightarrow 3\text{H}_2 + \text{CO}$; steam reforming of naphtha is used to produce synthetic natural gas. See hydroforming; “Platforming.”

“Refractaloy” [Westinghouse]. TM for a nickel-cobalt-chromium-molybdenum-iron alloy. Type 26 is a precipitation-hardenable material using titanium as the hardening agent and having high strength, high ductility, and corrosion resistance up to 1450F.

Use: Gas turbine discs, bolting, and blading are typical applications.

refraction. The change in direction (apparent bending) of a light ray passing from one medium to another of different density, as from air to water or glass. The ratio of the sine of the angle of incidence to the sine of the angle of refraction is the index of refraction of the second medium. Index of refraction of a substance may also be expressed as the ratio of the velocity of light in a vacuum to its velocity in the substance. It varies with the wavelength of the incident light, temperature, and pressure. The usual light source is the D line of sodium, the standard temperature being 20C, the expression of refractive index is $20/D$.

refractive. Descriptive of a substance having a high refractive index.

refractive index. See refraction.

refractometer. A device for checking the index of refraction.

refractory. (1) An earthy, ceramic material of low thermal conductivity that is capable of withstanding extremely high temperature (1650–2200C) without essential change. There are three broad groups of these: (a) acidic (silica, fireclay), (b) basic (magnesite, dolomite), and (c) amphoteric (alumina, carbon, and silicon carbide). Their primary use is for lining steel furnaces, coke ovens, glass lehrs, and other continuous high-temperature applications.

They are normally cast in the form of brick and are sometimes bonded to assure stability. The outstanding property of these materials is their ability to act as insulators. The most important are fireclay (aluminum silicates), silica, high alumina (70–80% Al_2O_3), mullite (clay-sand), magnesite (chiefly MgO), dolomite (CaO-MgO), forsterite (MgO-sand), carbon, chrome ore–magnesite, zirconia, and silicon carbide. (2) Characterizing the ability to withstand extremely high temperature, e.g., tungsten and tantalum are refractory metals, clay is a refractory earth, ceramics are refractory mixtures.

refractory ceramic fibers. (RCFs). Man-made insulating fibers.

Use: To replace asbestos in coke ovens and industrial furnaces.

“Refrasil” [Carborundum]. TM for a group of materials having outstanding high-temperature resistance. Composed of white, vitreous fibers having up to 99% silicon dioxide content.

Available forms: Bulk fiber, batt, cloth, tape, sleeving, yarn, cordage, and flakes.

Use: Aircraft and missile ablative composites; industrial insulation and filtration applications; protective welding shield for spark and slag containment.

“Refrax” [Carborundum]. TM for silicon nitride-bonded silicon carbide refractories. Available in brick and precision-formed shapes and parts.

Use: Brazing and furnace fixtures; pumps and pump parts handling corrosive, abrasive slurries; rocket motor components; spray nozzles; burners; pyrometer protection tubes; sinker assemblies in wire aluminumizing; bolts and nuts; valve parts; aluminum-melting furnace linings and parts; conveyor parts.

refrigerant. Any substance that by undergoing a change of phase (solid to liquid or liquid to vapor) lowers the temperature of its environment because of its latent heat. Melting ice, with latent heat of 80 calories per gram removes heat and exerts a considerable cooling effect. Most commercial refrigerants are liquids whose latent heat of vaporization results in cooling. Ammonia, sulfur dioxide, and ethyl or methyl chloride were once widely used. The flammability and toxicity of these compounds led to a search for safer refrigerants that resulted in the discovery of halogenated hydrocarbons, especially fluorocarbons, which are nonflammable. Under various trademarks, these are now generally used for domestic refrigeration and air-conditioning. Ice and circulating brine are still used for preservation of fish at sea, and ammonia systems are operated for seafood storage in warehouses.

refrigerant 112a. See 1,1,2-tetrachloro-2,2-difluoroethane.

regenerated cellulose. See cellophane.

regeneration. (1) Restoration of a material to its original condition after it has undergone chemical modification necessary for manufacturing purposes. The most common instance is that of cellulose for rayon production. The wood pulp used must first be converted to a solution by reaction with sodium hydroxide and carbon disulfide; in this form (cellulose xanthate) it can be extruded through spinnerettes. After this operation it is regenerated to cellulose by passing it through acid (viscose process). Collagen can also be regenerated by acid treatment after it has been purified for use in food products by alkaline solution.

(2) Renewal or reactivation of a catalyst that has accumulated reaction residues such as coke, usually accomplished by passage of steam or reducing gases over the catalyst bed.

(3) Replenishing the sodium ions of a zeolite or similar ion-exchange agent by treatment with sodium chloride solution. Molecular sieves are regenerated by heat removal of the water (200C), followed by treatment with an inert gas.

regulatory enzyme. An enzyme which can be regulated by allosteric mechanisms or by covalent modification.

regulatory gene. A gene that gives rise to a product involved in the regulation of the expression of another gene. An example would be the gene coding for cro, a repressor protein.

regulatory region or sequence. A DNA base sequence that controls gene expression.

regulatory sequence. A DNA sequence involved in regulating the expression of a gene.

regulon. A group of genes that are coordinately regulated.

rehydration. See reconstitution.

Reichert-Meissl number. A measure of volatile, soluble fatty acids derived under arbitrary conditions.

Reich process. A method of purifying carbon dioxide produced in fermentation. The small amounts of organic impurities are oxidized and absorbed, and the gas is then dehydrated with chemicals.

Reimer-Tiemann reaction. Reaction for the formation of phenolic aldehydes by heating a phenol with chloroform in the presence of alkali.

reineckate. Tetrathiocyanato diammino chromium compound.

Reinecke salt. (ammonium tetrathio-cyanodiammonochromate; ammonium reineck-

cate).

CAS: 19441-09-9. $\text{NH}_4[\text{Cr}(\text{NH}_3)_2(\text{SCN})_4]\cdot\text{H}_2\text{O}$.

Properties: Dark-red crystals or crystalline powder. Moderately soluble in cold water; soluble in hot water and alcohol, decomposes in aqueous solution.

Derivation: From fusion of ammonium thiocyanate with ammonium dichromate.

Use: Precipitating agent for organic bases such as choline, amines, for certain amino acids; reagent for mercury.

reinforced plastic. A composite structure comprising of a thermosetting or thermoplastic resin and fibers, filaments, or whiskers of glass, metal, boron, or aluminum silicate. Unless otherwise indicated, this term refers to fiberglass-reinforced plastic (FRP).

Properties: Exceptionally high strength, good electrical resistivity, weather and corrosion resistance, low thermal conductivity, and low flammability.

Derivation: Basic acid glass in the form of fiber (0.0005 inch), strands of 50–200 fibers, filaments, or woven fabric are coated by passing through a bath of molten resin, which acts as a binder. The assembly can be either compression- or injection-molded. Large, high-strength parts are made by filament winding. Resins used are polyester, epoxy, phenolic, polypropylene, polystyrene, nylon, polycarbonate, and polyphenylene oxides.

Use: Automotive body components, ablative coatings on rockets and space vehicles, appliances (air-conditioning and refrigerator cases), electrical equipment, oil-well piping and tubing, large-diameter pipe, industrial piping systems, chemical storage and mixture tanks, unitized cargo containers, marine equipment, pressure vessels, prefabricated building panels and other structural components, blades for wind machines.

See glass fiber; composite; fiber; whiskers.

reinforcing agent. (1) One of numerous fine powders used in rather high percentages to increase the strength, hardness, and abrasion resistance of rubber, plastics, and flooring compositions. The reinforcing effect is in general a function of the particle size of the powder. The finest of all is channel carbon black, whose surface area may be as great as 18 acres per pound. Other widely used reinforcing agents are thermal and furnace blacks, magnesium carbonate, zinc oxide, hard clay (kaolin), and hydrated silicas. Though some reinforcing agents have positive coloring properties, the term should not be used as a general synonym for pigment.

(2) Fibers, fabric, or metal insertions in plastics, rubber, flooring, etc., for the purpose of imparting impact strength and tear resistance. See pigment; filler; whiskers.

Reinsch test. A test for detecting small amounts of arsenic, silver, bismuth, and mercury.

Reissert indole synthesis. Condensation of an *o*-nitrotoluene with oxalic ester, reduction to the amine, and cyclization to the indole.

Reissert reaction. Formation of 1-acyl-2-cyano-1,2-dihydroquinoline derivatives (Reissert compounds) by reaction of acid chlorides with quinoline and potassium cyanide; hydrolysis of these compounds yields aldehydes and quinaldic acid.

relative error. Ratio of absolute error to exact value.

relaxation time. A measure of the rate at which a disequilibrium distribution decays toward an equilibrium distribution. The electron relaxation time in a metal, for example, describes the time required for a disequilibrium distribution of electron momenta (e.g., in a flowing current) to decay toward equilibrium in the absence of an ongoing driving force and can be interpreted as the mean time between scattering events for a given electron.

relaxin.

CAS: 9002-69-1.

Hazard: A poison. A reproductive hazard.

Use: Hormone.

release. (1) Separation of a cured or baked product from the metal mold or pan in which it is formed. Common release agents for rubber and plastics are waxy or fatty materials such as paraffin and tallow; vegetable oils are used in the baking industry. Such materials are collectively called abherents.

(2) Gradual diffusion of an active ingredient through a permeable or soluble coating. Pelleted products such as fertilizers and medicinals are often covered with a layer of a substance that permits slow and uniform escape of the active principle. Sulfur is used to coat controlled-release fertilizers; gelatin and similar materials serve the same purpose in pharmaceuticals.

release factors. See termination factors.

releasing factors. Hypothalamic hormones that stimulate release of other hormones by the pituitary gland. For example, Luteinizing Hormone Releasing Hormone (LHRH)

rem. The unit of radiation dose equivalent, the dosage in rads multiplied by a factor representing the different biological effects of various types of radiation. The Federal radiation safety standard is 0.5 rem per person per year for non-occupational exposure, and even this is considered too high by some authorities. Occupational exposure is set at 5 rem per year.

See rad; dosimetry; radiation.

Remsen, Ira. (1846–1927). An American chemist born in New York. He began his career in

medical practice but abandoned it for chemistry and went to Germany to study. He received his doctorate in chemistry from the University of Gottingen in 1870. Returning to the U.S. he taught physics and chemistry at Williams and was later invited to join the staff of Johns Hopkins University where he became head of the department of chemistry. There he established the first graduate curriculum in chemistry in the U.S. based on the system then in use in Germany. In 1879, saccharin was discovered in his research laboratory. He wrote several widely used textbooks and founded the *American Journal of Chemistry* which later merged with *JACS*. He was President of Johns Hopkins from 1901 to 1912, and is recognized as one of the great teachers of chemistry.

renaturation. Refolding of a denatured protein so as to restore native structure and protein function.

rendering. The procedure that separates fats from protein connective tissue and other water-insoluble materials by treating small pieces of animal matter with hot water or steam.

renewable resources. See biomass; waste control; gasohol.

“Renite” [Renite]. TM for a series of high-temperature lubricants, swabbing compounds, release agents, and automatic spray equipment for hot-forming glass, hot-working metals, and the lubrication of oven conveyer chains and bearings.

Use: Glassware products, forging, extrusions and die castings; provides lubrication for conveyer chains and bearings in bakery and brick industries.

rennet. See rennin.

rennin. (rennase; chymosin).

CAS: 9001-98-3. A digestive enzyme secreted by the glands of the stomach and causes curdling of milk. It has the power of coagulating 25,000 times its own weight of milk.

Properties: Yellowish-white powder or as yellow grains or scales; characteristic slightly salty taste; peculiar odor. Slightly hygroscopic; partially soluble in water and dilute alcohol.

Derivation: From the glandular layer (inner lining) of the true stomach of the calf. It has been made experimentally by gene-splicing techniques.

Grade: Rennet is the dried commercial extract containing the rennin.

Use: Pharmacy, cheese making, coagulation of casein for plastics, food additive.

repeat sequences. The length of a nucleotide sequence that is repeated in a tandem cluster.

repellent. (1) A substance that causes an insect or animal to turn away from it or reject it as food. Repellents may be in the form of gases (olfactory),

liquids, or solids (gustatory). Standard repellents for mosquitos, ticks, etc., are citronella oil, dimethyl phthalate, *n*-butylmesityl oxide oxalate, DEET, and 2-ethyl hexanediol-1,3. Actidione is the most effective rodent repellent, but is too toxic and too costly to use. Thiuram disulfide, amino complexes with trinitrobenzene, and hexachlorophene are successfully used. Copper naphthenate and lime/sulfur mixtures protect vegetation against rabbits and deer. Shark repellents are copper acetate or formic acid mixed with ground asbestos. Bird repellents are chiefly based on taste, but this sense varies widely with the type of bird so that generalization is impossible. α -Naphthol, naphthalene, sandalwood oil, quinine, and ammonium compounds have been used, with no uniformity of result.

See fumigant. (2) A substance that, because of its physicochemical nature, will not mix or blend with another substance. All hydrophobic materials have water-repellent properties due largely to differences in surface tension or electric charges, e.g., oils, fats, waxes, and certain types of plastics. Silicone resin coatings can keep water from penetrating masonry by lining the pores, not by filling them; they will not exclude water under pressure.

replacement. See substitution.

replication. (1) Making a reverse image of a surface by means of an impression on or in a receptive material; usually applied to microscopic techniques for obtaining plastic replicas of observed objects. (2) In biochemistry, the term refers to reproduction of the DNA molecule, which is composed of two interlocking chains of nucleotides (the double helix structure elucidated by Watson and Crick in 1953). It reproduces itself by forming two identical daughter molecules, each of which receives one of the two chains of the original molecule, the other in each case being synthesized from nucleic acids by enzymes (DNA polymerases). In the oversimplified drawing below the solid lines are the strands of the original molecule, and the broken lines are the synthesized strands:

The chemical mechanisms in replication are more complex than previously thought; 12–15 proteins are involved as well as several enzymes. See deoxyribonucleic acid; genetic code.

replisome. The multiprotein complex that promotes DNA synthesis at the replication fork.

reporter gene. See marker.

Repe process. Any of several processes involving reaction of acetylene (1) with formaldehyde to produce 2-butyne-1,4-diol which can be converted to butadiene; (2) with formaldehyde under different conditions to produce propargyl alcohol and, from this, allyl alcohol; (3) with hydrogen cyanide to yield acrylonitrile; (4) with alcohols to give vinyl ethers; (5) with amines or phenols to give vinyl derivatives; (6) with carbon monoxide and alcohols to give esters of acrylic acid; (7) by polymerization to produce cyclooctatetraene; and (8) with phenols to make resins. The use of catalysts, pressures up to 30 atm, and special techniques to avoid or contain explosions are important factors in these processes. See acetylene.

repetitive DNA. Sequences of varying lengths that occur in multiple copies in the genome; it represents much of the human genome.

repressible enzyme. An enzyme whose synthesis is inhibited when its reaction product is readily available to the cell. Occurs only in bacteria.

repression. A decrease in the expression of a gene in response to a regulatory protein.

repressor. The protein that binds to the regulatory sequence of a gene, blocking its transcription.

reprocessing. Treatment of spent nuclear reactor fuel to recover the unconsumed uranium-235 and plutonium by separating them from each other and from the fission products formed in the reactor. The

Purex process is the accepted procedure used for this purpose. The spent fuel is dissolved in nitric acid; separation is effected by solvent extraction with tributyl phosphate, ion-exchange reactions, and precipitation. The reclaimed uranium-235 and plutonium are sent to fuel fabrication plants for reuse. The fission product waste is evaporated and stored. Another method, called the Civex process, has been proposed to prevent theft of plutonium; here the mixture of waste products, uranium isotopes, and plutonium is not separated. Since its plutonium content is only 20% it could not be used for weapons; the mixture is suitable for fast breeder reactors. Serious radiation hazards are involved in reprocessing and require use of appropriate shielding and remote-control handling procedures. Storage of the radioactive waste also presents a long-range problem that has not yet been satisfactorily solved. There are no commercial reprocessing plants operational in the U.S., though there are several in Europe. See radioactive waste; breeder.

reprography. A coined name for the technique of reproducing drawings, blueprints, and typographic matter by the use of photosensitized papers, or polyester sheeting, which may be coated with diazo dyes. The process has broad potential in the photocopying field and in communications technology. It involves colloid and surface chemistry, ink-paper interactions, and unusual imaging techniques.

Research octane number (RON). See octane number.

resene. The unsaponifiable component of rosin and other natural resins.

reserpine.
CAS: 50-55-5.

Properties: White or pale-buff to slightly yellowish; odorless powder; darkens slowly on exposure to light and darkens more rapidly in solution. Mp 264–265C (decomposes). Insoluble in water; slightly soluble in alcohol; soluble in chloroform and benzene.

Derivation: From *Rauwolfia serpentina*.

Grade: USP.

Hazard: Carcinogen in animals, potential cancer risk in humans.

Use: Antihypertensive agent, tranquilizer.

“Resicure” [Atofina]. TM for a series of epoxy curing agents.

residual oil. A liquid or semiliquid product resulting from the distillation of petroleum and con-

taining largely asphaltic hydrocarbons. Also known as asphaltum oil, liquid asphalt, black oil, petroleum tailings, and residuum. Combustible.

Use: Roofing compounds, hot-melt adhesives, friction tape, sealants, heating oil for large buildings, factories, etc.

See fuel oil.

Note: Gasoline of 94 octane can be produced from residual oil in a high-temperature catalytic process, thus increasing the yield of gasoline from a barrel of crude by 33% when full-scale production is achieved.

residue. A single unit within a polymer, for example, an amino acid within a polypeptide chain.

“Resimene” [Solutia]. TM for melamine and ureaformaldehyde resins. Supplied in organic liquid solutions. The melamine is also available in water-alcohol and soluble, spray-dry powders.

Use: Paint, varnish, lacquer for automobiles, machinery, appliances, construction, electronics, missiles, chemicals, pulp and paper.

resin. A semisolid or solid complex amorphous mix of organic compounds.

Properties: It has no definite melting point and no tendency to crystallize.

Derivation: Resins can be from animal, vegetable, or synthetic origins.

resinamine. $C_{35}H_{42}N_2O_9$, Alkaloid from certain species of Rauwolfia.

Properties: White or pale-buff to cream-colored, crystalline powder; odorless; darkens slowly on exposure to light, more rapidly when in solution. Mp 238C (in vacuo). Partially soluble in organic solvents; insoluble in water.

Use: Medicine (antihypertensive).

resinate. A salt of the resin acids found in rosin. They are mixtures rather than pure compounds.

Use: See soap (2).

resiniferatoxin.

CAS: 57444-62-9. mf: $C_{37}H_{40}O_9$.

Hazard: A poison.

resin, ion-exchange. See ion-exchange resin.

resin, liquid. An organic, polymeric liquid that, when converted to its final state for use, becomes solid (ASTM). Example: linseed oil, raw or heat-bodied (partially polymerized).

See drying oil; resinoid.

resin, natural. (1) Vegetable-derived, amorphous mixture of carboxylic acids, essential oils, and terpenes occurring as exudations on the bark of many varieties of trees and shrubs. They are combustible, electrically nonconductive, hard and glassy with conchoidal fracture when cold, and soft and

sticky below the glass transition point. Most are soluble in alcohols, ethers and carbon disulfide, and insoluble in water. The best known of these are rosin and balsam, obtained from coniferous trees; these have a high acid content. Of more remote origin are such resins as kauri, congo, dammar, mastic, sandrac, and copal. Their use in varnishes, adhesives, and printing inks is still considerable, though diminishing in favor of synthetic products. (2) Miscellaneous types: shellac, obtained from the secretion of an Indian insect, is still in general use as a transparent coating; amber is a hard, polymerized resin that occurs as a fossil; ester gum is a modified rosin; amorphous sulfur is considered an inorganic natural resin; liquid resins, sometimes called resinoids, are represented by linseed and similar drying oils.

See gum, natural (note); resin, synthetic (note).

resinoid. Any thermosetting synthetic resin, either in its initial temporarily fusible state or its final infusible state (ASTM). Heat-bodied linseed oil, partially condensed phenol-formaldehyde and the like are also considered resinoids.

resinol. A coal tar distillation fraction containing phenols. It is the fraction soluble in benzene but insoluble in light petroleum, obtained by solvent extraction of low-temperature tars or similar materials. Resinols are very sensitive to heat and oxidation.

resin, synthetic. A manufactured high polymer resulting from a chemical reaction between two (or more) substances, usually with heat or a catalyst. This definition includes synthetic rubbers and silicones (elastomers), but excludes modified, water-soluble polymers (often called resins). Distinction should be made between a synthetic resin and a plastic; the former is the polymer itself, whereas the latter is the polymer plus such additives as fillers, colorant, plasticizers, etc.

The first truly synthetic resin was developed by Baekeland in 1911 (phenol-formaldehyde). This was soon followed by a petroleum-derived product called coumarone-indene, which did indeed have the properties of a resin. The first synthetic elastomer was polychloroprene (1931) originated by Nieuwland and later called neoprene. Since then many new types of synthetic polymers have been synthesized, perhaps the most sophisticated of which are nylon and its congeners (polyamides, by Carothers), and the inorganic silicone group (Kipping). Other important types are alkyds, acrylics, aminoplasts, polyvinyl halides, polyester, epoxies, and polyolefins.

In addition to their many applications in plastics, textiles, and paints, special types of synthetic resins are useful as ion-exchange media. See “Cumar”; plastic; paint; fiber; film; elastomer.

Note: Because the term *resin* is so broadly used as to be almost meaningless, it would be desirable to restrict its application to natural, organo-soluble, hydrocarbon-based products derived from trees and

shrubs. But in view of the tendency of inappropriate terminology to “gel” irreversibly, it is a losing battle to attempt to replace “synthetic resin” with the more precise “synthetic polymer.”

See gum, natural (note).

resist. A material that will prevent the fixation of dye on a fiber, thus making color designs and pattern prints possible. The resist may act mechanically, as a wax, resin, or gel that prevents absorption of the dye or its accompanying mordant. Citric acid, oxalic acid, and various alkalis are among the more common resists of the chemical type.

resistor composition. A specially treated, semiconducting, metal powder compounded with glass binders and temporary organic carriers. Can be applied to glass or ceramic surfaces by stenciling, spraying, brushing, or dipping; firing range 704–760C. Compositions can be blended with members of the same series to produce intermediate resistance values. Fired resistors have good reproducibility, low temperature and voltage coefficients, and stability to abrasion, moisture, and relatively high (125C) ambient temperature.

Use: To produce fired-on resistor components for electronic circuits.

resite. See C-stage resin.

resitol. See B-stage resin.

“Resmetal” [Borden]. TM for a resin-metal composition that when catalyzed converts to metal-like solid. Recommended for mold making, patching, forming, and general repair of metal surfaces and objects.

resol. See A-stage resin.

resolution. Degree of molecular detail on a physical map of DNA, ranging from low to high. See resolving power.

resolving power. The extent to which a lens can distinguish small particles and minute distances, i.e., fine structure. The human eye can resolve objects of 1/250th inch (100 microns) in any dimension. The compound microscope has a resolving power of 0.5 micron; an electron microscope can resolve fine structure as small as 5 Å, that is, in the molecular range. Two factors determine resolving power, the wavelength of the radiation utilized and the focal depth of the lens. The resolving power of a microscope is much more important than its ability to magnify, for no magnification, however large, can add detail to an image that was not first discerned by the lens system.

See optical microscope; electron microscope.

resonance. (1) In chemistry, resonance (or mesomerism) is a mathematical concept based on quan-

tum mechanical considerations (i.e., the wave functions of electrons); it is used to describe or express the true chemical structure of certain compounds that cannot be accurately represented by any one valence-bond structure. It was originally applied to aromatic compounds such as benzene, for which there are many possible approximate structures, none of which is completely satisfactory.

See benzene.

The resonance concept indicates that the actual molecular structure lies somewhere between these various approximations, but is not capable of objective representation. This idea can be applied to any molecule, organic or inorganic, in which an electron pair bond is present. The term *resonance hybrid* denotes a molecule that has this property. Such molecules do not vibrate back and forth between two or more structures, nor are they isotopes or mixtures; the resonance phenomenon is rather an idealized expression of an actual molecule that cannot be accurately pictured by any graphic device.

(2) In the terminology of spectroscopy, resonance is the condition in which the energy state of the incident radiation is identical with that of the absorbing atoms, molecules or other chemical entities. Resonance is applied in various types of instrumental analysis such as nuclear resonance absorption and nuclear magnetic resonance. See absorption spectroscopy.

Note: The multiple meanings of *nucleus* and *resonance* can be a source of confusion, especially when these terms are closely associated, as in *nuclear magnetic resonance* and *resonance of a molecular nucleus*. In the first of these expressions, *nucleus* is used in the sense of (1) under “nucleus”, and *resonance* in sense of (2) under “resonance”. In the second expression, *nucleus* is used in the sense of (3) under “nucleus” and *resonance* in the sense of (1) under *resonance*.

resorcinol. (resorcin; *m*-dihydroxybenzene; 3-hydroxyphenol).
CAS: 108-46-3. C₆H₄(OH)₂.

Properties: White crystals, becoming pink on exposure to light when not perfectly pure; sweet taste. D 1.2717, mp 110.7, bp 281C, flash p 261F (127C), autoign temp 1126F (607C). Soluble in water, alcohol, ether, glycerol, benzene, and amyl alcohol; slightly soluble in chloroform. Combustible.

Derivation: By fusing benzene-*m*-disulfonic acid with sodium hydroxide.

Grade: USP, powder, resublimed, pure, reagent, technical, crude.

Hazard: Irritant to skin and eyes. TLV: 10 ppm; STEL 20 ppm; not classifiable as a human carcinogen.

Use: Resorcinol-formaldehyde resins, dyes, pharmaceuticals, cross-linking agent for neoprene, rubber tackifier, adhesives for wood veneers and rubber-to-textile composites, manufacture of styphnic acid, cosmetics.

resorcinol acetate. (resorcinol monoacetate).

CAS: 102-29-4. $\text{HOC}_6\text{H}_4\text{OCOCH}_3$.

Properties: Viscous, pale-yellow or amber liquid; faint odor; burning taste. Bp 283C (decomposes), boiling range (10 mm Hg) 150–153C, d 1.203–1.207. Saturated solution is acid to litmus; soluble in alcohol and most organic solvents; sparingly soluble in water. Combustible.

Derivation: Action of acetic anhydride on resorcinol.

Grade: CP, NF.

Use: Medicine, cosmetics.

resorcinol bis(diphenyl phosphate).

CAS: 57583-54-7. mf: $\text{C}_{30}\text{H}_{24}\text{O}_8\text{P}_2$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

resorcinol dicyanate.

CAS: 1129-88-0. mf: $\text{C}_8\text{H}_4\text{N}_2\text{O}_2$.

Hazard: Low toxicity by ingestion and skin contact. A mild skin irritant.

resorcinol blue. See lacmoid.

resorcinol diglycidyl ether. (RDGE; 1,3-diglycidylloxybenzene; *m*-bis(2,3-epoxypropoxybenzene).

CAS: 101-90-6.

Properties: Straw-yellow liquid. D 1.21 (25C), bp 172C (0.8 mm Hg), refr index 1.541 (25C), viscosity 500 cP (25C), flash p 350F (176C) (COC). Miscible with most organic resins. Combustible.

Use: Epoxy resins.

resorcinol dimethyl ether. (dimethyl resorcinol; 1,3-dimethoxy benzene).

CAS: 151-10-0. $\text{C}_6\text{H}_4(\text{OCH}_3)_2$.

Properties: Pale-straw-tint liquid. Bp 204–212C, d 1.063–1.066 (25/25C), refr index 1.523–1.527 (20C). Combustible.

Use: Organic intermediate, flavoring.

resorcinol-formaldehyde resin. A type of phenol-formaldehyde resin. Permanently fusible; soluble in water, ketones, and alcohols. By dissolving and adjusting the pH to 7, an adhesive base is formed. These adhesives can be used whenever phenolics are used and where fast or room-temperature cure is desired. An important use of these adhesives is in wood gluing, particularly marine plywood.

resorcinol monobenzoate.

CAS: 136-36-7. $\text{C}_6\text{H}_5\text{COOC}_6\text{H}_3\text{OH}$.

Properties: White, crystalline solid. Mp 132–135C, bp 140C (0.15 mm Hg). Insoluble in water, benzene, di-(2-ethylhexyl)phthalate; soluble in acetone and ethanol. Combustible.

Use: Noncoloring UV inhibitor for various plastics, color stabilizer in cosmetic compositions.

resorcinolphthalein. See fluorescein.

resorcinolphthalein sodium. See uranine.

α -resorcylic acid. (3,5-dihydroxybenzoic acid).

CAS: 99-10-5. $(\text{OH})_2\text{C}_6\text{H}_3\text{COOH}$.

Properties: White crystals. Mp 237C. Soluble in water, ethanol, and ether. Combustible.

Grade: CP.

Use: Intermediate for dyes, pharmaceuticals, light stabilizers, resins.

β -resorcylic acid. (BRA; 2,4-dihydroxybenzene carboxylic acid; 2,4-dihydroxybenzoic acid; 4-hydroxysalicylic acid; 4-carboxyresorcinol).

CAS: 89-86-1. $(\text{OH})_2\text{C}_6\text{H}_3\text{COOH}$.

Properties: White needles. Mp (decomposes) 219–220C, bp decomposes. Almost insoluble in water and benzene; soluble in alcohol, ethyl ether. The sodium, potassium, ammonium, calcium, and barium salts are soluble in water; the silver, lead and copper salts are only slightly soluble. Combustible.

Use: Dyestuff and pharmaceutical intermediate, chemical intermediate in synthesis of fine organic chemicals, reagent for iron.

“Resorsabond” [Georgia Pacific]. TM for lumber resins.

Available forms: Liquid, powder and slurry.

Use: For lumber laminating and end jointing applications.

respiration. (1) In humans and animals, inhalation of oxygen and exhalation of carbon dioxide; the oxygen supports the oxidation (combustion) of organic nutrients in the body, yielding energy, carbon dioxide, and water.

(2) In growing plants, respiration occurs in both the presence and the absence of light. Some of the energy produced in respiration is used to form adenosine triphosphate, pyruvic acid, and other metabolic intermediates. Fruits and vegetables continue to respire after harvest, a fact that must be taken into account in transportation and storage.

respiratory chain. The sequence of electron-carrying proteins that transfer electrons from substrates to molecular oxygen in aerobic cells.

response element. By definition, a response element is a portion of a gene which must be present

in order for that gene to respond to some hormone or other stimulus. Response elements are binding sites for transcription factors. Certain transcription factors are activated by stimuli such as hormones or heat shock. A gene may respond to the presence of that hormone because the gene has in its promoter region a binding site for hormone-activated transcription factor.

restriction. To “restrict” DNA means to cut it with a restriction enzyme.
See: restriction enzyme.

restriction endonucleases. Site-specific endonucleases causing cleavage of both strands of DNA at points within or near the specific site recognized by the enzyme. Many generate sticky ends, making them important tools in genetic engineering. See restriction enzyme.

restriction enzyme. (restriction endonucleases). A class of enzymes generally isolated from bacteria, which are able to recognize and cut specific sequences (restriction sites) in DNA. Every copy of a plasmid is identical in sequence, so if an enzyme cuts a particular circular plasmid at three sites producing three “restriction fragments”, then a million copies of that plasmid will produce those same restriction fragments a million times over. There are more than six hundred known restriction enzymes. Bacteria produce restriction enzymes for protection against invasion by foreign DNA such as phages. The bacteria’s own DNA is modified in such a way as to prevent it from being clipped.

restriction-enzyme cutting site. A specific nucleotide sequence of DNA at which a particular restriction enzyme cuts the DNA. Some sites occur frequently in DNA (e.g., every several hundred base pairs); others much less frequently (rare-cutter; e.g., every 10,000 base pairs).

restriction enzyme, endonuclease. A protein that recognizes specific, short nucleotide sequences and cuts DNA at those sites. Bacteria contain over 400 such enzymes that recognize and cut more than 100 different DNA sequences.
See restriction enzyme cutting site.

restriction fragment. (1) The piece of DNA released after restriction digestion of plasmids or genomic DNA. See “Restriction enzyme”. One can digest a plasmid and isolate one particular restriction fragment (actually a set of identical fragments). (2) Also describes the fragments detected on a genomic blot which carry the gene of interest.

restriction fragment length polymorphism. (RFLP). Variation between individuals in DNA fragment sizes cut by specific restriction enzymes; polymorphic sequences that result in RFLPs are used as markers on both physical maps and genetic

linkage maps. RFLPs usually are caused by mutation at a cutting site.
See marker; polymorphism.

restriction map. A “cartoon” depiction of the locations within a stretch of known DNA where restriction enzymes will cut. The map usually indicates the approximate length of the entire piece (scale on the bottom), as well as the position within the piece at which designated enzymes will cut.

restriction site. See Restriction enzyme.

“Reswax” [Borden]. TM for a series of wax-resin blends used as coatings and hot-melt adhesives in paper conversion. The polymers used include butyl rubber, polyisobutylene, chlorinated rubber, polyethylene, and styrene copolymers.

ret. To reduce or digest fibers, especially linen, by enzymatic action.

retarder. See inhibitor.

“Reten” 205 [Aqualon]. TM for a strongly cationic, high molecular weight, synthetic, water-soluble polymer. A finely divided white powder, dissolves in either hot or cold water to produce clear, smooth, viscous, nonthixotropic solutions; available in a variety of viscosity grades and cationic functionality. “Reten” 763 is an aqueous solution of a modified polyamide-epichlorohydrin resin.
Use: Flocculant, binder, and viscosifier.

retene. (7-isopropyl-1-methylphenanthrene).
 $C_{18}H_{18}$.
Properties: Mw 234.36.

retention index. (RI). An indication whereby a compound will appear on a chromatogram with respect to *n*-paraffins.

reticulation. Joining of separate lineages on a phylogenetic tree, generally through hybridization or through lateral gene transfer. Fairly common in certain land plant clades; reticulation is thought to be rare among metazoans.

reticulopodia. Long thread-like pseudopodia that branch apart and rejoin, forming a fine network. They are characteristic of forams.

retinal. Preferred name for retinene.

retinene. (vitamin A aldehyde; retinal).
 $C_{20}H_{28}O$. A necessary component of rhodopsin, the light-sensitive pigment of the eye. Retinene is the aldehyde form of vitamin A, which is an alcohol.

retinol.
CAS: 68-26-8. $C_{20}H_{30}OH$. (1) A component of vita-

min A.

See carotene.

(2) A resin distillate similar to rosin oil.

retort. A utensil for distilling volatile materials. A globular glass vessel with an extended side tube used for distillation.

retort gas. The gas that results from the heating of coal in retorts, as in the by-product process of coke manufacture.

retorting. (1) A process much used in the early years of chemistry for destructive distillation of heavy organic liquids and for laboratory separations. It involves the use of a cylindrical vessel made of glass (for laboratory work), fireclay, or metal, with a neck bent at a downward angle to facilitate distillation. For gas manufacture the equipment is built on a heavier scale to handle destructive distillation of coal.

(2) Processing shale oil.

(3) Heating canned or pouched foods with steam to stop bacterial growth.

(4) Volatilization of mercury from gold and silver amalgams.

retro Diels-Alder reaction. Thermal dissociation of Diels-Alder adducts, occurring most readily when one or both fragments are particularly stable.

retropinacol rearrangement. Conversion of an alcohol to the rearranged olefin on treatment with acid.

4,14-retro-retinol-14-hydroxy-, (14r)-.

CAS: 139257-77-5. mf: $C_{20}H_{30}O_2$.

Hazard: A reproductive hazard.

trans-retrorsine.

CAS: 15503-87-4. mf: $C_{18}H_{25}NO_6$.

Hazard: A poison.

Source: Natural product.

retrosynthesis. A computer-assisted analysis of an organic molecule that is to be synthesized, i.e., the target molecule, in which the computer works back through the precursors of the target substance to a group of possible starting materials that are readily available from natural sources or as commercial products. Retrosynthetic analysis is thus the opposite of the usual direct approach to laboratory synthesis.

See computational chemistry.

retroviral infection. The presence of retroviral vectors, such as some viruses, which use their recombinant DNA to insert their genetic material into the chromosomes of the host's cells. The virus is then propagated by the host cell.

retrovirus. An RNA virus containing reverse transcriptase.

reumycin. See 1-demethyltoxoflavine.

reverberatory furnace. An ore-roasting kiln having a curved or sloping roof from which the heat is deflected onto the material being treated. The fuel and the charge occupy separate areas in the kiln so that there is no direct contact between them, thus avoiding contamination of the ore with fuel particulates. The heat rising from the ignited fuel impinges on the curved roof and is reflected downward onto the ore. After passing over the ore, the heat escapes through suitably located vents.

Reverdin reaction. Migration of iodine during nitration of iodophenolic ethers.

"Reversacol" [James Robinson]. TM for a line of photochemical dyes.

reversal spectrum. A spectrum that can be observed in intense, white light. The bright lines in the emission spectrum of the gas have traversed a luminous gas reversing the color of the dark spectrum lines.

See emission spectroscopy.

reverse osmosis. See osmosis, desalination.

reverse transcriptase. An RNA-directed DNA polymerase in retroviruses. These viruses are capable of making DNA complementary to an RNA and incorporating it into the genome.

reversible. (1) A chemical reaction that proceeds first to the right and then to the left when the ambient conditions are changed; the product of the first reaction decomposes to the original components as a result of different conditions of temperature or pressure. Examples are $H_2O + CO_2 \rightleftharpoons H_2CO_3$, in which the carbonic acid reverts to water and carbon dioxide on heating; $NH_4Cl \rightleftharpoons NH_3 + HCl$, in which the ammonium chloride decomposes on heating to ammonia and hydrochloric acid, which recombine on cooling.

(2) A colloidal system such as a gel or suspension that can be changed back to its original liquid form by heating, addition of water, or other method. For example, evaporated egg white can be restored (reconstituted) by addition of water.

reversible colloid. (lyophilic colloid). A colloid that is readily dispersible in a suitable medium and may be redispersed after coagulation.

reversible electrode. An electrode that owes its potential to unit charges of a reversible nature, in contrast to electrodes used in electroplating that are destroyed during their use.

See chemical reaction; equilibrium constant; irreversible.

reversion. The softening and weakening of a natural rubber vulcanizate when the curing operation has been too long continued.

Reynold's number. The function DUP/μ used in fluid flow calculations to estimate whether flow through a pipe or conduit is streamline or turbulent in nature. D is the inside pipe diameter, U is the average velocity of flow, P is density, and μ is the viscosity of the fluid. Different systems of units give identical values of the Reynold's number, and values much below 2100 correspond to streamline flow, while values above 3000 correspond to turbulent flow.

Rf. Symbol for rutherfordium.

RFLP. See restriction fragment length polymorphism.

RFNA. Abbreviation for red fuming nitric acid. See nitric acid, fuming.

R group. An abbreviation used to denote an organic substituent such as the R groups of amino acids.

Rh. Symbol for rhodium.

rhamnose. $C_6H_{12}O_5$. A deoxyhexose monosaccharide found combined in the form of glycosides in many plants. Two forms exist, α - and β -, of which the α - is the more stable.

Properties: White crystals. Mp 82–92C (α - form converts partially to the β - form on heating). For equilibrium mixture optical rotation is +9.18 degrees. Very soluble in water and in methanol; soluble in absolute alcohol.

Use: Synthetic sweetener research.

rhenium.

CAS: 7440-15-5. Re. Metallic element, atomic number 75, group VIIB of the periodic table, aw 186.207; valences = -1, 1 through 7; 4, 6, and 7 are most common, the last being the most stable. There are two isotopes.

Properties: Silver-white solid or gray to black powder. D 21.02 (20C), mp 3180C, bp 5630C, tensile strength 80,000 psi, high modulus of elasticity, attacked by strong oxidizing agents (nitric and sulfuric acids). Practically insoluble in hydrochloric acid. Retains its crystalline structure all the way to its mp. Has widest range of valences of any element. Rhenium-molybdenum alloys are superconductive at 10K. Not attacked by seawater.

Source: Principally molybdenite.

Derivation: Solutions from refinery residues (molybdenum ore flue dust, copper ore treatment) are (1) concentrated by a salting-out processes and reduced

by hydrogen gas under press to give the metal, or (2) passed through an anionic resin from which pure rhenium can be extracted by a strong mineral acid.

Available forms: Powder that can be consolidated into rods, wires, or strips by powder metallurgy. Annealed metal is very ductile and can be bent, coiled, or rolled. Single crystals 2 inches \times 0.05–0.005 inch diameter.

Hazard: Flammable in powder form.

Use: Additive to tungsten- and molybdenum-based alloys, electronic filaments, electrical contact material, high-temperature thermocouples, igniters for flash bulbs, refractory metal components of missiles, catalyst, plating of metals by electrolysis and vapor-phase deposition.

rhenium heptasulfide. Re_2S_7 .

Properties: Brown-black solid. D 4.87, decomposes to ReS_2 at 600C. Insoluble in water; dissolves in solutions of alkali sulfides.

Hazard: Ignites on heating in air.

Use: Catalyst.

rhenium heptoxide. Re_2O_7 .

Properties: Yellow crystals. D 6.103, mp 297C. Dissolves in water to form perrhenic acid $HReO_4$; very soluble in alcohol.

Derivation: Oxidation of metallic rhenium at 400C.

rhenium pentachloride. $ReCl_5$.

Properties: Dark-green to black solid. D 4.9, decomposes on heating. Decomposes in water; soluble in hydrochloric acid and alkalies.

Derivation: By reacting rhenium heptoxide with carbon tetrachloride at 400C.

rhenium trichloride. $ReCl_3$.

Properties: Dark red solid, on heating emits green vapor from which the metal may be deposited, nonelectrolyte in solution, soluble in water and glacial acetic acid.

Derivation: Distillation of rhenium pentachloride.

rhenium trioxychloride. ReO_3Cl .

Properties: Colorless liquid. D 3.867 (20/4C), mp 4C, bp 131C. Decomposes in water; soluble in carbon tetrachloride, reacts readily with organic substances.

rheology. Science of the deformation and flow of materials in terms of stress, strain, and time. Has important bearing on the behavior of viscous liquids in plastic molding.

See liquid, Newtonian; dilatancy; thixotropy; viscosity.

rheometer. A device that continuously measures the viscosity and elasticity of resin solutions and polymer melts at high shear rates.

rhesus factor. (Rh factor). A substance present in the red blood cells of the rhesus monkey

and of 85% of an average, white, American population. Those whose red cells contain this factor are termed Rh-positive; others, Rh-negative. A negative individual may develop anti-Rh antibodies if Rh-positive red cells enter his blood; such antibodies can then agglutinate Rh-positive cells. Hemolytic reactions may thus occur following transfusion of Rh-positive blood cells into a recipient previously sensitized and having Rh antibodies in the serum. Likewise, an Rh-positive fetus, may give rise to antibodies in the blood of an Rh-negative mother; the antibodies, returning into the fetus may then produce the disease erythroblastosis fetalis. There are many subtypes of the Rh factor; these can be distinguished by serologic tests, and the laws of their inheritance have been determined.

rhizobitoxin. A broad-spectrum herbicide that attacks young growth and new leaves but has little effect on older growth. Said to have low toxicity to humans (USDA).

rho acid. See anthraquinone-1,5-disulfonic acid.

rhodamine B. (CI 45170).

CAS: 81-88-9. $C_{28}H_{31}ClN_2O_3$. A basic, red fluorescent dye, structurally related to xanthenes.

Properties: Green crystals or reddish-violet powder. Very soluble in water and alcohol, forming bluish red, fluorescent solution; slightly soluble in acids or alkalis.

Derivation: By fusion of *m*-diethylaminophenol and phthalic anhydride followed by acidification with hydrochloric acid.

Use: Red dye for paper, also for wool and silk where brilliant fluorescent effects are desired and light-fastness is of secondary importance; analytical reagent for certain heavy metals, biological stain.

rhodamine toner. Red to maroon lakes of rhodamine dyes and phosphotungstic or phosphomolybdic acid. They have good lightfastness and are used principally in printing inks. See phosphomolybdic pigment; phosphotungstic pigment.

rhodanine. (2-thio-4-keto-thiazolidine).

CAS: 141-84-4.

$SCH_2C(O)NHCS$.

Properties: Finely crystalline, light yellow color. D 0.868, bulk d 0.617, mp decomposes (often violently) 166C, pure material 167–168.5C. Soluble in methanol, ethyl ether, and hot water.

Hazard: May explode when heated to 166C. Toxic by ingestion.

Use: Organic synthesis (phenylalanine), laboratory reagent.

rhodinol.

CAS: 106-22-9. A mixture of terpene alcohols consisting principally of *l*-citronellol.

Properties: Colorless liquid; pronounced roselike odor. D 0.860–0.880 (25C), refr index 1.4630–1.4730 (20C), optical rotation –4 to –9 degrees. Soluble in alcohol and mineral oil; insoluble in water. Combustible.

Derivation: From Reunion geranium oil.

Grade: FCC.

Use: Perfumery, flavoring agent.

rhodinyl acetate. A mixture of terpene alcohol acetates consisting primarily of *l*-citronellyl acetate.

Properties: Colorless to slightly yellow liquid; rose-like odor. D 0.895–0.908 (25C), refr index 1.4530–1.4580 (20C), optical rotation –2 to 6 degrees. Soluble in alcohol and mineral oil; insoluble in glycerol. Combustible.

Derivation: Action of acetic anhydride on rhodinol in the presence of sodium acetate.

Grade: Technical, FCC.

Use: Perfumery, flavoring agent.

rhodinyl formate. mf: $C_{11}H_{20}O_2$

Properties: Colorless to slightly yellow liquid; leafy, rose-like odor. Mw: 184.28, d: 0.901–0.908, refr index: 1.453–1.458. Soluble in alcohol, fixed oils; insoluble in glycerin, propylene glycol, water at 200C.

Use: Flavoring agent.

rhodium.

CAS: 7440-16-6. Rh. Metallic element having atomic number 45, group VIII of the periodic table, aw 102.9055, no isotopes, valence = 3.

Properties: White solid of platinum group. D 12.41 (20C), mp 1966C, bp 4500C. Insoluble in acids and aqua regia; soluble in fused potassium bisulfate. Harder and higher-melting than platinum or palladium, highest in electrical and thermal conductivity of the platinum group. High surface reflectivity. A strong complexing agent.

Occurrence: Ontario, South Africa, Siberia.

Derivation: Occurs with platinum, from which it is recovered during the purification process.

Available forms: Produced as powder that can be fabricated by casting or powder metallurgy techniques. Single crystals are available.

Hazard: Flammable in powder form. TLV: (insoluble rhodium compounds) 1 mg/m³; (soluble rhodium salts): 0.01 mg/m³.

Use: Alloy with platinum for high temperature thermocouples, furnace windings, laboratory crucibles, spinnerettes in rayon industry; electrical contacts, jewelry, catalyst, optical instrument mirrors, electrodeposited coatings for metals, vacuum-deposited glass coatings, headlight reflectors.

rhodium carbonyl chloride. $Rh(CO)_2Cl_2$.

Properties: Reddish crystals. Mp 125C. Soluble in

alcohol, benzene, acetone, with decomposition; solid material is stable in dry air.

Use: Catalyst for organic reactions.

rhodium chloride. (rhodium trichloride).

CAS: 10049-07-7. RhCl_3 .

Properties: Reddish-brown powder. Mp 450–500C, bp 800C (sublimes). Insoluble in water and acids; soluble in solutions of alkalis and cyanides.

Hazard: Toxic by ingestion.

Use: Manufacture of rhodium trifluoride.

rhodium (III), triaminetrinitratato-

See triaminetrinitratatorhodium (III).

rhodochrosite. MnCO_3 with partial replacement by iron, calcium, magnesium, zinc.

Properties: Light-pink, rose-red, brownish-red, or brown mineral; white streak; vitreous to pearly luster; photoluminescent. Found in veins with ores of silver, lead, copper manganese. D 3.3–3.6, Mohs hardness 3–4.

Occurrence: U.S. (Connecticut, New Jersey, Colorado, Montana, Nevada), Europe.

Use: Manganese ore.

rhodonite. An ore of manganese.

See manganous silicate.

rhodopsin. The red-light-sensitive pigment of the eye (visual purple) consisting of the proteins opsin and retinene (vitamin A aldehyde). It occurs in land and marine vertebrates.

rhodoxanthin. $\text{C}_{40}\text{H}_{50}\text{O}_2$. A natural carotenoid pigment used in the food, drug, and cosmetic industries.

Properties: Soluble in benzene and chloroform; slightly soluble in alcohols.

“Rhonite” [Rohm & Haas]. TM for thermo-setting modified and unmodified urea-formaldehyde condensates. Supplied as water-clear solutions and aqueous pastes. Reactive with cotton, various grades producing shrink resistance, crease proofing, or modification of hand.

Use: Finishing of natural and synthetic fabrics.

“Rhoplex” [Rohm & Haas]. TM for aqueous dispersions of acrylic copolymers. White, opaque emulsions; various grades differing in hardness, flexibility, adhesion, and tack of film; some thermosetting. Produce colorless, transparent films with outstanding permanence, durability, adhesion, and pigment-binding capacity.

Use: Emulsion paints, paper coatings and saturation, floor sealers and wax emulsions, textile-backing and finishing, bonding fibers and pigments, clear and pigmented coatings on wood and metals.

“Rhothane” [Rohm & Haas]. TM for an agricultural insecticide based on 1,1-

bis(chlorophenyl)-2,2-dichloroethane and supplied as a wettable powder or emulsion concentrate.

“Rhozyme” [Rohm & Haas]. TM for enzyme concentrate with diastatic or proteolytic activity. Buff-colored powders or liquids of fungal or bacterial origin that hydrolyze and solublize proteins and starches.

Use: Desizing textile fabrics; drycleaning; liquefaction of starch paste; fermentation processes; manufacture of corn syrup, fish solubles, septic tank formulations; animal feed; meat tenderizer.

rhubarb yellow.

CAS: 478-43-3. mf: $\text{C}_{15}\text{H}_8\text{O}_6$.

Hazard: Low toxicity by ingestion.

RI. See retention index.

Rib. Abbreviation for ribose.

ribavirin. See 1- β -*d*-ribofuranosyl-1,2,4-triazole-3-carboxamide.

ribbon mixer. A mixing or blending machine whose essential components are a steel bowl or trough, jacketed for temperature control, within which rotates an agitating device consisting of two or more metal strips (ribbons) pitched in opposite directions spirally arranged around a central shaft. The curved and reverse-pitched ribbons operate on the principle of the screw; the material is moved forward by one ribbon and backward by another, so that efficient mixing is effected. Continuous operation is possible in some types. Such equipment is used for mixing dry powders, viscous liquids, slurries, etc., as well as for drying, crystallizing, and deaerating. Large sizes have a bowl diameter of 5 ft and a length of 9.5 feet.

riboflavin. (vitamin B_2 ; 7,8-dimethyl-10-(1'-*d*-ribityl) isoalloxazine).

CAS: 83-88-5. $\text{C}_{17}\text{H}_{20}\text{N}_4\text{O}_6$. A crystalline pigment, the principal growth-promoting factor of the vitamin B_2 complex. It functions as a flavoprotein in tissue respiration. A syndrome resembling pellagra is thought to be due to riboflavin deficiency.

Properties: Orange-yellow crystals; bitter taste. Mp 282C (decomposes). Slightly soluble in water and alcohols; insoluble in lipid solvents; stable to heat in dry form and in acid solution. Stable to ordinary

oxidation, unstable in alkaline solution and quite sensitive to light. In solution, riboflavin has an intense greenish-yellow fluorescence. Amounts are expressed in milligram or micrograms of riboflavin.

Source: (Food) Milk, green leafy vegetables, egg yolk, liver, enriched flour, yeast; (commercial) distiller's residues, fermentation solubles, synthetic production (indirectly from dextrose, lactose, yeast, and whey).

Grade: USP, FCC.

Use: Medicine, nutrition, animal feed supplement, enriched flours, dietary supplement.

riboflavin-5'-phosphate. (FMN; flavin mononucleotide). The phosphate ester of riboflavin in which the phosphate is esterified to the ribityl portion of riboflavin. It functions as a coenzyme for many flavine enzymes. The riboflavin group has the ability to take up hydrogen atoms, thus oxidizing the substrate.

Properties: (Sodium salt) Yellow crystals; quite sensitive to UV light. Much more soluble than riboflavin in water.

Derivation: By treating riboflavin with chlorophosphoric acid.

Use: Dietary supplement, flavor potentiator.

riboflavin 5'-phosphate sodium.

CAS: 130-40-5. mf: $C_{127}H_{20}N_4NaO_9 \cdot 2H_2O$.

Properties: Fine orange-yellow crystalline powder; slt odor. Hygroscopic; sol in water. Decomposed by light when in solution.

Use: Food additive.

9-β-D-ribofuranosyladenine. See adenosine.

1-β-d-ribofuranosyl-1,2,4-triazole-3-carboxamide.

CAS: 36791-04-5. mf: $C_8H_{12}N_4O_5$.

Properties: Mp: 174–176°. Sol in H_2O .

Hazard: Mildly toxic by ingestion. An experimental teratogen.

Use: As an antiviral agent.

ribonuclease. An enzyme that causes splitting of ribonucleic acid. Pancreatic ribonuclease for example, cleaves only phosphodiester bonds that are linked to pyrimidine-3'-phosphates. It is a critical regulator of life processes in the cell. The first enzyme to be synthesized (1969), it is composed of 124 amino acid residues. It is one of the proteins for which the sequence of amino acids has been elucidated (the order or sequence of amino acids is of critical importance in the functioning of enzymes, genes, and nucleotides).

See: Genetic code; RNAse.

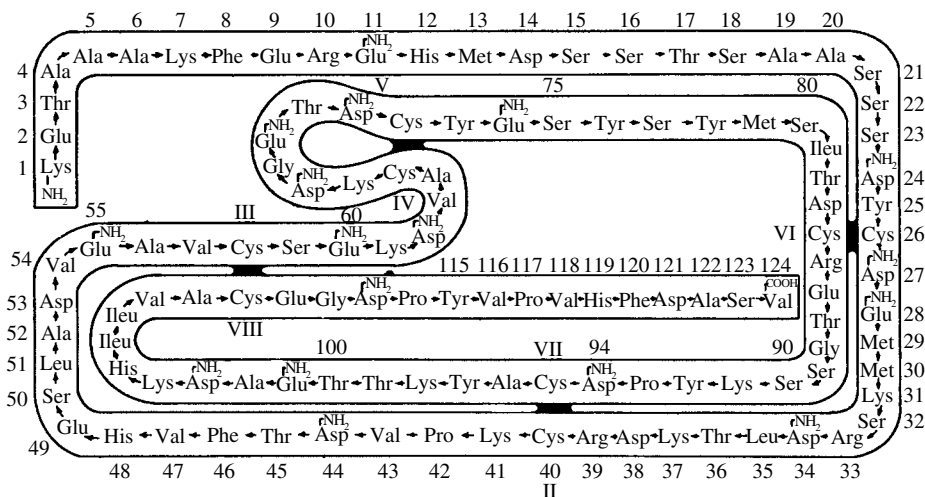

ribonucleic acid. (ribose nucleic acid; RNA).

Generic term for a group of natural polymers consisting of long chains of alternating phosphate and d-ribose units, with the bases adenine, guanine, cytosine, and uracil bonded to the 1-position of the ribose. Ribonucleic acid is universally present in living cells and has a functional genetic specificity due to the sequence of bases along the polyribonucleotide chain.

Four types are recognized:

(1) Messenger RNA, synthesized in the living cell by the action of an enzyme that carries out the polymerization of ribonucleotides on a DNA template region that carries the information for the primary sequence of amino acids in a structural protein. It is a ribonucleotide copy of the deoxynucleotide sequences in the primary genetic material.

(2) Ribosomal RNA, that exists as a part of a functional unit within living cells called the ribosome, a particle containing protein and ribosomal RNA in roughly 1:2 parts by weight having a particle weight, of about three million. See ribosome.

Messenger RNA combines with ribosomes to form polysomes containing several ribosome units, usually 5 (e.g., during hemoglobin synthesis), complexed to the messenger RNA molecule. This aggregate structure is the active template for protein biosynthesis.

(3) Transfer RNA, the smallest and best characterized RNA class. Its molecules contain only 80 nucleotides per chain. Within the class of transfer RNA molecules there are probably at least 20 separate kinds, correspondingly related to each of the 20 amino acids naturally occurring in proteins. Transfer RNA must have at least two kinds of specificity: (a) It must recognize (or be recognized by) the proper amino acid-activating enzyme so that the proper amino acid will be transferred to its free 2'- or 3'-OH group. (b) It must recognize the proper triplet on the messenger RNA-ribosome aggregate. Having these properties, the transfer RNA accepts or forms an intermediate transfer RNA-amino acid that finds its way to the polysome, complexes at a triplet coding for the activated amino acid, and allows transfer of the amino acid into peptide linkage.

(4) Viral RNA, isolated from a number of plant, animal, and bacterial viruses, may be considered as a polycistronic messenger RNA. It has been shown to have molecular weights of one or two million. Generally speaking, there is one molecule of RNA per infective virus particle. The RNA of an RNA virus can be separated from its protein component and is also infective, bringing about the formation of complete virus.

From article by F. J. Bollum in *Encyclopedia of Biochemistry*. See deoxyribonucleic acid; RNA.

ribonucleotide. A nucleotide containing D-ribose as its pentose component.
See nucleotide.

riboprobe. A strand of RNA synthesized in-vitro (usually radiolabeled) and used as a probe for hybridization reactions. An RNA probe can be synthesized at very high specific activity, is single stranded (and therefore will not self anneal), and can be used for very sensitive detection of DNA or RNA.

ribose. See ribonucleic acid; deoxyribose.

D-ribose-5-phosphoric acid. $C_5H_9O_4 \cdot H_2PO_4$.
A constituent of nucleotides and nucleic acids.
Properties: The barium salt (5.5 H_2O) is sparingly soluble in cold water and crystallizes in hexagonal plates.

Derivation: From inosinic acid.

Use: Biochemical research.

ribosome. A ribonucleoprotein, the smallest organized structure in the cell. Ribosomes occur in all cells including bacteria, fungi, algae, and protozoa. They are the central point of protein synthesis. They contain from 45 to 60% of ribonucleic acid (RNA),

the balance being proteins. Ribosome crystals have been produced; in the electron microscope these appear as sheets of black dots, each sheet (one ribosome thick) containing hundreds of ribosomes in recurring groups of four.

See deoxyribonucleic acid; ribonucleic acid.

D-ribosyl uracil. See uridine.

rice bran wax.

Properties: Tan to brown hard wax. Mp: 75°. Sol in chloroform, benzene; insol in water.

Use: Food additive.

rice paper. See straw.

Richards, Theodore W. (1868-1928). An American chemist born in Germantown, PA. He was the first American to receive the Nobel Prize in chemistry. He studied chemistry at Haverford and Harvard, with a doctorate in chemistry from Harvard where he later became Erving Professor of Chemistry. An outstanding experimental chemist, his major interests were atomic weights, thermochemistry, and thermodynamics. He was also a brilliant teacher. He was president of the ACS in 1914, and the recipient of many honorary awards, including the Davy, Faraday, and Gibbs medals.

"Ricilan" [Dow]. TM for esters synthesized from castor oil and lanolin components. Amber, viscous liquids.

Use: Hydrophobic emollients, pigment dispersants.

ricin.

CAS: 9009-86-3.

Properties: White powder. The albumin of the castor oil bean is the toxic principle. Extracted from the pressed seeds with 10% solution of sodium chloride followed by precipitation with magnesium sulfate.

Hazard: Very highly toxic by ingestion; small particle in cut, abrasion, eye, or nose may prove fatal.

Use: Reagent for pepsin and trypsin, agriculture.

ricin D.

CAS: 9040-12-4.

Hazard: A poison.

Source: Natural product.

ricinin.

CAS: 524-40-3. mf: $C_8H_8N_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

ricinine. (1,2-dihydro-4-methoxy-1-methyl-2-oxonicotinonitrile). $C_8H_8O_2N_2$.

Properties: White, crystalline alkaloid. Slightly soluble in water, chloroform, and ether. Mp 201.5C, sublimes 170-180C (20 mm Hg).

Derivation: From castor oil seeds and leaves.

Hazard: Toxic by ingestion.

Use: Biochemical research.

ricinoleic acid. (*cis*-12-hydroxyoctadec-9-enoic acid; 12-hydroxyoleic acid; castor oil acid). CAS: 141-22-0.

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}_2\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOH}$. A C_{18} unsaturated fatty acid that comprises 80% of the fatty acid content of castor oil.

Properties: Colorless to yellow, viscous liquid. D 0.940 (27.4/4C), mp 5.5C, bp 226C (10 mm Hg), refr index 1.4697 (20C), dextrorotatory. Soluble in most organic solvents; insoluble in water. Combustible.

Derivation: Saponification of castor oil.

Use: Soaps, Turkey red oil, textile finishing, source of sebatic acid and heptanol, ricinoleate salts, 12-hydroxystearic acid.

ricinoleyl alcohol. (9-octadecen-1,12-diol).

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}_2\text{CH}=\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The fatty alcohol derived from ricinoleic acid. It has a long, straight chain with one double bond and one hydroxyl group in a secondary position besides the primary group on the end. Available as a 90% product.

Properties: Colorless, nondrying liquid at room temperature. Iodine value 91.8%, cloud point -12.2C, boiling range 170-328C, viscosity 51 (SSU/21C). Combustible.

Derivation: Reduction of acid made from castor oil.

Impurities: Oleyl and linoleyl alcohols.

Use: Protective coatings, polyesters, plasticizers, organic synthesis, pharmaceuticals, lubricants, surface-active agents.

ricinus oil. See castor oil.

Riegler's test. A test for nitrous acid using sodium naphthionate and β -naphthol.

Riehm quinoline synthesis. Formation of quinoline derivatives by prolonged heating of arylamine hydrochlorides with ketones with or without use of aluminum chloride or phosphorus pentachloride.

Riemschneider thiocarbamate synthesis.

The action of concentrated sulfuric acid followed by treatment with ice water serves to transform arylthiocyanates into the corresponding thiocarbamates.

rifametane.

CAS: 94168-98-6. mf: $\text{C}_{44}\text{H}_{60}\text{N}_4\text{O}_{12}$.

Hazard: Moderately toxic by ingestion.

rifapentine.

CAS: 61379-65-5. mf: $\text{C}_{47}\text{H}_{64}\text{N}_4\text{O}_{12}$. /T Hazard: Moderately toxic by ingestion.

Riley oxidations. Oxidations of organic compounds with selenium dioxide, e.g., the oxidation of active methylene groups to carbonyl groups.

"Rilsan." TM for nylon 11.

See nylon.

RIM. Abbreviation for reaction injection molding.

ring compound. See cyclic compound; alicyclic; aromatic; heterocyclic.

Ringer's solution. Physiologic solution containing 0.650 g sodium chloride, 0.014 g potassium chloride, 0.0129 g calcium chloride, 0.020 g sodium bicarbonate, 0.001 g monosodium phosphate, 0.200 g dextrose in 100 g water. It is isotonic with frog blood serum.

ring whizzer. A fluxional molecule frequently encountered in organometallic chemistry in which rapid rearrangements occur by migrations about unsaturated organic rings.

ripening. (cheese).

See aging; curing.

risedronate sodium.

CAS: 115436-72-1. mf: $\text{C}_7\text{H}_{10}\text{NO}_7\text{P}_2 \bullet \text{Na}$.

Hazard: Human systemic effects.

risk communication. In genetics, a process in which a genetic counselor or other medical professional interprets genetic test results and advises patients of the consequences for them and their offspring.

ristocetin. An antibiotic produced by the fermentation of *Nocardia lurida*, a species of Actinomycetes. The antibiotic has two components, ristocetin A and ristocetin B. The commercial product is a lyophilized preparation representing a mixture of A and B, of which B is no more than 25%.

Properties: White or tan crystals or powder; practically odorless. Freely soluble in water; practically insoluble in organic solvents.

Grade: USP.

Use: Medicine.

"Riston" [DuPont-Toray]. TM for engineering resins and high end specialty polymers.

"Ritalan" [RITA]. TM for ethoxylated, hydrogenated, hydroxylated lanolin.

Use: As an emulsifier, emollient, conditioner, moisturizer, stabilizer in make-up, lipstick, skincare products, bath products, shampoo, soap, shaving cream, ointment, sun preparations, and veterinary products.

ritanserin.

CAS: 87051-43-2. mf: $\text{C}_{27}\text{H}_{25}\text{F}_2\text{N}_3\text{O}_5$.

Hazard: A poison.

Ritter reaction. Formation of amides by addition of olefins or secondary and tertiary alcohols to nitriles in strongly acidic media.

Rittinger's law. The energy required for reduction in particle size of a solid is directly proportional to the increase in surface area.

See Kick's law.

rivastatin.

CAS: 143201-11-0. mf: $C_{26}H_{33}FNO_5 \bullet Na$.

Hazard: A poison by ingestion.

Rn. Symbol for radon.

RNA (ribonucleic acid). A chemical found in the nucleus and cytoplasm of cells; it plays an important role in protein synthesis and other chemical activities of the cell. The structure of RNA is similar to that of DNA. There are several classes of RNA molecules, including messenger RNA, transfer RNA, ribosomal RNA, and other small RNAs, each serving a different purpose.

RNAi. (RNA interference; RNA silencing).

The mechanism by which small double-stranded RNAs can interfere with expression of any mRNA having a similar sequence. Those small RNAs are known as "siRNA", for short interfering RNAs. The mode of action for siRNA appears to be via dissociation of its strands, hybridization to the target RNA, extension of those fragments by an RNA-dependent RNA polymerase, then fragmentation of the target. Importantly, the remnants of the target molecule appears to then act as an siRNA itself; thus the effect of a small amount of starting siRNA is effectively amplified and can have long-lasting effects on the recipient cell.

The RNAi effect has been exploited in numerous research programs to deplete the call of specific messages, thus examining the role of those messages by their absence.

RNA interference. See RNAi.

RNA polymerase. An enzyme essential in imparting the DNA genetic code to ribonucleic acid (RNA).

RNase. Ribonuclease; an enzyme which degrades RNA. It is ubiquitous in living organisms and is exceptionally stable. The prevention of RNase activity is the primary problem in handling RNA.

RNase protection assay. This is a sensitive method to determine (1) the amount of a specific mRNA present in a complex mixture of mRNA and/or (2) the sizes of exons which comprise the mRNA of interest. A radioactive DNA or RNA probe (in excess) is allowed to hybridize with a sample of mRNA (for example, total mRNA isolated from tissue), after which the mixture is digested with

single-strand specific nuclease. Only the probe which is hybridized to the specific mRNA will escape the nuclease treatment, and can be detected on a gel. The amount of radioactivity which was protected from nuclease is proportional to the amount of mRNA to which it hybridized. If the probe included both intron and exons, only the exons will be protected from nuclease and their sizes can be ascertained on the gel.

RNA silencing. See RNAi.

RNA splicing. Removal of introns and joining of exons in a primary transcript.

roasting. Heating in the presence of air or oxygen. Most commonly used in converting natural metal sulfide ores to oxides as a first step in recovery of metals such as zinc, lead, copper, etc. Roasting is an oxidation process.

See smelting.

Robinson annellation reaction. Formation of six-membered-ring α,β -unsaturated ketones by condensation of cyclohexanones with methyl vinyl ketone or its equivalents, followed by an intramolecular aldol condensation.

Robinson-Schopf reaction. Synthesis of tropinones from a dialdehyde, methylamine, and acetonedicarboxylic acid.

Robinson, Sir Robert. (1886–1975). An English chemist who won the Nobel Prize for chemistry in 1947. His work began on plants with biological significance, particularly those containing alkaloids. He synthesized brazilin and haematoxylin. In organic chemistry he discovered an important qualitative electronic theory. He explicated the penicillin structure as well. His education, which began at the University of Manchester, took him throughout Europe.

Rochelle salt. See potassium-sodium tartrate.

rock crystal. See quartz.

rocket fuel. (rocket propellant). A substance or mixture that has the capacity for extremely rapid but controlled combustion that produces large volumes of gas at high pressure and temperature. These fuels may be either liquid, solid, or combinations of both. Liquid monopropellants are hydrogen peroxide and hydrazine, catalyzed by finely divided metals to decompose them into gases. Liquid bipropellants consist of the fuel and an oxidizer; typical fuels of this type are hydrogen, hydrazine, ammonia, and boron hydride, the oxidizers being oxygen, nitric acid, ozone, hydrogen peroxide, and water. Solid propellants include nitrocellulose plasticized with nitroglycerin or various phthalates and inorganic salts suspended in a plastic or synthetic rubber

(e.g., "Thiokol") and containing a finely divided metal. The inorganic oxidizers used are ammonium and potassium nitrates and perchlorates.

rock flour. Mud-sized material ground from coarse grains by the movement of a glacier.

Rockwell hardness. See hardness.

rodenticide. A pesticide used to kill rats and other rodents.
See warfarin.

rod mill. A closed steel cylinder one-third filled with rods of about the same length as the cylinder and 1–2 inches in diameter. As the cylinder rotates, the rods roll over one another, exerting a combination of impact and grinding action on the charge. It gives a product of 50–60 mesh with a minimum of fines. Rod mills are used for pulp grinding in the paper industry and for size reduction of ores, minerals, metal powders, etc.

roentgen. (r). The international unit of quantity or dose for both X-rays and γ -rays. It is defined as the quantity of X or γ rays that will produce as a result of ionization one electrostatic unit of electricity of either sign in 1 cc (0.001293 g) of dry air as measured at 0C and standard atmospheric pressure. The use of the roentgen unit has been extended to include particle radiation such as α - and β -particles and protons and neutrons.
See rad; curie.

Roentgen, W. K. (1845–1923). A German physicist who discovered X rays in 1895, for which he was awarded the Nobel Prize in 1901. Application of these to a number of important problems in analytical chemistry was developed by the Braggs, Moseley, von Laue, and Debye and Sherrer.

Rohrbach solution.

Properties: Clear, yellow liquid. Very refractive, d 3.5.

Derivation: An aqueous solution of mercuric barium iodide.

Hazard: Toxic by ingestion and inhalation.

Use: Separating minerals by their specific gravity, microchemical detection of alkaloids.

roll mill. Two chilled steel rolls 48–72 inches wide and 12–24 inches in diameter turning in opposite directions at different speeds to exert shearing action; the separation (or nip) is adjustable by set screws. Because the shearing friction generates considerable heat, the rolls are water cooled. Such mills are standard equipment in the rubber, plastic, and adhesives industries; several usually rotate on one shaft. They can be used for mixing, but their chief use is for prewarming calender and extruder feed. Mills with three rolls are used for mixing and grind-

ing paints and printing inks. Laboratory sizes of all types are available.

RON. Abbreviation for Research octane number.

ronnell. (*O,O*-dimethyl-*O*-(2,4,5 trichlorophenyl)phosphorothioate).

CAS: 299-84-3. $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_2\text{Cl}_3$.

Properties: Powder or granules. Mp 41C. Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by ingestion and inhalation. Cholinesterase inhibitor, use may be restricted. TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide.

room temperature. An ambient temperature from 20 to 25C (68–77F).

ropivacaine.

CAS: 98717-16-9. mf: $\text{C}_{17}\text{H}_{26}\text{N}_2\text{O}$.

Hazard: Human systemic effects

rosaniline.

CAS: 632-99-5. $\text{HOC}(\text{C}_6\text{H}_4\text{NH}_2)_2\text{C}_6\text{H}_5(\text{CH}_3)\text{NH}_2$. A triphenylmethane dye.

Properties: Reddish-brown crystals. Mp 186C (decomposes). Soluble in acids and alcohol; slightly soluble in water.

Use: Dye (usually as the hydrochloride), fungicide.

roscoelite. $\text{K}_2\text{V}_4\text{AlSi}_6\text{O}_{20}(\text{OH})_4$.

Properties: A vanadium-bearing species of mica. Formula variable with V_2O_5 up to 28%. Occurs as minute scales with micaceous cleavage, dark green to brown in color, pearly luster, Mohs hardness 2.5, d 3.0.

Occurrence: Colorado, California, Australia.

Use: Source of vanadium.

Rose Bengal. $\text{C}_{20}\text{H}_4\text{Cl}_4\text{I}_4\text{O}_5$.

Properties: Bluish-pink powder. Soluble in water.

Use: Biological stain; colorant for inks, celluloses, foods, cosmetics, medicine (diagnostic aid).

Rose, Irwin. (1926–). An American born in Brooklyn, New York who won the Nobel Prize for chemistry in 2004 for his pioneering work concerning the discovery of ubiquitin-mediated protein degradation. Rose received his B.S. in 1948 from Washington State University and his Ph.D. in biochemistry in 1952 from the University of Chicago. He is currently a distinguished professor-in-residence at the Department of Physiology and Biophysics of the College of Medicine at the University of California, Irvine.

Rosenheim color test. On addition of nine parts of trichloroacetic acid in water to a solution of ergosterol in chloroform, an immediate red color develops, gradually changing to pure blue. The test is specific to sterols containing a diene system or capable of forming one on acid dehydration.

Rosenmund reaction. Formation of aromatic arsonic acids by heating equimolar amounts of sodium or potassium arsenite with aryl halides in aqueous solution. The reaction is an extension of the Meyer reaction.

Rosenmund reduction. Catalytic reduction of acid chlorides to aldehydes. To prevent further hydrogenation, a poison is added to the catalyst.

Rosenmund—von Braun synthesis. Formation of aromatic nitriles from aryl halides and cuprous cyanide.

rosin.

Properties: Angular, translucent, amber-colored fragments. D 1.08, mp 100–150C, acid number above 150, flash p 370F (187C). Insoluble in water; freely soluble in alcohol, benzene, ether, glacial acetic acid, oils, carbon disulfide, dilute solutions of fixed alkali hydroxides. Hard and friable at room temperature; soft and very sticky when warm. Combustible.

Chief constituents: Resin acids of the abietic and pimaric types, having the general formula $C_{19}H_{29}COOH$ and a phenanthrene nucleus.

See turpentine.

Derivation: From pine trees, chiefly *Pinus palustris* and *Pinus caribaea*. (1) Gum rosin is the residue obtained after the distillation of turpentine oil from the oleoresin tapped from living trees. (2) Wood rosin is obtained by extracting pine stumps with naphtha and distilling off the volatile fraction. (3) Tall-oil rosin is a by-product of the fractionation of tall oil.

Grade: Virgin, yellow dip, hard, NF. Wood rosin grades are B, C, D, E, F, FF, G, H, I, J, K, L, M, N, W-G (window-glass), W-W (water-white). The grading is done by color; B is the darkest and W-W the lightest.

Hazard: Evolves irritating and suffocating fumes on heating.

Use: Hot-melt and pressure-sensitive adhesives, mastics and sealants, varnishes, ester gum, soldering compounds, core oils, insulating compounds, soaps, paper sizing, printing inks, polyesters (formed by reaction of the conjugated acids of rosin with acrylic acid, followed by reaction with a glycol).

See abietic acid.

rosin core solder pyrolysis products.

CAS: 8050-09-7.

Hazard: A poison by ingestion and inhalation route.

TLV: Reduce to as low a concentration as possible
Source: Natural product.

rosin oil.

Properties: Water-white to brown liquid, viscous; odorless; strong peculiar taste. D 0.980–1.110, iodine number 112–115. Soluble in ether, chloroform, fatty oils, and carbon disulfide; slightly soluble in

alcohol, insoluble in water. Essentially decarboxylated rosin acids.

Derivation: By fractional distillation of rosin, that portion distilling above 360C being rosin oil.

Hazard: Spontaneous heating, fire risk when heated.

Use: Lubricant, adulterant for boiled linseed oil, hot-melt adhesives, printing inks, impregnating paper for wrapping electric cables, core compounds, varnishes.

rosin soap. See sodium abietate; soap.

rosolic acid. See aurin.

rotameter. An instrument for measuring the flow rates of liquids and gases.

“Rotax” TM for a purified grade of 2-mercapto-benzothiazole.

Use: Primary accelerator for rubber.

rotenone. (tubatoxin).

CAS: 83-79-4. $C_{23}H_{22}O_6$. A pentacyclic compound.

Properties: White, crystals; odorless. D 1.27 (20C), mp 163C. Strongly levorotatory in solution. Specific rotation for D line 230 degrees in benzene, 62 degrees in ethylene dichloride. Soluble in ether, alcohol, acetone, and other organic solvents; insoluble in water; not compatible with alkalis.

Grade: CP crystals, technical, also as extracts of derris and cube root.

Hazard: Toxic by ingestion, overexposure can be fatal, irritant to skin. TLV: 5 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide, flea powders, fly sprays, moth-proofing agents.

Rothmund reactions. Preparation of *meso*-tetrasubstituted porphyrins by condensation of pyrrole with an aldehyde.

rottenstone. Soft, friable aluminum silicate.

Use: Polishing agent.

rouge.

CAS: (1) 1309-37-1. (1) A high-grade red pigment used as a polishing agent for glass, jewelry, etc.

Properties: Dark-red powder. Insoluble in water.
Hazard: TLV: 10 mg/m³; not classifiable as a human carcinogen.

See iron oxide red.

(2) A cosmetic prepared from dried flowers of the safflower.

Rowe rearrangement. Intramolecular rearrangement of pseudophthalazones into phthalazones by heating at 180C in the presence of dilute aqueous acids.

Rowland, Frank Sherwood (1927–). An American who won the Nobel Prize for chemistry along with Paul Crutzen and Mario Molina in 1995

for their work in atmospheric chemistry, particularly concerning the formation and decomposition of ozone.

See Crutzen, Paul; Molina, Mario.

Roxel process. A process for increasing the flame resistance of cotton by chemically modifying the fiber, i.e., by applying a formulation consisting of tetrakis(hydroxymethyl)phosphonium chloride (THPC), triethylamine, and urea in aqueous solution. These substances cross-link with the hydroxyl groups of the cellulose to form an efficient and durable protective medium. This process is used in the manufacture of blankets, curtains, bed linen, and industrial safety garments.

“Royalac” [Uniroyal]. TM for an accelerator for EPDM elastomers.

“Royalene” [Great Lakes/Asia Pacific].

TM for a low-cost, high-performance ethylene-propylene terpolymer.

Properties: Resistance to ozone, heat, weather, sunlight aging, steam, and chemicals. Resilient at low temperatures, excellent electrical properties and can be easily colored.

Use: Tires, automotive parts, tank cars, hoses, and insulation.

royal jelly. A complex mixture secreted by “worker” honeybees that composes the sole nutrient of the queen bee. It contains 31% protein, 15% carbohydrate, 15% lipid, plus vitamins. The free fatty acid portion of the lipid is a mixture of C₁₀ acids.

Royal Society of London. As the UK national academy of science founded in 1660, the Royal Society plays a crucial role as the champion of top quality science and technology. It does this by: funding research, grants, issuing reports, publishing journals, and awarding medals and prizes to scientists throughout the world. By virtue of its independent status and its body of some 1300 Fellows and Foreign Members covering all scientific disciplines, the Society is uniquely placed to represent the interests of top quality science and technology in its interactions with government, the public and the media. It adopts a high profile on issues which are vital to scientific progress and is taking an increasingly prominent position in furthering the role of science, engineering and technology in society by facilitating constructive dialogue between scientists and non-scientists. Headquarters are at 6 Carlton House Terrace, London, SW1Y 5AG, UK.
Website: <http://www.royalsoc.ac.uk>.

RR acid. (2-amino-8-naphthol-3,6-disulfonic acid; 2R acid). C₁₀H₄NH₂OH(SO₃H)₂.

Derivation: Fusion of a naphthylamine trisulfonic acid with sodium hydroxide.

Use: Azo dye intermediate.

rRNA. A class of RNA molecules serving as components of ribosomes.

RTV. (room-temperature-vulcanizing). Rubbers that have good physical properties and electrical properties similar to silicone rubber.

Use: Sealing, caulking, encapsulating and flexible mold-making in electronic, aircraft, missile and building industries.

See silicone.

Ru. Symbol for ruthenium.

RU 13. See 9-diethylaminoethyl-2-phenylimidazo(1,2-a)benzimidazole.

rubber. Any of a number of natural or synthetic high polymers having unique properties of deformation (elongation or yield under stress) and elastic recovery after vulcanization with sulfur or other cross-linking agent, which in effect changes the polymer from thermoplastic to thermosetting. The yield or stretch of the vulcanized material ranges from a few hundred to over 1000%. The deformation after break, called *permanent set*, is usually taken as the index of recovery; it ranges from 5 to 10% for natural rubber to 50% or more for some synthetic elastomers, and varies considerably with the state of vulcanization and the pigment loading. See elastomer.

rubber cement. See adhesive, rubber-based.

rubber, chlorinated. An elastomer (natural rubber or a polyolefin) to which 65% of chlorine has been added to give a solid, film-forming resin. White, amorphous powder available in viscosity grades from 5 to 125 cP, the figures indicating viscosity of a 20% solution in toluene. Decomposes at 125C, soluble in aromatics, insoluble in aliphatics and alcohols. Compatible with almost all natural and synthetic resins. Chief use is in maintenance paints (marine, swimming pool, traffic, masonry, etc.). See “Hypalon”; rubber hydrochloride.

Hazard: Do not dry-mill chlorinated rubber with zinc oxide; mixture reacts violently at 216C. Do not use in baked enamels.

rubber, cold. See cold rubber.

rubber fiber. Generic name for a manufactured fiber in which the fiber-forming substance comprises natural or synthetic rubber (Federal Trade Commission). Often the rubber is a core around which cotton or other fibers are wrapped to make an elastic yarn used for girdles, swimwear, elastic bands, and tapes.

rubber, hard. A rubber compounded with 30–50% by weight of sulfur and cured until an extremely hard, brittle product is formed. Lime or magnesia is used as activator. The theoretical maxi-

mium of sulfur that can combine chemically with rubber hydrocarbon is 32%. Combustible.

Hazard: Flammable in form of dust.

Use: Battery boxes, tank linings, acid- and alkali-resistant equipment, combs. As dust, filler for low-cost rubber products.

rubber hydrochloride. A hydrochloride derivative, as distinct from a chlorine derivative.

Properties: Thermoplastic, white powder or clear film; odorless; tasteless. Chlorine content 29–30.5%. Soluble in aromatic hydrocarbons. Softens at 110–120C. Films are highly resistant to moisture, oils, acids, and alkalis but tend to become brittle on exposure to sunlight. The life of such films is greatly extended by the incorporation of suitable stabilizers and plasticizers. Nonflammable, non-toxic.

Derivation: A solution of natural rubber is treated with anhydrous hydrogen chloride under pressure and at low temperature. After neutralization of excess hydrochloric acid, the product is precipitated by the addition of ethanol.

Use: Protective coverings for machinery, rain clothing, shower curtains, food packaging.

rubber latex. See latex

rubber, liquid. Any of several proprietary products consisting of high polymers in liquid form for use as coatings, adhesives, etc.

rubber, natural. (polyisoprene).
CAS: 9006-04-6. (C₅H₈)_x.

(1) Crude (unvulcanized)

Properties: Chemically unsaturated. D 0.92. Amorphous when unstretched, but has oriented crystalline structure on stretching; not stable to temperature changes (thermoplastic), readily oxidizable by mastication; soluble in acetone, carbon tetrachloride, and most organic solvents; refr index 1.52; dielectric constant 2.5. Processed by calendars and extruders; can be injection molded with low sulfur and high accelerator. Cured by hot-molding or in open steam at temperatures from 120 to 150C after addition of 3% sulfur, 1% organic accelerator, 3% zinc oxide, plus fillers or reinforcing agents. The only factors of significance in vulcanization are the time of exposure to heat and the temperature used.

Derivation: From latex obtained from Hevea trees, coagulated with acetic or formic acid. Also made synthetically.

See "Coral"; "Natsyn."

Occurrence: Brazil, Malaysia, Indonesia.

Grade: Ribbed, smoked sheets, pale (yellow) crepe; brown crepe.

Use: Cements, adhesives, electrical insulating tapes and cable wrapping.

(2) Cured (vulcanized, i.e., sulfur cross-linkages)

Properties: High tensile strength; relatively low permanent set; insensitive to temperature changes. Attacked by heat, atmospheric oxygen, ozone, hydrocarbons, and unsaturated fats and oils. Insoluble in acetone. Permeable to gases; supports combustion; abrasion resistance poor unless compounded with carbon black; dissipates vibration shock; high electrical resistivity.

Use: Vehicle tires, hose, conveyor-belt covers, footwear, specialized mechanical products, drug sundries, foam rubber, electric insulation, etc.

Note: Gutta percha and balata have similar chemical composition (isomeric) but have very different properties and few commercial uses. Neither can be vulcanized. See latex; guayule; Appendix II for history of the industry.

rubber sponge. (foam rubber; cellular rubber). A flexible foam produced by beating air into heat-sensitized latex, with subsequent vulcanization, or by incorporating ammonium carbonate or sodium bicarbonate into a strongly masticated and highly accelerated rubber mixture. As the temperature rises to the curing range, ammonia or carbon dioxide is released, forming uniform pores throughout the mixture just before the onset of vulcanization.

Use: Vibration damping pads and inserts, rug and carpet underlays, mattresses and upholstery, seat cushions.

rubber, synthetic. Any of a group of manufactured elastomers that approximate one or more of the properties of natural rubber. Some of these are: sodium polysulfide ("Thiokol"), polychloroprene (neoprene), butadiene-styrene copolymers (SBR), acrylonitrilebutadiene copolymers (nitrile rubber), ethylenepropylene-diene (EPDM) rubbers, synthetic polyisoprene ("Coral," "Natsyn"), butyl rubber (copolymer of isobutylene and isoprene), polyacrylonitrile ("Hycar"), silicone (polysiloxane), epichlorohydrin, polyurethane ("Vulkollan").

The properties of these elastomers are widely different. All require vulcanization. In general, sulfur is used only for unsaturated polymers; peroxides, quinones, metallic oxides, or diisocyanates effect vulcanization with saturated types. Many are special-purpose rubbers, some can be used in tires when loaded with carbon black, others have high resistance to attack by heat and hydrocarbon oils and thus are superior to natural rubber for steam hose, gasoline and oil-loading hose. Most are available in latex form.

rubber, thermoplastic. Any of several block copolymers of propylene/EPDM or styrene/ethylene-butylene. Cross-linking results from crystallization of polypropylene or polystyrene segments. Since this is reversible on heating, the product is

thermoplastic. Its chief use is in oil-resistant wire and cable insulation.

ruberythric acid. $C_{26}H_{28}O_{14}$. An alizarin glucoside.

rubidium. Rb.

CAS: 7440-17-7. Metallic element of atomic number 37, group IA of the periodic table, aw 85.4678, valence = 1. One stable form, principal natural radioactive isotope is rubidium-87. It is the second most electropositive and the second most alkaline element, has lowest ionization potential. Highly reactive.

Properties: Soft, silvery-white solid. Easily oxidized in air. Decomposes water, d 1.532 (20C as solid), mp 39C, bp 688C, high heat capacity and heat transfer coefficient. Soluble in acids and alcohol.

Derivation: (1) Thermochemical reduction of rubidium chloride with calcium, (2) electrolysis of fused cyanide or chloride.

Source: Lepidolite, carnallite, pollucite, mineral springs, and natural brines.

Grade: Technical, 99+%.

Hazard: Reacts vigorously with air and water, must be stored under kerosene or similar liquid, dangerous fire and explosion risk. Metal causes serious skin burns.

Use: Photocells, catalyst or catalyst promotor.

rubidium alum. See aluminum rubidium sulfate.

rubidium azide.

CAS: 22756-36-1. mf: N_3Rb .

Hazard: A poison by ingestion. May be unstable, especially when heated.

rubidium carbonate. Rb_2CO_3 .

Properties: White powder. Mp 837C. Extremely hygroscopic; soluble in water. Dissociates above 900C.

Hazard: Strong irritant to tissue.

Use: Special glass formulations.

rubidium chloride.

CAS: 7791-11-9. $RbCl$.

Properties: White, crystalline powder; lustrous. D 2.76, mp 715C, bp 1390C. When heated it decrepitates, melts, and volatilizes. Soluble in water; almost insoluble in alcohols.

Grade: Technical, CP, single crystals.

Use: Analysis (testing for perchloric acid), source of rubidium metal.

rubidium dichromate.

CAS: 13446-73-6. mf: $Cr_2O_7Rb_2$.

Properties: Crystals. D: 3.02–3.13. IDLH Ca [15 mg/m³ [Cr(VI)].

Hazard: A confirmed carcinogen. A poison. A powerful oxidizer. TWA 0.05 mg(Cr)/m³; Confirmed Human Carcinogen

rubidium fluoride. RbF .

Properties: White crystals. D 3.557, mp 775C, bp 1410C. Soluble in water; insoluble in alcohol.

Available forms: Single large crystals.

Hazard: Strong irritant to tissue. TLV: 2.5 mg(F)/m³.

rubidium hexafluorogermanate. Rb_2GeF_6 .

Properties: White, crystalline solid. Mp 696C. Slightly soluble in cold water; very soluble in hot water.

rubidium hydroxide. (rubidium hydrate).

CAS: 1310-82-3. $RbOH$.

Properties: Grayish-white mass. D 3.2, mp 300C. Extremely hygroscopic. Absorbs carbon dioxide from air. Strong base. Soluble in alcohol, water. Attacks glass at room temperature.

Hazard: Strong irritant to tissue.

Use: Suggested for electrolyte in storage batteries for low-temperature use.

ruby. Synthetic rubies, usually in the form of rods, are made from aluminum oxide containing small amounts of other metals, such as 0.05% chromic oxide, by single-crystal-growing techniques. These are used extensively in masers and lasers.

See corundum.

ruby glass. See glass, ruby.

“Rucate” [Bayer Material]. TM for powder coating resins.

rue oil and herb.

Properties: From steam distillation of fresh blossoming plants *Ruta graveolens* L., *Ruta montana* L., or *Ruta bracteosa* L. (Fam. *Rutaceae*). Yellow to amber liquid; fatty odor. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol.

Use: Food additive.

Ruff-Fenton degradation. Shortening of the carbon chain of sugars by the oxidation of aldonic acids (as calcium salts) with hydrogen peroxide and ferric salts.

run. (1) The amount of substance processed in a single operation. (2) Complete cycle of operations. (3) Completed procedure.

runner. The secondary feed channel (usually circular) in a multiple-cavity injection mold that connects the sprue with the gate. In certain cases, molding can be performed satisfactorily without runners (runnerless molding).

run-off. see Nuclear run-on.

run-on. see Nuclear run-on.

Rupe reaction. The dehydration of an acetylenic alcohol to a substituted vinyl acetylene followed

by hydration of the triple bond to give α,β -unsaturated ketones.

rupture disk. Thin pieces of metal between flanges that break at a certain pressure.

rust. (1) The reddish corrosion product formed by electrochemical interaction between iron and atmospheric oxygen; ferric oxide (Fe_2O_3). The reaction occurs most rapidly in moist air, indicating the catalytic activity of water.

(2) A reddish-yellow fungus that attacks plants, especially cereal grains; it is also called smut. It can be controlled by treatment with formaldehyde.

ruthenium.

CAS: 7440-18-8. Ru. Metallic element of atomic number 44, group VIII of the periodic table, aw 101.07, valences = 3, 4, 5, 6, 8. Seven stable isotopes.

Properties: Silvery-white solid of the platinum metal group. D 12.41 (20C), mp 2310C, bp 3900C, Brinell hardness 220 (cast). Insoluble in acids and in aqua regia. Attacked by alkaline oxidants (concentrated sodium hydroxide solution) and by fused alkalis.

Derivation: Occurs with platinum, from which it is recovered.

Grade: Technical, single crystals.

Use: Hardener for platinum and palladium in jewelry, electrical contact alloys, catalyst, medical instruments, corrosion-resistant alloys, electrodeposited coatings, nitrogen-fixing agent (experimental), solar cells (experimental); the oxide is used to coat titanium anodes in electrolytic production of chlorine; the dioxide serves as an oxidizer in photolysis of hydrogen sulfide.

ruthenium chloride. (ruthenic chloride; ruthenium sesquichloride).

CAS: 10049-08-8. RuCl_3 .

Properties: Black solid; deliquescent. D 3.11. Decomposes above 500C. Insoluble in cold water; decomposes in hot water; slightly soluble in alcohol.

Grade: Technical, CP.

Use: Analysis (testing for sulfur trioxide).

ruthenium red. (ammoniated ruthenium oxychloride). $\text{Ru}_2(\text{OH})_2\text{Cl}_2 \cdot 7\text{NH}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Brownish-red powder. Soluble in water.

Use: Microscopic stain and reagent for pectin, plant mucin, and gum.

ruthenium tetroxide.

CAS: 20427-56-9. RuO_4 .

Properties: Yellow crystals. Mp 25C, bp 100C. Sublimes at room temperature. Strong oxidizing agent. Soluble in carbon tetrachloride.

Derivation: Acidic solutions of ruthenium compounds are heated with strong oxidizing agents.

Hazard: Fire risk in contact with organic materials.

Use: Oxidizing agent (carbon tetrachloride as solvent).

ruthenocene. (dicyclopentadienylruthenium).

$(\text{C}_5\text{H}_5)_2\text{Ru}$.

Properties: A stable, light-yellow solid. Mp 199C.

Use: Intermediate for high-temperature compounds and for UV radiation absorbers in paints.

rutherfordium. Rr. A transfermium element.

Atomic number 104. Very short half-life.

Rutherford, Sir Ernest. (1871–1937). Born

in New Zealand, Rutherford studied under J. J. Thomson at the Cavendish Laboratory in England. His work constituted a notable landmark in the history of atomic research as he developed Becquerel's discovery of radioactivity into an exact and documented proof that the atoms of the heavier elements, which had been thought to be immutable, actually disintegrate (decay) into various forms of radiation. Rutherford was the first to establish the theory of the nuclear atom and to carry out a transmutation reaction (1919) (formation of hydrogen and an oxygen isotope by bombardment of nitrogen with α -particles). Uranium emanations were shown to consist of three types of rays, α (helium nuclei) of low penetrating powder, β (electrons), and γ , of exceedingly short wavelength and great energy. Rutherford also discovered the half-life of radioactive elements and applied this to studies of age determination of rocks by measuring the decay period of radium to lead-206. See Aston; Bohr.

rutile. TiO_2 . Natural titanium dioxide. May contain up to 10% iron.

Properties: Red to reddish-brown to black color, adamantine to submetallic luster, streak pale-brown. Hardness 6–6.5, d 4.3, mp 1640C, refr index 2.7. Insoluble in acids.

Occurrence: Virginia, West Africa, Australian beach sands.

Use: Source of titanium and titanium compounds; ceramics; steel deoxidizer; welding rod coatings; pigment for paints, enamels, and tile.

Ruzicka large-ring synthesis. Formation of

large-ring alicyclic ketones from dicarboxylic acids by thermal decomposition of salts with metals of the second and fourth groups of the periodic table (calcium, thorium, cerium).

Ruzicka, Leopold. (1887–1976). A chemist

who won the Nobel Prize in 1939 with Butenandt. His work involved research in organic synthesis including polymethylenes and higher terpenes. He was the first chemist to synthesize musk, androsterone, and testosterone from cholesterol. His medical degree was awarded at the University of Basel, Switzerland, although he was born in Croatia and partially educated in Germany.

ryania. An insecticidal principle extracted from the wood of a family of tropical American trees (*Ryania speciosa*). In commercial practice the wood is fine-ground and used as a component of certain insecticide formulations.

Hazard: Moderately toxic.

"Rynite" [Du Pont]. TM for a glass-reinforced polyester engineering plastic; it is extremely stiff, with glass content of 45%. A modified polyeth-

ylene terephthalate featuring high temperature resistance, high tensile and impact strength, and good electrical resistance.

"Ryolex" [Silbrico]. TM for industrial perlite insulation.

Use: For coatings, adhesives, and sealants; as a filter aid for purifying chemicals.

See perlite.

S

S. Symbol for sulfur.

S. See Svedberg.

S. (S).
See entropy.

Sabatier, Paul. (1854–1941). A French chemist who received the Nobel Prize in chemistry in 1912 along with Victor Grignard. His work involved the behavior of oxides as oxidizing catalysts and as agents for dehydrating and dehydrogenating. He received his Ph.D. in Nîmes, France, and went on to become lecturer and faculty member in Toulouse, France.

Sabatier-Senderens reduction. Catalytic hydrogenation of organic compounds in the vapor phase by passage over hot, finely divided nickel (the oldest of all hydrogenation methods).

D-saccharic acid. (2,3,4,5-tetrahydroxyhexanedioic acid; tetrahydroxyadipic acid). $\text{COOH}(\text{CH}_2\text{O})_4\text{COOH}$. The 1,6-dicarboxylic acid formed by the oxidation of D-glucose.

Properties: White needles or syrup. Mp 125–126C with decomposition. Very soluble in water, alcohol, or ether; deliquescent. Combustible.

Derivation: Oxidation of cane sugar, glucose, starch by nitric acid.

saccharification. Conversion of wood and other cellulose (biomass) to glucose by acid hydrolysis or enzymic hydrolysis. An experimental method using anhydrous hydrogen fluoride with vacuum distillation is under development.

saccharin. (*o*-benzosulfimide; gluside; benzoylsulfonic imide).
CAS: 81-07-2. The anhydride of *o*-sulfimide benzoic acid. A nonnutritive sweetener.

Properties: White, crystalline powder; exceedingly sweet taste (500 times that of sucrose). Mp 226–230C. Soluble in amyl acetate, ethyl acetate, benzene, and alcohol; slightly soluble in water, chloroform, and ether.

Derivation: A mixture of toluenesulfonic acids is converted into the sodium salt then distilled with phosphorus trichloride and chlorine to obtain the *o*-toluene sulfonyl chloride which, by means of am-

monia, is converted into *o*-toluenesulfamide. This is oxidized with permanganate, treated with acid, and saccharin crystallized out. In food formulations, saccharin is used in the form of its sodium and calcium salts. Sodium bicarbonate is added to provide water solubility.

Grade: Commercial, CP, USP, FCC.

Hazard: The National Academy of Sciences has stated that saccharin is a weak carcinogen in animals and a potential human carcinogen. Products containing it must have a warning label.

saccharin ammonium. See ammonium saccharin.

saccharolactic acid. See mucic acid.

saccharose. See sucrose, carbohydrate.

saccharose unit. See carbohydrate.

Sachse process. See BASF process.

“SACI” [Crompton & Knowles]. TM for a rust-, and corrosion-preventive product effective in coatings as thin as 0.5 mil.

S acid. (1-amino-8-naphthol-4-sulfonic acid).

Properties: Gray needles, white when pure. Slightly soluble in water, insoluble in alcohol and ether.

Derivation: Fusion of 1-naphthylamine-4,8-disulfonic acid with sodium hydroxide.

Use: Azo dye intermediate.

2S acid. See Chicago acid.

sacrificial protection. The preferential corrosion of a metal coating for the sake of protecting the substrate metal. For example, when zinc is in contact with a more noble (less reactive) metal in the electromotive series, such as steel, a galvanic cell is created in which electric current will flow in the presence of an electrolyte. Atmospherically contaminated moisture constitutes the electrolyte. Under these conditions, the zinc coating rather than the steel is affected. Thus, galvanic protection with zinc is sometimes called sacrificial protection.
See galvanizing.

S-adenosylmethionine. (adoMet; SAM). An enzymatic cofactor involved in methyl group transfers.

SAE. Abbreviation for Society of Automotive Engineers. The initials are applied to its specifications and tests for motor fuels, oils, and steels.

SAE steel. A grade or type of steel indicated by a number system; they are principally plain carbon and of low to medium alloy content, used primarily in machine parts. The first two numerals designate either plain carbon or the alloy grouping and quantity, and the last two the mean carbon content in hundredths of 1%. Thus, 10 indicates carbon steels, 13 manganese steels; 40 and 44, molybdenum steels (the latter of higher alloy content); 50 and 51, chromium steels (the latter of higher alloy content); 41, chromium-molybdenum; 61, chromium-vanadium; 92, silicon and silicon-chromium; 46 and 48, nickel-molybdenum (the latter of higher nickel content); and 81, 94, 86, 87, 88, 47, 43, and 93, nickel-chromium-molybdenum in the order of increasing alloy content. The letter B between the first two and last two numerals indicates the presence of boron in amounts of 0.0005–0.003% as a depth-hardening addition.

SAF black. Abbreviation for super-abrasion furnace black.

safety engineering. Application of engineering principles to chemical plant safety by professionally trained personnel. Following is a checklist of the more important items.

(1) Plant construction: separate buildings or outdoor location of hazardous reaction vessels, storage tanks, etc.; interior fire walls and doors, exterior blow-out walls, sprinkler systems, enclosed stairways, explosion vents and safety valves, scram alarm systems, color-coded pipelines.

(2) Fire and explosion prevention, dust control, proper storage of flammable liquids, grounding of electrical equipment, accessibility of extinguishers and hose lines, leak detection of reaction vessels, adequate ventilation of storage rooms, accumulation of solid wastes, static spark control (metal-free shoes, static bars on friction-generating machinery).

(3) Toxic hazards: workroom concentration of toxic agents must conform to OSHA and ACGIH tolerances.

(4) Protective equipment: goggles and gloves, acid-proof clothing, face masks and respirators, lifelines, eye-wash fountains, flooding showers. For hot labs and plants handling radioactive materials; decontamination equipment, glove boxes, and remote-control devices.

(5) Accident prevention: emergency shutoffs on machines with moving parts; housing on gears, lathes, rotors, etc.; operator-restraining devices; proper handling of chain hoists, carton stackers, pallets; training personnel in safety practice.

safety glass. (shatterproof glass). A composite or laminate consisting of two sheets of plate glass with an interlayer of polyvinyl butyral. The plastic is bonded to the glass such that shattering on impact is virtually eliminated. Required for automobile windshields, also used for bulletproof glass, train windows, etc.

Saffil. TM for a group of synthetic inorganic fibers made from alumina and zirconia.

safflower oil. Drying oil from safflower (*carthamus*) seed, somewhat similar to linseed oil. It is nonyellowing. Contains 78% linoleic acid (unsaturated fatty acid).

Properties: Straw-colored liquid. D 0.923–0.927 (25/25C), refr index 1.4740–1.4745 (25C), acid value 0.6–1.5, iodine no. 140–152, saponification no. 186–193, unsaponifiable 0.3–1.0%. Combustible.

Derivation: Hydraulic or solvent extraction of seeds. **Use:** Alkyd resins, paints, varnishes, medicine, dietetic foods, margarine, hydrogenated shortening.

saffron.

Properties: From the dried stigma of *Crocus sativus* L.

Use: Food additive.

“Saflex” [Solutia]. TM for polyvinyl butyral adhesive film supplied in clear, translucent, tinted, or graduated color, for the plastic interlayer in safety glass.

safranine. A family of dyes, some of which are useful as biological stains, based on phenazine, having CI Nos. 50200–50375

safrole. (4-allyl-1,2-methylenedioxybenzene).

CAS: 94-59-7. $C_{11}H_{14}O_2$

Properties: Colorless or pale-yellow oil. The odor-giving constituent of sassafras, camphorwood, and other oils. D 1.100–1.107 (15C), mp 11C, bp 233C, optical rotation –0 degrees 30 minutes (15C), refr index 1.5363–1.5385 (20C). Soluble in alcohol; slightly soluble in propylene glycol; insoluble in water and glycerol.

Derivation: From oil of sassafras or camphor oil.

Method of purification: Rectification or freezing.

Grade: Technical.

Hazard: Toxic by ingestion, may not be used in food products (FDA), a carcinogen.

Use: Perfumery and soaps, manufacture of heliotropin, medicine (antiseptic).

“SAG” [Dow]. TM for silicone defoamers used in many industrial and chemical processes.

sage oil. A yellow to green essential oil used in perfumery and flavoring; dextrorotatory. There are two varieties (Clary and Dalmatian) which have different constituents.

SAIB. Abbreviation for sucrose acetate isobutyrate.

sal ammoniac. See ammonium chloride.

salicin. (salicyl alcohol glucoside).

$HOCH_2C_6H_4OC_6H_{11}O_5$. A glucoside obtained from several species of *Salix* and *Populus*.

Properties: Colorless crystals or white powder. Mp 199–202C, d 1.43. Soluble in water, alcohol, alkalies, glacial acetic acid; insoluble in ether.

Use: Medicine (analgesic), reagent for nitric acid.

salicylal. See salicylaldehyde.

salicyl alcohol. (*o*-hydroxybenzyl alcohol; α -2-dihydroxytoluene; saligenin).

CAS: 90-01-7. $\text{C}_6\text{H}_4(\text{CH}_2\text{OH})\text{OH}$.

Properties: White crystals; pungent taste. Mp 86–87C, d 1.16, sublimes at 100C. Very soluble in alcohol, chloroform, ether; soluble in propylene glycol, benzene, and fixed oils; sparingly soluble in cold water; soluble in hot water. Combustible.

Derivation: Hydrolysis of salicin, heating phenol and methylene chloride with caustic.

Use: Medicine (local anesthetic).

salicyl alcohol glucoside. See salicin.

salicylaldehyde. (salicylal; salicylic aldehyde; *o*-hydroxybenzaldehyde).

CAS: 90-02-8. $\text{C}_6\text{H}_4\text{OHCHO}$.

Properties: Colorless, oily liquid or dark-red oil; bitter, almondlike odor; burning taste. D 1.165–1.172, fp –7C, bp 196C, flash p 172F (77.7C). Soluble in alcohol, ether, and benzene; slightly soluble in water. Combustible.

Derivation: Interaction of phenol and chloroform in presence of aqueous alkali.

Use: Analytical chemistry, perfumery (violet), synthesis of coumarin, auxiliary fumigant, flavoring.

salicylaldehyde dimethyl acetal carbamate.

CAS: 6884-59-9. mf: $\text{C}_{11}\text{H}_{15}\text{NO}_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

salicylamide. (*o*-hydroxybenzamide).

CAS: 65-45-2. $\text{C}_6\text{H}_4(\text{OH})\text{CONH}_2$.

Properties: White or slightly pink crystals. Mp 139–142C, bp decomposes at 270C. Soluble in hot water, alcohol, ether, chloroform; slightly soluble in cold water, naphtha, and carbon tetrachloride.

Derivation: Treatment of methyl salicylate with dry ammonia gas.

Grade: Technical, NF.

Use: Medicine (analgesic).

salicylanilide.

CAS: 87-17-2. $\text{HOC}_6\text{H}_4\text{CONHC}_6\text{H}_5$.

Properties: Odorless, white, or slightly pink crystals. Mp 136–138C, bp decomposes, stable in air. Slight-

ly soluble in water; freely soluble in alcohol, ether, chloroform and benzene.

Grade: NF.

Hazard: Toxic by ingestion, irritant to skin.

Use: Fungicide, slimicide, antimildew agent, intermediate.

salicylic acid. (*o*-hydroxybenzoic acid).

CAS: 69-72-7. $\text{C}_6\text{H}_4(\text{OH})(\text{COOH})$.

Properties: White powder; acrid taste. Stable in air but gradually discolored by light, d 1.443 (20/4C), mp 158–161C, bp 211C (20 mm Hg), sublimes at 76C. Soluble in acetone, oil of turpentine, alcohol, ether, benzene; slightly soluble in water. Combustible.

Derivation: Reacting a hot solution of sodium phenolate with carbon dioxide and acidifying the sodium salt thus formed.

Grade: Technical, USP, crude.

Hazard: Dust forms explosive mixture in air. Toxic by ingestion.

Use: Manufacture of aspirin and salicylates, resins, dyestuff intermediate, prevulcanization inhibitor, analytical reagent, fungicide.

salicylic acid, bismuth basic salt.

CAS: 14882-18-9. mf: $\text{C}_7\text{H}_5\text{BiO}_4$.

Hazard: A poison by ingestion. Human systemic effects.

Use: Agricultural chemical.

salicylic acid dipropylene glycol

monoester. See dipropylene glycol mono-salicylate.

salicylic aldehyde. See salicylaldehyde.

salicyloyloxytributylstannane.

CAS: 4342-30-7. mf: $\text{C}_{19}\text{H}_{32}\text{O}_3\text{Sn}$.

Hazard: A poison by ingestion. Tributyl tin compounds are extremely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

saligenin. (salicyl alcohol). $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$.

Use: Treatment for rheumatism.

saligenin cyclic phenyl phosphate.

CAS: 4081-23-6. mf: $\text{C}_{13}\text{H}_{11}\text{O}_4\text{P}$.

Hazard: A poison.

Use: Agricultural chemical.

saline water. See brine; ocean water.

salinity. The saltiness of natural water. The salinity of normal seawater is 35 parts salt per 1000 parts water.

salinomycin.CAS: 53003-10-4. mf: $C_{42}H_{70}O_{11}$.**Properties:** Crystals. Mp: 112.5–113.5°.**Use:** Drug (veterinary); food additive.**salmine.** A protein specific to the salmon.**Use:** Nutritional and biochemical research.**salol.** See phenyl salicylate.**saloquinine.** (salicyl quinine.) $HO C_6H_4COOC_{20}H_{23}N_{20}$.**Use:** Antipyretic, antiperiodic.**sal soda.** (washing soda; sodium carbonate decahydrate). $Na_2CO_3 \cdot 10H_2O$.**Properties:** White crystals. D 1.44, mp 32.5–34.5C (loses water at this temperature). Easily soluble in water; insoluble in alcohol. A pure form of sodium carbonate (soda ash).**Use:** Washing textiles, bleaching linen and cotton, general cleanser.**salt.** (1) The compound formed when the hydrogen of an acid is replaced by a metal or its equivalent (e.g., an NH_4^+ radical). Example:

This is typical of the general rule that the reaction of an acid and a base yields a salt and water. Most inorganic salts ionize in water solution.

(2) Common salt, sodium chloride, occurs widely in nature, both as deposits left by ancient seas and in the ocean, where its average concentration is 2.6%.

See sodium chloride; soap.

salt bath. A molten mixture of sodium, potassium, barium, and calcium chlorides or nitrates to which sodium carbonate and sodium cyanide are sometimes added. Used for hardening and tempering of metals and for annealing both ferrous and nonferrous metals. Temperatures used may be as high as 1315C for hardening high-speed steels. Commercial mixtures are available for a variety of specifications.

See fused salt.

salt bridge. An ionic bond between charged groups that are part of larger covalent structures; salt bridges occur in many proteins.**salt cake.** Impure sodium sulfate (90–99%).**Properties:** For properties and derivation see sodium sulfate.**Grade:** Technical, glassmakers' (iron-free).**Use:** Paper pulp, detergents and soaps, plate and window glass, sodium salts, ceramic glazes, dyes. See sodium sulfate.**salt, fused.** See fused salt.**salting out.** Reduction in the water solubility of an organic solid or liquid by adding a salt (usually

sodium chloride) to an aqueous solution of the substance. Ions of the dissolved salt attract and hold water molecules, thus making them less free to react with the solute. The result of this is to decrease the solubility of the solute molecules with consequent separation or precipitation. Colloidal suspensions of proteins, soaps, and similar substances are precipitated in this way.

salt, molten. See fused salt.**salt of tartar.** See acid potassium tartrate.**salt peter.** See niter, potassium nitrate.**salt, rock.** See sodium chloride.**salts of fatty acids.****Properties:** Consists of aluminum, calcium, magnesium, potassium, and sodium salts of capric, caprylic, lauric, myristic, oleic, palmitic, and stearic acids manufactured from fats and oils derived from edible sources.**Use:** Food additive.**salvage pathway.** Synthesis of a biomolecule from intermediates in the degradative pathway for the biomolecule; a recycling pathway, as distinct from a de novo pathway.**salvarsan.** (dihydroxydiaminoarsenobenzene dihydrochloride). $C_{12}H_{14}O_2N_2Cl_2As_2 \cdot 2H_2O$.**Use:** To treat syphilis.**salvia oil.** The Dalmatian variety of sage oil.**SAM.** See S-adenosylmethionine.**samarium.** Sm. A rare-earth metal of the lanthanide group (group IIIB of the periodic table), atomic number 62, aw 150.4; valences = 2, 3; seven stable isotopes.**Properties:** Hard, brittle metal that quickly develops an oxide film in air. An active reducing agent. Ignites at 150C, liberates hydrogen from water. D 7.53, mp 1072C, bp 1900C, hardness similar to iron, high neutron absorption capacity. Combustible.**Occurrence:** Australia, Brazil, southeastern U.S., South Africa; also from bastnasite ore in California.**Derivation:** Reduction of the oxide with barium or lanthanum.**Use:** Neutron absorber, dopant for laser crystals, metallurgical research, permanent magnets.**samarium chloride.** $SmCl_3 \cdot 6H_2O$.**Properties:** Faintly yellow, hygroscopic crystals. D 2.383. Loses $5H_2O$ at 110C. Soluble in water.**Derivation:** By treating the carbonate or oxide with hydrochloric acid.**samarium oxide.** Sm_2O_3 .**Properties:** Cream-colored powder. D 8.347, mp

2300C. Insoluble in water; soluble in acids. Absorbs moisture and carbon dioxide from the air.

Use: Catalyst in the dehydrogenation of ethanol, infrared-absorbing glass, neutron absorber, preparation of samarium salts.

sampling. The methods and the techniques used in obtaining representative test samples of quantity lots of raw materials, semiprocessed work, and finished product for production and quality control. Rules for sampling procedures for both solid and liquid materials have been established by the National Cottonseed Products Association, Memphis, TN and by the National Institute of Oilseed Products, San Francisco, CA. The techniques of physical sampling are one application of statistical quality control.

SAN. Abbreviation for styrene-acrylonitrile polymer.

See polystyrene.

sand. Sediment particulates ranging in size from 1/16 to 2 mm.

See silica.

sandalwood oil. (santal oil). A pale-yellow, essential oil; strongly levorotatory.

Use: In fragrances, perfumes, and flavoring.

sandalwood oil, West Indian oil. See amyris oil, West Indian type.

sandarac. A natural resin obtained from Morocco. Its commercial form is yellow, brittle, amorphous lumps or powder; soluble in alcohol; insoluble in benzene and water.

Use: Special types of varnishes and lacquers.

sand casting. See foundry sand.

Sandmeyer diphenylurea isatin synthesis.

Formation of a cyanoforamidine by treatment of a symmetrical diphenylthiourea with potassium cyanide in alcohol containing lead carbonate, reduction with ammonium sulfide, and ring closure with concentrated sulfuric acid to isatin-2-anil; also formed smoothly by ring closure of the cyanoforamidine with aluminum chloride in benzene or carbon disulfide.

Sandmeyer isonitrosoacetanilide isatin

synthesis. Formation of isonitrosoacetodiphenylamide by condensation of chloral hydrate, hydroxylamine, and aniline; cyclization with concentrated sulfuric acid; and quantitative hydrolysis to isatin on dilution.

Sandmeyer reaction. Replacement of diazonium groups in aromatic compounds by halo or cyano groups in the presence of cuprous salts, copper powder, or cupric salts.

sandstone. A siliciclastic sedimentary rock consisting primarily of sand, usually sand that is predominantly quartz.

sandwich molecule. See metallocene; ferrocene.

Sanger, Frederick. (1918–). An English biochemist who won the Nobel Prize for chemistry in 1958. His research was on protein structure. He identified the amino acid sequence of the protein insulin. His Ph.D. was awarded from Cambridge University.

Sanger sequencing. A widely used method of determining the order of bases in DNA.

See sequencing; shotgun sequencing.

sanguinarine hydrochloride.

CAS: 5578-73-4. mf: $C_{20}H_{14}NO_4 \bullet Cl$.

Hazard: Moderately toxic by ingestion.

sanitizer. A special class of disinfectant designed for use on food-processing equipment, dairy utensils, dishes, and glassware in restaurants. Among them are the hypochlorites, chloramines, and other organic, chlorine-liberating compounds, and quaternary ammonium compounds, many of which are proprietary.

See antiseptic; disinfectant.

santal oil. See sandalwood oil.

santalol.

CAS: (α) 8006-87-9. $C_{15}H_{24}O$. A sesquiterpene alcohol.

Properties: Colorless liquid; odor of oil of sandalwood. D 0.971–0.973, refr index 1.504–1.508, bp 300C. Soluble in three parts of 70% alcohol; insoluble in water. Combustible.

Derivation: From sandalwood oil.

Use: Perfumery.

santalyl acetate. Acetic acid ester of a mixture of α - and β -santalols.

Properties: Colorless liquid; light odor of sandalwood. D 0.982–0.985, refr index 1.487–1.492.

Derivation: Treatment of sandalwood oil or santalol with acetic anhydride.

Use: Perfumery.

“Santicizer” [Solutia]. TM for a series of plasticizers, including various sulfonamides, phthalates, and glycolates.

“Santicizer 141” [Solutia]. TM for an alkylaryl phosphate ester plasticizer.

Properties: Clear, oily liquid.

Use: Imparts flame resistance, good low temperature properties, light and weathering stability, and stability in vinyls.

“Santicizer 148” [Solutia]. (alkyl diaryl phosphate ester). TM for a flexible, processable, and compatible flame-retardant plasticizer.

Properties: Clear liquid.

Use: For vinyl and nonvinyl resins.

“Santochlor” [Solutia]. (*p*-dichlorobenzene).

CAS: 106-46-7. TM for moth- and mildew-control agents.

Use: For space deodorants.

“Santocure” [Solutia]. TM for a series of accelerators for natural and synthetic rubbers.

“Santoflex” [Solutia]. TM for a series of rubber antioxidants and antiozonants.

α -santonin.

CAS: 481-06-1. $C_{15}H_{18}O_3$. A tricyclic structure.

Properties: White powder turning yellow on exposure to light; odorless; tasteless at first, then bitter. D 1.187, mp 170–173C, bp sublimes, specific rotation –170 to –175 degrees (2 g/100 mL alcohol). Soluble in chloroform, alcohol, and most volatile and fatty oils; very slightly soluble in water; solutions are levorotatory.

Derivation: By extraction from *Artemisia*.

Hazard: Toxic by ingestion, affects color vision.

Grade: Technical.

Use: Medicine (anthelmintic).

“Santoquin” [Solutia]. TM for ethoxyquin.

Use: Antioxidant in animal feeds and dehydrated forage crops.

“Santovar A” [Solutia]. TM for 2,5-di-*tert*-amylhydro-quinone.

“Santowax” R [Solutia]. TM for mixed terphenyls. Yellowish-white, noncrystalline, flaked solid.

Use: Extender for polystyrene.

saponification. The chemical reaction in which an ester is heated with aqueous alkali such as sodium hydroxide to form an alcohol (usually glycerol) and the sodium salt of the acid corresponding to the ester. The process is usually carried out on fats (glyceryl esters of fatty acids). The sodium salt formed is called a soap. A typical saponification reaction is $(C_{17}H_{35}COO)_3C_3H_5 + 3NaOH \rightarrow 3C_{17}H_{35}COONa + C_3H_5(OH)_3$.

See soap.

saponification number. The number of milligrams of potassium hydroxide required to hydrolyze 1 g of a sample of an ester (glyceride, fat) or mixture.

saponin. (1) A general term applied to two groups of plant glycosides that on shaking with water form colloidal solutions giving soapy lathers; they form oil/ester emulsions and are used as protective col-

loids. They also have the ability to hemolyze red blood corpuscles at very great dilutions. The two groups are triterpenoid and steroid saponins; the latter are used in research on sex hormones.

(2) Specific term refers to saponin derived from *Saponaria* or *Quillaja*.

Properties: White, amorphous glucoside; pungent, disagreeable taste and odor. It foams strongly when shaken with water. Soluble in water.

Grade: Crude, purified, highest purity.

Hazard: Highly toxic by injection; destroys red blood cells. Moderately toxic by ingestion.

Use: Foam producer in fire extinguishers, detergent in textile industries, sizing, substitute for soap, emulsification agent for fats and oils.

sapphire. (Al_2O_3). Synthetic sapphire is made by crystal-growing techniques.

Properties: Hard, crystalline solid. D 3.98, Mohs hardness 9.0, mp 2040C, dielectric strength 480 kV/cm, dielectric constant 9.0 (20C), coefficient of friction 0.05 micron, inert to strong acids and alkalis, excellent high-temperature stability. Can be sealed to glass. High transmission in infrared and ultraviolet.

Available forms: Rods, spheres, disks, whiskers, single crystals.

Use: Electron and microwave tubes, optical elements in radiation detectors, substrate for thin-film components and integrated circuits, abrasive, record needles, precision instrument bearings, aluminum composites, micromortars for hand-pulverizing chemicals.

See corundum.

sauquinavir mesylate. See fortovase.

saran. See polyvinylidene chloride; saran fiber.

saran fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 80% by weight of vinylidene chloride units ($-CH_2CCl_2-$) (Federal Trade Commission).

Properties: Tenacity 2–2.5 g/denier, elongation 15–30%, softens at 115–137C. Highly resistant to most chemicals and solvents, weather, moths, and mildew. Combustible but self-extinguishing.

Use: Screens, upholstery, curtain and drapery fabrics, rugs and carpets, awnings, filter cloth. See polyvinylidene chloride.

sarcosine. See melphalan.

sarcomere. A functional and structural unit of the muscle contractile system.

sarcosine. (methyl glyco-coll; methylaminoacetic acid). CH_3NHCH_2COOH .

Properties: Deliquescent crystals; sweet taste. Mp

210–215C (decomposes). Very soluble in water; slightly soluble in alcohol. Combustible.

Derivation: Decomposition of creatine or caffeine.
Grade: Technical.

Use: Synthesis of foaming antienzyme compounds for toothpaste, cosmetics, and pharmaceuticals.

sardine oil. See fish oil.

Sarett oxidation. Oxidation of primary and secondary alcohols to aldehydes and ketones by means of CrO_3 -pyridine complex.

sarin. (methylphosphonofluoride acid, isopropyl ester).
CAS: 107-44-8. $[(\text{CH}_3)_2\text{CHO}](\text{CH}_3)\text{FPO}$. A nerve gas.

Hazard: Toxic by inhalation and skin absorption, cholinesterase inhibitor.

“Sartoner 213” monomer [Sartomer].

TM for 1,4-butanediol diacrylate.

CAS: 1070-70-8.

Available forms: Liquid.

Use: A cross-linking agent with polymerization characteristics. Product is a hard, clear, infusible resin. Uses include inks, adhesives, textile products, polyesters, and photoresists.

SAS. (1) Abbreviation for sodium aluminum sulfate.

See aluminum sodium sulfate.

(2) Abbreviation for sodium alkane sulfonate.

SASOL process. See gasification.

satellite. A chromosomal segment that branches off from the rest of the chromosome but is still connected by a thin filament or stalk.

satellite DNA. Highly repeated, nontranslated segments of DNA whose function is not clear.

satın spar. See calcite.

“Satintone” [Engelhard]. (aluminum silicate). TM for pigments, coatings, and reinforcements.

Use: In plastics, rubber, adhesives, inks, and pharmaceuticals.

satın white. A high-bulking filler used in paper-coating formulations; a mixture of hydrated lime, potash alum, and aluminum sulfate. Readily hydrated. Particle size range 0.2–2 microns.

saturation. (1) The state in which all available valence bonds of an atom (especially carbon) are attached to other atoms. The straight-chain paraffins are typical saturated compounds. (2) The state of a solution when it holds the maximum equilibrium

quantity of dissolved matter at a given temperature. See unsaturation; solubility (true); supersaturation.

saveall. A device used in the papermaking industry to reclaim wastewater containing suspended solids (fiber, pigment, etc.) for further processing. There are three types: (1) sedimentation, (2) vacuum filter, and (3) flotation. Types 1 and 2 are large tanks made of tile or concrete, type 3 is a rotary vacuum filter drum that separates solids from wastewater.

savory oil.

CAS: 8016-68-0. An essential oil used in flavoring, especially in stuffing for meats and poultry.

saxitoxin.

CAS: 35523-89-8. $\text{C}_{10}\text{H}_{17}\text{N}_7\text{O}_4 \cdot 2\text{HCl}$. A toxic principle present in certain species of shellfish. It is a paralytic poison that attacks the central nervous system, acting as a muscular nerve block.

Saybolt Universal viscosity. The efflux time in seconds (SUS) of 60 mL of sample flowing through a calibrated Universal orifice in a Saybolt viscometer under specified conditions.

See viscosity.

“Saytex” [Albermarle Corp.]. TM for flame retardant for engineering plastics used in high temperature applications. Its polymeric structure encourages non-blooming and resists breakdown.

Use: For demanding molding applications such as cool body toasters, PC diskette drives, and electronic connections.

Saytzeff (Zaitsev) rule. The rule predicts that in elimination reactions the olefin predominantly formed will be the one with the largest possible number of substituents on the carbon-carbon double bond.

Sb. Symbol for antimony (from Latin stibium).

SBA. Abbreviation for *sec*-butyl alcohol.

SBG. Abbreviation for standard battery grade, highly purified chemicals manufactured for use in the battery industry.

SBR. Abbreviation for styrene-butadiene rubber.

Sc. Symbol for scandium.

scaffold. In genomic mapping, a series of contigs that are in the right order but not necessarily connected in one continuous stretch of sequence.

scale. (1) A calcareous deposit in water tubes or steam boilers resulting from deposition of mineral compounds present in the water, e.g., calcium carbonate. (2) A type of paraffin or petroleum wax from which all but a few percent of oil has been removed

by hydraulic pressing and subsequent processing. (3) A graduated standard of measurement in which the units (degrees) are defined in relation to some property of what is measured, e.g., temperature scale, Brix scale, Baumé scale. (4) The markings indicating such units as on a thermometer or graduate. (5) A weighing device that may be of the beam type in which weights (poises) and lever systems are used, or of the direct-reading spring type in which the gravitational pull of the object being weighed is counterbalanced by a known constant spring force. See boiler scale; balance (2).

scale-up. A term used in chemical engineering to describe the calculations and planning involved in carrying a chemical processing operation from the pilot plant to large-scale production stage.

scandium. Sc. Metallic element of atomic number 21, group IIIB of the periodic table, aw 44.9559, valence = 3, no stable isotopes.

Properties: Silvery-white solid. Mp 1539C, bp 2727C, d 2.99. Does not tarnish in air, reacts rapidly with acids, strongly electropositive. Not attacked by 1:1 mixture of nitric and 48% hydrofluoric acids. It is chemically similar to the rare earths.

Source: Chief ores are wolframite and thortveitite (Norway, Madagascar).

Derivation: Reduction of scandium fluoride with calcium or with zinc or magnesium alloy. Purification by distillation gives purity of 99+%.

Use: No major industrial use. An artificial radioactive isotope has been used in tracer studies and leak detection, and there is some application in the semiconductor field.

scandium fluoride. ScF_3 .

Derivation: Reaction of scandium oxide with ammonium hydrogen fluoride.

Use: Preparation of scandium metal.

scandium oxide. Sc_2O_3 .

Properties: White, amorphous powder. D 3.864, specific heat 0.153, a weak base. Soluble in hot acids, less so in cold acids.

Source: Thortveitite.

Use: Preparation of scandium fluoride.

scanning tunneling microscope. Instrument that uses a sharply tipped electrode in close proximity to a surface. As the electrode is moved, the change in electrode signal relates to the shape of the surface being scanned.

Use: Study of atomic-scale structure of surfaces, drawing molecular-sized markings on surfaces and transport of atoms and molecules.

See: atomic force microscopy; chemical force microscopy.

scatter diagram. (correlation table). The plotted record of frequency distribution of two different

characters showing the tendency for one character to change as the other character or variable changes.

scavenger. (getter). (1) In chemistry, any substance added to a system or mixture to consume or inactivate traces of impurities. (2) In metallurgy, an active metal added to a molten metal or alloy that combines with oxygen or nitrogen in the melt and causes its removal into the slag. Alloys including such metals as thorium, zirconium, and cerium as well as carbon and misch metal are used in vacuum tubes to absorb traces of residual gases.

“Scav-Ox” [Olin]. TM for a hydrazine oxygen scavenger.

Use: Prevent corrosion in boilers and oil-wheel casings.

SCC. Abbreviation for the Society of Cosmetic Chemists.

Schaeffer acid. (2-naphthol-6-sulfonic acid; β -naphtholsulfonic acid).

Properties: White leaflets. Mp 122C. Soluble in water and alcohol.

Derivation: Sulfonation of β -naphthol with 94% sulfuric acid at 95C, yielding a mixture comprising chiefly Schaeffer acid (56%), R-acid (15%), and G-acid (10%). Separation is effected by dilution with water, boiling to hydrolyze the sulfonic acid group, and addition of metallic salts.

Use: Azo dye intermediate.

Schaeffer's salt. (sodium salt of 2-naphthol-6-sulfonic acid). $\text{C}_{10}\text{H}_6\text{OHSO}_3\text{Na}$.

Use: Intermediate for organic chemicals.

Scheele, C. W. (1742–1786). One of the outstanding early chemical thinkers and experimenters, Scheele was a Swedish scientist who discovered a number of previously unknown substances, among which were tartaric acid, chlorine, manganese salts, arsine, and copper arsenite (Scheele's green). He also noted the oxidation states of various metals, observed the nature of oxygen two years before Priestley's discovery, and discovered the chemical action of light on silver compounds, thus laying the foundation of photochemistry and photography. Scheelite, or natural calcium tungstate, is named after him.

Scheele's green. See copper arsenite.

scheelite. CaWO_4 . A natural calcium tungstate found in igneous rocks, usually with granite. Some molybdenum may replace tungsten.

Use: Ore of tungsten; as a phosphor.

Schiemann reaction. Formation of diazonium fluoborates by diazotization of aromatic amines in the presence of fluoborates, followed by their thermal decomposition to aryl fluorides.

Schiff base. A class of compounds derived by chemical reaction (condensation) of aldehydes or ketones with primary amines. The general formula is $RR'X=NR''$.

Properties: Usually colorless, crystalline solids, although some are dyes. Very weakly basic and hydrolyzed by water and strong acids to carbonyl compounds and amines.

Use: Rubber accelerators; dyes (phenylene blue and naphthol blue); chemical intermediate; liquid crystals in electronic display systems; perfume base.

Schmidlin ketene synthesis. Formation of ketene by thermal decomposition of acetone over electrically heated wire at 500–750 degrees by a reaction involving radical formation with generation of methane and carbon monoxide.

Schmidt reaction. Acid catalyzed addition of hydrazoic acid to carboxylic acids, aldehydes, and ketones to give amines, nitriles, and amides, respectively.

Scholler saccharification process. Industrial saccharification of wood using 0.5% sulfuric acid at 170–180 degrees and 165–180 lb/sq inch pressures. Recovered sugars are fermented to produce about 40 gal alcohol per ton of dry wood.

Scholl reaction. Coupling of aromatic molecules by treatment with Lewis acid catalysts.

Schorigin (Shorygin) reaction. Organometallic reactions of the Grignard type, employing sodium in place of magnesium; the reaction of alkyl sodium compounds with carbon dioxide to give monobasic acids is sometimes known as the Wanklyn reaction.

Schotten-Baumann reaction. Acylation of alcohols with acyl halides in aqueous alkaline solution.

schradan. (generic name for octamethyl pyrophosphoramide; OMPA).

CAS: 152-16-9. $[(CH_3)_2N]_2P(O)OP(O)[N(CH_3)_2]$.

Properties: Viscous liquid. D 1.137, bp 120–125C (0.5 mm Hg), refr index 1.462 (25C). Miscible with water; soluble in most organic solvents; hydrolyzed in the presence of acids, but not by alkalis or water alone.

Hazard: Toxic by ingestion and inhalation, a cholinesterase inhibitor, use may be restricted.

Use: A systemic insecticide that is absorbed by the

plant which then becomes toxic to sucking and chewing insects.

Schrock, Richard R. (1945–). An American Born in Berne, Indiana who won the Nobel Prize for chemistry in 2005 for his pioneering work concerning the development of the metathesis method in organic synthesis. Awarded a B.A. from the University of California, Riverside and a Ph.D. from Harvard University. A member of the American Academy of Arts and Sciences and the National Academy of Sciences.

Schweitzer's reagent. A solution of copper hydroxide in strong ammonia used in analytical chemistry as a test for wool. It dissolves cotton, silk, and linen.

SCI. Abbreviation for the Society of the Chemical Industry.

scillirubroside.

CAS: 23604-99-1. mf: $C_{30}H_{42}O_{10}$.

Hazard: A poison.

Source: Natural product.

scintillation counter. A device used to detect a pulse of radiation by emitting a flicker of light. α -radiation is counted by inorganic detectors such as sodium iodide, while organic materials such as plastics may be used for β - and γ -particles. See phosphor.

scirpenetriol triacetate.

CAS: 4297-61-4. mf: $C_{21}H_{28}O_8$.

Hazard: A poison by ingestion.

scission. (1) The rupture of a chemical bond with production of 5-electron-volts of energy. (2) In agricultural technology, the separation of fruit or vegetable products from the tree or vine.

scleroprotein. Any of a large class of proteins that have a supporting or protective function in tendons, bones, cartilages, ligaments, and other hard or tough parts of the animal body. They include the collagens of skin, tendons, and bones, as well as the elastic proteins known as elastins and the keratins. Specific examples are the keratin of hair, hooves, and horns, and fibroin from silk.

scleroscope hardness. See hardness.

scopolamine.

CAS: 51-34-3. $C_{17}H_{21}NO_4$. A drug used to inhibit effects of acetylcholine; viscous liquid, soluble in water and alcohol.

scouring agent. A compound used to remove the natural oils and fats from raw wool, also used to remove lubricants applied to rayon yarns or fabrics

during such operations as throwing, winding, weaving, knitting, etc.

SCP. Abbreviation for single-cell protein.
See protein; single-cell.

screen. A woven, fabriclike structure made of intersecting strands of wire or plastic, usually mounted in a steel frame. They are available in a wide range of sizes, weaves, and meshes from as coarse as 25 to as fine as 400. The mesh is the number of apertures per square inch; it is the square of the number of strands of metal or plastic per linear inch. The strands can be made of any suitable metal (copper, nickel), alloy (steel, bronze), or synthetic (nylon, PVC). Some types of screen are mechanically vibrated or gyrated to facilitate solids separation; fine mesh screens require application of force, such as a stream of water, to effect separation. Screens are used for filtration, clarification of suspensions, separation and classification of solids, and removal of contaminants from semisolid materials. Lab sizes are available. A special application is the wire of a fourdrinier papermaking machine; it may be 38–60 inches wide and 55–85 mesh; it moves continuously over return rolls, the sheet being formed upon it by filtration of wood pulp slurry.
See filter media.

screening. To screen a library (see “Library”) is to select and isolate individual clones out of the mixture of clones. For example, if you needed a cDNA clone of the pituitary glycoprotein hormone alpha subunit, you would need to make (or buy) a pituitary cDNA library, then screen that library in order to detect and isolate those few bacteria carrying alpha subunit cDNA.

(1) Screening by hybridization involves spreading the mixture of bacteria out on a dozen or so agar plates to grow several ten thousand isolated colonies. Membranes are laid onto each plate, and some of the bacteria from each colony stick, producing replicas of each colony in their original growth position. The membranes are lifted and the adherent bacteria are lysed, then hybridized to a radioactive piece of alpha DNA (the source of which is a story in itself—see “Probe”). When X-ray film is laid on the filter, only colonies carrying alpha sequences will “light up”. Their position on the membranes show where they grew on the original plates, so you now can go back to the original plate (where the remnants of the colonies are still alive), pick the colony off the plate and grow it up. You now have an unlimited source of alpha cDNA.

(2) Screening by antibody is an option if the bacteria and plasmid are designed to express proteins from the cDNA inserts (see “Expression clones”). The principle is similar to hybridization, in that you lift replica filters from bacterial plates, but then you use the antibody (perhaps generated after old tyme protein purification rituals) to show which colony expresses the desired protein.

screw. (auger; worm). A simple machine employing the principle of the inclined plane, invented by the Greek scientist Archimedes. It consists of a central shaft around which winds a spiral of ribs (called “flights”) that are integral with the shaft. The distance between the flights is the pitch, or angle of inclination of the screw. This distance may be uniform throughout the length of the screw or it may vary from one point to another, depending on use requirements. The shorter the distance between flights, the more pressure the screw will deliver. Screws have a number of important applications in industrial operations. (1) Extrusion of rubber, plastics, and food products: the screw rotates in a chamber or barrel, the product being introduced through a port where the flights are farthest apart; it is forced through a die at the opposite end of the barrel, which molds it to the form desired. (2) Mixing of solids: continuous mixing is possible with screws having a wide variety of pitches and contours that impart a back-and-forth motion to the product being mixed without moving it to the discharge end until it is pushed along by added material. Two screws may operate in parallel, their pitches opposing each other in such a way as to effect maximum mixing. Some screws are cored for circulation of cooling water. (3) Conveying of solids: for this purpose screws with uniform and fairly wide pitch are used; as the screw turns the solids are passed along from one flight to the next. These are used for conveying wet and dry solids, wood chips, and similar particulates. (4) An engineering application of the screw is the mechanism known as a worm gear, in which the flights of the screw engage corresponding indentations or notches in a shaft or wheel, causing it to turn.

scrubber. See absorption tower; scrubbing.

scrubbing. Process for removing one or more components from a mixture of gases and vapors by passing it upward and usually countercurrent to and in intimate contact with a stream of descending liquid, the latter being chosen so as to dissolve the desired components and not others. The gas or vapor may be broken into fine bubbles upon entering a tower filled with liquid, but more frequently the tower is filled with coke, broken stone, or other packing, over which the liquid flows while exposing a relatively large surface to the rising gas or vapor.
See absorption (1).

scruple. Unit of weight used in pharmacy equivalent to 20 grains or 1/3 dram.

SDA. Abbreviation for specially denatured alcohol.

SDDC. Abbreviation for sodium dimethyldithiocarbamate.

SDA. Abbreviation for the Soap and Detergent Association.

SDP. Abbreviation for 4,4'-sulfonyldiphenol.

Se. Symbol for selenium.

Seaboard process. Method of removing hydrogen sulfide from a gas by absorption in sodium carbonate solution. Sodium bicarbonate and sodium hydrosulfide are formed. By blowing air through this solution, hydrogen sulfide is released and carried off, and the sodium carbonate is regenerated.

Seaborg, Glen T. (1912–1999). An American chemist who won the Nobel Prize for chemistry in 1951 along with McMillan. He did research in nuclear chemistry, physics, and artificial radioactivity. He discovered the elements plutonium, americium, berkelium, californium, einsteinium, fermium, and medeleevium with his colleague. He codiscovered numerous isotopes and radioisotopes. His Ph.D. is from the University of California at Berkeley.

seaborgium. Sg. A transfermium element. Atomic number 106. Very short half-life.

sea coal. Finely ground bituminous coal used in sand mixtures for iron molds to prevent sticking.

“Sea Harmony” [Premier]. TM for an organic blend of North Atlantic seaweed and alfalfa. **Use:** Food supplement.

sealant. Any organic substance that is soft enough to pour or extrude and is capable of subsequent hardening to form a permanent bond with the substrate. Most sealants are synthetic polymers (silicones, urethanes, acrylics, polychloroprene) that are semisolid before application and later become elastomeric. A few of the best-known sealants are such natural products as linseed oil (putty), asphalt, and various waxes. **See** adhesive.

Sealstix. TM for a cement of the deKhotinsky type which adheres to almost any surface; insoluble in all common reagents except alcohol, strong caustics, and chromic acid cleaning solution.

“Sealz” [Uniroyal]. TM for a line of thermoplastic rubber compounds that are used as additives for asphalt and tar products to raise softening point, improve low-temperature flexibility, enhance adhesive qualities, and increase elasticity.

Searles Lake brine. **See** brine; Trona process.

seasoning. Any food additive used in low concentration to contribute to the taste of food. Best known is sodium chloride, but the term also includes various spices, onions, mustards, etc. **See** enhancer; potentiator.

“SeaWash” [ForBest]. TM for a pH neutral floor cleaning solution.

Use: Used in food preparation areas of food manufacturers, hospitals, restaurants, or schools.

“SeaWash 70” [ForBest]. TM for a parts cleaning solution, certified as clean air solvent.

Use: For degreasing in industrial manufacturing or machine shops.

seawater. **See** ocean water.

seaweed. **See** algae; phycocolloid; carrageenan; kelp.

sebacic acid. (1,8-octanedicarboxylic acid; sebacic acid; decanedioic acid). CAS: 111-20-6. $\text{COOH}(\text{CH}_2)_8\text{COOH}$.

Properties: White leaflets. Mp 133C, d 1.110 (25C), bp 295.0C (100 mm Hg), refr index 1.422 (133.3C). Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: From butadiene via dichlorobutene and its nitrile derivatives, dry distillation of castor oil with alkali.

Grade: CP, purified.

Use: Stabilizer in alkyd resins, maleic and other polyesters, polyurethanes, fibers, paint products, candles and perfumes, low-temperature lubricants and hydraulic fluids, manufacture of nylon 610.

sebaconitrile. $\text{NC}(\text{CH}_2)_8\text{CN}$.

Properties: Straw-colored, oily liquid. Bp 199C (15 mm Hg).

Use: Chemical intermediate for drugs, dyes, and high polymers.

sebacoyl chloride. (*n*-octane-1,8-dicarboxylic acid dichloride). $\text{ClOC}(\text{CH}_2)_8\text{COCl}$.

Properties: Liquid. Bp 137–140C (3 mm Hg), 97% pure. Decomposes slowly in cold water; soluble in hydrocarbons and ethers.

Use: Organic intermediate.

sebacoyldioxybis(tributylstannane). **See** bis(tributyl(sebacoyldioxy))tin.

sebacic acid. **See** sebacic acid.

sec-. Abbreviation for secondary.

(1- α ,3- β ,5z,7e,24r)-9,10-secocholesta-5,7,10(19)-triene-1,3,24-triol.

CAS: 57333-96-7. mf: $\text{C}_{27}\text{H}_{44}\text{O}_3$.

Hazard: A poison by ingestion.

seconal sodium. (sodium seconal). Proprietary preparation of quinalbarbitone sodium.

Use: Sedative and hypnotic.

secondary. (1) For chemical meaning refer to “primary.” (2) Designates a reversible (recharge-

able) electric battery, generally called a storage battery. (3) Designates recovery of metal values from scrap or waste products such as aluminum from cans or steel from car bodies; also recovery of petroleum by chemical flooding and hydraulic fracturing.

secondary calcium phosphate. See phosphate, dibasic.

secondary metabolism. Pathways that lead to specialized products, not found in every living cell. Contrast with intermediary metabolism

secondary structure. The localized conformation of a protein.

second law of thermodynamics. The law stating that the entropy of the universe is increasing.

second messenger. An effector molecule synthesized within a cell in response to an external signal (first messenger) such as a hormone.

sectrometer. A potentiometer for electrometric titration using a cathode-ray tube instead of a microammeter.

secular trend. The persistent tendency of a variable to increase or decrease with passage of time.

sedanolic acid. $C_{12}H_{20}O_3$. A constituent of celery seed oil. Its lactone, also present, which is the source of the characteristic odor, is sedanolide.

sedative. A natural or synthetic therapeutic agent having the property of inducing relaxation and varying degrees of depression of the central nervous system. The major types of sedatives are (1) chlorine substitution products (chloral hydrate, chlorobutanol); (2) ethanol derivatives (ethyl carbamate, hedonal); (3) specific aldehydes and ketones (paraldehyde, amylen hydrate), (4) barbituric acid derivatives (barbital, barbiturates). Sedatives are almost always prescription drugs. See tranquilizer.

sedentary. Living in a fixed location, as with most plants, tunicates, sponges. See motile.

sedimentation. The settling out by gravity of solid particles suspended in a liquid, the rate of settling being defined by Stoke's law. This method is used industrially in water purification. It is also an analytical procedure for separation of solids of different particle size, as well as for molecular weight determination. The sedimentation of large molecules in a strong centrifugal field permits determination of both average molecular weights and the distribution of molecular weights in certain systems. When a solution containing polymer or other large molecules is centrifuged at forces up to 250,000

times gravity, the molecules begin to settle, leaving pure solvent above a boundary that progressively moves toward the bottom of the cell. An optical system is provided for viewing this boundary, and a study as a function of the time of centrifuging yields the rate of sedimentation for the single component, or for each of many components of a polydisperse system. These sedimentation rates may then be related to the corresponding molecular weights of the species present after the diffusion coefficients for each species are determined by independent experiments. The result of this work is the distribution of molecular weights in the sample which is attainable by few other methods. See precipitate.

sedimentation coefficient. A physical constant specifying the rate of sedimentation of a particle in a centrifugal field under specified conditions.

seed. That part of a plant that includes the plant embryo itself, a quantity of stored food (fats, carbohydrates, and proteins in varying proportions), and the enclosing cellulosic coats. The food-storage tissue is called the endosperm. Starch is an important food reserve in the endosperms of cereals and legumes; sugar in sweet corn; protein in soybean and wheat; and fats in such plants as coconut, cacao, castor bean, and most types of palms. Growth substances such as giberellin also occur in seeds; some also contain alkaloids (ricinine, hyoscyne, and caffeine). The seeds or bulbs of some plants are highly toxic, e.g., hyacinth, larkspur, castor bean, cashew nut shells. Bitter almond contains as much as 10% of hydrogen cyanide which is removed in processing. Seeds (which in many cases are equivalent to nuts) are an important source of vegetable oils, which are used as food components, in paints and other industrial products, and in medicine. There has been considerable experimentation with sunflower seeds, coconuts, and soybeans as a source of diesel fuel.

seeding. Trace proportions of a material introduced to initiate a desired reaction where the "seed" acts as a nucleating agent. An example is the addition of a crystal into a supersaturated solution to induce crystallization. See nucleation.

seeding, cloud. See nucleation.

Seger cone. See pyrometric cone.

segregation. The normal biological process whereby the two pieces of a chromosome pair are separated during meiosis and randomly distributed to the germ cells.

Seidlitz salt. See epsom salts.

Seismotite. Trade name for pumice.
Use: Abrasive in scouring agents.

“**Selectophore**” [*Fluka*]. TM for products meeting the requirements for the production of reliable ion-selective electrodes and optodes.

“**Selectra-Sil**” [*United Chemical*]. TM for derivatizing reagents of the highest chemical purity.
Use: Reagent

selenic acid.

CAS: 7783-08-6. H_2SeO_4 .

Properties: White, hygroscopic solid. D 3.004 (15/4C), mp 58C (easily undercools), decomposes at 260C. Very soluble in water; decomposes in alcohol; usually available as a liquid.

Hazard: Strong irritant to skin and mucous membranes.

selenious acid. See selenous acid.

selenious acid disodium salt pentahydrate.

See sodium selenite pentahydrate.

selenious acid, monosodium salt.

CAS: 7782-82-3. mf: $HO_2Se \bullet Na$.

Hazard: A reproductive hazard.

selenium.

CAS: 7782-49-2. Se. A nonmetallic element, atomic number 34, group VIA of the periodic table, aw 78.96, valences = 2, 4, 6; 6 stable isotopes.

Properties: Amorphous, red powder becoming black on standing and crystalline on heating; vitreous and colloidal forms may be prepared. Crystalline form has d 4.5, mp 217C, bp 685C; amorphous form softens at 40C and melts at 217C. Crystalline selenium is a p-type semiconductor; electrically it acts as a rectifier and has marked photoconductive and photovoltaic action (converts radiant to electrical energy); the electrical conductivity increases with increasing light irradiation. Soluble in concentrated nitric acid and (in liquid form) in common alkalis; forms binary alloys with silver, copper, zinc, lead, etc. A necessary nutritional factor for animals.

Occurrence: Canada, Japan, Yugoslavia, Mexico; also in certain soils.

Grade: Commercial (powder or lumps), high-purity up to 99.999%.

Use: Electronics, xerographic plates, TV cameras, photocells, magnetic computer cores, solar batteries (rectifiers, relays), ceramics (colorant for glass), steel and copper (degasifier and machinability improver), rubber accelerator, catalyst, trace element in animal feeds.

selenium diethyldithiocarbamate.

CAS: 5456-28-0. $Se[SC(S)N(C_2H_5)_2]_4$.

Properties: Orange-yellow powder; characteristic odor. D 1.32 (20/20C), melting range 63–71C. Soluble in carbon disulfide, benzene, chloroform; insoluble in water.

Hazard: Toxic by inhalation, ingestion, and skin absorption. TLV: 0.2 mg(Se)/m³.

Use: Vulcanization agent without added sulfur, or as a primary or secondary accelerator with sulfur.

selenium dioxide. (selenous acid anhydride).

CAS: 7446-08-4. SeO_2 .

Properties: White or yellowish-white to slightly reddish, lustrous, crystalline powder or needles. D 3.954 (15/15C), mp 340–350C (sublimes). Soluble in alcohol, water.

Hazard: Toxic by inhalation, ingestion, and skin absorption. TLV: 0.2 mg(Se)/m³.

Use: Analysis (testing for alkaloids), oxidizing agent, antioxidant in lubricating oils, catalyst.

selenium sulfide. (selenium disulfide).

CAS: 7488-56-4. SeS_2 .

Properties: Bright-orange powder. Mp less than 100C. Practically insoluble in water and organic solvents.

Grade: USP.

Hazard: Toxic by ingestion, strong irritant to eyes and skin, an animal carcinogen. TLV: 0.2 mg(Se)/m³.

Use: Medicine (treatment of seborrhea, medicated shampoos).

selenium tetrafluoride.

CAS: 10026-03-6. SeF_4 .

Properties: Colorless, fuming liquid. Fp –10C, bp 105C, d 2.75; reacts strongly with phosphorus and with water (hydrolysis). Soluble in alcohol, sulfuric acid, ether, and carbon tetrachloride.

Derivation: Reaction of selenium chloride and silver fluoride.

Hazard: Irritant.

Use: Fluorinating agent.

selenoformaldehyde.

CAS: 6596-50-5. mf: CH_2Se .

Hazard: A poison. TWA 0.2 mg(Se)/m³

Use: Agricultural chemical.

dl-selenomethionine.

CAS: 2578-28-1. mf: $C_5H_{11}NO_2Se$.

Hazard: A poison. TWA 0.2 mg(Se)/m³

selenous acid. (selenious acid). H_2SeO_3 .

Properties: Transparent, colorless, deliquescent crystals. D 3.0066, mp 70C (decomposes). Soluble in water and alcohol; insoluble in ammonia.

Derivation: Action of hot nitric acid on selenium.

Hazard: Toxic by inhalation, ingestion, and skin absorption. TLV: 0.2 mg(Se)/m³.

Use: Reagent for alkaloids.

selenous acid anhydride. See selenium dioxide.

Semenov, Nikolai N. (1896–1986). A Russian chemist and physicist who won the Nobel Prize in 1956. He authored books on the chain reaction and problems of chemical kinetics and reactivity, as well

as many articles. His work concerning thermal combustion and explosion is utilized in rockets and jet engines. He received his doctorate at Leningrad State University.

“Semesan” [Du Pont]. TM for a wettable powder containing 25.3% hydroxymercurichlorophenol.

Hazard: As for mercury compounds.

“Semesan Bel” [Du Pont]. TM for a seed disinfectant containing 12.5% hydroxymercurini-drophenol and 3.8% hydroxymercurichlorophenol.

Hazard: As for mercury compounds.

semicarbazide hydrochloride. (carbamyldiazine hydrochloride; aminourea hydrochloride).

CAS: 563-41-7. $\text{H}_2\text{NCONHNH}_2\cdot\text{HCl}$.

Properties: White crystals. Mp 172–175°C (decomposes). Soluble in water; insoluble in absolute alcohol and ether.

Derivation: From hydrazine sulfate, potassium or sodium cyanate, and sodium carbonate, or electrolytically by the reduction of nitrourea.

Grade: CP, technical.

Hazard: Toxic by ingestion.

Use: Reagent for aldehydes and ketones, isolation of hormones and isolation of certain fractions from essential oils.

semiconductor. An element or compound having an electrical conductivity intermediate between that of conductors and nonconductors (insulators). Most metals have quite high conductivity, while substances like diamond and mica have very low conductivity (high resistance). Between these extremes lie the semiconductors, of which germanium, silicon, silicon carbide, and selenium are examples, with resistivities in the range of $10\text{--}2^{109}$ ohms/cm. Slight traces of impurities in the crystalline structure are essential for semiconduction; arsenic is a typical impurity in semiconductor crystals. These impurities function as electron donors or acceptors, and the semiconductor is designated n-type or p-type, depending on the electrical nature of the “holes” or energy deficits in the crystalline lattice.

The functioning of semiconductors involves the science of solid-state physics. Their discovery in the early 1940s made possible the development of transistors, with their manifold applications in electronic devices in which they have largely replaced the vacuum tube.

There are a few organic semiconducting compounds that contain a significant amount of carbon-carbon bonding and are also capable of supporting electronic conduction. Anthracene and Ziegler-catalyzed acetylene polymers (conjugated polyolefins) are examples. See crystals; impurity; solid; solid-state chemistry.

semimicrochemistry. Any chemical method (usually analytical) in which the weight of the sample used is from 10 to 100 mg.

semipermeable membrane. See membrane, semipermeable.

semisynthetic. A term often used to describe end products that are manufactured from natural materials but do not occur in the free state, for example, paper, glass, soap, cement, rayon, leather, etc.

Semmler-Wolff reaction. Rearrangement of α,β -unsaturated cyclohexenyl ketoximes into aromatic amines under acidic conditions.

S1 end mapping. A technique to determine where the end of an RNA transcript lies with respect to its template DNA (the gene). Can't be described in a short paragraph. See “RNAse Protection assay” for a closely related technique.

Sense strand. The strand of DNA during transcription which is not transcribed into mRNA. This results from its position as colinear, as opposed to complementary, for the RNA sequence. It makes “sense” with the genetic code.

“Sentry” [Dow]. 1. TM for propionic acid. 2. TM for high purity grades of Carbowax polyethane glycol, polyox water-soluble polymers, and polyvinyl chloride. Solvent for flavors and colors.

Use: Fungistats for the control of certain molds and yeast in foods; humectant for baked goods, and plasticizer for cork seals and crowns.

“Separan” [Dow]. TM for a series of flocculating agents. AP30. Synthetic, high molecular weight, anionic polymer. C-90 and C-120. Synthetic, high molecular weight, cationic polymers. MGL. Similar to NP10. Used in production of uranium. NP10. Synthetic, water-soluble, nonionic, high molecular weight polymer of acrylamide. “Separan” NP 10 potable-water-grade flocculant has been accepted, subject to maximum use concentration of 1 ppm, by the U.S. Public Health Service. NP20 Nonionic polyacrylamide polymer. PG2 Similar to NP10. Used in paper manufacture.

separation. A collective term including a large number of unit operations that, in one way or another, isolate the various components of a mixture. Chief among these are evaporation, distillation, drying, gas absorption, sedimentation, solvent extraction, press extraction, adsorption, and filtration. Specialized methods include centrifugation, electromagnetic separation (mass spectrograph), gaseous diffusion, and various types of chromatography.

Sephadex. TM for a dry, insoluble powder composed of microscopic beads that are synthetic organ-

ic compounds derived from the polysaccharide dextran. The dextran chains are cross-linked to give a three-dimensional network, and the functional ionic groups are attached to the glucose units of the polysaccharide chains by ether linkages. Available in various forms for use in many different phases of chromatography.

sepia. The red-brown color (pigment).

Derivation: Ink of cuttlefish, calcareous portion of the backs of cuttlefish.

septanose ring. A seven-membered ring formed by reaction of a CHO group at one end of the septanose molecule with CH_2OH at the other end.

septiphene. See *o*-benzyl-*p*-chlorophenol.

“Seqlene” [Hall]. TM for chelating agents.

Use: In derusting and descaling processes for metal; concrete admixtures to retard set and reduce water required; textile applications; aluminum etching; and caustic bottle washing.

sequence. See base sequence.

sequence assembly. A process whereby the order of multiple sequenced DNA fragments is determined.

sequence tagged site. (STS). Short (200 to 500 base pairs) DNA sequence that has a single occurrence in the human genome and whose location and base sequence are known. Detectable by polymerase chain reaction.

sequencing. Determination of the order of nucleotides (base sequences) in a DNA or RNA molecule, or the order of amino acids in a protein.

sequencing technology. The instrumentation and procedures used to determine the order of nucleotides in DNA.

sequestration. The formation of a coordination complex by certain phosphates with metallic ions in solution so that the usual precipitation reactions of the latter are prevented. Thus, calcium soap precipitates are not produced from hard water treated with certain polyphosphates and metaphosphates (these polyphosphates are often improperly referred to as hexametaphosphates). The term *sequestration* may be used for any instance in which an ion is prevented from exhibiting its usual properties due to close combination with an added material. Two groups of organic sequestering agents (chelates in these examples) of economic importance are the aminopolycarboxylic acids such as ethylenediaminetetraacetic acid, and the hydroxycarboxylic acids such as gluconic, citric, and tartaric acids. In the food industry sequestering agents aid in stabilizing color, flavor,

and texture.

See chelate; coordination compound; complex.

“Sequestrene” [Novartis]. TM for a series of complexing agents and metal complexes consisting of ethylenediaminetetraacetic acid and salts.

Ser. Abbreviation for serine.

serendipity. An unexpected scientific discovery that turns out to be more important than the project being researched. One example is the discovery of the sodium sulfide polymer later known as “Thiokol.” White, the researcher, was seeking to develop an improved automotive coolant. Another is the discovery of the reinforcing effect of carbon black on rubber while technologists were using it as a black pigment to counteract the whitening effect of zinc oxide.

serendipity berry. See sweetener, nonnutritive.

SERI. Abbreviation for Solar Energy Research Institute.

See solar energy.

serine. (β -hydroxyalanine; α - α - β -hydroxypropionic acid). $\text{HOCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino acid occurring naturally in the L(-) form.

Properties: Colorless crystals. Soluble in water; insoluble in alcohol and ether. Optically active. DL-serine: mp 246C with decomposition; D(+)-serine: mp 228C with decomposition.

Available forms: Commercially in all three forms.

Derivation: Hydrolysis of protein (especially silk protein); synthesized from glycine.

Use: Biochemical research, dietary supplement, culture media, microbiological tests, feed additive.

dl-serine.

CAS: 302-84-1. mf: $\text{C}_3\text{H}_7\text{NO}_3$.

Properties: White crystals from powder, or crystalline powder. Mp: 246° (decomp). Sol in water; insol in alc, ether.

Use: Food additive.

Serini reaction. Zinc-promoted rearrangement of 17-hydroxy-20-acetoxysterol derivatives into C-20 ketones. The reaction is applicable to other cyclic, as well as open-chain alcohols.

serotonin. (5-hydroxytryptamine; 5-hydroxy-3-(β -aminoethyl)indole).

CAS: 50-67-9. $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}$. A powerful vasoconstrictor occurring in the brain and blood platelets, it is thought to play a part in regulation of blood pressure and also has muscle-contracting properties. It has been isolated from beef serum and may be synthesized from 5-benzyloxyindole. Serotonin is similar to the hallucinogenic drugs mescaline, LSD, psilo-

cin, and psilocybin. Its formation is inhibited by *p*-chlorophenylalanine.

serpentine. A type of asbestos.
See asbestos.

serum. (1) The continuous phase of a biocolloid after the solid or disperse phase has been removed by centrifugation, coagulation, or similar means. In the case of milk, for example, the serum, or whey, is a true solution of sugars, proteins, and mineral compounds in water. (2) Specifically blood from which corpuscles, platelets, etc., have been removed, especially when prepared with antigenic bacteria for inoculation to effect the cure of a disease.

serum albumin. Blood albumin comprising 60% of the plasma proteins.
Use: As a plasma volume expander.

SES. Abbreviation for sodium-2,4-dichlorophenoxyethyl sulfate.
See sesone.

sesame oil. (benne oil; teel oil).
CAS: 8008-74-0. A bland, yellowish, vegetable oil.
Use: Shortenings, salad oil, margarine, and similar food products.

sesamex. (generic name for 2-(2-ethoxyethoxy)ethyl-3,4-(methylenedioxy)phenyl acetal of acetaldehyde).
 $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{OCH}(\text{CH}_2)\text{OC}_6\text{H}_4\text{OC}_6\text{H}_4\text{OC}_2\text{H}_5$.
Properties: Liquid. Bp 137–141°C (0.08 mm Hg). Soluble in nonpolar solvents.
Use: Synergist for insecticides.

sesamin. (generic name for 2,6-bis[3,4-(methylenedioxy)phenyl]-3,7-dioxabicyclo[3.3.0]octane). $\text{C}_{20}\text{H}_{18}\text{O}_6$.
Properties: Solid. Mp 122.5°C. Combustible.
Use: Synergist for insecticides and fungicides.

sesamol. (generic name for 6-[3,4-(methylenedioxy)phenoxy]-2-[3,4-(methylenedioxy)phenyl]3,7-dioxabicyclo[3.3.0]octane). $\text{C}_{22}\text{H}_{18}\text{O}_7$. Constituent of sesame oil that is a powerful synergist of pyrethrum. A 1:1 mixture of pyrethrum and sesamol has 31 times the insecticidal activity of pyrethrum alone.

sesin.
CAS: 94-83-7. mf: $\text{C}_{15}\text{H}_{12}\text{Cl}_2\text{O}_3$.
Hazard: Moderately toxic by ingestion.
Use: Agricultural chemical.

sesone. (generic name for sodium-2,4-dichlorophenoxy-ethyl sulfate; SES; "Crag").
CAS: 136-78-7. $\text{C}_6\text{H}_3\text{Cl}_2\text{OCH}_2\text{CH}_2\text{SO}_4\text{Na}$.
Properties: Crystalline solid. Mp 245°C. Soluble in water.
Use: Preemergence herbicide.

sesqui. A prefix meaning one-and-a-half. Often used for salts in which the proportions of metal oxide to acid anhydride are 2:3, or vice-versa, as in sodium sesquicarbonate.

sesquiterpene. A terpene having the formula $\text{C}_{15}\text{H}_{24}$, one and a half times the standard terpene formula of $\text{C}_{10}\text{H}_{16}$. An example is cadinene, a constituent of various wood oils (cade oil, cedarleaf oil, etc.).

set point. A value, such as temperature, to be maintained by a controlling instrument for a procedure.

setting point. (1) The temperature at which a liquid sets or congeals. (2) The temperature at which an oil stops flowing when acted on by a small, definite pressure under the proper conditions.

setting up. The cessation of flow in a drying coating such as varnish.

Sevin.
CAS: 63-25-2.
Properties: White crystals. Mp 142°C, d 1.232 (20°C/20°C). TM for a carbaryl insecticide (1-naphthyl-*N*-methyl carbamate).
Hazard: Toxic by inhalation. TLV: 5 mg/m³; not classifiable as a human carcinogen.
See carbaryl.

"Sevron" [Crompton]. TM for a group of cationic dyes.
Available forms: Liquid and powder.
Use: For acrylic and cationic-dyeable polyester apparel and carpet.

sewage sludge. A mixture of organic materials resulting from purification of municipal waste. There are two types: (1) Imhoff sludge: a low-grade sludge containing 2–3% ammonia and about 1% phosphoric acid.
See Imhoff tank.

(2) Activated sludge: a high-grade sludge containing 5.0–7.5% ammonia and 2.5–4.0% phosphoric acid.

Derivation: (1) By running sewage through settling tanks without access of air. The sludge or solid matter is decomposed by anaerobic bacteria. Lagooning may be used effectively following activated sludge treatment. (2) By running sewage through settling tanks and pumping air (or oxygen) through porous plates at the bottom of the tanks; 20% of the current "make" is also added. The waste acts as nutrient for aerobic bacteria, that consume the polluting organic matter. The resulting solids are filtered and dried.

Use: Fertilizer base.

sex chromosome. The X or Y chromosome in human beings that determines the sex of an individu-

al. Females have two X chromosomes in diploid cells; males have an X and a Y chromosome. The sex chromosomes comprise the 23rd chromosome pair in a karyotype.

See autosome.

sex-linked. Traits or diseases associated with the X or Y chromosome; generally seen in males. See gene; mutation; sex chromosome.

sexual reproduction. A type of reproduction in which two parents give rise to offspring that have unique combinations of genes inherited through the gametes of the two parents. Sexual reproduction involves meiosis and syngamy.

“S-Fatty Acids” [Procter & Gamble]. TM for fatty acids derived from soybean oil. S-210 is a soy fatty acid developed primarily for alkyd resins. S-230 is a soy-type fatty acid having a lower unsaturated acids content and higher titer than S-210. **Properties:** S-210 is a light-yellow liquid and S-230 a light-yellow semisolid at ambient temperature. **Use:** Chemical intermediate, paints and varnishes, alkyd resins, and soaps.

SFS. (1) Abbreviation for Saybolt Furol seconds. See Furol viscosity; Saybolt Universal viscosity. (2) Abbreviation for sodium formaldehyde sulfoxylate.

Sg. Symbol for seaborgium.

SGR. Abbreviation for steam gas recycle process for shale oil recovery. See shale oil.

shale oil. A mixed-base crude oil extracted from mountains of sedimentary shale in Colorado, Utah, and Wyoming by heating at 425–535C (approximately 800–1000F). Two methods can be used: surface mining and excavation. In the first, the shale is bulldozed from beds, crushed, and fed into retorts of either the vertical or horizontal type. In the second, shafts are driven into the mountain and the shale is heated in situ by direct combustion in an interior chamber excavated for the purpose. The in situ method is the more efficient. The oil-bearing component of the shale is called kerogen. Only 20–30 gallons (less than one barrel) of oil is obtained per ton of shale processed, and less than 33% of the total oil content is recoverable. Major obstacles are the vast earth-moving operations necessary, the need for large volumes of cooling water, and disposal of the spent shale. Though rather extensive pilot plant operations have been carried out in recent years, no large-scale production is likely for the indefinite future for both economic and technical reasons. See kerogen; oil shale; synfuel.

shape-selective catalyst. See catalyst, shape-selective.

shark liver oil.

Properties: Yellow to red-brown liquid; strong odor. D 0.917–0.928. Soluble in ether, chloroform, benzene, and carbon disulfide.

Derivation: By expression from shark livers.

Method of purification: Chilling and filtration.

Grade: Crude, refined.

Use: Source of vitamin A and squalene, biochemical research.

sharp. (1) In reference to cheeses, this term denotes length of the curing period, usually at least six months, twice as long as for mild cheeses. (2) Descriptive of a technique for quick-freezing of foods at –20F.

Sharpless, K. Barry. (1941–). An American who won the Nobel Prize for chemistry in 2001 for his work concerning chirally catalyzed oxidation reactions. Awarded an Undergraduate degree from Dartmouth College and a Ph.D. from Stanford University (E. E. van Tamelen) in 1968. Professorships at Massachusetts Institute of Technology, Stanford and The Scripps Research Institute. Awarded the ACS Arthur C. Cope Award, 1992 and many other awards.

Sharpless reaction. Metal-catalyzed asymmetric epoxidation of allylic alcohols employing a system consisting of titanium tetrakispropoxide, (+)- or (–)-diethyl tartrate, and *tert*-butyl hydroperoxide. The epoxy alcohols are obtained with a high degree of optical purity (90%), and their absolute stereochemistry is predictable.

Shea butter A substance obtained from the nuts of *Bassia*.

Properties: Grey-white solid. D 0.9175.

See “Shebu” [R. I. T. A.].

shear. The ratio between a stress (force per unit area) applied laterally to a material and the strain resulting from this force. Determination of this ratio is one method of measuring the viscosity of a liquid or semisolid. See viscosity.

“Shebu” [R. I. T. A.]. TM for shea butter. **Derivation:** Extracted from fruit of the Karite tree. **Use:** To ameliorate dry skin.

“Sheliflex” [Shell]. TM for a series of petroleum products largely composed of naphthenic and/or paraffinic hydrocarbons.

Properties: Colors ranging from near water-white to black; odor slight to none. Viscosity 3–55 cP at 99C, d 0.85–0.95, very low volatilities.

Hazard: Combustible.

Use: Rubber processing and extending oils, miscellaneous process oil uses.

shell. (1) In physical chemistry, this term is applied to any of the several sets of, or orbits of, the electrons in an atom as they revolve around its nucleus. They constitute a number of principal quantum paths representing successively higher energy levels. There may be from one to seven shells, depending on the atomic number of the element and corresponding to the seven periods of the periodic table. The shells are usually designated by number, though letter symbols have been used, i.e., K, L, M, N, O, P, Q. The laws of physics limit the number of electrons in the various shells as follows: two in the first (K), eight in the second (L), 18 in the third (M), and 32 in the fourth (N). With the exception of hydrogen and helium, each shell contains two or more orbitals, each of which is capable of holding a maximum of two electrons.

See quantum number; orbital theory; Pauli exclusion principle.

(2) The hard integument of mollusks and crustaceans, consisting mostly of calcium carbonate, chitin, etc. See nacre; oyster shells.

(3) The brittle covering of avian eggs, chiefly calcium carbonate, lime, etc. The formation of proper shell structures in certain species of birds is said to be adversely affected by DDT and similar insecticidal contaminants of their food.

(4) The shells of nuts are cellulosic in character. Some contain industrially useful oils.

shellac. (lac; garnet lac; gum lac; stick lac).

Derivation: A natural resin secreted by the insect *Laccifer lacca* (*Coccus lacca*) and deposited on the twigs of trees in India. After collection, washing, and purification by melting and filtering, it is formed into thin sheets, that are later fragmented into flakes of orange shellac. This may be dewaxed and bleached to a transparent product. Soluble in alcohol; insoluble in water.

Grade: (1) Orange: TN (impure), fine, superfine, heart, superior; (2) bleached and dewaxed (colorless).

Hazard: (Alcohol solution) Flammable, dangerous fire risk.

Use: Sealer coat under varnish; finish coat for floors, furniture, etc.; dielectric coatings, deKhotinsky cement.

shellac, bleached.

Properties: From the resinous secretion, called lac, of the insect *Laccifer* (*Tachardia*) *lacca* Kerr (fam. *Coccidae*). Off white, amorphous, granular solid. Sol in alc; insol in water; sltly sol in acetone, ether.

Use: Food additive.

shellac, bleached, wax-free.

Properties: From the resinous secretion, called lac, of the insect *Laccifer* (*Tachardia*) *lacca* Kerr (fam. *Coccidae*). light yellow, amorphous, granular solid. Sol in alc; insol in water; sltly sol in acetone, ether.

Use: Food additive.

“Shell Sol” [Shell]. TM for a series of aliphatic hydrocarbon solvents composed of a mixture of paraffinic, naphthenic, and aromatic hydrocarbons.

“Shellwax” [Shell]. TM for a series of paraffin waxes derived from distillate lube streams.

sherardizing. The process by which relatively small articles made of iron or steel are coated with zinc powder. The metal forms an alloy with the steel surface and produces a thin, tightly adherent, corrosion-resistant coating.

“Sherbelizer” [Kelco]. TM for an algin derivative-vegetable gum composition.

Use: Stabilizer for sherbets, water ices, frozen fruits, syrups, purees, chocolate ice cream.

“Sherbrite” [Aqualon]. TM for brighteners for nickel plating. Active ingredient is 1,2-benzisothiazolin-3-one-1,1-dioxide sodium salt.

sher, extract. See euphorbia tirucalli l., extract.

shielding. Protection of personnel from the harmful effects of ionizing radiation and/or neutrons by enclosure of the equipment (reactor, particle accelerator, X-ray generator, etc.) with an absorbing material. The most efficient of these are cadmium, lead, steel, and high-density concrete (3 ft of concrete equals about 1 ft of steel). Among the plastics, polyethylene affords reasonable protection in thick sheets. Water and paraffin wax are good neutron absorbers because of their high hydrogen content. Materials such as graphite and beryllium are able to deflect and retard neutrons and are used for this purpose as moderators in nuclear reactors. Heavy water is also used.

shiga toxin. See shigella dysenteriae toxin.

shigella dysenteriae toxin.

CAS: 75757-64-1.

Hazard: A poison.

Source: Natural product.

Shine-Dalgarno sequence. A sequence in an mRNA required for binding prokaryotic ribosomes. The sequence consists of 4-9 purine residues, located 8-13 bp upstream of the initiation codon.

Shirakawa, Hideki. (1936-). Awarded Nobel Prize in chemistry in 2000 jointly with Alan J. Heeger and Alan G. MacDiarmid for the discovery and development of conductive polymers. He performs his research at University of Tsukuba, Japan.

shiu oil. (apopino oil). A Japanese oil with a high linalool content.

shoddy. Reclaimed scrap wool, rubber, leather, etc., often used in the manufacture of low-quality products.

Shoelkopf acid. (1-naphthol-4,8-disulfonic acid). $C_{10}H_5OH(SO_3H)_2$.

Properties: Colorless crystals.

Derivation: Decomposition of 1-naphthylamine-4,8-disulfonic acid by diazotization and acidifying with heat.

Use: Azo dye intermediate.

short. Baked products: crisp, flaky, e.g., short-cake; steel: brittle, friable under certain temperature conditions, e.g., hot-short (above red heat) and cold-short (below red heat). Clay: dry, lacking plasticity.

shortening. See cooking (5).

shortstopping agent. A material used in a polymerization reaction to cut off the reaction at a predetermined point, e.g., use of diethylhydroxylamine or sodium dimethyldithiocarbamate to control synthetic rubber polymerization; tetraethylsilanol is used in silicone polymers.

short-term exposure limit. (STEL). The 15-minute concentration of an air contaminant that should not be exceeded at any time during a workday.

See Threshold Limit Value.

shotgun cloning. The practice of randomly clipping a larger DNA fragment into various smaller pieces, cloning everything, and then studying the resulting individual clones to determine what occurred.

shotgun method. Sequencing method that involves randomly sequenced cloned pieces of the genome, with no foreknowledge of where the piece originally came from.

See genomic library.

shotgun sequencing. See shotgun method.

shot metal. Lead alloy with less than 3% arsenic.

shuttle vector. A recombinant DNA vector that can be replicated in two or more different host species, making possible the movement of DNA between organisms.

SI. Abbreviation for International System of Units (metric system) which is now in use in most countries but not yet officially adopted in U.S.

Si. Symbol for silicon.

sickle-cell anemia. A human disease characterized by hemoglobin molecules in which a Glu is replaced by a Val. This creates a "sticky patch"

when the hemoglobin is deoxygenated, causing hemoglobin molecules to polymerize and deform the red blood cells.

side chain. See chain.

siderite. (chalybite; spathic iron ore). $FeCO_3$ (usually with some calcium, magnesium, or manganese).

The term *siderite* is also used for an iron alloy found in meteorites.

Properties: Gray, yellow, brown, green, white, or brownish-red mineral; vitreous inclining to pearly luster; white streak. D 3.83–3.88, Mohs hardness 3.5–4.

Occurrence: U.S. (Vermont, Massachusetts, Connecticut, New York, North Carolina, Pennsylvania, Ohio), Europe.

Use: An ore of iron, when high in manganese used in the manufacture of spiegeleisen.

"SiDigester Liquid" [ACC Silicones]. TM for a silicone digester liquid.

sienna. A yellowish hydrated iron oxide. Raw sienna is a brown-tinted yellow ochre occurring in Alabama, California, Pennsylvania, Cyprus, and Italy. Burnt sienna is an orange-brown pigment made by calcining raw sienna.

See ochre; iron oxide reds.

Use: Colorant in oil paints, stains, pastels, etc.

sieve. See screen.

Sievert's law. Refers to the solubility of molecules that dissociate during solution, varies as the square root of the pressure.

siglure. (generic name for *sec*-butyl-6-methyl-3-cyclohexane-1-carboxylate).

Properties: Liquid. Bp 113–114C (15 mm Hg). Soluble in most organic solvents; insoluble in water. Combustible.

Use: Insect attractant.

sigma blade. A rotating agitator set horizontally in a kneading bowl or chamber used for mixing doughs and heavy pastes. The blade or arm is shaped somewhat like a Greek capital sigma (Σ) lying on its side; variations of this shape simulate horizontal letters S and Z. Some kneaders have two such blades that overlap as they turn to provide maximum mixing efficiency.

See kneading.

sigma bond. A covalent bond directed along the line joining the centers of two atoms. They are the normal single bonds in organic molecules.

See pi bond.

sigma function. Enthalpy of an air-stream mix, minus the heat of the liquid.

sigma phase. The nonmagnetic, brittle, corundum-hard FeCr constituent in stainless steel.

sigma value. The value of a quantum number, which quantizes the component of angular momentum, of spin about the axis of a diatomic molecule.

signal sequence. An amino-terminal sequence that signals the cellular destination of a newly synthesized protein.

signal transduction. The process by which an extracellular signal is converted to an intracellular response.

sig water. The alkaline solution of soda ash, borax, or ammonia for washing the grain surface of leather before applying color or dye.

silane. (silicon tetrahydride).

CAS: 7803-62-5. SiH_4 .

Properties: A gas; repulsive odor. Solidifies at -200C , bp -112C , d 0.68. Decomposes in water; insoluble in alcohol and benzene.

Hazard: Dangerous fire risk, ignites spontaneously in air. Strong irritant to tissue. TLV: 5 ppm.

Use: Doping agent for solid-state devices, production of amorphous silicon.

silane compounds. Gaseous or liquid compounds of silicon and hydrogen ($\text{Si}_n\text{H}_{2n+2}$), analogous to alkanes or saturated hydrocarbons. SiH_3 is called silyl (analogous to methyl), and Si_2H_5 is disilanyl (analogous to ethyl). A cyclic silicon and hydrogen compound having the formula SiH_2 is called a cyclo-silane. Organofunctional silanes are noted for their ability to bond organic polymer systems to inorganic substrates.

Hazard: Dangerous fire risk.

See silicone; siloxane.

“Silastic” [Dow Corning]. TM for compositions in physical character comparable to milled and compounded rubber prior to vulcanization but containing organosilicon polymers. Parts fabricated of “Silastic” are serviceable from -73 to $+260\text{C}$, retain good physical and dielectric properties in such service, show excellent resistance to compression set, weathering, and corona. Thermal conductivity is high, water absorption low.

Use: Diaphragms, gaskets and seals, O-rings, hose, coated fabrics, wire and cable, and insulating components for electrical and electronic parts.

“Silcogum” [Grayson]. TM for a rubber additive.

Use: For coloring high consistency silicone rubber.

“Silcolapse 430” [ACC Silicones]. TM for a 100% non-aqueous antifoam liquid.

“Silcopas” [Grayson]. TM for a coloring liquid.

Use: To color silicone rubber and RTV silicone.

sildenafil citrate. See “Viagra” [Pfizer].

silent mutation. A mutation in a gene that causes no detectable change in the biological characteristics of the gene product.

silica. (silicon dioxide). SiO_2 . Occurs widely in nature as sand, quartz, flint, diatomite.

Properties: Colorless crystals or white powder; odorless and tasteless. D 2.2–2.6; thermal conductivity about half that of glass, mp 1710C , bp 2230C , high dielectric constant, high heat and shock resistance. Insoluble in water and acids except hydrogen fluoride; soluble in molten alkali when finely divided and amorphous. Combines chemically with most metallic oxides; melts to a glass with lowest known coefficient of expansion (fused silica). Noncombustible.

Derivation: Can be made from a soluble silicate (water glass) by acidification, washing and ignition. Arc silica is made from sand, vaporized in a 3000C electric arc.

Grade: By purity and mesh size, silica aerogel, hydrated, precipitated.

Hazard: Toxic by inhalation, chronic exposure to dust may cause silicosis.

Use: (Powder) Manufacture of glass, water glass, ceramics, abrasives, water filtration, microspheres, component of concrete, source of ferrosilicon and elemental silicon, filler in cosmetics, pharmaceuticals, paper, insecticides, hydrated and precipitated grades as rubber reinforcing agent, including silicone rubber, anticaking agent in foods, flattening agents in paints, thermal insulator. (Fused) Ablative material in rocket engines, spacecraft, etc.; fibers in reinforced plastics; special camera lenses. (Amorphous) Silica gel.

See quartz; silicic acid; silica gel.

silica, amorphous fume. (amorphous silica fume).

CAS: 69012-64-2.

Hazard: TLV: 2 mg/m^3 , respirable dust.

silica, fumed. A colloidal form of silica made by combustion of silicon tetrachloride in hydrogen-oxygen furnaces. Fine, white powder.

Use: Thickener, thixotropic, and reinforcing agent in inks, resins, rubber, paints, cosmetics, etc. Base material for high-temperature mortars.

See “Aerosil”; “Cab-O-Sil.”

silica, fused. (amorphous quartz).

CAS: 60676-86-0. O_2Si .

Properties: Mw 60.09. Made up of spherical submicroscopic particles under 0.1 micron in size.

Hazard: TLV: 0.1 mg/m³ (Respirable Fraction).

Use: Concrete, grouts, mortars, elastomers, refractory and coating applications.

See silica; quartz, fused.

silica gel.

CAS: 7631-86-9. (silica, amorphous hydrated; silicic acid). A regenerative adsorbent consisting of amorphous silica. Noncombustible.

Derivation: From sodium silicate and sulfuric acid.

Grade: Commercial grades capable of withstanding temperatures up to 260–315°C are supplied in the following mesh sizes: 3–8, 6–16, 14–20, 14–42, 28–200, and through 325.

Hazard: TLV: TWA (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%).

Use: Dehumidifying and dehydrating agent, air-conditioning, drying of compressed air and other gases and liquids such as refrigerants and oils containing water in suspension, recovery of natural gasoline from natural gas, bleaching of petroleum oils, catalyst and catalyst carrier, chromatography, anticaking agent in cosmetics and pharmaceuticals, in waxes to prevent slipping, in dietary supplements. See silicic acid; “Britesorb” [PQ].

“**Silic AR**” [Mallinckrodt]. TM for silica-gel-based formulations suitable for various chromatographic applications. The numerical suffixes indicate the approximate pH of a 10% slurry. Letters F, G, or GF indicate that the product contains a fluorescent material, gypsum binder, or both. “TLC” indicates suitability for thin-layer chromatography.

silicate. Any of the widely occurring compounds containing silicon, oxygen, and one or more metals with or without hydrogen. The silicon and oxygen may combine with organic groups to form silicate esters. Most rocks (except limestone and dolomite) and many mineral compounds are silicates. Typical natural silicates are gemstones (except diamond), beryl, asbestos, talc, clays, feldspar, mica, etc. Portland cement contains a high percentage of calcium silicates. Best known of the synthetic (soluble) silicates is sodium silicate (water glass).

Hazard: (Natural silicate dusts) Toxic by inhalation.

Use: Fillers in plastics and rubber, paper coatings, antacids, anticaking agents, cements.

silicate garden. The irregular, colored, tubular growths formed in dilute aqueous silicate solutions by dropping water solutions of heavy metal salts into it.

silicic acid. (hydrated silica).

CAS: 7699-41-4. SiO₂•nH₂O. The jellylike precipitate obtained when sodium silicate solution is acidified. The proportion of water varies with the conditions of preparation and decreases gradually during

drying and ignition, until relatively pure silica remains. During drying the jelly is converted to a white, amorphous powder or lumps.

Use: Laboratory reagent and reinforcing agent in rubber.

See silica gel.

silicic acid (ortho).

CAS: 10193-36-9. mf: H₄O₄Si.

Hazard: A poison.

silicic acid, sodium salt.

CAS: 1344-09-8.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A severe skin and eye irritant.

silicochloroform. See trichlorosilane.

silicol. Silicic oxide casein metaphosphate.

silicomanganese. Alloys consisting principally of manganese, silicon, and carbon.

Use: Low-carbon steel in which silicon is not objectionable. Silicon manganese steels are used for springs and high-strength structural steels.

See ferromanganese.

silicomolybdic acid. See 12-molybdosilicic acid.

silicon. (silicon powder, amorphous).

CAS: 7440-21-3. Si. Nonmetallic element Atomic number 14, group IVA of the periodic table, aw 28.086, valence = 4, three stable isotopes. It is the second most abundant element (25% of the earth's crust) and is the most important semiconducting element; it can form more compounds than any other element except carbon.

Properties: Dark-colored crystals (the octahedral form in which the atoms have the diamond arrangement). The amorphous form is a dark-brown powder (see silicon, amorphous). D 2.33, mp 1410°C, bp 2355°C, Mohs hardness 7, dielectric constant 12, coordination number 6. Soluble in a mixture of nitric and hydrofluoric acids and in alkalis; insoluble in water, nitric acid, and hydrochloric acid. Combines with oxygen to form tetrahedral molecules in which one silicon atom is surrounded by four oxygen atoms. In this respect it is similar to carbon. It is also capable of forming –Si=Si– double bonds in organosilicon compounds.

Occurrence: Does not occur free in nature but is a major portion of silica and silicates (rocks, quartz, sand, clays, etc.).

Derivation: Crystalline silicon is made commercially (96–98% pure) in an electric furnace by heating SiO₂ with carbon, followed by zone refining. It can be purified to 99.7% by leaching. The ultrapure semiconductor grade (99.97%) is obtained by reduction of purified silicon tetrachloride or trichlorosilane with purified hydrogen; the silicon is deposited on hot filaments (800°C) of tantalum or tungsten. In a

one-step method, sodium fluorosilicate is reacted with sodium, the heat produced being sufficient to form silicon tetrafluoride; this, when reacted with sodium, yields high-purity silicon and sodium fluoride. The process requires no heat except that provided by the original reaction. Single crystals of both *n*- and *p*-type are grown by highly specialized techniques.

Grade: Ferrosilicon, regular (97% silicon), semiconductor or hyperpure (99.97% silicon), amorphous.

Hazard: TLV: TWA (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%). Flammable in powder form.

Use: Semiconductor in solid-state devices (transistors, photovoltaic cells, computer circuitry, rectifiers, etc.); organosilicon compounds; silicon carbide; alloying agent in steels, aluminum, copper, bronze, and iron (ferrosilicon); cermets and special refractories; halogenated silanes; spring steels; deoxidizer in steel manufacture.

See silica; silicate; silicone; ferrosilicon; silicon, amorphous.

silicon, amorphous. A noncrystalline allotrope of silicon that exists in the form of a dark-brown powder. It is made from silane (SiH₄) plus doping agents in a glow-discharge tube at low pressure. A film only a few microns in thickness is deposited on a glass or metal substrate. The amorphous product contains about 20% hydrogen. It has been found superior to crystalline silicon in the manufacture of solar cells.

silicon-bronze. An alloy of copper, tin, and silicon used for telephone and telegraph wires.

silicon carbide.

CAS: 409-21-2. SiC.

Properties: Bluish-black, iridescent crystals. Mohs hardness 9, d 3.217, sublimes with decomposition at 2700C. Insoluble in water and alcohol; soluble in fused alkalis and molten iron. Excellent thermal conductivity, electrically conductive, resists oxidation at high temperatures. Noncombustible, a nuisance particulate.

Derivation: Heating carbon and silica in an electric furnace at 2000C.

Available forms: Powder, filament, whiskers (3 million psi), single crystals.

Hazard: TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Abrasive for cutting and grinding metals, grinding wheels, refractory in nonferrous metallurgy, ceramic industry and boiler furnaces, composite tubes for steam reforming operations. Fibrous form used in filament-wound structures and heat-resistant, high-strength composites.

See "Carborundum"; "Carbofrax."

silicon-copper. (copper silicide).

Properties: A hard, tough, bronzelike alloy containing 10–30% silicon.

Derivation: From silica and copper electrolytically.

Use: Manufacture of silicon-bronze.

silicone. (organosiloxane). Any of a large group of siloxane polymers based on a structure consisting of alternate silicon and oxygen atoms with various organic radicals attached to the silicon:

Discovered by Kipping in England in 1900.

Properties: Liquids, semisolids, or solids depending on molecular weight and degree of polymerization. Viscosity ranges from less than 1 to more than 1 million centistokes. Polymers may be straight chain, or cross-linked with benzoyl peroxide or other free radical initiator, with or without catalyst. Stable over temperature range from –50 to +250C. Very low surface tension; extreme water repellency; high lubricity; excellent dielectric properties; resistant to oxidation, weathering, and high temperatures; permeable to gases. Soluble in most organic solvents; unhalogenated types are combustible.

Derivation: (1) Silicon is heated in methyl chloride to yield methylchlorosilanes; these are separated and purified by distillation and the desired compound mixed with water. A polymeric silicone results. (2) Reaction of silicon tetrachloride and a Grignard reagent (RMgCl), with subsequent hydrolysis and polymerization.

Available forms: Fluids, powders, emulsions, solutions, resins, pastes, elastomers.

Use: (Liquid) Adhesives, lubricants, protective coatings, coolants, mold release agents, dielectric fluids, heat transfer, wetting agents and surfactants, foam stabilizer for polyurethanes, diffusion pumps, anti-foaming agent for liquids, textile finishes, water repellent, weatherproofing concrete, brake fluids, cosmetic items, polishes, foam shields in solar energy collectors, rust preventives. (Resin) Coatings, molding compounds, laminates (with glass cloth), filament winding sealants, room-temperature curing cements, electrical insulation, impregnating electric coils, bonding agent, modifier for alkyd resins, vibration-damping devices. (Elastomer, or silicone rubber) Encapsulation of electronic parts; electrical insulation; gaskets; surgical membranes and implants; automobile engine components; flexible windows for face masks, air locks, etc.; miscellaneous mechanical products.

See organosilicon.

silicone oil. See silicone.

silicone rubber. See silicone.

silicon-gold alloy. See gold-silicon alloy.

silicon monoxide.

CAS: 10097-28-6. SiO.

Properties: Amorphous, black solid. D 2.15–2.18, sublimes at high temperature, hard and abrasive. Noncombustible.**Grade:** Lumps, powders, tablets; optical.**Use:** To form thin surface films for protection of aluminum coatings, optical parts, mirrors, dielectrics, or insulators.**silicon nitride.** Si₃N₄.**Properties:** Gray, amorphous powder (can be prepared as crystals). Sublimes at 1900C, d 3.44, bulk d 70–75 lb/cu ft depending on mesh, Mohs hardness 9+, thermal conductivity 10.83 Btu/in/sq ft/hr/F (400–2400F). Resistant to oxidation, various corrosive media, molten aluminum, zinc, lead, and tin; soluble in hydrogen fluoride.**Derivation:** Reaction of powdered silicon and nitrogen in an electric furnace at 1300C.**Use:** Refractory coatings, bonding silicon carbide, mortars, abrasives, thermocouple tubes in molten aluminum, crucibles for zone-refining germanium, rocket nozzles, high-strength fibers and whiskers, insulator and passivating agent in transistors and other solid-state devices.**silicon tetrabromide.** (tetrabromosilane).SiBr₄.**Properties:** Fuming, colorless liquid that turns yellow in air; disagreeable odor. Decomposed by water with evolution of heat, d 2.82 (0C), bp 153C, mp 5C. Noncombustible.**Grade:** Purity: 99.999%.**Hazard:** Strong irritant to tissue.**silicon tetrachloride.** (tetrachlorosilane; silicon chloride).CAS: 10026-04-7. SiCl₄.**Properties:** Colorless, exceedingly mobile, fuming liquid; suffocating odor. Corrosive to most metals when water is present; in the absence of water it has practically no action on iron, steel, or the common metals and alloys, and can be stored and handled in metal equipment without danger. D 1.483 (20C), bulk d 12.4 lb/gal, fp –70C, bp 57.6C, refr index 1.412 (20C). Miscible with carbon tetrachloride, tin tetrachloride, titanium tetrachloride, and sulfur mono- and dichlorides; decomposed by water and alcohol with evolution of hydrogen chloride. Noncombustible.**Derivation:** Heating silicon dioxide and coke in a stream of chlorine.**Grade:** Technical, 99.5%, CP (99.8%), semiconductor.**Hazard:** Toxic by ingestion and inhalation, strong irritant to tissue.**Use:** Smoke screens; manufacture of ethyl silicate and similar compounds; production of silicones; manufacture of high-purity silica and fused silica glass; source of silicon, silica, and hydrogen chloride; lab reagent.**silicon tetrafluoride.** (tetrafluorosilane; silicon fluoride).CAS: 7783-61-1. SiF₄.**Properties:** Colorless gas; suffocating odor similar to hydrogen chloride. Fumes strongly in air, d 3.57 (gas, air = 1) (15C), fp –90C, bp –86C. Absorbed readily in large quantities by water with decomposition; soluble in absolute alcohol. Noncombustible.**Derivation:** (1) Action of hydrogen fluoride or concentrated sulfuric acid and a metallic fluoride on silica or silicates; (2) direct synthesis.**Grade:** Pure, 99.5% min.**Hazard:** Toxic by inhalation, strong irritant to mucous membranes. TLV: 2.5 mg(F)/m³.**Use:** Manufacture of fluosilicic acid, intermediate in manufacture of pure silicon, to seal water out of oil wells during drilling.**silicon tetrahydride.** See silane.**silicon tetraiodide.** SiI₄.**Properties:** White crystals. Mp 120C, bp 290C. Noncombustible.**Grade:** Up to 99.999%.**Hazard:** Toxic by ingestion and inhalation, irritant to tissue.**silicotungstic acid.** (12-tungstosilicic acid; silicowolframic acid). H₄SiW₁₂O₄₀•5H₂O.**Properties:** White, crystalline powder. Very soluble in water and polar organic solvents; relatively insoluble in nonpolar organic solvents. Strong acid. Noncombustible.**Grade:** Reagent, technical.**Use:** Catalyst for organic synthesis, reagent for alkaloids, additive to plating processes, as precipitant and inorganic ion exchanger, minerals separation, mordant.

See sodium 12-tungstosilicate; tungstosilicates.

silicowolframic acid. See silicotungstic acid.**silk.** A natural fiber secreted as a continuous filament by the silkworm, *Bombyx mori*; silk consists essentially of the protein fibroin and, in the raw state, is coated with a gum that is usually removed before spinning. D 1.25, elongation at rupture about 20%, tenacity 3–5 g/denier. Combustible but self-extinguishing.**“Sil-Kleer” [Silbrico].** TM for perlite filter aid. **sillimanite.** An aluminum silicate, a high-heat-resisting material containing a maximum amount of mullite, developed from the alteration of andalusite during firing. This necessitates firing at above 1550C for the development of a suitable crystalline structure.**Use:** Spark plugs, chemical lab ware, pyrometer tubes, special porcelain shapes, furnace patch and refractories.

sil. See ensilage.

siloxane. (oxosilane). A straight-chain compound (analogous to paraffin hydrocarbons) consisting of silicon atoms single-bonded to oxygen and so arranged that each silicon atom is linked with four oxygen atoms.

In some types, hydrogen may replace two or more of the oxygens. Disiloxane and trisiloxane are examples. See silicene.

“Silspan” [Pecora]. TM for preformed silicone profile seals.

“Siltemp” [Ametek]. TM for a substantially pure fibrous silica for use in rocket and missile construction and for high-temperature insulation of motor components and similar applications.

Use: As a construction material in laminate form impregnated and bonded with high-temperature resins.

silteplase.

CAS: 131081-40-8.

Hazard: A poison by ingestion.

“Sil-Trode” [Ampco]. TM for silicon bronze electrodes and filler rod for use in inert-gas welding.

silumin. Aluminum-silicon alloys containing 12% silicon.

Properties: D 2.63–2.65.

silver.

CAS: 7440-22-4. Ag. Metallic element, atomic number 47, group IB of the periodic table, aw 107.868, valence of 1, two stable isotopes.

Properties: Soft, ductile, lustrous, white solid; highest electrical and thermal conductivity of all metals. Excellent light reflector that resists oxidation, but tarnishes in air through reaction with atmospheric sulfur compounds. D 10.53, mp 961C, bp 2212C, thermal conductivity 1.01 cal/cm/sec/C, absorbs oxygen strongly at the melting point. Soluble in nitric acid, hot sulfuric acid, and alkali cyanide solutions; insoluble in water and alkalies. Noncombustible except as powder.

Derivation: By-product of operations on copper, zinc, lead, or gold ores, but some smelters still operate on native silver. The recovery ranges from 166 ounces to a few thousandths of an ounce per ton. See Parkes process; Pattinson process.

Source: Chief silver ores are native silver, argentite (silver sulfide), and cerargyrite (silver chloride).

Available forms: Pure (“fine”), sterling (7.5% cop-

per), various alloys; plate, ingot, bullion, moss, sheet, wire, tubing, castings, powder, high purity (impurities less than 100 ppm), single crystals, whiskers.

Hazard: Toxic material. TLV: (metal) 0.1 mg/m³; (soluble compounds as silver) 0.01 mg/m³.

Use: Manufacture of silver nitrate, silver bromide, photographic chemicals; lining vats and other equipment for chemical reaction vessels, water distillation, etc.; mirrors; electric conductors, such as bus bars; silver plating; electronic equipment; sterilant; water purification; surgical cements; hydration and oxidation catalyst; special batteries; solar cells; reflectors for solar towers; low-temperature brazing alloys; table cutlery; jewelry; dental, medical, and scientific equipment; electrical contacts; bearing metal; magnet windings; dental amalgams. Colloidal silver is used as a nucleating agent in photography and in medicine, often combined with protein. See “Argyrol.”

Note: A sandwich assembly consisting of a layer of silver between two layers of TiO₂ is used to coat the interior of light bulbs; it is said to reduce power consumption by more than 50% and triple the life of the bulb. Each layer of the coating, applied by the sputtering technique is 180 Å thick.

silver acetate.

CAS: 563-63-3. CH₃COOAg.

Properties: White crystals or powder. D 3.26. Moderately soluble in hot water; soluble in nitric acid.

Hazard: Toxic material. TLV: 0.01 mg/m³.

Use: Lab reagent, oxidizing agent.

silver acetylde.

CAS: 13092-75-6. Ag₂C₂.

Properties: White, unstable powder. A salt of acetylene.

Derivation: Reaction of acetylene with aqueous solution of argentous salts.

Hazard: Severe explosion risk when shocked or heated.

Use: Detonators.

silver bromate. AgBrO₃.

Properties: White powder. Decomposed by heat, d 5.2. Sensitive to light, keep in amber bottle. Soluble in ammonium hydroxide; slightly soluble in hot water.

silver bromide. AgBr.

Properties: Pale yellow crystals or powder, darkens on exposure to light, finally turning black. D 6.473 (25C), mp 432C, bp decomposes at 700C. Soluble in potassium bromide, potassium cyanide, and sodium thiosulfate solutions; very slightly soluble in ammonia water; insoluble in water.

Derivation: Silver nitrate is dissolved in water and a solution of alkali bromide added slowly. The precipitated silver bromide is washed repeatedly with hot water; the operation must be carried on in a dark-room under a ruby-red light.

Use: Photographic film and plates, photochromic glass, laboratory reagent.

silver carbonate. Ag_2CO_3 .

Properties: Yellow to yellowish-gray powder. Contains 78% silver. Light-sensitive. D 6.077; decomposes at 218C. Soluble in ammonium hydroxide, nitric acid; insoluble in alcohol and water.

Use: Lab reagent.

silver chlorate. (argentous chlorate).

CAS: 7783-92-8. AgClO_3 .

Properties: White, crystalline solid. Mp 230C, decomposes at 270C, d 4.44. Partially soluble in water, light-sensitive.

Derivation: Reaction of silver nitrate and sodium chlorate.

Hazard: Oxidizing agent, may react violently when shocked or heated, store away from combustible materials. Toxic by ingestion.

Use: Organic synthesis.

silver chloride. AgCl .

Properties: White, granular powder; darkens on exposure to light, finally turning black. Exists in several modifications differing in behavior toward light and in their solubility in various solvents. D 5.56, mp 445C, bp 1550C. Soluble in ammonium hydroxide, concentrated sulfuric acid and sodium thiosulfate and potassium bromide solutions; very slightly soluble in water. Can be melted, cast, and fabricated like a metal.

Derivation: Silver nitrate solution is heated and hydrochloric acid or salt solution added. The whole is boiled, then filtered, all in the dark or under a ruby-red light.

Method of purification: Resolution in ammonium hydroxide and precipitation by hydrochloric acid.

Grade: Technical; CP; single, pure crystals.

Hazard: As for silver.

Use: Photography, photometry and optics, batteries, photochromic glass, silver plating, production of pure silver, antiseptic. Single crystals are used for infrared absorption cells and lens elements, lab reagent.

silver chromate. Ag_2CrO_4 .

Properties: Dark, brownish-red powder. D 5.625. Soluble in acids, ammonium hydroxide, potassium cyanide, solutions of alkali chromates; insoluble in water.

Use: Lab reagent.

silver cyanide.

CAS: 506-64-9. AgCN .

Properties: White powder; odorless, tasteless. Darkens on exposure to light. D 3.95, decomposes at 320C. Soluble in ammonium hydroxide, dilute boiling nitric acid, and potassium cyanide and sodium thiosulfate solutions; insoluble in water.

Derivation: By adding sodium cyanide or potassium cyanide to a solution of silver nitrate.

Hazard: Toxic by ingestion or inhalation. TLV: 0.01 mg/m³.

Use: Silver plating.

silver dichromate. (silver bichromate).

$\text{Ag}_2\text{Cr}_2\text{O}_7$.

Properties: Dark-red, almost black, crystalline powder. D 4.770. Soluble in ammonium hydroxide and nitric acid; slightly soluble in water.

Hazard: Possible carcinogen. TLV: 0.01 mg/m³.

silver fluoride.

CAS: 7775-41-9. $\text{AgF}\cdot\text{H}_2\text{O}$.

Properties: Yellow or brownish crystalline mass. Very hygroscopic, becomes dark on exposure to light. D 5.852 (anhydrous), mp 435C, bp 1159C. Soluble in water.

Hazard: Strong irritant. TLV: 0.01 mg/m³.

Use: Medicine (antiseptic), substitution of fluorine for bromine and chlorine in organic compounds.

silver iodide. AgI .

Properties: Pale-yellow powder; odorless, tasteless; darkens on exposure to light. D 5.675, mp 556C. Soluble in hydrogen iodide, potassium iodide, potassium cyanide, ammonium hydroxide, sodium chloride, and sodium thiosulfate solutions. Insoluble in water.

Derivation: Silver nitrate solution is heated, alkali iodide solution added, and the precipitate washed with boiling water in the dark or under ruby red illumination.

Use: Photography, cloud seeding for artificial rain-making, lab reagent, antiseptic.

“Silver-Lume” A, B [ATOTECH]. TM for a bright silver electroplating process for use by silversmiths and electronics manufacturers. The materials used are silver cyanide, potassium cyanide, potassium carbonate, and addition agents.

silver mercury iodide. See mercuric silver iodide.

silver methylarsonate. (methanearsonic acid, disilver salt). $\text{CH}_3\text{AsI}_2\text{Ag}_2$.

Derivation: Reaction of disodium methylarsonate with silver salts.

Hazard: Very toxic. TLV: 0.01 mg/m³.

Use: Algicides.

silver nitrate.

CAS: 7761-88-8. AgNO_3 .

Properties: Colorless, transparent, tabular, rhombic crystals; becomes gray or grayish-black on exposure to light in the presence of organic matter; odorless; bitter, caustic metallic taste. Strong oxidizing agent and caustic. D 4.328, mp 212C, bp (decomposes). Soluble in cold water; more soluble in hot water, glycerol, and hot alcohol; slightly soluble in ether.

Derivation: Silver is dissolved in dilute nitric acid and the solution evaporated. The residue is heated to

a dull red heat to decompose any copper nitrate, dissolved in water, filtered, and recrystallized.

Grade: Technical, CP, USP.

Hazard: Strong irritant to skin and tissue. TLV: 0.01 mg/m³.

Use: Photographic film, catalyst for ethylene oxide, indelible inks, silver plating, silver salts, silvering mirrors, germicide (as a wall spray), hair dyeing, antiseptic, fused form to cauterize wounds, lab reagent.

silver nitride. Ag_3N .

Properties: Colorless powder.

Derivation: Reaction of silver compounds with ammonia, with or without additives.

Hazard: Severe explosion hazard when shocked. It is unusually sensitive to mechanical action of any kind and can explode even in water suspension.

silver nitrite. AgNO_2 .

Properties: Small yellow or grayish-yellow needles; becomes gray on exposure to light. Decomposes at 140C, d 4.453 (26C). Contains 70% silver. Decomposed by acids; soluble in hot water; insoluble in alcohol.

Hazard: Highly toxic. TLV: 0.01 mg/m³.

Use: Reagent for alcohols, preparation of aliphatic nitrogen compounds, and standard solutions for water analysis.

silver orthophosphate. See silver phosphate.

silver oxide. (argentous oxide).

CAS: 20667-12-3. Ag_2O .

Properties: Dark-brown or black powder; odorless; metallic taste. D 7.14 (16C), mp decomposes when heated above 300C, strong oxidizing agent. Soluble in ammonium hydroxide, potassium cyanide solution, nitric acid, and sodium thiosulfate solution; slightly soluble in water; insoluble in alcohol.

Derivation: Silver nitrate and alkali hydroxide solutions are mixed, the precipitate filtered and washed.

Grade: Technical, up to 99.6% pure, particle size 2–3 microns.

Hazard: Fire and explosion risk in contact with organic materials or ammonia.

Use: Polishing glass, coloring glass yellow, catalyst, purifying drinking water, lab reagent.

silver oxide battery. See zinc–silver oxide battery.

silver perchlorate.

CAS: 7783-93-9. AgClO_4 .

Properties: Colorless crystals. Deliquescent, mp 485C (decomposes), d 2.80. Soluble in water; reacts with explosive violence with many organic solvents; explodes on grinding.

Use: Manufacture of explosive compositions.

silver permanganate. AgMnO_4 .

Properties: Violet, crystalline powder. D 4.27

(25C), mp decomposes; contains 47.5% silver; decomposed by alcohol; light-sensitive, use dark-colored bottles.

Grade: Technical.

Hazard: Dangerous explosion risk, may detonate if shocked or heated.

Use: Gas masks, medicine (antiseptic).

silver peroxide. (argentic oxide). Ag_2O_2 .

Properties: Grayish powder. D 7.44 (25C), decomposes above 100C. Insoluble in water; soluble in sulfuric acid, nitric acid, and ammonium hydroxide.

Hazard: Dangerous fire and explosion risk, strong oxidizing agent. Keep out of contact with organic materials.

Use: Manufacture of silver-zinc batteries.

silver phosphate. (silver orthophosphate).

Ag_3PO_4 .

Properties: Yellow powder, turns brown when heated or on exposure to light. D 6.370 (25C), mp 849C. Soluble in acids, potassium cyanide solutions, ammonium hydroxide, ammonium carbonate and acetic acid; very slightly soluble in water.

Derivation: Interaction of silver nitrate and sodium phosphate.

Use: Photographic emulsions, catalyst, pharmaceuticals.

silver picrate.

CAS: 146-84-9. $\text{C}_6\text{H}_2\text{O}(\text{N}_2)_3\text{Ag}\cdot\text{H}_2\text{O}$.

Properties: Yellow crystals containing 30% silver, soluble in water. Slightly soluble in alcohol and acetone; insoluble in ether and chloroform.

Hazard: Severe explosion risk. Very toxic.

Use: Medicine (antimicrobial agent).

silver potassium cyanide. (potassium cyanargentate; potassium argentocyanide).

CAS: 506-61-6. $\text{KAg}(\text{CN})_2$.

Properties: White crystals. D 2.36 (25C), sensitive to light. Soluble in water and alcohol; insoluble in acids.

Derivation: By adding silver chloride to a solution of potassium cyanide.

Hazard: Very toxic. TLV: 0.01 mg/m³.

Use: Silver plating, bactericide, antiseptic.

silver sodium chloride. (sodium silver chloride). $\text{AgCl}\cdot\text{NaCl}$.

Properties: Hard, white crystals. Decomposed by water. Soluble in a concentrated solution of sodium chloride.

silver sodium thiosulfate. (sodium silver thiosulfate). $\text{Ag}_2\text{S}_2\text{O}_3\cdot 2\text{Na}_2\text{S}_2\text{O}_3\cdot 2\text{H}_2\text{O}$.

Properties: White to gray, crystalline powder; sweet taste. Soluble in water.

silver, sterling. See sterling silver.

silver sulfate. (silver sulfate, normal).

Ag_2SO_4 .

Properties: Small, colorless, lustrous crystals or crystalline powder. Contains about 69% silver, turns gray on exposure to light. D 5.45 (29C), bp 1085C (decomposes), mp 652C. Soluble in ammonium hydroxide, nitric acid, sulfuric acid, hot water; insoluble in alcohol.

Grade: Technical, CP.

Hazard: Highly toxic. TLV: 0.01 mg/m³.

Use: Lab reagent.

silver sulfate, normal. See silver sulfate.

silver sulfide. Ag_2S .

Properties: Grayish-black powder. D 7.32 (25C), bp decomposes, mp 825C. Soluble in concentrated sulfuric and nitric acids; insoluble in water.

Derivation: By passing hydrogen sulfide gas into silver nitrate solution, washing and drying.

Use: Inlaying in niello metalwork, ceramics.

silver trinitromethanide.

CAS: 25987-94-4. mf: CAgN_3O_6

Properties: Soft, ductile, malleable, bright silver metal. Tarnishes in air, forming sodium oxides, the carbonates, and the hydroxide. mw: 257.90, Mp: 97.8C, bp: 881C. Soluble in liquid NH_3 .

Hazard: An explosive.

“Silver Universal Klister” [Swix]. TM for a ski wax.

Use: Wax useful on both sides of freezing as conditions are changing.

silvex. (fenoprop; generic name for 2-(2,4,5-trichlorophenoxy)propionic acid).

CAS: 93-72-1. $\text{Cl}_3\text{C}_6\text{H}_4\text{OCH}(\text{CH}_3)\text{COOH}$.

Properties: Solid. Mp 180.4–181.6C. Slightly soluble in water; freely soluble in acetone, methanol. Combustible.

Hazard: Use has been restricted.

Use: Herbicide and plant growth regulator.

silvichemical. A chemical derived from wood, e.g., lignins, lignosulfonates (from spent sulfite liquor), vanillin, yeast (from fermentation of wood sugars), tall oil, sulfate turpentine, bark extracts, phenolic materials.

silvicide. A nonselective herbicide used to kill or defoliate bushes and small trees, e.g., ammonium sulfamate.

silybum marianum (linn.) gaertn., extract.

CAS: 84604-20-6.

Hazard: Moderately toxic.

Source: Natural product.

silylene. An organosilicon compound containing double-bonded silicon.

simazine. (2-chloro-4,6-bis(ethylamino)-s-triazine).

CAS: 122-34-9. $\text{ClC}_3\text{N}_3(\text{NHC}_2\text{H}_5)_2$.

Properties: White solid. Mp 225C. Insoluble in water; slightly soluble in organic solvents. Combustible.

Use: Herbicide.

Simmons-Smith reaction. Stereospecific synthesis of cyclopropanes by treatment of olefins with methylene iodide and zinc-copper couple.

Simonini reaction. The preparation of aliphatic esters by the reaction of two moles of the silver salt of a carboxylic acid and one mole of iodine.

Simonis chromone cyclization. Formation of chromones from phenol and β -keto esters in the presence of phosphorus pentoxide, phosphorus oxychloride, or sulfuric acid. Coumarins may also be formed.

Simons process. An electrochemical fluorination process that makes fluorocarbons by passing an electric current through a mixture of the organic starting compound and liquid anhydrous hydrogen fluoride. The products are hydrogen and the desired fluorocarbon.

simple diffusion. The unassisted movement of molecules across a membrane to a region of lower concentration.

simple distillation. Distillation in which no appreciable rectification of the vapor occurs, i.e., the vapor formed from the liquid in the still is completely condensed in the distillate receiver and does not undergo change in composition due to partial condensation or contact with previously condensed vapor.

simple protein. A protein yielding only amino acids on hydrolysis.

SIMS. Abbreviation for secondary ion mass spectroscopy.

single-cell protein. See protein, single-cell.

single-gene disorder. Hereditary disorder caused by a mutant allele of a single gene. Examples are Duchenne muscular dystrophy, retinoblastoma, and sickle cell disease. See polygenic disorders.

single nucleotide polymorphism (SNP).

DNA sequence variations that occur when a single nucleotide (A, T, C, or G) in the genome sequence is altered.

See mutation; polymorphism; single-gene disorder.

singlet. Two unpaired electrons of a diradical having antiparallel spins.

singlet oxygen. An electronically stimulated oxygen molecule.

sinorphan.

CAS: 112573-73-6. mf: $C_{21}H_{23}NO_4S$.

Hazard: A poison.

sintering. The agglomeration of metal or earthy powders at temperatures below the melting point. Occurs in both powder metallurgy and ceramic firing. While heat and pressure are essential, decrease in surface area is the critical factor. Sintering increases strength, conductivity, and density. See Rittinger's law.

SIPP. Abbreviation for sodium iron pyrophosphate.

siRNA. (RNAi). Small Inhibitory RNA.

sisal.

Properties: Hard, strong, light-yellow to reddish fibers obtained from the leaves of *Agave sisilana*. Strength 4.5 g/denier, fineness ranges from 300–500 denier. Combustible, not self-extinguishing.

Source: Africa, Haiti, Bahama, Indonesia.

Hazard: Dust is flammable, may ignite spontaneously when wet. Toxic by inhalation.

Use: Twine, sacking, upholstery, life preservers, mattress liners, floor covering.

site-directed mutagenesis. A set of methods used to create specific alterations in the sequence of nucleotides in a gene.

site-specific recombination. A type of genetic recombination that occurs only at specific sequences.

"Sitol" [Du Pont]. TM for an oxidizing agent in flake form used in discharge printing.

β -sitosterol. (dihydrostigmasterol). $C_{29}H_{50}O$.

Properties: Waxy-white solid; almost odorless and tasteless. Insoluble in water; soluble in benzene, chloroform, carbon disulfide, and ether. Can be crystallized from ether as anhydrous needles or from aqueous alcohol as leaflets with one molecule of water.

Derivation: Soybeans, tall oil.

Use: Biochemical research, anticholesteremic. See cholesterol.

sitosterol sulfate.

CAS: 24815-93-8. mf: $C_{29}H_{50}O \bullet HO_4S$.

Hazard: A reproductive hazard.

size oil. See throwing oil.

sizing compound. (1) A material such as starch, gelatin, casein, gums, oils, waxes, asphalt emulsions, silicones, rosin, and water-soluble polymers applied to yarns, fabrics, paper, leather, and other products to improve or increase their stiffness, strength, smoothness, or weight. (2) A material used to modify the cooked starch solutions applied to warp ends prior to weaving. See slashing compound.

"Skamex" [Du Pont]. TM for a fluorocarbon plastic used as a metallurgical additive for the beneficiation of molten metal. Cakes and slugs of it are specifically designed for immersion in hot metal for removal of excessive quantities of dissolved hydrogen. Other forms are added to molds during casting to create a protective atmosphere against the effects of absorbed oxygen. Can be used for ferrous and nonferrous metals.

skatole. (3-methylindole).

CAS: 83-34-1. C_9H_9N .

Properties: White, crystalline substance; browns upon aging; fecal odor. Mp 93–95C, bp 265C. Soluble in hot water, alcohol, benzene. Gives violet color in potassium ferrocyanide and sulfuric acid.

Derivation: Feces; African civet cat; *Celtis reticulosa*, a Javanese tree.

Use: Perfumery (fixative), artificial civet.

Skou, Jens C. (1918–). A Danish chemist who won the Nobel Prize in 1997 for his discovery of the first molecular pump, an ion transporting enzyme called Na^+K^+ ATPase. He is emeritus professor of biophysics at Aarhus University, Denmark. He received his Ph.D. from Aarhus University. See Boyer, Paul D., Walker, John E.

Skraup synthesis. Synthesis of quinoline or its derivatives by heating aniline or an aniline derivative, glycerol, and nitrobenzene in the presence of sulfuric acid.

SKY. See spectral karyotype.

"Skybond" [Solutia]. TM for polyimide resins.

Use: In insulation to provide heat resistance, component strength, fire resistance; in aircraft reinforcement, construction; in foams and adhesives.

"Skydrol" [Solutia]. TM for a series of fire-resistant aircraft hydraulic fluids.

500-A: Used for hydraulic systems in turbo jet and turbo prop aircraft, which must operate at -54°C .
 7000: Used in aircraft cabin superchargers, expansion turbines for air-conditioning systems and the aircraft hydraulic system itself.

“SkyKleen” [*Solutia*]. TM for an aviation solvent that is a replacement for chlorinated or ozone depleting solvents such as MEK (methyl ethyl ketone), 1,1,1, trichlorethane, isopropyl alcohol, and acetone. It contains no halogenated materials.

Properties: Biodegradable. Non-combustible.

Use: A sealant and adhesive removal solvent, useful for surface preparation for prepaint and prebonding, general surface cleaning and degreasing.

slack. (1) Descriptive of a soft paraffin wax resulting from incomplete pressing of the settlings from the petroleum distillate. Though it has some applications in this form, it is actually an intermediate product between the liquid distillate and the scale wax made by expressing more of the oil.

See scale (2).

(2) Specifically, to react calcium oxide (lime) with water to form calcium hydroxide (slaked or hydrated lime), the reaction is $\text{CaO} + \text{H}_2\text{O} \rightarrow \text{Ca}(\text{OH})_2 + \text{heat}$. The alternate spelling “slake” has the same meaning.

slaframine. (1-acetoxy-8-aminooctahydroindolizine). An alkaloid derived from a fungus that infests clover. It is under research development for use as an agent in retarding cystic fibrosis.

slag. (dross; cinder). (1) Fused agglomerate (usually high in silicates) that separates in metal smelting and floats on the surface of molten metal. Formed by combination of flux with gangue of ore, ash of fuel, and perhaps furnace lining. Slag is often the medium by means of which impurities may be separated from metal.

(2) The residue or ash from coal gasification processes, it may run as high as 40% depending on the rank of coal used.

Use: Railroad ballast, highway construction, cement and concrete aggregate, raw material for Portland cement, mineral wool, and cinder block.

slake. See slack.

slaked lime. See calcium hydroxide; lime, hydrated.

slashing compound. A textile sizing material applied to cotton or rayon warp ends by a special machine (slasher).

slash pine. A loblolly pine growing in swampy areas (slashes) in southeastern U.S.

Use: Primarily for manufacture of kraft paper pulp.

slate. A fine-grained metamorphic rock that cleaves into thin slabs or sheets. Color usually gray to black, sometimes green, yellow, brown, or red. Slates are composed of micas, chlorite, quartz, hematite, clays, and other minerals.

Occurrence: Pennsylvania, Vermont, Maine, Virginia, California, Colorado, Europe.

Use: Roofing, blackboards; (as powder) filler in paint, rubber, abrasive.

slate flour. Finely divided slate used as a filler and dusting agent in rubber, plastics, etc.

slate, green. See slate flour.

slave. A remote-controlled mechanism or instrument that repeats the action of an identical mechanism that is controlled by an operator in another location; it may be activated by electromagnets or by electronic means. Such devices are used chiefly in handling or processing radioactive materials but also have communication uses, as in the Telautograph.

slimicide. A chemical that is toxic to the types of bacteria and fungi characteristic of aqueous slimes. Examples are chlorine and its compounds, organomercurial compounds, phenols, and related substances.

Use: Largely in paper mills and to some extent in textile and leather industries.

See biocide.

slip clay. A type of clay containing such a high percentage of fluxing impurities and of such a texture that it melts at a relatively low temperature to a greenish or brown glass, thus forming a natural glaze. It must be fine-grained, free from lumps or concretions, show a low air shrinkage, and mature in burning at as low as 704°C .

slipicone. Fluid silicone compositions to prevent adhesion of materials to one another.

Use: Food-processing and packaging equipment.

“Slipkote” [*Specialty Lubes*]. TM for an anti-seize lube for engine assembly.

slot blot. Similar to a dot blot, but the analyte is put onto the membrane using a slot-shaped template. The template produces a consistently shaped spot, thus decreasing errors and improving the accuracy of the analysis. See Dot blot.

“Slow-Mag” [*Searle*]. TM for magnesium chloride.

Use: Drug.

sludge. Any thick, viscous mass, usually a sedimented or filtered waste product. Examples are (1) aluminum ore tailings (red mud), (2) asphaltic petroleum residues, and (3) municipal waste (Imhoff and

activated sludge). All these may be used as components of useful products, e.g., (1) in steel manufacturing, (2) in roofing and road treatment compositions, and (3) as a base for fertilizers. See sewage sludge.

“Sludge Conditioner” [*Nalco*]. TM for a series of polyelectrolytes.

Use: Conditions sludge for dewatering and settling in municipal sewage treatment plants.

slurry. A thin, watery suspension; for example, the feed to a filter press or to a fourdrinier machine; also a stream of pulverized metal ore. A special use of this term refers to a type of explosives called “slurry blasting agents” based on gelatinized aqueous ammonium nitrate, sensitized with various other explosives.

slushing agent. A nondrying oil, grease, or similar material.

Use: Coat metals to afford temporary protection against corrosion.

slush molding. A method of molding certain toys such as doll parts in which a preheated mold is filled with liquid plastic composition and then heated until the required wall thickness has formed. The remaining liquid plastic is then poured out and the mold heated further at 200–220C until the product has completely set. The mold is then cooled and the product removed.

Sm. Symbol for samarium.

Smalley, Richard E. (1943–2005). An American who won the Nobel Prize for chemistry along with Robert F. Curl, Jr. and Sir Harold W. Kroto in 1996, the 100th anniversary of Alfred Nobel’s death. The trio won for the discovery of the C₆₀ compound called buckminsterfullerene. He graduated from the University of Michigan and earned a Ph.D. from Princeton University.

See buckminsterfullerene; Curl, Robert F., Jr.; Kroto, Sir Harold W.

small nuclear riboNucleoProtein. See snRNP.

small nuclear RNA (snRNA). Any of several small RNA molecules in the nucleus. Most known snRNAs have a role in the splicing reactions that remove introns from mRNA, tRNA, and rRNA molecules.

smalt.

Properties: Blue powder.

Derivation: A potash-cobalt glass made by fusing pure sand and potash with cobalt oxide, grinding, and powdering.

Use: Paint pigments, ceramic industries (pigment),

coloring glass, bluing paper, starch and textiles, coloring rubber.

“392 SmartPlate Etch” [*Hurst*]. TM for a prewetting etch.

Use: For use on laser plates.

“Smart Plate Fountain Solution” [*Hurst*].

TM for a one step fountain solution.

Use: Formulated for use with laser plates.

“394 SmartPlate Prep” [*Hurst*]. TM for liquid cleaner.

Use: Removes scattered toner particles to allow clean, sharp images.

smectic. A molecular structure (layers or planes) occurring in some liquid crystals; it imparts a soft, soapy property. There are nine types of smectic orientation.

smelting. Heat treatment of an ore to separate the metallic portion with subsequent reduction.

See roasting.

Smiles rearrangement. Intramolecular nucleophilic aromatic substitution in alkaline solution resulting in the migration of an aromatic system from one heteroatom to another.

“Smite” [*Du Pont*]. TM for emulsifiable insecticide containing 12.5% methoxychlor and 12.5% malathion.

Smith, Michael. (1932–2000). A Canadian who won the Nobel Prize for chemistry in 1993 for the development of site-specific mutagenesis.

See Mullis, Kary Banks.

smog. A coined word denoting a persistent combination of smoke and fog occurring under appropriate meteorological conditions in large metropolitan or heavy industrial areas. The discomfort and danger of smog is increased by the action of sunlight on the combustion products in the air, especially sulfur dioxide, nitric oxide, and exhaust gases (photochemical smog). Strongly irritant and even toxic substances may be present, e.g., peroxybenzoyl nitrate. Fatalities have resulted from exposure to particularly severe photochemical smogs.

See air pollution.

smoke. A colloidal or microscopic dispersion of a solid in gas, an aerosol. (1) Coal smoke: A suspension of carbon particles in hydrocarbon gases or in air, generated by combustion. The larger particles can be removed by electrostatic precipitation in the stack (Cottrell). Dark color, nauseating odor. See smog; air pollution; Cottrell. (2) Wood smoke: Light-colored particles of cellulose ash, pleasant aromatic odor. Smoke from special kinds of wood

(e.g., hickory, maple) is used to cure ham, fish, etc., also to preserve crude rubber.

(3) Chemical smoke: Generated by chemical means for military purposes (concealment, signaling, etc.).

(4) Metallic smoke (fume): An emanation from heated metals or metallic ores, the particles being of specific geometric shapes. Such smoke is particularly damaging to vegetation in the neighborhood of zinc and tin smelters.

(5) Cigarette smoke: There is conclusive evidence that the tars occurring in cigarette smoke can lead to lung cancer; chief factors are age of individual at initiation of smoking, extent of inhalation, and amount smoked per day. Polonium, a radioactive element, is known to occur in cigarette smoke; more than 100 compounds have been identified, including nicotine, cresol, carbon monoxide, pyridene, and benzopyrene, the latter a carcinogen. See cigarette tar.

“Smokehouse Cleaner” [*Ace*]. TM for a high strength mechanical and recirculation cleaner. Use: Cleaner.

smokeless powder. Nitrocellulose containing about 13.1% nitrogen, produced by blending material of somewhat lower (12.6%) and slightly higher (13.2%) nitrogen content, converting to a dough with alcohol-ether mixture, extruding, cutting, and drying to a hard, horny product. Small amounts of stabilizers (amines) and plasticizers are usually present, as well as various modifying agents (nitrotoluene, nitroglycerin salts).

Hazard: A low explosive, dangerous fire and explosion risk when exposed to flame or impact.

Use: Sports ammunition, military purposes.

smudge oil. An oil burned in fruit orchards to prevent frost from injuring the trees. No. 3 fuel oil is typical of oils used.

smut. See fungus; rust (2).

Sn. Symbol for tin (from Latin stannum).

snake venom. There are two functional types: (1) those that bring about blood coagulation either by direct action on fibrinogen or by converting prothrombin to thrombin; (2) neurotoxins that act on the central nervous system, e.g., by inactivation of acetylcholine. Rattlesnake and moccasin venom are examples of (1) and cobra venom of (2). The enzymes of snake venoms are thought to be the actual toxic principles. Solutions of cobra venom have found use in treatment of arthritis and cancer. The chemistry and pharmacological properties of these poisons are not well understood.

Note: A person bitten by a poisonous snake should be carried, *not walked*, to a hospital. *No alcohol* should be administered.

SNDA. Supplemental New Drug Application.

sneezing gas. See diphenylchloroarsine.

snerps. See snRNP.

SNG. Abbreviation for synthetic or substitute natural gas.

snow, artificial. See artificial snow.

“Snowmelt Instant Ice Melter” [*Standard*]. TM for calcium chloride.

Use: Pellets for snow and ice melter. Flake for concrete accelerator and dust control.

snow point. Referring to a gas mixture, the temperature at which the vapor pressure of the sublimable component is equal to the actual partial pressure of that component in the gas mixture. This is the gaseous analog to dew point.

SNP. See single nucleotide polymorphism.

snRNA. Small nuclear RNA; forms complexes with proteins to form snRNPs; involved in RNA splicing, and polyadenylation reactions.

snRNP. (small nuclear riboNucleoProtein; *snerps*). Particles which are complexes between small nuclear RNAs and proteins, and which are involved in RNA splicing and polyadenylation reactions.

SNTA. Abbreviation for sodium nitrilotriacetate.

S1 nuclease. An enzyme which digests only single-stranded nucleic acids.

soap. (1) The water-soluble reaction product of a fatty acid ester and an alkali (usually sodium hydroxide), with glycerol as by-product. For the reaction, see saponification. A soap is actually a specific type of salt, the hydrogen of the fatty acid being replaced by a metal, which in common soaps is usually sodium. Soap lowers the surface tension of water and thus permits emulsification of fat-bearing soil particles. A typical commercial cleansing soap is made by reacting sodium hydroxide with a fatty acid. The lower the hydrogen content of the acid the thinner the soap. The by-product of the reaction is glycerol. Many different carboxyl-containing substances are used, including rosin, tall oil, vegetable and animal oils and fats (stearic, palmitic, and oleic acids). Olive oil is used for Castile soap; transparent soaps are made from decolorized fats. The specific gravity of soaps is slightly more than 1.0; inclusion of air gives a floating product. Water solutions of sodium soaps in bar, chip, or powder form are universally used as mild, emulsifying detergents for washing textiles, skin, paint, etc. Medically, soap is used as an antidote for poisoning by ingestion of mineral acids or heavy metals. Liquid green soap is made with potassium hydroxide and a vegetable oil.

(2) Heavy-metal soaps (loosely called metallic soaps) are those formed by metals heavier than sodium (aluminum, calcium, cobalt, lead, and zinc). These soaps are not water soluble; specific types are used in lubricating greases, gel thickeners, and in paints as driers and flattening agents. Napalm is an aluminum soap. See saponification; detergent.

soap builder. Any material mixed with soap to improve the cleaning properties, modify the alkali content, or impart water-softening characteristics. The commonest are some of the sodium phosphates and rosin.
See builder detergent.

Soap and Detergent Association. (SDA).
The Soap and Detergent Association is the non-profit trade association representing some 120 North American manufacturers of household, industrial and institutional cleaning products; their ingredients; and finished packaging. SDA member companies produce more than 90% of the cleaning products marketed in the U.S. Established in 1926, SDA is dedicated to advancing public understanding of the safety and benefits of cleaning products, and protecting the ability of its members to formulate products that best meeting consumer needs. SDA serves both its member and the public by developing and sharing information about industry products with the technical community, policy makers, child care and health professionals, educators, media and consumers. Its headquarters is at 1500 K Street, NW, Suite 300, Washington, DC 20005
Website: <http://sдахq.org>.

soap, heavy metal. See soap (2).

soap, soft. See green soap; soap.

soapstone. See talc.

Society of the Chemical Industry.
(SCIAS, SCI). This society was founded in London in 1881 to advance applied chemistry in all its branches. The American Section was established in 1894. In 1906 on the anniversary of the "birth of the coal tar industry," it founded the famous Perkin Medal, which has since been awarded annually for outstanding achievement in chemistry in the U.S. It has also offered the Chemical Industry Medal since 1932, given for conspicuous service to applied chemistry. Perkin Medalists include L. Baekeland, F. G. Cottrell, Irving Langmuir, Herbert Dow, A. D. Little, R. R. Williams, Glenn T. Seaborg, and Roger Adams. Its address is 14/15 Belgrave Square, London SW1X 8PS, UK
Website: <http://sci.mond.org>.

Society of Cosmetic Chemists. (SCC) The Society was founded in 1945 to promote high standards of practice in the cosmetic sciences and to serve as a focus for the exchange of ideas and new

developments in cosmetic research and technology. The Society has a membership of over 3,700 individuals. Its offices are at 120 Wall Street, Suite 2400, New York, NY 10005-4088.
Website: <http://www.sсconline.org>.

Society of Plastics Engineers. (SPE). An incorporated technical organization founded in 1942 and devoted primarily to the application of sound engineering principles to the manufacture and use of plastics, this rapidly growing organization has contributed much to the correct evaluation of these versatile materials in many fields. It publishes a monthly journal and sponsors a series of technical books on both theoretical and applied aspects of plastics technology. Can be reached at PO Box 403, Brookfield, CT 06804-0403, USA.
Website: <http://www.4spec.org>.

Society of the Plastics Industry. (SPI).
An incorporated technical organization founded in 1937 and serving the needs of the entire plastics industry in the U.S. It establishes standards for the properties and selection of materials and for product design and engineering. Its two major publications are the *Plastics Engineering Handbook* and the *Reinforced Plastics Handbook*. With it are associated the Plastics Pipe Institute and the Reinforced Plastics/Composites Institute. It is located at 1801 K ST NW, Suite 600K, Washington DC 20006.
Website: <http://www.socplas.org>.

SOCMA. Abbreviation for Synthetic Organic Chemical Manufacturers Association.

soda. Any one of the forms of sodium carbonate, also used loosely as equivalent to the word sodium in compounds.

soda alum. See aluminum sodium sulfate.

soda ash. (soda, calcined; sodium carbonate, anhydrous).
CAS: 497-19-8. Na₂CO₃. The crude sodium carbonate of commerce.

Properties: Grayish-white powder or lumps containing up to 99% sodium carbonate. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: For nearly a century most of the soda ash produced in the U.S. has been made synthetically by the ammonia soda (Solvay) process. Largely because of high energy costs and strict pollution controls, most of the synthetic production is being abandoned in favor of the natural product obtained from deposits in Utah, California, Wyoming, etc. One of the largest producing sites of the natural product is in Green River, Wyoming.

Impurities: Sodium chloride, sodium sulfate, calcium carbonate and magnesium carbonate, sodium bicarbonate.

Grade: Dense 58%, light 58%, extra light, natural, refined.

Use: Glass manufacture, chemicals, pulp and paper manufacture, sodium compounds, soaps and detergents, water treatment, aluminum production, textile processing, cleaning preparations, petroleum refining, sealing ponds from leakage (sodium ions bind to clay particles, which swell to seal leaks), catalyst in coal liquefaction.

soda, baking. See sodium bicarbonate.

soda, calcined. See soda ash.

soda, caustic. See sodium hydroxide.

soda crystals. See sodium carbonate monohydrate.

soda lime.

CAS: 8006-28-8. A mixture of calcium oxide with sodium hydroxide or potassium hydroxide intended for the absorption of carbon dioxide gas and water vapor.

Properties: White or grayish-white granules unless colored by a specified indicator. Must be kept in airtight containers.

Grade: Technical, reagent. Usually percentage moisture and mesh size are stated.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue.

Use: Drying agent and carbon dioxide absorbent, lab reagent.

soda lime glass. See glass.

sodalite. See cage zeolite.

sodamide. See sodium amide.

soda, modified. (neutral soda). A combination of soda ash and bicarbonate of soda in definite proportions for purposes where an alkali is needed, ranging in causticity between bicarbonate of soda and soda ash. White, crystalline powders; water-soluble and possessing valuable cleansing and purifying properties. Prepared in various strengths.

Use: Washing powders, laundering, wool scouring powders, bottle cleansers, textile cleaners, mild detergents.

soda monohydrate. See sodium carbonate, monohydrate.

soda, natural. See trona.

soda niter. See sodium nitrate.

“Sodaphos” [FMC]. TM for glassy sodium tetraphosphate.

soda pulp. See pulp, paper.

soda, washing. See sal soda.

Soddy, Frederick (1877–1965). A British physicist who won the Nobel Prize in chemistry in 1921. His work was concerned with radioactive elements and atomic energy. His concept of isotopes and the displacement law of radioactive change is basic to nuclear physics. His education was at Oxford and Glasgow. He later worked in Canada and Australia.

α -sodio-sodium acetate. (sodium α -sodioacetate). $\text{NaCH}_2\text{COONa}$.

Properties: Free-flowing powder. Stable in dry air, decomposes slowly in moist air, decomposes 280C without melting. Insoluble in ethers and hydrocarbons; reacts mildly with water.

Grade: 80–85% pure. Impurities are sodium acetate, sodium amide, and sodium hydroxide.

Hazard: Toxic by inhalation, irritant to skin and mucous membranes.

Use: Organic intermediate, drying agent for organic solvents.

sodium. (natrium).

CAS: 7440-23-5. Na. Metallic element, atomic number 11, group IA of periodic table, aw 22.98977, valence = 1, no stable isotopes but several radioactive forms, extremely reactive.

Properties: Soft, silver-white solid oxidizing rapidly in air; waxlike at room temperature, brittle at low temperatures. Store in airtight containers or in naphtha or similar liquid that does not contain water or free oxygen. D 0.9674 (25C), mp 97.6C, bp 892C. Decomposes water on contact, with evolution of hydrogen to form sodium hydroxide; insoluble in benzene, kerosene, and naphtha. Has excellent electrical conductivity and high heat-absorbing capacity.

Derivation: Electrolysis of a fused mixture of sodium chloride and calcium chloride.

Method of purification: Distillation.

Grade: Commercial, technical, brick, amalgam, coated powders, dispersions (sodium dispersion), reactor (99.99% pure).

Hazard: Severe fire risk in contact with water in any form, ignites spontaneously in dry air when heated; to extinguish fires use *dry* soda ash, salt, or lime. Forms strong caustic irritant to tissue.

Use: Tetraethyl and tetramethyl lead, titanium reduction, sodium peroxide, sodium hydride, polymerization catalyst for synthetic rubber, lab reagent, coolant in nuclear reactors, electric power cable (encased in polyethylene), nonglare lighting for highways, radioactive forms in tracer studies and medicine, heat transfer agent in solar-powered electric generators.

See sodium dispersions.

sodium abietate. (rosin soap; sodium resin-ate). $\text{C}_{19}\text{H}_{29}\text{COONa}$.

Properties: White powder. Soluble in water. Combustible.

Derivation: By leaching rosin with sodium hydroxide solution.

Use: Soap making, paper coating.

sodium acetate.

CAS: 127-09-3. (1) $\text{NaC}_2\text{H}_3\text{O}_2$. (2) $\text{NaC}_2\text{H}_3\text{O}_2 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals; odorless; efflorescent. (1) D 1.528, mp 324C, (2) d 1.45, mp 58C, autoign temp 1125F (607C). Soluble in water; slightly soluble in alcohol; soluble in ether. Combustible.

Grade: Highest purity, pure fused, CP, NF, technical, FCC.

Use: Dye and color intermediate, pharmaceuticals, cinnamic acid, soaps, photography, purification of glucose, meat preservation, medicine, electroplating, tanning, dehydrating agent, buffer, lab reagent, food additive.

sodium acetone bisulfate. (acetone-sodium bisulfite). $(\text{CH}_3)_2\text{CONaHSO}_3$.

Properties: Crystalline material. Soluble in water; decomposed by acids; slightly soluble in alcohol. Combustible.

Derivation: Interaction of sodium bisulfite and acetone.

Use: Chemical (pure acetone), photography, textile (dyeing and printing).

sodium acetylformate. See sodium pyruvate.

sodium acid carbonate. See sodium bicarbonate.

sodium acid methanearsonate. See sodium methanearsonate.

sodium acid phosphate. See sodium phosphate, monobasic.

sodium acid pyrophosphate. See sodium pyrophosphate, acid.

sodium acid sulfate. See sodium bisulfate.

sodium acid sulfite. See sodium bisulfite.

sodium acid tartrate. See sodium bitartrate.

sodium alginate. (sodium polymannuronate). CAS: 9005-38-3. $(\text{C}_6\text{H}_7\text{O}_6\text{Na})$.

Properties: Colorless or slightly yellow solid occurring in filamentous, granular, and powdered forms. Forms a viscous colloidal solution with water; insoluble in alcohol, ether, and chloroform. Combustible.

Derivation: Extracted from brown seaweeds (alginic acid).

Grade: NF, FCC, technical.

Use: Thickeners, stabilizers, and emulsifiers in foods, especially ice cream; boiler compounds; medicine; experimental ocean-floor covering; tex-

tile printing; cement compositions; paper coating; foods; pharmaceutical preparations; water-base paints.

sodium alkane sulfonate. (SAS). RSO_3Na .

The sodium salt of an alkane sulfonic acid of linear paraffins having chain lengths of 14–18 carbon atoms. Preparation: By reaction of paraffins with sulfur dioxide and oxygen in the presence of γ -radiation from a cobalt-60 source.

Use: Biodegradable detergent intermediate.

sodium *n*-alkylbenzene sulfonate.

Use: Food additive.

sodium alum. See aluminum sodium sulfate.

sodium aluminate.

CAS: 11138-49-1. $\text{Na}_2\text{Al}_2\text{O}_3$ or NaAlO_2 .

Properties: White powder. Mw 81.97, mp 1650C. Soluble in water; insoluble in alcohol; aqueous solution strongly alkaline.

Derivation: By heating bauxite with sodium carbonate and extracting the sodium aluminate with water.

Grade: Technical, reagent, also 27° Bé solution.

Hazard: (Solution) Strong irritant to tissue.

Use: Mordant, zeolites, water purification, sizing paper, manufacture of milk glass, soap and cleaning compounds.

sodium aluminosilicate. (sodium silicoaluminate). A series of hydrated sodium aluminum silicates having a $\text{Na}_2\text{O}:\text{Al}_2\text{O}_3:\text{SiO}_2$ mole ratio of approximately 1:1:13.2.

Properties: Fine, white, amorphous powder or beads; odorless and tasteless. Insoluble in water and in alcohol and other organic solvents; at 80–100C is partially soluble in strong acids and solutions of alkali hydroxides, pH of a 20% slurry is between 6.5 and 10.5. Noncombustible.

Grade: Technical, FCC.

Use: Anticaking agent in food preparations (up to 2%).

sodium aluminum hydride.

CAS: 13770-96-2. NaAlH_4 .

Properties: White, crystalline material. D 1.24, stable in dry air at room temperature but very sensitive to moisture, begins to melt at 183C with decomposition to evolve hydrogen. Soluble in tetrahydrofuran, dimethyl "Cellosolve."

Derivation: By reaction of aluminum chloride with sodium hydride.

Hazard: Severe fire and explosion risk in contact with oxidizing agents and water, forms caustic and irritating compounds.

Use: Reducing agent similar to lithium aluminum hydride.

sodium aluminum phosphate. (sodium aluminum phosphate, acidic).

$\text{NaAl}_3\text{H}_{14}(\text{PO}_4)_8 \cdot 4\text{H}_2\text{O}$ or $\text{Na}_3\text{Al}_2\text{H}_{15}(\text{PO}_4)_n$.

Properties: White powder; odorless. Insoluble in water; soluble in hydrochloric acid.

Grade: Technical, FCC.

Use: Food additive (baked products).

sodium aluminum phosphate, basic.

Properties: White powder; odorless. Insol in water; sol in hydrochloric acid.

Hazard: A nuisance dust.

Use: Food additive.

sodium aluminum silicofluoride. (sodium aluminum fluosilicate). $\text{Na}_3\text{Al}(\text{SiF}_6)_4$.

Properties: White powder. Somewhat soluble in cold water. Corrosive to galvanized iron.

Hazard: Avoid prolonged skin contact. TLV: 2.5 mg(F)/m³.

Use: Moth-proofing and insecticides, also to obtain acid medium in dyebath.

sodium aluminum sulfate. See aluminum sodium sulfate.

sodium amalgam. Na_2Hg .

Properties: A silver-white, porous, crystalline mass containing 2–20% of metallic sodium. Decomposes water.

Derivation: Mercury is heated to about 200C and sodium, in small pieces, is added slowly. Also formed at one stage of the process for making chlorine and sodium hydroxide by the mercury cell process.

Grade: 2, 3, 4, 5, 6, 7, 8, 9, 10, and 20%.

Hazard: Flammable, dangerous fire risk.

Use: Preparation of hydrogen, reduction of metal halogen compounds and organic compounds, reagent in analytical chemistry.

sodium amide. (sodamide).

CAS: 7782-92-5. NaNH_2 .

Properties: White, crystalline powder; ammonia odor. Mp 210C, bp 400C. Decomposes in water and hot alcohol.

Derivation: Dry ammonia gas is passed over metallic sodium at 350C.

Hazard: Flammable, dangerous fire risk.

Use: Manufacture of sodium cyanide, organic synthesis, lab reagent, dehydrating agent.

sodium aminophenylarsonate. See sodium arsanilate.

sodium ammonium hydrogen phosphate.

See sodium ammonium phosphate.

sodium ammonium phosphate. (micro-cosmic salt; sodium ammonium hydrogen phosphate; phosphorus salt). $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Transparent, colorless, monoclinic crystals; odorless; efflorescent. Gives off water and ammonia on heating leaving NaPO_3 , D 1.57, mp about

79C with decomposition. Soluble in water; insoluble in alcohol.

Derivation: Mixing solutions of sodium phosphate and ammonium chloride.

Grade: Granular, CP, technical.

Use: Analytical reagent.

sodium amytal. (sodium isoamyl ethyl barbiturate).

Use: Hypnotic.

sodium anilinearsonate. See sodium arsanilate.

sodium antimonate. (antimony sodiate).

CAS: 11112-10-0. NaSbO_3 . Other forms are sodium metaantimonate, $2\text{NaSbO}_3 \cdot 7\text{H}_2\text{O}$, and sodium pyroantimonate, $\text{Na}_2\text{H}_2\text{Sb}_2\text{O}_7 \cdot \text{H}_2\text{O}$.

Properties: White, granular powder. Slightly soluble in water and alcohol; insoluble in dilute alkalis, mineral acids; soluble in tartaric acid. Noncombustible.

Grade: Technical, glassmakers' grade.

Hazard: Toxic by ingestion and inhalation. TLV: 0.5 mg(Sb)/m³.

Use: Opacifier in enamels for cast iron and glass, ingredient of acid-resisting sheet steel enamels, high-temperature oxidizing agent.

sodium aristolochate I.

CAS: 10190-99-5. mf: $\text{C}_{17}\text{H}_{10}\text{NO}_7 \cdot \text{Na}$.

Hazard: Suspected carcinogen.

Source: Natural product.

sodium arsanilate. (sodium anilinearsonate; sodium aminophenylarsonate).

CAS: 127-85-5. $\text{C}_6\text{H}_4\text{NH}_2(\text{AsO} \cdot \text{OH} \cdot \text{ONa})$ Often with one or more water.

Properties: White, crystalline powder; odorless; faint salty taste. Soluble in water; slightly soluble in alcohol.

Derivation: By dissolving arsanilic acid in sodium carbonate solution and crystallizing.

Grade: Technical, medicinal.

Hazard: Highly toxic by ingestion and inhalation, may cause blindness.

Use: Medicine (anthelmintic), organic synthesis.

sodium arsenate.

CAS: 7778-43-0. $\text{Na}_3\text{AsO}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Clear, colorless crystals; mild alkaline taste. D 1.7593, mp 86C. Soluble in water; slightly soluble in alcohol and glycerol; insoluble in ether.

Derivation: Reaction of arsenic trioxide and sodium nitrate.

Grade: Pure crystals, CP, technical (60% arsenic pentoxide).

Hazard: Toxic by ingestion and inhalation.

Use: Mordant and assist in dyeing and printing, other arsenates, germicide.

sodium arsenite. (sodium metaarsenite).

CAS: 7784-46-5. NaAsO_2 .

Properties: Grayish-white powder that absorbs carbon dioxide from the air. D 1.87. Soluble in water; slightly soluble in alcohol.

Derivation: Arsenic trioxide is dissolved in a solution of sodium carbonate or hydroxide and boiled.

Grade: Crude, pure, 75% arsenious oxide (94% solution).

Hazard: Toxic by ingestion and inhalation.

Use: Arsenical soaps for taxidermists, antiseptic, dyeing, insecticides, hide preservation, herbicide.

sodium arsphenamine. See arsphenamine.

sodium ascorbate.

CAS: 134-03-2. $\text{C}_6\text{H}_7\text{NaO}_6$. The sodium salt of ascorbic acid.

Use: Antioxidant in food products.

sodium azide.

CAS: 26628-22-8. NaN_3 .

Properties: Colorless, hexagonal crystals. Decomposes at about 300C, d 1.846 (20C). Soluble in water and in liquid ammonia; slightly soluble in alcohol; hydrolyzes to form hydrazoic acid. Combustible.

Hazard: Highly toxic. TLV: ceiling of 0.29 mg/m³; not classifiable as a human carcinogen.

Use: Air-bag inflation, preservative in diagnostic medicinals, intermediate in explosive manufacture.

sodium barbiturate. $\text{C}_4\text{H}_3\text{N}_2\text{O}_3\text{Na}$.

Properties: White to yellow-tinted powder. Soluble in water and dilute mineral acid, pH of a 1% aqueous solution 10.5.

Hazard: Toxic by ingestion.

Use: Synthetic intermediate, catalyst in ammonium nitrate propellants, wood impregnating solutions. See barbiturate.

sodium benzenesulfonchloramine. See chloramine-B.

sodium benzoate.

CAS: 532-32-1. $\text{C}_6\text{H}_5\text{COONa}$.

Properties: White crystals or granular; odorless powder; sweetish, astringent taste. Soluble in water and alcohol. Combustible.

Derivation: Benzoic acid is neutralized with sodium bicarbonate solution, the solution filtered, concentrated, and allowed to crystallize.

Grade: USP, FCC, technical.

Hazard: Use in foods limited to 0.1%.

Use: Food preservative, antiseptic, medicine, tobacco, pharmaceutical preparations, intermediate for manufacture of dyes, rust and mildew inhibitor.

sodium benzosulfimide. See saccharin.

sodium benzylpenicillin. See penicillin.

sodium benzyl succinate.

$\text{C}_6\text{H}_5\text{CH}_2\text{O}_2\text{C}(\text{CH}_2)_2\text{COONa}$.

Properties: White amorphous or crystalline powder; slight benzyl odor; cool, salty taste. Soluble in water.

sodium beryllium fluoride. See beryllium sodium fluoride.

sodium bicarbonate. (baking soda; sodium acid carbonate).

CAS: 144-55-8. NaHCO_3 .

Properties: White powder or crystalline lumps; cooling, slightly alkaline taste. D 2.159, mp loses carbon dioxide at 270C. Soluble in water; insoluble in alcohol. Stable in dry air, but slowly decomposes in moist air. Noncombustible.

Derivation: Principally by treating a saturated solution of soda ash with carbon dioxide to precipitate the less soluble bicarbonate; also by purifying the crude product from the Solvay process.

Grade: Commercial, pure, highest purity, CP, USP, FCC.

Use: Manufacture of effervescent salts and beverages, artificial mineral water, baking powder; other sodium salts; pharmaceuticals; sponge rubber; gold and platinum plating; treating wool and silk; fire extinguishers; prevention of timber mold; cleaning preparations; lab reagent; antacid; mouthwash.

sodium bichromate. See sodium dichromate.

sodium bifluoride. (sodium acid fluoride).

CAS: 1333-83-1. NaHF_2 .

Properties: White, crystalline powder. D 2.08. Soluble in water; decomposes on heating.

Hazard: Highly toxic, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Tin-plate production, neutralizer in laundry rinsing operations, preservative for zoological and anatomical specimens, etching glass, antiseptic.

sodium biphosphate. See sodium phosphate, monobasic.

sodium bis(2-methoxyethoxy)-aluminumhydride.

An organometallic metal hydride, the alkoxy adduct of sodium aluminum hydride, soluble in benzene and other hydrocarbons; reacts less strongly with water than lithium aluminum hydride.

Use: For reduction of organic compounds.

sodium bismuthate.

CAS: 12232-99-4. NaBiO_3 .

Properties: Yellow or brown, amorphous powder. Slightly hygroscopic. Insoluble in cold water; decomposes in hot water and acids.

Use: Analysis (testing for manganese in iron, steel, and ores), reagent, pharmaceuticals.

sodium bisulfate. (sodium acid sulfate; niter cake; sodium hydrogen sulfate).

CAS: 7681-38-1. (1) NaHSO_4 or (2) $\text{NaHSO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white, fused lumps. Aqueous solution is strongly acid. (1) d 2.435 (13C), m_p above 315C, (2) d 2.103 (13C), m_p 58.5C. Soluble in water. Noncombustible.

Derivation: A by-product in the manufacture of hydrochloric acid and nitric acid.

Method of purification: Recrystallization.

Grade: Pure crystals, pure fused, pure dry, reagent, crude, CP, technical, FCC.

Available forms: Cakes, powder, prills, pearls.

Hazard: Strong irritant to tissue.

Use: Flux for decomposing minerals; substitute for sulfuric acid in dyeing; disinfectant; manufacture of sodium hydrosulfide, sodium sulfate, and soda alum; liberating CO_2 in carbonic acid baths, in thermophores; carbonizing wool; manufacture of magnesia cements, paper, soap, perfumes, foods, industrial cleaners, metal pickling compounds; lab reagent.

sodium bisulfide. See sodium hydrosulfide.

sodium bisulfite. (sodium acid sulfite; sodium hydrogen sulfite).

CAS: 7631-90-5. NaHSO_3 .

Properties: White crystals or crystalline powder; slight sulfurous odor and taste. Unstable in air, d 1.48, m_p decomposes. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: Sodium carbonate solution is saturated with sulfur dioxide and the solution crystallized.

Grade: Crystals, pure dry, commercial dry, reagent, commercial solution 35 degrees Bé, powder (67% SO_2), CP, USP, FCC.

Hazard: Not permitted in meats and other sources of vitamin B₁, strong irritant to skin and tissue. TLV: 5 mg/m^3 ; not classifiable as a human carcinogen.

Use: Chemicals (sodium salts, cream of tartar), vat dye preparation, textiles (antichlor, mordant, discharge), food preservative. Bleaching groundwood, wool, etc. Reducing agent, fermentation, antiseptic, cask sterilization (brewing), copper and brass plating, color preservative for pale crepe rubber, wood-pulp digestion, analytical reagent, dietary supplement.

sodium bitartrate. (acid sodium tartrate).

$\text{NaHC}_4\text{H}_4\text{O}_6 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. m_p loses water at 100C, bp 219C (decomposes). Soluble in water (aqueous solution in acid); slightly soluble in alcohol. Combustible.

Grade: CP, technical, reagent.

Use: Analysis (testing for potassium), effervescent mixture, nutrient media.

sodium bithionolate. (USAN; thiobis(4,6-dichloro-*o*-phenylene)oxy disodium; disodium

2,2'-thiobis-(4,6-dichlorophenoxide)).

$\text{C}_{12}\text{H}_2\text{Cl}_4\text{Na}_2\text{O}_2\text{S}$.

Properties: Solid. Soluble in water.

Use: Self-sanitizing polishes, waxes, and cleaners; shoe polish and leather conditioners.

sodium borate. (borax; sodium borate decahydrate; sodium pyroborate; sodium tetraborate).

CAS: 1303-96-4. $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$.

See borax, anhydrous; borax pentahydrate.

Properties: White crystals or powder; odorless. D 1.73 (20/4C). Loses water of crystallization when heated, with melting, between 75C and 320C; fuses to a glassy mass at red heat (borax glass); effloresces slightly in warm, dry air. Soluble in water and glycerol, insoluble in alcohol. Noncombustible.

Derivation: Fractional crystallization from Searles Lake brine, solution of kernite ore followed by crystallization. Also from colemanite, natural borax, uxeelite, and other borates.

Grade: Crystals, granulated, powdered (refined, USP), CP, technical.

Hazard: Toxic by inhalation. TLV: 1 mg/m^3 .

Use: Heat-resistant glass, porcelain enamel, detergents, herbicides, fertilizers, rust inhibitors, pharmaceuticals, leather, photography, bleaches, paint, boron compounds, flux for smelting, flame-retardant fungicide for wood, soldering flux, cleaning preparations, lab reagent.

sodium borate, anhydrous. See borax, anhydrous.

sodium boroformate.

$\text{NaH}_2\text{BO}_3 \cdot 2\text{HCOOH} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline solid. m_p 110C. Soluble in water.

Use: Buffering agent toward both acid and alkali in the range of pH 8.5, textile treating and tanning baths.

sodium borohydride.

CAS: 16940-66-2. NaBH_4 .

Properties: White, crystalline powder. D 1.07, hygroscopic, stable in dry air to 300C; decomposes slowly in moist air or in vacuum at 400C. Soluble in water, ammonia, amines, pyridine, and dimethyl ether of diethylene glycol; insoluble in other ethers, hydrocarbons, and alkyl chlorides.

Derivation: By reaction of sodium hydride and trimethyl borate at 250C.

Grade: Technical, powdered, pellets.

Hazard: Reacts with water to evolve hydrogen and sodium hydroxide. Flammable, dangerous fire risk. Store out of contact with moisture. *Note:* An explosion can occur by spontaneous ignition of the gases released from a saturated solution of sodium borohydride in dimethylformamide at 17C.

Use: Source of hydrogen and other borohydrides. Reduces aldehydes, ketones and acid chlorides. Bleaching wood pulp, blowing agent for plastics, precipitation of mercury from waste effluent (by

reduction), decolorizer for plasticizers, recycling of gold and platinum group metals, inorganic and organometallic reductions, organic synthesis.

sodium bromate.

CAS: 7789-38-0. NaBrO_3 .

Properties: White crystals or powder; odorless. D 3.339, mp 381C (decomposes). Soluble in water; insoluble in alcohol.

Derivation: By passing bromine into a solution of sodium carbonate, sodium bromide and sodium bromate being formed.

Hazard: Oxidizing material, dangerous fire risk near organic materials. Toxic by ingestion.

Use: Analytical reagent.

sodium bromide.

CAS: 7647-15-6. (1) NaBr . (2) $\text{NaBr}\cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder or granules; saline and somewhat bitter taste. Absorbs moisture from the air, becoming very hard. D (1) 3.208, (2) 2.176, mp (1) 757.7C, bp 1390C. Soluble in water; moderately soluble in alcohol.

Derivation: Occurs naturally in some salt deposits. Made synthetically by first causing iron to react with bromine and water. The resulting ferrous-ferric bromide is dissolved in water, sodium carbonate added, the solution filtered and evaporated.

Grade: CP, crystals, powdered, commercial, pure, highest purity, NF.

Hazard: Toxic by inhalation and ingestion.

Use: Photography, medicine (sedative), preparation of bromides.

sodium bromite. NaBrO_2 .

Use: A desizing compound for textiles.

sodium buthalital.

CAS: 510-90-7. mf: $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_2\text{S}\cdot\text{Na}$.

Hazard: A poison.

sodium cacodylate. (sodium dimethylarsenate).

CAS: 124-65-2. $(\text{CH}_3)_2\text{AsOONa}\cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous crystals or powder. Deliquescent. Melts about 60C, loses water at 120C. Soluble in water and alcohol.

Derivation: Oxidation and neutralization of cacodyl oxide.

Hazard: Toxic by inhalation and ingestion.

Use: Herbicide.

sodium calcium aluminosilicate, hydrated.

Hazard: A nuisance dust.

Use: Food additive.

sodium carbolate. See sodium phenate.

sodium carbonate. (soda).

See soda ash; sal soda; sodium bicarbonate; sodium carbonate monohydrate; sodium sesquicarbonate.

sodium carbonate monohydrate. (crystal, carbonate; soda monohydrate; soda crystals).

CAS: 497-19-8. $\text{Na}_2\text{CO}_3\cdot\text{H}_2\text{O}$.

Properties: White, small crystals or crystalline powder; odorless; alkaline taste. D 1.55, mp 109C (loses water) 851C. Soluble in water and glycerol; insoluble in alcohol. Noncombustible.

Grade: USP, technical, FCC.

Use: Photography, cleaning and boiler compounds, pH control of water, food additive, intermediate in thermochemical reactions, manufacture of glass, cleaning and bleaching textiles, analytical reagent.

sodium carbonate peroxide. See sodium percarbonate

sodium carbonate peroxohydrate. See sodium percarbonate.

sodium carboxymethylcellulose. See carboxymethylcellulose.

sodium *o*-carboxymethyltartronate.

CAS: 41999-58-0. mf: $\text{C}_5\text{H}_7\text{O}_6\cdot 3\text{Na}$.

Hazard: Questionable carcinogen.

sodium caseinate.

CAS: 9005-46-3.

Properties: White, coarse powder; odorless; tasteless. Contains 65% proteins. Soluble in water (usually with turbidity).

Derivation: By dissolving casein in sodium hydroxide and evaporating.

Grade: Edible.

Use: Food additive (binder and extender in sausage, soups, etc.), emulsifier, and stabilizer.

sodium catechol disulfonate. See disodium-1,2-dihydroxybenzene-3,5-disulfonate.

sodium cellulosate.

Properties: A cellulosic fiber.

Derivation: Reaction of sodium methoxide with cotton or rayon swollen in methanol.

Use: Intermediate in preparing grafted fibers when combined with polyacrylonitrile, there is an average substitution of one polyacrylonitrile chain for every 100 to 300 anhydroglucose units of the cellulose.

sodium chlorate.

CAS: 7775-09-9. NaClO_3 .

Properties: Colorless crystals; odorless; cooling, saline taste. Must not be triturated with any combustible substance. D 2.490, mp 255C, bp (decomposes). Soluble in water and alcohol.

Derivation: A concentrated acid solution of sodium chloride is heated and electrolyzed, the chlorate crystallizing out.

Grade: Technical, CP, crystals, powder.

Hazard: Dangerous fire risk, strong oxidant, contact with organic materials may cause fire.

Use: Oxidizing agent and bleach (especially to make

chlorine dioxide) for paper pulps; ore processing; herbicide and defoliant; substitute for potassium chlorate, being more soluble in water; matches, explosives, flares, and pyrotechnics; recovery of bromine from natural brines; leather tanning and finishing; textile mordant; to make perchlorates.

sodium chloraurate. See sodium gold chloride.

sodium chloride. (table salt; sea salt; halite; rock salt). NaCl.

Properties: Colorless, transparent crystals or white, crystalline powder. D 2.165, mp 801C, somewhat hygroscopic. Soluble in water and glycerol; very slightly soluble in alcohol. Essential in diet to maintain chloride balance in body. Noncombustible.

Occurrence: Ocean water (2.6% concentration), deposits in central New York, Southern Michigan, Gulf Coast, Great Salt Lake, Newfoundland.

Derivation: (1) Evaporation and crystallization of natural brines, (2) solar evaporation of seawater, (3) direct mining from underground or surface deposits.

Method of purification: Recrystallization.

Impurities: Sulfates, heavy metals, alkaline earths, magnesium salts, ammonium salts.

Grade: Highest purity medicinal, crystals; highest purity, dried; highest purity, fine powder; highest purity, fused; reagent; reagent, fused; sea evaporated; ground; microsized; powdered; table salt; rock salt; CP; USP; FCC; single, pure crystals.

Use: Chemical (sodium hydroxide, soda ash, hydrogen chloride, chlorine, metallic sodium), ceramic glazes, metallurgy, curing of hides, food preservative, mineral waters, soap manufacture (salting out), home water softeners, highway deicing, regeneration of ion-exchange resins, photography, food seasoning, herbicide, fire extinguishing, nuclear reactors, mouthwash, medicine (heat exhaustion), salting out dyestuffs, supercooled solutions. Single crystals are used for spectroscopy, UV and infrared transmissions.

See fused salt.

sodium chlorite.

CAS: 7758-19-2. NaClO₂.

Properties: White crystals or crystalline powder. Mp 180–200C (decomposes). Slightly hygroscopic. Soluble in water.

Grade: Technical, reagent.

Hazard: Flammable, strong oxidizing agent, dangerous fire and moderate explosion risk. (Solution) Strong irritant to skin and tissue.

Use: For improving taste and odor of potable water (as an oxidizing agent); bleaching agent for textiles, paper pulp, edible and inedible oils, shellacs, varnishes, waxes and straw products; oxidizing agent; reagent.

sodium chloroacetate.

CAS: 3926-62-3. ClCH₂COONa.

Properties: White, nonhygroscopic powder;

odorless. Easier to handle than chloroacetic acid. Soluble in water; slightly soluble in methanol; insoluble in acetone benzene, ether, and carbon tetrachloride. Noncombustible.

Use: Manufacture of weed killers, dyes, vitamins, pharmaceuticals; also a defoliant.

sodium chloroaluminate. See sodium tetrachloroaluminate.

sodium chloroaurate. See sodium gold chloride.

sodium-*p*-chloro-*m*-cresolate. A water-soluble preservative for cutting oils.

sodium (r,r)-5-(2-((2-(3-chlorophenyl)-2-hydroxyethyl)amino)propyl)-1,3-benzodioxole-2,2-.

CAS: 138908-40-4. mf: C₂₀H₁₈ClNO₇•2Na.

Hazard: A poison.

sodium-4-chlorophthalate. (monosodium-4-chlorophthalate). ClC₆H₃(COOH)COONa.

Properties: White to light-gray powder.

Grade: Commercial.

Use: Modifying agent in the manufacture of phthalocyanine pigments.

sodium chloroplatinate. (platonic sodium chloride; platinum sodium chloride; sodium platinchloride; sodium hexachloroplatinate).

CAS: 1307-82-0. Na₂PtCl₆•4H₂O.

Properties: Yellow powder. Soluble in alcohol, water. Noncombustible.

Grade: Technical, CP.

Use: Etching on zinc, indelible ink, microscopy, mirrors, photography, plating, catalyst, determination of potassium.

sodium-*o*-chlorotoluene-*p*-sulfonate.

NaSO₃C₆H₃(CH₃)Cl.

Properties: Gray to light-tan powder. Soluble in water and organic solvents.

Derivation: Sulfonation of *o*-chlorotoluene, neutralized to form the sodium salt.

Use: Synthesis of dyes, intermediates and drugs.

sodium chromate.

CAS: 7775-11-3. NaCrO₄•10H₂O.

Properties: Yellow, translucent, efflorescent crystals. D 1.483, mp 19.92C. Soluble in water; slightly soluble in alcohol.

Derivation: Chrome iron ore is melted in a reverberatory furnace with lime and soda, in presence of air. The melt is dissolved in water, a small amount of sodium carbonate added, the solution decanted, acidified with acetic acid, concentrated, and crystallized.

Available forms: Anhydrous.

Grade: Pure neutral, highest purity, technical, CP, reagent.

Hazard: Toxic material. TLV: 0.5 mg(Cr)/m³.

Use: Inks, dyeing, paint pigment, leather tanning, other chromates, protection of iron against corrosion, wood preservative.

sodium chromate decahydrate.

CAS: 13517-17-4. mf: CrO₂Na•10H₂O.

Properties: Deliquescent yellow monoclinic crystals from H₂O. IDLH Ca [15 mg/m³ ças Cr(VI)].

Hazard: Confirmed human carcinogen. TWA 0.05 mg(Cr)/m³; Confirmed Human Carcinogen.

sodium chromate tetrahydrate.

Na₂CrO₄•4H₂O.

Properties: Yellow crystals. Deliquescent. Soluble in water.

Grade: Technical.

Hazard: As for sodium chromate.

Use: Pigment manufacture, corrosion inhibition, leather tanning, other chromium compounds.

sodium citrate. (trisodium citrate).

CAS: 68-04-2. C₆H₅O₇Na₃•2H₂O.

Properties: White crystals or granular powder; odorless; pleasant acid taste. Mp loses 2 waters at 150C, bp decomposes at red heat, stable in air. Soluble in water, insoluble in alcohol. Combustible.

Derivation: Sodium sulfate solution is treated with calcium citrate, filtered, concentrated and crystallized.

Grade: Highest purity, medicinal; pure; commercial; CP; USP; FCC.

Use: Soft drinks, photography, frozen desserts, meat products, detergents, special cheeses, electroplating, sequestrant and buffer, nutrient for cultured buttermilk, removal of sulfur dioxide from smelter waste gases, medicine (diuretic, expectorant), anti-coagulant for blood withdrawn from body.

sodium clodronate.

CAS: 22560-50-5. mf: CH₂Cl₂O₆P₃•2Na.

Hazard: Moderately toxic by ingestion.

sodium copper chloride. See copper sodium chloride.

sodium copper cyanide. (copper sodium cyanide; sodium cyanocuprate).

CAS: 14264-31-4. NaCu(CN)₂.

Properties: White, crystalline, double salt of copper cyanide and sodium cyanide. D 1.013 (20C), decomposes at 100C. Soluble in water.

Hazard: Toxic material. TLV: TWA (fume) 0.2 mg/m³; (dust, mist) 1 mg(Cu)/m³; (Proposed: TWA (fume and respirable particles) 0.05 mg/m³; (dust, mist) 1 mg(Cu)/m³).

Use: For preparing and maintaining cyanide copper plating baths based on sodium cyanide.

sodium cyanate.

CAS: 917-61-3. NaOCN.

Properties: White, crystalline powder. D 1.937

(20C), mp 700C. Soluble in water; insoluble in alcohol and ether.

Use: Organic synthesis, heat treating of steel, intermediate for manufacture of medicinals.

sodium cyanide.

CAS: 143-33-9. NaCN.

Properties: White, deliquescent, crystalline powder. Mp 563C, bp 149C, the aqueous solution is strongly alkaline and decomposes rapidly on standing. Soluble in water; slightly soluble in alcohol.

Derivation: By absorption of hydrogen cyanide in a solution of sodium hydroxide with subsequent vacuum evaporation.

Grade: 30% solution, 73–75%, 96–98%, reagent, technical, briquettes, granular.

Hazard: Toxic by ingestion and inhalation. TLV: 5 mg(CN)/m³.

Use: Extraction of gold and silver from ores, electroplating, heat treatment of metals (case-hardening), making hydrogen cyanide, insecticide, cleaning metals, fumigation, manufacture of dyes and pigments, nylon intermediates, chelating compounds, ore flotation.

sodium cyanoaurite. See sodium gold cyanide.

sodium cyanocuprate. See sodium copper cyanide.

sodium-2-cyanoethanesulfonate. (sodium-2-sulfopropionitrile). NaO₂S(CH₂)₂CN.

Properties: Colorless crystals. Mp 240C. Soluble in water and glacial acetic acid; insoluble in benzene, alcohol, and ether.

Use: Introduction of sulfonic acid group into surfactants and other organics.

sodium cyclamate. (sodium cyclohexylsulfamate).

CAS: 139-05-9. C₆H₁₁NHSO₃Na.

Properties: White crystals or powder; practically odorless; sweet taste. Freely soluble in water; practically insoluble in alcohol, benzene, chloroform, and ether; pH (10% solution) 5.5–7.5. Sweetening power about 30 times that of sucrose.

Grade: NF, FCC.

Hazard: Some evidence of causing cancer in laboratory animals. Prohibited by FDA for food use.

Use: Nonnutritive sweetener.

sodium dehydroacetate.

CAS: 4418-26-2. C₈H₇NaO₄•H₂O.

Properties: Tasteless, white powder. Soluble in water and propylene glycol; insoluble in most organic solvents.

See dehydroacetic acid.

Grade: FCC.

Use: Fungicide, plasticizer, toothpaste, pharmaceutical, preservative in food, mold inhibitor for strawberries and similar fruits.

sodium deoxycholate. See deoxycholic acid.

sodium dextran sulfate. (dextran sulfate).

Properties: Solid. Soluble in water.

Derivation: Derivatives of dextran having a molecular weight of 500,000–2,000,000.

Use: Fractionation and separation of biological preparations.

sodium-3,5-diacetamido-2,4,5-triiodobenzoate. See sodium diatrizoate.

sodium diacetate.

CAS: 126-96-5. $\text{CH}_3\text{COONa} \cdot x(\text{CH}_3\text{COOH})$, anhydrous or $\text{CH}_3\text{COONa} \cdot x(\text{CH}_3\text{COOH}) \cdot y\text{H}_2\text{O}$, technical.

Properties: White crystals; acetic acid odor. Decomposes above 150C. Soluble in water; slightly soluble in alcohol; insoluble in ether. Combustible.

Grade: FCC.

Use: Buffer, mold inhibitor, souring agent, intermediate for acid salts, mordants, varnish hardeners, antitarnishing agents, sequestrant and preservative in foods.

sodium diatrizoate. (sodium-3,5-diacetamido-2,4,6-triiodobenzoate).

CAS: 737-31-5. $\text{C}_9\text{I}_3(\text{COONa})(\text{NHCOCH}_3)_2$.

Properties: White crystals. Soluble in water; solutions are radiopaque.

Grade: USP (as solution for injection).

Use: Radiopaque medium, medicine.

sodium-1-diazo-2-naphthol-4-sulfonate.

See 1-diazo-2-naphthol-4-sulfonic acid.

sodium dibutylthiocarbamate. See "Trepidone."

sodium- α,β -dichloroisobutyrate. A plant growth regulator.

sodium dichloroisocyanurate. (sodium salt

of dichloro-*s*-triazine-2,4,6-trione).

CAS: 2244-21-5.

$\text{NaN}(\text{O})\text{NCIC}(\text{O})\text{NCICO}$.

Properties: White, slightly hygroscopic, crystalline powder. Loose bulk d about 37 lb/ft³, granulated 57 lb/ft³. Active ingredient about 60% available chlorine; decomposes at 230C.

Hazard: Strong oxidizing material, fire risk near organic materials. Toxic by ingestion.

Use: Active ingredient in dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers, swimming pool disinfectants, water and sewage treatment, replacement for calcium hypochlorite.

sodium-2,4-dichlorophenoxyacetate. (2,4-D, sodium salt).

CAS: 2702-72-9. $\text{C}_6\text{H}_3(\text{OCH}_2\text{COONa})\text{Cl}_2$.

Properties: Crystalline solid. Decomposes at 215C. Slightly soluble in water.

Hazard: Irritant by inhalation.

Use: Herbicide.

See 2,4-D.

sodium-2,4-dichlorophenoxyethyl sulfate.

See sesone.

sodium-2,2-dichloropropionate. See dalapon.

sodium dichromate. (sodium bichromate).

CAS: 10588-01-9. $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Red or red-orange deliquescent crystals. D 2.52 (13C), mp 357C, decomposes at 400C, loses 2H₂O on prolonged heating at 100C. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: (a) From chromite ore by alkaline roasting and subsequent leaching, (2) action of sulfuric acid on sodium chromate.

Grade: Technical crystals, technical liquor containing 69–70% $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$, anhydrous 95C, soluble in water and alcohol.

Use: Colorimetry (copper determination), complexing agent, oxidation inhibitor in ethyl ether.

sodium dihydrogen phosphate. See sodium phosphate, monobasic.

sodium dihydroxyethylglycine. (*N,N*-bis[2-hydroxyethyl]-glycine).

$\text{NaOOCCH}_2\text{N}(\text{CH}_2\text{CH}_2\text{OH})_2$.

Properties: Clear, straw-colored liquid. D 1.204 (25C), fp about –10C.

Use: Complexing agent for the transition metals.

sodium dimethylarsenate. See sodium cacodylate.

sodium dimethylthiocarbamate.

(SDDC).

CAS: 148-18-5. $(\text{CH}_3)_2\text{NCS}_2\text{Na}$.

Properties: 40% solution is amber to light green. D 1.17–1.20 (25/25C).

Derivation: Reaction of dimethylamine, carbon disulfide, and sodium hydroxide.

Use: Fungicide, corrosive inhibitor, rubber accelerator, intermediate, polymerization shortstop.

sodium 2,2-dimethylpropanoate.

CAS: 1184-88-9. mf: $\text{C}_5\text{H}_9\text{O}_2 \cdot \text{Na}$.

Hazard: A reproductive hazard.

sodium dinitro-*o*-cresylate.

CAS: 25641-53-6. $\text{CH}_3\text{C}_6\text{H}_3(\text{NO}_2)_2\text{ONa}$.

Properties: Brilliant-orange-yellow dye that may stain clothing and wood.

Derivation: By treating 4,6-dinitro-*o*-cresol with sodium hydroxide.

Hazard: Toxic by ingestion and inhalation.

Use: Herbicide (control of mustard and other suscep-

tible weeds), fungicide.
See 4,6-dinitro-*o*-cresol.

sodium dioctyl sulfosuccinate. See dioctyl sodium sulfosuccinate.

sodium dioxide. NaO_2 . Exists as impurity (about 10%) in sodium peroxide, obtained by heating sodium peroxide in oxygen, reacts with water to yield hydrogen peroxide, oxygen, and sodium hydroxide.

sodium dispersion. A stable suspension of microscopic sodium particles in a hydrocarbon or other medium boiling at temperatures above the melting point of sodium (97.5C), e.g., heptane, *n*-octane, toluene, xylene, naphtha, kerosene, mineral oil, *n*-butyl ether, etc. Particles range in size from submicron to 30 μm depending on the method of preparation. Dispersions contain up to 50% (by weight) of sodium metal.

Hazard: Flammable, dangerous fire risk. To extinguish use dry soda ash, sodium chloride, or graphite, followed by carbon dioxide. Do not use carbon tetrachloride.

Use: For chemical reactions where advantages of controlled reaction rate, lower reaction temperature, increased yields, or substitution for more expensive reagent can be achieved, as in, removal of sulfur from hydrocarbons and petroleum, metal powders, sodium hydride, alcohol-free alcoholates, phenylsodium.

sodium dithionate. (sodium hyposulfate).
 $\text{Na}_2\text{S}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Large, transparent crystals; bitter taste. D 2.189 (25C), loses $2\text{H}_2\text{O}$ at 110C, decomposes at 267C. Soluble in water; insoluble in alcohol and concentrated hydrochloric acid. Combustible.

Use: Chemical reagent.

sodium dithionite. (sodium hydrosulfite).
CAS: 7775-14-6. $\text{Na}_2\text{S}_2\text{O}_4$.

Properties: Light-lemon-colored solid in powder or flake form. Mp 55C (decomposes). Also available in liquid form. Partially soluble in water; insoluble in alcohol; strong reducing agent.

Derivation: (1) Zinc is dissolved in a solution of sodium bisulfite, the zinc-sodium sulfite precipitated by milk of lime, leaving the hydrosulfite in solution; (2) reaction of sodium formate with sodium hydroxide and sulfur dioxide.

Grade: Technical, reagent.

Hazard: Fire risk in contact with moisture. To extinguish fires, flood the reacting mass with water.

Use: Vat dyeing of fibers and textiles; stripping agent for dyes; reagent; bleaching of sugar, soap, oils, and groundwood; oxygen scavenger for synthetic rubbers.

sodium diuranate. (uranium yellow).
 $\text{Na}_2\text{U}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow-orange solid. Insoluble in water; soluble in dilute acids.

Derivation: By treating a solution of uranyl salt with sodium hydroxide.

Hazard: Radioactive and probably a poison.

Use: Ceramics to produce colored glazes, manufacture of fluorescent uranium glass.

sodium dodecylbenzenesulfonate.

CAS: 25155-30-0. $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{SO}_3\text{Na}$.

Properties: White to light-yellow flakes, granules, or powder; biodegradable. The dodecyl radical may have many isomers and the benzene may be attached to it in many positions. Combustible.

Derivation: Benzene is alkylated with dodecene, to which it attaches itself in any secondary position; the resulting dodecylbenzene is sulfonated with sulfuric acid and neutralized with caustic soda. For ABS (branched-chain alkyl) the dodecene is usually a propylene tetramer, made by catalytic polymerization of propylene. For LAS (straight-chain alkyl), the dodecene may be removed from kerosene or crudes by molecular sieve, may be formed by Ziegler polymerization of ethylene, or by cracking wax paraffins to α -olefins.

See biodegradability; alkyl sulfonate, linear; detergent; alkylate (3).

Use: Anionic detergent.

sodium dodecyl diphenyl oxide disulfonate.

$\text{C}_{24}\text{H}_{34}\text{O}(\text{SO}_3)_2\text{Na}$.

Properties: Dry form 90% min active solution (45%). Mp 150C, d 1.1. Very soluble in water, strong acids, bases, and electrolytes; stable to oxidation.

sodium edetate. See tetrasodium EDTA.

sodium enolate monohydrate. See erythorbic acid sodium salt.

sodium erythorbate. (sodium isoascorbate).

$\text{NaC}_6\text{H}_7\text{O}_6$. White free-flowing crystals, soluble in water.

Grade: Technical, FCC.

Use: Antioxidant and preservative.

sodium ethoxide. See sodium ethylate.

sodium ethylate. (sodium ethoxide; caustic alcohol). $\text{C}_2\text{H}_5\text{ONa}$.

Properties: White powder, sometimes having brownish tinge; readily hydrolyzes to alcohol and sodium hydroxide.

Derivation: By carefully adding small amounts of sodium to absolute alcohol kept at a temperature of 10C, heating carefully to 37.7C, again carefully adding sodium, cooling to 10C, and adding the same quantity of absolute alcohol as was used originally.

Hazard: As for caustic soda, ethanol. Sodium hydroxide is formed when sodium ethylate is exposed to moisture.

Use: Organic synthesis.
See sodium hydroxide; ethanol.

sodium ethylenebisdithiocarbamate. See nabam.

sodium 2-ethylhexanoate.

CAS: 19766-89-3. mf: $C_8H_{15}O_2 \bullet Na$.

Hazard: A reproductive hazard.

sodium-2-ethylhexylsulfoacetate.

$C_8H_{17}OOCCH_2SO_3Na$.

Properties: Light-cream-colored flakes, water-soluble, good foaming properties and excellent resistance to hard water; solutions practically neutral and stable to mineral acids. Combustible.

Use: Solubilizing agent, particularly for soapless shampoo compositions; electroplating detergent.

sodium ethylmercurithiosalicylate. See thimerosal.

sodium ethyl oxalacetate. See ethyl sodium oxalacetate.

sodium ethylxanthate. (sodium xanthogenate; sodium xanthate). $C_2H_5OC(S)SNa$.

Properties: Yellowish powder. Soluble in water, alcohol.

Use: Ore flotation agent.

See xanthic acids.

sodium ferric pyrophosphate. mf:

$Na_3Fe_2(P_2O_7)_2 \bullet xH_2O$.

Properties: White to tan powder; odorless. Insol in water; sol in hydrochloric acid.

Hazard: A nuisance dust.

Use: Food additive.

sodium ferricyanide. (red prussiate of soda). $Na_3Fe(CN)_6 \bullet H_2O$.

Properties: Ruby-red, deliquescent crystals. Soluble in water; insoluble in alcohol.

Derivation: Chlorine is passed into sodium ferrocyanide solution.

Grade: Technical, CP.

Use: Production of pigments, dyeing, printing.

sodium ferrocyanide. (yellow prussiate of soda).

CAS: 13601-19-9. $Na_4Fe(CN)_6 \bullet 10H_2O$.

Properties: Yellow, semitransparent crystals. D 1.458. Partially soluble in water; insoluble in organic solvents.

Grade: Technical, FCC.

Use: Manufacture of sodium ferricyanide, blue pigments, blueprint paper, anticaking agent for salt, ore flotation, pickling metals, polymerization catalyst, photographic fixing agent.

sodium fluoborate. See sodium fluoroborate.

sodium fluophosphate. See sodium fluorophosphate.

sodium fluorescein. USP name for uranine.

sodium fluoride.

CAS: 7681-49-4. NaF.

Properties: Clear, lustrous crystals or white powder. Insecticide grade frequently dyed blue. D 2.558 (41C), mp 988C, bp 1695C. Soluble in water; very slightly soluble in alcohol.

Derivation: By adding sodium carbonate to hydrogen fluoride.

Grade: Pure; CP; USP; insecticide; technical; single, pure crystals.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Fluoridation of municipal water (1 ppm), degassing steel, wood preservative, insecticide (not to be used on living plants), fungicide and rodenticide, chemical cleaning, electroplating, glass manufacture, vitreous enamels, preservative for adhesives, toothpastes, disinfectant (fermentation equipment), dental prophylaxis, cryolite manufacture, single crystals used as windows in UV and infrared radiation detecting systems.

sodium fluoroacetate. (also known as 1080).

CAS: 62-74-8. FCH_2COONa .

Properties: Fine, white powder; odorless. Nonvolatile, decomposes at 200C. Soluble in water; insoluble in most organic solvents.

Derivation: Ethyl chloroacetate and potassium fluoride form ethyl fluoroacetate, which is then treated with a methanol solution of sodium hydroxide.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.05 mg/m³; STEL 0.15 mg/m³. Toxic by skin absorption. For use by trained operators only, use has been restricted.

Use: Predator elimination (coyotes), rodenticide.

sodium fluoroborate. $NaBF_4$.

Properties: White powder; bitter acid taste. Slowly decomposed by heat. D 2.47 (20C), mp 384C. Soluble in water; slightly soluble in alcohol.

Derivation: By heating sodium fluoride and hydrofluoboric acid and cooling slowly.

Use: Sand casting of aluminum and magnesium, electrochemical processes, oxidation inhibitor, fluxes for nonferrous metals, fluorinating agent.

sodium fluorophosphate. (sodium fluorophosphate). Na_2PO_3F .

Properties: Colorless crystals. Mp about 625C. Soluble in water.

Grade: 97%.

Hazard: Toxic by ingestion, strong irritant.

Use: Preparation of bactericides and fungicides.

sodium fluorosilicate. (sodium silicofluoride; sodium hexafluorosilicate; sodium fluosilicate). Na_2SiF_6 .

Properties: White, free-flowing powder; odorless; tasteless. D 2.7, mp decomposes at red heat. Partially soluble in cold water; more soluble in hot water; insoluble in alcohol.

Derivation: From fluosilicic acid and sodium carbonate, or sodium chloride.

Grade: Technical, CP.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Fluoridation, laundry soaps, opalescent glass, vitreous enamel frits, metallurgy (aluminum and beryllium), insecticides and rodenticides, chemical intermediate, glue, leather and wood preservative, moth repellent, manufacture of pure silicon.

sodium formaldehyde bisulfite.

$\text{HOCH}_2\text{SO}_3\text{Na}$.

Properties: White, water-soluble solid.

Derivation: Action of sodium bisulfite, formaldehyde, and water.

Use: Textile stripping agent.

See hydrosulfite-formaldehyde.

sodium formaldehyde hydrosulfite.

Use: Synthetic rubber polymerization and textile dyeing and stripping agent.

See hydrosulfite-formaldehyde.

sodium formaldehyde sulfoxylate. (sodium sulfoxylate; sodium sulfoxylate formaldehyde; SFS). $\text{HCHO}\cdot\text{HSO}_2\text{Na}\cdot 2\text{H}_2\text{O}$.

Properties: White solid. Mp 64C. Soluble in water and alcohol. Usually admixed with a sulfite.

Use: Stripping and discharge agent for textiles, bleaching agent for molasses, soap.

See hydrosulfite-formaldehyde.

sodium formate.

CAS: 141-53-7. HCOONa .

Properties: White, slightly hygroscopic, crystalline powder; slight odor of formic acid. D 1.919, mp 253C. Soluble in water and glycerol; slightly soluble in alcohol; insoluble in ether.

Derivation: Carbon monoxide and sodium hydroxide are heated under pressure, also from pentaerythritol manufacture.

Grade: Technical, CP.

Use: Reducing agent, manufacture of formic acid and oxalic acid, organic chemicals, mordant, manufacture of sodium dithionite, complexing agent, analytical reagent (noble metal precipitant), buffering agent.

sodium glucoheptonate.

$\text{HOCH}_2(\text{CH}_2\text{O})_5\text{COONa}$.

Properties: Light-tan, crystalline powder. A sequestering agent for polyvalent metals.

Use: Metal cleaning, bottle washing, kier boiling,

mercerizing, caustic boiloff, paint stripping, aluminum etching.

sodium gluconate.

CAS: 527-07-1. $\text{NaC}_6\text{H}_{11}\text{O}_7$.

Properties: White to yellowish crystalline powder. Soluble in water; sparingly soluble in alcohol.

Derivation: From glucose by fermentation.

Grade: Purified, technical, FCC.

Use: Foods and pharmaceuticals, sequestering agent, metal cleaners, paint stripper, aluminum deoxidizer, bottle-washing preparations, rust removal, chrome tanning, metal plating, mordant in dyeing.

sodium glucosulfone. (*p'*-diaminodiphenylsulfone-*N,N'*-di-dextrose sodium sulfonate).

$\text{C}_{14}\text{H}_{34}\text{N}_2\text{Na}_2\text{O}_{18}\text{S}_3$ The USP grade is an aqueous solution (for injection), clear and pale yellow, pH 5.0–6.5.

Use: Medicine.

sodium glutamate. (monosodium glutamate; MSG).

CAS: 142-47-2. $\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COONa}$. Sodium salt of glutamic acid, one of the common, naturally occurring amino acids.

Properties: White, crystalline powder. Mp (decomposes). Soluble in water and alcohol. Shows optical activity, most effective between pH 6 and 8.

Derivation: (1) Alkaline hydrolysis of the waste liquor from beet sugar refining, (2) a similar hydrolysis of wheat or corn gluten, (3) organic synthesis based on acrylonitrile.

Grade: Technical, 99%, ND, FCC.

Use: Flavor enhancer for foods in concentration of about 0.3%.

See flavor; glutamic acid.

sodium glycolate. (sodium hydroxyacetate). $\text{NaOOCCH}_2\text{OH}$.

Properties: White powder.

Use: Buffer in electrodeless plating and textile finishing.

sodium gold chloride. (sodium aurichloride; sodium chloraurate; sodium chloroaurate; gold sodium chloride; gold salts). $\text{NaAuCl}_2\cdot 2\text{H}_2\text{O}$.

Properties: Yellow crystals. Soluble in water and alcohol.

Derivation: By neutralizing chloroauric acid with sodium carbonate.

Use: Photography, staining fine glass, decorating porcelain, medicine.

sodium gold cyanide. (sodium cyanoaurite; sodium aurocyanide; gold sodium cyanide). $\text{NaAu}(\text{CN})_2$.

Properties: Yellow powder. Soluble in water. Contains 46% gold (min).

Hazard: Toxic. TLV: 5 mg(CN)/m³.

Use: For gold plating electronic components.

sodium guanylate. (GMP; disodium guanylate).

CAS: 5550-12-9. $\text{Na}_2\text{C}_{10}\text{H}_{12}\text{N}_5\text{O}_8\text{P}\cdot 2\text{H}_2\text{O}$. A 5'-nucleotide.

Properties: Crystals. Soluble in cold water; very soluble in hot water.

Derivation: From a seaweed or from dried fish.

Use: Flavor potentiator in foods.

See guanylic acid.

sodium heparin. See heparin.

sodium heptametaphosphate. See sodium metaphosphate.

sodium hexachloroosmate. (osmium-sodium chloride; sodium-osmium chloride). Na_2OsCl_6 .

Properties: Orange, rhombic prisms. Contains 40.3% osmium, unstable. Soluble in alcohol, water.

Grade: Technical.

Use: Catalyst (oxidation).

sodium hexachloroplatinate. See sodium chloroplatinate.

sodium hexadecanoate. See sodium palmitate.

sodium hexafluorosilicate. See sodium fluorosilicate.

sodium hexametaphosphate. See "Calgon."

sodium hexylene glycol monoborate.

$\text{C}_6\text{H}_{12}\text{O}_3\text{BNa}$.

Properties: Amorphous, white solid. Bulk d 0.25, mp 426C. Soluble in nonpolar solvents.

Grade: Min 98%.

Use: Corrosion inhibitor in organic systems, additive to lubricating oils, flame-retardant, siloxane resin additive.

sodium hydrate. See sodium hydroxide.

sodium hydride.

CAS: 7646-69-7. NaH .

Properties: Powder; practically odorless. D 0.92, mp 800C (decomposes). Must be kept cool and dry. Particle size range 5–50 μm . Starts to decompose with evolution of hydrogen at about 255C. Preparation: Reaction of sodium metal with hydrogen. A microcrystalline dispersion of gray powder in oil containing 50 or 25% by weight.

Hazard: Dangerous fire risk, reacts violently with water evolving hydrogen. Irritant.

Use: Condensing or alkylating agent, especially for amines, descaling metals.

sodium hydrogen sulfide. See sodium hydrosulfide; sodium bisulfite.

sodium hydrogen trioxoselenite. See selenious acid, monosodium salt.

sodium hydrosulfide. (sodium sulfhydrate; sodium bisulfide; sodium hydrogen sulfide).
CAS: 16721-80-5. $\text{NaSH}\cdot 2\text{H}_2\text{O}$.

Properties: Colorless needles to lemon-colored flakes. 70–72% NaSH , mp 55C, water of crystallization 26–28%. Soluble in water, alcohol, and ether.

Derivation: From calcium sulfide by treating it in the cold with sodium bisulfate.

Grade: Technical, flake, 70–72%, soluble 40–44%.

Hazard: Contact with acids causes evolution of toxic gases.

Use: Paper-pulping dyestuffs processing, rayon and cellophane desulfurizing, unhairing hides, bleaching reagent.

sodium hydrosulfite. See sodium dithionite.

sodium hydroxide. (caustic soda; sodium hydrate; lye; white caustic).

CAS: 1310-73-2. The most important commercial caustic.

Properties: White, deliquescent solid; chiefly in form of beads or pellets, also 50% and 73% aqueous solutions. Absorbs water and carbon dioxide from the air. D 2.13, mp 318C, bp 1390C. Soluble in water, alcohol, and glycerol.

Derivation: Electrolysis of sodium chloride (brines) (electrolytic cell), reaction of calcium hydroxide and sodium carbonate.

Grade: Commercial, ground, flake, beads, FCC, granulated (60% and 75% Na_2O), rayon (low in iron, copper, and manganese), purified by alcohol (sticks, lumps, and drops), reagent, highest purity, CP, USP.

Hazard: Corrosive to tissue in presence of moisture, strong irritant to tissue (eyes, skin, mucous membranes), poison by ingestion. TLV: ceiling 2 mg/m^3 .

Use: Chemical manufacture, rayon and cellophane, neutralizing agent in petroleum refining, pulp and paper, aluminum, detergents, soap, textile processing, vegetable-oil refining, reclaiming rubber, regenerating ion exchange resins, organic fusions, peeling of fruits and vegetables in food industry, lab reagent, etching and electroplating, food additive.

sodium hypochlorite.

CAS: 7681-52-9. $\text{NaOCl}\cdot 5\text{H}_2\text{O}$.

Properties: Pale-greenish color; disagreeable, sweetish odor. Mp 18C. Soluble in cold water; decomposed by hot water. Unstable in air unless mixed with sodium hydroxide. Strong oxidizing agent. Usually stored and used in solution.

Derivation: Addition of chlorine to cold dilute solution of sodium hydroxide.

Grade: Technical.

Hazard: Fire risk in contact with organic materials. Toxic by ingestion, strong irritant to tissue.

Use: Bleaching paper pulp, textiles, etc.; intermediate; organic chemicals; water purification; medi-

cine; fungicides; swimming pool disinfectant laundering; reagent; germicide.

sodium hypophosphite.

CAS: 7681-53-0. $\text{NaH}_2\text{PO}_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, pearly, crystalline plates or white, granular powder; saline taste; deliquescent. Soluble in water; partially soluble in alcohol.

Derivation: By neutralizing hypophosphoric acid with sodium carbonate.

Grade: Technical, CP.

Hazard: Explosion risk when mixed with strong oxidizing agents, decomposes to phosphine on heating, store in cool, dry place, away from oxidizing materials.

Use: Pharmaceuticals, reducing agent in electrodeless nickel plating of plastics and metals, lab reagent, substitute for sodium nitrite in smoked meats.

sodium hyposulfate. See sodium dithionate.

sodium inosinate.

CAS: 4691-65-0. $\text{C}_{10}\text{H}_{11}\text{Na}_2\text{N}_4\text{O}_8\text{P}$. A 5'-nucleotide derived from seaweed or dried fish. Sodium guanylate is a by-product.

Use: Flavor potentiator in foods.

See inosinic acid.

sodium iodate.

CAS: 7681-55-2. NaIO_3 .

Properties: White crystals. D 4.28. Soluble in water and acetone; insoluble in alcohol.

Derivation: Interaction of sodium chlorate and iodine in presence of nitric acid.

Grade: CP, reagent, technical.

Hazard: Oxidizing agent, fire risk near organic materials.

Use: Antiseptic, disinfectant, feed additive reagent.

sodium iodide.

CAS: 7681-82-5. (1) NaI . (2) $\text{NaI} \cdot 2\text{H}_2\text{O}$.

Properties: White, cubical crystals or powder, or colorless crystals; odorless, saline, somewhat bitter taste. D (1) 3.665, (2) 2.448 (21C), mp (1) 653C, bp (1) 1304C. Slowly becomes brown in air, deliquescent. Soluble in water, alcohol, and glycerol.

Grade: Technical, CP, USP, single crystals.

Use: Photography, solvent for iodine, organic chemicals, reagent, feed additive, cloud seeding, scintillation (thallium-activated form), expectorant.

sodium iodide (I-131). (sodium radioiodide). A radioactive form of sodium iodide containing iodine-131 which can be used as a tracer.

Grade: USP (as capsules or solution).

See iodine 131.

sodium iodipamide. $\text{C}_{20}\text{H}_{12}\text{I}_6\text{N}_2\text{NaO}_6$. *N,N'*-adi-polybis(3-amino-2,4,6-triiodobenzoic acid) disodium salt.

Properties: Colorless to pale-yellow, slightly viscous liquid. Water soluble. Radiopaque.

Derivation: By dissolving the free acid in dilute sodium hydroxide and buffering to pH 6.5–7.7.

Available forms: A 20% solution for injection.

Grade: USP.

Use: X-ray contrast medium.

sodium iodomethanesulfonate. See sodium methiodal.

sodium iothalamate. (sodium-5-acetamido-2,4,6-triiodo-*N*-methylisophthalamate).

CAS: 1225-20-3. $\text{C}_6\text{I}_3(\text{CONHCH}_3)_2\text{COONa}$.

Grade: USP (for injection).

Use: Medicine (radiopaque medium).

sodium ipodate. (USAN; sodium-3-(dimethylaminomethyleneamino)-2,4,6-triiodohydrocinna-mate).

CAS: 1221-56-3.

$\text{NaOOCCH}_2\text{CH}_2\text{C}_6\text{H}(\text{I}_3)\text{N}:\text{CHN}(\text{CH}_3)_2$.

Use: Radiopaque agent.

sodium iron pyrophosphate. (SIPP).

$\text{Na}_8\text{Fe}_4(\text{P}_2\text{O}_7)_5 \cdot x\text{H}_2\text{O}$.

Properties: Tan powder. Insoluble in water; soluble in dilute acid. Min 14.5% iron. Iron is in complex form and will not catalyze oxidation reactions.

Derivation: By reacting tetrasodium pyrophosphate with a soluble iron salt.

Use: For iron enrichment, particularly in flours and cereals.

sodium isoascorbate. See sodium erythorbate.

sodium *d*-isoascorbate. See erythorbic acid sodium salt.

sodium isobutylxanthate.

$\text{CH}(\text{CH}_3)_2\text{CH}_2\text{OC}(\text{S})\text{SNa}$.

Use: Ore flotation agent.

See xanthic acid.

sodium isopropylxanthate.

CAS: 140-93-2. $(\text{CH}_3)_2\text{CHOC}(\text{S})\text{SNa}$.

Properties: Light-yellow crystals. Soluble in water. Deliquescent, decomposes 150C.

Hazard: Moderate fire risk. Irritant to skin and mucous membranes.

Use: Chemical weed killer, fortifying agent for certain oils, ore flotation.

sodium lactate.

CAS: 72-17-3. $\text{CH}_3\text{CH}_2\text{OCOONa}$.

Properties: Colorless or yellowish, syrupy liquid. Very hygroscopic. Mp 17C, decomposes 140C. Soluble in water. Combustible.

Grade: Technical, USP (solution with pH 6.0–7.3).

Use: Hygroscopic agent, glycerol substitute, plasticizer for casein, corrosion inhibitor in alcohol antifreeze.

sodium-*n*-lauroyl sarcosinate.C₁₅H₂₈NO₂Na.**Use:** Dentrifices, hair shampoos, rug shampoos.**sodium lauryl sulfate.**CAS: 151-21-3. NaC₁₂H₂₅SO₄.**Properties:** Small, white or light-yellow crystals; slight characteristic odor. Soluble in water, forming an opalescent solution.**Grade:** USP, technical, FCC.**Use:** Wetting agent in textile industry, detergent in toothpaste, food additive (emulsifier and thickener).

sodium-lead alloy. One of several alloys as follows: (1) usually containing 10% sodium and 90% lead, used in the manufacture of lead tetraethyl; (2) containing 2% sodium, used as a deoxidizer and homogenizer in nonferrous metals where lead is a component; (3) used as a stabilizer and deoxidizer for lead in cable sheathing.

Hazard: Moderate fire and explosion risk, reacts with moisture, acids, and oxidizing agents.

sodium lead hyposulfite. See lead sodium thiosulfate.

sodium lead thiosulfate. See lead sodium thiosulfate.

sodium lignosulfonate.**Properties:** Tan, free-flowing, spray-dried powder, containing 70–80% total lignin sulfonates, balance wood sugars. Combustible.**Use:** Dispersant, emulsion stabilizer, chelating agent. See lignin sulfonate.

sodium liothyronine. (sodium-1-3[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]alanine). NaOOCCH(NH₂)CH₂C₆H₂OC₆H₃IOH.

Properties: Light-tan, crystalline powder; odorless. Very slightly soluble in water; slightly soluble in alcohol; insoluble in most other organic solvents.**Grade:** USP.**Use:** Medicine (a thyroid hormone).

sodium magnesium aluminosilicate. See "Hydrex" [Huber].

sodium MBT. (NaMBT). C₇H₄NS₂Na. A 50% aqueous solution of sodium mercaptobenzothiazole, light-amber liquid, bulk d 10.5 lb/gal.

Use: Corrosion inhibitor for nonferrous metals, anti-freeze, paper-mill systems.

sodium mercaptoacetate. See sodium thio-glycolate.

sodium-2-mercaptobenzothiazole. See sodium MBT.

sodium metabisulfite. (sodium pyrosulfite). CAS: 7681-57-4. Na₂S₂O₅. Chief constituent of

commercial dry sodium bisulfite with which most of its properties and uses are practically identical.

Grade: FCC.**Hazard:** Toxic by inhalation. TLV: 5 mg/m³; not classifiable as a human carcinogen.**Use:** In foods, as preservative, lab reagent.**sodium metaborate.**CAS: 7775-19-1. NaBO₂.**Properties:** White lumps. D 2.464, mp 966C, bp 1434C. Soluble in water. Noncombustible.**Derivation:** By fusing sodium carbonate and borax.**Use:** Herbicide. Also available commercially as octahydrate and tetrahydrate.

sodium metanilate. NaSO₃C₆H₄NH₂.

Derivation: The metasodium sulfonate of aniline sold as a solid or 20% aqueous solution prepared by neutralizing metanilic acid.**Grade:** Technical, 99%, also 20% solution.**Use:** Manufacture of synthetic dyestuffs and drugs.

sodium metaperiodate. See sodium periodate.

sodium metaphosphate.

CAS: 10361-03-2. (NaPO₃)_{*n*}. The value of *n* ranges from 3 to 10 (cyclic molecules) or may be a much larger number (polymers). Cyclic sodium metaphosphate, based on rings of alternating phosphorus and oxygen atoms, range from the trimetaphosphate (NaPO₃)₃ to at least the decametaphosphate. So-called sodium hexametaphosphate is probably a polymer where *n* is between 10 and 20 ("Calgon"). The vitreous sodium phosphates having a Na₂O/P₂O₅ mole ratio near unity are classified as sodium metaphosphates (Graham's salts). The average number of phosphorus atoms per molecule in these glasses ranges from 25 to infinity. The term *sodium metaphosphate* has also been extended to short-chain vitreous compositions, the molecules of which exhibit the polyphosphate formula Na_{*n+2*}P_{*n*}O_{*3n+1*} with *n* as low as 4–5. These materials are more correctly called sodium polyphosphates.

Use: Dental polishing agents, detergent builders, water softening, sequestrants, emulsifiers, food additives, textile processing and laundering.**sodium metasilicate, anhydrous.**CAS: 6834-92-0. Na₂SiO₃. A crystalline silicate.**Properties:** Dustless, white granules. Mp 1089C, total Na₂O content 51.5%, total Na₂O in active form 48.6%, bulk d 2.61 or 75 lb/cu ft. Soluble in water; precipitated by acids and by alkaline earths and heavy metal ions, pH of 1% solution 12.6, Noncombustible.**Derivation:** Crystallized from a melt of Na₂O and SiO₂ at approximately 1089C.**Use:** Laundry, dairy, and metal cleaning; floor cleaning; base for detergent formulations; bleaching aid; deinking paper. Also available as the pentahydrate whose properties are mp 72.2C, total Na₂O content

29.3%, total Na₂O in active form 27.8%, d 1.75 or 55 lb/cu ft.

sodium metavanadate.

CAS: 13718-26-8. NaVO₃, often with 4H₂O.

Properties: Colorless, monoclinic, prismatic crystals or pale-green crystalline powder. Mp 630C. Soluble in water. Noncombustible.

Derivation: Sodium hydrate and vanadium pentoxide in water solution.

Grade: Technical, CP.

Hazard: Toxic by ingestion.

Use: Inks, fur dyeing, photography, inoculation of plant life, mordants and fixers, corrosive inhibitor in gas-scrubbing systems.

sodium methacrylate. CH₂:C(CH₃)COONa.

Properties: Water-soluble monomer.

Use: Resins, chemical intermediate.

sodium methanearsonate. (disodium methylarsonate; monosodium methanearsonate; sodium acid methanearsonate; sodium methylarsonate).

CAS: 2163-80-6. (CH₃AsO(OH)ONa).

Properties: White solid. Mp 130–140C. Very soluble in water.

Hazard: Toxic by ingestion and inhalation.

Use: Postemergence herbicide for grassy weeds.

sodium methiodal. (sodium iodomethanesulfonate).

CAS: 126-31-8. ICH₂SO₃Na.

Properties: A white, crystalline powder; odorless; slight salty taste followed by sweetish aftertaste. Decomposes on exposure to light, solutions are neutral to litmus. Soluble in water; very soluble in methanol; slightly soluble in alcohol; practically insoluble in acetone, ether, and benzene.

Derivation: From sodium sulfite and methylene iodide.

Grade: NF.

Use: Radiopaque contrast medium.

sodium methylate. (sodium methoxide).

CAS: 124-41-4. CH₃ONa.

Properties: White, free-flowing powder; sensitive to oxygen; decomposed by water; soluble in methanol and ethanol; decomposes in air above 126C.

Hazard: (Solid) Flammable when exposed to heat or flame. (Solution) Flammable, moderate fire risk.

Use: Condensation reactions; catalyst for treatment of edible fats and oils, especially lard; intermediate for pharmaceuticals; preparation of sodium cellulose; analytical reagent.

sodium methyl carbonate. CH₃OCOONa.

Properties: White powder. Mp 330C (decomposes), d 1.66, purity 90% min.

sodium-N-methyldithiocarbamate dihydrate.

CAS: 137-42-8. CH₃NHC(S)SNa•2H₂O.

Properties: White, crystalline solid. Readily soluble in water; moderately soluble in alcohol; stable in concentrated aqueous solution but decomposes in dilute aqueous solution; unstable in moist soil.

Hazard: Irritant to tissue, toxic to plants and vegetation.

Use: Fungicide, nematocide, weed killer, insecticide, soil fumigant.

sodium-N-methyl-N-oleoyl taurate. (oleyl methyl tauride).

CAS: 137-20-2.

(CH₃)(CH₂)₇CHCH(CH₂)₇CON(CH₃)CH₂CH₂SO₃ONa.

Properties: Fine, white powder; sweet odor.

Grade: Technical, 32% purity (remainder is mainly sodium sulfate).

Use: Detergent, pesticide aid.

sodium methyl silicate. Most effective water repellent and cleaner for limestone, concrete, and similar masonry. Reaction product of aqueous sodium hydroxide and a resinous silicone. Total solids about 30%.

sodium-N-methyltaurate. See *N*-methyltaurine.

sodium molybdate.

CAS: 7631-95-0. Commercially, the normal molybdate Na₂MoO₄ or its dihydrate (called sodium molybdate crystals). Chemically, a wide variety of complex molybdenum and sodium compounds are known.

Properties: Small, lustrous, crystalline plates. Mp 687C, d 3.28 (18C). Soluble in water. Noncombustible.

Derivation: By the action of sodium hydroxide on molybdenum trioxide. Complex molybdates are prepared by dissolving large amounts of molybdenum trioxide in solutions of normal molybdates.

Grade: Anhydrous, crystals.

Hazard: Irritant.

Use: Reagent in analytical chemistry, paint pigment, production of molybdated toners and lakes, metal finishing, brightening agent for zinc plating, corrosion inhibitor, catalyst in dye and pigment production, additive for fertilizers and feeds, micronutrient.

sodium molybdophosphate.

CAS: 1313-30-0. mf: Mo₁₂O₄₀P•3Na.

Hazard: Moderately toxic by ingestion. TWA 5 mg(Mo)/m³

sodium-12-molybdophosphate. (sodium phospho-12-molybdate). Na₃PMo₁₂O₄₀.

Properties: Yellow crystals. D 2.83. Soluble in water, although less soluble than the free acid; strong oxidizing action in aqueous solution.

Grade: Technical.

Use: Analysis, neuromicroscopy, catalysts, additives in photographic processes, imparting water resis-

tance to plastics, adhesives and cements, pigments. See heteromolybdate.

sodium-12-molybdsilicate. (sodium silico-12-molybdate). $\text{Na}_2\text{SiMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Yellow crystals. Bulk d 3.44. Soluble in water, acetone, alcohol, ethyl acetate; insoluble in ether, benzene, and cyclohexane.

Grade: Reagent.

Hazard: Water solution is strong oxidizer, store away from organic materials.

Use: Catalysts; reagents; fixing and oxidizing agents in photography; precipitants and ion exchangers in atomic energy; plating processes; imparting water resistance to plastics, adhesives, and cement.

sodium mono- and dimethyl naphthalene sulfonate.

Use: Food additive.

sodium monoxide. (sodium oxide).

CAS: 12401-86-4. Na_2O .

Properties: White powder. D 2.27, sublimes at 1275C. Soluble in molten caustic soda or potash; converted to sodium hydroxide by water.

Hazard: Caustic and strong irritant when wet with water.

Use: Condensing or polymerizing agent in organic reactions, dehydrating agent, strong base.

sodium myristyl sulfate.

CAS: 1191-50-0. $\text{NaC}_{14}\text{H}_{29}\text{SO}$. Anionic detergent.

Use: Foaming, wetting, and emulsifying in cosmetic, household, and industrial uses.

sodium naphthalenesulfonate. $\text{C}_{10}\text{H}_7\text{SO}_3\text{Na}$.

Properties: Yellowish, crystalline plates or white odorless scales. Soluble in water; insoluble in alcohol. Combustible.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation.

Use: Organic synthesis, liquefying agent in animal glue preparations, naphthols.

sodium naphthenate. A white paste, the most important of the naphthenic acid salts, commercial samples have consistency of grease, but this will vary with source and manner of processing. Excellent emulsifying and foam-producing properties, low hydrolytic dissociation.

Use: Detergent, emulsifier, disinfectant, manufacture of paint driers. See naphthenic acid.

sodium naphthionate. (sodium α -naphthylaminesulfonate). $\text{NH}_2\text{C}_{10}\text{H}_7\text{SO}_3\text{Na} \cdot 4\text{H}_2\text{O}$.

Properties: White crystals, turns violet on exposure to light. Soluble in water; insoluble in ether. Combustible.

Grade: Technical (paste, crystals).

Use: Riegler's reagent for nitrous acid, manufacture of dyestuffs.

sodium naphthylaminesulfonate. See sodium naphthionate.

sodium niobate. (sodium columbate).

$\text{Na}_2\text{Nb}_2\text{O}_6 \cdot 7\text{H}_2\text{O}$. Important in the purification of niobium materials. The crystalline compound forms when a niobium compound is treated with hot, concentrated sodium hydroxide. It is sparingly soluble in water.

sodium nitrate. (soda niter).

CAS: 7631-99-4. NaNO_3 . Chile saltpeter (caliche) is impure natural sodium nitrate.

Properties: Colorless, transparent crystals; odorless; saline, slightly bitter taste. D 2.267, mp 308C, explodes at 1000F (537C), decomposes at 380C. Soluble in water and glycerol; slightly soluble in alcohol.

Derivation: From nitric acid and sodium carbonate and from Chile saltpeter.

Grade: Granular, sticks, powder; crude, 99.5%, double refined, recrystallized, CP, technical, reagent, diuretic, FCC.

Hazard: Fire risk near organic materials, ignites on friction and explodes when shocked or heated to 1000F (537C). Toxic by ingestion; content in cured meats, fish, and other food products restricted.

Use: Oxidizing agent; solid rocket propellants; fertilizer; flux; glass manufacture; pyrotechnics; reagent; refrigerant; matches; dynamites; black powders; manufacture of sodium salts and nitrates; dyes; pharmaceuticals; an aphrodisiac; color fixative and preservative in cured meats, fish, etc.; enamel for pottery; modifying burning properties of tobacco.

sodium nitrilotriacetate. See nitrilotriacetic acid.

sodium nitrite.

CAS: 7632-00-0. NaNO_2 .

Properties: Slightly yellowish or white crystals, pellets, sticks, or powder. Oxidizes on exposure to air. D 2.157, mp 271, explodes at 1000F (537C), decomposes at 320C. Soluble in water; slightly soluble in alcohol and ether.

Grade: Reagent, technical, USP, FCC.

Hazard: Dangerous fire and explosion risk when heated to 537C (1000F) or in contact with reducing materials; a strong oxidizing agent. Carcinogen in test animals; its use in curing fish and meat products is restricted to 100 ppm.

Use: Diazotization (by reaction with hydrochloric acid to form nitrous acid); rubber accelerators; color fixative and preservative in cured meats, meat products, fish; pharmaceuticals; photographic and analytical reagent; dye manufacture; antidote for cyanide poisoning.

sodium nitroferriocyanide. (sodium nitroprussiate; sodium nitroprusside).

$\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$.

Properties: Red, transparent crystals; d 1.72; soluble

in water with slow decomposition; slightly soluble in alcohol.

Grade: Reagent, technical.

Use: Analytical reagent.

sodium-*p*-nitrophenolate. See *p*-nitrophenol, sodium salt.

sodium novobiocin. See novobiocin.

sodium octyl sulfate.

CAS: 142-31-4. $C_8H_{17}OSO_3Na$. Anionic detergent, available commercially as a 35% solution.

Use: Wetting, dispersing, and emulsifying agent.

sodium oleate.

CAS: 143-19-1. $C_{17}H_{33}COONa$.

Properties: White powder; slight tallowlike odor. Mp 232–235C. Soluble in water with partial decomposition; soluble in alcohol. Combustible.

Derivation: Action of alcoholic sodium hydroxide on oleic acid.

Use: Ore flotation, waterproofing textiles, emulsifier of oil-water systems.

sodium orthophosphate. See sodium phosphate, monobasic; sodium phosphate, dibasic; sodium phosphate, tribasic.

sodium orthosilicate. $Na_2SiO_3 \cdot 2NaOH$ or other proportions such as $2Na_2O \cdot SiO_2$ (anhydrous) or $2Na_2O \cdot SiO_2 \cdot 5.4H_2O$.

Properties: (Composition $2Na_2O \cdot SiO_2$) Dustless, white, flaked product. Bulk d 75/lb/cu ft. Total Na_2O content 60.8%, percent of total Na_2O in active form 59.0. Soluble in water, pH of a 1% solution 13.0.

Hazard: Strong irritant to skin, eyes, and mucous membranes.

Use: Commercial laundries, metal cleaning, heavy duty cleaning.

sodium orthovanadate. (sodium vanadate; trisodium orthovanadate; vanadic(II) acid, trisodium salt).

CAS: 13721-39-6. mf: $O_4V \cdot 3Na$

Properties: Colorless, hexagonal prisms. Mw 183.91, mp 850–866C.

Hazard: Poison by ingestion. TLV: 0.05 mg(V_2O_5)/ m^3

sodium oxalate.

CAS: 62-76-0. $Na_2C_2O_4$.

Properties: White, crystalline powder. D 2.34, mp 250–270C (decomposes). Soluble in water; insoluble in alcohol.

Grade: Reagent, technical, 88%, 99%.

Hazard: Toxic by ingestion.

Use: Reagent, textile finishing, pyrotechnics, leather finishing, blue printing.

sodium oxide. See sodium monoxide.

sodium palconate. The sodium salt of an acid that may be extracted with alkali from redwood dust. The dark reddish-brown material consists mainly of a partially methylated phenolic acid containing aliphatic hydroxyls, phenolic hydroxyls, and carboxyl groups in the ratio of 2:4:3. The viscosity of aqueous solutions rises rapidly with concentration.

Use: To control viscosity and water loss in drilling muds and as a dispersing agent.

sodium palladium chloride. See palladium sodium chloride.

sodium palmitate. (sodium hexadecanoate; sodium pentadecanecarboxylate; sodium salt of hexadecanoic acid).

CAS: 408-35-5. $CH_3(CH_2)_{14}COONa$.

Properties: White to yellow powder.

Hazard: A poison. Combustible.

Use: Polymerization catalyst for synthetic rubbers, laundry and toilet soaps, detergents, cosmetics, pharmaceuticals, printing inks, and as an emulsifier.

sodium pantothenate.

Hazard: A nuisance dust.

Use: Food additive.

sodium paraperiodate. (sodium triparaperiodate). $Na_3H_2IO_6$.

Properties: White, crystalline solid. Very slightly soluble in water; soluble in concentrated sodium hydroxide solutions.

Use: Selectively oxidizes specific carbohydrates and amino acids, wet-strengthens paper, aids combustion of tobacco.

sodium pentaborate decahydrate.

$Na_2B_{10}O_{16} \cdot 10H_2O$.

Properties: White crystals. Free-flowing; stable under ordinary conditions. D 1.72, pH of solution 7.5. Solubility in water 15.4% (20C), increasing with temperature. Noncombustible.

Use: Weed killer, cotton defoliant, fireproofing compositions, glass manufacture, B supplement for tree fruit and truck crops.

sodium pentachlorophenate.

CAS: 131-52-2. C_6Cl_5ONa .

Properties: White or tan powder. Soluble in water, ethanol, and acetone; insoluble in benzene.

Grade: Technical, powder, pellets, or briquettes.

Hazard: Toxic by ingestion, inhalation; skin irritant.

Use: Fungicide; herbicide; slimicide; fermentation disinfectant, especially in finishes and papers.

sodium pentadecanecarboxylate. See sodium palmitate.

sodium pentafluorostannite.

CAS: 22578-17-2. mf: $F_5Sn_2 \cdot Na$

Properties: Colorless acicular crystals from H_2O .

Mw: 355.37. Soluble in H₂O; solubility increased in aq HF.

Hazard: A poison by ingestion. TLV: 2 mg(Sn)/m³
Use: Drug.

sodium pentobarbital. See barbiturate.

sodium "Pentothal" [Abbott]. See "Pentothal" [Abbott]; thiopental sodium.

sodium perborate, anhydrous.

CAS: 7632-04-4. NaBO₃.

Properties: White, amorphous powder of unknown constitution containing active oxygen. Evolves oxygen gas when dissolved in water; hygroscopic.

Derivation: By heating sodium perborate tetrahydrate.

Hazard: Strong oxidizing agent, fire risk in contact with organic materials. Toxic by ingestion.

Use: Denture cleaner, oxygen source.

sodium perborate monohydrate.

NaBO₃•H₂O, better represented as Na₂[B₃(O₃)₂(OH)]₂.

Properties: White, amorphous powder. Rapidly soluble in water giving a solution of H₂O₂ and sodium borate.

Derivation: By partial dehydration of sodium perborate tetrahydrate.

Hazard: Strong oxidizing agent, fire risk in contact with organic materials. Toxic by ingestion.

Use: Denture cleaner, bleaching agent in special detergents.

sodium perborate tetrahydrate.

NaBO₃•4H₂O better represented as Na₂[B₃(O₃)₂(OH)]₂•6H₂O.

Properties: Colorless crystals. Mp 63C, loses water at 130–150C. Soluble in water 21.5 g/L at 18C, giving a solution of H₂O₂ and sodium borate.

Derivation: By crystallization from solutions of borax and H₂O₂.

Hazard: Oxidizing agent. Toxic by ingestion.

Use: Bleaching agent for domestic detergents and industrial laundries, mild antiseptic, mouthwash (under medical supervision).

sodium percarbonate. (sodium carbonate peroxohydrate, sodium carbonate peroxide).

CAS: 3313-92-6. Na₂CO₃•1.5H₂O₂.

Properties: Stable, microcrystalline powder. Soluble in water 120 g/kg at 20C giving a solution of H₂O₂ and sodium carbonate.

Derivation: By solution crystallization or by a fluid-bed process, from concentrated solutions of sodium carbonate and hydrogen peroxide, with stabilizers.

Hazard: Oxidizing agent; when intimately mixed with certain organic substances, it may initiate combustion. Toxic by ingestion.

Use: Bleaching agent for domestic and industrial use, denture cleaner, mild antiseptic.

sodium perchlorate.

CAS: 7601-89-0. NaClO₄ sometimes with an H₂O.

Properties: White, deliquescent crystals. Mp 482C, bp (decomposes), d 2.02. Soluble in water and alcohol.

Derivation: (1) Sodium chlorate and sodium chloride are mixed and heated until fused. The unchanged chloride is leached out. (2) A cold solution of sodium chlorate is electrolyzed, the solution concentrated and crystallized.

Hazard: Dangerous fire and explosion risk in contact with organic materials and sulfuric acid.

Use: Explosives, jet fuel, analytical reagent.

sodium periodate. (sodium metaperiodate).

(1) NaIO₄. (2) NaIO₄•3H₂O.

Properties: Colorless crystals. D (1) 3.865 (16C), (2) 3.219 (18C), mp (1) 300C (decomposes), (2) 175C (decomposes). Very soluble in water.

Hazard: Fire risk in contact with organic materials. Toxic by ingestion.

Use: Source of periodic acid, analytical reagent, oxidizing agent.

See sodium paraperiodate.

sodium permanganate.

CAS: 10101-50-5. NaMnO₄•3H₂O.

Properties: Purple to reddish-black crystals or powder. D 2.47, mp 170C (decomposes). Soluble in water.

Derivation: Sodium manganate is dissolved in water and chlorine or ozone passed in. The solution is concentrated and crystallized.

Grade: Technical, sold commercially in solution.

Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.

Use: Oxidizing agent; disinfectant; bactericide; manufacture of saccharin; antidote for poisoning by morphine, curare, and phosphorus.

sodium peroxide.

CAS: 1313-60-6. Na₂O₂.

Properties: Yellowish-white powder, turning yellow when heated. Absorbs water and carbon dioxide from air. Active oxygen content about 20% by weight. D 2.805, mp 460C (decomposes), bp 657 (decomposes). Soluble in cold water with evolution of heat.

Derivation: Metallic sodium is heated at 300C in aluminum trays in a retort in a current of dry air from which the carbon dioxide has been removed.

Grade: Technical, reagent.

Hazard: Dangerous fire and explosion risk in contact with water, alcohols, acids, powdered metals, and organic materials. Strong oxidizing agent. Keep dry. Irritant.

Use: Oxidizing agent; bleaching of miscellaneous materials including paper and textiles; deodorant; antiseptic; organic chemicals; water purification; pharmaceuticals; oxygen generation for diving bells, submarines, etc.; textile dyeing and printing;

ore processing; analytical reagent; calorimetry; germicidal soaps.

sodium persulfate. (sodium peroxydisulfate).

CAS: 7775-27-1. $\text{Na}_2\text{S}_2\text{O}_8$.

Properties: White, crystalline powder. Soluble in water; decomposed by alcohol; decomposes in moist air.

Hazard: By ingestion, strong irritant to tissue. TLV: 0.1 mg/m³.

Use: Bleaching agent (fats, oils, fabrics, soap), battery depolarizers, emulsion polymerization.

sodium phenate. (sodium phenolate; sodium carbolate).

CAS: 139-02-6. $\text{C}_6\text{H}_5\text{ONa}$.

Properties: White, deliquescent crystals. Soluble in water and alcohol; decomposed by carbon dioxide in the air.

Derivation: Phenol is dissolved in caustic soda solution, concentrated, and crystallized.

Hazard: Strong irritant to skin and tissue.

Use: Antiseptic, salicylic acid, organic synthesis.

sodium phenobarbital. (phenobarbital, solution).

See barbiturate.

sodium phenolate. Legal label name for sodium phenate.

sodium phenolsulfonate. (sodium sulfocarbolate). $\text{HOC}_6\text{H}_4\text{SO}_3\text{Na}\cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals or granules. Slightly efflorescent; chars at high temperature, evolving phenol. Soluble in water, hot alcohol, and glycerol.

Use: Medicine (intestinal antiseptic).

sodium phenylacetate. (sodium α -toluate).

$\text{C}_6\text{H}_5\text{CH}_2\text{COONa}$.

Properties: Soluble in water; insoluble in alcohol, ether, and ketones; 50% aqueous solution has pH 7.0–8.5 and is pale yellow. Solution tends to crystallize at 15C.

Grade: 50% solution, dry salt.

Use: Precursor in production of penicillin G, intermediate for producing heavy metal salts that act as fungicides.

sodium-N-phenylglycinamide-p-arsenate.

See tryparsamide.

sodium-o-phenylphenate. (sodium-o-phenylphenolate). $\text{C}_6\text{H}_4(\text{C}_6\text{H}_5)\text{ONa}\cdot 4\text{H}_2\text{O}$.

Properties: Practically white flakes. Bulk d 38–43 lb/cu ft, pH of saturated solution in water 12.0–13.5. Soluble in water, methanol, acetone.

Use: Industrial preservative (bactericide and fungicide), mold inhibitor for apples and other fruit (postharvest).

sodium phenylphosphinate.

$\text{C}_6\text{H}_5\text{PH}(\text{O})(\text{ONa})$.

Properties: Crystals. Mp 355C (decomposes to give phenylphosphine), stable at room temperature. Soluble in water.

Use: Antioxidant, heat and light stabilizer.

sodium phenyl sulfinate dihydrate.

CAS: 25932-11-0. mf: $\text{C}_6\text{H}_5\text{O}_2\text{S}\cdot\text{Na}\cdot 2\text{H}_2\text{O}$.

Hazard: A mild eye irritant.

sodium phosphate. See "Nutrifos" [Solutia];

sodium metaphosphate; sodium phosphate, dibasic; sodium phosphate, monobasic; sodium phosphate (P-32); sodium phosphate, tribasic; sodium polyphosphate; sodium pyrophosphate; sodium pyrophosphate, acid; sodium tripolyphosphate.

sodium phosphate, dibasic. (DSP; disodium phosphate; sodium orthophosphate, secondary; disodium orthophosphate; disodium hydrogen phosphate).

CAS: 7558-79-4. (1) Na_2HPO_4 . (2) $\text{Na}_2\text{HPO}_4\cdot 2\text{H}_2\text{O}$. (3) $\text{Na}_2\text{HPO}_4\cdot 7\text{H}_2\text{O}$. (4) $\text{Na}_2\text{HPO}_4\cdot 12\text{H}_2\text{O}$. The dihydrate (2) is also marketed as the duohydrate.

Properties: Colorless, translucent crystals or white powder; saline taste. (1) Hygroscopic; converted to sodium pyrophosphate at 240C; (2) mp loses water at 92.5C, d 2.066 (15C); (3) d 1.679, loses 5H₂O at 48C; (4) mp 35C, d 1.5235, readily loses 5H₂O on exposure to air at room temperature, loses 12H₂O at 100C. Soluble in water; very soluble in alcohol; pH of 1% solution 8.0–8.8. Nonflammable.

Derivation: (1) By treating phosphoric acid with a slight excess of soda ash, boiling the solution to drive off carbon dioxide, and cooling to permit the dodecahydrate to crystallize; (2) by precipitating calcium carbonate from a solution of dicalcium phosphate with soda ash.

Grade: Commercial, NF (1) and (3), FCC (1) or (2).

Use: Chemicals, fertilizers, pharmaceuticals, textiles (weighting silk, dyeing and printing), fireproofing wood and paper; ceramic glazes, tanning, galvanoplastics, soldering enamels, analytical reagent, cheese, detergents, boiler-water treatment, dietary supplement, buffer, sequestrant in foods.

sodium phosphate, monobasic. (sodium acid phosphate; sodium biphosphate; sodium orthophosphate, primary; MSP, sodium dihydrogen phosphate).

CAS: 7558-80-7. (1) NaH_2PO_4 . (2) $\text{NaH}_2\text{PO}_4\cdot \text{H}_2\text{O}$.

Properties: (1) White, crystalline powder. Slightly hygroscopic. Very soluble in water. Has acid reaction; forms sodium acid pyrophosphate at 225–250C and sodium metaphosphate at 350–400C; (2) large transparent crystals. Mp loses water at 100C, d 2.040. Very soluble in water; insoluble in alcohol; pH of 1% solution 4.4–4.5. Nonflammable.

Derivation: By treating disodium phosphate with proper proportion of phosphoric acid.

Grade: Commercial, food, (2) NF, (1) FCC.

Use: Boiler-water treatment, electroplating, dyeing, acid cleansers, baking powders, cattle feed supplement, buffer, emulsifier, nutrient supplement in food, lab reagent, acidulant.

sodium phosphate (P-32). (sodium radio-phosphate). A radioactive form of sodium phosphate (which phosphate is not specified) containing phosphorus-32 which can be used as a tracer. See phosphorus-32.

Grade: USP, as solution.

Use: Biochemical research, medicine (diagnostic aid, antineoplastic).

sodium phosphate, tribasic. (TSP; trisodium orthophosphate; trisodium phosphate; tertiary sodium phosphate; sodium orthophosphate, tertiary).

CAS: 7601-54-9. $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals. D 1.62 (20C), mp 75C (decomposes), loses $12\text{H}_2\text{O}$ at 100C, pH of 1% solution is 11.8–12.0. Soluble in water. Nonflammable.

Derivation: By mixing soda ash and phosphoric acid in proper proportions to form disodium phosphate and then adding caustic soda.

Grade: Commercial, high purity, CP, FCC (anhydrous), anhydrous salt also available.

Hazard: Toxic by ingestion, irritant to tissue.

Use: Water softeners, boiler-water compounds, detergent, metal cleaner, textiles, manufacture of paper, laundering, tanning, sugar purification, photographic developers, paint removers, industrial cleaners, dietary supplement, buffer, emulsifier, food additive.

sodium phosphate tribasic dodecahydrate.

CAS: 10101-89-0. mf: $\text{O}_4\text{P} \cdot 3\text{Na} \cdot 12\text{H}_2\text{O}$.

Hazard: Low toxicity by ingestion.

sodium phosphide.

CAS: 12058-85-4. Na_3P .

Properties: Red solid. Decomposes on heating and in water, forming phosphine.

Hazard: Dangerous fire risk, reacts with water and acids to form phosphine.

sodium phosphite. $\text{Na}_2\text{HPO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Hygroscopic. Mp 53C, bp 200–250C Soluble in water; insoluble in alcohol. (decomposes).

Use: Antidote in mercuric chloride poisoning.

sodium phosphoaluminate. White powder composed primarily of sodium aluminate (hydrated), sodium phosphate (ortho), and small amounts of sodium carbonate and sodium silicate.

Use: Paper industry as a sizing adjunct, as an aid in

retention of filler and fiber and in pH control, boiler-feed-water treatment, and as a food additive.

sodium phospho-12-molybdate. See sodium-12-molybdophosphate.

sodium phospho-12-tungstate. See sodium-12-tungstophosphate.

sodium phytate. (USAN; inositol hexaphosphoric ester, sodium salt). $\text{C}_6\text{H}_9\text{O}_{24}\text{P}_6\text{Na}_9$.

Properties: Hygroscopic powder. Water-soluble.

Use: Chelating agent for trace heavy metals, color improvement, medicine.

sodium picramate.

CAS: 831-52-7. $\text{NaOC}_6\text{H}_2(\text{NO}_2)_3\text{NH}_2$.

Derivation: Yellow, water-soluble salt resulting from neutralization of picramic acid with caustic soda.

Hazard: Dangerous fire and explosion hazard when dry. Toxic by ingestion and skin absorption.

Use: Manufacture of dye intermediates, organic synthesis.

sodium platinichloride. See sodium chloroplatinate.

sodium plumbate. $\text{Na}_2\text{PbO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Fused, light-yellow lumps. Hygroscopic, decomposed by water and acids. Soluble in alkalis.

Hazard: As for lead.

sodium plumbite. Na_2PbO_2 .

Derivation: Solution of PbO (litharge) in sodium hydroxide.

Hazard: Highly toxic, corrosive.

See lead.

Use: Doctor solution for improving the odor of gasoline and other petroleum distillates.

sodium polyphosphate. $\text{Na}_{n+2}\text{P}_n\text{O}_{3n+1}$. The two most important crystalline sodium polyphosphates are the pyrophosphate ($n = 2$) and the tripolyphosphate, also called the triphosphate ($n = 3$). The term *sodium polyphosphate* also includes the system of vitreous sodium phosphates for which the mole ratio of $\text{Na}_2\text{O}/\text{P}_2\text{O}_5$ is between 1 and 2.

Hazard: As for sodium phosphate.

Use: Sequestering and deflocculating agents, primarily in water treatment, food processing, and cleaning compounds; heavy-set detergent builders.

See sodium metaphosphate; sodium pyrophosphate; sodium tripolyphosphate.

sodium polysulfide. Na_2S_x .

Properties: Yellow-brown, granular, free-flowing polymer. Bulk d 56 lb/cu ft. Combustible.

Use: Manufacture of sulfur dyes and colors, insecticides, oil-resistant synthetic rubber ("Thiokol"), petroleum additives, electroplating.

sodium-potassium alloy. Legal label name for NaK.

sodium-potassium carbonate. (potassium-sodium carbonate). $\text{NaKCO}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals. D 1.6344, mp 135C. The double salt fuses more readily than the single salts. (decomposes); soluble in water.

Derivation: Mixture of potassium and sodium carbonates.

Use: Analysis (flux).

sodium-potassium phosphate. (potassium-sodium phosphate). $\text{NaKHPO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: White powder. Stable in air. Soluble in water.

sodium-potassium tartrate. See potassium-sodium tartrate.

sodium propionate.

CAS: 137-40-6. $\text{CH}_3\text{CH}_2\text{COONa}$ or $\text{C}_2\text{H}_5\text{COO-Na} \cdot x\text{H}_2\text{O}$.

Properties: Transparent crystals or granules; almost odorless. Deliquescent in moist air. Soluble in water and alcohol. Combustible.

Grade: NF, FCC.

Use: Fungicide, mold preventive, food preservative (bread and other bakery products).

sodium prussiate, red. See sodium ferricyanide.

sodium prussiate, yellow. See sodium ferrocyanide.

sodium pyroantimonate. See sodium antimonate.

sodium pyroborate. See sodium borate.

sodium pyrophosphate. (tetrasodium pyrophosphate; sodium pyrophosphate, normal; TSP).

CAS: 7722-88-5. (1) $\text{Na}_4\text{P}_2\text{O}_7$. (2) $\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$ (one of the sodium polyphosphates).

Properties: Colorless, transparent crystals or white powder. (1) Mp 880C, d 2.45. Soluble in water; decomposes in alcohol. (2) Mp 94C (loses water), d 1.8. Soluble in water; insoluble in alcohol and ammonia.

Derivation: By fusing sodium phosphate, dibasic.

Grade: Pure crystals, dried, fused, CP, FCC.

Hazard: Toxic by inhalation. TLV: 5 mg/m³

Use: Water softener, soap and synthetic detergent builder, dispersing and emulsifying agent, metal cleaner, boiler-water treatment, viscosity control of drilling muds, de-inking newsprint, synthetic rubber manufacture, textile dyeing, scouring of wool, buffer, sequestrant, nutrient supplement, food additive.

sodium pyrophosphate, acid. (disodium pyrophosphate; sodium acid pyrophosphate; disodium diphosphate; disodium dihydrogen pyrophosphate; SAPP). $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline powder. Mp (decomposes) 220C, d 1.862. Soluble in water.

Derivation: Incomplete decomposition of monobasic sodium phosphate.

Grade: Technical, food, FCC.

Use: Electroplating, metal cleaning and phosphatizing, drilling muds, baking powders and leavening agent, buffer, sequestrant, peptizing agent in cheese and meat products, frozen desserts.

sodium pyrophosphate, normal. See sodium pyrophosphate.

sodium pyrophosphate peroxide.

$\text{Na}_4\text{P}_2\text{O}_7 \cdot 2\text{H}_2\text{O}_2$.

Properties: White powder. Bulk d 73 lb/cu ft, active oxygen min 9.0% by weight. Water-soluble; mildly alkaline.

Hazard: Fire risk in contact with organic materials, oxidizing agent.

Use: Denture cleansers, dentrifices, household and laundry detergents, antiseptic.

sodium pyroracemate. See sodium pyruvate.

sodium pyrosulfite. See sodium metabisulfite.

sodium pyrovanadate. $\text{Na}_4\text{V}_2\text{O}_7 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless, six-sided plates. Mp (anhydrous) 654C. Soluble in water; insoluble in alcohol.

Derivation: Sodium hydroxide and vanadium pentoxide in water solution.

sodium pyruvate. (sodium pyroracemate; sodium acetylformate). NaOCCCOCH_3 . White powder, apparent mp 205C, very soluble in water.

Use: Biochemical research.

sodium resinate. See sodium abietate.

sodium rhodanate. See sodium thiocyanate.

sodium rhodanide. See sodium thiocyanate.

sodium ricinoleate.

CAS: 5323-95-5. $\text{C}_{17}\text{H}_{32}\text{OHCOONa}$.

Properties: White or slightly yellow powder; nearly odorless. Soluble in water or alcohol. Combustible.

Derivation: Sodium salt of the fatty acids from castor oil.

Use: Emulsifying agent in special soaps.

sodium saccharin. (sodium benzosulfimide; gluside, soluble; soluble saccharin).

CAS: 128-44-9. $\text{C}_7\text{H}_4\text{NNaO}_3\text{S} \cdot 2\text{H}_2\text{O}$. The sodium salt of saccharin.

Properties: White crystals or crystalline powder; odorless or with a faint aromatic odor. In dilute solutions has an intensely sweet taste (500 times sweeter than sugar). Very soluble in water; slightly soluble in alcohol.

Grade: NF, FCC.

Use: Foods (nonnutritive sweetener).

See saccharin.

Hazard: The use of saccharin is being limited due to possible carcinogenicity.

sodium salicylate.

CAS: 54-21-7. $\text{HO}_2\text{C}_6\text{H}_4\text{COONa}$.

Properties: Lustrous, white, crystalline scales or amorphous powder; saline taste. Soluble in water, alcohol, and glycerol. Combustible.

Grade: Technical, CP, USP.

Use: Production of salicylic acid; preservative for paste, mucilage, glue, and hides; medicine (analgesic).

sodium salt of hexadecanoic acid. See sodium palmitate.

sodium sarcosinate. (sodium sarcosine).

$\text{CH}_3\text{NHCH}_2\text{COONa}$.

Grade: 33% aqueous solution.

Use: Intermediate, stabilizer for diazonium salts, chelating agent.

sodium secobarbital. See barbiturate.

sodium selenate.

CAS: 13410-01-0. $\text{Na}_2\text{SeO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: White crystals. D 1.603–1.620. Soluble in water.

Hazard: Toxic by ingestion. TLV: 0.2 mg(Se)/m³.

Use: Reagent, insecticide for nonedible plants.

sodium selenite.

CAS: 10102-18-8. $\text{Na}_2\text{SeO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water; insoluble in alcohol.

Derivation: By neutralizing selenious acid with sodium carbonate and crystallizing.

Hazard: Toxic by ingestion. TLV: 0.2 mg(Se)/m³.

Use: Glass manufacture (color control), reagent in bacteriology, testing germination of seeds, decorating porcelain.

sodium selenite pentahydrate. (selenious acid disodium salt pentahydrate).

CAS: 26970-82-1. mf: $\text{O}_3\text{Se} \cdot 2\text{Na} \cdot 5\text{H}_2\text{O}$

Properties: White tetragonal crystals; decomp on heating by H₂O loss. Mw: 332.01. Soluble in H₂O; insoluble in EtOH.

Hazard: A poison. TWA 0.2 mg(Se)/m³

sodium sesquicarbonate.

CAS: 533-96-0. $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White, needle-shaped crystals. D 2.112,

mp decomposes. Soluble in water; less alkaline than sodium carbonate. Noncombustible.

Derivation: Crystallization of a solution containing equimolar quantities of sodium carbonate and sodium bicarbonate, also occurs native (as trona) in desert areas and in Searles Lake brine.

Grade: Technical, FCC.

Hazard: Irritant to tissue.

Use: Detergent and soap builder, mild alkaline agent for general cleaning and water softening, bath crystals, alkaline agent in leather tanning, food additive.

sodium sesquisilicate. $\text{Na}_6\text{Si}_2\text{O}_7$ (anhydrous).

Properties: White, granular powder. Soluble in water; pH of 1% solution 12.7. Noncombustible.

Derivation: Crystals from solutions obtained by heating silica or sodium metasilicate with sodium hydroxide. Intermediate in composition between ortho- and metasilicates, less alkaline than sodium orthosilicate.

Hazard: Toxic by ingestion, protective clothing required.

Use: Heavy-duty cleaning (metals, laundries), textile processing.

sodium silicate. (water glass).

CAS: 6834-92-0. Formulas: Vary from $\text{Na}_2\text{O} \cdot 3.75\text{SiO}_2$ to $2\text{Na}_2\text{O} \cdot \text{SiO}_2$ and with various proportions of water. The simplest form of glass.

Properties: Lumps of greenish glass soluble in steam under pressure, white powders of varying degrees of solubility, or liquids cloudy or clear and varying from highly fluid to extreme viscosity, viscosity range from 0.4 to 600,000 cP, fp slightly below water, miscible with some polyhydric alcohols, partially miscible with primary alcohols and ketones, gels form with acids between pH 3 and pH 9, coagulated by brine, precipitated by alkaline earth and heavy metal ions. Noncombustible.

Derivation: By fusing sand and soda ash.

Grade: (liquid) 40, 47, 52 degrees Bé.

Use: Catalysts and silica gels, soaps and detergents, adhesives (especially sealing and laminating paper-board containers), water treatment, bleaching and sizing of textiles and paper pulp, ore treatment, soil solidification, glass foam, pigments, drilling fluids, binder for abrasive wheels, foundry cores and molds, waterproofing mortars and cements, flame-retardant, chemical equipment lining, enhanced oil recovery.

See sodium metasilicate, anhydrous; sodium metasilicate pentahydrate; sodium sesquisilicate; sodium orthosilicate.

sodium silicoaluminate. See sodium aluminosilicate.

sodium silicofluoride. See sodium fluorosilicate.

sodium silico-12-molybdate. See sodium-12-molybdosilicate.

sodium-12-silicotungstate. See sodium-12-tungstosilicate.

sodium silver chloride. See silver sodium chloride.

sodium silver thiosulfate. See silver sodium thiosulfate.

sodium- α -sodioacetate. See α -sodium acetate.

sodium sorbate.

CAS: 7757-81-5. $\text{CH}_3\text{CH}:\text{CHCH}:\text{CHCOONa}$. Combustible.

Use: Food preservative.

sodium stannate. $\text{Na}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$ or $\text{Na}_2\text{Sn}(\text{OH})_6$.

Properties: White to light-tan crystals. Soluble in water; insoluble in alcohol; decomposes in air; aqueous solution slightly alkaline; loses $3\text{H}_2\text{O}$ at 140C.

Derivation: (1) By fusion of metastannic acid and sodium hydroxide, (2) by boiling tin scrap and sodium plumbate solution.

Hazard: Toxic material. TLV: 2 mg/m³.

Use: Mordant in dyeing, ceramics, glass, source of tin for electroplating and immersion plating, textile fireproofing, stabilizer for hydrogen peroxide, blueprint paper, laboratory reagent.

sodium stearate.

CAS: 822-16-2. $\text{NaOOC}_{17}\text{H}_{35}$.

Properties: White powder with fatty odor. Soluble in hot water and hot alcohol; slowly soluble in cold water and cold alcohol; insoluble in many organic solvents.

Impurities: Varying quantities of sodium palmitate.

Grade: Technical.

Use: Waterproofing and gelling agent, toothpaste and cosmetics, stabilizer in plastics.

sodium stearyl lactylate.

CAS: 25383-99-7.

Properties: Cream-colored powder; caramel-like odor. Sol in hot oil or fat, dispersible in warm water.

Use: Food additive.

See "Emulsilac-S" [ACH].

sodium stearyl-2-lactylate.

Properties: White powder. Melting range 46–52C.

Derivation: Sodium salt of reaction product of lactic and stearic acids.

Use: Emulsifier; dough conditioner; whipping agent in baked products, desserts, and mixes; complexing agent for starches and proteins.

sodium stearyl fumarate. mf: $\text{C}_{22}\text{H}_{39}\text{NaO}_4$.

Properties: Fine white powder. Sol in methanol; insol in water.

Use: Food additive.

sodium styrenesulfonate.

$\text{CH}_2:\text{CH}_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}$. White, free-flowing powder.

Use: Reactive monomer.

sodium subsulfite. See sodium thiosulfate.

sodium sulfachloropyrazine monohydrate.

Use: Drug (veterinary); food additive.

sodium sulfate, anhydrous.

CAS: 7757-82-6. Na_2SO_4 .

Properties: White crystals or powder; odorless; bitter saline taste. D 2.671, mp 888C. Soluble in water and glycerol; insoluble in alcohol. Noncombustible.

Derivation: (1) Purification of natural sodium sulfate from deposits or brines; (2) by-product of hydrochloric acid manufacture from salt and sulfuric acid, $2\text{NaCl} + \text{H}_2\text{SO}_4 \rightarrow 2\text{HCl} + \text{Na}_2\text{SO}_4$; (3) by-product of phenol manufacture (caustic fusion process); (4) Hargreaves process.

Grade: Technical, CP, detergent, rayon, glass maker's.

Use: Manufacture of kraft paper, paperboard, and glass; filler in synthetic detergents; sodium salts; ceramic glazes; processing textile fibers; dyes; tanning; pharmaceuticals; freezing mix; laboratory reagent. food additive.

See salt cake.

sodium sulfate decahydrate. (sodium sulfate, crystals; Glauber's salt). $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: Large, transparent crystals, small needles, or granular powder. D 1.464 (crystals), mp 33C (liquefies). Loses water of hydration at 100C. Energy storage capacity is more than seven times that of water. Soluble in water and glycerol; insoluble in alcohol; solutions neutral to litmus. Nonflammable.

Derivation: Crystallization of sodium sulfate from water solutions (Glauber's salt); also occurs in nature as mirabilite.

Grade: Technical, NF.

Use: Solar heat storage, air-conditioning.

sodium sulfhydrate. See sodium hydrosulfide.

sodium sulfide.

CAS: 1313-82-2. (1) Na_2S . (2) $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$.

Properties: Yellow or brick-red lumps or flakes or deliquescent crystals. (1) D 1.856 (14C), mp 1180C; (2) d 1.427 (16C), decomposes at 920C. Soluble in water; slightly soluble in alcohol; insoluble in ether; largely hydrolyzed to sodium acid sulfide and sodium hydroxide.

Derivation: By heating sodium acid sulfate with salt and coal to above 950C, extraction with water, and crystallization.

Grade: Flake, fused, chip sulfide (60% Na_2S), 60% fused and broken, 30% crystals, liquid.

Hazard: Flammable, dangerous fire and explosion

risk. Strong irritant to skin and tissue, liberates toxic hydrogen sulfide on contact with acids.

Use: Organic chemicals, dyes (sulfur), intermediates, viscose rayon (sulfur removal), leather (depilatory), paper pulp, hydrometallurgy of gold ores, sulfiding oxidized lead and copper ores preparatory to flotation, sheep dips, photographic reagent, engraving and lithography, analytical reagent.

sodium sulfite.

CAS: 7757-83-7. (1) Na_2SO_3 . (2) $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals or powder; saline, sulfurous taste. D(1) 2.633, (2) d 1.539; mp (1) decomposes, (2) loses 7 H_2O at 150C. Soluble in water; sparingly soluble in alcohol.

Derivation: (1) Sulfur dioxide is reacted with soda ash and water and a solution of the resulting sodium bisulfite is treated with additional soda ash; (2) by-product of the caustic fusion process for phenol.

Grade: Reagent, technical, FCC.

Hazard: Use prohibited in meats and other sources of Vitamin B₁.

Use: Paper industry (semichemical pulp), reducing agent (dyes), water treatment, photographic developer, food preservative and antioxidant, textile bleaching (antichlor).

sodium sulfoacetate derivatives of mono and diglycerides.

Use: Food additive.

sodium sulfobromophthalein.

$\text{C}_{20}\text{H}_8\text{Br}_4\text{O}_{10}\text{S}_2\text{Na}_2$.

Properties: White, crystalline powder; odorless; bitter taste. Hygroscopic; soluble in water; insoluble in alcohol and acetone.

Derivation: From phenol and tetrabromophthalic acid or anhydride.

Grade: USP, technical.

Use: Medicine (diagnostic aid).

sodium sulfocarbolate.

See sodium phenol-sulfonate.

sodium sulfocyanate.

See sodium thiocyanate.

sodium sulfocyanide.

See sodium thiocyanate.

sodium sulfonate. Class name for various sulfonates derived from petroleum, e.g., sodium dodecylbenzenesulfonate, sodium xylenesulfonate, sodium toluenesulfonate.

See sodium alkanesulfonate.

Use: Textile processing oils; oils for metal-working (emulsifying and antirust agents); lubricating oils; emulsifiers for insecticides, herbicides, fungicides; preparation of dyes and intermediates; hydrotropic solvent; coatings in food packaging.

sodium-2-sulfopropionitrile. See sodium-2-cyanoethanesulfonate.

sodium sulforicinoleate.

Derivation: Product of successive sulfonation (partial) and saponification of castor oil. Composition indefinite.

Use: Emulsifying and wetting agent.

sodium sulfoxylate. See sodium formaldehyde sulfoxylate.

sodium tartrate. (sal tartar; disodium tartrate).

CAS: 868-18-8. $\text{Na}_2\text{C}_4\text{H}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or granules. D 1.794, loses 2 H_2O at 150C. Soluble in water; insoluble in alcohol.

Derivation: Neutralization of tartaric acid with sodium carbonate, concentration, and crystallization.

Grade: Technical, CP, reagent, FCC.

Use: Reagent, food additive, as sequestrant and stabilizer.

sodium tartrate, acid. See sodium bitartrate.

sodium TCA. See sodium trichloroacetate.

sodium tellurite.

CAS: 10102-20-2. Na_2TeO_3 .

Properties: White powder. Soluble in water.

Hazard: Toxic by ingestion.

Use: Bacteriology, medicine.

sodium tetraborate. See sodium borate.

sodium tetraborate pentahydrate.

CAS: 12179-04-3. mf: $\text{B}_4\text{O}_7 \cdot 2\text{Na} \cdot 5\text{H}_2\text{O}$.

Hazard: A severe eye irritant. TWA 1 mg/m³ (pentahydrate).

sodium tetrachloroaluminate. (sodium chloroaluminate). AlCl_4Na . A water-soluble powder used as catalyst in organic reactions.

sodium-2,3,4,6-tetrachlorophenate.

$\text{C}_6\text{HCl}_4\text{ONa} \cdot \text{H}_2\text{O}$.

Properties: Buff to light-brown flakes. Bulk d 26–29 lb/cu ft, pH of water-saturated solution 9.0–13.0. Soluble in water; methanol and acetone.

Hazard: Toxic by ingestion.

Use: Industrial preservative (bactericide and fungicide).

sodium tetradecyl sulfate. (sodium-7-ethyl-2-methyl-4-hendecanol sulfate).

CAS: 139-88-8. $\text{C}_{14}\text{H}_{29}\text{SO}_4\text{Na}$.

Properties: White, waxy solid; odorless. Soluble in alcohol, ether, and water; 5% solution is clear and colorless; pH (5% solution) 6.5–9.0.

Use: Wetting agent, detergent.

sodium tetrafluoropropionate.CAS: 22898-01-7. mf: $C_3HF_4O_2 \cdot Na$.**Hazard:** Moderately toxic by skin contact. Low toxicity by ingestion.**Use:** Agricultural chemical.**sodium tetraphosphate.** See sodium polyphosphate.**sodium tetrasulfide.** Na_2S_4 .**Properties:** Yellow, hygroscopic crystals or clear, dark-red liquid. Mp of crystals 275C.**Grade:** Aqueous solution containing 40% by weight of compound.**Hazard:** Fire risk when exposed to flame. Irritant to skin and tissue.**Use:** Reducing organic nitro compounds, manufacture of sulfur dyes, insecticides and fungicides, ore flotation, soaking hides and skins, preparation of metal sulfide finishes.**sodium thimerfonate.**CAS: 5964-24-9. mf: $C_8H_8HgO_3S \cdot Na$.**Hazard:** A poison. TWA 0.1 mg(Hg)/m³ (skin).**sodium thiocyanate.** (sodium sulfocyanate; sodium sulfocyanide; sodium rhodanate; sodium rhodanide).CAS: 540-72-7. $NaSCN$.**Properties:** Colorless, deliquescent crystals or white powder. Mp 287C. Soluble in water and alcohol; hygroscopic and affected by light.**Derivation:** By boiling sodium cyanide with sulfur.**Grade:** Technical; pure (crystals or dried); CP; reagent; ACS.**Use:** Analytical reagent, dyeing and printing textiles, black nickel plating, manufacture of other thiocyanate salts and artificial mustard oil, solvent for polyacrylates, medicine (antihypertensive).**sodium thioglycolate.** (sodium mercaptoacetate).CAS: 367-51-1. HSC_2COONa . The sodium salt of thioglycolic acid.**Properties:** Crystals; characteristic odor; hygroscopic; discolors on exposure to air or iron. Soluble in water; slightly soluble in alcohol. Combustible.**Hazard:** Yields toxic hydrogen sulfide on decomposition, may be toxic by skin absorption.**Use:** Bacteriology, cold-waving hair, depilatory, analytical reagent.**sodium thiosulfate.** (sodium subsulfite; hypo).CAS: 7772-98-7. $Na_2S_2O_3 \cdot 5H_2O$. The anhydrous salt is also commercially available.**Properties:** White, translucent crystals or powder; cooling taste; bitter aftertaste. Efflorescent above 33C in dry air, d 1.729 (17C), mp 48C, bp decomposes. Soluble in water and oil of turpentine; insoluble in alcohol; deliquescent in moist air.**Derivation:** Heating a solution of sodium sulfite with powdered sulfur.**Grade:** Technical, crystals, granulated, photographic, CP, pure, USP, FCC.**Hazard:** Use in foods restricted to 0.1%.**Use:** Photography (fixing agent to dissolve unchanged silver salts from exposed negatives), chrome tanning, removing chlorine in bleaching and papermaking, extraction of silver from its ores, dechlorination of water, mordant, reagent, bleaching, reducing agent in chrome dyeing, sequestrant in salt (up to 0.1%), antidote for cyanide poisoning.**sodium *l*-thyroxine pentahydrate.**CAS: 6106-07-6. mf: $C_{15}H_{10}I_4NO_4 \cdot Na \cdot 5H_2O$.**Hazard:** A reproductive hazard.**sodium titanate.** (sodium tritanate). $Na_2Ti_3O_7$.**Properties:** White crystals. D 3.35–3.50, mp 1128C. Insoluble in water. Combustible.**Use:** Welding.**sodium- α -toluate.** See sodium phenylacetate.**sodium toluenesulfonate.** (*p*-toluenesulfonic acid, sodium salt).CAS: 657-84-1. $CH_3C_6H_4SO_3Na$.**Properties:** Crystals. Soluble in water.**Use:** Dye chemistry, hydrotropic solvent.**sodium-*p*-toluenesulfonchloramine.** See chloramine.**sodium trichloroacetate.** (sodium TCA).CAS: 650-51-1. CCl_3COONa .**Hazard:** Toxic by ingestion, irritant to skin and eyes.**Use:** Herbicide, pesticide.**sodium-2,4,5-trichlorophenate.** $C_6H_2Cl_3ONa \cdot 1.5H_2O$.**Properties:** Buff to light-brown flakes. Bulk d 28–33 lb/cu ft, pH of water-saturated solution 11.0–13.0. Soluble in water, methanol, acetone.**Use:** Industrial preservative (bactericide and fungicide).**sodium tridecylbenzenesulfonate.** Not a true compound but a mixture of C_{12} and C_{15} alkyl benzene sulfonates that approximates C_{13} . See sodium dodecylbenzene sulfonate.**sodium 2,3,5-triiodobenzoate.**CAS: 17274-12-3. mf: $C_7H_2I_3O_2 \cdot Na$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**sodium tri-metaphosphate.** See sodium metaphosphate.**sodium triparaperiodate.** See sodium paraperiodate.

sodium triphenyl-*p*-rosaniline sulfonate.

See methyl blue.

sodium triphosphate. See sodium tripolyphosphate.**sodium tripolyphosphate.** (STFF; sodium triphosphate, tripoly; pentasodium triphosphate). CAS: 13573-18-7. $\text{Na}_3\text{P}_3\text{O}_{10}$.

Properties: White powder. Two crystalline forms of anhydrous salt (transition p 417C, mp 622C to give melt and sodium pyrophosphate), and a hexahydrate.

Derivation: Controlled calcination of sodium orthophosphate mixture from sodium carbonate and phosphoric acid. May contain up to 10% pyrophosphate and up to 5% tri-metaphosphate.

Grade: Powdered and granular, FCC, food.

Use: Water softening; sequestering, peptizing, or deflocculating agent; food additive and texturizer.

sodium trithiocyanurate.

CAS: 17766-26-6. mf: $\text{C}_3\text{N}_3\text{S}_3 \cdot 3\text{Na}$.

Hazard: Moderately toxic by skin contact.

sodium trititanate. See sodium titanate.**sodium tungstate.** (sodium wolframate).

CAS: 13472-45-2. $\text{Na}_2\text{WO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. D 3.245, mp loses $2\text{H}_2\text{O}$ at 100C and then melts at 692C. Soluble in water; insoluble in alcohol and acids. Noncombustible.

Derivation: By dissolving tungsten trioxide or the ground ore in caustic soda solution, concentration, and crystallization.

Grade: Technical, CP, crystals.

Use: Intermediate in preparation of tungsten compounds, (e.g., phosphotungstate), reagent, fireproofing fabrics and cellulose, alkaloid precipitant.

sodium-12-tungstophosphate. (sodium phosphotungstate; phosphotungstic acid, sodium salt).

CAS: 51312-42-6. $\text{Na}_4\text{O}_2 \cdot \text{O}_5\text{P}_2 \cdot \text{O}_{36}\text{W}_{12} \cdot 18\text{H}_2\text{O}$.

Properties: Yellowish-white powder. Very soluble in water and alcohols.

Grade: Reagent, technical.

Hazard: An oxidizing agent.

Use: Reagent; manufacture of organic pigments; treatment of furs; antistatic agent for textiles; leather tanning; making plastic films, cements, and adhesives water-resistant.

sodium-12-tungstosilicate.

$\text{Na}_4\text{SiW}_{12}\text{O}_{40} \cdot 5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water and alcohols; although less so than the free acid. Noncombustible.

Grade: Reagent, technical.

Use: Catalyst for organic synthesis, precipitant and

inorganic ion-exchanger, additive in plating processes.

sodium undecylenate.

$(\text{CH}_2=\text{CH}(\text{CH}_2)_9\text{COO})_2\text{Na}$.

Properties: White powder. Decomposes above 200C, limite. Solubility in most organic solvents; soluble in water. Combustible.

Use: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

sodium uranate. See sodium diuranate.**sodium valproate.** A drug that has proved effective in treating epilepsy. Approved (1978) by FDA, successfully used in Europe since 1970.**sodium vanadate.** See sodium orthovanadate; sodium pyrovanadate; sodium metavanadate.**sodium-*p*-vinylbenzene sulfonate.** See sodium styrene sulfonate.**sodium warfarin.** (sodium-(3- α -acetylbenzyl)-4-hydroxycoumarin). $\text{C}_{19}\text{H}_{15}\text{NaO}_4$. See warfarin.**sodium xanthate.** See sodium ethylxanthate.**sodium xanthogenate.** See sodium ethylxanthate.**sodium xylenesulfonate.** (dimethylbenzenesulfonic acid, sodium salt).

CAS: 1300-72-7. $(\text{CH}_3)_2\text{C}_6\text{H}_4\text{SO}_3\text{NaH}_2\text{O}$.

Use: Hydrotropic solvent, used in detergents.

sodium zinc hexa-metaphosphate. See sodium metaphosphate.**sodium zirconium glycolate.**

$\text{NaH}_2\text{ZrO}(\text{H}_2\text{COCO})_2$.

Properties: Clear, light-straw-colored solution. D 1.28–1.30, containing 35.7–38.6% solids, 12.5–13.5% ZrO_2 .

Use: Deodorant, astringent, germicide, sequestrant, fire-retardant.

sodium zirconium lactate.

CAS: 10377-98-7. $\text{NaH}_2\text{ZrO}(\text{CH}_3\text{CHOCO})_2$.

Properties: Clear, straw-colored solution. D 1.28–1.30, containing 12.5–13.5% ZrO_2 , equivalent to 42.5–45.9% sodium zirconium lactate; pH 7.5–8.0.

Use: Deodorant and antiperspirant.

sodium zirconium sulfate. See zirconium sodium sulfate.

soft. A nontechnical word used by chemists in several senses, it describes the following: (1) an acid

having little or no positive charge and whose valence electrons are easily excited (see acid); (2) water that is relatively free from calcium compounds (see water, hard); (3) wood from coniferous trees (see softwood).

softener. (1) A substance used when dry powders are added to a polymeric material (e.g., rubber or plastic) to reduce the friction of mechanical mixing and to facilitate subsequent processing. It exerts both lubricating and dispersing action, often by means of emulsification. Examples are vegetable oils, asphaltic materials, and stearic acid, the latter being especially effective with carbon black. It is difficult to distinguish precisely between softeners and plasticizers; in general, softeners do not enter into chemical combination with the polymer, and their softening effect tends to be temporary.

(2) A fatliquoring agent used to soften leather.

(3) A sulfonated oil, fatty alcohol, or quaternary ammonium compound used in textile finishing to impart superior "hand" to the fabric and facilitate mechanical processing.

(4) A substance that reduces the hardness of water by removing or sequestering calcium and magnesium ions; among those used are various sodium phosphates and zeolites. See water, hard.

"Softigen" [Degussa]. TM for fatty acid esters. See "Witepsol."

"Softisan" [Degussa]. TM for fatty acid esters. See "Witepsol."

soft lithography. See nanoimprinting.

softwood. In papermaking terminology, an arbitrary name for the wood from coniferous trees (pine, spruce, fir, hemlock) regardless of the hardness or softness of the wood itself. Softwoods are used for almost all commercial grades of paper. See pulp, paper.

soil. (1) A mixture of inorganic matter derived from weathered rocks and organic components resulting from decay of prior vegetation. Eight elements are present in the inorganic component in excess of 1% (oxygen, silicon, aluminum, iron, calcium, potassium, magnesium, and sodium), most in the ionized state. Water and air are also present, either in the voids between the particles or adsorbed on their surfaces. Many other elements occur in lower percentages, including trace elements in concentration of less than 1000 ppm. Some of these, e.g., boron (about 20 ppm), are essential for plant nutrition. Both nitrogen and phosphorus are associated with the organic content. The concentration of these is a fraction of 1% of each, but they play a vital part in plant and animal life. The pH of soils varies widely with location; some soils are as low as pH 4.5 (very acid) and others as high as pH 10 (strongly alkaline). For most crops the pH ranges around the

neutral point (6.5–7.5). Texturally, soils are classified on the basis of their content of sand, silt, and clay. Those having 45–50% sand and 20–28% clay are called loams, those with more than 50% sand are called sandy, and those with more than 28% clay are in the clay group. Technologists consider soil as being made up of layers, known as horizons, each having a characteristic composition and physical properties; the spectrum of these horizons is called the soil profile. Organic matter is usually excluded from the profile.

(2) In textile literature, any foreign matter present in or on fiber or fabric, i.e., dirt, oil, grease, etc. These are usually removable by the action of soap, synthetic detergents, or organic solvents.

"Soilbond" [Huntsman]. TM for a soil stabilizer.

Use: Dust control for road improvement.

soil conditioner. (1) A synthetic, long-chain organic molecule having carboxyl groups along the chain whose charges react with the positive charges on the soil particles (aluminum and iron). The conditioners affect the anion exchange capacity of a soil. (2) Loosely, any material added to topsoil to reduce acidity (lime) and promote growth (bone meal).

"Soilfume" [FMC]. TM for a soil fumigant whose active ingredient is ethylene dibromide.

Hazard: As for ethylene dibromide.

sol. (1) An abbreviation for soluble. (2) A class of colloid.

See colloidal; colloid chemistry.

solan. (generic name for 3'-chloro-2-methyl-*p*-valerolulide or *N*-(3-chloro-4-methylphenyl)-2-methylpentanamide).

CAS: 2307-68-8.

$\text{H}_3\text{CC}_6\text{H}_4(\text{Cl})\text{NHCOCH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Solid. Mp 86°C. Insoluble in water; soluble in pine oil, diisobutyl ketone, isophorone, and xylene. Combustible.

solanine.

CAS: 20562-02-1. $\text{C}_{45}\text{H}_{73}\text{NO}_{15}$. An alkaloid found in low percentages in potato and other plants, insoluble in water, soluble in alcohol, decomposes at 285°C.

solanoside.

CAS: 4356-33-6. mf: $\text{C}_{30}\text{H}_{46}\text{O}_8$.

Hazard: A poison.

Source: Natural product.

solar cell. (photovoltaic cell). A battery-like device in which the radiant energy of the sun is converted to electrical energy by means of a semiconductor. The essential component of a solar cell is a thin sheet or wafer of crystalline or amorphous silicon, plus doping agents. The crystalline form is used in 3-inch squares, but the hydrogenated amor-

phous form is effective in 1-foot squares which are produced as vapor-deposited coatings on glass only a few microns in thickness. A notable advance in the technology of solar cells is the experimental development of a photoelectrochemical cell, that utilizes silicon electrodes by which incident light is converted to energy. The conversion efficiency is sufficient to indicate that this type of cell may have an important future. Its success is due to microthin films of doped oxides of alumina or magnesia deposited on the electrode surfaces, which in turn are coated with platinum a few angstroms thick. The cell can also be operated as a battery for use in remote power sources.

solar collector. A device for utilizing solar energy either by absorption or reflection of the incident radiation. Several types have been developed for both domestic and industrial application. Some are in the experimental stage. (1) Collection units consisting of a blackened absorber surface enclosed by one or two layers of silvered glass or polished aluminum, which admit the incident radiation but prevent the escape of heat; the energy absorbed is transferred to air or water circulating between the glass plates and the absorber. (2) Energy-focusing systems (solar towers) in which the incident radiation is concentrated on a central receiver from an array of flat or parabolic mirrors. This method is utilized for evaporating low-level radioactive wastewater at Los Alamos, as well as in a power generating plant. Solar energy has important possibilities for chemical synthesis. A prototype collector for producing ammonia from the reduction of nitrogen and water at low temperature and pressure has been reported. This reaction is

solar energy. The National Renewable Energy Laboratory, 1617 Cole Blvd., Golden, CO 80401 is a center for information on solar energy. See solar cell; solar collector; solar furnace. For the problem of heat and power storage when sunlight is not available, see storage (4).

solar furnace. An experimental device for attaining extremely high temperatures for physical and chemical research. Solar radiation is directed by an array of 63 heliostats onto a parabolic reflector that is 2000 m² in area and composed of more than 9000 curved mirrors. By this means the radiation is focused on a target area of 0.3 m². Three furnaces, each of 1000 kW capacity, have been constructed; one is located in New Mexico, the others are in France and Japan. Calcium carbide is reported to have been made in the French solar furnace from lime and coke at 1980C (3600F), under the sponsorship of the Institute of Gas Technology.

solar pond. An experimental means of storing solar energy in either fresh- or saltwater. The "pond" is actually a large, suitably lined, open container of varying dimensions. In the freshwater type, the heat absorbed is retained at night by covering the pond with an inflated plastic film, supplemented by a layer of foam applied directly to the water. In the salt-water type, heat loss is prevented by a salt gradient, that minimizes convection currents that would cool the water. The sodium chloride or magnesium chloride used is not uniformly dispersed, but is most highly concentrated in the darker, bottom layers where most of the solar radiation is absorbed. Thus the water is warmest and densest at the bottom, where it remains, and no convection occurs. The salt concentration ranges from zero at the surface to 18% or more at the bottom. An experimental salt-gradient pond at Argonne National Laboratory 100 × 100 × 12 ft containing 2800 tons of water and 700 tons of sodium chloride has attained a bottom temperature approaching 180F.

solder. A low-melting alloy usually of the lead-tin type used for joining metals at temperatures below 425C. The solder acts as an adhesive and does not form an intermetallic solution with the metals being joined.

See brazing; welding.

solid. Matter in its most highly concentrated form, i.e., the atoms or molecules are much more closely packed than in gases or liquids and thus more resistant to deformation. The normal condition of the solid state is crystalline structure—the orderly arrangement of the constituent atoms of a substance in a framework called a lattice (see crystal). Crystals are of many types and normally have defects and impurities that profoundly affect their applications, as in semiconductors. The geometric structure of solids is determined by X rays which are reflected at characteristic angles from the crystalline lattices, which act as diffraction gratings.

See crystallography. Some materials that are physically rigid, such as glass, are regarded as highly viscous liquids because they lack crystalline structure. All solids can be melted (i.e., the attractive forces acting between the crystals are disrupted) by heat and are thus converted to liquids. For ice, this occurs at 0C; for some metals the melting point may be as high as 3300C. Some solids convert by sublimation directly to a gas.

solid-state chemistry. Study of the exact arrangement of atoms in solids, especially crystals, with particular emphasis on imperfections and irregularities in the electronic and atomic patterns in a crystal and the effects of these on electrical and chemical properties.

See crystal; semiconductor; impurity.

"Solphenyl" [Novartis]. TM for fast-to-light direct dyes for cellulosic fibers.

solubility. The ability or tendency of one substance to blend uniformly with another, e.g., solid in liquid, liquid in liquid, gas in liquid, gas in gas. Solids vary from 0–100% in their degree of solubility in liquids, depending on the chemical nature of the substances; to the extent that they are soluble they lose their crystalline form and become molecularly or ionically dispersed in the solvent to form a true solution. Examples are sugar/water, salt/water. Liquids and gases are often said to be miscible with other liquids and gases rather than soluble. Thus nitrogen, oxygen, and carbon dioxide are freely miscible with each other and air is a solution (uniform mixture) of these gases.

The physical chemistry of solutions is an extremely complex mathematical subject in which the principles of electrolytic dissociation, diffusion, and thermodynamics play controlling parts. Raoult's law and Henry's law are also involved. See miscibility; solution, true.

soluble oil. An oil (also called emulsifying oil) that, when mixed with water, produces milky emulsions. In some soluble oils the emulsion is so fine that instead of milky solutions in water, amber-colored, transparent solutions are formed. Typical examples are sodium and potassium petroleum sulfonates.

Use: Metal-cutting lubricants, textile lubricants, metal-boring lubricants, emulsifying agents.

soluble starch. See starch, modified.

“Solulan” [Dow]. TM for an emulsifier and stabilizer emollient, solubilizer, or foam fortifier.

Use: In cold, cleansing or shave creams, lotions, mousses, soaps, and shampoos.

solute. One or more substances dissolved in another substance, called the solvent; the solute is uniformly dispersed in the solvent in the form of either molecules (sugar) or ions (salt), the resulting mixture is a solution.

See solution, true; solvent.

solution, colloidal. A liquid colloidal dispersion is often called a solution. Since colloidal particles are larger than molecules it is strictly incorrect to call such dispersions solutions; however, this term is widely used in the literature.

Note: Wolfgang Ostwald stated, “There are no sharp differences between mechanical suspensions, colloidal solutions, and molecular [true] solutions. There is a gradual and continuous transition from the first through the second to the third.”

See colloid chemistry.

solution hybridization. A method closely related to RNase protection (see “RNase protection assay”). Solution hybridization is designed to measure the levels of a specific mRNA species in a complex population of RNA. An excess of radioac-

tive probe is allowed to hybridize to the RNA, then single-strand specific nuclease is used to destroy the remaining unhybridized probe and RNA. The “protected” probe is separated from the degraded fragments, and the amount of radioactivity in it is proportional to the amount of mRNA in the sample which was capable of hybridization. This can be a very sensitive detection method.

solution, true. A uniformly dispersed mixture at the molecular or ionic level, of one or more substances (the solute) in one or more other substances (the solvent). These two parts of a solution are called phases.

Common types are:

liquid-liquid: alcohol-water

solid-liquid: salt-water

solid-solid: carbon-iron

Solutions that exhibit no change of internal energy on mixing and complete uniformity of cohesive forces are called *ideal*; their behavior is described by Raoult's law. Solutions are involved in most chemical reactions, refining and purification, industrial processing, and biological phenomena.

The proportion of substances in a solution depends on their limits of solution. The solubility of one substance in another is the maximum amount that can be dissolved at a given temperature and pressure. A solution containing such a maximum amount is *saturated*. A state of supersaturation can be created, but such solutions are unstable and may precipitate spontaneously.

solutrope. A ternary mixture having two liquid phases between which one component is distributed in an apparent ratio varying with concentration from less than 1 to greater than 1. In other words, the solute may be selectively dissolved in one or the other of the phases or solvents, depending on the concentration. This phenomenon has been compared to azeotropic behavior.

solvation. In the parlance of colloid chemistry, the adsorption of a microlayer or film of water or other solvent on individual dispersed particles of a solution or dispersion. The term *solvated hulls* has been used to describe such particles. It is also applied to the action of plasticizers on resin dispersions in plastisols.

See hydration (2).

Solvay process. (ammonia soda process).

Manufacture of sodium carbonate (soda ash, Na_2CO_3) from salt, ammonia, carbon dioxide, and limestone by an ingenious sequence of reactions involving recovery and reuse of practically all the ammonia and part of the carbon dioxide. Limestone is heated to produce lime and carbon dioxide. The latter is dissolved in water containing the ammonia and salt, with resultant precipitation of sodium bicarbonate. This is separated by filtration, dried, and

heated to form normal sodium carbonate. The liquor from the bicarbonate filtration is heated and treated with lime to regenerate the ammonia. Calcium chloride is a major by-product. *Note:* Because this process requires much energy and pollutes streams and rivers with chloride effluent, many plants using it have closed, production being obtained from the natural deposits in the western U.S.

"Solvenol" [Aqualon]. TM for a group of monocyclic terpene hydrocarbons with minor amounts of terpene alcohols and ketones.

Use: General solvent, rubber reclaiming.

solvent. A substance capable of dissolving another substance (solute) to form a uniformly dispersed mixture (solution) at the molecular or ionic size level. Solvents are either polar (high dielectric constant) or nonpolar (low dielectric constant). Water, the most common of all solvents, is strongly polar (dielectric constant 81), but hydrocarbon solvents are nonpolar. Aromatic hydrocarbons have higher solvent power than aliphatics (alcohols). Other organic solvent groups are esters, ethers, ketones, amines, and nitrated and chlorinated hydrocarbons. The chief uses of organic solvents are in the coatings field (paints, varnishes and lacquers), industrial cleaners, printing inks, extractive processes, and pharmaceuticals. Since many solvents are flammable and toxic to varying degrees, they contribute to air pollution and fire hazards. For this reason their use in coatings and cleaners has declined in recent years. See individual compounds.

solvent, aprotic. A solvent that cannot act as a proton acceptor or donor, i.e., as an acid or base.

solvent drying. Removal of water from metal surfaces by means of a solvent that displaces it preferentially, as on precision equipment, electronic components, etc. Examples of solvents used are acetone, 1,1,2-trichloro-1,2,2-trifluoroethane, 1,1,1-trichloroethane.

solvent dye. See dye, solvent.

solvent extraction. A separation operation that may involve three types of mixture: (1) a mixture composed of two or more solids, such as a metallic ore; (2) a mixture composed of a solid and a liquid; (3) a mixture of two or more liquids. One or more components of such mixture are removed (extracted) by exposing the mixture to the action of a solvent in which the component to be removed is soluble. If the mixture consists of two or more solids, extraction is performed by percolation of an appropriate solvent through it. This procedure is also called leaching, especially if the solvent is water; coffee making is an example. Synthetic fuels can be made from coal by extraction with a coal-derived solvent followed by hydrogenation.

In liquid-liquid extraction one or more components are removed from a liquid mixture by intimate contact with a second liquid that is itself nearly insoluble in the first liquid and dissolves the impurities and not the substance that is to be purified. In other cases the second liquid may dissolve, i.e., extract from the first liquid, the component that is to be purified, and leave associated impurities in the first liquid. Liquid-liquid extraction may be carried out by simply mixing the two liquids with agitation and then allowing them to separate by standing. It is often economical to use counter-current extraction, in which the two immiscible liquids are caused to flow past or through one another in opposite directions. Thus fine droplets of heavier liquid can be caused to pass downward through the lighter liquid in a vertical tube or tower.

The solvents used vary with the nature of the products involved. Widely used are water, hexane, acetone, isopropyl alcohol, furfural, xylene, liquid sulfur dioxide, and tributyl phosphate. Solvent extraction is an important method of both producing and purifying such products as lubricating and vegetable oils, pharmaceuticals, and nonferrous metals.

solvent, latent. (cosolvent). An organic liquid that will dissolve nitrocellulose in combination with an active solvent. Latent solvents are usually alcohols and are used widely in nitrocellulose lacquers in a ratio of 1 part alcohol to 2 parts active solvent.

solvent naphtha. See naphtha (2b).

Solvent Red 73. See 4',5'-diiodofluorescein.

solvent refining. See solvent extraction.

Solvent Yellow 3. See *o*-aminoazotoluene.

"Solvesso 100" [ExxonMobil].

CAS: 63231-51-6. TM for a solvent for active ingredients, typically in emulsifiable concentrates.

Hazard: Moderately toxic. A moderate skin and eye irritant.

Use: In agriculture applications; in coatings; as a solvent in architectural and industrial coatings applications.

solvolysis. A reaction involving substances in solvent, in which the solvent reacts with the dissolved substance (solute) to form a new substance. Intermediate compounds are usually formed in this process.

See hydrolysis.

soman. (methylphosphonofluoridic acid-1,2,2-trimethylpropylester).

CAS: 96-64-0. $(\text{CH}_3)_3\text{CCH}(\text{CH}_3)\text{OPF}(\text{O})\text{CH}_3$. A nerve gas.

Properties: Colorless liquid. Evolves odorless gas. Bp 167C, fp -70C, d 1.026 (20C).

Hazard: Highly toxic by ingestion, inhalation, and

skin absorption; may be fatal on short exposure; cholinesterase inhibitor; military nerve gas; fatal dose (man) 0.01 mg/kg.

somatic cell gene therapy. Incorporating new genetic material into cells for therapeutic purposes. The new genetic material cannot be passed to offspring.
See gene therapy.

somatic cell genetic mutation. (acquired mutations). A change in the genetic structure that is neither inherited nor passed to offspring.
See germ line genetic mutation.

somatic cells. Any cell in the body, except gametes and their precursors.
See gamete.

somatostatin-28 (sheep).
CAS: 73032-94-7. mf: $C_{137}H_{207}N_{41}O_{39}S_3$.
Hazard: A poison.

somatotropic hormone. (STH; somatotropin).
CAS: 9002-72-6. Hormone secreted by the anterior lobe of the pituitary. It causes an increase in general body growth and also affects carbohydrate and lipid metabolism.

Sommelet-Hauser rearrangement. Rearrangement of benzyl quaternary ammonium salts to *ortho*-substituted benzyldialkylamines on treatment with alkali metal amides.

Sommelet reaction. Preparation of aldehydes from aralkyl or alkyl halides by reaction with hexamethylenetetramine followed by mild hydrolysis of the formed quaternary salt.

Sonn-Muller method. Preparation of aromatic aldehydes from anilides by conversion of an acid anilide with phosphorus pentachloride to an imido chloride, reduction of the imido chloride with stannous chloride, and hydrolysis of the obtained anil.

sonolysis. The breaking up (molecular fragmentation) of molecules by ultrasonic radiation. Examples: sonolysis in pure water produces hydrogen atoms, hydroxyl radicals, molecular hydrogen, oxygen, and hydrogen peroxide; acetonitrile in an argon atmosphere produces molecular hydrogen, nitrogen, and methane.

“Sonowax” [Crompton & Knowles]. TM for a series of wax emulsions based on microcrystalline wax for use with resins or as a top finish on various textile fabrics.

sorb. See sorption.

sorbent. A substance that has a great capacity for absorbing moisture or other gas or fluid. A compound that absorbs, adsorbs, or entraps something.

sorbic acid. (2,4-hexadienoic acid).
CAS: 110-44-1. $CH_3CH:CHCH:CHCOOH$.
Properties: White, crystalline solid. Mp 134.5C, bp 228C (decomposes), 153C (50 mm Hg), flash p (OC) 260F (126C). Slightly soluble in water and many organic solvents. Combustible.

Derivation: Trimerization of acetaldehyde and catalytic air oxidation of the resulting hexadienal. Found in berries of mountain ash.

Grade: FCC, technical.

Use: Fungicide, food preservative (mold inhibitor), alkyd resin coatings, upgrading of drying oils, cold rubber additive, intermediate for plasticizers and lubricants.

sorbide. (dianhydrosorbitol). $C_6H_8O_2(OH)_2$.
Generic name for anhydrides (dicyclic ether dihydric alcohols) derivable from sorbitol by removal of two molecules of water. The name is also applied to specific commercial varieties.

sorbitan. (monoanhydrosorbitol; sorbitol anhydride). $C_6H_8O(OH)_4$. Generic name for anhydrides (cyclic ether tetrahydric alcohols) derivable from sorbitol by removal of one molecule of water.

sorbitan fatty acid esters. Mixture of partial esters of sorbitol and its anhydrides with fatty acids.
Properties: Sorbitan monolaurate and sorbitan monooleate are amber liquids; sorbitan monostearate, sorbitan monopalmitate, and sorbitan tristearate are cream-colored, waxy solids with slight odor and bland taste; d of both liquid and solid esters is about 1.0 (25C), mp of solid esters is 54C; they are insoluble in water, somewhat soluble in organic solvents. Combustible.

Derivation: Esterification of sorbitol with fatty acids.

Grade: Technical, FCC (for sorbitan monostearate).

Use: Emulsifiers and stabilizers in foods, cosmetics, drugs, textiles; plastics, agricultural chemicals.
See polysorbate.

sorbitol. (*d*-sorbite; *d*-sorbitol; hexahydric alcohol).
CAS: 50-70-4. $C_6H_8(OH)_6$.

Properties: White, odorless, crystalline powder; hygroscopic; faint sweet taste. D 1.47 (–5C), mp (metastable form) 93C, (stable form) 97.5C. Soluble in water, glycerol, and propylene glycol; slightly soluble in methanol, ethanol, acetic acid, phenol, and acetamide; almost insoluble in most other organic solvents. Approved by FDA for food use.

Derivation: By pressure hydrogenation of dextrose with nickel catalyst. Occurs in small amounts in various fruits and berries.

Grade: Crystals, technical, 70% aqueous solution (USP), resin, powder, FCC (solid and solution).

Use: Ascorbic acid fermentation; in solution form for moisture-conditioning of cosmetic creams and lotions, toothpaste, tobacco, gelatin; bodying agent for paper, textiles, and liquid pharmaceuticals; softener for candy; sugar crystallization inhibitor; surfactants; urethane resins and rigid foams; plasticizer, stabilizer for vinyl resins; food additive (sweetener, humectant, emulsifier, thickener, anticaking agent); dietary supplement.

sorbitol anhydride. See sorbitan.

“Sorbo-Cel” [World Minerals]. TM for a chemical-coated diatomite filter aid used for selectively removing traces of oil from oil-in-water emulsions. Effective for removing other trace components free of emulsified systems.

Use: Conditioning of boiler-feed water.

L(-)-sorbose.

CAS: 87-79-6. $\text{HOCH}_2\text{CO}(\text{CH}_2\text{O})_3\text{CH}_2\text{OH}$.

Properties: White, crystalline powder; sweet taste. Mp 165C. Soluble in water; almost insoluble in organic solvents. Combustible.

Derivation: From sorbitol by submerged culture aerobic fermentation.

Grade: Technical, reagent.

Use: Manufacture of ascorbic acid (vitamin C), preparation of special diets, and media for the study of metabolism in animals and microorganisms.

Sorel cement. See magnesium oxychloride cement.

Soret effect. The difference in concentration in different parts of a solution when these parts are at different temperatures.

sorghum. A cereal plant cultivated in the temperate zones; its stems are rich in sucrose and can be processed in much the same way as sugarcane and used as a source of sugar and syrups. In the U.S. it is grown in the Midwest and in Texas.

sorption. A surface phenomenon that may be either absorption or adsorption, or a combination of the two. The term is often used when the specific mechanism is not known.

sorrel salt. See potassium binoxalate.

SOS response. In bacteria, a coordinated induction of a variety of genes as a response to high levels of DNA damage.

sour. (1) Any substance used in textile or laundry operations to neutralize residual alkali or decompose residual hypochlorite bleach. The commonly used sour is sodium bifluoride and sodium fluosilicate. (2) Contaminated with sulfur compounds, e.g., gasoline or natural gas. (3) Taste characteristic

of an acidic or fermented substance. See doctor treatment.

sour dip. An acid solution of Epsom salts and fermenting corn sugar.

sour gas. A natural gas containing 30 grains or more of sulfur in the form of hydrogen sulfide and mercaptans. A by-product of gas and oil refining.

sour mash. An unmalted cereal cooked with the spent liquor of a previously dealcoholized mash resulting from the manufacture of whiskey.

Southern blot. A technique for analyzing mixtures of DNA whereby the presence and rough size of one particular fragment of DNA can be ascertained. Named for its inventor, Dr. E. M. Southern. See blotting.

soybean flour. A fine-ground powder having a particle size of 100 mesh or less, made by steaming soybeans to inactive enzymes, followed by removal of hulls and mechanical grinding. It contains 40–50% protein, about 20% fat, and 5% moisture. Defatted flours are made by extraction with hexane to remove the oil. The flakes produced are used chiefly for animal feeds but the full-fat flour has become an increasingly important factor in high-protein food products, especially textured proteins and meat analogs.

soybean lectin.

CAS: 90320-57-3.

Hazard: Moderately toxic.

Source: Natural product.

soybean meal. The crushed residue from the extraction of soybeans. Extraction by the hydraulic or expeller process produces normally a meal with 6% residual oils, while the solvent process yields meal with 1% residual oil. Typical analysis; crude protein 43%, crude fiber 5.5%, nitrogen-free extract 30%, ash 6%, oil content 1–6%. Total digestible nutrients about 75%.

Use: Animal feeds, adhesives, medium for bacitracin production.

soybean oil. (soya bean oil; chinese bean oil; soy oil).

Properties: Pale yellow, fixed drying oil. D 0.924–0.929, mp 22–31C, refr index 1.4760–1.4775, solidifying p –15 to –8C, Hehner value 94–96, saponification value 190–193, iodine value 137–143, flash p 540F (282C), autoign temp 833F (445C), moderate spontaneous heating. Soluble in alcohol, ether, chloroform, and carbon disulfide. Combustible.

Use: Soap manufacture, high-protein foods, paints and varnishes, cattle feeds, margarine and salad dressings, printing inks, source of nylon 9, plasticizer (epoxidized), alkyd resins. *Note:* Soybean oil is

the most widely used vegetable oil for both edible and industrial use in the U.S.

soybean oil (unhydrogenated).

Properties: From the seed of the legume *Glycine max.* Amber-colored oil.

Use: Food additive.

soy protein, isolated.

Use: Food additive.

S Soxhlet extractor. A laboratory apparatus consisting of a glass flask and condensing unit used for continuous reflux extraction of alcohol- or ether-soluble components of food products. Named after its inventor, a German chemist.

space, chemistry in. Experiments carried out on the space shuttle in the early 1980s indicate that unique types of chemical reactions occur in outer space, and that actual products may result that are not achievable under the terrestrial environment. Several factors are believed to account for this, primarily zero gravity, though absence of oxygen and enhanced magnetic effects may also play a part. Several encouraging results have already been obtained, though until further experiments and operating data have been investigated, the conclusions must be considered tentative. Among projects that have been carried out or are contemplated are the following: (1) Uniform polymer microspheres that are over twice as large as possible on earth have been made due to zero gravity. (2) More effective electrophoresis reactions for making biological materials have been discovered, probably also because of zero gravity. (3) Possibilities exist for (a) making unique alloys in space that are not possible on earth, for example lead-copper, lead-zinc, and aluminum-indium; (b) purer crystals for microelectronics; (c) better glass for fiber optics; (d) new drugs and pharmaceuticals. Future experiments will involve human cells, enzymes, and hormones.

“Spacerite” [ALCOA]. $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$. TM for a spacer pigment of titanium dioxide in coatings and inks.

Properties: White powder.

space velocity. The volume of gas or liquid, measured at specified temperature and pressure (usually standard conditions) passing through unit volume in unit time.

Use: Comparing flow processes involving different conditions, rates of flow, and sizes or shapes of containers.

spalling. Chipping an ore for crushing or the cracking, breaking, or splintering of materials due to heat.

spandex. Generic name for a fiber in which the fiber-forming substance is a long-chain synthetic

polymer composed of at least 85% of a segmented polyurethane (Federal Trade Commission). Imparts elasticity to garments such as girdles, socks, special hosiery.

Spanish white. (1) Chalk, CaCO_3 . (2) Bismuth white, $\text{BiO}(\text{NO}_3)$, basic bismuth white.

spar. (1) A type of crystalline material such as Iceland spar or feldspar, usually containing calcium carbonate or an aluminum silicate; fluorspar is calcium fluoride. Iceland spar has unique optical properties. (2) A weather-resistant varnish originally used for coating wooden spars of sailing ships, which may be the reason for its name.
See spar varnish.

sparger. A perforated pipe through which steam, air, or water is sprayed into a liquid during a fermentation reaction.

Use: Brewing industry to remove traces of wort from the mash.

spar, Greenland. See cryolite.

spar, heavy. See barite.

spar, Iceland. See calcite.

sparkling metal. See pyrophoric alloy.

“Sparkolloid” [Scott]. TM for a fining agent for wine making derived from seaweed.

Use: To remove negatively charged particles.

spar, satin. See calcite; gypsum.

spar varnish. A durable, water-resistant varnish for severe service on exterior exposure. It consists of one or more drying oils (linseed, tung, or dehydrated castor oil), one or more resins (rosin, ester gum, phenolic resin, or modified phenolic resin), one or more volatile thinners (turpentine or petroleum spirits), and driers (linoleates, resinates, or naphthenates of lead, manganese, and cobalt). It is classed as a long-oil varnish and generally consists of 45–50 gals of oil for each 100 lb of resin.
See varnish.

SPE. Abbreviation for Society of Plastics Engineers.

spearmint oil. A yellowish essential oil, strongly levorotatory.

Use: Source of carvone and as flavoring for medicines, chewing gum, etc.

special pairs. Antenna molecules which have associated with them proteins required for the initial separation of charge during photosynthesis.

specific activity. (1) The activity of a radioelement per unit weight of the element. (2) The activity per unit mass of a pure radionuclide.

specific gravity. The ratio of the density of a substance to the density of a reference substance; it is an abstract number that is unrelated to any units. For solids and liquids, specific gravity is numerically equal to density, but for gases it is not, because of the difference between the densities of the reference substances, which are usually water (1 g/cc) for solids and liquids and air (0.00129 g/cc, or 1.29 g/L at 0C and 760 mm Hg) for gases. The specific gravity of a gas is the ratio of its density to that of air; since the *specific gravity* of air = 1.0 (1.29/1.29), this is usually stated to indicate the comparison with the gas under consideration. For example, the density of hydrogen is 0.089 g/L but its specific gravity is 0.069 (i.e., 0.089/1.29). The specific gravity of solids and liquids is the ratio of their density to that of water at 4C, taken as 1.0, as 1 cc of water weighs 1 gram. Thus, a solid or liquid with a density of 1.5 g/cc has a specific gravity of 1.5/1 or 1.5. Since weights of liquids and gases vary with temperature, it is necessary to specify both temperatures involved, except for rough or approximate values. Thus, the specific gravity of alcohol should be given as 0.7893 at 20/4C, the first temperature referring to the alcohol and the latter to the water. At 15.56C the specific gravity of alcohol is 0.816. See density; API gravity; Baumé.

specification. A schedule of minimum performance requirements for specialized products such as those established by the various committees of the American Society for Testing and Materials and the Underwriters Laboratories. Such products are subject to inspection and test before acceptance. See testing.

specific heat. The ratio of the heat capacity of a substance to the heat capacity of water, or the quantity of heat required for a 1 degree temperature change in a unit weight of material. Commonly expressed in Btu/lb/degree F or in cal/g/degree. For gas, the specific heat at constant pressure is greater than that at constant volume by the amount of heat needed for expansion.

specificity. The ability of an enzyme or receptor to discriminate among competing substrates or ligands.

specific rotation. The rotation, in degrees, of the plane of plane-polarized light (D-line of sodium) by an optically active compound at 25C, with a specified concentration and light path.

specific susceptibility. See mass susceptibility.

specific volume. The volume of unit weight of a substance, as cubic feet per pound or gallons per pound, but more frequently milliliters per gram. The reciprocal of density.

specific weight. The weight per unit volume of a substance.

“Spectra Flo” [Ferro]. TM for liquid colorants for thermoplastics,

Use: Colorants compatible with polyolefins, styrenics, and engineering resins.

spectral karyotype (SKY). A graphic of all of the chromosomes of an organism, each labeled with a different color. Useful for identifying chromosomal abnormalities.

See chromosome.

spectrophotometry. See absorption spectroscopy.

spectroquality. A specially prepared chemical of higher purity than those generally available for spectrophotometric use.

spectroscopy. (instrumental analysis). A branch of analytical chemistry devoted to identification of elements and elucidation of atomic and molecular structure by measurement of the radiant energy absorbed or emitted by a substance in any of the wavelengths of the electromagnetic spectrum in response to excitation by an external energy source. The types of absorption and emission spectroscopy are usually identified by the wavelength involved, namely, γ -ray, X ray, UV, visible, infrared, microwave, and radiofrequency. The technique of spectroscopic analysis was originated by Fraunhofer who in 1814 discovered certain dark (D) lines in the solar spectrum, which were later identified as characterizing the element sodium. In 1861 Kirchhoff and Bunsen produced emission spectra and showed their relationship to Fraunhofer lines. X-ray spectroscopy was utilized by Moseley (1912) to determine the precise location of elements in the periodic system. Since then, a number of sophisticated and highly specialized techniques have been developed including Raman spectroscopy, nuclear magnetic resonance, nuclear quadrupole resonance, dynamic reflectance spectroscopy, laser, microwave, and γ -ray spectroscopy, and electron paramagnetic resonance.

spectrum. The radiant energy emitted by a substance as a characteristic band of wavelengths by which it can be identified.

See radiation; spectroscopy.

speculum metal. (1) 66% copper, 34% tin with trace of arsenic; (2) 64% copper, 32% tin, 4% nickel.

Properties: D 8.6, mp 750C.

Use: For mirrors for reflecting telescopes.

spelter. Relatively pure zinc as encountered in industrial operations such as galvanizing. Lead and/or iron are common impurities.

spent mixed acid. Mixed acid that has given up part of its nitric acid.

Hazard: Dangerous fire risk. Strong irritant to tissue.

spent oxide. See iron sponge, spent.

Sperry process. An electrolytic process for the manufacture of lead carbonate, basic (white lead) from desilverized lead containing some bismuth. The impure lead forms the anode. A diaphragm separates anode and cathode compartments, and carbon dioxide is passed into the solution. Impurities, including bismuth, remain on the anode as a slime blanket.

sphalerite. (blende, zinc blende). ZnS . Natural zinc sulfide, usually containing some cadmium, iron, and manganese.

Properties: Color yellow, brown, black, or red; luster resinous. Hardness 3.5–4, d 3.9–4.1, good cleavage. Soluble in hydrochloric acid.

Occurrence: Missouri, Kansas, Oklahoma, Colorado, Montana, Wisconsin, Idaho, Australia, Canada, Mexico.

Use: Most important ore of zinc, also a source of cadmium; phosphor; source of sulfur dioxide for production of sulfuric acid.

sphingolipid. An amphipathic lipid with a sphingosine backbone to which are attached a long-chain fatty acid (at the nitrogen) and a polar alcohol.

sphingomyelin. Diaminophosphatides occurring primarily in nervous tissue and containing a fatty acid, phosphoric acid, choline, and sphingosine. They are soluble in hot absolute alcohol and insoluble in ether, acetone, and water.

sphingosine. (1,3-dihydroxy-2-amino-4-octadecene). $CH_3(CH_2)_{12}CH:CHCH_2OCH(NH_2)CH_2OH$. Forms part of certain phosphatides, such as cerebro-sides and sphingomyelins.

Properties: Waxy crystals. Mp 67°C. Soluble in ether.

SPI. Abbreviation for Society of the Plastics Industry.

spider. (1) A component of the ejector mechanism of a compression molding press. (2) A supporting device used in the die assembly of an extrusion machine.

spin coupling. (spin-spin interaction). The interaction of fields through electron spins.

spindle oil. Low-viscosity lubricating oil for textile and other high-speed machinery.

spinel. $MgAl_2O_4$. A natural oxide of magnesium and aluminum with replacement of magnesium by iron, zinc, and manganese and of aluminum by iron and chromium. There are also synthetic spinels, e.g., as magnesia-alumina or magnesia-chromia. Their structure is similar to ferrites.

Properties: Color, various shades of red, grading to green, brown, and black; luster vitreous. Hardness 8. There are many varieties.

Occurrence: New York, New Jersey, Massachusetts, Virginia, North Carolina, Ceylon, Thailand, Mozambique.

Use: Crystallography; synthetic spinel is used as a refractory and in electronic applications.

spin moment. The rotational moment of the momentum of an electron about its axis.

spinnerette. An extrusion device shaped somewhat like a thimble and containing a number of holes of exceedingly small diameter through which are forced solutions of viscose rayon, nylon, molten glass, and various other materials. It is made of precious metals such as gold or platinum. Spinnerets enable extrusion of filaments of one denier or less, one-denier filament has a diameter of 40 μm . For commercial work 12 to 15 denier fiber is generally used.

See denier.

spinosad.

Properties: Isolated from *Saccharopolyspora spinosa* (Actinomycetes)

CAS: 168316-95-8. mf: $C_{41}H_{65}NO_{10} \bullet C_{42}H_{67}NO_{10}$.

Hazard: A poison by inhalation. Moderately toxic by ingestion.

Use: Agricultural chemical.

spin resonance. (ESR). The spin state where electrons go from the lower to the upper energy level.

spin-spin interaction. See spin coupling.

spin state. Orientations, in a strong magnetic field, of an unpaired electron either parallel or antiparallel to the field direction.

“Spiralloy” [Aqualon]. TM for glass- and other filament-wound, resin-bonded internal and external pressure vessels.

Use: Rocket motor cases, underwater and space structures, pressure vessels, radomes, torpedo cases, booms, and tubes.

spirits. An obsolescent and ambiguous term usually taken to mean the distilled essence of a substance. Mineral or petroleum spirits is a volatile hydrocarbon distillate similar to naphtha; in pharmacy, the term refers to an alcoholic solution of volatile principles, e.g., spirits of ammonia, niter,

camphor, etc.
See tincture.

spiro(1,3-benzodioxole-2,1'-cyclohexan)-4-ol, methylcarbamate.

CAS: 22791-18-0. mf: $C_{14}H_{17}NO_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

spirobiindane.

CAS: 1568-80-5. mf: $C_{21}H_{24}O_2$.

Hazard: Low toxicity by ingestion and skin contact. A mild eye irritant.

spirochete. A type of bacteria characterized by a spiral shape; the infective organism of syphilis.

spirocyclane. See spiropentane.

spironolactone. (17-hydroxy-7- α -mercapto-3-oxo-17- α -pregn-4-ene-21-carboxylic acid- γ -lactone-7-acetate).

CAS: 52-01-7. $C_{24}H_{32}O_8S$.

Properties: Light-cream-colored to light-tan, crystalline powder; mild mercaptan-like odor. Mp 198–207C (decomposes). Stable in air. Practically insoluble in water; soluble in ethyl acetate and ethanol; slightly soluble in methanol.

Grade: USP.

Use: Medicine (diuretic).

spiropentane. (spirocyclane; cyclopropanespirocyclopropane).

Properties: Colorless liquid. Refr index 1.41220 (20C), d 0.7551 (20/4C), fp -107.05C, bp 39.03C.

Derivation: Heating pentaerythrityl tetrabromide in ethanol with zinc dust.

spiro system. A structural formula consisting of two rings having one carbon atom in common. Most bicyclic compounds such as naphthalene have two carbons in common.

See spiropentane.

splice site. Location in the DNA sequence where RNA removes the noncoding areas to form a continuous gene transcript for translation into a protein.

spodumene. $LiAl(SiO_3)_2$.

Properties: White, pale-green, emerald-green, pink, or purple mineral; white streak; vitreous luster. Contains up to 8% lithium oxide with some replacement by sodium. D 3.13–3.20, Mohs hardness 6.5–7. Insoluble in acids.

Occurrence: U.S. (North Carolina, California, Massachusetts, South Dakota), Brazil, Mozambique.

Use: Source of lithium, in ceramics and glass as a source of lithia and alumina.

sponge. (1) Metal: a finely divided and porous form of metal such as iron, platinum, or titanium. May be used in sponge form as a catalyst or pressed into metal ingots. (2) Plastic: cellular plastic, foam, rubber sponge. (3) Natural: siliceous cells of the Porifera group of sessile sea animals.

sponge iron. See iron sponge.

sponge, iron. (iron, sponge). High-purity, finely divided (dust) of very reactive, unstable metallic iron (Fe0). Made by reducing an iron oxide at such low temperatures that melting does not occur, usually by mixing iron oxide and coke and applying limited increase in temperature.

Hazard: Because of its highly reactive nature, sponge iron is subject to a variety of packaging and shipping restrictions.

spontaneous combustion. See combustion.

sporadic cancer. Cancer that occurs randomly and is not inherited from parents. Caused by DNA changes in one cell that grows and divides, spreading throughout the body.

See hereditary cancer.

spore. A single cell that is dispersed as a reproductive unit, or that encapsulates a cell during unfavorable environmental conditions; in organisms with an alternation of generations.

sporophyte. The diploid stage in the life cycle of an organism undergoing an alternation of generations. The sporophyte is multicellular and develops from a zygote. The mature sporophyte meiotically produces haploid spores that later generate the gametophyte generation.

spot test. Microchemical or semimicrochemical drop test for chemical compounds, ions, or radicals using sensitive chemical reactions.

spray drying. Drying solids by spraying solutions of them into a heated chamber.

sprue. (1) The main feed channel that runs from the outer face of an injection mold to the gate in a single-cavity mold or to the runners of a multiple-cavity mold. The liquid polymer is forced through this orifice from a nozzle till the mold is filled to capacity. Some polymer remains in the sprue after the mold is closed, leaving a projecting piece that must be removed after the product is ejected. The viscosity of the polymer must be low enough to permit it to pass through the sprue readily.

(2) A disease attacking the digestive organs as a result of inadequate nutrition, especially in tropical areas.

spun protein. See protein, textured.

sputtered coating. A protective metallic coating applied in a vacuum tube and consisting of metal ions emanating from a cathode and deposited as a film on objects within the tube. The process involves three phases: generation of metal vapor, diffusion of the vapor, and its condensation. Paper, plastics, and similar materials can be coated in this way.

squalane. (perhydrosqualene; 2,6,10,15,19,23-hexamethyltetracosane; spinacane; dodecahydrosqualane).

CAS: 111-01-3. $C_{30}H_{62}$. A saturated hydrocarbon.

Properties: Colorless liquid; odorless; tasteless. D 0.805–0.812 (20C), bp 350C, fp –38C, refr index 1.4520–1.4525 (20C). Miscible with vegetable and mineral oils; organic solvents, and lipophilic substances. Nondrying, nonoxidizing, noncongealing. Combustible.

Derivation: Hydrogenation of squalene, may occur naturally in sebum.

Use: High-grade lubricating oil, vehicle for externally applied pharmaceuticals and cosmetics, perfume fixative, gas chromatographic analysis, transformer oil.

squalene. (spinacene).

CAS: 111-02-4. 2,6,10,15,19,23-hexamethyl-2,6,10,14,18,22-tetracosahexaene) $C_{30}H_{50}$. A natural raw material found in human sebum (5%) and in shark-liver oil. An unsaturated aliphatic hydrocarbon (carotenoid) with six unconjugated double bonds.

Properties: Oil with faint odor. D 0.858–0.860 (20C), bp 285C (25 mm Hg), fp –60C, refr index 1.49–1.50, iodine no 360–380, saponification value 0–5. Insoluble in water; slightly soluble in alcohol; soluble in lipids and organic solvents. Combustible.

Grade: 90% min.

Use: Biochemical and pharmaceutical research, a precursor of cholesterol in biosynthesis, chemical intermediate.

squeegee oil. A liquid vehicle to mix with colors, that burns off completely on firing ceramics coated with it.

squib. A thin tube filled with black powder to form a slow-burning fuse to fire an explosive.

squirrel-cage disintegrator. See cage mill.

Sr. Symbol for strontium.

“SR1” [Sunburst]. TM for an oil based formula for removing oil based stains.

“SR2” [Sunburst]. TM for a general purpose spotter for a broad spectrum of stains.

“SR3” [Sunburst]. TM for a concentrated product for removing rust and iron stains.

SRF black. Abbreviation for semireinforcing furnace black.
See furnace black.

SS acid. See Chicago acid.

SSR. Simple Sequence Repeat.
See: Microsatellite.

“STAB2335” [Ashai Denka]. TM for a line of organic and inorganic industrial chemicals, synthetic resins, synthetic rubber, high-compound fertilizers, coating materials, latexes, pharmaceutical and food additives, explosives, photopolymers and platemaking systems, separation and ion-exchange membranes, systems, and equipment.

“Stabaxol P” [Rhein].

CAS: 159654-97-4. mf: $(C_{17}H_{22}N_2O_2 \bullet C_{14}H_{16}N_2O_2)_x$

Hazard: A poison. Moderately toxic by ingestion and inhalation.

Use: Hydrolysis protection.

“Stabil-9” [Solutia]. TM for sodium aluminum phosphate.

Grade: Powder.

Use: Primarily in self-rising flours.

“Stabileze” [International Specialty]. TM for chemical used as thickner and stabilizer for polymers.

“Stabilide” [Mallinckrodt]. TM for potassium iodide stabilized with calcium stearate.

Use: Animal feeds.

“Stabilisal C-1” [AKZO]. TM for an organic compound.

Use: An antigellation agent for nitrocellulose-based bronzing lacquers and for stabilizing dipping lacquers.

stabilizer. Any substance that tends to keep a compound, mixture, or solution from changing its form or chemical nature. Stabilizers may retard a reaction rate, preserve a chemical equilibrium, act as antioxidants, keep pigments and other components in emulsion form, or prevent the particles in a colloidal suspension from precipitating.

See inhibitor.

stable transfection. A form of transfection experiment designed to produce permanent lines of cultured cells with a new gene inserted into their genome. Usually this is done by linking the desired gene with a "selectable" gene, i.e. a gene which confers resistance to a toxin. Upon putting the toxin into the culture medium, only those cells which incorporate the resistance gene will survive, and essentially all of those will also have incorporated the experimenter's gene.

Staedel-Rugheimer pyrazine synthesis.

Formation of pyrazines by high-temperature autoclave reaction of α -halogenomethyl ketones with ammonia.

"Staflex Noda" [Bayer]. TM for *n*-octyl-*n*-decyl adipate.

Properties: Liquid

Use: For electrical properties for outdoor wire and cable applications. In vinyls, combines good heat and light stability with high compatibility.

stain. (1) An organic protective coating similar to a paint, but with much lower solids content (pigment loading).

Use: Exterior and interior coating of wood, furniture, flooring, etc.

(2) Any compound used to color bacteria for microscopic examination, e.g., osmium tetroxide, phosphotungstic acid, uranyl acetate, and certain chromium compounds.

stainless steel. See steel, stainless.

standard cell. See Weston cell.

standard free-energy change. The free-energy change for a reaction occurring under a set of standard conditions: temperature, 298 K, pressure, 1 atm, and all solutes at 1 M concentration.

standard solution. A solution of a specifically known concentration used in volumetric analysis.

Stanley, Wendell M. (1904–1971). An American biochemist who won the Nobel Prize for chemistry in 1946 along with Northrop and Sumner. His work on virus research resulted in isolation of crystals proving the virus to be proteinaceous. In the 1930s, he was concerned with isolating nucleic acid from crystallized virus, and the reproduction of influenza virus. His doctorate was from the University of Illinois. His many accomplishments included membership in the National Advisory Cancer Council of the United States Public Health Service in the 1950s.

stannic. The designation for quadrivalent tin or compounds containing quadrivalent tin.

stannic acid. See stannic oxide.

stannic anhydride. See stannic oxide.

stannic bromide. (tin bromide; tin tetrabromide).

CAS: 7789-67-5. SnBr_4 .

Properties: White, crystalline mass. Fumes when exposed to air. D 3.3, bp 203C, mp 31C. Soluble in water, alcohol, and carbon tetrachloride.

Hazard: Irritant to skin and eyes. TLV: 2 mg(Sn)/m³.

Use: Mineral separations.

stannic chloride. (tin chloride; tin tetrachloride; tin perchloride).

CAS: 7646-78-8. SnCl_4 . Often sold in the form of the double salt with sodium chloride: $\text{Na}_2\text{SnCl}_6 \cdot \text{H}_2\text{O}$.

Properties: Colorless, fuming, caustic liquid, that water converts into a crystalline solid, $\text{SnCl}_4 \cdot 5\text{H}_2\text{O}$. Keep well stoppered. D 2.2788, fp -33C, bp 114C. Soluble in cold water, alcohol, carbon disulfide; decomposed by hot water.

Derivation: Treatment of tin or stannous chloride with chlorine.

Grade: Technical, CP.

Hazard: Evolves heat on contact with moisture. Corrosive liquid. TLV: 2 mg(Sn)/m³.

Use: Electroconductive and electroluminescent coatings, mordant in dyeing textiles, perfume stabilization, manufacture of fuchsin, color lakes, ceramic coatings, bleaching agent for sugar, stabilizer for certain resins, manufacture of blueprint and other sensitized papers, other tin salts, bacteria and fungi control in soaps.

stannic chloride pentahydrate.

CAS: 10026-06-9. $\text{SnCl}_4 \cdot 5\text{H}_2\text{O}$.

Properties: White solid. Mp 56C. Soluble in water or alcohol.

Hazard: Toxic material. TLV: 2 mg(Sn)/m³.

Use: Substitute for anhydrous stannic chloride where the presence of water is not objectionable.

stannic chromate. (tin chromate). $\text{Sn}(\text{CrO}_4)_2$.

Properties: Brownish-yellow, crystalline powder. Partially soluble in water.

Derivation: Action of chromic acid on stannic hydroxide.

Hazard: Toxic material. TLV: 2 mg(Sn)/m³.

Use: Coloring porcelain and china.

stannic oxide. (stannic anhydride; tin peroxide; tin dioxide; stannic acid). SnO_2 or $\text{SnO}_2 \cdot x\text{H}_2\text{O}$.

Properties: White powder; anhydrous or containing variable amounts of water. D 6.6–6.9, mp 1127C, sublimes at 1800–1900C. Soluble in concentrated sulfuric acid, hydrochloric acid; insoluble in water. Noncombustible.

Derivation: (1) Found in nature as in the mineral cassiterite; (2) precipitated from stannic chloride solution by ammonium hydroxide.

Grade: White, pure; white; gray; CP.

Use: Tin salts; catalyst; ceramic glazes and colors;

putty; perfume preparations and cosmetics; textiles (mordant, weighting); polishing powder for steel, glass, etc.; manufacture of special glasses.

stannic phosphide. (tin phosphide).

CAS: 25324-56-5. Sn_2P_2 or SnP .

Properties: Silver-white, hard mass or lumps. D 6.56, mp forms Sn_3P_3 at 415C. Soluble in acids
Derivation: By heating together tin and phosphorus.
Hazard: Flammable, dangerous fire risk. TLV: 2 mg(Sn)/m³.

stannic sulfide. (artificial gold; mosaic gold; tin bronze; tin disulfide). SnS_2 .

Properties: Yellow to brown powder. D 4.42–4.60, mp decomposes at 600C. Soluble in concentrated hydrochloric acid and alkaline sulfides; insoluble in water.

Derivation: (1) Action of sulfur on a solution of stannic chloride; (2) by heating tin amalgam with sulfur and ammonium chloride, distilling off the mercury sulfide and ammonium chloride.

Grade: Technical, reagent.

Hazard: Irritant to skin and eyes. TLV: 2 mg(Sn)/m³.

Use: Imitation gilding, pigment.

“Stanno chlor” [ATOTECH].

CAS: 7772-99-8. TM for stannous chloride.

Use: For metalizing glass and plastic; catalyst in pharmaceuticals, resins, petrochemicals, solder, tanning agent, and food and beverage preservative.

stannous acetate. $\text{Sn}(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: Gray to yellow crystals. Mp 182C, d 2.30. Soluble in dilute hydrochloric acid.

Derivation: Refluxing stannous oxide with 50% acetic acid in an atmosphere of nitrogen.

Hazard: Toxic by ingestion.

Use: Reducing agent.

stannous bromide. (tin bromide; tin dibromide). SnBr_2 .

Properties: Yellow powder. D 5.117 (17C), bp 619C, mp 215C. Soluble in hydrochloric acid (dilute); soluble in water, alcohol, ether, and acetone; oxidizes and turns brown in air.

Hazard: Skin irritant. TLV: 2 mg(Sn)/m³.

stannous chloride. (tin crystals; tin salt; tin dichloride; tin protochloride).

CAS: 7772-99-8. (1) SnCl_2 , (2) $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline mass that absorbs oxygen from the air and is converted into the insoluble oxychloride. (1) D 3.95 (25/4C), mp 246.8C, bp 652C; (2) d 2.71, mp 37.7C, bp (decomposes). Soluble in water, alkalis, tartaric acid, and alcohol.

Derivation: By dissolving tin in hydrochloric acid.

Grade: Technical, CP, reagent, anhydrous, hydrated.

Hazard: Irritant to skin, use in foods restricted to 0.0015%, as tin. TLV: 2 mg(Sn)/m³.

Use: Reducing agent in manufacture of chemicals, intermediates, dyes, polymers, phosphors; manu-

facture of lakes; textiles (reducing agent in dyeing, discharge in printing); tin galvanizing; reagent in analytical chemistry; silvering mirrors; revivication of yeast shown in must (accelerator); antisludging agent for lubricating oils; food preservative; stabilizer for perfume in soaps; catalyst; soldering flux; sensitizing agent for glass, paper, plastics.

stannous chromate. (tin chromate). SnCrO_4 .

Properties: Brown powder. Almost insoluble in water.

Derivation: Interaction of stannous chloride and sodium chromate.

Hazard: Toxic material. TLV: 2 mg(Sn)/m³.

Use: Decorating porcelain.

stannous-2-ethylhexoate. (stannous octoate; tin octoate). $\text{Sn}(\text{C}_8\text{H}_{15}\text{O}_2)_2$.

Properties: Light-yellow liquid. D 1.25, Gardner color 3 (max). Insoluble in water, methanol; soluble in benzene, toluene, petroleum ether; hydrolyzed by acids and bases.

Hazard: Toxic material. TLV: 0.1 mg(Sn)/m³.

Use: Polymerization catalyst for urethane foams, lubricant, addition agent, stabilizer for transformer oils.

stannous fluoride. (tin fluoride; tin difluoride).

CAS: 7783-47-3. SnF_2 .

Properties: White, lustrous, crystalline powder; bitter, salty taste. Mp 212–214C. Practically insoluble in alcohol, ether, and chloroform; slightly soluble in water.

Grade: NF.

Hazard: Toxic by ingestion, strong irritant to skin and tissue. TLV: 2 mg(Sn)/m³.

Use: Fluoride source in toothpastes.

Note: Stannous hexafluorozirconate is said to be more effective than the fluoride in preventing dental caries.

stannous octoate. See stannous-2-ethylhexoate.

stannous oleate. (tin oleate).

CAS: 1912-84-1. $\text{Sn}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Light-yellow liquid. Insoluble in water and methanol; soluble in benzene, toluene, petroleum ether; hydrolyzed by acids and bases.

Hazard: Absorbed by skin. TLV: 0.1 mg(Sn)/m³.

Use: Polymerization catalyst, inhibitor.

stannous oxalate. (tin oxalate).

CAS: 814-94-8. SnC_2O_4 .

Properties: Heavy, white, crystalline powder. D 3.56, mp decomposes at 280C. Soluble in acids; insoluble in water and acetone.

Derivation: By the action of oxalic acid on stannous oxide.

Grade: Technical, CP, reagent.

Hazard: Absorbed by skin. TLV: 0.1 mg(Sn)/m³.

Use: Dyeing and printing textiles, catalyst for esterification reactions.

stannous oxide. (tin oxide; tin protoxide).
SnO.

Properties: Brownish-black powder. Unstable in air. Reacts with acids and strong bases. D 6.3, mp 1080C (600 mm Hg) (decomposes). Insoluble in water. A nuisance particulate.

Derivation: By heating stannous hydroxide in a current of carbon dioxide.

Grade: Technical, CP.

Use: Reducing agent, intermediate in preparation of stannous salts as used in plating and glass industries, pharmaceuticals, soft abrasive (putty powder).

stannous pyrophosphate. $\text{Sn}_2\text{P}_2\text{O}_7$.

Properties: White, free-flowing crystals. D 4.009 (16C). Insoluble in water.

Use: Toothpaste additive.

stannous stearate.

Use: Food additive.

stannous sulfate. (tin sulfate).

CAS: 7488-55-3. SnSO_4 .

Properties: Heavy white or yellowish crystals. Mp loses sulfur dioxide at 360C. Soluble in water and sulfuric acid; water solution decomposes rapidly.

Derivation: Action of sulfuric acid on stannous oxide.

Hazard: Toxic material. TLV: 2 mg(Sn)/m³.

Use: Dyeing; tin plating, particularly for plating automobile pistons and steel wire.

stannous sulfide. (tin monosulfide; tin proto-sulfide; tin sulfide). SnS .

Properties: Dark-gray or black, crystalline powder. D 5.080, bp 1230C, mp 880C. Soluble in concentrated hydrochloric acid (decomposes); insoluble in dilute acids and water.

Hazard: Toxic material. TLV: 2 mg(Sn)/m³.

Use: Making bearing material, catalyst in polymerization of hydrocarbons, analytical reagent.

stannous tartrate. (tin tartrate). $\text{SnC}_4\text{H}_4\text{O}_6$.

Properties: Heavy, white, crystalline powder. Soluble in water; dilute hydrochloric acid.

Derivation: Action of tartaric acid on stannous oxide.

Hazard: Toxic material. TLV: 0.1 mg(Sn)/m³.

Use: Dyeing and printing fabrics.

stannum. The Latin name for tin, hence the symbol Sn in chemical nomenclature.

staphylococcal enterotoxin b. See enterotoxin b, staphylococcal.

staple. A cotton fiber, usually in reference to length, i.e., short- or long-staple cotton.

starch.

CAS: 9005-25-8. A carbohydrate polymer having the following repeating unit:

It is composed of about 25% amylose (anhydroglucopyranose units joined by glucosidic bonds) and 75% amylopectin, a branched-chain structure.

Properties: White, amorphous, powder or granules; tasteless. Various crystalline forms may be obtained, including microcrystalline. Irreversible gel formation occurs in hot water; swelling of granules can be induced at room temperature with such compounds as formamide, formic acid, and strong bases and metallic salts.

Occurrence: Starch is a reserve polysaccharide in plants (corn, potatoes, tapioca, rice, and wheat are commercial sources).

Grade: Commercial, powdered, pearl, laundry, technical, reagent, edible, USP.

Hazard: TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Adhesive (gummed paper and tapes, cartons, bags, etc.), machine-coated paper, textile filler and sizing agent, beater additive in papermaking, gelling agent and thickener in food products (gravies, custards, confectionery), oil-well drilling fluids, filler in baking powders (cornstarch), fabric stiffener in laundering, urea-formaldehyde resin adhesives for particle board and fiberboard, explosives (nitro-starch), dextrin (starch gum), chelating and sequestering agent in foods, indicator in analytical chemistry, anticaking agent in sugar, face powders, adherent and mold release agent, polymer base.

See starch-based polymer.

starch-based polymer. (1) A reactive polyol derived from a mixture of a starch with dibasic acids, hydrogen-donating compounds, and catalysts dissolved in water; the slurry is subjected to high temperatures and pressures, yielding a low-viscosity polymer in a 50% solids aqueous solution. A molecular rearrangement takes place, and the polymer formed is completely different from starch in structure and properties. It can be further reacted with acids, bases, and cross-linking agents. Suggested uses are in high-wet-strength papers, as binders in paper coatings, as moisture barriers in packaging, and as water-resistant adhesives.

(2) Yeast fermentation of starch to form a biodegradable plastic called "pullulan" (a trigluco polysaccharide) has been reported to be commercially feasible. See "Pullulan."

starch dialdehyde. Starch in which the original anhydroglucose units have been partially changed to dialdehyde form by oxidation, for example, the product of the oxidation of cornstarch by periodic acid. Available in cationic dispersions up to 15% solids for mixing with paper pulp.

Use: Thickening agent, tanning agent, binder for leaf tobacco, adhesives, wet-strength additive in paper.

starch-iodide paper. Indicator paper made by dipping paper in starch paste containing potassium iodide.

Use: To test for halogens and oxidizers such as hydrogen peroxide.

starch, modified. Any of several water-soluble polymers derived from a starch (corn, potato, tapioca) by acetylation, chlorination, acid hydrolysis, or enzymatic action. These reactions yield starch acetates, esters, and ethers in the form of stable and fluid solutions and films. Modified starches are used as textile-sizing agents and paper coatings. Thin-boiling starches have high gel strength, oxidized starches made with sodium hypochlorite have low gelling tendency. Introduction of carboxyl, sulfonate, or sulfate groups into starch gives sodium or ammonium salts of anionic starches, yielding clear, nongelling dispersions of high viscosity. Cationic starches result from addition of amino groups. The glucose units of starch can be cross-linked with such agents as formaldehyde, soluble metaphosphates, and epichlorohydrin; this increases viscosity and thickening power for adhesives, canned foods, etc.

starch phosphate. An ester made from the reaction of a mixture of orthophosphate salts (sodium dihydrogen phosphate and disodium hydrogen phosphate) with starch.

Properties: Soluble in cold water (unlike regular starch) and has high thickening power. Can be frozen and thawed repeatedly without change in physical properties.

Use: Thickener for frozen foods; taconite ore binder; in adhesives, drugs, cosmetics; substitute for arabic gum, locust bean gum, and carboxymethyl cellulose.

starch syrup. See glucose.

starch, thin-boiling. See starch, modified.

starch xanthate. A water-insoluble synthetic polysaccharide made by reacting starch with sodium hydroxide and carbon disulfide; biodegradable.

Use: To encapsulate pesticides; the coating, though insoluble, is permeable to water, thus slowly releasing the pesticide. Rubber-reinforcing agent.

starch xanthide. Starch xanthate that has been cross-linked with oxygen.

Use: Strengthening agent in paper and manufacture of powdered rubbers.

"Starfol Wax" [Sherex]. TM for synthetic spermaceti wax.

Available forms: Flakes.

Use: As a cosmetic emollient, drawing compounds, finishing aids, lubricants, and leather treatments.

Stark-Einstein law. Every molecule in a chemical reaction induced by exposure to light absorbs one quantum of the radiation causing the reaction.

Stark-Luneland effect. The polarization of light by a beam of moving atoms.

starter distillate.

Properties: Steam distillate of culture of *Streptococcus lactis* *S. cremoris*, *S. lactis* subsp. *diacetylactis*, *Leuconostoc citrovorum*, and *L. dextranicum*.

Use: Food additive.

"Starwax" 100 [Baker Petrolite]. TM for a hard, petroleum microcrystalline wax, minimum mp 82.2C.

"Sta-Tac" [Reichhold]. TM for olefinic hydrocarbon resins used as coating vehicles.

statistical mechanics. Statistical mechanics treats the detailed state of a system (its quantum state or, in classical models, its position in phase space) as unknown and subject to statistical uncertainties. Entropy is a measure of this uncertainty. Statistical mechanics describes the distribution of states in an equilibrium system at a given temperature (describing either the distribution of probabilities of quantum states or the probability density function in phase space), and can be used to derive thermodynamic properties from properties at the molecular level.

Staudinger, Hermann. (1881–1965). A German chemist, winner of a Nobel Prize in 1953 for his pioneer work on the structure of macromolecules and polymerization. A large part of modern high-polymer chemistry is based on his original research.

Staudinger reaction. Synthesis of phosphazo compounds by the reaction of tertiary phosphines with organic azides.

stavudine.

CAS: 3056-17-5. mf: C₁₀H₁₂N₂O₄.

Hazard: Moderately toxic by ingestion.

"Staybelite" [Aqualon]. TM for hydrogenated rosin, a pale, thermoplastic resin. Acid number 165, USDA color X, softening point 75C, saponification number 167.

Use: Adhesives and protective coatings.

“Stayrite” [*Crompton & Knowles*]. TM for stabilizers used to provide increased heat and light stability to vinyl resins. Available in range of products, both liquid and solid.

Stead’s reagent. A metallographic etching solution consisting of acidified copper chloride. It is useful in detecting phosphorous segregation in steel. Copper tends to deposit on parts of low phosphorous content.

steady state. A condition where properties of any part of a system are constant during a process.

steam. An allotropic form of water formed at 212F (100C) and having a latent heat of condensation of 540 calories per gram. It has a number of industrial uses, one of the most important being the production of hydrogen by the steam-hydrocarbon gas process (reforming), by the steam-water gas process, the steam-iron process, and the steam-methanol process. It is also used in steam cracking of gas oil and naphtha; in food processing; as a cleaning agent; in rubber vulcanization; as a source of heat and power; in distillation of plants for production of essential oils and perfumes; and in secondary oil recovery.

Steam from geothermal sources such as hot springs and fumaroles is utilized as an energy source. Steam for industrial processing is also being generated by solar energy techniques. See geothermal energy; latent heat.

steam distillation. See hydrodistillation.

steam reforming. See reforming.

steapsin. A lipase in the pancreatic juice. See enzyme.

stearamide. (octadecanamide).

CAS: 124-26-5. $\text{CH}_3(\text{CH}_2)_{16}\text{CONH}_2$.

Properties: Colorless leaflets. Mp 109C, bp 251C (12 mm Hg). Insoluble in water; slightly soluble in alcohol and ether.

Use: Corrosion inhibitor in oil wells.

stearato chromic chloride. A polynuclear complex in the form of a six-membered ring. The two chromium atoms are bridged on one side by a hydroxyl group, and on the other side by the carboxyl oxygens of the stearic acid. The water-soluble complex results from the neutralization of stearic acid with basic chromic chloride. It acts as a water repellent and adherent.

stearic acid. (*n*-octadecanoic acid).

CAS: 57-11-4. $\text{CH}_3(\text{CH}_2)_{16}\text{COOH}$. The most common fatty acid occurring in natural animal and vegetable fats. Most commercial stearic acid is 45% palmitic acid, 50% stearic acid and 5% oleic acid, but purer grades are increasingly used.

Properties: Colorless, waxlike solid; slight odor and taste suggesting tallow. D 0.8390 (80/4C), mp 69.6C, bp 361.1C, refr index 1.4299 (80C), flash p 385F (196C), autoign temp 743F (395C). Soluble in alcohol, ether, chloroform, carbon disulfide, carbon tetrachloride; insoluble in water. Combustible.

Derivation: (1) From high-grade tallows and yellow grease stearin by washing, hydrolysis with the Twitchell or similar reagent, boiling, distilling, cooling, and pressing; (2) from oleic acid by hydrogenation.

Grade: Saponified, distilled, single-pressed, double-pressed, triple-pressed, USP, FCC, 90% stearic with low oleic, grade free from chick edema factor, 99.8% pure.

Use: Chemicals, especially stearates and stearate drivers; lubricants; soaps; pharmaceuticals and cosmetics; accelerator activator; dispersing agent and softener in rubber compounds; shoe and metal polishes; coatings; food packaging; suppositories and ointments.

See “Hydrofol” [*Ashland*].

stearic acid potassium salt. See potassium stearate.

stearin. (tristearin; glyceryl tristearate).

$\text{C}_3\text{H}_5(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$.

Properties: Colorless crystals or powder; odorless; tasteless. Mp 71.6C, d 0.943 (65C). Insoluble in water; soluble in alcohol, chloroform, carbon disulfide. Combustible.

Derivation: Constituent of most fats.

Grade: Technical, also graded as to source.

Use: Soap, candles, candies, adhesive pastes, metal polishes, waterproofing paper, textile sizes, leather stuffing, manufacture of stearic acid.

stearin pitch. See fatty acid pitch.

stearone. An aliphatic ketone, insoluble in water, stable to high temperatures, acids, and alkalis; compatible with high-melting vegetable waxes, paraffins, and fatty acids; incompatible with resins, polymers and organic solvents at room temperature but compatible with them at high temperature. Combustible.

Use: Antiblocking agent.

N-stearoyl-p-aminophenol.

$\text{HO}(\text{C}_6\text{H}_4)\text{NHCOCH}_2(\text{CH}_2)_{15}\text{CH}_3$.

Properties: White to off-white powder. Mp 131–134C. Insoluble in water; soluble in polar organic solvents (especially when hot) such as alcohol, dioxane, acetone, and dimethylformamide. Combustible.

Use: Antioxidant.

stearoyl chloride. (*n*-octadecanoyl chloride).

$\text{CH}_3(\text{CH}_2)_{16}\text{COCl}$.

Properties: Mp 23C, bp 174–178C (2 mm Hg). Soluble in hydrocarbons and ethers. Combustible.

Use: Preparation of substituted amines and amides, acid anhydrides, esterification of alcohols, synthesis of other organic compounds.

stearoyl proplene glycol hydrogen succinate. See succistearin.

stearyl alcohol. (1-octadecanol; octadecyl alcohol).

CAS: 112-92-5. $\text{CH}_3(\text{CH}_2)_{16}\text{OH}$.

Properties: Unctuous, white flakes or granules; faint odor; bland taste. D 0.8124 (59/4C), bp 210.5C (15 mm Hg), mp 59C. Soluble in alcohol, acetone, and ether; insoluble in water. Combustible.

Derivation: Reduction of stearic acid.

Grade: Commercial, technical, USP.

Use: Perfumery, cosmetics, intermediate, surface active agents, lubricants, resins, antifoam agent.

stearyl citrate.

Use: Food additive.

stearyl-2-lactylic acid.

Use: Food additive.

stearyl mercaptan. (octadecyl mercaptan).

$\text{CH}_3(\text{CH}_2)_{17}\text{SH}$.

Properties: Solid. Mp 25C, bp 205–209C (11 mm Hg), d 0.8420 (25/4C), refr index 1.4591 (34C).

Grade: 95% (min) purity.

Hazard: Strong irritant.

Use: Organic intermediate, synthetic rubber processing.

stearyl methacrylate. Group name for $\text{CH}_2=\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_n\text{CH}_3$ ($n = 13$ to 17).

Properties: Bulk d 0.864 (25/15C), boiling range 310–370C.

Use: Monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, paper finishing.

stearyl monoglyceridyl citrate.

Properties: A soft, practically tasteless, off-white to tan, waxy solid having a lardlike consistency; insoluble in water, soluble in chloroform and ethylene glycol.

Derivation: Reaction of citric acid, monoglycerides of fatty acids (obtained by the glycerolysis of edible fats and oils or derived from fatty acids), and stearyl alcohol.

Grade: FCC.

Use: Emulsion stabilizer in foods (not over 0.15%).

steatite. A mixture of talc, clay, and alkaline-earth oxides.

Use: Chiefly as a ceramic insulator in electronic devices.

steel. An alloy of iron and 0.02–1.5% carbon; it is made from molten pig iron by oxidizing out the excess carbon and other impurities. The open-hearth

process, which uses air for this purpose, has been supplanted by the basic oxygen process in which pure oxygen is injected into molten iron. A small percentage of steel is also made in the electric furnace, with iron ore as oxidant. Low-carbon (mild) steels contain 0.02–0.3% carbon; medium-carbon grades from 0.3–0.7% carbon; and high-carbon grades 0.7–1.5%.

There are many special-purpose types of steel in which one or more alloying metals are used, with or without special heat treatment. The most common additives are chromium and nickel, as in the 18-8 stainless steels; these add greatly to corrosion resistance. High-speed and tool steels, designed primarily for efficient cutting, contain such alloying metals as tungsten, molybdenum, manganese, and vanadium as well as chromium. Cobalt and zirconium are used for construction steels.

Available forms: Rods, bars, sheet, strips, wire, wool.

Use: Construction, ship hulls, auto bodies, machinery and machine parts, cables, abrasive, chemical equipment, belts for tire reinforcement.

steel, stainless. Alloy steels containing high percentages of chromium, from less than 10% to more than 25%. There are three groups: (1) Austenitic, which contain both chromium (16% min) and nickel (7% min); a stress-corrosion resistant type contains 2% silicon. (2) Ferritic, which contain chromium only and cannot be hardened by heat treatment. (3) Martensitic, which contain chromium and can be hardened by heat treatment; these last are ferromagnetic. A subgroup of the martensitic steels comprises the precipitation-hardening types.

See SAE steel.

Steffen process. A process used in beet sugar manufacture to separate residual sugar from molasses. Based on the formation of insoluble tricalcium saccharate and its subsequent decomposition to sugar in the presence of a weak acid such as carbonic.

Steinbuhl yellow. See barium chromate.

stellarator. A type of torus developed for fusion research. It differs from tokamaks in respect to the method of confining the plasma.

See torus; fusion; tokamak.

stem cell. Undifferentiated, primitive cells in the bone marrow that have the ability to both multiply and to differentiate into specific blood cells.

stem group. All the taxa in a clade preceding a major cladogenesis event. They are often difficult to recognize because they may not possess synapomorphies found in the crown group.

Stengel process. A method of making ammonium nitrate fertilizer from anhydrous ammonia and

nitric acid. The fertilizer particles can be made in different sizes according to the use.

“Stepantan” [*Stepan*]. TM for an aqueous solution.

Use: As a drilling foamer base, fire fighting foam, and other foam-forming applications.

Stephen aldehyde synthesis. Preparation of aldehydes from nitriles by reduction with stannous chloride in ether saturated with hydrochloric acid. The intermediate aldimine salts have to be hydrolyzed. The best results are obtained in the aromatic series.

stereoblock polymer. A polymer whose molecule is made of comparatively long sections of identical stereospecific structure, these sections being separated from one another by segments of different structure, as for example, blocks of an isotactic polymer interspersed with blocks of the same polymer with a syndiotactic structure.

See polymer, stereospecific; block polymer.

stereochemistry. A subdiscipline of organic chemistry devoted to study of the three-dimensional spatial configurations of molecules. One aspect of the subject deals with stereoisomers—compounds that have identical chemical constitution, but differ as regards the arrangement of the atoms or groups in space. Stereoisomers fall into two broad classes: optical isomers and geometric (*cis-trans*) isomers. Another aspect of stereochemistry concerns control of the molecular configuration of high-polymer substances by use of appropriate (stereospecific) catalysts.

See optical isomer; enantiomer; asymmetry; polymer, stereospecific; Ziegler catalyst; geometric isomer.

stereoisomer. See stereochemistry.

“Stereon” [*Firestone*]. TM for styrene-butadiene block copolymers.

Use: In adhesives, plastics, and asphalt.

stereoregular polymer. See polymer, stereospecific.

stereospecific catalyst. See catalyst, stereospecific.

stereospecific polymer. See polymer, stereospecific.

steric. Pertaining to the spatial relationships of atoms in a molecular structure, and in particular, to the space-filling properties of a molecule.

steric hindrance. A characteristic of molecular structure in which the molecules have a spatial arrangement of their atoms such that a given reaction with another molecule is prevented or retarded.

steric strain. The additional energy of molecular bonds due to peculiar molecular geometry.

sterilization. (1) Complete destruction of all bacteria and other infectious organisms in an industrial, food, or medical product; it must be followed by aseptic packaging to prevent recontamination, usually by hermetic sealing. The methods used involve either wet or dry heat, use of chemicals such as formaldehyde and ethylene oxide filtration (pharmaceutical products), and irradiation by UV or γ -radiation. Milk is sterilized by heating for 30 seconds at 135C, followed by in-can heating at 115C for several minutes and aseptic packaging.

(2) Rendering a life-form incapable of reproduction by radiation or chemical treatment. See chemosterilant.

sterling silver. According to U.S. law, this term is restricted to silver alloys containing at least 92.5% pure silver and 7.5% maximum other metal (usually copper).

See silver.

steroid. One of a group of polycyclic compounds closely related biochemically to terpenes. They include cholesterol, numerous hormones, precursors of certain vitamins, bile acids, alcohols (sterols), and certain natural drugs and poisons (such as the digitalis derivatives). Steroids have as a common nucleus a fused, reduced, 17-carbon-atom ring system, cyclopentanoperhydrophenanthrene. Most steroids also have two methyl groups and an aliphatic side chain attached to the nucleus. The length of the side chain varies and generally contains 8, 9, or 10 carbon atoms in the sterols, 5 carbon atoms in the bile acids, 2 in the adrenal cortical steroids, and none in the estrogens and androgens. Steroids are classed as lipids because of their solubility in organic solvents and insolubility in water.

Most of the naturally occurring steroids have been synthesized and many new steroids unknown in nature have been synthesized for use in medicine, such as the fluorosteroids (dexamethasone).

sterol. A steroid alcohol. Such alcohols contain the common steroid nucleus, plus an 8- to 10-carbon-atom sidechain and a hydroxyl group. Sterols are widely distributed in plants and animals, both in the free form and esterified to fatty acids. Cholesterol-

ol is the most important animal sterol; ergosterol is an important plant sterol (phytosterol).

Stevens rearrangement. Migration of an alkyl group from a quaternary ammonium salt to an adjacent carbanionic center on treatment with strong base. The product is a rearranged tertiary amine, sulfonium, or sulfide.

STH. See somatotrophic hormone.

stibic anhydride. See antimony pentoxide.

stibine. See antimony hydride.

stibium. The Latin name for the element antimony; hence the symbol Sb.

stibnite. (gray antimony; antimony glance; antimonite). Sb_2S_3 .

Properties: Lead-gray mineral, subject to blackish tarnish, metallic luster. D 4.52–4.62, Mohs hardness 2. Soluble in concentrated boiling hydrochloric acid with evolution of hydrogen sulfide.

Occurrence: Japan, China, Mexico, Bolivia, Peru, South Africa.

Use: The most important ore of antimony.

sticky ends. After digestion of a DNA with certain restriction enzymes, the ends left have one strand overhanging the other to form a short (typically 4 nt) single-stranded segment. This overhang will easily re-attach to other ends like it and become known as “sticky ends.”

The overhangs thus produced can still hybridize (“anneal”) with each other, even if they came from different parent DNA molecules, and the enzyme ligase will then covalently link the strands. Sticky ends therefore facilitate the ligation of diverse segments of DNA, and allow the formation of novel DNA constructs.

Stieglitz rearrangement. Rearrangement of trityl hydroxylamines to Schiff bases on treatment with phosphorous pentachloride.

stigmasterol. $C_{29}H_{48}O \cdot H_2O$. A plant sterol.

Properties: Insoluble in water; soluble in usual organic solvents. Combustible.

Derivation: From soy or calabar beans.

Use: Preparation of progesterone and other important steroids.

stilbene. (toluene; *trans* form of α,β -diphenylethylene).

CAS: 103-30-0. $C_6H_5CH:CHC_6H_5$.

Properties: Colorless or slightly yellow crystals. D 0.9707, mp 124–125, bp 306–307°C. Soluble in benzene and ether; slightly soluble in alcohol; insoluble in water. Combustible.

Derivation: By passing toluene over hot lead oxide.

Method of purification: Crystallization, zone melting used for very pure crystals.

Grade: Technical, pure.

Use: Manufacture of dyes and optical bleaches, crystals are used as phosphors and scintillators. *Note:* The *cis* form of α,β -diphenylethylene (isostilbene) is a yellow oil, bp 145°C (13 mm Hg), mp 1°C.

stilbene dye. A dye whose molecules contain both the $-N=N-$ and the $>C=C<$ chromophor groups in their structure and whose CI numbers range from 40,000 to 40,999. These are direct cotton dyes.

stilbestrol. See diethylstilbestrol.

still. A device for the conversion of a material from the solid or liquid state to the vapor state, with or without simultaneous chemical decomposition. The vapor is condensed in a separate part of the apparatus becoming liquid or solid again.

stillage. The grain residue from alcohol production used in feeds and feed supplements.

stirrer. See impeller; agitator.

STM. Abbreviation for scanning tunneling microscope.

Stobbe condensation. Condensation of aldehydes or ketones with diethyl succinate in the presence of a strong base to form monoesters of α -alkylidene (or arylidene) succinic acids.

Stock system. See chemical nomenclature.

Stoddard solvent.

CAS: 8052-41-3. A widely used dry cleaning solvent. U.S. Bureau of Standards and ASTM D-484-52 define it as a petroleum distillate clear and free from suspended matter and undissolved water, and free from rancid and objectionable odor. The minimum flash p is 100F (37.7C). Distillation range, more than 50% over at 350F (177C), 90% over at 375F (190C), and the end point below 410F (210C); autoign temp 450F (232C). Combustible.

Hazard: Fire risk. Toxic by ingestion. TLV: 100 ppm.

Use: Dry cleaning, spot and stain removal.

stoichiometry. The branch of chemistry and chemical engineering that deals with the quantities of substances that enter into and are produced by

chemical reactions. For example, when methane unites with oxygen in complete combustion, 16 g of methane requires 64 g of oxygen. At the same time 44 g of carbon dioxide and 36 g of water are formed as reaction productions. Every chemical reaction has its characteristic proportions. The methods of obtaining these from chemical formulas, equations, atomic weights, and molecular weights and determination of what and how much is used and produced in chemical processes is the major concern of stoichiometry.

Stokes's law. (1) The rate at which a spherical particle will rise or fall when suspended in a liquid medium varies as the square of its radius; the density of the particle and the density and viscosity of the liquid are essential factors. Stokes's law is used in determining sedimentation of solids, creaming rate of fat particles in milk, etc.

(2) In atomic processes, the wavelength of fluorescent radiation is always longer than that of the exciting radiation.

"Stoko" [Goldschmid]. TM for a line of skin care and cleansing products.

Stolle synthesis. Formation of indole derivatives by the reaction of arylamines with α -haloacid chlorides or oxalyl chloride, followed by cyclization of the resulting amides with aluminum chloride.

stop bath. An acid solution for stopping photographic development by chemical neutralization of developer.

stop codons. (termination codons; nonsense codons). UAA, UAG, and UGA. In protein synthesis these codons signal the termination of a polypeptide chain..

storage. Any method of keeping raw materials, chemicals, food products, and energy while awaiting use, transportation, or consumption. The term *storage* is often applied to various types of wastes, but the more accurate word is disposal.

See radioactive waste; chemical waste; waste control.

(1) *Raw materials.* Normally storage is in suitably protected and well-ventilated interior areas at ambient temperature. Outdoor storage is practicable in some cases, e.g., logs for pulpwood, certain bulk solids and liquids received in metal or fiber drums. Storage of flammable liquids in large underground tanks is standard practice (gasoline, fuel oil). Hygroscopic materials (paper, textiles) should be in a humidity-controlled environment. Combustible materials that tend to build up internal heat on long standing at high ambient temperature (cellulosics such as paper, hay, grain; bulk wool; and certain vegetable oils) should be stored in well-ventilated areas.

(2) *Chemicals.* Materials that may react to form hazardous products in case of spillage should be

kept well separated. Oxidizing agents (nitrates, peroxides, etc.) should not be stored near reducing or combustible materials. Heat-sensitive materials should be kept away from hot pipes or other heat sources, especially in the case of flammable liquids. Chemicals that will ignite spontaneously in air or react with water vapor require special storage conditions to keep them out of contact with air. See pyrophoric.

Reactive organic monomers that tend to polymerize at room temperature, e.g., styrene, must contain an inhibitor when stored or shipped.

(3) *Food Products.* Long shelf life at or near room temperature is highly desirable for processed foods. This is achieved partly by the use of antioxidants and other preservatives and partly by processing techniques. Much experimental work has been done in this field. Refrigerated storage at temperatures near 4.5C is used for meats, eggs, and other dairy products. Meats and quick-frozen foods can be stored indefinitely at or below -18C. Controlled-atmosphere storage to retard postharvest ripening is used for unprocessed fruits and vegetables. See aging (2); atmosphere, controlled.

(4) *Energy.* The conventional method of storing energy is by means of primary and secondary batteries. See dry cell; storage battery.

The growing need for energy conservation has stimulated research on new and more effective methods, especially in regard to solar and wind energy, the collection of which is intermittent or nonuniform. Two such methods are in limited use. One (for electric power plants) involves compressing air with off-peak electricity and storing it in subterranean cavities from which it can be withdrawn when needed. The other (for domestic use) involves electrical heating refractory bricks at night at off-peak rates; the stored heat is given up during the day with 90% energy recovery. A number of other techniques are in the experimental stage: use of Glauber's salt, which has seven times the heat capacity of water, for storing solar energy; specialized batteries; so-called solar ponds; groundwater heated by solar or industrial process heat and returned to underground storage; and mechanical devices such as flywheel technology.

(5) For information on storage, see chemical data storage.

storage battery. A secondary battery, so called because the conversion of chemical to electrical energy is reversible and the battery is thus rechargeable. An automobile battery usually consists of 12-17 cells with plates (electrodes) made of sponge lead (negative plate or anode) and lead dioxide (positive plate or cathode) that is in the form of a paste. The electrolyte is sulfuric acid. The chemical reaction that yields electric current is $Pb + PbO_2 + 2H_2SO_4 \rightleftharpoons 2PbSO_4 + 2H_2O + 2e$. More complicated and expensive types have nickel-iron, nickel-cadmium, silver-zinc, and silver-cadmium as electrode materials. A sodium-liquid sulfur battery for high-temper-

ature operation as well as a chlorine-zinc type using titanium electrodes have also been developed. As part of the U.S. effort to replace gasoline with another form of energy, DOE is supporting short- and long-term research on batteries for electric vehicles at Argonne National Laboratories. Three types intended to deliver 20–30 kwh are in the short-term program: improved lead-acid, nickel-zinc and nickel-iron. The long-term program includes lithium-metal sulfide, sodium-sulfur (β -battery), zinc-chlorine, and metal-air. Independent research indicates that a zinc-nickel oxide system has encouraging possibilities. A lead-acid battery for storing energy from solar cells has been reported to have a life of 5–7 years.

storax. USP name for styrax.

“Storite” [*MSD Agvet.*] TM for a post harvest pesticide.

Stork enamine reaction. Synthesis of α -alkyl or α -acyl carbonyl compounds from enamines and alkyl or acyl halides.

STP. Abbreviation for standard temperature and pressure, i.e., 0C and 1 atm pressure.

STP (hallucinogen).

CAS: 15588-95-1. mf: $C_{13}H_{21}NO_2$.

Hazard: A poison by ingestion.

STPP. Abbreviation for sodium tripolyphosphate.

straight chain. See aliphatic.

straight-run. See gasoline.

strain. The resistance to deformation, that is, the tendency to resume its original shape, of a material subjected to a static or dynamic load. Strain increases as a function of stress; at rupture it represents the maximum strength of the material, usually measured in pounds per square inch or kilograms per square centimeter. The relationship of stress to strain is indicated by a curve obtained by stretching a sample of standard dimensions in a device designed for that purpose.

See stress; modulus of elasticity.

Straits tin. 99.895% pure tin.

strangeness. See antiparticle.

strategy. A computer-aided approach to a problem in organic synthesis, e.g., in biomimetic chemistry or recombinant DNA. Strategies may be group oriented, nonoriented, or long range.

straw. A fibrous, cellulosic component of cereal plants (wheat, rice, etc.). Its fibers are 1–1.5 mm

long, similar to those of hardwoods. Straw can be pulped by the alkaline process to yield specialty papers of high quality. Use of straw for papermaking is of limited importance in the U.S. due to the abundance of pulpwood.

streaming electromotive force. See streaming potential

streaming potential. (streaming electromotive force). (1) The current set up between extremes of a diaphragm when a liquid is forced through a porous diaphragm. (2) The electromotive force produced by the flow of a liquid past a solid surface.

Strecker amino acid synthesis. Synthesis of α -amino acids by simultaneous reaction of aldehydes with ammonia and hydrogen cyanide followed by hydrolysis of the resulting amino nitriles.

Strecker degradation. Interaction of an α -amino acid with a carbonyl compound in aqueous solution or suspension to give carbon dioxide and an aldehyde or ketone containing one less carbon atom. Inorganic oxidizing agents can also be used to bring about the reaction.

Strecker sulfite alkylation. Formation of alkyl sulfonates by reaction of alkyl halides with alkali or ammonium sulfites in aqueous solution in the presence of iodide.

streptolin.

Properties: An antibiotic isolated as the hydrochloride. Gummy mass, soluble in water, most stable at pH 3.0–3.5.

Derivation: Produced by *Streptomyces* # 11.

Use: Antibiotic, possible rodenticide.

streptomycin.

CAS: 57-92-1. $C_{21}H_{39}N_7O_{12}$. A specific antibiotic, but the term is also used loosely to designate several chemically related antibiotics produced by actinomycetes. Streptomycin is produced by *Streptomyces griseus* and consists of streptidine attached in glycosidic linkage to the disaccharide, streptobiosamine. It is active against Gram-negative bacteria and the tubercle bacillus. Usually available as trihydrochloride, phosphate, or sesquisulfate.

Properties: A base that readily forms salts with anions. Quite stable but very hygroscopic. One unit equals one microgram of pure crystalline streptomycin base.

Derivation: From *Streptomyces griseus* by aerobic fermentation. The streptomycin is then concentrated by adsorption on activated carbon and purified.

Hazard: Damage to nerves and kidneys may result from ingestion. Use restricted by FDA.

Use: Medicine (antibacterial).

See dihydrostreptomycin.

streptonigrin. (USAN)

CAS: 3930-19-6. $C_{25}H_{27}N_5O_8$. An antibiotic derived from *Streptomyces flocculus*. Dark-brown, rectangular crystals.

stress. The deformation undergone by a material when subjected to a definite load (the force applied per unit area). The load may be static (constant) or dynamic (increasing at a uniform rate). In either case it induces a strain in the material that results in rupture if the deforming force exceeds its strength. See strain; modulus of elasticity.

stress cracking. (tension cracking). Development of transverse cracks in a rubber or plastic product exposed to atmospheric oxygen at low (5–10%) elongation for long periods of time, for example, coiled hose, packaging materials, etc., both in service and during storage. Cracking will occur in the absence of light. It can be minimized in the case of a plastic such as polyethylene by lowering the density and the melt index, and in rubber by use of antioxidants.

stringency. A term used to describe the conditions of hybridization. By varying the conditions (especially salt concentration and temperature), a given probe sequence may be allowed to hybridize only with its exact complement (high stringency), or with any somewhat related sequences (relaxed or low stringency). Increasing the temperature or decreasing the salt concentration will tend to increase the selectivity of a hybridization reaction, and thus will raise the stringency.

stripping. (1) Removal of relatively volatile components from a gasoline or other liquid mixture by distillation, evaporation, or by passage of steam, air, or other gas through the liquid mixture. (2) Rapid removal of color from an improperly dyed fabric or fiber by a chemical reaction. Compounds used for this purpose in vat dyeing or in discharge printing are termed *discharging agents*. Substances commonly used as strippers are sodium hydrosulfite, titanous sulfate, sodium and zinc formaldehyde sulfoxylates.

stroma. The space and aqueous solution enclosed within the inner membrane of a chloroplast.

strontia. See strontium oxide.

strontianite. $SrCO_3$. Natural strontium carbonate.

Properties: White, gray, yellow, green color; vitreous luster. Mohs hardness 3.5–4, d 3.7.

Occurrence: California, New York, Washington, Germany, Mexico.

Use: Source of strontium chemicals.

strontium. Sr. Metallic element of atomic number 38, group IIA of periodic table, aw 87.62, valence = 2, radioactive isotopes strontium-89 and strontium-90. There are four stable isotopes.

Properties: Pale-yellow, soft metal; chemically similar to calcium. D 2.54, mp 752, bp 1390C. Soluble in alcohol and acids, decomposes water on contact.

Occurrence: Ores of strontianite and celestite (Mexico, Spain).

Derivation: (1) Electrolysis of molten strontium chloride in a graphite crucible with cooling of the upper, cathodic space; (2) thermal reduction of the oxide with metallic aluminum (strontium aluminum alloy formed), and distilling the strontium in a vacuum.

Grade: Technical.

Hazard: Spontaneously flammable in powder form, ignites when heated above its mp. Reacts with water to evolve hydrogen. Store under naphtha.

Use: Alloys, "getter" in electron tubes.

strontium-90. Radioactive strontium isotope.

Properties: Half-life is 38 years. Radiation: β .

Derivation: From the fission products of nuclear reactor fuels.

Available forms: A mixture containing strontium-90, yttrium-90, and strontium-89 chlorides in hydrochloric acid solution; also as the carbonate and titanate.

Hazard: Highly toxic radioactive poison; present in fallout from nuclear explosions. Absorbed by growing plants; when ingested attacks bone marrow with possibly fatal results. It may be partially removed from milk by treatment with vermiculite.

Use: Radiation source in industrial thickness gauges, elimination of static charge, treatment of eye diseases, in radio-autography to determine the uniformity of material distribution, in electronics for studying strontium oxide in vacuum tubes, activation of phosphors, source of ionizing radiation in luminous paint, cigarette density control, measuring silk density, atomic batteries, etc.

strontium acetate.

CAS: 543-94-2. $Sr(C_2H_3O_2)_2 \cdot 1/2H_2O$.

Properties: White, crystalline powder. Soluble in water; loses $1/2H_2O$ at 150C.

Derivation: Interaction of strontium hydroxide and acetic acid, followed by crystallization.

Use: Intermediate for strontium compounds, catalyst production.

strontium bromate. $Sr(BrO_3)_2 \cdot H_2O$.

Properties: Colorless or yellowish crystals, lustrous powder, hygroscopic. Soluble in water. D 3.773. Loses water at 120C, decomposes at 240C.

Hazard: Strong oxidant, fire risk in contact with organic materials.

strontium bromide.

CAS: 10476-81-0. $SrBr_2 \cdot 6H_2O$.

Properties: White, hygroscopic crystals or powder. D 2.386 (25/4C), loses $4H_2O$ at 89C, losing remaining water by 180C; mp anhydrous salt 643C. Solu-

ble in water, alcohol, and amyl alcohol; insoluble in ether.

Derivation: Strontium carbonate is treated with bromine or hydrobromic acid.

Grade: Anhydrous powder, crystals, technical, CP.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine (sedative), lab reagent.

strontium carbonate. SrCO_3 .

Properties: White, impalpable powder. D 3.62, loses carbon dioxide at 1340C. Soluble in acids, carbonated water, and solutions of ammonium salts; slightly soluble in water.

Derivation: Celestite is boiled with a solution of ammonium carbonate or is fused with sodium carbonate.

Grade: Precipitated, technical, natural, reagent.

Use: Catalyst, in radiation-resistant glass for color television tubes, ceramic ferrites, pyrotechnics.

strontium chlorate.

CAS: 7791-10-8. (1) $\text{Sr}(\text{ClO}_3)_2$. (2) $\text{Sr}(\text{ClO}_3)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, crystalline powder. (1) D 3.152, mp decomposes at 120C. Soluble in water; slightly soluble in alcohol.

Derivation: Strontium hydroxide solution is warmed and chlorine passed in, with subsequent crystallization.

Grade: Technical, reagent.

Hazard: Dangerous explosion risk in contact with organic materials; highly sensitive to shock, heat, and friction; strong oxidizing agent.

Use: Manufacture of red-fire and other pyrotechnics, tracer bullets.

strontium chloride.

CAS: 10476-85-4. (1) SrCl_2 . (2) $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline needles; odorless; sharp, bitter taste. (1) D 3.054, mp 872C, bp 1250C; (2) d 1.964, mp loses $6\text{H}_2\text{O}$ at 150C. Soluble in water and alcohol.

Derivation: Strontium carbonate is fused with calcium chloride, the melt extracted with water, the solution concentrated and crystallized.

Grade: Reagent, technical, anhydrous.

Use: Strontium salts, pyrotechnics, electron tubes.

strontium chromate. (chromic acid, strontium salt (1:1)).

CAS: 7789-06-2. SrCrO_4 .

Properties: Light-yellow pigment. D 3.84. Rust-inhibiting and corrosion-resistant properties. Has good heat and light resistance and low reactivity in highly acid vehicles.

Hazard: Toxic by ingestion. TLV: TWA 0.0005 ppm; Suspected Human Carcinogen.

Use: Metal protective coatings to prevent corrosion, colorant in polyvinyl chloride resins; pyrotechnics, sulfate ion control in electroplating baths.

strontium dioxide. See strontium peroxide.

strontium fluoride.

CAS: 7783-48-4. SrF_2 .

Properties: White powder. D 4.2, mp 1463C, bp 2489C. Soluble in hydrochloric acid and hydrogen fluoride; insoluble in water.

Grade: Crystals, 99.2% pure.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Substitute for other fluorides, electronic and optical applications, single crystals for lasers, high-temperature dry-film lubricants.

strontium hydroxide. (strontium hydrate).

(1) $\text{Sr}(\text{OH})_2$. (2) $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless, deliquescent crystals. (1) D 3.625, mp 375C, decomposes 710C; (2) d 1.90. Soluble in acids and hot water; slightly soluble in cold water; absorbs carbon dioxide from air.

Derivation: Heating the carbonate or sulfide in steam.

Grade: Technical, CP, reagent.

Use: Extraction of sugar from beet sugar molasses, lubricant soaps and greases, stabilizer for plastics, glass, adhesives.

strontium hyposulfite. See strontium thio-sulfate.

strontium iodide.

CAS: 10476-86-5. (1) $\text{SrI}_2 \cdot 6\text{H}_2\text{O}$. (2) SrI_2 .

Properties: (1) White, crystalline plates. Decomposes in moist air; becomes yellow on exposure to air or light. (2) White crystals. Soluble in water and alcohol. (2) D 4.549, mp 515C, bp decomposes. (1) D 2.67 (25C), mp 90C (decomposes).

Derivation: By treating strontium carbonate with hydriodic acid.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine (source of iodine), intermediate.

strontium lactate. $\text{Sr}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals or granular powder; odorless. Soluble in water, alcohol, ether.

strontium molybdate. SrMoO_4 .

Properties: Crystalline powder. D 4, mp 1600C. Insoluble in water.

Grade: 99.39% pure, single crystals.

Use: Anticorrosion pigments, electronic and optical applications, single crystals, solid-state lasers.

strontium monosulfide. See strontium sulfide.

strontium nitrate.

CAS: 10042-76-9. $\text{Sr}(\text{NO}_3)_2$.

Properties: White powder. D 2.98, mp 570C, bp 645C. Soluble in water; slightly soluble in absolute alcohol.

Derivation: A concentrated solution of strontium chloride is treated with a solution of sodium nitrate.

Grade: Technical, reagent.

Hazard: Strong oxidizing agent, fire risk in contact

with organic materials, may explode when shocked or heated.

Use: Pyrotechnics, marine signals, railroad flares, matches.

strontium nitrite. $\text{Sr}(\text{NO}_2)_2$.

Properties: White or yellowish powder or hygroscopic needles. D 2.8, decomposes at 240C. Soluble in water; insoluble in alcohol.

strontium oxalate. $\text{SrC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: White powder; odorless. Loses H_2O at 150C. Insoluble in cold water.

Hazard: Toxic by ingestion.

Use: Pyrotechnics, catalyst manufacture, tanning.

strontium oxide. (strontia). SrO .

Properties: Grayish-white, porous lumps. D 4.7, mp 2430C, bp 3000C. Soluble in fused potassium hydroxide, converted to hydroxide by water. Combustible.

Derivation: Decomposition of strontium carbonate or hydroxide.

Grade: Lump, powder, porous carbide-free, reagent.

Use: Manufacture of strontium salts, pyrotechnics, pigments, greases and soaps, a major desiccant.

strontium perchlorate. $\text{Sr}(\text{ClO}_4)_2$.

Properties: Colorless crystals. Very soluble in water and alcohol.

Hazard: Fire and explosion risk in contact with organic materials.

Use: Oxidizing agent, pyrotechnics.

strontium peroxide. (strontium dioxide).

CAS: 1314-18-7. (1) SrO_2 , (2) $\text{SrO}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder; odorless; tasteless. (1) D 4.56, mp decomposes at 215C; (2) d 1.951, loses $8\text{H}_2\text{O}$ at 100C and decomposes when heated to a higher temperature. Soluble in ammonium chloride solution and alcohol; soluble in ammonium chloride solution and alcohol; decomposes in hot water; slightly soluble in cold water.

Derivation: (1) By passing oxygen over heated strontium oxide; (2) reaction of strontium hydroxide and hydrogen peroxide.

Hazard: Dangerous fire and explosion risk in contact with organic materials; sensitive to heat, shock, catalysts, reducing agents; oxidizing agent.

Use: Bleaching, fireworks, antiseptic.

strontium-potassium chlorate. (potassium-strontium chlorate). $\text{Sr}(\text{ClO}_3)_2 \cdot 2\text{KClO}_3$.

Properties: White, crystalline powder. Soluble in water.

Grade: Technical.

Hazard: Fire and explosion risk in contact with organic materials; sensitive to heat, shock, catalysts, reducing agents; oxidizing agent.

Use: Pyrotechnics.

strontium salicylate. $\text{Sr}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or powder; odorless; sweet saline taste. Soluble in water and alcohol; decomposes when heated. Protect from light.

Derivation: Interaction of strontium carbonate and salicylic acid.

Use: Pharmaceutical and fine chemical manufacture.

strontium stearate. $\text{Sr}(\text{OOC}_{17}\text{H}_{35})_2$.

Properties: White powder. Mp 130–140C. Insoluble in alcohol; soluble (forms gel) in aliphatic and aromatic hydrocarbons.

Use: Grease and wax compounding.

strontium sulfate. SrSO_4 .

Properties: White precipitate or crystals of the mineral celestite; odorless. D 3.71–3.97, mp 1605C. Slightly soluble in concentrated acids; very slightly soluble in water; insoluble in alcohol and dilute sulfuric acid.

Derivation: (1) Celestite is ground; (2) precipitation of any soluble strontium salt with sodium sulfate.

Grade: Natural, precipitated, air-floated, 90%, 325 mesh, free from sodium salts, CP.

Use: Pyrotechnics, ceramics and glass, paper manufacture.

strontium sulfide. (strontium monosulfide).

CAS: 1314-96-1. SrS.

Properties: Gray powder, has hydrogen sulfide odor when in presence of moist air. D 3.7, mp 2000C. Soluble in acids (decomposes); slightly soluble in water.

Derivation: Reduction of celestite with coke at high temperatures.

Grade: Technical, high purity.

Hazard: Moderate fire and explosion risk. Irritant to skin and tissues.

Use: Depilatory, luminous paints, manufacture of strontium chemicals.

strontium tartrate. $\text{SrC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.

Properties: White crystals. D 1.966. Slightly soluble in water. Combustible.

Use: Pyrotechnics.

strontium thiosulfate. (strontium hyposulfite). $\text{SrS}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

Properties: Fine needles. D 2.17, mp loses $4\text{H}_2\text{O}$ at 100C. Soluble in water; insoluble in alcohol.

strontium titanate. SrTiO_3 .

Properties: Powder. D 4.81, mp 2060C. Insoluble in water and most solvents.

Grade: Technical, single crystals.

Use: Electronics, electrical insulation.

strontium zirconate. SrZrO_3 .

Properties: Powder. Mp 2600C.

Use: Electronics.

structural antagonist. See antagonist, structural.

structural formula. See formula, chemical.

structural genomics. The effort to determine the 3D structures of large numbers of proteins using both experimental techniques and computer simulation.

structure. (1) In the terminology of the textile industry, any woven fabrics. (2) In chemistry, the arrangement of atoms and groups in a molecule.

strychnidine. $C_{21}H_{24}ON_2$.

Properties: Colorless crystals. Mp 256C.

Use: Reagent for nitrate determination.

strychnine.

CAS: 57-24-9. $C_{21}H_{22}N_2O_2$. An alkaloid.

Properties: Hard white crystals or powder; bitter taste. Mp 268–290C, bp 270C (5 mm Hg). Soluble in chloroform; slightly soluble in alcohol and benzene; slightly soluble in water and ether.

Derivation: Extraction of the seeds of *Nux vomica* with acetic acid, filtration, precipitation by alkali and filtration.

Grade: Crystals, powder, technical.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg/m³.

Use: Pesticide.

STS. See sequence tagged site.

stuff. Term used by papermakers to refer to the aqueous pulp suspension fed onto the fourdrinier wire from the headbox. See furnish.

Stuffer disulfone hydrolysis rule. (1) All sulfones containing vicinal sulfone group-substituted carbon atoms (γ -disulfones) are hydrolyzed by dilute alkali with formation of β -hydroxysulfone and sulfinate. (2) All sulfones in which adjacent carbon atoms carry a strongly negative group, and one or two sulfone residues can be cleaved into a sulfinic acid and an unsaturated compound.

“STXS” [Condea Vista].

Available forms: Liquid. TM for sodium, toluene, xylene, sulfonate.

Use: A hydrotrope or solubilizing agent in detergent formulas.

“Stymer” Vinyl Styrene [Solutia]. TM for resins used as sizes for filament acetates. L.F. A vinyl resin. Styrene copolymer resin.

Properties: Soluble in water, ammonium hydroxide, and sulfur.

S-type synthetic elastomer. See styrene-butadiene rubber.

styphnic acid. (2,4,6-trinitroresorcinol).

CAS: 82-71-3. $C_6H(OH)_2(NO_2)_3$.

Properties: Yellow crystals; astringent taste. An initiating explosive. Mp 179–180C. Forms addition compounds with many hydrocarbons; soluble in alcohol and ether; slightly soluble in water.

Derivation: Nitration of resorcinol.

Hazard: Severe explosion risk when heated.

Use: Priming agents in the explosives industry.

styracin. See cinnamyl cinnamate.

styrallyl acetate. See α -methylbenzyl acetate.

styrallyl alcohol. See α -methylbenzyl alcohol.

styrax. A type of balsam found in Central America and the Near East. See balsam.

styrenated oil. A drying oil whose drying and hardening characteristics have been modified by incorporation of styrene or a similar monomer.

styrene. See polystyrene; styrene monomer.

styrene-acrylonitrile. See polystyrene.

styrene-butadiene rubber. (SBR). By far the most widely used type of synthetic rubber, its consumption for all applications is four times that of polybutadiene, its nearest competitor, and 1.5 times that of all other elastomers combined. Its manufacture involves copolymerization of three parts butadiene with one part styrene. These materials are suspended in finely divided emulsion form in a large proportion of water, in the presence of a soap or detergent. Also present in small amounts are an initiator or catalyst which is usually a peroxide, and a chain-modifying agent such as dodecyl mercaptan. **Use:** Tires, footwear, mechanical goods, coatings, adhesives, solvent-release sealants, carpet backing. See rubber, synthetic; polymerization; free radical.

styrene glycol.

CAS: 93-56-1. $C_8H_{10}O_2$.

Properties: Acicular crystals. Mp 67C, bp 272C. Soluble in water and organic solvents.

Use: Plasticizers.

styrene monomer. (vinylbenzene; phenylethylene; cinnamene).

CAS: 100-42-5. $C_6H_5CH:CH_2$.

Properties: Colorless, oily liquid; aromatic odor. Fp -30.63C , bp 145.2C , d 0.9045 (25/25C), bulk d 7.55 lb/gal (20C), flash p 88F (31.1C), autoign temp 914F (490C). Insoluble in water; soluble in alcohol and ether; readily undergoes polymerization when heated or exposed to light or a peroxide catalyst. The polymerization releases heat and may become explosive.

Derivation: From ethylene and benzene in the presence of aluminum chloride to yield ethylbenzene, which is catalytically dehydrogenated at 630C to form styrene.

Grade: Technical 99.2%, polymer 99.6%.

Hazard: Flammable, moderate fire risk, explosive limits in air 1.1–6.1%, must be inhibited during storage. Toxic by ingestion and inhalation. TLV: 50 ppm; STEL 40 ppm; not classifiable as a human carcinogen.

Use: Polystyrene; SBR, ABS, and SAN resins; protective coatings (styrene-butadiene latex, alkyds); styrenated polyesters; rubber-modified polystyrene; copolymer resins; intermediate.

styrene nitrosite. A compound resulting from the reaction between styrene and nitrogen dioxide and used as a qualitative or quantitative specific test for monomeric styrene in mixtures with other hydrocarbons.

styrene oxide.

CAS: 96-09-3.

$\text{C}_8\text{H}_8\text{CHOCH}_2$.

Properties: Colorless to pale-straw-colored liquid. Boiling range $194.2\text{--}195\text{C}$ (5–95%), fp -36.6C , flash p 180F (82.2C) (COC), refractive index 1.5328 (25C), d 1.0469 (25/4C). Miscible with benzene, acetone, ether, and methanol. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Highly reactive organic intermediate.

“Styresol” [Reichhold]. TM for a group of styrenated alkyd resins with air-drying and baking properties and high resistance to gasoline, alkalis, acids, and water.

“Styrofoam” [Dow]. TM for expanded cellular polystyrene (available in colors).

Use: Insulating materials; light-weight materials for boats, toys, etc.; separators in packing containers; airport runways; highway construction; battery cases.

“Styron” [Dow]. TM for polystyrene resins, general purpose, medium and high impact, heat and impact-heat resistant, and light-stabilized resins

(“Styron Verelite”). Available in wide range of translucent and opaque colors, as well as natural and crystal.

Use: Packaging, toys, appliance parts, bottle closures and containers, hot and cold drinking cups, television cabinet backs, automotive components and machine housings, lighting equipment.

styryl carbinol. See cinnamic alcohol.

sub-cloning. If you have a cloned piece of DNA (say, inserted into a plasmid) and you need unlimited copies of only a part of it, you might “sub-clone” it. This involves starting with several million copies of the original plasmid, cutting with restriction enzymes, and purifying the desired fragment out of the mixture. That fragment can then be inserted into a new plasmid for replication. It has now been sub-cloned.

suberane. See cycloheptane.

suberic acid. (octanedioic acid).

$\text{HOOC}(\text{CH}_2)_6\text{COOH}$.

Properties: Colorless crystals from water. Mp 143C , bp 279C (100 mm Hg). Partially soluble in water and ether; soluble in alcohol. Combustible.

Derivation: Oxidation of oleic acid with nitric acid.

Use: Intermediate for the synthesis of drugs, dyes, and high polymers.

suberone. See cycloheptanone.

sublimation. The direct passage of a substance from solid to vapor without appearing in the intermediate (liquid) state. An example is solid carbon dioxide which vaporizes at room temperature; the conversion may also be from vapor to solid under appropriate conditions of temperature.

subnuclear particle. A particle either found in the nucleus or observed coming from the nucleus as the result of nuclear reaction or rearrangement, i.e., neutrons, mesons, etc.

substance. Any chemical element or compound. All substances are characterized by a unique and identical constitution and are thus homogeneous. “A material of which every part is like every other part is said to be homogeneous and is called a substance.” (Black and Conant, *Practical Chemistry*.) See homogeneous.

substantive dye. See direct dye.

substituent. An atom or radical that replaces another in a molecule as the result of a reaction. See substitution.

substitute natural gas. See synthetic natural gas.

substitution. The replacement of one element or radical by another as a result of a chemical reaction. Chlorination of benzene to produce chlorobenzene is a typical example; in this case a chlorine atom replaces a hydrogen atom in the benzene molecule.

substitution mutation.

In genetics, a type of mutation due to replacement of one nucleotide in a DNA sequence by another nucleotide; or replacement of one amino acid in a protein by another amino acid.

substrate. (1) A substance upon which an enzyme or ferment acts. (2) Any solid surface on which a coating or layer of a different material is deposited.

substrate-level phosphorylation. Phosphorylation of ADP or some other nucleoside 5'-diphosphate coupled to the dehydrogenation of an organic substrate; independent of the electron transport chain.

subtilin. An antibiotic produced by the metabolic processes of a strain of *Bacillus subtilis*. It is a cyclic polypeptide similar to bacitracin in chemical structure and antibiotic activity, but not as important clinically. Subtilin is active against many Gram-positive bacteria, some Gram-negative cocci, and some species of fungi. It is a surface tension depressant and its antibiotic action is increased by use of wetting agents.

Properties: Soluble in water in pH range 2.0–6.0. Soluble in methanol and ethanol (up to 80%); insoluble in dry ethanol or other common organic solvents. Relatively stable in acid solutions. Inactivated by pepsin and trypsin and destroyed by light.

Use: Seed disinfectant, bacteriostat in foods.

subtilisins. (Alk [*Solutia*]; *bacillus subtilis* BPN; "Maxatase" [*Pfizer*]).

CAS: 1395-21-7 and 9014-01-1.

Properties: Light-colored prills.

Proteolytic enzyme.

Hazard: TLV: ceiling 0.00006 mg/m³.

Use: Laundry detergent additive.

succinaldehyde. (butanedial).

$\text{OHCCH}_2\text{CH}_2\text{CHO}$.

Properties: Liquid. D 1.064 (20/4C), bp 169–170C, refr index 1.4254. Soluble in water, alcohol, and ether. The name succinaldehyde is often incorrectly used in commerce as a synonym for succinic anhydride.

succinic acid. (butanedioic acid).

CAS: 110-15-6. $\text{CO}_2\text{H}(\text{CH}_2)_2\text{CO}_2\text{H}$.

Properties: Colorless crystals; odorless; acid taste. D 1.552, mp 185C, bp 235C. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: Fermentation of ammonium tartrate.

Grade: Technical, CP, FCC.

Use: Organic synthesis, manufacture of lacquers,

dyes, esters for perfumes, photography, in foods as a sequestrant, buffer, neutralizing agent.

succinic acid-2,2-dimethylhydrazide.

(diaminozide). $(\text{CH}_3)_2\text{NNHCOCH}_2\text{CH}_2\text{COOH}$.

Properties: White crystals. Mp 155C, pH 3.8 (500 ppm). Soluble in water; insoluble in simple hydrocarbons.

Use: Growth retardant used in greenhouses, retards premature fruit drop.

succinic acid peroxide.

CAS: 123-23-9. $(\text{HOOCCH}_2\text{CH}_2\text{CO})_2\text{O}_2$.

Properties: Fine, white powder; odorless. Mp 125C (decomposes). Moderately soluble in water; insoluble in petroleum solvents and benzene.

Hazard: Fire risk in contact with combustible materials, oxidizing agent. Toxic by ingestion and inhalation, irritant to skin.

Use: Polymerization catalyst, deodorants, antiseptics.

succinic anhydride. (2,5-diketotetrahydrofuran; succinyl oxide; butanedioic anhydride).

CAS: 108-30-5.

$\text{H}_2\text{C}(\text{O})\text{OC}(\text{O})\text{CH}_2$.

Properties: Colorless or light-colored needles or flakes. D 1.104 (20/4C), mp 120C, bp 261C, sublimes at 115C (5 mm Hg). Soluble in alcohol and chloroform; insoluble in water. Combustible.

Grade: Distilled.

Use: Manufacture of chemicals, pharmaceuticals, esters; hardener for resins, starch modifier in foods.

succinimide. (2,5-diketopyrrolidine).

CAS: 123-56-8.

$\text{H}_2\text{C}(\text{O})\text{NHC}(\text{O})\text{CH}_2$ or $\text{C}_4\text{H}_6\text{O}_2\text{N}\cdot\text{H}_2\text{O}$.

Properties: Colorless crystals or thin, light-tan flakes. Nearly odorless; sweet taste. Mp 125–127C, bp 287–288C, d 1.41. Soluble in hot and cold water and in sodium hydroxide solution; slightly soluble in alcohol; insoluble in ether and chloroform.

Derivation: Conversion of succinic acid to succinamide, followed by heating; ammonia splits off to give a diacyl-substituted derivative (succinimide).

Grade: Purified, technical.

Use: Growth stimulants for plants, organic synthesis.

succinodimide. See *N*-iodosuccinimide.

succinonitrile. See ethylene cyanide.

succinylated monoglycerides.

Properties: Off-white colored waxy solid; bland taste. Mp: 60°. Sol in warm methanol, ether, *n*-propanol.

Use: Food additive.

succinyl oxide. See succinic anhydride.

succistearin.

Use: Food additive.

sucrase. See invertase.

sucroblanc. A mixture used to purify and bleach sugar solution in one operation. Contains high-test calcium hypochlorite, calcium superphosphate, lime, and Filtercel (a grade of "Celite").

sucrose. (table sugar; saccharose).

CAS: 57-50-1. $C_{12}H_{22}O_{11}$.

Properties: Hard, white, dry crystals, lumps, or powder; sweet taste; odorless. D 1.5877, decomposes 160–186C, optical rotation +33.6 degrees. Soluble in water; slightly soluble in alcohol; solutions are neutral to litmus. Combustible.

Derivation: By crushing and extraction of sugarcane (*Saccharum officinarum*) with water or extraction of the sugar beet (*Beta vulgaris*) with water, evaporating, and purifying with lime, carbon, and various liquids. Also obtainable from sorghum by conventional methods. Occurs in low percentages in honey and maple sap.

Grade: Reagent, USP, technical, refined.

Hazard: TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Sweetener in foods and soft drinks, manufacture of syrups, source of invert sugar, confectionery, preserves and jams, demulcent, pharmaceutical products, caramel, chemical intermediate for detergents, emulsifying agents, and other sucrose derivatives.

See sugar.

sucrose acetate isobutyrate. (SAIB).

$(CH_3COO)_2C_{12}H_{14}O_5[OOCCH(CH_3)_2]_6$.

Properties: Clear sucrose derivative available either as a semisolid (100%) or as a 90% solution in ethanol. D 1.146 (25/25C). Combustible.

Derivation: By controlled esterification of sucrose with acetic and isobutyric anhydrides.

Use: Modifier for lacquers, hot-melt coating formulations, extrudable plastics.

sucrose fatty acid esters.

Use: Food additive.

sucrose monostearate.

Properties: White powder; odorless, tasteless.

Derivation: By reaction of sugar and methyl stearate in a suitable solvent and with potassium carbonate catalyst.

Use: Low-foam nonionic detergent, surfactants.

sucrose octaacetate.

CAS: 126-14-7. $C_{12}H_{14}O_3(OOCCH_3)_8$.

Properties: White, hygroscopic, crystalline material; bitter taste. When once melted does not recrystallize on cooling but becomes a transparent film. Molten film is very adhesive but this property is lost on cooling. Rate of hydrolysis, practically nil. Gives no action with Fehling's solution. D (fused) 1.28 (20/20C), bp 260C (0.1 mm Hg), mp 79–84C, refr index 1.4660 (20C), decomposes at 285C, viscosity 29.5 cP (100C), specific rotation +54.96 degrees (CCl₄). Soluble in acetic acid, acetone, benzene; slightly soluble in water. Combustible.

Grade: Technical, reagent, denaturing.

Use: Plasticizer for cellulose esters and plastics, adhesive and coating compositions, insecticide, termite repellent, denaturant in rubbing alcohol formulas, lacquers, flavoring.

sucrose polyester. An experimental, synthetic, noncaloric fat substitute composed of a mixture of 6-, 7-, and 8-fatty acid esters of sucrose. These esters are not decomposed by the digestive enzymes as are the triesters in natural fats; thus they are not metabolized and can be recovered from the excreta. The physical properties of sucrose polyester are similar to those of fats occurring in milk, margarine, and vegetable oils. It has been found effective in notably reducing body weight in preliminary trials when substituted for natural dietary fats in salad dressings, spreads, and milk mixture. Sucrose polyester also has a beneficial effect on serum cholesterol levels. It has met all FDA test requirements satisfactorily.

sugar. A carbohydrate product of photosynthesis composing one, two, or more saccharose groups. The monosaccharide sugars (often called simple sugars) are composed of chains of 2–7 carbon atoms. One of the carbons carries aldehydic or ketonic oxygen which may be combined in acetal or ketal forms. The remaining carbons usually have hydrogen atoms and hydroxyl groups. Chief among the monosaccharides are glucose (dextrose) and fructose (levulose). These are optical isomers of formula $C_6H_{12}O_5$, i.e., their crystals have the property of rotating to either left or right under polarized light. Hence the alternate names dextrose and levulose.

See D-; optical rotation.

Among the disaccharides are sucrose (cane or beet sugar); lactose, found in milk; maltose, obtained by hydrolysis of starch; and cellobiose from partial hydrolysis of cellulose. High-polymer sugars occur as water-soluble gums such as arabic, tragacanth, etc. Hydrolysis of sucrose yields invert sugar composed of equal parts fructose and glucose. Sugar is an important source of metabolic energy in foods and its formation in plants is an essential factor in the life process.

sugarcane wax. A hard wax varying from dark green to tan and brown, produced by solvent extraction of cane, mp 76–79C. Combustible.

Grade: Domestic refined, in slabs.

Use: Carbon paper, pigment disperser, castings, lubricant for plastics in food wrappers.

sugar, corn. See dextrose.

sugar, grape. See dextrose.

sugar, invert. See invert sugar, sugar.

sugar of lead. See lead acetate.

sugar of milk. See lactose.

sugar, reducing. Sugars that will reduce Fehling's solution or similar test liquids, with conversion of the blue soluble copper salt to a red, orange or yellow precipitate of cuprous oxide. Glucose and maltose are typical examples of reducing sugars, their molecules containing an aldehyde group that is the basis for this type of reaction.

sugar substitute. See sweetener, nonnutritive.

suicide inhibitor. A relatively inert molecule that is transformed by an enzyme at its active site into a reactive substance that irreversibly inactivates the enzyme.

sulfabromomethazine sodium.

CAS: 116-45-0. mf: $C_{12}H_{13}BrN_4O_2S$.

Properties: Crystals. Decomp 250–252°. Sol in alkaline solns.

Use: Drug (veterinary); food additive.

sulfachlorpyridazine.

CAS: 80-32-0. mf: $C_{10}H_8ClN_4O_2S$.

Use: Drug (veterinary); food additive.

sulfa drug. Any of a group of 50 or more compounds characterized by the presence of both sulfur and nitrogen, with high specificity for certain bacteria. Because of their toxicity and often serious side effects, their use in treating disease is limited, since the less toxic antibiotics are generally available. Many are used in veterinary medicine. Among the best known are sulfanilamide, sulfadiazine, sulfapyridine, sulfamerazine, sulfasoxazole, and gantrisin.

sulfaethoxy pyridazine.

CAS: 963-14-4. mf: $C_{12}H_{14}N_4O_3S$.

Properties: Crystals. Mp: 183–184°. Sol in water at 37°.

Use: Drug (veterinary); food additive.

sulfamic acid.

CAS: 5329-14-6.

Properties: White, crystalline solid; odorless. Non-volatile; nonhygroscopic, d 2.1, mp 205C (decomposes). Soluble in water; slightly soluble in organic solvents. Aqueous solutions are highly ionized giving pH values lower than solutions of formic, phosphoric, and oxalic acids. All the common salts (including calcium, barium, and lead) are extremely soluble in water. Combustible.

Grade: Reagent, crystalline, granular.

Hazard: Toxic by ingestion.

Use: Metal and ceramic cleaning, nitrite removal in azo dye operations, gas-liberating compositions, organic synthesis, analytical acidimetric standard, amine sulfamates used as plasticizers and fire-retardants, stabilizing agent for chlorine and hypochlorite in swimming pools, bleaching paper pulp and textiles, catalyst for urea-formaldehyde resins, sulfonating agent, pH control, hard-water-scale removal, electroplating.

sulfanilamide. See sulfa drug.

sulfanilic acid. (*p*-aminobenzenesulfonic acid; *p*-anilinesulfonic acid).

CAS: 121-57-3. $H_2NC_6H_4SO_3H \cdot H_2O$.

Properties: Grayish-white, flat crystals. Mp chars at 280–300C. Soluble in fuming hydrochloric acid; slightly soluble in water; very slightly soluble in alcohol and ether. Combustible.

Derivation: By heating aniline with weak fuming sulfuric acid and pouring the reaction product into water.

Grade: Technical, pure, reagent.

Use: Dyestuffs, organic synthesis, medicine, reagent.

m-sulfanilic acid. See metanilic acid.

sulfanitran.

CAS: 122-16-7. mf: $C_{14}H_{13}N_3O_3S$.

Properties: Crystals from alc (aq). Mp: 239–240°. Sol in acetone, ethanol, methanol, water, ether.

Use: Drug (veterinary); food additive.

sulfate. The salt of sulfuric acid as in sodium sulfate.

sulfate mineral. A mineral in which the basic building block is a sulfur atom linked to four oxygen atoms. Most sulfate minerals are highly soluble in water and form by the evaporation of natural waters.

sulfate process. The process of producing paper products from woodchips by using a cooking liquor that contains caustic soda, sodium sulfide, soda ash, and sodium sulfate.

sulfate pulp. See pulp, paper.

sulfate-reducing bacteria. Fermenting bacteria that obtain energy by converting sulfate compounds into sulfide compounds. These bacteria, which cannot tolerate oxygen, are common in the muds of swamps, ponds, and lagoons. Bacteria of this type seem to have flourished in Archean time, when there was little atmospheric oxygen.

sulfate turpentine. A by-product turpentine from Kraft paper manufacture.

sulfation. (1) The formation of insoluble white lead sulfate in the plates of a lead storage battery. (2) The attachment of SO_3H to a carbon or nitrogen atom.

sulfenamide. A compound having the typical structure RSNH_2 .

sulfide dye. (sulfur dye). One of a group of water-insoluble dyes produced by heating various organic compounds with sulfur. The characteristic chromophore groupings are $\equiv\text{C}-\text{S}-\text{C}\equiv$ and $\equiv\text{C}-\text{S}-\text{S}-\text{C}\equiv$; CI numbers range from 53,000–54,999. Like vat dyes, sulfide dyes are reduced to a water-soluble, colorless form before application and are then oxidized to their original colored state. Application is usually to cotton from a sodium sulfide bath. Sulfur black (CI 53,185) is an important example.

1,1'-sulfanylbis(1,2-dichloroethane).

CAS: 23248-53-5. mf: $\text{C}_4\text{H}_2\text{Cl}_4\text{OS}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

sulfite. The normal salt of sulfurous acid as in sodium sulfite.

sulfite acid liquor. An aqueous solution of calcium bisulfite or calcium and magnesium bisulfites containing a large amount of free sulfur dioxide. It is prepared from sulfur dioxide and limestone, dolomite, or lime by countercurrent extraction.

Use: Manufacture of sulfite pulp for paper.

sulfite process. The treatment of wood chips with bisulfite under heat and pressure to remove impurities from cellulose to be used in papermaking.

sulfite pulp. See pulp, paper.

sulfite waste liquor. A waste liquor produced in the sulfite paper process. Sold in variations from a dilute solution to a solid.

Use: Foam producer, emulsifier, adhesives, tanning agent, binder for briquets, cores, unpaved roads, source of torula yeast.

See lignin sulfonate; waste disposal.

m-sulfobenzoic acid.

$\text{HO}_3\text{SC}_6\text{H}_4\text{COOH}\cdot 2\text{H}_2\text{O}$.

Properties: Grayish-white solid. Stable but hygroscopic in air. Mp 98C, anhydrous form melts at 141C. Soluble in water, alcohol; insoluble in benzene.

Derivation: Direct sulfonation of benzoic acid with sulfur trioxide.

Use: Derivative for surface-active agents.

o-sulfobenzoic acid. $\text{HO}_3\text{SC}_6\text{H}_4\text{COOH}$.

Properties: White needles. Mp 68–69C (with $3\text{H}_2\text{O}$ of crystallization), mp 134C (dry). Soluble in water and alcohol; insoluble in ether.

Derivation: (1) From saccharin and concentrated hydrochloric acid, (2) by the oxidation of thiosalicylic acid with potassium permanganate in alkaline solution.

Use: Manufacture of sulfonaphthalein indicators, dyes.

o-sulfobenzoic anhydride.

$\text{C}_6\text{H}_4\text{COOSO}_2$.

Properties: Solid. Mp 129.5C, bp 184–186C (18 mm Hg). Soluble in hot water, ether, and benzene.

Use: Polymerization inhibitor.

sulfobetaines. See "Crosultaines" [*Croda*].

sulfocarbanilide. See thiocarbanilide.

sulfocarbathion K.

CAS: 114654-31-8.

Hazard: Moderately toxic by ingestion and inhalation.

sulfocarbolic acid. See phenolsulfonic acid.

sulfodehydroabietic acid monosodium salt.

See ecabet sodium.

sulfoderm. Silicic acid with 1% colloidal sulfur.

1-(4-sulfo-2,3-dichlorophenyl)-3-methylpyrazolone.

$(\text{Cl}_2\text{C}_6\text{H}_2\text{SO}_3\text{H})\text{NNC}(\text{CH}_3)\text{CH}_2\text{CO}$.

Properties: White or yellowish powder or crystals. Very soluble in water; soluble in alkalis.

Derivation: By condensation of dichlorophenylhydrazine sulfonic acid with ethylacetoacetate.

Use: Intermediate for dyes.

"Sulfogene" [Du Pont]. TM for a series of sulfur colors.

Use: Extensively on cotton work clothing and similar fabrics and to a limited extent on rayon and other materials.

sulfolane. (1,1-dioxide tetrahydrothiofuran; tetramethylene sulfone).

CAS: 126-33-0.

Properties: Liquid. D 1.2606 at 30/4C, mp 27.4–27.8C, bp 285C, flash p 330F. Miscible with water, acetone, toluene (at 30C). Slightly miscible with octanes, olefins, naphthenes.

Grade: Technical.

Hazard: Combustible. Toxic by ingestion.

Use: Curing agent for epoxy resins, medicine (antibacterial).

n-sulfomethyl-polymyxin B sodium salt.

See sulfomyxin.

sulfomyxin.

Use: Drug (veterinary); food additive.

sulfonation. The introduction of the sulfo group into an organic compound whereby it connects to a carbon or nitrogen atom.

sulfonic acid. An organic compound containing in its molecule one or more sulfo radicals, $-\text{SO}_2\text{OH}$. The sulfur atom is directly united to a carbon atom.

4,4'-sulfonyldiphenol. (SDP). $(\text{C}_6\text{H}_5\text{OH})_2\text{SO}_2$.

Properties: White, crystalline powder. Mp above 247C; 99.5% pure.

Derivation: Oxidation of 4,4'-thiodiphenol.

Use: Intermediate, product modification.

p-1-sulfophenyl-3-methyl-5-pyrazolone.

Properties: White or yellowish powder. Very slightly soluble in water; soluble in alkalis.

Derivation: By condensation of phenylhydrazine sulfonic acid with ethylacetoacetate.

4-sulfophthalic anhydride.

Properties: Reddish-brown syrup. Crystallizes partially on long standing; hygroscopic; fluorescent in solution under UV radiation. D 1.62 (25C). Very soluble in water, alcohol; insoluble in ether, benzene. Combustible.

Use: Esters of 4-sulfophthalic acid used in wetting, cleansing, emulsifying, softening, and equalizing agents with textiles. Derivatives have application as surface-active agents.

5-sulfosalicylic acid.

Properties: Colorless crystals, colored pink by traces of iron. Mp 120C (anhydrous), decomposes at higher temperatures. Very soluble in water.

Derivation: Action of sulfuric acid and salicylic acid.

Use: Reagent for albumin, colorimetric reagent for ferric ion, intermediate for dyes, surfactants, catalysts, grease additives.

sulfotepp. (ethyl thiopyrophosphate; tetraethyl dithiopyrophosphate).

Properties: Yellow liquid. Bp 136–139C (2 mm Hg). Slightly soluble in water; soluble in most organic solvents.

Hazard: Toxic by ingestion, inhalation, and skin absorption; cholinesterase inhibitor; use may be restricted. TLV: 0.2 mg/m³; not classifiable as a human carcinogen. Toxic by skin absorption.

Use: Insecticide.

sulfoxide. (generic name for 1,2-(methylenedioxy)-4-[2-(octylsulfanyl)propyl]benzene(*n*-octyl sulfoxide isosafrole)).

Properties: Brown liquid. Insoluble in water; slightly soluble in oils, miscible with most organic solvents.

Use: Insecticide synergist.

sulfur.

CAS: 7704-34-9. S. Nonmetallic element, atomic number 16, group VIA of periodic table, aw 32.06, valences = 2, 4, 6; four stable isotopes.

Properties: Pure sulfur exists in two stable crystalline forms, α and β , and at least two amorphous (liquid) forms. (1) α -Sulfur: rhombic, octahedral, yellow crystals; stable at room temperature. D 2.06, transition to β form 94.5C, mp (rapid heating) 112.8C, refr index 1.957. (2) β -Sulfur: monoclinic, prismatic, pale-yellow crystals slowly changing to α form below 94.5C. D 1.96, mp 119C, bp 444.6C, flash p 405F (207C), autoign temp 450F (232C), refr index 2.038. Both forms are insoluble in water, slightly soluble in alcohol and ether, soluble in carbon disulfide, carbon tetrachloride, and benzene. Combustible.

Occurrence: Native in Texas, Louisiana, Sicily, Canada (Alberta), Poland, Saudi Arabia, Mexico, Iraq, offshore deposits in Gulf of Mexico, the former U.S.S.R., Japan.

Derivation: Direct mining by Frasch process, low-grade ores by Chemico process, smelter waste gas, sour natural gas, coal, iron pyrites, gypsum, solvent extraction of volcanic ash, petroleum, coke oven gas, photolysis of hydrogen sulfide.

Grade: Technical (lumps, roll, flour), rubber maker's, NF (sublimed), crude, refined, precipitated (milk of sulfur), high purity (impurities less than 10 ppm), also available in prilled form.

Hazard: Fire and explosion risk in finely divided form.

Use: Sulfuric acid manufacture, pulp and paper manufacture, carbon disulfide, rubber vulcanization, detergents, petroleum refining, dyes and chemicals, drugs and pharmaceuticals, explosives, insecticides, rodent repellents, soil conditioner, fungicide, coating for controlled-release fertilizers, nucleating agent for photographic film, cement sealant, binder and asphalt extender in road paving (up to 40%), base material for low-temperature mortars.

sulfur-35. Radioactive sulfur of mass number 35.

Properties: Half-life: 87.1 days, radiation: β .

Derivation: By pile irradiation of elemental sulfur or of various chlorides.

Available forms: Solid elemental sulfur, sulfate in weak hydrochloric acid, barium sulfide in barium hydroxide solution, elemental sulfur in benzene solution, in tagged compounds such as carbon disulfide, chlorosulfonic acid, thiourea, sulfanilamide, thiamine, heparin, insulin, "Sucaryl," etc.

Hazard: Radioactive poison.

Use: Research tool in studying mechanism of rubber vulcanization and polymerization of synthetic rubber, role of sulfur in the coking process and in steel, effect of sulfur on engine wear, sulfur removal in the viscose process, behavior of detergents during ashing, sulfur deposition in diesel engines, action of sulfur in silver plating solutions, protein metabolism, surface active agents and surface phenomena, drug actions, etc.

sulfurated lime. See lime, sulfurated.

sulfurated potash. See potash, sulfurated.

sulfur bromide. (sulfur monobromide). S_2Br_2 .

Properties: Yellow liquid, becomes red when exposed to air. D 2.6 (15C), fp $-40C$, bp $54C$ (0.2 mm Hg). Decomposed by water; soluble in carbon disulfide.

Hazard: Avoid inhalation of fumes, strong irritant to tissue.

sulfur chloride. (sulfur subchloride; sulfur monochloride).

CAS: 10025-67-9. S_2Cl_2 .

Properties: Amber to yellowish-red, oily, fuming liquid; penetrating odor. Soluble in alcohol, ether, benzene, carbon disulfide, and amyl acetate; decomposes on contact with water. D 1.690 (15.5C), fp $-80C$; bp $138C$; flash p 266F (130C). Combustible.

Derivation: By passing chlorine over molten sulfur.

Method of purification: Distillation.

Hazard: Reacts violently with water in closed vessel. Toxic by inhalation and ingestion, strong irritant to tissue. TLV: ceiling 1 ppm.

Use: Chemicals (sulfur solvent, acetic anhydride, thionyl chloride, carbon tetrachloride from carbon disulfide, various chlorohydrins from glycerol, glycol, etc.), analytical reagent, rubber vulcanizing, vulcanized oils, purifying sugar juices, military poison, insecticide, hardening soft woods (by treatment with sulfur chloride dissolved in carbon disulfide), pharmaceuticals, sulfur dyes, extraction of gold from its ores.

sulfur dichloride. SCl_2 .

Properties: Reddish-brown, fuming liquid; pungent chlorine odor. D 1.638 (15.5C), fp $-78C$, bp decomposes above $59C$ on rapid heating, boils near $60C$, refr index 1.567 (20C). Decomposes in water and alcohol; soluble in benzene.

Derivation: Chlorine is passed into sulfur monochloride to saturation at $6-10C$ followed by carbon dioxide to drive off the excess chlorine.

Grade: Technical.

Hazard: Toxic by inhalation and ingestion, strong irritant to tissue.

Use: Chlorine carrier or chlorinating agent, rubber vulcanizing, vulcanized oils, purifying sugar juices, sulfur solvent, chloridizing agent in metallurgy, manufacture of organic chemicals and insecticides.

sulfur dioxide.

CAS: 7446-09-5. SO_2 .

Properties: Colorless gas or liquid; sharp, pungent odor. D 1.4337, liquid at $0C$, fp $-76.1C$, bp $-10C$, vap press 3.2 atm (20C), refr index (liquid) 1.410 (24C), an outstanding oxidizing and reducing agent. Soluble in water, alcohol, and ether; forms sulfurous acid (H_2SO_3). Noncombustible.

Derivation: (1) By roasting pyrites in special furnaces. The gas is readily liquefied by cooling with ice and salt or at a pressure of three atmospheres. (2) By purifying and compressing sulfur dioxide gas from smelting operations. (3) By burning sulfur.

Grade: Commercial, USP, technical, refrigeration, anhydrous 99.98% min.

Hazard: Toxic by inhalation, strong irritant to eyes and mucous membranes, especially under pressure. Dangerous air contaminant and constituent of smog. Not permitted in meats and other sources of vitamin B_1 . TLV: 2 ppm; STEL 5 ppm; not classifiable as a human carcinogen. U.S. atmospheric standard 0.140 ppm.

Use: Chemicals (H_2SO_4 , salt cake, sulfites, hydrosulfites of potassium and sodium, thiosulfates, alum from shale, recovery of volatile substances), sulfite paper pulp, ore and metal refining, soybean protein, intermediates, solvent extraction of lubricating oils, bleaching agent for oils and starch, sulfonation of oils, disinfecting and fumigating, food additive (inhibition of browning, of enzyme-catalyzed reactions, bacterial growth), reducing agent, antioxidant.

sulfur dye. See sulfide dye.

sulfuretted hydrogen. See hydrogen sulfide.

sulfur hexafluoride.

CAS: 2551-62-4. SF_6 .

Properties: Colorless gas; odorless. Fp $-64C$ (sublimes), d (gas) 6.5 g/L, d (liquid) 1.67, specific volume 2.5 cu ft/lb (21.1C). Slightly soluble in water; soluble in alcohol and ether. Noncombustible.

Hazard: TLV: 1000 ppm.

Use: Dielectric (gaseous insulator for electrical equipment and radar wave guides).

sulfuric acid. (hydrogen sulfate; battery acid; electrolyte acid).

CAS: 7664-93-9. H_2SO_4 . By far the most widely used industrial chemical.

Properties: Strongly corrosive, dense, oily liquid; colorless to dark brown depending on purity. Miscible with water. Very reactive, dissolves most metals; concentrated acid oxidizes, dehydrates, or sulfonates most organic compounds, often causes charring; d of pure material 1.84; mp 10.4C; bp varies over range 315–338C due to loss of sulfur trioxide during heating to 300C or higher.

Note: Use great caution in mixing with water due to heat evolution that causes explosive spattering. Always add the acid to water, *never* the reverse.

Derivation: From sulfur, pyrite (FeS₂), hydrogen sulfide, or sulfur-containing smelter gases by the contact process (vanadium pentoxide catalyst). The first step is combustion of elemental sulfur or roasting of iron pyrites to yield sulfur dioxide. Then follows the critical reaction, catalytic oxidation of sulfur dioxide to sulfur trioxide.

in a four-stage converter at 425–450C with evolution of heat. After cooling to 160C, the sulfur trioxide is absorbed in a circulating stream of 98–99% sulfuric acid, where it unites with the small excess of water in the acid to form more sulfuric acid.

Sulfuric acid can also be made by the “Cat-Ox” process and from gypsum (calcium sulfate).

Grade: Commercial 60 degrees Bé: (d 1.71, 77.7% sulfuric acid); 66 degrees Bé (d 1.84, 93.2% sulfuric acid); 98% (d 1.84); 99% (d 1.84); 100% (d: 1.84) depending on supplier; reagent ACS, CP.

Hazard: Strong irritant to tissue. TLV: 1 mg/m³; STEL 3 ppm; Suspected Human CVarcinogen. See note above.

Use: Fertilizers, chemicals, dyes and pigments, etchant, alkylation catalyst, electroplating baths, iron and steel, rayon and film, industrial explosives, lab reagent, nonferrous metallurgy.

See sulfuric acid, fuming.

sulfuric acid, fuming. (oleum).

CAS: 8014-95-7. xH₂SO₄·ySO₃. A solution of sulfur trioxide in sulfuric acid.

Properties: Heavy, oily liquid; colorless to dark brown depending on purity. Fumes strongly in moist air. Extremely hygroscopic.

Derivation: Sulfur trioxide produced by the contact process is absorbed in concentrated sulfuric acid.

Grade: Commercial (10–70% free SO₃ depending on supplier), CP.

Hazard: Reacts violently with water. Strong irritant to tissue.

Use: Sulfating and sulfonating agent, dehydrating agent in nitrations, dyes, explosives, lab reagent.

sulfuric anhydride. See sulfur trioxide.

sulfuric chloride. See sulfuryl chloride.

sulfuric oxychloride. See sulfuryl chloride.

sulfur monobromide. See sulfur bromide.

sulfur monochloride. See sulfur chloride.

sulfurous acid.

CAS: 7782-99-2. A solution of sulfur dioxide in water. The formula H₂SO₃ is used, but the acid is known only through its salts.

Properties: Colorless liquid; suffocating sulfur odor. D 1.03, unstable. Soluble in water.

Derivation: Absorption of sulfur dioxide in water.

Grade: Technical, CP.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue.

Use: Organic synthesis; bleaching straw and textiles, etc.; paper manufacture; wine manufacture; brewing; metallurgy; ore flotation; medicine (antiseptic); reagent in analytical chemistry; sulfites; as preservative for fruits, nuts, foods, wines; disinfecting ships.

sulfur oxychloride. See thionyl chloride.

sulfur pentachloride. (disulfur decafluoride).

CAS: 5714-22-7. S₂F₁₀.

Properties: Colorless gas; SO₂ odor. Mw 254.11, sp g 2.08 at 0C, mp –92C, bp 29C, vp 561 torr (20C). Insoluble in water.

Hazard: TLV: ceiling 0.01 ppm.

sulfur subchloride. See sulfur chloride.

sulfur tetrafluoride.

CAS: 7783-60-0. SF₄.

Properties: A gas. Fp –124C, bp –40C. Decomposes in water. Noncombustible.

Grade: Available in cylinders at 90–94% purity.

Hazard: High by inhalation, strong irritant to eyes and mucous membranes. TLV: ceiling 0.1 ppm.

Use: Fluorinating agent for making water and oil repellents and lubricity improvers.

sulfur trioxide. (sulfuric anhydride).

CAS: 7446-11-9. SO₃, (SO₃)_n.

Properties: Exists in three solid modifications; α mp 62C, β mp 32.5C, γ mp 16.8C. The α form appears to be the stable form but the solid transitions are commonly slow; a given sample may be a mixture of the various forms and its melting point not constant. The solid sublimates easily.

Derivation: Passing a mixture of SO₂ and oxygen over a heated catalyst such as platinum or vanadium pentoxide.

See sulfuric acid.

Hazard: Oxidizing agent, fire risk in contact with organic materials, an explosive increase in vapor pressure occurs when the α form melts. The anhydride combines with water, forming sulfuric acid

and evolving heat. Highly toxic, strong irritant to tissue.

Use: Sulfonation of organic compounds, especially nonionic detergents, solar energy collectors. It is usually generated in the plant where it is to be used.

sulfuryl chloride. (chlorosulfuric acid; sulfonyl chloride; sulfuric chloride; sulfuric oxychloride).

CAS: 7791-25-5. SO_2Cl_2 .

Properties: Colorless liquid; pungent odor. Rapidly decomposed by alkalis and by hot water; soluble in glacial acetic acid. D 1.667 at 20C, bp 69.2C, fp -54C , vap d 4.6.

Derivation: (1) By heating chlorosulfonic acid in the presence of catalysts. (2) From sulfur dioxide and chlorine in the presence of either activated carbon or camphor.

Grade: Technical.

Hazard: Strong irritant to tissue.

Use: Organic synthesis (chlorinating agent, dehydrating agent, acylating agent) pharmaceuticals, dyestuffs, rubber-base plastics, rayon, solvent, catalyst.

sulfuryl fluoride.

CAS: 2699-79-8. SO_2F_2 .

Properties: Colorless gas. Fp -136.7C , bp -55.4C . Slightly soluble in cold water and most organic solvents. Noncombustible.

Hazard: Toxic by inhalation. TLV: 5 ppm; STEL 10 ppm.

Use: Insecticide, fumigant.

sulphenone. (*p*-chlorophenyl phenyl sulfone).

CAS: 80-00-2.

Properties: White solid. Mp 98C. Insoluble in water; soluble in hexane, xylene, carbon tetrachloride, and acetone.

Use: A miticide.

“Sulphon” [BASF]. TM for acid dyestuffs used on wool and silk, fair to good fastness to light, good fastness to washing, etc.; can be used on leather and paper.

sulprofos. (*O*-ethyl-*O*-[4-(methylthio)phenyl]-*S*-propyl phosphorodithioate; Bolstar [Bayer Corp]).

CAS: 35400-43-2. $\text{C}_{12}\text{H}_{19}\text{O}_2\text{P}_2\text{S}_3$.

Properties: Tan colored liquid; sulfide odor. Mw 322.43, sp g 1.20 (20C), bp 125C (0.0075 torr). Soluble in organic solvents; insoluble in water.

Hazard: TLV: 1 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide.

sultam acid. (1,8-naphthosultam-2,4-disulfonic acid). $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2\text{NHSO}_2$.

Properties: White solid. Soluble in water; slightly soluble in alcohol.

Derivation: Sulfonation of 1-naphthylamine-8-sulfonic acid or 1-naphthylamine-4,8-disulfonic acid.

Use: Intermediate for Chicago acid.

sulvanite. (ethyl sulfonyl chloride).

$\text{ClSO}_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid. Bp 135C.

Use: Poison gas.

sumiseven.

CAS: 83657-22-1. mf: $\text{C}_{15}\text{H}_{18}\text{ClN}_3\text{O}$.

Hazard: Moderately toxic by ingestion and skin contact.

Sumner, James B. (1887–1955). An American biochemist who won the Nobel Prize in chemistry in 1946 along with Northrop and Stanley. His work was mainly concerned with enzymes, and he was the first in the field to isolate and crystallize an enzyme and determined it was a protein. He inspired followers to continue research in virus and enzyme study. His education was at Harvard and he taught for many years at Cornell.

sump. A chamber or large container into which waste liquids from processing or mechanical operations are allowed to collect and from which they are removed by a pump.

“Sun Anti-Chek Wax 55” [Carroll]. TM for general purpose paraffin wax inhibitor for ozone cracking and weathering, nonstaining.

Use: As a process aid and lubricant.

sunflower cake. The press-cake resulting from hydraulic press expression of sunflower seeds. Typical analysis: proteins 21.0%, fats 8.5%, fiber 48.9%, water 10.2%, ash 11.4%.

Use: Cattle food, fertilizer ingredient.

sunflower meal. The mealy form assumed by sunflower seeds after crushing and heating. If the oil cake is ground the product again is in this mealy form. It contains 55–60% protein.

Use: Animal feed, fertilizers.

sunflower oil.

Properties: Pale-yellow, semidrying oil; mild taste; pleasant odor. D 0.924–0.926, iodine value 130–135, refr index 1.4611. Soluble in alcohol, ether, chloroform, and carbon disulfide. Combustible.

Chief constituents: Mixed triglycerides of linoleic, oleic, and other fatty acids.

Derivation: By expression from the seeds of *Helianthus annuus*.

Method of purification: Filtration.

Grade: Crude, refined.

Use: Modified alkyd resins, soap, edible oil, margarine, shortening, dietary supplement.

sunflower oil (unhydrogenated).

Properties: From the seed of *Helianthus annuus*. Amber-colored liquid.

Use: Food additive.

“Sunproof” [Uniroyal]. TM for a series of protective waxes to prevent static atmospheric cracking in all types of synthetic and natural rubbers.

“Supac” [Phillips]. TM for engineered geotextile nonwoven fabric.

Use: Civil engineering applications.

superactinide. See periodic table.

superalloy. An iron-base, cobalt-base, or nickel-base alloy that combines high-temperature mechanical properties, oxidation resistance and creep resistance to an unusual degree. Constitutions of these alloys are as follows. Iron-base: 10–45% nickel, 13–19% chromium, 1.3–6% molybdenum, balance iron. Cobalt-base: 0–26% nickel, 0–26% chromium, 0–15% tungsten, balance cobalt. Nickel-base: 55–75% nickel, 10–20% chromium, 0–6% aluminum, 0–5% titanium. All contain less than 0.5% carbon, plus other special ingredients. Superalloys can be used up to 2500F.

Use: Jet engine parts, turbo-superchargers, extreme high-temperature applications.

“Super-Backacite” [Reichhold]. TM for pure phenolic resins used as coating vehicles.

“Super-Beckamine” [Reichhold]. TM for melamine-formaldehyde resins used as coating vehicles.

supercalender. A machine used for finishing paper. It is a vertical stack of from 3 to 12 or more rolls through which the sheet is threaded. The top and bottom rolls are of chilled cast iron and are larger than the intermediate rolls, several of which are of the fiber type. Overall widths may be as much as 15 ft. Operating speeds range from 600 to 2000 ft per minute. The supercalender imparts gloss and smoothness to high-grade papers, both coated and uncoated, as a result of the interaction of the metal and resilient fiber rolls.

See fiber roll; calender; paper.

superconductivity. The phenomenon in which certain metals, alloys, and compounds at temperatures usually near absolute zero lose both electrical resistance and magnetic permeability, i.e., have infinite electrical conductivity. Depending upon the substance, the maximum temperature (transition temperature) for the phenomenon as of 1985 was 0.5–28K. Superconductivity does not occur in alkali metals, noble metals, ferro- and antiferromagnetic metals. It is well known in elements having 3, 5, or 7 valence electrons per atom, and is associated with high room-temperature resistivity. A system for

transmitting electric current underground by means of superconducting cables has been developed. See cryogenics.

supercooled liquid. A liquid cooled below its normal freezing point without solidification.

supercritical fluid. A dense gas that is maintained above its critical temperature (the temperature above which it cannot be liquefied by pressure). Such fluids are less viscous and diffuse more readily than liquids, and are thus more efficient than other solvents in liquid chromatography.

“Superfloc A-836” [Cytec].

Properties: Off-white granular powder. Den: 47-53 lb/f³, pH of 0.5% solution at 77F 6.5-8.5. TM for a dry polyacrylamide cationic, flocculated with controlled molecular weight distribution and varying charge densities.

Use: Works effectively to control and substantially prevent silt loss (erosion) in furrow irrigated agriculture.

“Supergro” [Phillips]. TM for engineered geotextile fabric.

Use: Erosion control mat.

“Superlitefast” [Crompton]. TM for a group of direct dyes.

Available forms: Powder.

Use: For dyeing of cellulosic fibers.

“Superloid” [Kelco]. TM for ammonium alginate, a hydrophilic colloid.

Use: Suspending, thickening, emulsifying, and stabilizing agent in creaming and bodying of rubber latex products; protective colloid in resin emulsion paints, adhesives, fire-retarding compositions, ceramics, etc.

“Superlume” [Uniroyal]. TM for a superleveling, bright-nickel electroplating process on steel stampings, brass, copper, zinc die castings, etc. The materials used are nickel sulfate, nickel chloride, boric acid, and addition agents.

supernatant. A liquid forming a clear layer above a precipitate produced from a solution of the liquid.

superoxide. A compound characterized by the presence in its structure of the O₂⁻ ion. The O₂⁻ ion has an odd number of electrons (17) and as a result all superoxide compounds are paramagnetic. At room temperature they have a yellowish color. At low temperature many of them undergo reversible phase transitions accompanied by a color change to white. The stable superoxides are

sodium superoxide	NaO ₂
potassium superoxide	KO ₂

rubidium superoxide	RbO ₂
cesium superoxide	CsO ₂
calcium superoxide	Ca(O ₂) ₂
strontium superoxide	Sr(O ₂) ₂
barium superoxide	Ba(O ₂) ₂
tetramethylammonium superoxide	(CH ₃) ₄ NO ₂

In these compounds each oxygen atom has an oxidation number of $-1/2$ instead of -2 , as a normal oxide.

superpalite. (diphosgene; green cross gas; trichloromethylchloroformate). ClCOOCCl₃.

Properties: D 1.6525, bp 127.5–128C.

“Superpax” [Pfizer]. TM for 92–94.5% zirconium silicate with bulk d 68 lb/cu ft, average particle size 5 microns max.

Use: Ceramic glazes and as a filler for resins and rubbers.

superphosphate. (acid phosphate). The most important phosphorus fertilizer, made by the action of sulfuric acid on insoluble phosphate rock (essentially calcium phosphate, tribasic) to form a mixture of gypsum and calcium phosphate, monobasic. A typical composition is CaH₄(PO₄)₂•H₂O 30%, CaHPO₄ 10%, CaSO₄ 45%, iron oxide, alumina, silica 10%, water 5%. Typical analysis: Moisture 10–15%, available phosphoric acid (as P₂O₅) 18–21%, insoluble phosphoric acid 0.3–2%, total phosphoric acid (as P₂O₅) 19–23%.

Grade: Based on available P₂O₅.

Use: Fertilizer.

See triple superphosphate; nitrophosphate.

superphosphoric acid. See polyphosphoric acid.

supersaturation. The condition in which a solvent contains more dissolved matter (solute) than is present in a saturated solution of the same components at equivalent temperature. Such solutions may occur or can be made when a saturated solution cools gradually so that nucleating crystals do not form. They are extremely unstable and will precipitate upon addition of even one or two crystals of the solute or upon shaking or other slight agitation. Supersaturated solutions occur in the confectionery industry, e.g., in fudges, maple sugar, etc.

“Super Shock” [Arch]. TM for a shock system for swimming pools.

Use: Fast dissolving weekly pool treatment.

“Super-Sta-Bac” [Reichhold]. TM for hydrocarbon resins that are polymers of mixed olefins.

suppressor gene. A gene that can suppress the action of another gene.

suppressor mutation. A mutation that totally or partially restores a function lost in a previous

mutation. Must be located at a site different from the site of the first mutation.

“Supralan” [BASF]. TM for metallized acid colors of good fastness and level dyeing properties.

“Supramine” XA [BASF]. TM for a leather chemical, solubilized sulfur phenol condensate, 75% active.

“Supranol” [BASF]. TM for dyestuffs used on wool and silk; good fastness to light, washing, and seawater; can also be used on leather.

surface. In physical chemistry the area of contact between two different phases or states of matter, e.g., finely divided solid particles and air or other gas (solid-gas); liquids and air (liquid-gas); insoluble particles and liquid (solid-liquid). Surfaces are the sites of the physicochemical activity between the phases that is responsible for such phenomena as adsorption, reactivity, and catalysis. The depth of a surface is of molecular order of magnitude. The term *interface* is approximately synonymous with *surface*, but it also includes dispersions involving only one phase of matter, i.e., solid-solid or liquid-liquid. See interface; surface area; surface chemistry.

surface-active agent. (surfactant). Any compound that reduces surface tension when dissolved in water or water solutions, or that reduces interfacial tension between two liquids, or between a liquid and a solid. There are three categories of surface-active agents: detergents, wetting agents, and emulsifiers; all use the same basic chemical mechanism and differ chiefly in the nature of the surfaces involved.

See interface; surface chemistry.

surface area. The total area of exposed surface of a finely divided solid (powder, fiber, etc.) including irregularities of all types. Since activity is greatest at the surface, that is, the boundary between the particle and its environment, the larger the surface area of a given substance, the more reactive it is. Thus reduction to small particles is a means of increasing the efficiency of both chemical and physical reactions; for example, the coloring effect of pigments is increased by maximum size reduction. Carbon black is notable among solids for its huge surface area (as much as 18 acres/lb for some types); the activity of its surface accounts for its outstanding ability to increase the strength and abrasion resistance of rubber. The capacity of activated carbon to adsorb molecules of gases is due to this factor. Surface area is measured most accurately by nitrogen adsorption techniques.

surface chemistry. The observation and measurement of forces acting at the surfaces of gases, liquids and solids or at the interfaces between them. This includes the surface tension of liquids (vapor

pressure, solubility); emulsions (liquid-liquid interfaces); finely divided solid particles (adsorption, catalysis); permeable membranes and microporous materials; and biochemical phenomena such as osmosis, cell function, and metabolic mechanisms in plants and animals. Surface chemistry has many industrial applications, a few of which are air pollution, soaps and synthetic detergents, reinforcement of rubber and plastics, behavior of catalysts, color and optical properties of paints, aerosol sprays of all types, monolayers and thin films, both metallic and organic. Outstanding names in the development of this science are Graham, Freundlich, and W. Ostwald in the 19th Century and Harkins, Langmuir, LaMer, and McBain in the 20th.

See colloid chemistry.

surface tension. In any liquid, the attractive force exerted by the molecules below the surface upon those at the surface-air interface, resulting from the high molecular concentration of a liquid compared to the low molecular concentration of a gas. An inward pull, or internal pressure, is thus created which tends to restrain the liquid from flowing. Its strength varies with the chemical nature of the liquid. Polar liquids have high surface tension (water = 73 dynes/cm at 20°C); nonpolar liquids have much lower values (benzene = 29 dynes/cm, ethanol = 22.3 dynes/cm), thus they flow more readily than water. Mercury, with the highest surface tension of any liquid (480 dynes/cm) does not flow, but disintegrates into droplets.

See interface; surface-active agent.

surfactant. See surface-active agent.

“Sur-Gard” [Nalco]. TM for chemicals used for treatment of boiler water to inhibit scale and corrosion and to remove oxygen from the boiler water.

“Surlyn” [Du Pont]. TM for a group of ion-omer resins.

Properties: (“Surlyn” A) Thermoplastic produced as a granular material; flexible, transparent, grease resistant; very light weight but tough. Izod impact strength 5.7–14.6 ft-lb/in (higher than any other polyolefin), tensile strength 3,500–5,500 psi, elongation 300–400%, softening point 71. Insoluble in any commercial solvent. Subject to slow swelling by hydrocarbons, to slow attack by acids.

Use: Coatings, packaging films, products made by injection or blow molding, or by thermoforming.

SUS. Abbreviation for Saybolt Universal Seconds.

See Saybolt Universal viscosity.

suspension. A system in which very small particles (solid, semisolid, or liquid) are more or less uniformly dispersed in a liquid or gaseous medium. If the particles are small enough to pass through

filter membranes, the system is a colloidal suspension (or solution). Examples of solid-in-liquid suspensions are comminuted wood pulp in water, which becomes paper on filtration; the fat particles in milk; and the red corpuscles in blood. A liquid-in-gas suspension is represented by fog or by an aerosol spray. If the particles are larger than colloidal dimensions they will tend to precipitate if heavier than the suspending medium, or to agglomerate and rise to the surface if lighter. This can be prevented by incorporation of protective colloids. Polymerization is often carried out in suspension, the product being in the form of spheres or beads.

See solution; colloidal; dispersion; emulsion; colloid chemistry.

“Sustane” [Eastman Chemical China].

TM for a low viscosity blend weighting agent for liquids.

“Sustane” [UOP]. TM for synthetic, food-grade antioxidant product line including BHA, BHT, TBHQ, propyl gallate, and liquid blends.

Use: To preserve vegetable oils, animal fats, spices, baked goods, nuts, pet foods, dressing oils, confections, cereals, sausage, cosmetics, and dehydrated potatoes.

Svedberg, Theodor. (1884–1971). A Swedish chemist who won the Nobel Prize in 1926. Author of *Die Methoden zur Herstellung Kolloider Losungen anorganischer Stoffe*. His work included research in colloidal chemistry, molecular size determination, and methods of electrophoresis, as well as the development of the ultracentrifuge for separation of colloidal particles in solution. His education was in Sweden with later work done at the University of Wisconsin before returning to Uppsalla.

Svedberg. (S). A unit of measure of the rate at which a particle sediments in a centrifugal field.

Swarts reaction. Fluorination of organic polyhalides with antimony trifluoride (or zinc and mercury fluorides) in the presence of a trace of a pentavalent antimony salt.

“Sweet Design” [Cargill]. TM for a sweetener system.

Use: In food and beverage manufacturing to produce better tasting frozen desserts and sweetened products with little or no sugar.

sweeten. (1) To add sugar or a synthetic product to foods or beverages to provide a sweet taste (flavor). (2) To deodorize and purify petroleum products by removing sulfur compounds (doctor treatment). (3) In industrial slang, to increase the quality of a low-cost product by adding more expensive ingredients.

sweetener, nonnutritive. A food additive, either natural or synthetic, usually having much greater sweetness intensity than sugar (sucrose), but without its caloric value. In some cases it acts as an enhancer or potentiator of sweetness. Chief among them is saccharin, a benzoic acid derivative. The cyclamate group was removed from the market by FDA in 1970 because of animal carcinogenicity, though the evidence in respect to human toxicity is controversial.

Increasing research has developed several new non-caloric sweeteners: the dihydrochalcone group of disaccharide, glycyrrhizin (licorice extract), especially its ammoniated derivative; dulcin (4-ethoxyphenylurea), the glycoprotein of "miracle fruit;" and a polypeptide from a tropical fruit called the "serendipity berry," said to be 3000 times sweeter than sucrose. "Aspartame" ($C_{14}H_{18}N_2O_5$) has been approved by FDA.

sweet oil. See olive oil.

sweet water. (1) The glycerin and water mixture obtained when fats are split (or hydrolyzed) with water to give fatty acid and glycerin. (2) The washings from char used in sugar refining. (3) In engineering terminology, plain water cooled to just below the freezing point and used to preserve milk and other food products.

swep. (generic name for methyl-3,4-dichloro-carbanilate; methyl-*n*-3,4-dichlorophenylcarbamate). $CH_3OOCNHC_6H_3Cl_2$.

Properties: Crystals. Mp 113C. Insoluble in water and kerosene; soluble in acetone and dimethylformamide.

Hazard: Toxic by ingestion.

Use: Herbicide.

swertianolin.

CAS: 23445-00-3. mf: $C_{20}H_{20}O_{11}$.

Hazard: A poison.

Source: Natural product.

"Sybicort" [Lagap]. TM for a drug.

Use: For treatment of asthma and pulmonary diseases.

"Sylgard" [Dow Corning]. TM for a series of silicone resin encapsulants used in electronic assemblies.

"Sylloid" [Grace]. TM for a series of micron-sized silicas.

Use: Flattening agents, lacquer, baking finishes, inks, paper reproduction, adhesives, pharmaceuticals, insulation.

"Syltherm" [Dow Corning]. TM for dimethylsiloxane polymer.

Use: (561) Dielectric coolant for transformers; (800) high temperature, liquid-phase, heat-transfer liquid.

Also used in industrial applications, glass and lens coating, cosmetics, penetrating oils, and personal-care products.

sylvan. (α -methylfuran). C_5H_6O . Constituent of wood tar.

sylvic acid. See abietic acid.

sylvite. (sylvine). KCl. A natural potassium chloride, contains 43% potassium chloride, 57% sodium chloride, sometimes with up to 0.26% bromide.

Properties: Colorless or white, bluish or reddish in color, white streak, vitreous luster, resembles rock salt in appearance. D 1.97–1.99, Mohs hardness 2.

Occurrence: West Texas, New Mexico, Europe.

Use: Major source of potassium compounds in the U.S., fertilizers.

symbiosis. Two (or more) organisms that are mutually interdependent and live in physical association.

symmetrical compound. A compound derived from benzene in which the hydrogen atom on three alternate carbon atoms has been replaced with another element or group, for example, at the 1, 3, and 5 positions.

"Symmetrel" [Du Pont]. (amantadine hydrochloride). TM for a synthetic antiviral drug specific for A_2 -type virus infection (one type of Asian flu). It is taken orally and acts by preventing the virus from entering cells. It is inactive against B-type viruses. Reported to be effective in treatment of Parkinson's disease.

symmetry. Arrangement of the constituents of a molecule in a definite and continuously repeated space pattern or coordinate system. It is described in terms of three parameters called elements of symmetry (1) The center of symmetry, around which the constituent atoms are located in an ordered arrangement; there is only one such center in a molecule, which may or may not be an atom. (2) Planes of symmetry, which represent division of a molecule into mirror-image segments. (3) Axes of symmetry, represented by lines passing through the center of symmetry; if the molecule is rotated it will have the same position in space more than once in a complete 360 degree turn, e.g., the benzene molecule with 6 axes of symmetry requires a 60-degree rotation to return to its identical position.

See stereochemistry; asymmetry.

symport. Cotransport of solutes across a membrane in the same direction.

synapomorphy. A character which is derived, and because it is shared by the taxa under consideration, is used to infer common ancestry.

synaptase. See emulsion.

“Syncal” [Aqualon]. TM for synthetic sweetener, saccharin, including sodium and calcium salts and insoluble form, as well as several different particle size distributions.

syndet. Abbreviation form for synthetic detergent.
See detergent.

syndiotactic. A type of polymer molecule in which groups of atoms that are not part of the backbone structure are located in some symmetrical and recurring fashion above and below the atoms in the backbone chain, when the latter are arranged so as to be in a single plane.
See polymer, stereospecific.

Syndiotactic polymer

syndrome. The group or recognizable pattern of symptoms or abnormalities that indicate a particular trait or disease.

syneresis. The contraction of a gel on standing, with exudation of liquid. The separation of serum from a blood clot, or of the whey in milk souring or cheese making are examples.

synergism. A chemical phenomenon (the opposite of antagonism) in which the effect of two active components of a mixture is more than additive, i.e., it is greater than the equivalent volume or concentration of either component alone. A substance that induces this result when added to another substance is called a synergist.

synfuel. Any gaseous or liquid fuel made by the synthesis gas reaction; synthetic natural gas (SNG) and methanol are examples, the latter being the only synfuel commercially available in the U.S. (Othmer, 1983).
See semisynthetic.

syngamy. The process of union of two gametes; sometimes called fertilization. It encompasses both plasmogamy and karyogamy.

syngas. Shortened form of synthesis gas.

syngeneic. Genetically identical members of the same species.

Synge, Richard L. M. (1914–1994). An Irish mathematician and physicist who won the Nobel Prize for chemistry in 1952 along with Archer. His research was on the application of methods of physical chemistry to isolate and analyze proteins, with special attention to antibiotic peptides and higher plants. He received his doctorate from Cambridge.

“Synoca” [Nalco]. TM for a group of cleaning compounds including wetting agents, detergents, or alkaline hexametaphosphate.

Use: Continuous conditioning and batch washing of paper machine felts. Paper-mill system boil-outs. Deinking of secondary fiber.

“Synotol” [Drew]. TM for a series of alkanolamides of fatty acids.

Use: Foam builders, viscosity improvers, wetting agents, detergents, and opacifiers.

“Synpro” [Ferro]. TM for aluminum, calcium, lithium, magnesium, and zinc stearates.

syntan. A synthetic organic tanning material made from phenolsulfonic acids and formaldehyde.

Use: Chrome- and vegetable-tanned leathers.
See tanning.

synteny. Genes occurring in the same order on chromosomes of different species.

See linkage; conserved sequence.

synthane process. See Fischer-Tropsch process; gasification.

synthases. Enzymes that catalyze reactions in which no NTP is required as an energy source.

“Synthe-Copal” [Reichhold]. TM for pale-colored rosin ester gums used as coating vehicles, and in chewing gums and rubber adhesives.

“Synthemul” [Reichhold]. TM for a series of acrylate-acrylonitrile, acrylic, and styrene acrylic emulsions.

synthesis. Creation of a substance that either duplicates a natural product or is a unique material not found in nature, by means of one or more chemical reactions, or (for elements) by a nuclear change. High temperature and pressures as well as a catalyst are usually required. Though syntheses are more readily achieved with organic compounds because of the great versatility of the carbon atom, extremely important syntheses of inorganic compounds were made in the early years of chemistry. A list of noteworthy syntheses with approximate dates would include the following:

Inorganic	Organic	
sulfuric acid (chamber)	urea (Wohler)	1828
	mauveine (Perkin)	1857
		1746

Inorganic		Organic	
(contact)	1890	Celluloid (Hyatt)	1869
soda ash (LeBlanc)	1800	ethylbenzene	
(Solvay)	1861	(Friedel Crafts)	1877
ammonia		rayon	
(Haber-Bosch)	1912	(Chardonnet)	1884
plutonium	1940	phenolic resins	
		(Bakeland)	1910
		neoarsphenamine	
		(Ehrlich)	1910
		aldehydes, alcohols	
		(Oxo synthesis)	1920
		methanol	1927
		neoprene	
		(Nieuwland)	1930
		nylon (Carothers)	1935
		SBR rubber	1940
		polyisoprene	1950

The tremendous proliferation of synthetic materials in recent years, especially in the high-polymer field, was made possible by the increasingly sophisticated use of catalysts, particularly the Ziegler and Natta stereospecific type.

Synthesis of elements has also occurred; since 1940 all the transuranic elements from 93 to 106, as well as a vast array of radioisotopes of natural elements, have been created by nuclear bombardment of various types. See resin, synthetic; semisynthetic.

synthesis gas. Any of several gaseous mixtures used for synthesizing a wide range of compounds, both organic and inorganic, especially ammonia. Such mixtures result from reacting carbon-rich substances with steam (steam reforming) or steam and oxygen (partial oxidation); they contain chiefly carbon monoxide and hydrogen, plus low percentages of carbon dioxide and usually less than 2.0% nitrogen. The organic source materials may be biomass, natural gas, methane, naphtha, heavy petroleum oils, or coke (coal). The reactions are nickel-catalyzed steam-cracking (reforming) of methane or natural gas ($\text{CH}_4 + \text{H}_2\text{O} \rightarrow \text{CO} + 3\text{H}_2$); partial oxidation of methane, naphtha, or heavy oils; and the water-gas reaction with coke ($\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2$). With transition-metal catalysts synthesis gas yields alcohols, aldehydes, acrylic acid, etc., and has many useful reactions with acetylene; it is the basis of the Oxo and Fischer-Tropsch reactions. Synthesis gas from that the carbon monoxide has been removed and which has been adjusted to a ratio of 3 parts hydrogen and 1 part nitrogen is used for ammonia synthesis (nitrogen fixation). Processing with a catalyst at high temperatures and pressures yields ammonia.

See ammonia, anhydrous; Oxo process; Haber, Fritz; water gas; gasification; Fischer-Tropsch process.

synthetases. Enzymes that catalyze reactions using ATP or another NTP as an energy source.

synthetic natural gas. (SNG; syngas). Any manufactured fuel gas of approximately the same composition and Btu value as that obtained naturally from oil fields (85% methane and 15% ethane). There are two major methods of synthesis involving catalysts, high temperature, and high pressure: (1) direct hydrogenation of coal; and (2) methanation of synthesis gas, obtained by hydrogenolysis of coal or steam-reforming of naphtha or similar petroleum distillate. Other methods involve pyrolysis of solid wastes and extraction from oil shale and manures. See gasification; hydrogenolysis.

Synthetic Organic Chemical Manufacturers Association. (SOCMA). Manufacturers of synthetic organic chemicals that are products manufactured from coal, natural gas, crude petroleum and certain natural substances such as vegetable oils, fats protein, carbohydrates, rosin, grain, and their derivatives. The address is 1850 M St N.W., Suite 700, Washington, DC 20036. Website: <http://www.socma.com>.

synthetic paraffin and succinic derivatives.
Use: Food additive.

synthetic resin. See resin, synthetic.

synthine process. See Fischer-Tropsch process.

synthol. Liquid fuel containing fatty acids, water-soluble alcohols, aldehydes, ketones, and esters. Obtained from reduction of carbon monoxide in water-gas at high temperature and pressure with iron as catalyst.

“Synthorich NC” [Synthotex]. TM for a softener.
Use: To give value added finish to fabrics.

“Synthorm RLS” [Synthotex]. TM for a mould releasing agent.
Use: For rubber moulds.

“Synthosoft SWNI” [Synthotex]. TM for a nonionic softner with extra whiteners.

synton. Any of several isomers of prostaglandin from which prostaglandin analogs and intermediates may be derived.

syntopherol acetate. See *dl*- α -tocopheryl acetate.

syrosingopine.
CAS: 84-36-6. $\text{C}_{35}\text{H}_{42}\text{N}_2\text{O}_{11}$. Methyl reserpate ester of syringic acid ethyl carbonate. An analog of reserpine.

Properties: White or slightly yellowish powder. Practically insoluble in water; slightly soluble in methanol; soluble in chloroform and acetic acid.

Grade: NF.
Use: Medicine.

syrup. Commercial name for an aqueous solution of cane or beet sugar (sucrose) sold in tank car lots to manufacturers of candy, soft drinks, soda-fountain goods, etc. USP grade is an aqueous solution of cane sugar (85g/100 mL). A viscous liquid with d 1.313.

systematics. Field of biology that deals with the diversity of life. Systematics is usually divided into phylogenetics and taxonomy.

“Systox” [Bayer]. TM for demeton.

“Syton” [Solutia]. TM for a series of colloidal silicas dispersed in water.
Use: Antisoil and antislip agents.

T

T. Symbol for (1) tritium; (2) tera-; (3) thymine.

2,4,5-T. Abbreviation for 2,4,5-trichlorophenoxyacetic acid.

2,4,6-T. Abbreviation for 2,4,6-trichlorophenol.

Ta. Symbol for tantalum.

tabun. (dimethylphosphoramidocyanidic acid, ethyl ester).
CAS: 77-81-6. $(\text{CH}_3)_2\text{NP}(\text{O})(\text{C}_2\text{H}_5\text{O})(\text{CN})$. A nerve gas.

Properties: Liquid. Fp -50C , bp 240C , flash p 172F (77.7C), d 1.4250 ($20/4\text{C}$). Readily soluble in organic solvents; miscible with water but readily hydrolyzed; destroyed by bleaching powder, generating cyanogen chloride. Combustible.

Hazard: Very toxic by inhalation, cholinesterase inhibitor, a military nerve gas, fatal dose (man) 0.01 mg/kg .

“TAC” [Mallinckrodt]. TM for tested additive chemical items, satisfactory for food additives and medical uses.

tachysterol. $\text{C}_{28}\text{H}_{44}\text{O}$.

Properties: Oil; levorotatory. Insoluble in water; soluble in most organic solvents. Protect from air.
Use: Medicine, as the dihydrotachysterol.

tackifiers. Refers to compounds used for making an adhesive stickier.

tackiness. (tack). Property of being sticky or adhesive.

taconite. A low-grade iron ore consisting essentially of a mixture of hematite and silica. It contains 25% iron. Found in the Lake Superior district and western states.

tacrolimus hydrate.

CAS: 109581-93-3. mf: $\text{C}_{44}\text{H}_{69}\text{NO}_{12}\cdot\text{H}_2\text{O}$.

Hazard: A poison by ingestion.

tacticity. The regularity or symmetry in the molecular arrangement or structure of a polymer molecule. Contrasts with random positioning of substituent groups along the polymer backbone, or random position with respect to one another of successive atoms in the backbone chain of a polymer molecule. See polymer, stereospecific; isotactic.

Tafel rearrangement. Rearrangement of the carbon skeleton of substituted acetoacetic esters to

hydrocarbons with the same number of carbon atoms by electrolytic reduction at a lead cathode in alcoholic sulfuric acid.

Tag Closed Cup. See TCC.

tagetes meal and extract.

Properties: Extracted from the dried ground flower petals of the Aztec marigold *Tagetes erecta* L. Mp: $53.5-55.0^\circ$. A permissible food additive used to increase the yellow color of the skin and eggs of poultry.

Use: Food additive.

tagged atom. A radioactive isotope used in tracing the behavior of a substance in both biochemical and engineering research, e.g., C-14 or I-131. See tracer; label (2).

Tagliabue Closed Cup. A standard method of determining flash points.

Tagliabue Open Cup. A standard method of determining flash points.

Tag Open Cup. See Tagliabue Open Cup.

tailings. (1) In flour milling, the product left after grinding and bolting middlings. (2) Impurities remaining after the extraction of useful minerals from an ore. (3) In general, any residue from a mechanical refining or separation process.

tailored molecule. A molecule that has been modified chemically to give it certain properties.

tails. Refers to high-boiling impurities that are less volatile than the solvent being distilled.

talc. (talcum; soapstone; steatite).

CAS: 14807-96-6.

$\text{Mg}_3\text{Si}_4\text{O}_{10}(\text{OH})_2$ or $3\text{MgO}\cdot 4\text{SiO}_2\cdot\text{H}_2\text{O}$. A natural hydrous magnesium silicate. Compact, massive varieties may be called steatite in distinction from the foliated varieties, which are called talc. Soapstone is an impure variety of steatite.

Properties: White, apple-green, gray powder; pearly or greasy luster, greasy feel. Mohs hardness 1–1.5 (may be harder when impure), high resistance to acids, alkalis and heat; d 2.7–2.8.

Grade: Crude, washed, air-floated, USP, fibrous (99.5%, 99.95%).

Hazard: Toxic by inhalation. TLV: 2 mg/m^3 , respirable dust; not classifiable as a human carcinogen.

Use: Ceramics; cosmetics and pharmaceuticals; filler in rubber, paints, soap, putty, plaster, oilcloth;

abherent; dusting agent; lubricant; paper; slate pencils and crayons; electrical insulation.
See magnesium silicate.

tall oil. (tallol; liquid rosin). A mixture of rosin acids, fatty acids, and other materials obtained by acid treatment of the alkaline liquors from the digesting (pulping) of pine wood; flash p 360F (182C). Combustible.

Derivation: The spent black liquor from the pulping process is concentrated until the sodium salts (soaps) of the various acids separate out and are skimmed off. These are acidified by sulfuric acid. Composition and properties vary widely, but average 35–40% rosin acids, 50–60% fatty acids.

Grade: Crude, refined.

Use: Paint vehicles, source of rosin, alkyd resins, soaps, cutting oils and emulsifiers, driers, flotation agents, oil-well drilling muds, core oils, lubricants and greases, asphalt derivatives, rubber reclaiming, synthesis of cortisone and sex hormones, chemical intermediates.

tall oil imidazoline.

CAS: 61791-36-4.

Hazard: A severe skin and eye irritant.

tallow. An animal fat containing C₁₆ to C₁₈.

Properties: The solidifying points of the different tallows are as follows: from 20–45C for horse fat, 27–38C for beef tallow, 54–56C for stearin and oleo, 32–41C for mutton tallow; d 0.86; refr index 46–49 (40C) (Zeiss); iodine value 193–202; flash p 509F (265C). Combustible.

Derivation: Extracted from the solid fat or “suet” of cattle, sheep, or horses by dry or wet rendering.

Chief constituents: Stearin, palmitin, and olein.

Grade: Edible; inedible; beef tallow; mutton tallow; horse fats; acidless; edible, extra.

Use: Soap stock, leather dressing, candles, greases, manufacture of stearic and oleic acids, animal feeds, abherent in tire molds.

tallow oil. See “Peacock” [*Pfau*].

taloximine hydrochloride.

CAS: 20230-77-7. mf: C₁₂H₁₆N₄O₂•ClH.

Hazard: Moderately toxic by ingestion.

“Tamol” [Rohm & Haas]. TM for anionic, polymer-type dispersing agents. Supplied as light-colored powders or aqueous solutions. Effective dispersant for aqueous suspensions of insoluble dye-stuffs, polymers, clays, tanning agents, and pigments.

Use: Manufacture of dyestuff pastes, textile printing and dyeing, pigment dispersion in textile backings, latex paints and paper coatings, retanning and bleaching of leather, dye resist in leather dyeing, dispersion of pitch in paper manufacture, prefloc prevention in the manufacture of synthetic rubber.

“Tamol 850” [Mid South]. TM for carboxylic homopolymer.

Use: For water treatment, as a scale inhibitor, and sludge dispersant.

tamuslosin hydrochloride. See r(-)-5-(2-((2-(2-ethoxyphenoxy)ethyl)amino)propyl)-2.

“Tanacol CG” [Sybron]. (isopropylbiphenyl).

CAS: 25640-78-2. TM for solvent.

Use: In carbonless-copy-paper systems, replaces PCB in capacitors, heat transfer fluid.

Tanaka, Koichi. (1959–). Born in Japan, Tanaka won the Nobel Prize for chemistry in 2002 for his pioneering work concerning the development of methods for identification and structure analyses of biological macromolecules. Tanaka received a degree in Electrical Engineering from Tohoku University and undertakes his research at the Shimadzu Corporation.

“Tanak” MRX [Cytec]. TM for melamine-formaldehyde resin tanning agent used to make pure-white leather and for bleaching and filling chrome leather.

“Tanamer” [Cytec]. TM for sodium polyacrylate adhesive for use during the drying of leather. See acrylate.

“Tandem 552” [ACH]. TM for emulsifiers.

Use: As pan release agents for frozen desserts, ice cream, baked goods; antibrowning agent for fresh-cut fruits, and vegetable.

tandem repeat sequences. Multiple copies of the same base sequence on a chromosome; used as markers in physical mapping.

See physical map.

tangerine oil. See citrus peel oil.

tankage. (animal tankage; tankage rough ammoniate). The product obtained in abattoir by-product plants from meat scraps and bones, that are boiled under pressure and allowed to settle. The grease is removed from the top and the liquor drawn off. The scrap is then pressed, dried, and sold for fertilizer.

Grade: Based on percentage of ammonia and bone phosphate. A medium grade has 10% ammonia and 20% bone phosphate. Concentrated tankage has had the boiled-down tank liquor and press water added to it before drying and runs 15–17% ammonia.

Hazard: Flammable, may ignite spontaneously.

tankage, garbage. (tankage fertilizer). Garbage treated with steam under pressure, the water and some of the grease removed by pressing, and further grease removed by solvent extraction. Con-

tains 3–4% ammonia, 2–5% phosphoric acid, and 0.50–1.00% potash.

Hazard: Flammable, may ignite spontaneously.

Use: Fertilizer.

tannic acid. (gallotannic acid; described as a penta-*m*-digalloyl)-glucose).

CAS: 1401-55-4. $C_{76}H_{52}O_{46}$. Natural substance widely found in nutgalls, tree barks, and other plant parts. Tannins are known to be gallic acid derivatives. A solution of tannic acid will precipitate albumin. Tannins are classified according to their behavior on dry distillation into two groups, (1) condensed tannins, which yield catechol, and (2) hydrolyzable tannins, which yield pyrogallol; (2) comprises two groups on the basis of its products of hydrolysis, glucose, and (a) ellagic acid or (b) gallic acid.

Properties: Lustrous, faintly yellowish, amorphous powder, glistening scales, or spongy mass; darkens on exposure to air; odorless; strong, astringent taste. Mp decomposes at 210C. Soluble in water, alcohol, and acetone; almost insoluble in benzene, chloroform, and ether. Flash p 390F (198C), autoign temp 980F (526C). Combustible.

Derivation: Extraction of powdered nutgalls with water and alcohol.

Grade: Technical, CP, NF, fluffy, FCC.

Hazard: Toxic by ingestion and inhalation.

Use: Chemicals (tannates, gallic acid, pyrogallic acid, hydrosols of the noble metals); alcohol denaturant; tanning; textiles (mordant and fixative); electroplating; galvanoplastics (gelatin precipitant); clarification agent in wine manufacture, brewing and foods, writing inks; pharmaceuticals; deodorization of crude oil; photography; paper (sizing, mordant for colored papers); treatment of minor burns.

tannin. Any of a broad group of plant-derived phenolic compounds characterized by their ability to precipitate proteins. Some are more toxic than others, depending on their source. Those derived from nutgalls are believed to be carcinogens, while those found in tea and coffee may be virtually non-toxic.

See tannic acid.

tanning. The preservation of hides or skins by use of a chemical that (1) makes them immune to bacterial attack; (2) raises the shrinkage temperature; and (3) prevents the collagen fibers from sticking together on drying, so that the material remains porous, soft, and flexible. Vegetable tanning is used mostly for sole and heavy-duty leathers. The chief vegetable tannins are water extracts of special types of wood or bark, especially quebracho and wattle. The main active constituent is tannic acid. The tannins penetrate the skin or hides after long periods of soaking, during which the molecular aggregates of the tannin form cross-links between the polypeptide chains of the skin proteins; hydrogen bonding is an important factor.

In mineral or chrome tanning, the sulfates of chromium, aluminum, and zirconium are used (the last two for white leather); here the reaction is of a coordination nature between the carboxyl groups of the skin collagen and the metal atom. Syntans are also used; these are sulfonated phenol or naphthols condensed with formaldehyde. Condensation products other than phenol having strong hydrogen-bonding power have been developed. Tanning by any method is a time-consuming and exacting process, requiring careful control of pH, temperature, humidity, and concentration factors.

For further information refer to Tanners' Council, University of Cincinnati, Cincinnati, Ohio. See leather.

tantallic acid anhydride. See tantalum oxide.

tantallic chloride. See tantalum chloride.

tantalite. $(Fe, Hg)(Ta, Nb)_2O_6$. The most important ore of tantalum, found in Canada, Africa, Brazil, Malaysia. When niobium content exceeds that of tantalum, the ore is called columbite.

tantalum.

CAS: 7440-25-7. Ta. Element of atomic number 73 in group VB of the periodic table, aw 180.9479, valences of 2, 3, 5; no stable isotopes.

Properties: (1) Black powder. (2) Steel-blue-colored metal when unpolished, nearly a platinum-white color when polished. D (1) 14.491, (2) 16.6 (worked metal), mp 2996C, bp 5425C, tensile strength of drawn wire may be as high as 130,000 psi, refr index 2.05, expansion coefficient 8×10^{-6} over range 20–1500C. Electrical resistance 13.6 microhm-cm (OC), 32.0 (500C). Soluble in fused alkalis; insoluble in acids except hydrofluoric and fuming sulfuric acids.

Occurrence: Canada, Thailand, Malaysia, Brazil.

Derivation: From tantalum potassium fluoride by heating in an electric furnace, by sodium reduction, or by fused salt electrolysis. The powdered metal is converted to a massive metal by sintering in a vacuum. Foot-long crystals can be grown by arc fusion. Corrosion resistance: 99.5% pure tantalum is resistant to all concentrations of hot and cold sulfuric acid (except concentrated boiling), hydrochloric acid, nitric and acetic acids, hot and cold dilute sodium hydroxide, all dilutions of hot and cold ammonium hydroxide, mine and seawaters, moist sulfurous atmospheres, aqueous solutions of chlorine.

Grade: Powder 99.5% pure, sheet, rods, wire, ultra-pure, single crystals.

Hazard: Dust or powder may be flammable. Toxic by inhalation. TLV: 5 mg/m³.

Use: Capacitors, chemical equipment, dental and surgical instruments, rectifiers, vacuum tubes, furnace components, high-speed tools, catalyst, getter alloys, sutures and body implants, electronic circuitry, thin-film components.

tantalum alcoholate. (pentaethoxytantalum).
(C₂H₅O)₅Ta.

Use: Catalyst, intermediate for pure tantalates, preparing thin dielectric films.

tantalum carbide. TaC.

Properties: Hard, heavy, refractory, crystalline solid. Mp 3875C, bp 5500C, d 14.5, hardness 1800 kg/sq mm, resistivity 30 microohm-cm (room temperature). Extremely resistant to chemical action except at elevated temperature.

Derivation: Tantalum oxide and carbon heated at high temperatures.

Use: Cutting tools and dies, cemented carbide tools.

tantalum chloride. (tantalal chloride; tantalum pentachloride).

CAS: 7721-01-9. TaCl₅.

Properties: Pale-yellow, crystalline powder; highly reactive. Decomposed by moist air. D 3.7, bp 242C, mp 221C. Soluble in alcohol and potassium hydroxide solution. Keep well stoppered.

Grade: Technical.

Use: Chlorination of organic substances, intermediate, production of pure metal.

tantalum disulfide. TaS₂.

Properties: Black powder or crystals. Mp above 3000C. Insoluble in water

Available forms: 40 micron size.

Use: Solid lubricant.

tantalum fluoride. (tantalum pentafluoride).

CAS: 7783-71-3. TaF₅.

Properties: Deliquescent crystals. Mp 97C, d 4.74. Soluble in water and nitric acid.

Use: Catalyst in organic reactions.

tantalum nitride. TaN.

Properties: Hexagonal, brown, bronze, or black crystals. D 16.3, mp 3310–3410C. Insoluble in water; slightly soluble in aqua regia, nitric acid, hydrogen fluoride.

Grade: Technical, powder.

tantalum oxide. (tantalal acid anhydride; tantalum pentoxide).

CAS: 1314-61-0. Ta₂O₅.

Properties: Rhombic, crystalline prisms. D 7.6, mp 1800C. Insoluble in water and acids except hydrogen fluoride.

Derivation: From tantalite, by removal of other metals.

Grade: Technical, optical (99.995% pure), single crystals.

Hazard: TLV: 5 mg/m³.

Use: Production of tantalum; "rare-element" optical glass; intermediate in preparation of tantalum carbide; piezoelectric, maser, and laser applications; dielectric layers in electronic circuits.

tantalum pentachloride. See tantalum chloride.

tantalum pentoxide. See tantalum oxide.

tantalum pentafluoride. See tantalum fluoride.

tantalum potassium fluoride. (potassium tantalum fluoride; potassium fluotantalate).

CAS: 16924-00-8. K₃TaF₇.

Properties: White, silky needles. Slightly soluble in cold water; quite soluble in hot water.

Hazard: Toxic by inhalation. TLV: 2.5 mg(F)/m³.

Use: Intermediate in preparation of pure tantalum.

tantiron. A ferrous alloy containing 84.8% iron, 13.5% silicon, 1% carbon, 0.4% manganese, 0.18% phosphorus, 0.05% sulfur. It is resistant to acids.

Use: Chemical equipment.

tafioca. A product rich in starch, obtained from the tuberous roots of the cassava plant. It is used both directly as a food and as a thickening agent in emulsions for food products and industrial applications (lithographic inks). In many uses it is a satisfactory substitute for gum arabic.

TAPPI. Abbreviation for Technical Association of the Pulp and Paper Industry.

taq polymerase. A DNA polymerase isolated from the bacterium *Thermophilis aquaticus* which is very stable to high temperatures. It is used in PCR procedures and high temperature sequencing.

tar. See coal tar; cigarette tar; pine tar; tar, wood.

tar acid. Any mixture of phenols present in tars or tar distillates and extractable by caustic soda solutions. Usually refers to tar acids from coal tar and includes phenol, cresols, and xylenols. When applied to the products from other tars it should be qualified by the appropriate prefix, e.g., wood tar acid, lignite tar acid, etc.

Properties: Soluble in alcohol and coal tar hydrocarbons. Combustible.

Grade: 15–18%, 25–28%, and 50–53% phenol.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant to tissue.

Use: Wood preservative, insecticide for cattle and sheep dipping (dip oils or sheep dip), manufacture of disinfectants.

tar base. A basic nitrogen compound derived from coal tar, such as pyridine, picoline, lutidine, and quinoline.

tar camphor. See naphthalene.

tar camphor, chlorinated. See chloronaphthalene.

“Tarcel” [Natrochem]. TM for DLC form of “Tarene.”

See “Tarene” [Natrochem].

tar, dehydrated. (tar, refined).

Properties: Dark-brown, thick, viscid liquid. Combustible.

Derivation: Tar from which the water has been driven off.

Grade: Technical.

Hazard: Strong irritant, absorbed by skin.

Use: Waterproofing compounds, roads, medicine.

tare. (1) The weight of a container, wrapper, or liner that is deducted in determining the net weight of a material. (2) A weight used in analytical work to offset the weight of a container.

“Tarene” [Natrochem]. TM for mixed naval stores (pine tar type).

Properties: Dark-brown, viscous liquid. D 0.99–1.02, ash 0.5%. Benzene soluble. Combustible.

Use: Plasticizer and softener.

targeted mutagenesis. Deliberate change in the genetic structure directed at a specific site on the chromosome. Used in research to determine the targeted region's function.

See mutation; polymorphism.

Tarmac. Proprietary preparation of blast furnace slag, refined tar, and other materials.

Use: Road dressing.

tarnish. A reaction product that occurs readily at room temperature between metallic silver and sulfur in any form. The well-known black film that appears on silverware results from reaction between atmospheric sulfur dioxide and metallic silver, forming silver sulfide. It is easily removable with a cleaning compound and is not a true form of corrosion. Plating with a mixture of silver and indium will increase tarnish resistance. Gold will also tarnish in the presence of a high concentration of sulfur in the environment.

tar oil. See creosote; coal tar.

tar oil, wood. (pine tar oil).

Properties: Almost colorless liquid when freshly distilled, turns dark reddish-brown; strong odor and taste. D 0.862–0.872. Soluble in ether, chloroform, alcohol, and carbon disulfide; flash p 144F (62.2) (CC). Combustible.

Derivation: Obtained by the destructive distillation of the wood of *Pinus palustris*.

Method of purification: Rectification.

Grade: Technical, rectified, refined.

Use: Paints, waterproofing paper, rubber reclaiming, varnishes, stains, ore flotation, cattle dips, insecticides.

tar, refined. See tar, dehydrated.

tar sands. See oil sands.

tar soap. Soap containing juniper tar oil.

tartar, cream of. See potassium bitartrate.

tartar emetic. See antimony potassium tartrate.

tartaric acid. (dihydroxysuccinic acid).

CAS: 87-69-4. $\text{HOOC}(\text{CH}_2\text{O})_2\text{COOH}$.

Properties: Colorless, transparent crystals or white, crystalline powder; odorless; acidic taste; stable in air. Soluble in water, alcohol, and ether. D 1.76, mp 170C. It has unusual optical properties. The molecule has two asymmetric carbon atoms that result in four isomeric forms, three of which are the natural D-form and the corresponding L-form, which are optically active, and the inactive *meso* form:

The occurrence of some DL-tartaric acid along with natural D-tartaric acid in the wine industry is explained on the basis of partial racemization. The L-form is the commercial product.

Derivation: Occurs naturally in wine lees; made synthetically from maleic anhydride and hydrogen peroxide and by an enzymatic reaction with a succinic acid derivative.

Grade: Technical, CP, crystals, powder, granular, NF, FCC.

Use: Chemicals (cream of tartar, tartar emetic, acetaldehyde), sequestrant, tanning, effervescent beverages, baking powder, fruit esters, ceramics, galvanoplastics, photography (printing and developing, light-sensitive iron salts), textile industry, silvering mirrors, coloring metals, acidulant in foods.

tartrazine. (FD&C Yellow No. 5; (3-carboxy-5-hydroxy)-1-*p*-sulfophenyl-4-*p*-sulfophenylazopyrazole trisodium salt; CI 19140).

CAS: 1934-21-0. $\text{C}_{10}\text{H}_9\text{N}_3\text{O}_6\text{S}_2$.

Properties: Bright orange-yellow powder. Soluble in water.

Hazard: An allergen.

Use: Dye, especially for foods, drugs, and cosmetics.

tar, wood. (tar, hardwood).

Properties: Black, syruplike, viscous fluid.

Derivation: A by-product of the destructive distillation of wood.

Grade: Technical.

Hazard: Flammable, moderate fire risk.

Use: Hardwood pitch, wood creosote, heavy high-boiling wood oils, wood-preserving oils, paint thinners.

taste. See flavor.

TATA box. A sequence found in the promoter (part of the 5' flanking region) of many genes. Deletion of this site (the binding site of transcription factor TFIID) causes a marked reduction in transcription, and gives rise to heterogeneous transcription initiation sites.

Taube, Henry. (1915–2005). A Canadian-born chemist who won the Nobel Prize for chemistry in 1983 for his pioneering work in inorganic chemistry and the study of electron-transfer reactions, particularly of metal complexes. Known as an outstanding teacher, he was admired and respected by students and colleagues for his work at Stanford University.

taurin. See gracilin.

taurine. (2-aminoethanesulfonic acid).

CAS: 107-35-7. $\text{NH}_2\text{CH}_2\text{CH}_2\text{SO}_3\text{H}$. A crystallizable amino acid found in combination with bile acids; its combination with cholic acid is called taurocholic acid.

Properties: Solid. Decomposes at 300C. Soluble in water; insoluble in alcohol.

Derivation: Isolated from ox bile, organic synthesis.

Hazard: Toxic by ingestion.

Use: Biochemical research, pharmaceuticals, wetting agents.

taurocholic acid. (cholaic acid; cholyltaurine).

CAS: 81-24-3. $\text{C}_{26}\text{H}_{45}\text{NO}_7\text{S}$. Occurs as sodium salt in bile. It is formed by the combination of the sulfur-containing amino acid taurine and cholic acid as the sodium salt. It aids in digestion and absorption of fats.

Properties: Crystals. Stable in air. Mp 125C (decomposes.) Freely soluble in water; soluble in alcohol, almost insoluble in ether and ethyl acetate.

Derivation: Isolation from bile.

Use: Biochemical research, emulsifying agent in foods (not over 0.1%).

tautomerism. A type of isomerism in which migration of a hydrogen atom results in two or more structures, called tautomers. The two tautomers are in equilibrium. For example, acetoacetic ester has the properties of both an unsaturated alcohol and a ketone. The tautomers are called enol and keto. See enol; isomer (1).

“Taxol.” [Bristol-Myers]. TM for 5- β ,20-epoxy-1,2- α ,4,7- β ,10- β ,13- α -hexahydroxy-tax-11-en-9-one 4,10-diacetate 2-benzoate 13-ester with

(2r,3s)-*n*-benzoyl-3-phenylisoserine.

See paclitaxel.

taxon. Any named group of organisms, not necessarily a clade. A taxon may be designated by a Latin name or by a letter, number, or any other symbol.

taxonomy. The science of naming and classifying organisms.

taxotere.

CAS: 114977-28-5. mf: $\text{C}_{43}\text{H}_{53}\text{NO}_{14}$.

Hazard: A poison. Human systemic effects.

Tb. Symbol for terbium.

“TBC” [Reilly]. (tri-*n*-butyl citrate).

CAS: 77-94-1. TM for aqueous-based pharmaceutical coatings, direct food ingredient.

TBDMS chloride. See *tert*-butylchlorodimethylsilane.

TBH. Abbreviation for technical benzene hexachloride.

Use: An insecticide.

See 1,2,3,4,5,6-hexachlorocyclohexane.

TBP. Abbreviation for tributyl phosphate.

TBSM. See *p-tert*-butoxycarbonyloxystyrene monomer.

TBT. Abbreviation for tetrabutyl titanate.

TBTO. Abbreviation for bis(tributyltin oxide).

TC. Abbreviation for trichloroacetic acid or its sodium salt.

Tc. Symbol for technetium.

TCA cycle. (tricarboxylic acid cycle; Krebs cycle; citric acid cycle). A series of enzymatic reactions occurring in living cells of aerobic organisms, the net result of which is the conversion of pyruvic acid, formed by anaerobic metabolism of carbohydrates, into carbon dioxide and water. The metabolic intermediates are degraded by a combination of decarboxylation and dehydrogenation. It is the major terminal pathway of oxidation in animal, bacterial, and plant cells. Recent research indicates that the TCA cycle may have predated life on earth and may have provided the pathway for formation of amino acids.

TCB. Abbreviation for tetracarboxybutane.

TCBO. See trichlorobutylene oxide.

TCC. Abbreviation for Tagliabue closed cup, a standard method of determining flash points.

TCDD. See dioxin.

TCEO. See epoxy-1,1,2-trichloroethane.

TCHH. See cyhexatin.

TCHTH. See cyhexatin.

TCP. Abbreviation for tricresyl phosphate.

TCP. See 2-hydroxy-3,5,6-trichloropyridine.

TDE. (generic name for 1,1-dichloro-2,2-bis(*p*-chlorophenyl)ethane; tetrachlorodiphenylethane; DDD).

CAS: 72-54-8. (C₁₂H₄)₂CHCHCl₂.

Properties: Colorless crystals. Mp 109–110C. Soluble in organic solvents; insoluble in water; not compatible with alkalis. Combustible.

Derivation: Chlorination of ethanol and condensation with chlorobenzene.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption; use restricted in some states.

Use: Dusts, emulsions, and wettable powders for contact control of leaf rollers and other insects.

TDI. Abbreviation for toluene diisocyanate.

TDP. Abbreviation for 4,4'-thiodiphenol.

TDQP. Abbreviation for trimethyldihydroquinoline polymer.

Te. Symbol for tellurium.

TEA. (1) Abbreviation for triethanolamine. (2) Abbreviation for triethylaluminum.

TEAC. Abbreviation for tetraethylammonium chloride.

tea catechin. See epigallocatechin 3-gallate.

tear resistance. The amount of force necessary to cause additional damage, in a cut made in a sample, by force on the sample, where the force is primarily normal to the plane of the cut.

tebufenozide.

CAS: 112410-23-8. mf: C₂₂H₂₈N₂O₂.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

Use: Agricultural chemical.

“TEC” [Reilly]. (triethyl citrate).

CAS: 77-93-0. TM for aqueous-based pharmaceutical coatings.

technplex.

CAS: 65454-61-7. mf: C₁₄H₁₇N₃O₁₀Tc•Na.

Hazard: Moderately toxic.

technetium. Tc. Element with atomic number 43, group VIIB of the periodic table, aw 98.9062, valences of 4, 5, 6, 7; three radioactive isotopes of half-life more than 105 years, also several of relatively short half-life, some of which are β emitters. Technetium was first obtained by the deuteron bombardment of molybdenum, but since has been found in the fission products of uranium and plutonium. The chemistry of technetium has been studied by tracer techniques and is similar to that of rhenium and manganese. The free metal is obtained from reactor fission products by solvent extraction followed by crystallization as ammonium pertechnetate, which is reduced with hydrogen. The metal is silver-gray in appearance, mp 2200C (4000F), d 11.5, slightly magnetic. Compounds of the types TcO₂, Tc₂O₇, NH₄TcO₄, etc. have been prepared. The pertechnetate ion has strong anticorrosive properties. Technetium and its alloys are superconductors and can be used to create high-strength magnetic fields at low temperature. Tc-99 (metastable) is the most widely used isotope in nuclear medicine.

Use: Metallurgical tracer, cryochemistry, corrosion resistance, nuclear medicine.

Technical Association of the Pulp and Paper Industry. (TAPPI).

A professional group of scientists devoted to the interests of pulp and paper chemistry and technology. Founded in 1915, it has seven sections, each concerned with a specific phase of the industry. It also has 11 local sections that hold monthly meetings. The association publishes its own journal, as well as industry data sheets, bibliographies, technical monographs on subjects relating to the paper industry. It establishes standards of quality and testing procedures. The address is Technical Park, P.O. Box 105113, Atlanta, GA 30348-5113.

Website: <http://www.tappi.org>.

technology transfer. The process of transferring scientific findings from research laboratories to the commercial sector.

“Tecto” [MSD Agvet]. TM a flowable SC fungicide.

“Tedlar” [Du Pont]. TM for polyvinylfluoride film.

TEDP. Abbreviation for tetraethyl dithiopyrophosphate.
See sulfotep.

“Tedur” [Bayer]. TM for polysulfide polymers.

Available forms: Glass, mineral, and mineral/glass grades.

Use: Injection molding for high-temperature and performance electronic and automotive parts.

tefestrol.

CAS: 129407-28-9.

Hazard: A reproductive hazard.

“Teflon” [Du Pont]. TM for tetrafluoroethylene (TFE) fluorocarbon polymers available as molding and extrusion powders, aqueous dispersion, film, finishes, and multifilament yarn or fiber. The name also applies to fluorinated ethylene-propylene (FEP) resins available in the same forms. The no-stick cookware finishes may be of either type. Fibers are monofilaments made from copolymer of TFE and FEP.

Use: Packing, bearings, filters, electrical insulation, high-temperature industrial plastics, cooking utensils, plumbing sealants, coating glass fiber for architectural structure composites, bonding industrial diamonds to metal in the manufacture of grinding wheels.

See fluorocarbon polymer.

“Teflon EFTE” [Thanavala]. TM for a copolymer of ethylene and tetra fluoro-ethylene, also known as Tefzel.

Use: Non-stick surfaces.

“Teflon FEP” [Thanavala]. TM for non-stick melt and flow system.

Use: During backing to provide non-porous films.

“Teflon PTFE” [Thanavala]. TM for a non-stick double coating (primer, top coat).

Use: Coating for the highest operating temperatures.

TEG. Abbreviation for tetraethylene glycol and triethylene glycol.

“Tego” [Rohm & Haas]. TM for thin tissue impregnated with heat-convertible phenol-formaldehyde resin, supplied in rolls. Produces waterproof bond with plywood veneers.

Use: Hot-press bonding of furniture veneers, premium wall paneling.

“Tekflame” [Exxon Chemical International]. TM for a firefighting fuel.

TEL. Abbreviation for tetraethyl lead.

telluric acid. (hydrogen tellurate).

CAS: 7803-68-1. $H_2TeO_4 \cdot 2H_2O$ or H_6TeO_6 .

Properties: White, heavy crystals. D 3.07, mp 136C. Soluble in hot water and alkalis; slightly soluble in cold water.

Derivation: Action of sulfuric acid on barium tellurate.

Hazard: As for tellurium.

Use: Chemical reagent.

telluric bromide. See tellurium tetrabromide.

tellurium.

CAS: 13494-80-9. Te. A nonmetallic element with many properties similar to selenium and sulfur. Atomic number 52, group VIA of the period table, aw 127.60, valences of 2, 4, 6; eight stable isotopes.

Properties: Silvery-white, lustrous solid with metal characteristics. D 6.24 g/cc (30C), Mohs hardness 2.3, mp 450C, bp 990C. Soluble in sulfuric acid, nitric acid, potassium hydroxide, and potassium cyanide solutions; insoluble in water. Imparts garlic-like odor to breath, can be depilatory. It is a p-type semiconductor and its conductivity is sensitive to light exposure.

Source: From anode slime produced in electrolytic refining of copper and lead.

Derivation: Reduction of telluric oxide with sulfur dioxide; by dissolving the oxide in a caustic soda solution and plating out the metal.

Grade: Powder, sticks, slabs, and tablets, 99.5% pure, crystals up to 99.999% pure.

Hazard: (Metal and compounds as tellurium) Toxic by inhalation. TLV: 0.1 mg(Te)/m³.

Use: Alloys (tellurium lead, stainless steel, iron castings), secondary rubber vulcanizing agent, manufacture of iron and stainless steel castings, coloring agent in glass and ceramics, thermoelectric devices, catalysts, with lithium in storage batteries for spacecraft.

tellurium bromide. See tellurium dibromide and tellurium tetrabromide.

tellurium chloride. See tellurium dichloride.

tellurium dibromide. (tellurium bromide; tellurous bromide). TeBr₂.

Properties: Blackish-green, crystalline mass or gray to black needles; very hygroscopic. Mp 210C, bp 339C. Decomposed by water; soluble in ether; violet vapor.

Hazard: As for tellurium.

tellurium dichloride. (tellurium chloride; tellurous chloride). TeCl₂.

Properties: Amorphous, black mass, greenish-yellow when powdered. Decomposed by water. D 6.9, bp 327C, mp 209C.

Hazard: As for tellurium.

tellurium dioxide. (tellurous acid anhydride). CAS: 7446-07-3. TeO₂.

Properties: Heavy, white, crystalline powder; odorless. D 5.89, mp 733C, bp 1245C. Soluble in concentrated acids, alkalis; slightly soluble in dilute acids, water.

Hazard: As for tellurium.

tellurium disulfide. (tellurium sulfide). TeS₂.

Properties: Red powder, turns in time to a dark-brown amorphous powder, fuses to gray lustrous mass. Soluble in alkali sulfides; insoluble in acids, water.

Hazard: As for tellurium.

tellurium lead. See lead; tellurium.

tellurium sulfide. See tellurium disulfide.

tellurium tetrabromide. (telluric bromide; tellurium bromide).

CAS: 10031-27-3. TeBr_4 .

Properties: Yellow crystals. D 4.3, mp 363C, bp 420C (decomposes into bromine and dibromide). Soluble in a little water (decomposes in excess water).

Hazard: As for tellurium.

tellurous acid. H_2TeO_3 .

Properties: White, crystalline powder. D 3.053, mp 40C (decomposes). Soluble in dilute acids, alkalis; slightly soluble in water, alcohol.

Hazard: As for tellurium.

tellurous acid anhydride. See tellurium dioxide.

tellurous bromide. See tellurium dibromide.

tellurous chloride. See tellurium dichloride.

telodrin. (1,3,4,5,6,7,8,8-octachloro-3a,4,7,7a-tetrahydro-4,7-methanonaphthalan).

CAS: 297-78-9.

Properties: Vap press 3 mm Hg (20C). Soluble in acetone, benzene, carbon tetrachloride, fuel oil, toluene, xylene.

telomer. Polymeric products formed from a telomerization reaction.

telomerase. The enzyme that directs the replication of telomeres.

telomere. The end of a chromosome. This specialized structure is involved in the replication and stability of linear DNA molecules.

See DNA replication.

telomerization reactions. In telomerization reactions, a polymerizable unsaturated compound (the taxogen) is reacted under polymerization conditions in the presence of radical-forming catalysts or promoters with a so-called telogen. During the reaction, the telogen is split into radicals that attach to the ends of the polymerizing taxogen and in some instances add on to the double bond of the taxogen and thereby form chains whose terminal groups are formed of the radicals formed from the telogen. Organic compounds containing an olefinic double bond, such as ethylene, propylene, hexene, octene, or styrene, are normally employed as taxogens. Many different types of compounds can be employed as telogens, for example, halogenated hydrocarbons, such as chloroform or carbon tetrachloride,

halogen derivatives of cyanogen, such as cyanogen chloride, aldehydes, alcohols, and the like.

Radical-forming catalysts, such as organic peroxides, hydrogen peroxide, aliphatic azo compounds of the type of azoisobutyric acid nitrile, and redox systems are employed for telomerization reactions. Telomerization reactions are as a rule carried out at an elevated temperature up to 250 degrees. When volatile reactants are used, the reaction is carried out under elevated pressures, i.e., between 20 and 1000 atmospheres.

“Telone” [Dow]. TM for fumigants containing 1,3-dichloropropene and related C_3 hydrocarbons.

“Tel-Tale” [Grace]. TM for silica gel that is impregnated with cobalt chloride and turns from blue to pink as the relative humidity increases.

TEM. Abbreviation for triethylene melamine.

temephos. (*O,O,O',O'*-tetramethyl-*O,O'*-thio-*di-p*-phenylene phosphorothionate).

CAS: 3383-96-8.

Properties: Mp 30–30.5C.

Use: Larvicide for mosquito and blackfly.

“Temfibre” [Borregaard]. TM for wood based chemicals.

tempalgin.

CAS: 39296-38-3.

mf: $\text{C}_{13}\text{H}_{17}\text{N}_3\text{O}_4\text{S}\bullet\text{C}_9\text{H}_{17}\text{NO}\bullet\text{C}_7\text{H}_8\text{O}_3\text{S}\bullet\text{Na}$.

Hazard: Moderately toxic by ingestion.

temper. To increase the hardness and strength of a metal by quenching or heat treatment.

temperate phage. A phage whose DNA may be incorporated into the host-cell genome without being expressed. Contrast with a virulent phage, which destroys the host cell.

temperature. The thermal state of a body considered with reference to its ability to communicate heat to other bodies (J. C. Maxwell). There is a distinction between temperature and heat, as is evidenced by Helmholtz's definition of heat as "energy that is transferred from one body to another by a thermal process," whereby a thermal process is meant radiation, conduction, and/or convection. Temperature is measured by such instruments as thermometers, pyrometers, thermocouples, etc., and by scales such as centigrade (Celsius), Fahrenheit, Rankine, Reaumur, and absolute (Kelvin). See absolute temperature; thermodynamics.

template. A macromolecular pattern for the synthesis of another molecule. For example, DNA is a template for RNA synthesis.

“Temprite CPVC” [B. F. Goodrich]. TM for chlorinated polyvinyl chloride resins formulated for process piping, valves, tanks, ductwork, and protective covers.

Use: For electrical conductors, residential hot and cold water-supply piping.

tenacity. Strength per unit weight of a fiber or filament, expressed as g/denier. It is the rupture load divided by the linear density of the fiber.
See tensile strength; denier.

tenderization. (1) Treatment of meats with UV radiation or with certain enzyme preparations to accelerate softening of the collagen fibers and thus reduce the time necessary to “hang” the meat. (2) The degradation and mechanical weakening undergone by textile fibers under excessive wet abrasion during laundering.

“Tenox” [Eastman]. TM for food-grade anti-oxidants containing one or more of the following ingredients: butylated hydroxyanisole, butylated hydroxytoluene, and/or propyl gallate with or without citric acid. Some formulas are supplied in solvents such as propylene glycol.

“Tenox GT-1” [Eastman]. TM for natural mixed tocopherols.

Use: Antioxidant in foods, cosmetics, and ointments.

tensile strength. The rupture strength (stress-strain product at break) per unit area of a material subjected to a specified dynamic load; it is usually expressed in pounds per square inch (psi). This definition applies to elastomeric materials and to certain metals.

See tenacity.

tension cracking. See stress cracking.

tenter. A machine used for holding a processed fabric taut as it is fed into a wind-up or to a cutter. It consists of a frame along the inner sides of which travel continuous chains to which gripping devices are attached at intervals of a few inches; these may be either hooks or clamps of various kinds. As the fabric moves into the machine, the edges are engaged by the grippers and are automatically released at the end of the frame.

tepa. (generic name for tris(1-aziridinyl)phosphine oxide).

See triethylenephosphoramidate.

“Tepidone” [Du Pont]. (C₄H₉)₂NC(S)SNa. TM for a water solution of sodium dibutylthiocarbamate.

Properties: Amber liquid. D 1.08.

Use: To accelerate vulcanization of natural and synthetic rubber and latex compounds.

TEPP. (ethyl pyrophosphate; tetraethyl pyrophosphate).

CAS: 107-49-3. (C₂H₅)₄P₂O₇.

Properties: Water-white to amber liquid depending on purity; hygroscopic. D 1.20, refr index 1.420, bp (pure compound) 135–138C (1 mm Hg). Miscible with water and all organic solvents except aliphatic hydrocarbons; hydrolyzed in water with formation of mono-, di-, and triethyl orthophosphates; water solutions attack metals; commercial material contains 40% TEPP.

Derivation: From phosphorus oxychloride and ethanol or phosphorus oxychloride and triethyl phosphate.

Grade: 40%.

Hazard: Toxic by skin contact, inhalation, or ingestion; rapidly absorbed through skin; repeated exposure may, without symptoms, be increasingly hazardous; cholinesterase inhibitor, use may be restricted. TLV: 0.004 ppm. Toxic by skin absorption.

Use: Insecticide for aphids and mites, rodenticide.

tera- Prefix meaning 10¹² units (symbol T), 1 Tg = 1 teragram = 10¹² grams.

teratogen. An agent that causes growth abnormalities in embryos, genetic modifications in cells, etc.; ionizing radiation can have this effect.

teratogenic. Substances such as chemicals or radiation that cause abnormal development of an embryo.

See mutagen.

terbacil.

CAS: 5902-51-2. C₉H₁₃ClN₂O₂.

Properties: Colorless crystals. Mp 175C. Soluble in dimethylacetamide and cyclohexanone; partially soluble in xylene and butyl acetate.

Use: Herbicide.

“Terbec” [Dow]. TM for a wet strength improver for soils; based on 4-*tert*-butylcatechol.

terbia. See terbium oxide.

terbium. Tb. Atomic number 65, group IIIB of the periodic table, a rare-earth element of the yttrium subgroup (lanthanide series), aw 158.9254, valences of 3, 4; no stable isotopes.

Properties: Metallic luster. D 8.332, mp 1356C, bp 2800C. Reacts slowly with water; soluble in dilute acids. Salts are colorless, highly reactive, handled in inert atmosphere or vacuum.

Source: See rare earths.

Derivation: Reduction of fluoride with calcium.

Grade: Regular, 99.9+% purity (ingots, lumps), single crystals.

Use: Phosphor activator, dope for solid-state devices.

terbium chloride, hexahydrate.TbCl₃•6H₂O.

Properties: Transparent, colorless, prismatic crystals. D 4.35, mp (anhydrous) 588C, very hygroscopic. Readily soluble in water or alcohol.

Derivation: By treatment of carbonate or oxide with hydrochloric acid in an atmosphere of dry hydrogen chloride.

terbium fluoride. TbF₃•2H₂O.

Properties: Solid. Mp 1172C, bp 2280C. Insoluble in water.

Hazard: Strong irritant.

Use: Source of terbium.

terbium nitrate. Tb(NO₃)₃•6H₂O.

Properties: Colorless, monoclinic needles or white powder. Mp 89.3C. Soluble in water.

Derivation: By treatment of oxide, carbonate, or hydroxide with nitric acid.

Hazard: Strong oxidant, fire risk in contact with organic materials.

terbium oxide. (terbia). Tb₂O₃.

Properties: Dark-brown powder. Soluble in dilute acids; slightly hygroscopic, absorbs carbon dioxide from air.

Derivation: By ignition of hydroxides or salts of oxy-acids.

Grade: 98–99%.

See rare earth.

terbium sulfate. Tb₂(SO₄)₃•8H₂O.

Properties: Colorless crystals. Lose 8H₂O at 360C. Soluble in water.

terbufos. (*O,O*-diethyl-*S*-(*tert*-butyl)methyl phosphorodithioate).

CAS: 13071-79-9. C₉H₂₁O₂PS₂. An ester of phosphoric acid.

Properties: Yellowish liquid. D 1.10, bp 70C (0.01 mm Hg), fp -29C, flash p 88C (TOC). Soluble in alcohol, acetone.

Hazard: Moderate fire risk. Toxic by ingestion.

Use: Soil insecticide.

terbutol.

CAS: 1918-11-2. mf: C₁₇H₂₇NO₂.

Hazard: Low toxicity by ingestion and skin contact.

Use: Agricultural chemical.

terebene. A mixture of terpenes, chiefly dipentene and terpinene.

Properties: Colorless liquid. D 0.862–0.866, inactive optical rotation, Bp 160–172C. Soluble in alcohol; insoluble in water.

Derivation: From oil of turpentine.

Hazard: Flammable, moderate fire risk. Toxic by ingestion and inhalation.

Use: To impart water and oil resistance to cellulose.

terephthalic acid. (*p*-phthalic acid; TPA; benzene-*p*-dicarboxylic acid).

CAS: 100-21-0. C₆H₄(COOH)₂.

Properties: White crystals or powder. D 1.51, sublimates above 300C. Insoluble in water, chloroform, ether, acetic acid; slightly soluble in alcohol; soluble in alkalis. Combustible.

Derivation: (1) Oxidation of *p*-xylene or of mixed xylenes and other alkyl aromatics (phthalic anhydride). (2) Reacting benzene and potassium carbonate over a cadmium catalyst.

Grade: Commercial, fiber.

Use: Production of linear, crystalline polyester resins, fibers, and films by combination with glycols; reagent for alkali in wool; additive to poultry feeds.

2-terephthaloylbenzoic acid.

HOOC₆H₄COC₆H₄COOH.

Properties: White to gray powder. Mp 233–237C.

Use: Chemical intermediate.

terephthaloyl chloride. (1,4-benzenedicarbonyl chloride). C₆H₄(COCl)₂.

Properties: Colorless needles. Mp 82–84C, bp 259C, flash p 356F (180C). Decomposes in water and alcohol; soluble in ether. Combustible.

Hazard: Skin irritant.

Use: Dye manufacture; synthetic fibers, resins, films; UV absorption; pharmaceuticals; rubber chemicals; cross-linking agent for polyurethanes and polysulfides.

“Tergitol” [Dow]. TM for a series of nonionic and anionic surfactants.

Use: Detergents, wetting agents, emulsifiers in water systems, leveling and spreading agents.

terminal transferase. An enzyme that catalyzes the addition of nucleotide residues of a single kind to the 3' end of DNA chains. For example, polyA synthetase.

termination codons. XH See stop codons.

termination factors. (release factors). Protein factors of the cytoplasm required in releasing a completed polypeptide chain from a ribosome..

termination sequence. A DNA sequence that appears at the end of a transcriptional unit and signals the end of transcription.

ternary. Descriptive of a solution or alloy having three components, or of a chemical compound having three constituent elements or groups.

ternary acid. An acid that contains three different elements. An example would be acetic acid, CH_3COOH .

ternary diagram. A constitution diagram for a ternary alloy system.

terneplate. (roofing tin). A lead-tin alloy used for coating iron or steel; its composition is 75% lead and 25% tin. It has a dull finish.

Use: Roofing, deep stamping, gasoline tanks, etc.

1,4(8)-terpadiene. See terpinolene.

terpene. $\text{C}_{10}\text{H}_{16}$. An unsaturated hydrocarbon occurring in most essential oils and oleoresins of plants. The terpenes are based on the isoprene unit

C_5H_8 , and may be either acyclic or cyclic with one or more benzenoid groups. They are classified as monocyclic (dipentene), dicyclic (pinene), or acyclic (myrcene), according to the molecular structure. Many terpenes exhibit optical activity. Terpene derivatives (camphor, menthol, terpineol, borneol, geraniol, etc.) are called terpenoids; many are alcohols.

See polyterpene resin.

terpene alcohol. A generic name for an alcohol related to or derived from a terpene hydrocarbon, such as terpineol or borneol.

terpene hydrochloride. See 2-bornyl chloride.

terpeneless oil. An essential oil from which the terpene components have been removed by extraction and fractionation, either alone or in combination. The optical activity of the oil is thus reduced. The terpeneless grades are much more highly concentrated than the original oil (15–30 times). Removal of terpenes is necessary to inhibit spoilage, particularly of oils derived from citrus sources. On atmospheric oxidation the specific terpenes form compounds that impair the value of the oil; for example, *d*-limonene oxidizes to carvone and γ -terpinene to *p*-cymene. Terpeneless grades of citrus oils are commercially available.

terpene resin, natural.

Properties: Extracted from wood. Mp: 155°.

Use: Food additive.

terpene resin, synthetic.

Properties: Polymers of α -pinene, β -pinene, and/or dipentene (FCC III). Mp: 112–118°. Sol in benzene.

Use: Food additive.

terpenoid. See terpene.

1,3-terphenyl. See *m*-terphenyl.

***m*-terphenyl.** (*m*-diphenylbenzene; isodiphenylbenzene; 1,3-terphenyl).

CAS: 92-06-8. mf: $\text{C}_{18}\text{H}_{14}$.

Properties: Needles. Mw 230.32, mp 86–87C, bp 379C.

Hazard: Moderately toxic by ingestion. TLV: ceiling of 0.5 ppm. Combustible.

***o*-terphenyl.** (1,2-diphenylbenzene).

CAS: 84-15-1. $\text{C}_{18}\text{H}_{14}$.

Properties: Prisms from MeOH. Mp 58–59°C, bp 337°C, mw 230.32, flash p >230°F.

Hazard: TLV: CL 0.5 ppm. Combustible.

***p*-terphenyl.** (1,4-diphenylbenzene).

CAS: 92-94-4. $(\text{C}_6\text{H}_5)_2\text{C}_6\text{H}_4$.

Properties: Liquid. D 1.234 (0C), mp 213C, bp 405C, flash p 405F (207C). Combustible.

Derivation: From *p*-dibromobenzene or bromobenzene and sodium.

Method of purification: Zone-melting.

Grade: Technical, scintillation.

Hazard: Toxic by ingestion and inhalation. TLV: ceiling 0.5 ppm.

Use: Polymerized with styrene to make a plastic phosphor. Single crystals used as scintillation counters.

terpilenol. See terpineol.

terpinene. $\text{C}_{10}\text{H}_{16}$. A mixture of three isomeric cyclic terpenes, α -, β -, and γ -terpinene. α -terpinene has a bp of 180–182C and d 0.8484 (14C). It is found in cardamom, marjoram, and coriander oils. β -terpinene has a bp of 183C and d 0.853 (15C). It is found in coriander, lemon, cumin, and ajawan oils.

Use: Synthetic flavors.

terpineol. (α -terpineol; β -terpineol; γ -terpineol; terpinolol).

CAS: (α) 8006-39-1. $\text{C}_{10}\text{H}_{17}\text{OH}$.

Properties: Colorless liquid or low-melting transparent crystals; lilac odor. D 0.930–0.936 (25C), solidification p 2C, optical rotation between –0 degrees 10 min and +0 degrees 10 min, boiling range 214 to 224C, 90% within 5C, refr index 1.4825–1.4850 (20C). Soluble in two volumes of 70% alcohol; slightly soluble in water, glycerol. Combustible.

Available forms: Mixture of the three isomers

Derivation: By heating terpin hydrate with phosphoric acid and distilling or with dilute sulfuric acid, using an azeotropic separation; fractional distilla-

tion of pine oil. Occurs naturally in several essential oils.

Grade: Technical, perfumery, extra, prime, FCC.
Use: Solvent for hydrocarbon materials, mutual solvent for resins and cellulose esters and ethers, perfumes, soaps, disinfectant, antioxidant, flavoring agent.

“Terpineol 318” [Aqualon]. TM for a highly refined mixture of tertiary terpene alcohols, predominantly α -terpineol; 97% total terpene alcohols; colorless liquid; fp below 10C; d 0.937 (15.6/15.6C); ASTM distillation range 5–95%, (216–220C).

terpin hydrate. (dipentene glycol).

Properties: Colorless, lustrous, rhombic, crystalline prisms or white powder; slight characteristic odor; slightly bitter taste. Efflorescent, mp 115–117C, anhydrous mp 105C, bp 258C. Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: From turpentine oil or *d*-limonene.

Grade: Technical, NF.

Use: Pharmaceuticals, source of terpineol, medicine (expectorant).

terpinolene. (1,4(8)-terpadiene).

Properties: Water-white to pale-amber liquid. D 0.864 (15.5/15.5C), bp 183–185C, flash p 99F (37.2C) (CC), bulk d 7.2 lb/gal (15.5C). Insoluble in water; soluble in alcohol, ether, glycol.

Derivation: Fractionation of wood turpentine.

Hazard: Flammable, moderate fire risk.

Use: Solvent for resins, essential oils; manufacture of synthetic resins, synthetic flavors.

terpinyl acetate.

Properties: Colorless liquid; odor suggestive of bergamot and lavender. D 0.958–0.968 (15C), refr index 1.4640–1.4660 (20C), optical rotation varies around 0 degrees, fp –50C, bp 220C. Soluble in five or more volumes of 70% alcohol; slightly soluble in water and glycerol. Combustible.

Derivation: By heating terpineol with acetic acid or anhydride in the presence of sulfuric acid and subsequent distillation.

Grade: Technical, prime, extra, FCC.

Use: Perfumes, flavoring agent.

terpolymer. A polymer made from three monomers, e.g., ABS polymers.

“Terramycin” [Pfizer]. Proprietary preparation containing oxytetracycline and oxytetracycline hydrochloride.

Use: Antibiotic.

“Terra XPS” [DSM China]. TM for fiber optic coatings.

“Tersan” 75 [Du Pont]. TM for a turf fungicide containing 75% thiram. “Tersan” OM contains 45% thiram and 10% hydroxymercurichlorophenol.

Hazard: Toxic by ingestion and inhalation.

tert-. Abbreviation for tertiary.

dl-tertatalol.

Hazard: Human systemic effects.

tertiary. (1) For chemical meaning see primary.

(2) In petroleum extraction technology, the term refers to recovery of petroleum by pumping detergents, high polymers, silicates, etc. into the rock structure. These techniques are generally known as enhanced oil recovery.

See chemical flooding; hydraulic fracturing.

tertiary alcohol. An alcohol in which the carbon atom to which the hydroxyl group is attached is also attached to three other carbon atoms.

tertiary amine. An amine in which three carbon atoms are attached to the amino nitrogen.

tertiary carbon. Carbon atom that is joined to three other carbon atoms.

tertiary structure. The three-dimensional conformation of a protein in its native folded state.

testing, chemical. Identification of a substance by means of reagents, chromatography, spectroscopy, melting and boiling point determination, etc. See analytical chemistry.

testing, physical. Application of any procedure whose object is to determine the physical properties of a material. There are four major categories of tests: (1) Those that are direct measurements of a property, e.g., tensile strength. (2) Those that subject the material to actual service conditions; these often require a long period of time, e.g., shelf life of foods and corrosion of metals. (3) Accelerated tests, which require specially designed equipment that simulates service conditions on an exaggerated scale; in these, only a few hours are necessary to duplicate years of service life, e.g., oxygen bomb aging of elastomers. (4) Nondestructive testing by X ray or radiography. Elaborate standard testing procedures are established by the American Society for Testing and Materials. The more common types of tests are as follows:

- abrasion (elastomers, textiles)
- adhesion (glues, resins)
- aging (elastomers, plastics, leather, food products)
- color stability (pigments, organic dyes) (exposure)
- corrosion (metals, alloys) (exposure)
- dielectric (electrical tapes, plastics, glass)
- flammability (textiles, fibers, paper, plastics)

flash point of combustible liquids (Tag closed cup TCC, Cleveland open cup COC, open cup OC hardness (metals, elastomers, plastics) (Brinell, Rockwell, Shore penetration) high temperature (elastomers, adhesives) impact strength (composites, glass cement) sun-cracking (paints, varnishes, elastomers) (exposure) tear (paper, rubber, textiles) tensile strength (fibers, elastomers, paper, textiles, metals) viscosity (lubricants) (Saybolt, Engler) See exposure testing; nondestructive testing; aging.

testing, physiological. Determination of the toxicity of a substance or product by administering it to laboratory animals in controlled dosages, by mouth, skin application, or injection. Materials commonly subjected to such evaluation are pharmaceuticals, pesticides, and foods. Extensive testing programs are required before such products are approved for human use. See LD₅₀.

testosterone.

CAS: 58-22-0. C₁₉H₂₈O₂.

An androgenic steroid; the male sex hormone produced by the testis. It has six times the androgenic activity of its metabolic product, androsterone.

Properties: White or slightly cream-white crystals or crystalline powder; odorless; stable in air. Mp 153–157C. Dextrorotatory in dioxane solution; very soluble in chloroform; soluble in alcohol, dioxane, and vegetable oils; slightly soluble in ether; insoluble in water.

Derivation: Isolation from extract of testis, synthesis from cholesterol or from the plant steroid diosgenin.

Grade: NF.

Hazard: A carcinogen (OSHA).

Use: Medicine, biochemical research. See methyltestosterone.

testosterone-17-β-estradiol mixt.

CAS: 8055-33-2. mf: C₁₉H₂₈O₂•C₁₈H₂₄O₂.

Hazard: Low toxicity by ingestion. A reproductive hazard.

Use: Hormone.

TETD. Abbreviation for tetraethylthiuram disulfide.

tetraamminecopper sulfate. N₄H₁₂CuSO₄.

Derivation: Dissolving copper sulfate in ammonia water, with precipitation by alcohol.

Use: Mordant in textile printing, fungicide.

1,5,8,12-tetraazadodecane.

CAS: 10563-26-5. mf: C₈H₂₂N₄.

Hazard: A poison by skin contact. Moderately toxic by ingestion.

tetrabromobisphenol A. See 4,4'-(1-methylethylidene)bis(2,6-dibromophenol).

tetrabromo-*m*-cresolphthalein sulfone.

CAS: 76-60-8. mf: C₂₁H₁₄Br₄O₅S.

Hazard: Moderately toxic.

tetrabromo-*o*-cresol.

CAS: 576-55-6. C₇H₄Br₄O.

Properties: Fine, white crystals. Mp 205C (decomposes). Insoluble in water; soluble in alcohol and ether.

Derivation: Bromination of *o*-cresol.

Hazard: Irritant to skin and mucous membranes.

Use: Fungicide.

tetrabromo-*m*-cresolphthalein sulfone.

See bromocresol green.

1,1,1,2-tetrabromoethane.

CAS: 630-16-0. mf: C₂H₂Br₄.

Hazard: Low toxicity by inhalation.

sym-tetrabromoethane. See acetylene tetrabromide.

(1*r*,3*s*)3[(1'*rs*)(1',2',2'-tetrabromoethyl)]-2,2-dimethylcyclopropanecarboxylic acid (s)-α-cyano-3-phenoxybenzyl ester.

Use: Food additive; insecticide.

tetrabromoethylene. C₂Br₄.

Properties: Colorless crystals. Mp 55–56C, bp 227C.

Derivation: Bromination of dibromoacetylene.

Use: Organic synthesis.

tetrabromofluorescein. See eosin.

tetrabromomethane. See carbon tetrabromide.

tetrabromophthalic anhydride. C₆Br₄C₂O₃.

Properties: Pale-yellow, crystalline solid. Mp 280C.

Use: Flame-retardant for plastics, paper, and textiles.

3,4,5,6-tetrabromophthalic anhydride.

CAS: 632-79-1. mf: C₈Br₄O₃.

Hazard: Low toxicity by ingestion, inhalation, and skin contact. A mild eye irritant.

tetrabromosilane. See silicon tetrabromide.

tetra-*n*-butylammonium chloride.

(C₄H₉)₄NCl.

Properties: Deliquescent, light-tan powder. Mp 50C.

Use: Substitute in solution for glass-calomel electrode systems, coagulant for silver iodide solutions, stereospecific catalyst.

tetrabutyl dichlorostannoxane.

CAS: 10428-19-0. mf: $C_{16}H_{36}Cl_2OSn_2$.

Properties: White crystals from Me_2CO . Mp: 112.5°. Sol in org solvs.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tetra(2-butylisopropyl) orthosilicate.

CAS: 63449-47-8. mf: $C_{28}H_{60}O_4Si$.

Hazard: Low toxicity by ingestion and skin contact. A moderate skin and eye irritant.

tetrabutylphosphonium phenylphosphinate.

See tetra-*n*-butylphosphonium phenylphosphinate.

tetra-*n*-butylphosphonium phenylphosphinate.

CAS: 60767-85-3. mf: $C_{16}H_{36}P \cdot C_6H_5O_2P$.

Hazard: A poison by ingestion. A severe skin irritant.

tetrabutylthiuram disulfide.

$[(C_4H_9)_2NCH]_2S_2$.

Properties: Amber-colored liquid; slightly sweet odor. D 1.03–1.06 (20/20C), solidifies at –30C. Soluble in carbon disulfide, benzene, chloroform, and gasoline; insoluble in water and 10% caustic. Combustible.

Use: Vulcanizing and accelerating agent.

tetrabutylthiuram monosulfide.

$[(C_4H_9)_2NCS]_2S$.

Properties: Brown, free-flowing liquid. D 0.99. Soluble in acetone, benzene, gasoline, and ethylene dichloride; insoluble in water. Combustible.

Use: Rubber accelerator.

tetrabutyltin.

CAS: 1461-25-2. $(C_4H_9)_4Sn$.

Properties: Colorless or slightly yellow, oily liquid. D 1.0572 (20/4C), fp –97C, bp 145C (10 mm Hg), decomposes at 265C. Insoluble in water; soluble in most common organic solvents. Combustible.

Derivation: Reaction of tin tetrachloride with butyl magnesium chloride.

Hazard: Irritant. TLV: 0.1 mg(Sn)/m³.

Use: Stabilizing and rust-inhibiting agent for silicones, lubricant and fuel additive, polymerization catalyst, hydrogen chloride scavenger.

tetrabutyl titanate. (TBT; butyl titanate; titanium butylate).

CAS: 5593-70-4. $Ti(OC_4H_9)_4$.

Properties: Colorless to light-yellow liquid. Bp 310–314C, forms a glass –55C, d 0.996, refr index

1.486, flash p 170F (76.6C). Decomposes in water; soluble in most organic solvents except ketones. Combustible.

Derivation: Reaction of titanium tetrachloride with butanol.

Use: Ester exchange reactions; heat-resistant paints (up to 500C); improving adhesion of paints, rubber, and plastics to metal surfaces; cross-linking agent; condensation catalyst.

tetrabutyl urea. $(C_4H_9)_2NCON(C_4H_9)_2$.

Properties: Liquid. D 0.880, refr index 1.4535, vap press below 0.01 mm Hg, bp 305C, fp below –60C, flash p 200F (93.3C). Insoluble in water. Combustible.

Use: Plasticizer.

tetrabutyl zirconate. $(C_4H_9O)_4Zr$.

Properties: White solid from reaction of zirconium tetrachloride with butanol.

Use: Condensation catalyst and cross-linking agent.

“Tetracaine” [Cetylite]. (2-dimethylaminoethyl-*p*-butylaminobenzoate).

CAS: 94-24-6.

$CH_3(CH_2)_3NHC_6H_4COOCH_2CH_2N(CH_3)_2$.

Properties: White or light-yellow, waxy solid. Mp 41–46C. Very slightly soluble in water; soluble in alcohol, ether, benzene, chloroform.

Grade: USP.

Use: Medicine (anesthetic).

tetracalcium aluminoferrate. An ingredient of Portland cement.

tetracarbonylhydrocobalt). See cobalt hydrocarbonyl.

1,2,3,4-tetracarboxybutane. (TCB; 1,2,3,4-butanetetracarboxylic acid).

$HOOCCH_2CH(COOH)CH(COOH)CH_2COOH$.

Use: Alkyd resins, epoxy curing agent, sequestrant.

tetracene. See naphthacene.

1,2,3,4-tetrachlorobenzene.

CAS: 634-66-2. $C_6H_2Cl_4$.

Properties: White crystals. Mp 46.6, bp 254C. Insoluble in water. Combustible.

Use: Component of dielectric fluids, synthesis.

1,2,4,5-tetrachlorobenzene.

CAS: 95-94-3. $C_6H_2Cl_4$.

Properties: White flakes. Mp 137.5–140C, flash p 311F (155C), distillation range 240–246C. Combustible.

Use: Intermediate for herbicides and defoliants, insecticide, impregnant for moisture resistance, electrical insulation.

tetrachloro-*p*-benzoquinone. See chloranil.

tetrachlorobisphenol. (C₆H₂Cl₂OH)₂C(CH₃)₂.

A monomer for flame-retardant epoxy, polyester, and polycarbonate resins.

tetrachlorocyclopentane.

CAS: 59808-78-5. mf: C₅H₆Cl₄.

Hazard: Moderately toxic by ingestion, skin contact, and inhalation. A moderate eye irritant.

2,3,7,8-tetrachlorodibenzo-*p*-dioxin. See dioxin.**1,1,2-tetrachloro-2,2-difluoroethane.** (halo-carbon 112a; refrigerant 112a).

CAS: 76-11-9. CCl₂CF₂Cl.

Properties: Colorless, liquid or solid; slight ether odor. Mw 202.83, mp 40.56C, bp 91.67C, vap press 40 torr (20C). Insoluble in water; soluble in ether, chloroform, and alcohol. Noncombustible.

Hazard: TLV: 500 ppm.

Use: Refrigerant.

***sym*-tetrachlorodifluoroethane.** (1,2-difluoro-1,1,2,2-tetrachloroethane; freon 112).

CAS: 76-12-0. CCl₂FCCl₂F.

Properties: White solid or colorless liquid; slightly camphorlike odor when concentrated. Bp 92.8C, mp 26C, critical temp 278C, d 1.6447 (25C), refr index 1.413 (25C), bulk d 13.8 lb/gal. Insoluble in water; soluble in alcohol. Nonflammable.

Grade: Purified, solvent.

Hazard: Toxic by inhalation. TLV: 500 ppm.

Use: Degreasing solvent.

tetrachlorodinitroethane. O₂NCCl₂CCl₂NO₂.

Properties: White crystals. Decomposes at 130C to nitrogen peroxide.

Hazard: Toxic by ingestion and inhalation, strong irritant.

tetrachlorodiphenylethane. See TDE.**2',3,4,6'-tetrachlorodiphenyl ether.** See

1,3-dichloro-2-(3,4-dichlorophenoxy)benzene.

tetrachlorodiphenyl sulfone. See tetradifon.***sym*-tetrachloroethane.** (acetylene tetrachloride).

CAS: 79-34-5. CHCl₂CHCl₂.

Properties: Heavy, colorless, corrosive liquid; chloroform-like odor. D 1.593 (25/25C), bp 146.5C, fp -43C, bulk d 13.25 lb/gal (25C), refr index 1.4918 (25C), flash p none. Soluble in alcohol and ether; slightly soluble in water. Nonflammable.

Derivation: Reaction of acetylene and chlorine and subsequent distillation.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, skin absorption. TLV: 1 ppm; not classifiable as a human carcinogen. Toxic by skin absorption.

Use: Solvent, cleansing and degreasing metals, paint

removers, varnishes, lacquers, photographic film, resins and waxes, extraction of oils and fats, alcohol denaturant, organic synthesis, insecticides, weed killer, fumigant, intermediate in manufacture of other chlorinated hydrocarbons.

tetrachloroethylene. See perchloroethylene.***cis-n*-[1,1,2,2-tetrachloroethylthio]-4-cyclohexene-1,2-dicarboximide.** ("Difolatan"; "captafol").

CAS: 2425-06-1. C₁₀H₉Cl₄NO₂S.

Properties: White solid. Mp 160C. Slightly soluble in most organic solvents; insoluble in water.

Hazard: Absorbed by skin. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

Use: Fungicide.

***n*-((tetrachloro-2-fluoroethylthio)methanesulfoanilide.** See *n*-(2-fluoro-1,1,2,2-tetrachloroethylthio).**tetrachloroisophthalonitrile.** (1,3-dicyano-2,4,5,6-tetrachlorobenzene). C₆Cl₄N₂.

Properties: Colorless crystals. Mp 245C, bp 350C, d 1.70, insoluble in water, almost insoluble in organic solvents.

Use: Bactericide, nematocide.

tetrachloromethane. See carbon tetrachloride.**tetrachloronaphthalene.** (Halowax).

CAS: 1335-88-2. C₁₀H₄Cl₄.

Properties: Colorless to pale-yellow solid; aromatic odor. Mw 265.96, sp g 1.59-1.65, mp 115C, bp 311.5-360C, flash p 410F. Insoluble in water.

Hazard: Combustible. Toxic by inhalation and skin contact. TLV: 2 mg/m³.

Use: Electrical insulating materials; in resins and polymers for coating textiles, wood, and paper; additive in cutting oils.

See chlorinated naphthalene.

2,3,4,6-tetrachlorophenol.

CAS: 58-90-2. C₆HCl₄OH.

Properties: Brown flakes or sublimed mass; strong odor. Mp 69-70C, bp 164C (23 mm Hg), d 1.839 (25/4C). Soluble in acetone, benzene, ether, and alcohol. Nonflammable.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Fungicide.

2,4,5,6-tetrachlorophenol.

CAS: 58-90-2. C₆HCl₄OH.

Properties: Brown solid; phenol odor. D 1.65 (60/4C), mp above 50C. Soluble in sodium hydroxide solutions and most organic solvents; insoluble in water.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Fungicide, wood preservative.

tetrachlorophthalic acid. $C_6Cl_4(CO_2H)_2$.

Properties: Colorless, crystalline plates. Soluble in hot water; sparingly soluble in cold water.

Derivation: By passing a stream of chlorine through a mixture of phthalic anhydride and antimony pentachloride.

Use: Dyes, intermediates.

tetrachlorophthalic anhydride.

CAS: 117-08-8. $C_6Cl_4(CO)_2O$.

Properties: White, odorless, free-flowing, nonhygroscopic powder. Mp 254–255C, bp 371C. Slightly soluble in water.

Use: Intermediate in dyes, pharmaceuticals, plasticizers, and other organic materials; flame-retardant in epoxy resins.

tetrachloroquinone. See chloranil.

tetrachlorosalicylanilide. $C_{13}H_7Cl_4NO_2$.

Properties: Crystalline solid. Mp 160C. Insoluble in water; soluble in common organic solvents and alkaline solutions.

Use: Bacteriostat; preservative (textile finishes, cutting oils, plastics); use in foods, drugs, and cosmetics may be restricted.

tetrachlorosilane. See silicon tetrachloride.

3,3,4,4-tetrachlorotetrahydrothiophene-1,1-dioxide.

CAS: 3737-41-5. mf: $C_4H_4Cl_4O_2S$.

Hazard: A poison by ingestion and skin contact. Moderately toxic by inhalation. A severe skin irritant.

tetrachlorothiophene.

CAS: 6012-97-1.

CCICCCICCCIS.

Properties: Liquid. Mp 29–30, bp 104C (10 mm Hg). Soluble in benzene, hexane, alcohols, chlorocarbons.

Use: Agricultural chemicals, lubricants.

tetrachlorvinphos.

CAS: 961-11-5. $C_{10}H_9Cl_4O_4P$.

Properties: Powder. Mp 97C. Partially soluble in chloroform; slightly soluble in water.

Hazard: Cholinesterase inhibitor.

Use: Insecticide.

tetracine. See tetrazene.

tetracosamethylhendecasiloxane.

$C_{24}H_{52}O_{10}Si_{11}$.

Properties: Colorless liquid. Bp 200C (5 mm Hg), d 0.924, refr index 1.399, flash p 188C. Soluble in

benzene and low molecular weight hydrocarbons; viscosity unaffected by temperature. Combustible.

Use: Silicone oils, foam inhibitor in lubricating oils.

tetracosane. $C_{24}H_{50}$ or $CH_3(CH_2)_{22}CH_3$.

Properties: Crystals. D 0.779 (51/4C), bp 324.1C, mp 51.5C. Soluble in alcohol; insoluble in water. Combustible.

Use: Organic synthesis.

n-tetracosanoic acid. See lignoceric acid.

tetracyanoethylene.

CAS: 670-54-2. $(CN)_2C:C(CN)_2$. The first member of a class of compounds called cyanocarbons.

Properties: Colorless crystals. Sublimes above 120C, mp 198–200C, bp 223C, high thermal stability. Burns in oxygen with a hotter flame than acetylene.

Hazard: Hydrolyzes in moist air to hydrogen cyanide.

Use: Organic synthesis, dyes, to make colored solutions with aromatics.

tetradecamethylhexasiloxane. $C_{14}H_{42}O_5Si_6$.

Properties: Colorless liquid. Bp 140C (20 mm Hg), fp below –100C, d 0.89, refr index 1.4, flash p 118C. Viscosity unaffected by temperature. Soluble in benzene and low molecular weight hydrocarbons; slightly soluble in alcohol. Combustible.

Use: Silicone oil base, foam inhibitor in lubricating oils.

n-tetradecane.

CAS: 629-59-4. $C_{14}H_{30}$ or $CH_3(CH_2)_{12}CH_3$.

Properties: Colorless liquid. D 0.7653 (20/4C), mp 5.5C, bp 253.5C, refr index 1.4302 (20C), flash p 212F (100C), autoign temp 396F (202C). Soluble in alcohol; insoluble in water. Combustible.

Grade: 95%, 99%.

Hazard: A fire hazard. Lower flammable limit in air 0.5%.

Use: Organic synthesis, solvent standardized hydrocarbon, distillation chaser.

tetradecanoic acid. See myristic acid.

tetradecanol. See myristyl alcohol; 7-ethyl-2-methyl-4-undecanol.

9-tetradecenal, (z)-.

CAS: 53939-27-8. mf: $C_{14}H_{26}O$.

Hazard: Low toxicity by ingestion.

Source: Natural product.

11-tetradecenal, (e)-.

CAS: 35746-21-5. mf: $C_{14}H_{26}O$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

Source: Natural product.

1-tetradecene. (α -tetradecylene).

Properties: Colorless liquid. D 0.775 (20/4C), fp -12C , bp 256C, flash p 230F (110C). Insoluble in water; very slightly soluble in alcohol and ether. Combustible.

Use: Solvent in perfumes, flavors, medicines, dyes, oils, resins.

cis-tetradec-9-enoic acid. See myristoleic acid.

(z)-9-tetradecenol acetate.

Hazard: Low toxicity by ingestion.

Source: Natural product.

tetradecylamine. $\text{C}_{14}\text{H}_{29}\text{NH}_2.$

Properties: White solid; odor of ammonia. Mp 37C, bp 291.2C. Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: 90% purity.

Use: Intermediate for manufacture of cationic surface-active agents, germicides.

tetradecylbenzyltrimethylammonium chloride monohydrate.

$[\text{C}_{14}\text{H}_{29}\text{N}(\text{CH}_3)_2\text{CH}_2\text{C}_6\text{H}_5]\text{Cl}\cdot\text{H}_2\text{O}.$ A quaternary ammonium salt.

Properties: (50% solution in aqueous isopropanol) Viscous liquid that may gelatinize on standing. D 0.978 (16C). Miscible with water, alcohol, glycerol and acetone; pH of a 10% solution in distilled water 7-8.

Grade: 50% solution in aqueous isopropanol.

Use: Production of bacteriostatic and fungistatic paper.

tetradecyl chloride. (myristyl chloride).

Properties: Water-white distilled liquid; mild odor. D 0.8590, fp -0.2C , bp 154-155C (15 mm Hg), 15.2% chloride, subject to mild hydrolysis on standing.

Grade: 97% min.

α -tetradecylene. See 1-tetradecene.

tetradecyl thiol. (myristyl mercaptan).

Properties: Liquid; strong odor. Mp 6.5C, bp 176-180C (22 mm Hg), d 0.8398 (25/4C), refr index 1.4612 (20C). Combustible.

Grade: 95% (min) purity.

Hazard: Toxic by inhalation, strong irritant.

Use: Organic intermediate, synthetic rubber processing.

tetradifon. (chlorophenyl-2,4,5-trichlorophenyl sulfone; 2,4,4',5-tetrachlorodiphenylsulfone).

Properties: White, crystalline powder. Mp 147C.

Soluble in chloroform and aromatic hydrocarbons; insoluble in water.

Use: Insecticide, acaricide, ovicide.

tetra(diphenylphosphito)pentaerythritol.

See pentaerythritol tetrakis(diphenyl phosphite).

tetradotoxin. A highly toxic venom found in pufferlike fish.

tetraethanolammonium hydroxide.

Properties: White, crystalline solid. Mp 123C, vap press below 0.01 mm Hg (20C). Completely soluble in water. A strong base, approaching sodium hydroxide in alkalinity. Aqueous solutions are stable at room temperature but decomposes on heating to weakly basic polyethanolamines.

Grade: Commercial grade is a 40% water solution.

Hazard: Strong irritant to skin and tissue.

Use: Alkaline catalyst, solvent for certain types of dyes, metal-plating solutions.

2,4,6,8-tetraethenyl-2,4,6,8-tetramethylcyclotetrasiloxane.

Hazard: Low toxicity by ingestion and inhalation.

tetraethylammonium perfluoro-1-octanesulfonate.

Hazard: A poison by ingestion.

1,1,3,3-tetraethoxypropane.

Properties: Liquid. Bp 105C, refr index 1.410 (20C), d 0.920 (20/20C), flash p 190F (87.7C). Slightly soluble in water; soluble in ether and alcohol. Combustible.

Use: Organic synthesis.

tetraethylammonium chloride. (TEAC;

TEA chloride). $(\text{C}_2\text{H}_5)_4\text{NCl}.$

Properties: (Anhydrous) Colorless, crystals; odorless. D 1.080. Hygroscopic; freely soluble in water, alcohol, chloroform, acetone; slightly soluble in benzene and ether. (Tetrahydrate) $(\text{C}_2\text{H}_5)_4\text{NCl}\cdot 4\text{H}_2\text{O}.$ Crystals. Mp 37.5C, d 1.084.

Use: Medicine (nerve-blocking agent).

tetraethylammonium hexafluorophosphate.

Properties: Solid. Mp 255C. Nonhygroscopic but soluble in water; stable to heat, can be stored in solution without decomposition of the PF_6^- ion.

Hazard: Irritant to skin.

Use: Maintenance of fluoride atmospheres; preparation of bactericides and fungicides.

tetra-(2-ethylbutyl) silicate.

Properties: Colorless liquid. D 0.8920–0.9018 (20/20C), fp –100C, bp 238C (50 mm Hg). Insoluble in water; slightly soluble in methanol; miscible with most organic solvents.

Use: Heat-transfer medium, hydraulic fluid, wide-temperature-range lubricant.

tetraethyl dithiopyrophosphate. (TEDP).
See sulfotep.

tetraethylene glycol. (TEG).
 $\text{HO}(\text{C}_2\text{H}_4\text{O})_3\text{C}_2\text{H}_4\text{OH}$.

Properties: Colorless liquid; hygroscopic. D 1.1248 (20/20C), fp –4C, bp 327.3C, vap press above 0.001 mm Hg (20C), refr index 1.4577 (20C), flash p 345F (174C), bulk d 9.4 lb/gal (20C). Soluble in water; insoluble in benzene, toluene, or gasoline. Combustible.

Use: Solvent for nitrocellulose, plasticizer, lacquers, coating compositions.

tetraethylene glycol dibutyl ether. See dibutoxytetraglycol.

tetraethylene glycol dimethacrylate.

Properties: Water-white to pale-straw liquid. Bp 200C (1 mm Hg), d 1.075 (20/20C), refr index 1.4620 (20C), viscosity 12 cP. Insoluble in water; soluble in styrene, many esters, and aromatics; limited solubility in aliphatic hydrocarbons. Combustible.

Hazard: Irritant to skin and eyes.

Use: Plasticizer.

tetraethylene glycol dimethyl ether. See dimethoxytetraglycol.

tetraethylene glycol distearate.

Properties: Liquid. Mp 32–33C. Insoluble in water. Combustible.

Use: Plasticizer.

tetraethylene glycol monostearate.

Properties: Liquid. D 0.971, mp 30–31C. Insoluble in water. Combustible.

Use: Plasticizer.

tetraethylenepentamine.

Properties: Viscous, hygroscopic liquid. D 0.9980 (20/20C), fp –30C, bp 333C, vap press above 0.01 mm Hg (20C), bulk d 8.3 lb/gal (20C), flash p 325F (162.7C). Soluble in most organic solvents and water. Combustible.

Hazard: Strong irritant to eyes and skin.

Use: Solvent for sulfur, acid gases, and various resins and dyes; saponifying agent for acidic materials; manufacture of synthetic rubber; dispersant in motor oils; intermediate for oil additives.

tetra-(2-ethylhexyl) silicate.

Properties: Colorless liquid. D 0.8838, bp 350–370C, fp –90C, flash p 390F (198C). Solubility in water below 0.01, 7.4 lb/gal. Combustible.

Use: Synthetic lubricants and functional fluids.

tetra-(2-ethylhexyl) titanate. (tetrakis(2-ethylhexyl)titanate). $[\text{C}_8\text{H}_{17}\text{CH}(\text{C}_2\text{H}_5)_2\text{CH}_2\text{O}]_4\text{Ti}$.

Properties: Light-yellow, viscous liquid from the transesterification of isopropyl titanate with 2-ethylhexanol. Combustible.

Use: Cross-linking agent, condensation catalyst, adhesion promoter, water repellents.

tetraethyl lead. (TEL).

Properties: Colorless, oily liquid; pleasant odor. D 1.65, bp 198–202C, 75–85C (13–14 mm Hg), fp –136C, decomposes slowly at room temperature, rapidly at 125–150C. Soluble in all organic solvents; insoluble in water and dilute acids or alkalis. Combustible.

Derivation: (1) Alkylation of lead-sodium alloy with ethyl chloride; (2) electrolysis of an ethyl Grignard reagent with an anode of lead pellets.

Grade: One grade only, about 98% pure.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.1 mg(Pb)/m³.

Use: Antiknock agent. Leaded gasoline contains 1.10 g lead per gallon. TEL has been largely replaced by MBTE.

tetraethyl orthosilicate. See ethyl silicate.

tetraethyl pyrophosphate. Legal label name for tepp.

tetraethylthiuram disulfide. (disulfiram;

TTD; TETD; bis[diethylthiocarbamyl] disulfide).

Properties: Light-gray powder; slight odor. D 1.27, melting range 65–70C. Soluble in carbon disulfide, benzene, and chloroform; insoluble in water.

Hazard: Toxic symptoms when ingested with alcohol; animal teratogen. TLV: 2 mg/m³; not classifiable as a human carcinogen.

Use: Fungicide, ultraaccelerator for rubber.

tetraethylthiuram sulfide. [bis-(diethylthiocarbamyl)sulfide]. $[(\text{C}_2\text{H}_5)_2\text{NCS}]_2\text{S}$.

Properties: Dark-brown powder; slight odor. D 1.12 (20/20C), boiling range 225–240C (3 mm Hg).

Hazard: Toxic by ingestion and inhalation.

Use: Pharmaceutical ointments, fungicide, insecticide.

tetraethyltin.

Properties: Colorless liquid. D 1.187 (23C), bp 181C, fp –112C. Insoluble in water; soluble in alcohol and ether.

Hazard: Toxic material. TLV: 0.1 mg(Sn)/m³.

tetrafluorodichloroethane. See dichlorotetrafluoroethane.

tetrafluoroethylene. (perfluoroethylene; TFE).

CAS: 116-14-3. F₂C:CF₂.

Properties: Colorless gas. Fp -142C, bp -78.4C. Insoluble in water; much heavier than air.

Derivation: By passing chlorodifluoromethane through a hot tube.

Hazard: Flammable, dangerous fire risk.

Use: Monomer for polytetrafluoroethylene polymers.

tetrafluoroethylene epoxide. (TFEO).

Derivation: Oxidation of tetrafluoroethylene at 120C with UV light; reaction proceeds by free-radical mechanism.

Use: Monomer for products ranging from dimers to polymers of dp 35.

See "FreonE"; "Krytox."

tetrafluorohydrazine.

CAS: 13847-65-9. F₂NNF₂.

Properties: Colorless, mobile liquid or colorless gas. Bp (calc) -73C, heat of vaporization 3170 cal/mole, critical temp 36C.

Hazard: Explodes on contact with reducing agents and at high pressures. Irritant.

Use: Organic synthesis; oxidizer in fuels for rockets, missiles, etc.

tetrafluoromethane. (fluorocarbon 14; carbon tetrafluoride).

CAS: 75-73-0. CF₄.

Properties: Colorless gas. D (liquid) 1.96 (-184C), sp vol 4.4 cu ft/lb (70F), fp -184C, bp -128C. Slightly soluble in water. Nonflammable.

Grade: 95% min purity.

Hazard: Toxic by inhalation.

Use: Refrigerant, gaseous insulator.

3-(4,6-(tetrafluoromethoxy)pyrimidin-2-yl)-1-((2-methoxycarbonyl)phenylsulfonyl)urea.

CAS: 86209-51-0. mf: C₁₅H₁₂F₄N₄O₇S.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion.

tetrafluorosilane. See silicon tetrafluoride.

tetraformaltrisazine. See octahydro-(1,2,4,5)tetrazino(1,2-a)(1,2,4,5)tetrazine.

tetragastrin. See gastrin tetrapeptide amide.

tetraglycol dichloride.

(ClCH₂CH₂OCH₂CH₂)₂O.

Properties: Colorless liquid. D 1.186, bp 114 (2 mm Hg). Slightly soluble in water. Combustible.

Use: High-boiling solvent and extractant for oils, fats, waxes, and greases; chemical intermediate.

tetraglyme. See dimethoxytetraglycol.

1,2,3,6-tetrahydrobenzaldehyde. Legal label name for 3-cyclohexene-1-carboxaldehyde.

1,2,3,4-tetrahydrobenzene. See cyclohexene.

tetrahydrobiopterin. The fully reduced coenzyme form of biopterin.

tetrahydrocannabinol. C₂₁H₃₀O₂. The active principle of marijuana, a hallucinatory drug. It has been synthesized and is available in laboratory quantities, subject to legal restrictions. Animal tests have indicated that it can retard cancer growth and also may promote the acceptance of organ transplants in the human body.

1,4,5,6-tetrahydro-3-(10,11-dihydro-dibenzo(a,d)cyclohepten-5-yl)-1-methyl-as-triazine hydrobromide.

CAS: 22187-44-6. mf: C₁₉H₂₁N₃•BrH.

Hazard: A poison.

α-(tetrahydro-4,6-dioxo-2-thioxo-5(2h)pyrimidinylidene)-o-toluic acid.

CAS: 73909-20-3. mf: C₁₂H₈N₂O₄S.

Hazard: A poison.

3,4,5,6-tetrahydro-2-(α-ethoxybenzyl)-5-ethyl-5-methylpyrimidine.

CAS: 33236-07-6. mf: C₁₆H₂₄N₂O.

Hazard: A poison by ingestion.

tetrahydrofolate. The reduced, active coenzyme form of the vitamin folate which functions as an antioxidant.

tetrahydrofuran. (THF).

CAS: 109-99-9.

Properties: Water-white liquid; ethereal odor. D 0.888 (20C), refr index 1.4070 (20C), fp -65C, bp 66C, flash p 5F (-15C) (OC), autoign temp 610F (321C). Soluble in water and organic solvents.

Derivation: (1) Catalytic hydrogenation of furan with nickel catalyst. (2) Acid-catalyzed dehydration of 1,4-butanediol.

Grade: Technical, spectrophotometric.

Hazard: Flammable, dangerous fire risk. Flammable limits in air 2-11.8%. Toxic by ingestion and inhalation. TLV: 200 ppm; STEL 250 ppm.

Use: Solvent for natural and synthetic resins (particularly vinyls), in top-coating solutions, polymer coating, cellophane, protective coatings, adhesives, magnetic tapes, printing inks, etc. Grignard reactions, lithium aluminum hydride reductions, and polymerizations; chemical intermediate and monomer.

tetrahydro-3-furancarboxaldehyde. See 3-formyltetrahydrofuran.

2,5-tetrahydrofurandimethanol. (2,5-bis[hydroxymethyl]tetrahydrofuran). $C_6H_{12}O_3$.
Properties: Colorless liquid. D 1.154, mp below $-50^{\circ}C$, bp $265^{\circ}C$, refr index 1.47. Soluble in water, alcohol, acetone, benzene; hygroscopic.
Hazard: Strong irritant to tissue.
Use: Organic synthesis, humectant, solvent.

(tetrahydro-2-furanyl)methyl 2-propenoate.
 See tetrahydrofurfuryl acrylate.

tetrahydrofurfuryl acetate.
 $C_4H_7OCH_2OOCCH_3$.
Properties: Colorless liquid. D 1.061 (20/0C), bp $194-195^{\circ}C$ (753 mm Hg). Soluble in water, alcohol, ether, and chloroform. Combustible.
Derivation: By treatment of tetrahydrofurfuryl alcohol with acetic anhydride.
Use: Flavoring.

tetrahydrofurfuryl acrylate.
 CAS: 2399-48-6. mf: $C_8H_{12}O_3$.
Hazard: A moderate skin irritant.

tetrahydrofurfuryl alcohol. (tetrahydrofuryl carbinol).
 CAS: 97-99-4. $C_4H_7OCH_2OH$.

Properties: Colorless liquid; mild odor; hygroscopic. D 1.0543 (20/20C), bp $178^{\circ}C$, refr index 1.4520 (20C), flash p 167F (75C) (OC), viscosity 5.49 cP (25C), autoign temp $540^{\circ}F$ (282C). Miscible with water. Combustible.
Derivation: Catalytic hydrogenation of furfural.
Grade: Commercial, industrial (80%).
Use: Solvent for vinyl resins; dyes for leather; chlorinated rubber; cellulose esters; solvent softener for nylon; vegetable oils; coupling agent; organic synthesis.

tetrahydrofurfurylamine.
 CAS: 4795-29-3. $C_4H_7OCH_2NH_2$.
Properties: Colorless to light-yellow liquid. Refr index 1.4520-1.4535 (25C), distilling range $150-156^{\circ}C$, d 0.977 (20C/20C). Combustible.

Use: Chemical intermediate, fine-grain photographic development, vulcanization accelerator.

tetrahydrofurfuryl benzoate.
 $C_9H_{10}OCH_2OOC_6H_5$.
Properties: Colorless liquid. D 1.137 (20/0C), bp $300-302^{\circ}C$, $138-140^{\circ}C$ (2 mm Hg). Insoluble in water; soluble in alcohol, ether, and chloroform. Combustible.
Derivation: Tetrahydrofurfuryl alcohol and benzoic acid by esterification.
Use: Chemical intermediate.

tetrahydrofurfuryl laurate.
 $C_{11}H_{18}OCH_2OOC_9H_{17}$.
Properties: Colorless liquid. D 0.930 (25C). Insoluble in water. Combustible.
Use: Plasticizer.

tetrahydrofurfuryl levulinate.
 $CH_3CO(CH_2)_2COOCH_2C_4H_7O$.
Properties: Colorless liquid. Mp $59-62^{\circ}C$. Soluble in water. Combustible.
Use: Plasticizer.

tetrahydrofurfuryl oleate.
 $C_{17}H_{33}COOCH_2C_4H_7O$.
Properties: Colorless liquid. D 0.923 (25C), bp $240^{\circ}C$ (5 mm Hg), fp $-30^{\circ}C$, flash p 329F (165C). Insoluble in water. Combustible.
Use: Plasticizer.

tetrahydrofurfuryl phthalate.
 $C_6H_4(COOCH_2C_4H_7O)_2$.
Properties: Colorless liquid. D 1.194 (25C), mp below $15^{\circ}C$. Insoluble in water. Combustible.
Use: Plasticizer.

tetrahydrofuryl carbinol. See tetrahydrofurfuryl alcohol.

3-(2-tetrahydrofuryl)-5-fluorouracil. See 5-fluoro-3-(tetrahydro-2-furyl)uracil.

tetrahydrogeraniol. See 3,7-dimethyl-1-octanol.

4-(1,2,3,4-tetrahydro-4-(4-hydroxy-2-oxo-2h-1-benzopyran-3-yl)-2-naphthalenyl)benzotrile.
 CAS: 90035-01-1. mf: $C_{26}H_{19}NO_3$.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

4'-(1,2,3,4-tetrahydro-4-(4-hydroxy-2-oxo-2h-1-benzopyran-3-yl)-2-naphthalenyl)(1,1'-biphenyl)-4-carbonitrile, cis-.
 CAS: 90034-98-3. mf: $C_{32}H_{23}NO_3$.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

4'-(1,2,3,4-tetrahydro-4-(4-hydroxy-2-oxo-2h-1-benzopyran-3-yl)-2-naphthalenyl)(1,1'-biphenyl)-4-carbonitrile, trans-

CAS: 90034-97-2. mf: $C_{32}H_{23}NO_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-((4-(1,2,3,4-tetrahydro-4-(4-hydroxy-2-oxo-2h-1-benzopyran-3-yl)-2-naphthalenyl)phenoxy)benzoyl)pyridin-3-ol.

CAS: 90035-05-5. mf: $C_{32}H_{23}NO_4$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4,5,6,7-tetrahydroisoxazolo(4,5-c)pyridin-3-ol.

CAS: 64603-91-4. mf: $C_6H_8N_2O_2$.

Hazard: A poison.

tetrahydrolinalool. (3,7-dimethyl-3-octanol).

CAS: 78-69-3. $C_{10}H_{21}OH$.

Properties: Colorless liquid; floral odor. D 0.832–0.837, optically inactive. Combustible.

Use: Perfumery, flavoring.

1-((1,2,3,4-tetrahydro-1-(4-(4-(2-methoxyphenyl)-1-piperazinyl)butyl)-7-methyl-2,4-dioxo-3-phenylpyrido(2,3-d)pyrimidin-5-yl)carbonyl)pyrrolidine.

CAS: 272774-82-0. mf: $C_{34}H_{40}N_6O_4$.

Hazard: A poison.

1-((1,2,3,4-tetrahydro-7-methyl-2,4-dioxo-3-phenyl-1-(4-(4-phenyl-1-piperazinyl)butyl)pyrido(2,3-d)pyrimidin-5-yl)carbonyl)pyrrolidine.

CAS: 272774-79-5. mf: $C_{33}H_{38}N_6O_3$.

Hazard: A poison.

1-((1,2,3,4-tetrahydro-7-methyl-1-(4-(4-methyl-1-piperazinyl)butyl)-2,4-dioxo-3-phenylpyrido(2,3-d)pyrimidin-5-yl)carbonyl)pyrrolidine.

CAS: 272774-83-1. mf: $C_{28}H_{36}N_6O_3$.

Hazard: A poison.

1,4,5,6-tetrahydro-3-(α -methylphenethyl)-as-triazine hydrochloride.

CAS: 21038-21-1. mf: $C_{12}H_{17}N_3 \cdot ClH$.

Hazard: A poison.

1,2,3,6-tetrahydro-1-methyl-4-phenylpyridine.

CAS: 28289-54-5. mf: $C_{12}H_{15}N$.

Hazard: A poison. A reproductive hazard.

1,2,3,4-tetrahydro-6-methylquinoline.

$C_{10}H_{13}N$.

Properties: Yellowish crystals; strong, civetlike

odor. Mp 33C. Soluble in 2 parts of 80% alcohol. Combustible.

Use: Perfumery.

tetrahydronaphthalene.

CAS: 119-64-2. $C_{10}H_{12}$.

Properties: Colorless liquid; pungent odor. D 0.981 (13C), bp 206C, refr index 1.540–1.547, flash p 160F (71.1C), fp –25C, moisture content none, residue on evaporation none, acidity neutral, bulk d 8 lb/gal, autoign temp 723F (384C). Miscible with most solvents; compatible with natural and synthetic vehicles; insoluble in water. Combustible.

Derivation: Hydrogenation of naphthalene in the presence of a catalyst at 150C.

Grade: Technical.

Hazard: Irritant to eyes and skin; narcotic in high concentration.

Use: Chemical intermediate; solvent for greases, fats, oils, waxes; substitute for turpentine.

tetrahydrophthalic anhydride.

CAS: 85-43-8. $C_6H_8(CO)_2O$.

Properties: White, crystalline powder. Solidification p 99–101C, d 1.20 (105C), flash p 315F (157C) (OC). Slightly soluble in petroleum ether and ethyl ether; soluble in benzene. Combustible.

Derivation: Diels-Alder reaction of butadiene and maleic anhydride.

Use: Chemical intermediate for light-colored alkyds, polyesters, plasticizers, and adhesives; intermediate for pesticides; hardener for resins.

(+)-(4ar,10br)-3,4,4a,10b-tetrahydro-4-propyl-2h,5h-(1)benzopyrano(4,3-b)-1,4-oxazin-9-ol.

CAS: 123671-92-1. mf: $C_{14}H_{19}NO_3$.

Hazard: A poison.

tetrahydropyran-2-methanol.

CAS: 100-72-1.

Properties: Liquid. D 1.0272 (20C), bp 187.2C, fp sets to glass below –70C, flash p 200F (93.3C) (OC). Miscible with water. Combustible.

Use: Chemical intermediate.

1,2,3,3-tetrahydro-3h-pyrano-(3,2-f)quinoline-8(7h)-one.

CAS: 128202-32-4. mf: $C_{12}H_{11}NO_2$.

Hazard: Moderately toxic by ingestion.

1,2,5,6-tetrahydropyridine. C_5H_9N .

Properties: Colorless liquid. D 0.912–0.914 (20/4C), fp –44C, bp 115.5–120.0C. Combustible.

Grade: 96% min.

Use: Organic intermediate.

tetrahydrothiophene. (thiophane).

CAS: 110-01-0.

Properties: Water-white liquid. D 1.00 (15.6/15.6C), boiling range 115–124.4C. Combustible.

Use: Solvent, intermediate, fuel gas odorant.

tetrahydrothiophene-1,1-dioxide. See sulfolane.

7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-10-((2,3,6-trideoxy-3-(2,3-dihydro-1h-pyrrol-1-yl)- α -lyxo-hexopyranosyl)oxy)-, (8s,10s)-5,12-naphthacenedione.

CAS: 175795-76-3. mf: $\text{C}_{31}\text{H}_{33}\text{NO}_{11}$.

Hazard: A poison.

tetrahydroxybutane. See erythritol.

tetrahydroxydiphenyl. See diorescinol.

tetrahydroxyethylethylenediamine.

[*N,N,N',N'*-tetrakis-(2-hydroxyethyl)ethylenediamine].

$(\text{HOCH}_2\text{CH}_2)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_2\text{CH}_2\text{OH})_2$.

Properties: Clear, viscous liquid. Good heat stability. Combustible.

Use: Organic intermediate, cross-linking of rigid polyurethane foams, chelating agent, humectant, gas absorbent, resin formation, detergent processing.

3',4',5,7-tetrahydroxyflavone.

CAS: 491-70-3. mf: $\text{C}_{15}\text{H}_{10}\text{O}_6$.

Hazard: A poison.

2,3,4,5-tetrahydroxyhexanedioic acid. See saccharic acid.

2,3,9,10-tetrahydroxyprotoberberine.

CAS: 162854-37-7. mf: $\text{C}_{17}\text{H}_{14}\text{NO}_4$.

Hazard: A poison by ingestion.

tetrahydroxysilane. See silicic acid (ortho).

tetraiodoethylene. (iodoethylene). $\text{I}_2\text{C}:\text{CI}_2$.

Properties: Light-yellow, crystals; odorless; turns brown on exposure to light. Mp 187C, d 2.98. Insoluble in water; soluble in most organic solvents.

Derivation: Iodine on diiodoacetylene obtained from calcium carbide and iodine.

Use: Surgical dusting powder, antiseptic ointment, fungicide.

tetraiodofluorescein. See iodeosin.

tetraisopropylstannane. See tetraisopropyltin.

tetraisopropylthiuram disulfide.

$[(\text{CH}_3\text{CH}_2\text{CH}_2)\text{NCS}]_2\text{S}_2$.

Properties: Tan powder; amine odor. D 1.12 (20/20C), melting range 95–99C. Soluble in benzene, chloroform, gasoline; insoluble in water, 10% caustic, carbon disulfide.

Use: Rubber accelerator.

tetraisopropyltin.

CAS: 2949-42-0. mf: $\text{C}_{12}\text{H}_{28}\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tetraisopropyl titanate. (TPT; titanium isopropylate; isopropyl titanate). $\text{Ti}[\text{OCH}(\text{CH}_3)_2]_4$.

Properties: Light-yellow liquid that fumes in moist air. Bp 102–104C (10 mm Hg), mp 14.8C, d 0.954, refr index 1.46, apparent viscosity 2.11 cP (25C). Decomposes rapidly in water; soluble in most organic solvents.

Derivation: Reaction of titanium tetrachloride with isopropanol

Use: Ester exchange reactions; adhesion of paints, rubber, and plastics to metals; condensation catalyst.

tetraisopropyl zirconate. $\text{Zr}[\text{OCH}(\text{CH}_3)_2]_4$.

Properties: White solid. Decomposes before melting.

Derivation: By reaction of zirconium tetrachloride with isopropanol.

Use: Condensation catalyst, cross-linking agent.

tetrakis(2-chloroethyl) ethylene diphosphate.

CAS: 33125-86-9. mf: $\text{C}_{10}\text{H}_{20}\text{Cl}_4\text{O}_8\text{P}_2$.

Hazard: A reproductive hazard.

tetrakis(dimethylamino)silane. See octamethylsilanetetramine.

tetrakis(1,1-dimethylpentyl) silicate. See tetra(2-butyloisopropyl) orthosilicate.

tetrakis(hydroxymethyl)phosphonium chloride. (THPC). $(\text{HOCH}_2)_4\text{PCl}$. A crystalline compound made by the reaction of phosphine, formaldehyde, and hydrochloric acid.

Use: Flame-retarding agent for cotton fabrics. May be used in combination with triethylolamine and urea (Roxel process) or with triethanolamine and tris(1-aziridinyl) phosphine oxide.

***N,N,N',N'*-tetrakis(2-hydroxypropyl) ethylenediamine.** (ethylenedinitrilotetra-2-propanol). $[-\text{CH}_2\text{N}(\text{CH}_2\text{CH}_2\text{OCH}_2)_2]$.

Properties: Viscous, water-white liquid. Miscible with water; soluble in ethanol, toluene, ethylene glycol, and perchloroethylene. Combustible.

Use: Cross-linking agent and catalyst in urethane foams, epoxy resin curing, metal complexes, intermediate.

tetrakis(*p*-phenoxyphenyl)tin.

CAS: 6452-62-6. mf: $C_{48}H_{36}O_4Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

“Tetralin” [Du Pont]. TM for tetrahydronaphthalene.

tetralite. See tetryl.

“Tetralol” [Millenium]. TM for an additive.

Use: In floral fragrances and soap perfumes to impart fresh floral and citrus aroma.

1-tetralone.

A ketone of tetrahydronaphthalene.

Properties: Liquid. D 1.090–1.095 (20/20C), bp 120–125C (10 mm Hg), vap press 0.02 mm Hg (20C), mp 5.3–6.0C, flash p 265F (129.5C). Insoluble in water. Combustible.

Grade: Solvent and intermediate.

tetram. (*O,O*-diethyl-*S*-(β-diethylamino)-ethyl phosphorothioate hydrogen oxalate).

CAS: 78-53-5. $(C_2H_5O)_2POSCH_2CH_2N(C_2H_5)_2$.

Hazard: Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

tetramer. An oligomer whose molecule is composed of four molecules of the same chemical composition. See polymer.

1,1,3,3-tetramethoxypropane.

Properties: Liquid. Bp 183C, refr index 1.408 (20C), d 0.995 (20/20C). Soluble in water, hexane, ether, and alcohol. Combustible.

Use: Organic synthesis.

tetramethoxy silane. See methyl silicate.

3,3',4,4'-tetramethoxystilbene.

CAS: 18513-98-9. mf: $C_{18}H_{20}O_4$.

Hazard: Moderately toxic by ingestion.

tetramethylammonium chloride.

$(CH_3)_4NCl$. A quaternary ammonium compound.

Properties: White, crystalline solid. D 1.1690 (20/4C), mp (decomposes). Soluble in water and alcohol; insoluble in ether, also available as a 50% solution.

Use: Chemical intermediate, catalyst, inhibitor.

tetramethylammonium chlorodibromide.

Properties: Powder. Mp 118–126C. Soluble in water and other polar solvents.

Hazard: Evolves bromine on contact with water.

Use: Dry brominating agent, ingredient in formulation of sanitizers.

tetramethylammonium hydroxide.

CAS: 75-59-2. $(CH_3)_4NOH$.

Properties: A strong base available in 10% solution.

Hazard: Strong irritant to skin and tissue.

1,2,3,5-tetramethylbenzene. See isodurene.

***sym*-tetramethylbenzene.** See durene.

***N,N,N',N'*-tetramethyl-1,3-butanediamine.**

Properties: Colorless, stable liquid. Fp –100C, bp 165.0C, d 0.8020 (20/20C), vap press 1.64 mm Hg (20C), miscible with water, viscosity 1.0 cP (20C), flash p 114F (45.5C) (TOC). Combustible.

Use: Catalyst for polyurethane foams and epoxy resins; high-energy fuels.

***n,n',o,o'*-tetramethylcurinium diiodide.**

CAS: 16240-52-1. mf: $C_{40}H_{48}N_2O_6 \cdot 2I$.

Hazard: A poison.

2,2,4,4-tetramethyl-1,3-cyclobutanediol.

Properties: White solid. Mp 124–135C, bp 220–225C, isomer composition 50% *cis*, 50% *trans*, flash p 125F (51.6C).

Hazard: Moderate fire risk. Irritant.

Use: Chemical intermediate, lubricants.

tetramethyldiamidophosphoric fluoride.

See dimefox.

tetramethyldiaminobenzhydrol.

(tetramethyldiaminodiphenylcarbinol; Michler's hydrol; hydrol).

Properties: Colorless prisms. Forms a colorless solution in ether or benzene and a blue solution in alcohol or acetic acid.. Mp 96C. Soluble in alcohol, ether, benzene, and acetic acid. Combustible.

Derivation: Reaction of tetramethyldiaminodiphenylmethane, hydrochloric acid, and glacial acetic acid; oxidized with lead peroxide.

Grade: Technical.

Use: Dye intermediate, organic synthesis.

tetramethyldiaminobenzophenone. (Mi-

chler's ketone; 4,4'-bis[dimethylamino]benzophenone).

Properties: Crystalline leaflets. Mp 172C, bp decomposes at 360C. Soluble in alcohol, ether, and water. Combustible.

Derivation: From dimethylaniline by reaction with phosgene.

Use: Synthesis of dyestuffs, especially auramine derivatives.

4,4'-tetramethyldiaminodiphenylmethane.

(tetra base).

CAS: 101-61-1. $\text{H}_2\text{C}[\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2]_2$.

Properties: Yellowish leaflets or glistening plates. Mp 90–91C, sublimes with decomposition, bp 390C. Insoluble in water; soluble in benzene, ether, carbon disulfide, and acids.

Derivation: By heating dimethylaniline with hydrochloric acid and formaldehyde.

Use: Dye intermediate.

tetramethyldiaminodiphenylsulfone. (4,4'-bis(dimethylamino)diphenylsulfone).

$[(\text{CH}_3)_2\text{NC}_6\text{H}_4]_2\text{SO}_2$.

Properties: Solid. Mp 259–260C. Combustible.

Grade: Technical, reagent.

Use: Intermediate in making dyestuffs and medicinal chemicals; analytical reagent for lead.

1,1,3,3-tetramethyl-1,3-divinyldisilazane.

CAS: 7691-02-3. mf: $\text{C}_8\text{H}_{16}\text{NSi}_2$.

Hazard: A poison by ingestion.

sym-tetramethyldivinyldisiloxane.

CAS: 2627-95-4. mf: $\text{C}_8\text{H}_{18}\text{OSi}_2$.

Hazard: Low toxicity by ingestion and inhalation.

tetramethylene. See cyclobutane.

tetramethylenediamine.

CAS: 110-60-1. $\text{H}_2\text{N}(\text{CH}_2)_4\text{NH}_2$.

Properties: Colorless crystals; strong odor. Mp 27C, bp 158–159C. Soluble in water with strongly basic reaction. Combustible.

Use: Chemical intermediate, complexing agent, catalyst in resin technology, synthesis of quaternary ammonium compounds.

tetramethylene dichloride. See 1,4-dichlorobutane.

3,3'-(tetramethylenedioxy)bis(propylamine).

See 1,4-bis(3-aminopropoxy)butane.

tetramethylene glycol. See 1,4-butylene glycol.

tetramethylene sulfone. See sulfolane.

1,1,4,4-tetramethyl-6-ethyl-7-acetyl-1,2,3,4-tetrahydronaphthalene. $\text{C}_{18}\text{H}_{26}\text{O}$. A polycyclic musk.

Properties: Colorless crystals. Mp 45C, bp 130C (2 mm Hg). Insoluble in water; soluble in alcohol.

Use: Perfumes, cosmetics, soaps.

tetramethylethylenediamine. (TMEDA; *N,N,N',N'*-tetramethylethylenediamine).

CAS: 110-18-9. $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.

Properties: Colorless liquid; slight ammoniacal odor. Bp 121–122C, d 0.7765 (20/4C), refr index 1.4170 (25C), fp –55.1C. Soluble in water and most organic solvents. Combustible.

Grade: Anhydrous (100%), aqueous (65%).

Use: Preparation of epoxy curing agents, polyurethane formation, corrosion inhibitor, textile finishing agents, intermediate for quaternary ammonium compounds.

tetramethylguanidine.

$(\text{CH}_3)_2\text{NC}(\text{NH})\text{N}(\text{CH}_3)_2$.

Properties: Liquid; slight ammoniacal odor. Bp 159–160C. Soluble in both water and organic solvents. A strong base. Combustible.

2,6,10,14-tetramethylhexadecane. See phytane.

tetramethyl lead. (TML).

CAS: 75-74-1. $(\text{CH}_3)_4\text{Pb}$.

Properties: Colorless liquid. D 1.995, fp –27.5C, bp 110C (10 mm Hg), flash p 100F (37.7C). Insoluble in water; slightly soluble in benzene, petroleum ether, alcohol.

Derivation: As for tetraethyl lead. Methyl reagents used instead of ethyl.

Hazard: Flammable, moderate fire risk. Toxic by ingestion, inhalation, and skin absorption. Lower explosion level 1.8%. TLV: 0.15 mg(Pb)/m³. Toxic by skin absorption.

tetramethylmethane. See neopentane.

3,3'-tetramethylnonyl thiodipropionate.

See tridecyl thiodipropionate.

tetramethyl phosphonosuccinate. See phosphonosuccinic acid tetramethyl ester.

tetramethylsilane.

CAS: 75-76-3. $(\text{CH}_3)_4\text{Si}$.

Properties: Colorless, volatile liquid. Bp 26.5C, d 0.646 (20/4C), flash p 0F (–17.7C). Insoluble in water and cold concentrated sulfuric acid; soluble in most organic solvents.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Grade: Technical, purified.

Hazard: Flammable, high fire risk.

Use: Aviation fuel, internal standard for NMR analytical instruments.

tetramethyl succinonitrile. (TMSM).

CAS: 3333-52-6. $\text{C}_8\text{H}_{12}\text{N}_2$.

Properties: Colorless, solid; odorless. Mw 136.19, sp g 1.070, mp 170.5C, bp (sublimes). Insoluble in water.

Hazard: Toxic by inhalation and skin contact. TLV: 0.5 ppm.

Use: Blowing agent for vinyl foam production.

tetramethylthiourea.

CAS: 2782-91-4. mf: C₅H₁₂N₂S.

Properties: Crystals from H₂O. Mp: 79–80°, bp: 245°.

Hazard: Moderately toxic by ingestion.

Use: As a drug.

1,1,3,3-tetramethylthiourea. See tetramethylthiourea.

tetramethylthiuram disulfide. See thiram.

tetramethylthiuram monosulfide. (bisdimethylthiocarbamyl sulfide).

CAS: 97-74-5. [(CH₃)₂NCH₂]₂S.

Properties: Yellow powder. D 1.40, mp 104–107C. Soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline. Combustible.

Use: Ultraaccelerator for rubber, fungicide, insecticide.

tetramethylurea.

CAS: 632-22-4. C₅H₁₂N₂O.

Properties: Liquid. Bp 176C, flash p 75C (167F), d 1.45. Soluble in water and organic solvents.

Use: Solvent, analytical reagent.

tetranitroaniline. (TNA).

CAS: 3698-54-2. C₆H(NO₂)₄NH₂. A nitration product of aniline.

Properties: Mp 170C; explodes at 237C.

Hazard: Dangerous fire and explosion risk.

Use: Manufacture of detonators and primers.

tetranitromethane.

CAS: 509-14-8. C(NO₂)₄.

Properties: Colorless liquid; pungent odor. Bp 125.7C, mp 12.5C, d 1.650 (13C). Miscible with alcohol and ether; insoluble in water; decomposed by alcoholic solution of potassium hydroxide. Powerful oxidizing agent.

Derivation: By action of fuming nitric acid on benzene, acetic anhydride, or acetylene.

Hazard: Dangerous fire and explosion risk. Toxic by ingestion, inhalation, skin absorption. TLV: 0.005 ppm; animal carcinogen.

Use: Rocket fuel, as an oxidant or monopropellant; qualitative test for unsaturated compounds; diesel fuel booster; organic reagent.

tetra(octylene glycol) titanate. See octylene glycol titanate.

tetraphene. See benz(a)anthracene.

1,1,4,4-tetraphenylbutadiene. (TPB).

(C₆H₅)₄C:CHCH:C(C₆H₅)₂.

Properties: White crystals. Two forms, mp 194–196C and mp 202–204C. Insoluble in water; soluble in most organic solvents. Combustible.

Grade: Purified.

Use: Primary fluor or wavelength shifter in soluble scintillators.

tetraphenylresorcinol diphosphate. See resorcinol bis(diphenyl phosphate).

tetraphenylsilane. (C₆H₅)₄Si.

Properties: White solid. Mp 237C, bp 428C. Very stable and inert. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride.

Grade: Technical.

Use: Heat-transfer medium, polymers.

tetraphenyltin. (C₆H₅)₄Sn.

Properties: White powder. D 1.490, mp 225–228C, bp above 420C. Insoluble in water; soluble in hot benzene, toluene, xylene.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Hazard: Skin irritant.

Use: Stabilizer in chlorinated transformer oils, mothproofing agent, scavenger in dielectric fluids, intermediate.

tetraphosphoric acid. See polyphosphoric acid.

tetraphosphorus heptasulfide. See phosphorus heptasulfide.

tetraphosphorus hexasulfide. See phosphorus trisulfide.

tetraphosphorus trisulfide. See phosphorus sesquisulfide.

tetrapotassium ethylenediaminetetraacetate. See ethylenediaminetetraacetic acid (note).

tetrapotassium pyrophosphate. (TKPP). See potassium pyrophosphate.

tetrapropenylsuccinic anhydride. See dodecenylsuccinic anhydride. Many isomers are possible.

tetra-*n*-propyl dithionopyrophosphate.

CAS: 3244-90-4. (C₃H₇O)₂P(S)OP(S)(OC₃H₇)₂.

Properties: Amber liquid. Bp 148C (2 mm Hg). Miscible with most organic solvents; insoluble in water.

Hazard: Highly toxic.

Use: Insecticide, acaricide.

tetrapropylene. (dodecene; propylene tetramer). CAS: 6842-15-5. $C_{12}H_{24}$. A mixture of C_{12} monoolefins.

Properties: Liquid. D 0.770 (20/20C), boiling range 183–218C, bulk d 6.44 lb/gal (15.5). Combustible.

Derivation: Olefin fraction obtained from catalytic polymerization of propylene.

Use: Detergents (dodecylbenzene), lubricant additives, plasticizers.

tetrapropylenepentamine.

CAS: 13274-42-5. mf: $C_{12}H_{31}N_5$.

Hazard: A poison by ingestion and skin contact. A moderate skin and severe eye irritant.

tetrapropylthiuram disulfide.

$[(C_4H_7)_2NCS]_2S_2$.

Properties: Light-cream color; musty odor. D 1.13 (20/20C), melting range 49–51.5C. Soluble in carbon disulfide, benzene, chloroform, and gasoline; insoluble in water and 10% caustic soda. Combustible.

tetrasilane.

Si_4H_{10} .

Properties: Colorless liquid. Fp –93.5C, bp 109C, d 0.825 (0C).

Hazard: Severe fire and explosion risk, can ignite or explode in air.

tetrasodium diphosphate. See sodium pyrophosphate; sodium polyphosphate.

tetrasodium EDTA. (ethylenediaminetetraacetic acid; tetrasodium salt; EDTA Na_4 ; sodium edetate).

CAS: 64-02-8. $C_{10}H_{12}N_2Na_4O_8$ anhydrous or $2H_2O$.

Properties: White powder. Freely soluble in water.

Use: General-purpose chelating agent.

See ethylenediaminetetraacetic acid (note).

tetrasodium hydrogen 2-phosphonobutane-1,2,4-tricarboxylate.

CAS: 66669-53-2. mf: $C_7H_7O_9P \cdot 4Na$.

Hazard: Moderately toxic by ingestion and skin contact.

tetrasodium monopotassium tripolyphosphate.

$Na_4KP_3O_{10}$.

Properties: White, crystalline solid. Mp 580–600C, d 2.55. Solubility in water 30 g/100 mL (26C).

Use: Sequesterant.

tetrasodium pyrophosphate. See sodium pyrophosphate; sodium polyphosphate.

tetrastearyl titanate. Organic intermediate, adhesion promoter, pigment dispersant.

tetrathiin. See oxidimethiin.

tetrazene. (4-amidino-1-[nitrosamino-amidino]-1-tetrazene).

CAS: 109-27-3.

$H_2NC(:NH)NHNHN:NC(:NH)NHNHNO$.

Properties: Colorless or pale-yellow, fluffy solid. Apparent d 0.45 but yields a pellet of d 1.05 under pressure of 3000 psi. Practically insoluble in water, alcohol, ether, benzene, and carbon tetrachloride; slightly hygroscopic.

Derivation: Interaction of an aminoguanidine salt with sodium nitrite in the absence of free mineral acid.

Use: Initiating explosive.

1h-tetrazol-5-amine. See aminotetrazole.

tetrazolium chloride. (tetrazolium salt; TTC; 2,4,5-triphenyltetrazolium chloride).

$CN_4Cl(C_6H_5)_3$.

Properties: White to pale-yellow crystalline powder that darkens on exposure to light. Mp (with decomposition) 245C. Readily soluble in water.

Use: In germination and viability tests. Viable parts of seed are stained red by deposition of red insoluble triphenyl formazan.

tetrazolium nitro blue. See *p*-nitro blue tetrazolium chloride.

tet resistance. See: Antibiotic resistance.

tetrol. See furan.

“Tetrone” A [Du Pont]. TM for dipentamethylenethiuram tetrasulfide rubber accelerator.

“Tetronic” [BASF]. TM for a nonionic tetrafunctional series of polyether block polymers ranging in physical form from liquids through pastes to flakable solids. They are polyoxyalkylene derivatives of ethylenediamine. Physical state varies with molecular weight and oxyethylene content, 100% active.

Use: Low-foaming detergent formulations; defoaming agents; flexible and rigid polyurethane foams; emulsifying and demulsifying agents; textile processing.

tetryl. (tetralite and nitramine are common commercial names for trinitrophenylmethylnitramine).

CAS: 479-45-8. $(NO_2)_3C_6H_2N(NO_2)CH_3$.

Properties: Yellow crystals. Mp 130–132C, d 1.57

(19C), explodes at 187C. Insoluble in water; soluble in alcohol, ether, benzene, glacial acetic acid.

Hazard: Dangerous fire and explosion risk. Skin irritant, absorbed by skin. TLV: 1.5 mg/m³.

Use: Detonating agent for less-sensitive high explosives, indicator (colorless at pH 10.8, dull red at pH 13.0).

textile oil. Any of various specially compounded oils used to condition raw fibers, yarns, or fabric for manufacturing, bleaching, dyeing, and finishing operations.

“Textone” [Vulcan]. TM for sodium chlorite.

Available forms: Liquid solutions and powder.

Use: Used for water disinfection, as a bleaching agent for textiles, and for algae control.

textryl. Generic name for nonwoven structures that may be manufactured by wet-processing from staple fibers and fibril binder.

texture. The physical structure of a solid or semi-solid material that results from the shape, arrangement, and proportions of its components. The term is used in the textile industry to characterize fabrics of various types and in the food industry to describe quality characteristics of bakery products, margarines, meats, spun proteins, etc. It is also regarded by geologists as a property of rocks and soils. See protein, textured.

textured protein. See protein, textured.

TFE. Abbreviation for tetrafluoroethylene. See polytetrafluorethylene.

TFEO. Abbreviation for tetrafluoroethylene epoxide.

TGA. Abbreviation for (1) triglycollamic acid; (2) thermogravimetric analysis. See thermogravimetric analysis; nitrilotriacetic acid.

TGDR. See thioguanine deoxyriboside.

Th. Symbol for thorium.

thallium.

CAS: 7440-28-0. Tl. Metallic element of atomic number 81, group IIIA of the periodic table, aw 204.37, valences = 1, 3; two stable isotopes.

Properties: Bluish-white, leadlike metal. D 11.85, mp 302C, bp 1457C, oxidizes in air at room temperature. Soluble in nitric and sulfuric acids; insoluble in water but readily forms soluble compounds when exposed to air or water.

Derivation: Flue dusts from lead and zinc smelting. The thallium compounds recovered are treated to obtain the metal by electrolysis, precipitation, or reduction.

Grade: Technical, high purity.

Hazard: Forms toxic compounds on contact with moisture; keep from skin contact. TLV: (soluble salts) 0.1 mg(Tl)/m³.

Use: Thallium salts, mercury alloys, low-melting glasses, rodenticides, photoelectric applications, electrodes in dissolved oxygen analyzers.

thallium acetate. (thallous acetate).

CAS: 563-68-8. TlOCOCH₃.

Properties: White, deliquescent crystals. Mp 131, d 3.68. Soluble in water and alcohol.

Derivation: Interaction of acetic acid and thallium carbonate.

Hazard: As for thallium.

Use: High specific gravity solutions used to separate ore constituents by flotation.

thallium amalgam.

Properties: Reported to have fp -60C (30C below that of mercury).

Hazard: As for thallium.

Use: Substitute for mercury in electrical switches, thermometers, etc. for extremely low-temperature service.

thallium bromide. (thallous bromide).

CAS: 7789-40-4. TlBr.

Properties: Yellowish-white, crystalline powder. D 7.557, bp 815C, mp 460C. Soluble in alcohol. Slightly soluble in water. Insoluble in acetone.

Hazard: As for thallium.

Use: Mixed crystals with thallium iodide for infrared radiation transmitters used in military detection devices.

thallium carbonate. (thallous carbonate).

CAS: 6533-73-9. Tl₂CO₃.

Properties: Heavy, shiny, colorless or white crystals. D 7, mp 272C. Highly refractive, melts to dark gray mass, slightly alkaline taste. Soluble in water; insoluble in alcohol.

Hazard: As for thallium.

Use: Analysis (testing for carbon disulfide), artificial diamonds.

thallium chloride. (thallous chloride).

CAS: 7791-12-0. TlCl.

Properties: White, crystalline powder; becomes violet on exposure to light. D 7.004 (30/4C), mp 430C, bp 720C. Slightly soluble in water; insoluble in alcohol, ammonium hydroxide.

Hazard: As for thallium.

Use: Catalyst (chlorination), suntan lamp monitors.

thallium hydroxide. (thallous hydroxide).

TlOH•H₂O.

Properties: Yellow needles. Bp (dehydrated) 139C, (decomposes). Soluble in alcohol, water.

Hazard: As for thallium.

Use: Analysis, indicator.

thallium iodide. (thallous iodide).

CAS: 7790-30-9. TII.

Properties: Yellow powder. D 7.09, bp 824C, mp 440C, becomes red at 170C. Insoluble in alcohol; slightly soluble in water; soluble in aqua regia.

Hazard: As for thallium.

Use: Mixed crystals with thallium bromide for infrared radiation transmitters.

thallium monoxide. (thallium oxide; thallous oxide).

CAS: 1314-32-5. Tl₂O.

Properties: Black powder. Mp 300C, bp 1080C, d 9.52 (16C). Soluble in alcohol, water (decomposes). Oxidizes when exposed to air, keep well stoppered.

Hazard: As for thallium.

Use: Analysis (testing for ozone), artificial gem, optical glass of high refractive index.

thallium nitrate. (thallous nitrate).

CAS: 10102-45-1. TlNO₃.

Properties: Colorless crystals. D 5.5, mp 206C (solidifies to a glasslike solid), decomposes at 450C. Soluble in hot water; insoluble in alcohol.

Grade: Technical.

Hazard: A poison. Strong oxidizing agent, fire and explosion risk. TLV: 0.1 mg(Tl)/m³. Toxic by skin absorption.

Use: Analysis, pyrotechnics (green fire).

thallium(III) nitrate.

CAS: 13746-98-0. mf: N₃O₉Tl.

Properties: IDLH 15 mg/m³ (as Tl).

Hazard: A poison by skin contact.

thallium oxide. (thallous oxide).

CAS: 1314-12-1. Tl₂O.

Properties: Finely divided black solid. Mp about 300C. Soluble in water and alcohol. Oxidizes when exposed to air.

Hazard: Toxic by ingestion.

Use: Optical glass, synthetic gemstones.

thallium sesquichloride. (thallo-thallic chloride). TlCl₃•3TlCl or Tl₂Cl₃.

Properties: Yellow, crystalline powder. D 5.9, mp 400–500C. Slightly soluble in water.

Hazard: As for thallium.

thallium sulfate. (thallous sulfate).

CAS: 7446-18-6. Tl₂SO₄.

Properties: Colorless crystals. D 6.77, mp 632C. Soluble in water.

Grade: Technical, 99%.

Hazard: As for thallium.

Use: Analysis (testing for iodine in the presence of chlorine), ozonometry, rodenticides, pesticide.

thallium sulfide. (thallous sulfide). Tl₂S.

Properties: Blue-black, lustrous, microscopic crystals or amorphous powder. D 8.46, mp 448C. Solu-

ble in mineral acids; insoluble in water, alcohol, or ether.

Hazard: As for thallium.

Use: Infrared-sensitive photocells.

thallous compound. See corresponding thallium compound.

thalrugosamine. See homoaromoline.

THAM. See

tris(hydroxymethyl)aminomethane.

thebaine. (*p*-morphine).

CAS: 115-37-7. C₁₉H₂₁NO₃.

Properties: White, crystalline alkaloid. Mp 193C, d 1.30. Slightly soluble in water; soluble in alcohol and ether. It is extracted from poppies of a different species from morphine-producing opium poppies.

Hazard: Toxic by ingestion, may induce addiction.

theca. General term for any stiff outer covering of a unicellular protist, and usually made up of interlocking plates. Dinoflagellates and diatoms are examples of protists with thecae.

theine. See caffeine.

Thenard's blue. See cobalt blue.

The National Dendrimer and

Nanotechnology Center. (NDNC). Serves as a catalyst for new dendrimer-based research yielding a growing body of valuable intellectual property. Working cooperatively on a broad range of research projects. Located at 625 Denison Drive, Mount Pleasant, MI 48858.

Website: <http://www.dendrimercenter.org/research.html>.

thenyl alcohol. (2-thienylmethanol; 2-hydroxymethylthiophene; 2-thiophenecarbinol).

C₄H₄SCH₂OH.

Properties: Colorless liquid. Bp 207C. Insoluble in water; soluble in alcohol and ether.

Derivation: A heterocyclic alcohol made by reaction of 2-thienylmagnesium iodide and formaldehyde.

Use: No commercially developed applications. d's

thenyldiamine. (coined name for 2-[2-dimethylaminoethyl]-3-thenylaminopyridine).

CAS: 91-79-2.

(C₄H₄SCH₂)N(C₂H₅N)CH₂CH₂N(CH₃)₂.

Properties: Liquid. Bp 169–172C (1.0 mm Hg).

Derivation: Condensing *N,N*-dimethylaminoethyl- α -aminopyridine with 3-thenyl bromide.

Use: Medicine (as base for various salts, especially the hydrochloride).

theobroma oil. (cacao butter; cocoa butter).

Properties: Yellowish-white solid; chocolate-like taste and odor. D 0.858–0.864 (100/25C), mp

30–35C, refr index 1.4537–1.4585 (40C), saponification number 188–195, iodine number 35–43. Insoluble in water; slightly soluble in alcohol; soluble in boiling dehydrated alcohol; freely soluble in ether and chloroform. Combustible.

Derivation: From the cacao bean, by expression, decoction, or extraction by solvent.

Chief constituents: Glycerides of stearic, palmitic, and lauric acids.

Grade: Crude, refined, USP.

Use: Confectionery, suppositories and pharmaceuticals, soaps, cosmetics.

theobromine. (3,7-dimethylxanthine).

CAS: 83-67-0. $C_7H_8N_4O_2$. The alkaloid found in cocoa and chocolate products. A purine base closely related to caffeine. Also occurs in tea and cola nuts.

Hazard: Toxic by ingestion.

theophylline. (1,3-dimethylxanthine).

CAS: 58-55-9. $C_7H_8N_4O_2$.

Properties: White, crystalline alkaloid; odorless; bitter taste. Mp 270–274C. Slightly soluble in water and alcohol; more soluble in hot water; soluble in alkaline solutions.

Derivation: (1) By extraction from tea leaves, (2) synthetically from ethyl cyanoacetate.

Grade: Technical, NF.

Use: Medicine (diuretic, muscle relaxant).

theoretical plate. Any contacting device in a fractionating column, such as packing, grids, or screens, that effects the same degree of separation of vapor from liquid as one simple distillation. A column that gives the same separation as 10 successive simple distillations is considered to have 10 theoretical plates. The effectiveness of a fractionating column is measured in terms of theoretical plates. As many as 100 theoretical plates are used in laboratory and industrial operations. The total column height divided by the number of theoretical plates is known as HETP (height equivalent to a theoretical plate). This concept is also used in chromatographic techniques.

“Therabloat” [Pfizer]. (poloxalene).

CAS: 9003-11-6.

mf: $HO(CH_2CH_2O)_n[CH(CH_3)CH_2O]_m(CH_2CH_2O)_nH$

Properties: Liquid nonionic surfactant polymer. TM for a veterinary drug used to treat bloat.

Use: Drug (veterinary); food additive.

therm. A unit of heat equal to 100,000 Btu. It has also been used to mean one Btu or one small calorie, but these uses have been abandoned in the U.S.

thermal black. Carbon black made from natural gas by the thermatomic process or by pyrolysis of bituminous coal. It is no longer widely used.

thermal cracking. See cracking.

thermal decomposition. See decomposition (6); pyrolysis.

thermal expansion coefficient. The change in volume per unit volume per degree change in temperature (cubical coefficient). For isotropic solids the expansion is equal in all directions, and the cubical coefficient is about three times the linear coefficient of expansion. These coefficients vary with temperature, but for gases at constant pressure the coefficient of volume expansion is nearly constant and equals 0.00367 for each degree Celsius at any temperature.

thermal neutron. A slow neutron. See neutron.

thermal pollution. Heat introduced into rivers or estuaries by power plants or other industrial cooling waters or chemical wastes, which has adverse effects on estuarine ecology. See water pollution.

thermatomic process. Methane or natural gas is cracked over hot bricks at 870C to form amorphous carbon (carbon black) and hydrogen. See thermal black; carbon black.

“Therm-Chek” [Ferro]. TM for heat stabilizers.

“Therminol” FR [Solutia]. TM for a family of heat-transfer fluids thermally stable to 400C.

thermite. A mixture of ferric oxide and powdered aluminum, usually enclosed in a metal cylinder and used as an incendiary bomb, invented by the German chemist Hans Goldschmidt around 1900. On ignition by a ribbon of magnesium, the reaction produces a temperature of 2200C, that is sufficient to soften steel. This is typical of some oxide/metal reactions which provide their own oxygen supply and thus are very difficult to stop.

Hazard: Dangerous fire risk.

thermochemistry. That branch of chemistry comprising the measurement and interpretation of heat changes that accompany changes of state and chemical reactions. It is closely related to chemical thermodynamics. The heat of formation of a compound is the heat absorbed when it is formed from its elements in their standard states. An exothermic reaction evolves heat, an endothermic reaction requires heat for initiation.

Application of thermochemical principles to generation of hydrogen by water splitting is being extensively researched. The advantage of this method over electrolysis is its greater net efficiency. Many techniques have been explored, but only a few have practical potential. One of the more promising is the S-I cycle under study at Lawrence Livermore Laboratory. The heat for this would be obtained from either solar receivers or nuclear reactors. The reactions involved are

thermocouple. (thermoelectric thermometer).

An instrument composed of two wires made of dissimilar metals or semiconducting materials that are joined at one end (the measuring junction), the other end being the reference junction, which is maintained at a known temperature (usually 0C). The difference in temperature between the measuring junction and the reference junction generates an electromotive force that is proportional to the temperature difference. Thermocouples are applicable over a range of -200C to 1800C. The most suitable conducting materials are iron-constantan, platinum-platinum-rhodium, copper-constantan, and Chromel-Alumel; graphite-silicon carbide is used in the metallurgical field. Thermocouples are essential for determinations of extreme temperatures that are beyond the range of liquid-in-glass thermometers. Their industrial applications include molten metals, fuel beds, ceramic kilns, furnaces, etc.; in laboratories they are used for both high-temperature and cryogenic research. They are also applicable to intermediate temperatures in cases where conventional thermometers are impracticable.

See thermoelectricity.

thermodynamic potential. See Nernst potential.

thermodynamics. A rigorously mathematical analysis of energy relationships (heat, work, temperature, and equilibrium), the principles of which were first elaborated by J. Willard Gibbs in the mid-19th century. It describes systems whose states are determined by thermal parameters, such as temperature, in addition to mechanical and electromagnetic parameters. A *system* is a geometric section of the universe, whose boundaries may be fixed or varied, and that may contain matter or energy or both. The *state* of a system is a reproducible condition, defined

by assigning fixed numerical values to the measurable attributes of the system. These attributes may be wholly reproduced as soon as a fraction of them has been reproduced. In this case the fractional number of attributes determines the state, and is referred to as the *number of variables of state* or the *number of degrees of freedom* of the system.

The concept of *temperature* can be evolved as soon as a means is available for determining when a body is "hotter" or "colder." Such means might involve the measurement of a physical parameter such as the volume of a given mass of the body. When a "hotter" body, A, is placed in contact with a "colder" body, B, it is observed that A becomes "colder" and B "hotter." When no further changes occur, and the joint system involving the two bodies has come to equilibrium, the two bodies are said to have the same temperature. Thus temperature can only be measured at equilibrium. Therefore thermodynamics is a science of equilibrium, and a thermodynamic state is necessarily an equilibrium state. Thermodynamics is a macroscopic discipline, dealing only with the properties of matter and energy in bulk, and does not recognize atomic and molecular structure. Although severely limited in this respect, it has the advantage of being completely insensitive to any change in our ideas concerning molecular phenomena, so that its laws have broad and permanent generality. Its chief service is to provide mathematical relations among the measurable parameters of a system in equilibrium so that, for example, a variable like pressure may be computed when the temperature is known, and vice versa.

thermodynamics, chemical. See chemical thermodynamics.

thermoelectricity. Electricity produced directly by applying a temperature difference to various parts of electrically conducting or semiconducting materials. Usually two dissimilar materials are used, and the points of contact are kept at different temperatures (Peltier effect). Many temperature-measuring devices (thermocouples, thermopiles) work on this principle, since the voltage is proportional to the temperature difference. Metallic conductors are usually used for these "thermometers," which produce a rather small current. A newer use for the effect is as a source of electrical energy, i.e., a means of direct conversion of heat into electricity (or vice versa) without the use of a generator (or motor). The materials used for these thermoelectric couples are semiconductors (e.g., tellurium; zinc antimonide; lead, bismuth, and germanium tellurides; samarium sulfide) or thermoelectric alloys, all of which produce relatively large currents. Several of these "cells" are then hooked in series much like the cells of a battery.

"Thermoflex" A [Du Pont]. TM for a rubber antioxidant containing 25% di-*p*-methoxydiphenylamine (CH₃OC₆H₄)₂NH; 25% diphenyl-*p*-phe-

nylenediamine $C_6H_4(NHC_6H_5)_2$; and 50% phenyl- β -naphthylamine $C_{10}H_7NHC_6H_5$.

Properties: Dark-gray pellets. D 1.21, fp above 67C. **Use:** Tire carcasses, transmission belts, etc., to promote resistance to flexing at operating temperatures. See antioxidant.

thermoform. A heat-transfer medium. See coolant.

thermoforming. (1) See reforming. (2) Forming or shaping a thermoplastic sheet by heating the sheet above its melting point, fitting it along the contours of a mold with pressure supplied by vacuum or other force, and removing it from the mold after cooling below its softening point. The method is applied to polystyrenes, acrylics, vinyls, polyolefins, cellulose, etc.

thermoform process. A moving-bed catalytic cracking process in which petroleum vapor is passed up through a reactor countercurrent to a flow of small beads or catalyst. The deactivated catalyst then passes through a regenerator and is recirculated.

thermogravimetric analysis. (TGA). The weight of a substance heated or cooled at a controlled rate, in thermogravimetry, which is recorded as a function of time or temperature. Frequently the rate of weight change also is measured electronically by taking the first derivative of the weight change with time.

“Thermoguard” [ATOTECH]. TM for antimony-based materials for incorporation in PVC and other chlorine-containing plastics for flameproofing properties.

thermometer. An instrument for measuring temperature. The liquid-in-glass thermometer consists of a graduated glass tube and a bulb containing a suitable liquid whose expansion and contraction indicate the temperature. Its range is from -130 to $600C$. For scientific purposes the most widely used liquid is mercury down to its freezing point at $-40C$; below this, alcohol gives readings to $-100C$ and pentane to $-130C$. Colored alcohol is generally used in household thermometers. Mercury thermometers ranging up to $600C$ are available; the mercury is prevented from vaporizing by a pressurized inert gas inserted above the mercury column. Metal protection tubes for stem and bulb are necessary. The softening point of the glass is of primary importance; borosilicate glasses are satisfactory up to $500C$, but Jena glass is required for higher temperatures. Minimum and maximum thermometers are so made as to retain their lowest and highest readings indefinitely; the latter are used for oil-well and other geothermal measurements.

There are several other types of thermometers: (1) Gas in which either the pressure at constant volume

or the volume at constant pressure measure the temperature; these are used for extremely accurate thermodynamic determinations. The gases used are helium, nitrogen, and hydrogen. (2) Bimetallic, in which the sensing element consists of two strips of metals having different expansion coefficients; its range is from -185 to $425C$. (3) Thermoelectric (thermocouple), in which measurement is made by the electromotive force generated by two dissimilar metals; its range is from -200 to $1800C$. (4) Resistance, in which temperature is measured by change in the electrical resistance of a metal, usually platinum; its range is from -163 to $660C$. (5) An optical fiber thermometer developed by NBS Center for Chemical Engineering has a range of up to $2000C$. It is made from a single crystalline sapphire and is much more accurate than the existing standard. Based on fundamental radiation principles, it measures thermodynamic temperatures directly. See thermocouple; bimetal.

thermonuclear reaction. See fusion.

thermoplastic. A high polymer that softens when exposed to heat and returns to its original condition when cooled to room temperature. Natural substances that exhibit this behavior are crude rubber and a number of waxes; however, the term is usually applied to synthetics such as polyvinyl chloride, nylons, fluorocarbons, linear polyethylene, polyurethane prepolymer, polystyrene, polypropylene, and cellulosic and acrylic resins.

See thermoset.

thermoset. A high polymer that solidifies or “sets” irreversibly when heated. This property is usually associated with a cross-linking reaction of the molecular constituents induced by heat or radiation, as with proteins, and in the baking of doughs. In many cases, it is necessary to add “curing” agents such as organic peroxides or (in the case of rubber) sulfur. For example, linear polyethylene can be cross-linked to a thermosetting material by either radiation or chemical reaction. Phenolics, alkyds, amino resins, polyesters, epoxides, and silicones are usually considered to be thermosetting, but the term also applies to materials in which additive-induced cross-linking is possible, e.g., natural rubber.

THF. Abbreviation for tetrahydrofuran.

thia- Prefix indicating the presence of sulfur in a heterocyclic ring.

thiabendazole. (4-[2-benzimidazolyl]thiazole). CAS: 148-79-8. $C_{10}H_7N_3S$.

Properties: White to tan crystals. Mp $304C$. Slightly soluble in water, alcohols, and chlorinated hydrocarbons; soluble in dimethylformamide.

Use: Fungicide effective on citrus fruits, anthelmintic.

thiacloprid. See (3-((6-chloro-3-pyridinyl)methyl)-2-

thiamine. (3-(4-amino-2-methylpyrimidyl-5-methyl)-4-methyl-5, β -hydroxy-ethylthiazolium chloride; vitamin B₁). C₁₂H₁₇ClN₄OS. The antineuritic vitamin, essential for growth and the prevention of beriberi. It functions in intermediate carbohydrate metabolism in coenzyme form in the decarboxylation of α -keto acids. Deficiency symptoms: emotional hypersensitivity, loss of appetite, susceptibility to fatigue, muscular weakness, and polyneuritis.

Source: Enriched and whole-grain cereals, milk, legumes, meats, yeast. Most of the thiamine commercially available is synthetic.

Use: Medicine, nutrition, enriched flours. Isolated usually as the chloride (see formula above). Available as thiamine hydrochloride and thiamine mononitrate.

thiamine pyrophosphate. The active coenzyme form of vitamin B₁ which functions in aldehyde transfer reactions.

1,4-thiazane.

Properties: Colorless liquid; pyridine-like odor. Bp 169C (758 mm Hg). Fumes in air. Absorbs carbon dioxide from the air. Soluble in alcohol, benzene, ether, water. Combustible.

Derivation: Interaction of alcoholic ammonia and dichlorodiethyl sulfide.

Grade: Technical.

Use: Organic synthesis.

thiazole.

CAS: 288-47-1.

Properties: Colorless or pale-yellow liquid; odor resembles that of pyridine. D 1.18, bp 116.8C. Soluble in alcohol and ether; slightly soluble in water.

Use: Organic synthesis of fungicides, dyes, and rubber accelerators.

thiazole dye. A dye whose molecular structure contains the thiazole ring. The chromophore groups are $=\text{C}=\text{N}-$, $-\text{S}-\text{C}=\text{C}$, but the conjugated double bonds are also of importance. The members of the class are mainly used as direct or developed dyes for cotton, though some find use as union dyes. One

example is primuline, CI 49000. See thiazole.

3-(*n*-2-thiazolylformimidoyl)indole.

CAS: 22394-38-3. mf: C₁₂H₉N₃S.

Hazard: A poison.

thiazophyr.

CAS: 117718-60-2. mf: C₁₆H₁₇F₃N₂O₂S.

Hazard: Questionable carcinogen.

Use: Agricultural chemical.

2-thiazylamine. See 2-aminothiazole.

thickened oil. See blown oil.

thickener. A circular or cylindrical tank equipped with revolving rakes or plows so designed as to increase the concentration of solids in a suspension. The slurry enters through a feed trough or well, which distributes it uniformly around the circumference of the tank; the rakes move the thickened sediment toward the center where it is discharged through a collecting cone. Thickeners are applicable to the metallurgical and food industries, ore flotation, and municipal water treatment. See clarification.

thickening agent. Any of a variety of hydrophilic substances used to increase the viscosity of liquid mixtures and solutions and to aid in maintaining stability by their emulsifying properties. Four classifications are recognized: (1) starches, gums, casein, gelatin, and phycocolloids; (2) semisynthetic cellulose derivatives (carboxymethyl-cellulose, etc.); (3) polyvinyl alcohol and carboxy-vinylates (synthetic); and (4) bentonite, silicates, and colloidal silica. The first group is widely used in the food industries, especially in ice creams, confectionery, gravies, etc.; other major consumers are the paper, adhesives, textiles, and detergent fields. See emulsion; colloid, protective; gel.

Thiele reaction. Formation of triacetoxo aromatic compounds by the reaction of quinones with acetic anhydride catalyzed by sulfuric acid or boron trifluoride.

(thienyl)hydrazine.

CAS: 64059-33-2. mf: C₄H₆N₂S.

Hazard: A poison.

thimerosal. (sodium ethylmercurithiosalicylate; ethylmercurithiosalicylic acid, sodium salt). CAS: 54-64-8. NaOCC₆H₄SHgC₂H₅.

Properties: Light-cream-colored, crystalline powder; slight characteristic odor. Affected by light. Soluble in water and alcohol; almost insoluble in ether and benzene; pH (1% solution) 6.7.

Derivation: Reaction between ethylmercuric chloride and thiosalicylic acid in alcoholic sodium hydroxide.

Grade: NF.

Hazard: Toxic by ingestion, inhalation.

Use: Medicine, bacteriostat, fungistat.

thin. A nontechnical word used by scientists with a variety of meanings. (1) In electronic metallurgy, a thin film is a vapor-deposited coating having a thickness of only a single atom; such *monatomic* films, e.g., thorium on tungsten, are used in electronic devices such as cathodes. (2) A coating or film of a fatty acid on water that is one molecule thick (about 200 Å) is called a *monomolecular* film. (3) In thin-layer chromatography the term applies to a specially prepared mixture of adsorbents spread on a glass slide to a thickness of 1/100 inch. (4) The word is also used in the sense of a liquid of low viscosity, as in paint thinner and thin-boiling starch.

thin-boiling starch. See starch, modified; thin.

thin film. In electronic engineering a film having a "thickness" of a single atom and consisting of a metal deposited on a metallic substrate either externally by vapor deposition or internally by diffusion. The base metal is usually tungsten (for a cathode), the film being any of a number of other metals (thorium, cesium, zirconium, barium, or cerium). "The greatest benefit is obtained when the films are of a monatomic nature; in the case of thorium on tungsten, the optimum coverage is 0.67 monatomic layer, i.e., the thorium atoms do not completely cover the tungsten surface. Such films are very tightly bound to the base metal by atomic forces" (W. H. Kohl).

See thin; film.

thin-layer chromatography. (TLC). A micro type of chromatography. The thin layer (0.01 inch) is the adsorbent, usually a special silica gel spread on glass or incorporated in a plastic film. Single drops of the solutions to be investigated are placed along one edge of the glass plate, and this edge then dipped into a solvent. The solvent carries the constituents of the original test drops up the thin layer in a selective separation, so that a comparison with known standards and various identifying tests may be made on the spots formed.

See thin.

thinner. A hydrocarbon (naphtha) or oleoresinous solvent (turpentine) used to reduce the viscosity of paints to appropriate working consistency, usually just before application. In this sense a thinner is a liquid diluent, except that it has active solvent power on the dissolved resin.

thio- A prefix used in chemical nomenclature to indicate the presence of sulfur in a compound, usually as a substitute for oxygen.

See thiol.

thioacetamide.

CAS: 62-55-5. CH_3CSNH_2 .

Properties: Colorless leaflets. Mp 115C. Stable in solution. Soluble in water, alcohol, ether, benzene. Combustible.

Hazard: Toxic by ingestion and inhalation, a carcinogen (OSHA).

Use: To replace gaseous hydrogen sulfide in qualitative analysis.

thioacetic acid. (thiacetic acid; ethanethiolic acid).

CAS: 507-09-5. CH_3COSH .

Properties: Clear, yellow liquid; strong unpleasant odor. D 1.05 (25C), fp -17C, bp 81.8C (630 mm Hg). Soluble in water, alcohol, and ether. Combustible.

Derivation: By heating glacial acetic acid and phosphorus pentasulfide, with subsequent distillation.

Hazard: Toxic by ingestion and inhalation.

Use: Chemical reagent, lachrymator.

thioallyl ether. See allyl sulfide.

thioanisole. $\text{C}_6\text{H}_5\text{CH}_3$.

Properties: Colorless liquid; strong unpleasant odor. D 1.053 (25C), fp -15.5C, bp 188C, refr index 1.5842 (25C). Insoluble in water; soluble in most organic solvents. Combustible.

Use: Intermediate, solvent for polymeric systems.

thiobenzoic acid. $\text{C}_6\text{H}_5\text{COSH}$.

Properties: Yellow oil or crystals. D 1.1825-1.1835 (20/4C), mp 24C, bp 77.5C (5 mm Hg), 122C (30 mm Hg), refr index 1.602-1.604 (20C). Insoluble in water; miscible with organic solvents. Combustible.

Grade: 95% min.

Use: Organic intermediate.

2-thio-2h-1,3-benzoxazine-2,4(3h)-dione.

CAS: 10021-35-9. mf: $\text{C}_8\text{H}_5\text{NO}_2\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4,4'-thiobis(6-tert-butyl-m-cresol).

CAS: 96-69-5.

Properties: Light-gray to tan powder. Mp 150C min, d 1.10 (25C).

Hazard: Toxic by inhalation. TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Protection of light-colored rubber from oxidation and of nonstaining neoprene compounds against deterioration.

2,2'-thiobis(chlorophenol).

CAS: 97-18-7. $[\text{ClC}_6\text{H}_4(\text{OH})]_2\text{S}$.

Properties: White, crystalline solid; odorless. Mp 175.8-186.8C. Insoluble in water.

Hazard: Toxic by ingestion.

Use: Bacteriostat for cosmetics, fungicide.

2,2'-thiobis(4,6-di-*sec*-amyphenol). (2,2'-thiobis[4,6-bis-(1-methylbutyl)phenol]).
 $[(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{C}_6\text{H}_4]_2\text{S}$.

Properties: A dark, viscous liquid. Softening p 0C, d 0.99 (50C).

Use: Rubber antioxidant.

thiocarbamide. See thiourea.

thiocarbanil. See phenyl mustard oil.

thiocarbanilide. (*N,N'*-diphenylthiourea; sulfocarbanilide).

CAS: 102-08-9. $\text{CS}(\text{NHC}_6\text{H}_5)_2$.

Properties: Gray powder. Mp 148C, d 1.32. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Interaction of aniline and carbon disulfide and alcohol in the presence of sulfur.

Use: Intermediates, dyes (sulfur colors, indigo, methyl indigo), vulcanization accelerator, synthetic organic pharmaceuticals, flotation agent, acid inhibitor.

thiocarbonyl chloride. See thiophosgene.

4-thiochromanyl-*o,o*-dimethyl dithiophosphate.

CAS: 41219-25-4. mf: $\text{C}_{11}\text{H}_{15}\text{O}_2\text{PS}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

thioctic acid. See *dl*- α -lipoic acid.

thiocyanic acid, phenyl ester.

CAS: 5285-87-0. mf: $\text{C}_7\text{H}_7\text{NS}$.

Hazard: A poison by ingestion.

thiocyanic acid, trimethylstannyl ester.

See trimethyltin thiocyanate.

thiodiethylene glycol. See thiodiglycol.

thiodiglycol. (thiodiethylene glycol; β -bis-hydroxyethyl sulfide; dihydroxyethyl sulfide).
 $(\text{CH}_2\text{CH}_2\text{OH})_2\text{S}$.

Properties: Syrupy, colorless liquid; characteristic odor. D 1.1852 (20C), bp 283C, fp -10C, viscosity 0.652 cP (20C), flash p 320F (160C), bulk d 9.85 lb/gal, refr index 1.5217 (20C). Soluble in acetone, alcohol, chloroform, water; slightly soluble in benzene, carbon tetrachloride, and ether. Combustible.

Derivation: Hydrolysis of dichloroethyl sulfide, interaction of ethylene chlorohydrin and sodium sulfide.

Hazard: Do not use with hydrochloric acid.

Use: Intermediate for elastomers and antioxidants; solvent for dyes in textile printing.

thiodiglycolic acid.

CAS: 123-93-3. $\text{HOOCCH}_2\text{SCH}_2\text{COOH}$. A dicarboxylic acid.

Properties: Colorless crystals. Mp 128C. Soluble in water and alcohol. Combustible.

Use: Analytical reagent.

4,4'-thiodiphenol. (TDP). $(\text{C}_6\text{H}_4\text{O})_2\text{S}$.

Properties: White, crystalline powder. Mp above 151C, 99.5% pure.

Use: Intermediate, flame-retardant, antioxidant, engineering plastics.

thiodiphenylamine. See phenothiazine.

thiodipropionic acid.

CAS: 111-17-1. $\text{HOOCCH}_2\text{CH}_2\bullet\text{S}\bullet\text{CH}_2\text{CH}_2\text{COOH}$. A dicarboxylic acid.

Properties: Leaflets. Mp 135. Soluble in water and alcohol.

Hazard: Use in foods restricted to 0.02% of fat and oil content, including essential oils.

Use: Antioxidant in food packaging, soaps, plasticizers, lubricants, fats, and oils.

β,β -thiodipropionitrile.

CAS: 111-97-7. $\text{S}(\text{CH}_2\text{CH}_2\text{CN})_2$.

Properties: White crystals or light-yellow liquid. D 1.1095 (30C), mp 28.65C. Slightly soluble in water and alcohol; soluble in acetone, chloroform, and benzene.

Use: Preservative, selective solvent, chromatography.

thio-1,3-dithio[4,5-b]quinoxaline. See thioquinox.

thioester. An ester of a carboxylic acid with a thiol instead of an alcohol.

thioethanolamine. See 2-aminoethanethiol.

thioflavine T. (CI 49005).

$\text{CH}_3\text{C}_6\text{H}_3\text{N}(\text{HCl})\text{SCC}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: A yellow basic dye of the thiazole class., fluoresces yellow to yellowish-green when excited by UV.

Derivation: By heating *p*-toluidine with sulfur in the presence of lead oxide.

Use: Textile dyeing, fluorescent sign paints, in combination with green or blue pigments to produce brilliant greens, phosphotungstic pigments.

thiofuran. See thiophene.

1-thioglycerol.

CAS: 96-27-5. $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{SH}$.

Properties: Water-white liquid. Bp 118C (5 mm Hg), d 1.295 (14.4C). Soluble in water, alcohol, and ether. Combustible.

Use: Reducing agent for cystine molecule in human hair and wool, for stabilization of acrylonitrile polymers, medicine.

thioglycolic acid. (mercaptoacetic acid).

CAS: 68-11-1. HSCH_2COOH .

Properties: Colorless liquid; strong unpleasant odor. D 1.325, fp -16.5C , bp 123C (29 mm Hg). Miscible with water, alcohol, or ether. Combustible.

Derivation: Heating chloroacetic acid with potassium hydrogen sulfide.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 1 ppm.

Use: Reagent for iron, manufacture of thioglycolates, permanent-wave solutions and depilatories, vinyl stabilizer, manufacture of pharmaceuticals.

thioguanine deoxyriboside.

CAS: 789-61-7. mf: $\text{C}_{10}\text{H}_{13}\text{N}_5\text{O}_5\text{S}$.

Hazard: Questionable carcinogen.

2-thiohydantoin. (glycolylthiourea).

NHC(S)NHC(O)CH_2 .

Properties: Crystals or tan powder. Mp 230C . Slightly soluble in water; insoluble in alcohols and ethers.

Grade: 99% min.

Use: Intermediate for pharmaceuticals, rubber accelerators, copper-plating brighteners, and dyestuffs.

2-thio-4-keto-thiazolidine. See rhodanine.

-thiol. (mercaptan). Suffix indicating that a substance belongs to the group of organic compounds resembling alcohols but having the oxygen of the hydroxyl group replaced by sulfur, as in ethanethiol ($\text{C}_2\text{H}_5\text{SH}$). Many thiols are characterized by strong and repulsive odors.

Hazard: Aliphatic thiols are flammable. Toxic by inhalation.

Use: Warning agents in fuel gas lines, chemical intermediates. *Note:* Adoption of the name *thiol* to replace *mercaptan* has been officially approved as more consistent with the molecular constitution of these compounds. The older term, which literally means "mercury seizing," is inappropriate.

thiolactic acid. (2-mercapto propionic acid).

CAS: 79-42-5. $\text{CH}_3\text{CH(SH)COOH}$.

Properties: Oily liquid; unpleasant odor. Becomes crystalline at 10C , d 1.22, bp 116C (16 mm Hg), refr index 1.482. Soluble in water, alcohol, and acetone. Readily forms salts with numerous metals that have quite different properties.

Derivation: Reaction of sodium sulfide, sulfur, and bromopropionic acid.

Use: Depilatory, hair-waving preparations.

thiol protease inhibitor.

CAS: 66701-25-5. mf: $\text{C}_{15}\text{H}_{27}\text{N}_3\text{O}_5$.

Hazard: A reproductive hazard.

thiomalic acid. (mercaptosuccinic acid).

CAS: 70-49-5. $\text{HOOCCH(SH)CH}_2\text{COOH}$.

Properties: White crystals or powder; sulfuric odor.

Mp $149-150\text{C}$. Soluble in water, alcohol, acetone, and ether; slightly soluble in benzene. Combustible.

Use: Biochemical research, intermediate, rust inhibitor, antidarkening agent for crepe rubber, tackifier for synthetic rubber.

thiomerin.

CAS: 20223-84-1. mf: $\text{C}_{16}\text{H}_{25}\text{HgNO}_6\text{S}\cdot 2\text{H}$.

Properties: IDLH 10 mg/m^3 (as Hg).

Hazard: A poison. TWA 0.01 . STEL 0.03 mg/m^3 (skin).

thionazin. (generic name for *O,O*-diethyl-*O*-2-pyrazinyl phosphorothioate).

CAS: 297-97-2.

$\text{NCHCHNCHCOPS(C}_2\text{H}_5\text{O)}_2$.

Properties: Amber liquid. Mp -1.7C , bp 80C (0.01 mm Hg). Slightly soluble in water; miscible with most organic solvents.

Hazard: Toxic by ingestion, inhalation, and skin absorption; cholinesterase inhibitor.

Use: Insecticide, fungicide, nematocide.

"Thionex" [Du Pont]. TM for tetramethylthiuram monosulfide.

thionyl chloride. (sulfurous oxychloride; sulfur oxychloride).

CAS: 7719-09-7. SOCl_2 .

Properties: Pale-yellow to red liquid; suffocating odor. D 1.638, fp -105C , bp 79C , decomposes at 140C , decomposes (fumes) in water. Soluble in benzene, carbon tetrachloride.

Grade: 93%, 97.5%.

Hazard: Strong irritant to skin and tissue. TLV: ceiling 1 ppm .

Use: Pesticides, engineering plastics, chlorinating agent, catalyst.

thiopental sodium. ("Pentothal"; "Sodium Pentothal"; sodium-5-ethyl-5(1-methylbutyl)-2-thiobarbiturate). ($\text{C}_{11}\text{H}_{17}\text{N}_2\text{O}_2\text{SNa}$). A rapidly acting barbiturate administered intravenously for general anesthesia and hypnosis. Commonly known as "truth serum."

Hazard: May cause respiratory failure; use only with physician in attendance.

thiophane. See tetrahydrothiophene.

thiophene. (thiofuran).

CAS: 110-02-1.

Properties: Colorless liquid. Refr index 1.5285 (20C), d 1.0644 ($20/4\text{C}$), fp -38.5C , bp 84C , flash p

30F (−1.1C). Soluble in alcohol and ether; insoluble in water.

Derivation: From coal tar (benzene fraction) and petroleum, synthetically from heating sodium succinate with phosphorus trisulfide.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis (condenses with phenol and formaldehyde, copolymerizes with maleic anhydride), solvent, dye, and pharmaceutical manufacture.

α -thiophenealdehyde. (2-thiophenecarboxaldehyde). C_4H_3SCHO .

Properties: Oily liquid; almondlike odor. Bp 198C, 90C (20 mm Hg), d 1.210–1.220. Very soluble in alcohol, benzene, ether; slightly soluble in water. Combustible.

Grade: 95%.

Use: Thiophene derivatives, introducing thenyl group into organic compounds.

thiophenol. (phenyl mercaptan).

CAS: 108-98-5. C_6H_5SH .

Properties: Water-white liquid; repulsive odor. Bp 168.3C, bp 71C (15 mm Hg), refr index 1.5891, d 1.075 (25/25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Reduction of benzenesulfonyl chloride with zinc dust in sulfuric acid.

Grade: 99%.

Hazard: Skin irritant.

Use: Pharmaceutical synthesis.

thiophosgene. (thiocarbonyl chloride).

CAS: 463-71-8. $CSCl_2$.

Properties: Reddish liquid. D 1.5085 (15C), bp 73.5C. Decomposes in water and alcohol; soluble in ether.

Hazard: Toxic by ingestion and inhalation.

Use: Organic synthesis.

thiophosphoryl chloride.

CAS: 3982-91-0. $PSCl_3$.

Properties: Colorless liquid; penetrating odor. D 1.635, bp 126C, fp −35C, decomposed by water, flash p none. Soluble in carbon disulfide, carbon tetrachloride. Nonflammable.

Hazard: Strong irritant to skin and tissue.

thiophosphoryl chlorodifluoride. See thiophosphoryl difluoride monochloride.

thiophosphoryl difluoride monochloride.

CAS: 2524-02-9. mf: ClF_2PS .

Hazard: Low toxicity by inhalation.

thioquinox. (generic name for 2,3-quinoxalinedithiol cyclic trithiocarbonate). $C_6H_4N_2C_2S_2CS$ (tricyclic).

Properties: Yellow solid. Mp 180C. Insoluble in water; slightly soluble in acetone, kerosene, and alcohol.

Hazard: Toxic by ingestion.

Use: Fungicide, acaricide.

thioridazine. (USAN for 2-methylthio-10-[2-(N-methyl-2-piperidyl)-ethyl]phenothiazine).

CAS: 50-52-2. $C_{21}H_{26}N_2S_2$.

Properties: Colorless crystals. Mp 158C. Soluble in water and alcohol.

Grade: ND (as the hydrochloride).

Use: Medicine (tranquilizer).

thiosalicylic acid. (2-mercaptobenzoic acid).

CAS: 147-93-3. $HOOC_6H_4SH$.

Properties: Yellow solid. Mp 164–165C, sublimes. Slightly soluble in hot water; soluble in alcohol, ether, and acetic acid. Combustible.

Grade: Reagent, technical 80%, pharmaceutical.

Use: Dyes, reagent for iron determination, intermediate.

thiosemicarbazide. (aminothiourea).

CAS: 79-19-6. $NH_2CSNHNH_2$.

Properties: White, crystalline powder; no odor. Mp 180–184C. Soluble in water and alcohol.

Derivation: From potassium thiocyanate and hydrazine salts.

Grade: Technical and pure.

Use: Reagent for ketones and certain metals, photography, rodenticide.

thiosinamine. See allyl thiourea.

thiosorbitol. $CH_2OH(CH_2O)_4CH_2SH$.

Properties: Colorless, nonhygroscopic crystals. Mp 92C, strong reducing agent. Soluble in water, ethylene glycol, and formamide; insoluble in benzene, carbon tetrachloride and carbon disulfide.

Use: Corrosion protection in pickling and plating baths.

“Thiostat-B” [Uniroyal]. TM for 40% aqueous solution of sodium dimethyldithiocarbamate.

Use: Bactericide in oil-well water flooding, paper slimicide, specialty bactericide.

“Thiostop” [Uniroyal]. TM for aqueous solutions of the sodium and potassium salts of dimethyl dithiocarbamate.

Properties: Clear, yellow to amber liquid. D 1.18–1.23, good storage stability, potassium salt will crystallize out at −6.6C and the sodium salt at 0C. Avoid long storage in partially filled containers.

Use: Short stop in SBR polymerization.

thiotepa. USP name for triethylenethiophosphoramidate.

thiourea. (thiocarbamide).

CAS: 62-56-6. $(NH_2)_2CS$.

Properties: White, lustrous crystals; bitter taste. D 1.406, mp 180–182C, bp sublimes in vacuo at 150–160C. Soluble in cold water, ammonium thiocyanate solution, and alcohol, nearly insoluble in ether.

Derivation: (1) By heating dry ammonium thiocyanate, extraction with a concentrated solution of ammonium thiocyanate, with subsequent crystallization; (2) action of hydrogen sulfide on cyanamide.

Grade: Technical, reagent.

Hazard: A carcinogen (OSHA). May not be used in food products (FDA); skin irritant (allergenic).

Use: Photography and photocopying papers, organic synthesis (intermediate, dyes, drugs, hair preparations), rubber accelerator, analytical reagent, amino resins, mold inhibitor.

“Thioxin” [Morton]. TM for a series of rubber-to-metal bonding adhesives. Available in water- and solvent-based formulations for bonding a wide variety of elastomers and rubbers to metal and engineered plastics.

Use: Antivibration components, transmission seals, hoses, bushings, automotive weatherstrip, solid tires, storage tanks, and bridge bearing pads.

thioxyleneol. (mixed isomers). $\text{C}_6\text{H}_3(\text{CH}_2)_2\text{SH}$.

Properties: Colorless liquid. D 1.03 (15.6/15.6C), bp 122–133C (50 mm Hg). Oxidizes on exposure to air, supplied under nitrogen atmosphere. Combustible.

Use: Chemical intermediate, peptizer for natural and SBR rubbers.

thiram. (tetramethylthiuram disulfide; bis-(dimethylthiocarbamyl)disulfide; thiuram; TMTD). CAS: 137-26-8. $[(\text{CH}_3)_2\text{NCH}]_2\text{S}_2$.

Properties: White, crystalline powder; characteristic odor. D 1.29 (20C), melting range 155–156C. Soluble in alcohol, benzene, chloroform, carbon disulfide; insoluble in water, dilute alkali, gasoline.

Grade: 75% wettable powder, 95% technical powder, ND.

Hazard: Toxic by ingestion and inhalation, irritant to skin and eyes. TLV: 1 mg/m³; not classifiable as a human carcinogen.

Use: Vulcanizing agent for rubber, especially for steam hose and other heat-resistant uses; fungicide; insecticide; seed disinfectant; lubricating oil additive; bacteriostat; animal repellent.

“Thiramad” [Mallinckrodt]. TM for a 75% thiram formulation. A turf fungicide.

Hazard: See thiram.

thiuram. A compound containing the group R_2NCS . Most are disulfides. The most common monosulfide is tetramethylthiuram monosulfide.

See thiram.

thixotropy. The ability of certain colloidal gels to liquefy when agitated (as by shaking or ultrasonic vibration) and to return to the gel form when at rest. This is observed in some clays, paints, and printing inks that flow freely on application of slight pressure, as by brushing or rolling. Suspensions of bentonite clay in water display this property, which is desirable in oil-well drilling fluids. See rheology; dilatancy.

“Thompson’s Concrete Care Cleaner and Degreaser” [Thompson]. TM for a liquid concrete cleaner.

Use: To remove oil, dirt, algae, and mildew.

“Thompson’s Water Seal Maximum Deck Stripper” [Thompson]. TM for a liquid deck stripper.

Use: To remove oil and latex-based solid and semi-transparent stains and waterproofers from decks and other surfaces.

“Thompson’s Water Seal No Drip Gel Stain” [Thompson]. TM for a gel wood stain.

Use: A gel stain for outdoor furniture and shutters without the mess of ordinary stain.

Thomson, J. J., Sr. (1856–1940). A native of England, Thomson entered Cambridge University in 1876 and remained there permanently as a professor of physics, especially in the field of electrical phenomena. His observations and calculations of cathode ray experiments led to proof of the existence of the electron as the lightest particle of matter (1896). This proof was announced at the Royal Institution in the following year. This was the keystone of the theory of atomic structure and one of the most notable discoveries in the history of science. See Rutherford, Sir Ernest.

thomsonite. $(\text{NaCa}_2\text{Al}_3(\text{SiO}_4)_5 \cdot 6\text{H}_2\text{O})$. A mineral, one of the zeolites.

thonzylamine hydrochloride. (2-[(2-dimethylaminoethyl)(p-methoxybenzyl)amino]-pyrimidinedihydrochloride).

CAS: 63-56-9. $\text{C}_{16}\text{H}_{22}\text{N}_4\text{O} \cdot \text{HCl}$.

Properties: White, crystalline powder; faint odor. Mp 173–176. Very soluble in water; freely soluble in alcohol and chloroform; practically insoluble in ether and benzene; pH 5.0–6.0 (2% solution).

Grade: NF.

Use: Medicine (antihistamine).

thoria. See thorium dioxide.

thorin. $\text{HOC}_{10}\text{H}_4(\text{SO}_3\text{H})_2\text{NNC}_6\text{H}_4\text{AsO}_3\text{H}_2$. A reagent for the colorimetric determination of microgram quantities of thorium.

Hazard: Toxic by ingestion.

thorite. ThSiO_4 . A natural thorium silicate, usually impure, found in pegmatites.

Properties: Black to orange color, vitreous to resinous luster. Mohs hardness 4.5–5, d 4.4–5.2. Radioactive.

Occurrence: Norway, Ceylon.

Use: Source of thorium.

thorium.

CAS: 7440-29-1. Th. Metallic element of atomic number 90, a member of the actinide series (group IIIB of periodic table), aw 232.0381, valence of 4; radioactive, no stable isotopes.

Properties: Soft metal with bright silvery luster when freshly cut, similar to lead in hardness when pure. Can be cold-rolled, extruded, drawn, and welded. D about 11.7, mp 1700C, bp 4500C. Soluble in acids; insoluble in alkalis and water. Some alloys may ignite spontaneously, the metal in massive form is not flammable.

Source: Monazite, thorite. It is about as abundant as lead.

Derivation: (1) Reduction of thorium dioxide with calcium; (2) fused salt electrolysis of the double fluoride $\text{ThF}_4 \cdot \text{KF}$. The product of both processes is thorium powder, fabricated into the metal by powder metallurgy techniques. Hot surface decomposition of the iodide produces crystal bar thorium.

Available forms: Powder, unsintered bars, sintered bars, sheets.

Hazard: Flammable and explosive in powder form. Dusts of thorium have very low ignition points and may ignite at room temperature. Radioactive decay isotopes are dangerous when ingested.

Use: Nuclear fuel (thorium-232 is converted to uranium-233 on neutron bombardment after several decay steps), sun lamps, photoelectric cells, target in X-ray tubes, alloys.

thorium acetylacetonate.

Properties: Crystalline powder. Slightly soluble in water; resistant to hydrolysis. A chelating, nonionizing compound.

thorium anhydride.

See thorium dioxide.

thorium carbide.

Properties: Yellow solid. D 8.96 (18C), mp 2630–2680C, bp 5000C. Decomposes in water.

Use: Nuclear fuel.

thorium chloride.

(thorium tetrachloride).

Properties: Colorless or white, lustrous needles (light-yellow color caused by iron trace); hygroscopic; partially volatile; crystallizes with variable water of crystallization. D 4.59, bp 928C (decomposes), mp 820C. Soluble in alcohol, water.

Grade: Technical; as 50% ThO_2 .

Use: Incandescent lighting.

thorium decay series. The series of radioactive elements produced as successive intermediate products when thorium undergoes spontaneous natural radioactive disintegration into lead. Many of these are severe radioactive poisons when ingested or inhaled as thorium dust particles.

thorium dioxide. (thorium anhydride; thorium oxide; thoria). ThO_2 .

Properties: Heavy white powder. D 9.7, mp 3300C (highest of all oxides), bp 4400C, Mohs hardness 6.5, very refractory. Soluble in sulfuric acid; insoluble in water.

Derivation: Reduction of thorium nitrate.

Grade: Technical and purities to 99.8% ThO_2 ; granular particles; crystals.

Use: Ceramics (high temperature), gas mantles, nuclear fuel, flame spraying, crucibles, medicine, non-silica optical glass, catalyst, thoriated tungsten filaments.

thorium disulfide.

Properties: Dark-brown crystals. D 7.30 (25/4C), mp 1875–1975C (in vacuo). Insoluble in water.

Use: Solid lubricant.

thorium fluoride.

Properties: White powder. Dehydrated between 200 and 300C. D (anhydrous) 6.32 (24C), mp 1111C, above 500C reacts with atmospheric moisture to form thorium oxyfluoride, ThOF_2 , and finally the oxide, ThO_2 . Forms a series of compounds with other metallic fluorides such as NaF and KF.

Grade: 79–80% ThO_2 .

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Production of thorium metal and magnesium-thorium alloys, high temperature ceramics. ThOF_2 is used as a protective coating on reflective surfaces.

thorium nitrate.

Properties: White, crystalline mass. Mp 500C (decomposes). Soluble in water and alcohol.

Grade: Technical, CP.

Hazard: Dangerous fire and explosion risk in contact with organic materials, strong oxidizing agent. Radioactive.

Use: Reagent for determination of fluorine, thoriated tungsten filaments.

thorium oxalate.

Properties: White powder. D (anhydrous) 4.637 (16C). Insoluble in water and most acids. Soluble in solutions of alkali and of ammonium oxalates. Above 300–400C decomposes to thorium oxide, ThO_2 .

Grade: Purities to 99.9%; as 59% ThO_2 .

Use: Ceramics.

thorium oxide.

See thorium dioxide.

thorium sulfate. (thorium sulfate, normal).

$\text{Th}(\text{SO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.8, mp loses $4\text{H}_2\text{O}$ at 42C, remainder at 400C. Slightly soluble in water; soluble in ice water.

Grade: As 43% ThO_2 .

thorium tetrachloride. See thorium chloride.

Thorpe reaction. Base-catalyzed condensation of two molecules of nitrile to yield imines that tautomerize to enamines.

thortveitite. An ore containing 37–42% scandium oxide. A basic material in the production of scandium.

THPC. See tetrakis(hydroxymethyl)phosphonium chloride.

Thr. Abbreviation of threonine.

3' end. The end of a nucleic acid that lacks a nucleotide bound at the 3' position of the terminal residue.

three-phase equilibrium. The state of equilibrium of vapor, liquid, and solid phases of a pure substance at a definite pressure and temperature.

threonine. (α -amino- β -hydroxybutyric acid).

CAS: 72-19-5. $\text{CH}_3\text{CH}(\text{OH})\text{CH}(\text{NH}_2)\text{COOH}$. An essential amino acid.

Properties: Colorless crystals. (*dl*-threonine) Mp 228–229C with decomposition; (*l*(-)-threonine) (naturally occurring) mp 255–257C with decomposition; (*dl*-allo-threonine), mp 250–252C. Soluble in water. Optically active.

Derivation: Hydrolysis of protein (casein), organic synthesis.

Use: Nutrition and biochemical research, dietary supplement.

threshold energy. The energy limit for an incident particle or photon below which a particular endothermic reaction will not occur.

Threshold Limit Value. (TLV). A set of standards established by the American Conference of Governmental Industrial Hygienists for concentrations of airborne substances in workroom air. They are time-weighted averages based on conditions that it is believed that workers may be repeatedly exposed to day after day without adverse effects. The TLV values are revised annually and provide the basis for the safety regulations of OSHA. They are intended to serve as guides in control of health hazards rather than definitive marks between safe and dangerous concentration. In this book, these are indicated by *TLV*.

See air pollution; American Conference of Governmental Industrial Hygienists.

thrombin. A proteolytic enzyme that catalyzes the conversion of fibrinogen to fibrin and thus is essential in the clotting mechanism of blood. It is present in the blood in the form of prothrombin under normal conditions; when bleeding begins, the prothrombin is converted to thrombin, which in turn activates the formation of fibrin.

thrombocyte. See platelet.

thromboxane. See prostaglandin.

throwing oil. An oil applied to prepare raw silk and filament rayon for "throwing," the operation by which the filaments are twisted into threads. Applied by a bath, the oils condition the filaments and yarns for subsequent weaving or knitting. Usually compounded to be self-emulsifying and may contain a sizing agent such as dextrin, gelatin, etc. See slashing compound.

throwing power. A term denoting the effectiveness of an electrolytic cell for depositing metal uniformly over a surface being electroplated, particularly in irregular and recessed areas. The throwing power is the weight of deposition per unit distance between the electrodes.

thuja oil. (arbor vitae oil).

CAS: 8007-20-3.

Properties: Pale-yellow essential oil; camphorlike odor. D 0.910–0.920, refr index 1.459 (20C), optical rotation –10 to –13 degrees in 100 mm tube. Soluble in alcohol, ether, chloroform, carbon disulfide, fixed oils, and mineral oil. Combustible. Chief known constituents: Dextro-pinene, levofenchone, thujone, should contain more than 60% ketones calculated as thujone.

Derivation: Distilled from the leaves of the white cedar, *Thuja occidentalis*.

Grade: Technical, FCC (as cedarleaf oil).

Use: Perfumery, flavoring.

α -thujaplicin.

CAS: 1946-74-3.

Properties: A minor component of *Thujopsis dolabrata*. SIEB. et ZUCC. var. *hondai* MAKINO mf: $\text{C}_{10}\text{H}_{12}\text{O}_2$.

Hazard: A poison.

thujone.

CAS: 546-80-5. $\text{C}_{10}\text{H}_{16}\text{O}$. A terpene-type ketone contained in thuja oil and the oils of sage, tansy, and wormwood.

Properties: Colorless liquid. D 0.915–0.919 (20/20C), bp 203C. Insoluble in water; soluble in alcohol. Combustible.

Hazard: Toxic by ingestion.

Use: Solvent.

thulia. See thulium oxide.

thulium. Tm. Atomic number 69, group IIIB of the periodic table, a rare-earth element of the lanthanide groups, aw 168.9342, valence of 3; no stable isotopes.

Properties: Metallic luster. D 9.318, mp 1550C, bp 1727C. Reacts slowly with water; soluble in dilute acids. Salts colored green.

Derivation: Isolated by reduction of the fluoride with calcium.

Grade: Regular high purity (ingots, lumps).

Hazard: Fire risk in form of dust.

Use: Ferrites, X-ray source.

See rare earth.

thulium-170. Radioactive thulium of mass number 170.

Use: X-ray source in portable units.

thulium chloride. $\text{TmCl}_3 \cdot 7\text{H}_2\text{O}$.

Properties: Green, deliquescent crystals. Mp 824C, bp 1440C. Very soluble in water and alcohol.

thulium nitrate.

CAS: 14985-19-4. mf: $\text{N}_3\text{O}_9 \cdot \text{Tm}$.

Hazard: A poison.

thulium oxalate. $\text{Tm}_2(\text{C}_2\text{O}_4)_3 \cdot 6\text{H}_2\text{O}$.

Properties: Greenish-white precipitate, loses H_2O at 50C. Soluble in aqueous alkali oxalates.

Derivation: Precipitation of a solution containing a thulium salt and a mineral acid by addition of oxalic acid.

Use: Analytical separation of thulium (and other rare-earth metals) from the common metals.

thulium oxide. (thulia). Tm_2O_3 .

Properties: Dense white powder with greenish tinge, slightly hygroscopic. Absorbs water and carbon dioxide from the air. D 8.6. Exhibits a reddish incandescence on heating, changing to yellow and then white on prolonged heating. Slowly soluble in strong acids.

Derivation: By ignition of thulium oxalate, salt of other oxyacids, or hydroxide.

Grade: 99–99.9%.

Use: Source of thulium metal.

thylakoid. Closed cisterna, or disc, formed by the pigment-bearing internal membranes of chloroplasts.

“Thylate” [Du Pont]. TM for a wettable off-white powder containing 65% thiram.

thymic acid. See thymol.

thymidine. (thymine-2-deoxyriboside).

CAS: 50-89-5. $\text{C}_{10}\text{H}_{14}\text{N}_2\text{O}_5$. The nucleoside (deoxyriboside) of thymine. Occurs in DNA.

Properties: Crystalline needles. Mp 185C. Dextro-

rotatory in solution; soluble in water, methanol, hot ethanol, hot acetone, and hot ethyl acetate; sparingly soluble in hot chloroform; soluble in pyridine and glacial acetic acid.

Use: Biochemical research. Also available as trityl thymidine and as tritiated thymidine in a radioactive form.

thymidylic acid. The nucleotide of thymine, i.e., the phosphate ester of thymidine.

thymine. (5-methyluracil; 5-methyl-2,4-dioxy-pyrimidine; T).

CAS: 65-71-4.

$\text{CH}_3\text{CC}(\text{O})\text{NHC}(\text{O})\text{NHCH}$. One of the pyrimidine bases of living matter.

Properties: White, crystalline powder. Decomposes at 335–337C. Slightly soluble in hot water; insoluble in cold water, alcohol; sparingly soluble in ether; readily soluble in alkalis.

Derivation: Hydrolysis of deoxyribonucleic acid, from methylcyanoacetylurea by catalytic reduction.

Use: Biochemical research.

See base pair; nucleotide.

thymine-2-deoxyriboside. See thymidine.

thymine dimer. See pyrimidine dimer.

thymol. (isopropyl-*m*-cresol; thyme camphor; thymic acid).

CAS: 89-83-8. $(\text{CH}_3)_2\text{CHC}_6\text{H}_3(\text{CH}_3)\text{OH}$.

Properties: White crystals; aromatic odor and taste. D 0.979, mp 48–51, bp 233C. Soluble in alcohol, carbon disulfide, chloroform, glacial acetic acid, ether, and fixed or volatile oils; slightly soluble in water and glycerol. Combustible.

Derivation: From thyme oil or other oils, synthetically from *m*-cresol and isopropyl chloride by the Friedel-Crafts method at –10C.

Grade: Technical, NF, reagent.

Use: Perfumery, mold and mildew preventive, microscopy, preservative, antioxidant, flavoring, laboratory reagent, synthetic menthol.

thymol blue. (thymolsulfonphthalein).

CAS: 76-61-9.

$\text{C}_6\text{H}_4\text{SO}_2\text{OC}[\text{C}_6\text{H}_2(\text{CH}_3)(\text{OH})\text{CH}(\text{CH}_3)_2]_2$.

Properties: Brown-green powder or crystals. Mp

223C (decomposes). Insoluble in water; soluble in alcohol or dilute alkali.

Use: Acid-base indicator in pH range 1.5 (pink) to 2.8–8 (yellow) to 9.6 (blue).

See indicator.

thymol iodide. $[C_6H_2(CH_3)(OI)(C_3H_7)]_2$. Principally dithymol diiodide.

Properties: Red-brown powder or crystals; slight aromatic odor; affected by light. Soluble in ether, chloroform, and fixed or volatile oils; slightly soluble in alcohol; insoluble in water. Combustible.

Derivation: Interaction of thymol and potassium in alkaline solution.

Grade: Technical.

Use: Feed additive, antifungal agent.

thymolphthalein.

$C_6H_4COOC[C_6H_2(CH_3)(OH)CH(CH_3)_2]$.

Properties: White powder. Mp 245C. Insoluble in water; soluble in alcohol and acetone, and dilute alkali and acids.

Use: Acid-base indicator in pH range 9.3 (colorless) to 10.5 (blue).

See indicator.

thymolsulfonphthalein. See thymol blue.

***p*-thymoquinone.** (2-isopropyl-5-methylbenzoquinone).

CAS: 490-91-5. $C_9H_{10}O_2(CH_3)CH(CH_3)_2$.

Properties: Bright-yellow crystals; penetrating odor. Mp 45.5C, bp 232C. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: From diazonium salt of aminothymol and nitrous acid.

Use: Fungicide.

thyrocalcitonin. A thyroid hormone having significant effect on the calcium content of bone and blood. It can retard bone damage and may be involved in the incidence of dental caries and the form of dental calculus known as tartar.

thyroid. See thyroxine.

thyronine. (desiodothyroxine).

$HOC_6H_4OC_6H_4CH_2CH(NH_2)COOH$. The *p*-hydroxyphenyl ether of tyrosine. Thyronine and its iodinated derivatives are used in biochemical research on the thyroid gland and its activity.

thyrotropic hormone. (TSH; thyrotropin). A hormone secreted by the anterior lobe of the pituitary gland. It increases the rate of removal of iodine from the blood by the thyroid gland, synthesis of the thyroid hormone, and its release into the bloodstream. The thyrotropic hormone is a protein with a low molecular weight (about 10,000) that contains some carbohydrate.

thyroxine. (3,5,3',5'-tetraiodothyronine).

CAS: 51-48-9.

$HOC_6H_2I_2OC_6H_2I_2CH_2CH(NH_2)COOH$.

The hormone produced by the thyroid gland. It is an amino acid and a derivative of tyrosine. It increases the metabolic rate and oxygen consumption of animal tissues.

Properties: Optically active, the *l*-isomer is the natural and physiologically active form. (*dl*-thyroxine) Needles. Decomposes at 231–233C. Insoluble in water, alcohol, and the common organic solvents; soluble in alcohol in the presence of mineral acids or alkalis. (*l*-thyroxine) Crystals. Decomposes at 235–236C. (*d*-thyroxine) Crystals. Decomposes at 237C.

Derivation: Obtained from the thyroid glands of animals; also made synthetically.

Use: Medicine (hormone), biochemical research. See triiodothyronine.

Ti. Symbol of titanium.

TIBAL. Abbreviation for triisobutylaluminum.

“TIC Pretested Guarcel 302” [TIC]. TM for a powder developed with bland guar gum.

Use: For dairy-based dry mix beverages.

“TIC Pretested Nutriloid Arabic” [TIC].

TM for a sprayable dry powder food additive.

Use: As a mouthfeel aid providing a creamy texture without viscosity.

Tiemann rearrangement. Rearrangement of amide oximes (available from nitriles and hydroxylamine) to monosubstituted ureas by treatment with benzenesulfonyl chloride and water.

Tiffeneau-Demjanov ring expansion. Rearrangement of β -amino alcohols on diazotization with nitrous acid to give ring-expanded carbonyl compounds.

tiglic acid. (methylcrotonic acid; crotonolic acid; *trans*-2-methyl-2-butenic acid).

CAS: 80-59-1. $CH_3CH:C(CH_3)COOH$. The *trans* isomer of angelic acid.

Properties: Thick, syrupy liquid or colorless crystals; spicy odor. D 0.9641, mp 65C, bp 198.5C. Soluble in alcohol, ether, hot water. Combustible.

Derivation: From croton oil. Also occurs in English chamomile oil.

Use: Perfumes, flavors, emulsion breakers.

tiglium oil. See croton oil.

time-weighted average. (TWA).

The average concentration of an air contaminant for a conventional 8-hour workday and a 40-hour work-week.

See Threshold Limit Value.

timolol. C₁₃H₂₄N₄O₃S.

Properties: Colorless crystals. Mp 72C.

Use: Adrenergic blocker used in treatment of hypertension, glaucoma, and for reducing risk of second heart attack. FDA approved.

tin. (stannum).

CAS: 7440-31-5. Sn. Metallic element of atomic number 50, group IVA of the periodic system, aw 118.69, valences of 2, 4; 10 isotopes.

Properties: Silver-white, ductile solid (β form). D 7.29 (20C), mp 232C, bp 2260C. Changes to brittle, gray (α) tin at temperature of 18C, but the transition is normally very slow. Soluble in acids and hot potassium hydroxide solution; insoluble in water. Elemental tin has low toxicity, but most of its compounds are toxic.

Derivation: By roasting the ore (cassiterite) to oxidize sulfates and to remove arsine, then reducing with coal in a reverberatory furnace or by smelting in an electric furnace; secondary recovery from tin plate.

Occurrence: Malaysia (called Straits tin), Indonesia, Thailand, Bolivia.

Grade: By percentage purity; spectrographic grade is 99.9999%; block tin is a common designation for pure tin.

Available forms: Sheet, wire, tape, pipe, bar, ingot, powder, single crystals.

Hazard: All organic tin compounds are toxic. TLV: (inorganic compounds except SnH₄ and SnO₂ as Sn) 2 mg/m³; (organic compounds as Sn) 0.1 mg/m³.

Use: Tin plate,terneplate, Babbitt metal, pewter, bronze, corrosion-resistant coatings, collapsible tubes, anodes for electroplating, hot-dipped coatings, cladding, solders, low-melting alloys for fire control, organ pipes, dental amalgams, diecasting. White, type, and casting metal. Manufacture of chemicals, tinned wire (all copper wire that is to be rubber covered). Block tin is used to coat copper cooking utensils and lead sheet, or to line lead pipe for distilled water, beer, carbonated beverages, and some chemicals. *Note:* In speaking of fabricated articles, "tin" is often used when tinplate (thin sheets of steel coated with tin) is meant, e.g., "a tin can." To distinguish, articles (such as condenser coils) made of solid tin are said to be made of "block tin."

tin anhydride. See stannic oxide.

tin ash. See stannic oxide.

tin bis(diethylthiocarbamate).

CAS: 16248-90-1. mf: C₁₀H₂₀N₂S₄•Sn.

Hazard: A poison. TWA 2 mg(Sn)/m³.

Use: Agricultural chemical.

tin bisulfide. See stannic sulfide.

tin bronze. See stannic sulfide.

tincal. See borax.

tincture. An alcoholic or aqueous alcoholic solution of an animal or vegetable drug or a chemical substance. The tincture of potent drugs is essentially a 10% solution. Tinctures are more dilute than fluid extracts and less volatile than spirits.

tin dibutylditrifluoroacetate. See bis(trifluoroacetoxy)dibutyltin.

tin, dichlorodidodecyl-. See didodecyltin dichloride.

tin, dioctyldiphenyl-. See dioctyldiphenyltin.

"Tinopal" [Novartis]. TM for a group of fluorescent whitening agents, which absorb UV light in the near visible range and reemit the energy as visible light.

Use: Heavy-duty detergents to whiten fabrics, paper, plastics, fibers, coatings, waxes, etc.

tin oxide. See stannous oxide.

tin perchloride. See stannic chloride.

tin plating. The process of covering steel, iron, or other metal with a layer of tin by dipping it in the molten metal, by electroplating, or by immersion in solutions that deposit tin by chemical action of their components. Ingredients for the chemical process are cream of tartar and stannous chloride. The metal being plated also takes part in the process. The objective is to utilize the superior corrosion resistance of tin and in some cases to improve appearance. See terneplate.

tin protochloride. See stannous chloride.

tin protosulfide. See stannous sulfide.

tin protoxide. See stannous oxide.

tin resinate. See soap (2).

tin salt. See stannous chloride.

tin spirits. Solutions of tin salts used in dyeing.

tin stearate. See stannous stearate.

tin tetrabromide. See stannic bromide.

tin tetrachloride. Legal label name (Rail) for stannic chloride.

tintometer. A device for comparison of colors of solutions.

“Tinuvin” [Novartis]. TM for a group of UV absorbers, substituted hydroxyphenyl benzotriazoles, e.g., 2-(2'-hydroxy-5'-methylphenyl)benzotriazole.

tiocarbazil.

CAS: 36756-79-3. mf: C₁₆H₂₅NOS.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion.

Use: Agricultural chemical.

“Tipersul” [Du Pont]. TM for fibrous potassium titanate, crystalline fibers 1 micron in diameter melting at 1371C, useful to 1204C.

Available forms: Lumps, blocks, and loose fibers.

Use: High-temperature thermal, acoustical, and electrical insulation; filter media.

“Tiron” [LaMotte]. TM for disodium-1,2-dihydroxybenzene-3,5-disulfonate.

Use: Colorimetric determination of ferric iron, titanium, or molybdenum.

Tiselius, Arne W. K. (1902–1971). A Swedish biochemist who won the Nobel Prize for chemistry in 1948. Renowned for research in separation methods of biochemical matter, in particular electrophoresis and chromatography. Work also involved virus isolation and synthesis of blood plasma. He earned degrees from the University of Upsala and Princeton University, as well as a multitude of honorary degrees.

Tishchenko reaction. Formation of esters from aldehydes by an oxidation-reduction process in the presence of aluminum or sodium alkoxides.

tissue culture. Method by which cells derived from multicellular organisms are grown in liquid media.

tissue-specific expression. Gene function which is restricted to a particular tissue or cell type. For example, the glycoprotein hormone alpha subunit is produced only in certain cell types of the anterior pituitary and placenta, not in lungs or skin; thus, expression of the glycoprotein hormone alpha-chain gene is said to be tissue-specific. Tissue specific expression is usually the result of an enhancer which is activated only in the proper cell type.

titanellor. See titanium trioxide (not to be confused with titan yellow, an organic dye containing no titanium).

titania. See titanium dioxide.

titanic acid. (titanic hydroxide; metatitanic acid). H₂TiO₃ or Ti(OH)₄. Water content variable. **Properties:** White powder. Insoluble in mineral acids and alkalis except when freshly precipitated; insoluble in water.

Derivation: From hydrochloric acid solution of titanates by treating with ammonia and then drying over concentrated sulfuric acid or by boiling titanium sulfate solution.

Grade: Technical.

Use: Mordant.

titanium.

CAS: 7440-32-6. Ti. Metallic element of atomic number 22, group IVB of the periodic table, aw 47.90, valences of 2, 3, 4; five isotopes.

Properties: Silvery solid or dark-gray, amorphous powder. D 4.6 (20C), mp 1675C, bp 3260C, sp heat 0.13 Btu/lb/F, thermal conductivity 105 Btu/ft²/F/hour, as strong as steel but 45% lighter, Vickers hardness 80–100, excellent resistance to atmospheric and seawater corrosion and to corrosion by chlorine, chlorinated solvents, and sulfur compounds; reactive when hot or molten. Insoluble in water, inert to nitric acid but attacked by concentrated sulfuric acid and hydrochloric acid. Unaffected by strong alkalis.

Source: Ilmenite, rutile, titanite, titanium slag from certain iron ores.

Derivation: (1) Reduction of titanium tetrachloride with magnesium (Kroll process) or sodium (Hunter process) in an inert atmosphere of helium or argon. The titanium sponge is consolidated by melting. (2) Electrolysis of titanium tetrachloride in a bath of fused salts (alkali or alkaline-earth chlorides).

Grade: Technical (powder), commercially pure (sheets, bars, tubes, rods, wire, and sponge), single crystals.

Hazard: Flammable, dangerous fire and explosion risk. (Metal) Ignites in air at 1200C, will burn in atmosphere of nitrogen. Do not use water or carbon dioxide to extinguish.

Use: Alloys (especially ferrotitanium); as structural material in aircraft, jet engines, missiles, marine equipment, textile machinery, chemical equipment (especially as anode in chloride production), desalination equipment, surgical instruments, orthopedic appliances, food-handling equipment; X-ray tube targets; abrasives; cermets; metal-ceramic brazing, especially in nickel-cadmium batteries for space vehicles; electrodeposited and dipped coatings on metals and ceramics; electrodes in chlorine battery.

titanium acetylacetonate. See titanylacetylacetonate.

titanium ammonium oxalate. See ammonium titanium oxalate.

titanium boride. (titanium diboride). TiB_2 .
Properties: Extremely hard solid with oxidation resistance up to 1400C. Mp 2980C, d 4.50, Mohs hardness 9+, low electrical resistivity.
Use: Metallurgical additive, high-temperature electrical conductor, refractory, cermet component, coatings resistant to attack by molten metals, aluminum manufacture, super alloys.

titanium butylate. See tetrabutyl titanate.

titanium carbide. TiC .
Properties: Extremely hard, crystalline solid with gray metallic color. Mp 3140C, bp 4300C, d 4.93, resistivity 60 micro-ohm-cm (room temperature). Insoluble in water; soluble in nitric acid and aqua regia.
Use: Additive (with tungsten carbide) in making cutting tools and other parts subjected to thermal shock, arc-melting electrodes, cermets, coating dies for metal extrusion (0.2 mil film by vapor deposition).

titanium chelate. $(HOYO)_2Ti(OR)_2$ or $(H_2NYO)_2Ti(OR)_2$. A series of titanium compounds where Y and R are hydrocarbon groups, e.g., octylene glycol titanate, triethanolamine titanate.
Use: Surface-active agents, corrosive inhibitors, cross-linking agents.

titanium diboride. See titanium boride.

titanium dichloride.
CAS: 10049-06-6. $TiCl_2$.
Properties: Black powder. D 3.13. Decomposed by water; decomposes at 475C in vacuo; hygroscopic. Soluble in alcohol; insoluble in chloroform, ether, carbon disulfide.
Derivation: Reduction of titanium tetrachloride with sodium amalgam, dissolving titanium metal in hydrochloric acid.
Hazard: Flammable, dangerous fire risk, ignites in air, store under water or inert gas.

titanium dioxide. (titanic anhydride; titanic acid anhydride; titanic oxide; titanium white; titania).
CAS: 13463-67-7. TiO_2 .
Properties: White powder in two crystalline forms, anatase and rutile. It has the greatest hiding power of all white pigments. Noncombustible.
Derivation: From ilmenite or rutile. (1) Ilmenite is treated with sulfuric acid and the titanium sulfate further processed. The product is primarily the anatase form. (2) Rutile is chlorinated and the titanium tetrachloride converted to the rutile form by vapor-phase oxidation. Papermakers are using this form to an increasing extent in preference to the anatase form.

Grade: Technical, of many variations, pure, USP, single crystals, whiskers.

Hazard: TLV: (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%); Not Classifiable as a Human Carcinogen.

Use: White pigment (in paints, paper, rubber, plastics, etc.), opacifying agent, cosmetics, radioactive decontamination of skin, floor coverings, glassware and ceramics, enamel frits, delustering synthetic fibers, printing inks, welding rods. Single crystals are high-temperature transducers.

titanium disilicide. $TiSi_2$.
Use: In special alloy applications, as a flame or blast impingement-resistant coating material.

titanium disulfide. TiS_2 .
Properties: Yellow solid. D 3.22 (20C). Decomposed by steam.
Use: Solid lubricant.

titanium ester. A series of titanium compounds whose general formula is $Ti(OR)_4$ where R is a hydrocarbon group, e.g., tetraisopropyl titanate.
Use: Adhesion promoters, ester-exchange catalysts, cross-linking agents, heat-resistant paints. See tetrabutyl titanate; tetra(2-ethylhexyl) titanate.

titanium ferrocene. See titanocene dichloride.

titanium hydride. TiH_2 .
Properties: Black, metallic powder that dissociates above 288C. The evolution of hydrogen is gradual and practically complete at 650C. D 3.8, attacked by strong oxidizing agents.
Derivation: Direct combination of titanium with hydrogen, reduction of titanium oxide with calcium hydride in the presence of hydrogen above 600C.
Hazard: Flammable, dangerous fire risk, dust may explode in presence of oxidizing agents.
Use: Powder metallurgy, production of pure hydrogen (can contain 1800 cc (STP) H/cc of hydride), production of foamed metals, solder for metal-glass composites, electronic getter, reducing atmosphere for furnaces, hydrogenation agent, refractories.

titanium isopropylate. See tetraisopropyl titanate.

titanium monoxide. TiO . A weakly basic oxide of titanium, prepared by reduction of the dioxide at 1500C; it has no important industrial uses.

titanium nitride. TiN .
Properties: Golden-brown, hard, brittle plates. Mp 2927C, d 5.24, sp heat 8.86 cal/mole at 25C, electrical resistivity 21.7 micro-ohm-cm.
Use: High-temperature bodies, cermets, alloys, rectifiers, semiconductor devices.

titanium ore. See rutile; ilmenite.

titanium oxalate. (titanous oxalate).
 $\text{Ti}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Yellow prisms. Soluble in water; insoluble in alcohol and ether.

Derivation: Action of oxalic acid on titanous chloride.

titanium peroxide. See titanium trioxide.

titanium potassium fluoride. (potassium titanium fluoride). TiK_2F_6 .

Properties: White leaflets. Soluble in hot water.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Titanic acid, titanium metal.

titanium potassium oxalate. (potassium titanium oxalate). $\text{TiO}(\text{C}_2\text{O}_4\text{K})_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, lustrous crystals. Soluble in water.

Derivation: By treating titanium hydroxide with potassium oxalate and oxalic acid.

Grade: Technical, pure, 22% TiO_2 (min).

Use: Mordant in cotton and leather dyeing, sensitization of aluminum for photography.

titanium sesquisulfate. See titanous sulfate.

titanium sponge. The metal in crude form as reduced from the tetrachloride; ingots are made from it by consumable-electrode refining (arc-melting).

See titanium.

titanium sulfate. (titanic sulfate; basic titanium sulfate; titanyl sulfate).

CAS: 13825-74-6. $\text{Ti}(\text{SO}_4)_2 \cdot 9\text{H}_2\text{O}$, also $\text{TiOSO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$. A commercial material, possibly a mixture.

Properties: White, cakelike solid. Highly acidic, similar to 50% sulfuric acid, typical composition 20% TiO_2 , 50% sulfuric acid, 30% water, hygroscopic. D 1.47. Soluble in water; solutions hydrolyze readily unless protected from heat and dilution.

Derivation: Action of sulfuric acid on ilmenite ore.

Hazard: Irritant to skin and tissue.

Use: Treatment of chrome yellow and other colors, production of titanous sulfate used as reducing agent or stripper for dyes, laundry chemical.

titanium tetrachloride. (titanic chloride).

CAS: 7550-45-0. TiCl_4 .

Properties: Colorless liquid. Fumes strongly when exposed to moist air, forming a dense and persistent white cloud. (Pure) d 1.7609 (0C), bp 136.4C, fp -30C. Soluble in dilute hydrochloric acid; soluble in water with evolution of heat; concentrated aqueous solutions are stable and corrosive; dilute solutions precipitate insoluble basic chlorides.

Derivation: By heating titanium dioxide or the ores and carbon to redness in a current of chlorine.

Grade: Technical, CP.

Hazard: Toxic by inhalation, strong irritant to skin and tissue.

Use: Pure titanium and titanium salts, iridescent effects in glass, smoke screens, titanium pigments, polymerization catalyst.

titanium trichloride. (titanous chloride).

CAS: 7705-07-9. TiCl_3 .

Properties: Dark-violet, anhydrous, deliquescent crystals. D 2.6, decomposes above 440C, decomposes in air and water with heat evolution. Soluble in alcohol, acetonitrile, certain amines; slightly soluble in chloroform; insoluble in ether and hydrocarbons.

Hazard: Fire risk in the presence of oxidizing materials. Irritant to skin and tissue; open container only in oxygen-free or inert atmosphere.

Use: Reducing agent, organic synthesis, cocatalyst for polyolefin polymerization, organometallic synthesis involving titanium, laundry stripping agent.

titanium trioxide. (titanium peroxide; titanillo; pertitanic acid). TiO_3 .

Properties: Yellow powder. Soluble in acids.

Use: Dental porcelain and cements, yellow tile.

titanocene dichloride. (dicyclopentadienyltitanium dichloride; titanium ferrocene).

$(\text{C}_5\text{H}_5)_2\text{TiCl}_2$.

Properties: Red crystals. Mp 287–289C. Moderately soluble in toluene, chloroform; sparingly soluble in ether and water. Stable in dry air, slowly hydrolyzed in moist air.

Hazard: Toxic by inhalation, irritant to skin and mucous membranes.

Use: Ziegler polymerization catalyst (with aluminum alkyls).

See metallocene.

titanous chloride. See titanium trichloride.

titanous oxalate. See titanium oxalate.

titanous sulfate. (titanium sesquisulfate).

$\text{Ti}_2(\text{SO}_4)_3$.

Properties: Green, crystalline powder. Insoluble in water, alcohol, concentrated sulfuric acid; soluble in dilute hydrochloric acid or sulfuric acid, giving violet solutions.

Grade: Commercial grade made and supplied as a dark-purple solution containing 15% $\text{Ti}_2(\text{SO}_4)_3$.

Use: Textile industry as reducing agent for stripping or discharging colors.

"Titanox" [Velsicol]. TM of a series of white pigments comprising titanium dioxide in both anatase and rutile crystalline forms and also extended with calcium sulfate (titanium dioxide-calcium pigment). Noncombustible.

Use: Paints, paper, rubber, plastics, leather and leather finishes, inks, coated textiles, textile delustering,

ceramics, roofing granules, welding rod coatings, and floor coverings.

titanyl acetylacetonate. (titanium acetylacetonate). $\text{TiO}[\text{OC}(\text{CH}_3)_2\text{C}(\text{COCH}_3)_2]$.

Properties: Crystalline powder. Slightly soluble in water; resistant to hydrolysis. A chelating, nonionizing compound.

Derivation: Reaction of titanium oxychloride with acetylacetone and sodium carbonate.

Use: Cross-linking agent for cellulosic lacquers.

titanyl sulfate. See titanium sulfate.

titer. In solutions (1) the concentration of a dissolved substance as determined by titration; (2) the minimum amount or volume needed to bring about a given result in titration; or (3) the solidification point of fatty acids that have been liberated from the fat by hydrolysis.

titration. Any of a number of methods for determining volumetrically the concentration of a desired substance in solution by adding a standard solution of known volume and strength until the reaction is completed, usually as indicated by a change in color due to an indicator. Organic solvents are used in titrating water-insoluble substances (nonaqueous titration). Several types of electrical measurement techniques are used, among which are amperometric, conductometric, and coulometric titration methods, and spectrophotometry is another possible procedure. Titration has been successfully automated, the extent depending on the type of measurement used.

titration curve. A plot of the pH versus the equivalents of acid or base, added during titration of a base or an acid.

TKP. Abbreviation for tripotassium phosphate. See potassium phosphate, tribasic.

TKPP. Abbreviation for tetrapotassium pyrophosphate. See potassium pyrophosphate.

Tl. Symbol for thallium.

TLV. See Threshold Limit Value.

Tm. Symbol for thulium.

Tm. The melting point for a double-stranded nucleic acid. Technically, this is defined as the temperature at which 50% of the strands are in double-stranded form and 50% are single-stranded, i.e., midway in the melting curve. A primer has a specific Tm because it is assumed that it will find an opposite strand of appropriate character.

TMA. Abbreviation for trimethylamine and trimellitic anhydride.

TMEDA. Abbreviation for tetramethylethylenediamine.

TML. Abbreviation for tetramethyllead.

TMSM. See tetramethyl succinonitrile.

TMTD. Abbreviation for tetramethylthiuram disulfide. See thiram.

TMTU. See tetramethylthiourea.

TNA. Abbreviation for tetranitroaniline.

TNB. Abbreviation for trinitrobenzene.

TNBS. See 2,4,6-trinitrobenzenesulfonic acid.

TNT. Abbreviation for trinitrotoluene.

tobacco. Cured leaves of plants of the family *Solanaceae*, genus *Nicotiana*; the species *N. tabacum* is the most important domestic source. Curing consists of drying and long aging. The leaves are dehydrated by hanging in warm air to terminal moisture content of 20–30%, during which time starches reduce to sugars, the chlorophyll is discharged, and the color darkens. The product is then aged from one to five years to remove unpleasant odor; cigar tobacco is “fermented” with water, with resulting hydrolysis, deamination, and decarboxylation. Aging fermentation and oxidizers improve taste, aroma, and smoking qualities. Humectants and flavoring agents are added to some cigarette blends.

Scores of chemical compounds have been identified in unburned tobacco. Basically it is cellulose. The cured product contains acids (citric, oxalic, formic), alkaloids (nicotine, anabasine, myosmine), and carbohydrates (lignin, pentosans, starch, sucrose), as well as tannin, ammonia, glutamine, and micro amounts of zinc, iodine, copper, manganese, and polonium-210. See cigarette tar; smoke (4). A nicotine-free tobacco substitute, TM “Cytrel,” has been developed. See “Cytrel” [*Celanese*].

Hazard: A carcinogen. Many other deleterious effects from chronic inhalation of cigarette smoke.

tobacco mosaic virus. The first virus to be obtained in crystalline form (from diseased tobacco plants). The protein portion of this virus (95% of each particle) contains about 2300 peptide chains, each having 150 amino acids and ending with threonine. Molecular weight of each chain is about 17,000, total molecular weight 40 million. The complete sequence of the amino acids has been determined.

tobermorite gel. $3\text{CaO}\cdot 2\text{SiO}_2\cdot 3\text{H}_2\text{O}$. A calcium silicate hydrate; a main cementing ingredient of concrete because of its great surface area.

Tobias acid. (2-naphthylamine-1-sulfonic acid; 2-amino-1-naphthalene-sulfonic acid).

Properties: White needles. Soluble in hot water.

Derivation: Sulfonation of β -naphthol with chlorosulfonic acid in nitrobenzene at 0C followed by heating the resulting 1-sulfonic acid with ammonium hydrogen sulfite and ammonia at 145–150C. Purification is by precipitation from dilute solution of the sodium salt.

Use: Azo dye intermediate, optical brighteners.

TOC. Abbreviation for Tagliabue open cup, a standard method for determining flash points.

tocamphyl. See hepasynthyl.

tocopherol. (vitamin E). Any of a group of related substances (α -, β -, γ -, and Δ -tocopherol) that constitute vitamin E. The α -form (which occurs naturally as the *d*-isomer) is the most potent. Occurs naturally in plants, especially wheat germ. All are derivatives of dihydrobenzo- γ -pyran and differ from each other only in the number and position of methyl groups. Vitamin E is required by certain rodents for normal reproduction. Muscular and central nervous system depletion along with generalized edema are deficiency symptoms in all animals. It is not required as a dietary supplement for humans.

Properties: Viscous oils. Soluble in fats; insoluble in water. Stable to heat in the absence of oxygen, to strong acids, and to visible light; unstable to UV light, alkalis, and oxidation.

Use: Medicine, nutrition, antioxidants for fats, animal feed additive.

***dl*- α -tocopherol.** (*dl*-2,5,7,8-tetramethyl-2-(4',8',12'-trimethyltridecyl)-6-chromanol). CAS: 59-02-9. $\text{C}_{29}\text{H}_{50}\text{OOH}$. The most important of the vitamin E group.

Properties: Clear yellow, viscous oil. D 0.947–0.958 (25/25C), refr index 1.5030–1.5070 (20C).

Derivation: Synthetic.

Grade: NF, FCC.

Use: Biological antioxidant, meat curing (nitrosamine blocker), nutrient, medicine. Also available as the acetate.

See tocopherol.

tocophersolan. (USAN for *d*- α -tocopheryl polyethylene glycol 1000 succinate). $\text{C}_{29}\text{H}_{49}\text{O}\cdot\text{OOC}(\text{CH}_2)_2\text{COO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$. $n = 22$. A water-miscible vitamin E.

Use: Dietary food supplement, medicine.

***d*- α -tocopheryl acetate.**

CAS: 58-95-7. mf: $\text{C}_{31}\text{H}_{52}\text{O}_3$.

Properties: From vacuum steam distillation and acetylation of edible vegetable oil products. (FCC III) Colorless to yellow oil; odorless. Mp: 26.5–27.5°, bp: 205° @ 0.02 mm (bath). Insol in water, sol in alc; misc with acetone, chloroform, ether, vegetable oil.

Use: Food additive; drug.

***dl*- α -tocopheryl acetate.**

CAS: 7695-91-2. mf: $\text{C}_{31}\text{H}_{52}\text{O}_3$.

Properties: From vacuum steam distillation and acetylation of edible vegetable oil products. (FCC III) Colorless to yellow oil; odorless. Insol in water; sol in alc; misc with acetone, chloroform, ether, vegetable oil.

Hazard: A reproductive hazard.

Use: Food additive.

***dl*- α -tocopheryl acid succinate.**

CAS: 4345-03-3. mf: $\text{C}_{33}\text{H}_{54}\text{O}_5$.

Properties: From vacuum steam distillation and succinylation of edible vegetable oil products. (FCC III) Colorless to white crystalline powder or needles from pet ether; odorless and tasteless. Mp: 76–77°. Insol in water; very sol in chloroform, sol in acetone, alc, ether, vegetable oil.

Use: Food additive.

Todd, Sir Alexander R. (1907–1997). A British chemist who won the Nobel Prize for chemistry in 1957. His diverse research and accomplishments involved phosphorylation and mechanisms of

biological reactions concerning phosphates. Many of his studies concerned the structure of nucleic acids, nucleotides, nucleotidic coenzymes, as well as vitamins B₁, B₁₂, and E. Work in biological organic chemistry indicated that hemp plant could be used for production of narcotics. Todd had degrees awarded from Oxford, Frankfurt, and Glasgow, among others.

"Tofranil" [Novartis]. Proprietary preparation of imipramine hydrochloride.

Use: Antidepressant.

toilettries. Liquid cosmetic preparations usually consisting of an essential oil-alcohol mixture used chiefly for application to hair and scalp, as after-shave lotions, etc.

"Tok" [Rohm & Haas]. TM for 2,4-dichlorophenyl-4-nitrophenyl ether product.

Use: Herbicide.

tokamak. A transliterated Russian word for an assembly for producing nuclear fusion. It consists essentially of a doughnut-shaped evacuated chamber called a torus, of 18-inch cross section, through which the plasma moves. Surrounding the torus is an electromagnetic field powerful enough to confine the energized plasma sufficiently to achieve the required density of 10¹⁴ particles/cc/sec and a temperature well above 44 million centigrade. Up to 74 million centigrade has been obtained experimentally, but 100 million centigrade will be necessary for power production. The vacuum chamber and the magnetic field simulate conditions on the sun, i.e., absence of air and immense gravitational forces. Several experimental tokamaks are in operation in the U.S., the largest being at Princeton, NJ. It is utilizing hydrogen and deuterium as a test plasma and thus can attain temperatures of only 100,000C. After further experimentation and modification, it should be capable of reaching the 100 million centigrade necessary for power production when tritium is used.

See fusion.

tokuthion oxon. See ethaphos.

tolan. (diphenylacetylene). C₆H₅C:CC₆H₅.

Properties: Monoclinic crystals. Mp 59–61C, bp 300C, 170C (19 mm Hg), d 0.966 (100/4C). Insoluble in water; soluble in ether or hot alcohol.

Grade: Technical, purified.

Use: Organic synthesis, purified grade, primary fluor or wavelength shifter in soluble scintillators.

***o*-tolidine.** (3,3'-dimethylbenzidine; diaminoditoly).

CAS: 119-93-7. [C₆H₃(CH₃)NH₂]₂.

Properties: Glistening plates, white to reddish. Mp 129–131C. Soluble in alcohol and ether; sparingly soluble in water. Affected by light. Combustible.

Derivation: Reduction of *o*-nitrotoluene with zinc dust and caustic soda and conversion of the hydrazo-toluene by boiling with hydrochloric acid.

Grade: Technical, dry, or paste.

Hazard: TLV: Animal Carcinogen.

Use: Dyes, sensitive reagent for gold (1:10 million detectable) and for free chlorine in water, curing agent for urethane resins (also available as the dihydrochloride).

Tollens' reagent. Solution of ammoniacal silver nitrate containing free sodium bicarbonate.

Hazard: May explode on standing from the formation of silver nitride.

Use: To test for aldehydes.

tolnaftate. (USAN for *o*-2-naphthyl-*meta-N*-dimethylthiocarbamate).

CAS: 2398-96-1. C₁₀H₇OC(S)N(CH₃)C₆H₄CH₃.

Use: Antifungal treatment (medicine).

tolualdehydy. See tolyl aldehydes.

toluazotoluidine. See *o*-aminoazotoluene.

tolu balsam. See balsam.

toluene. (methylbenzene; phenylmethane).

CAS: 108-88-3. C₆H₅CH₃.

Properties: Colorless liquid; benzenelike odor. D 0.866 (20/4C), fp -94.5C, bp 110.7C, refr index 1.497 (20C), aniline equivalent 15, flash p 40F (4.4C) (CC), autoign temp 997F (536C). Soluble in alcohol, benzene, and ether; insoluble in water.

Derivation: (1) By catalytic reforming of petroleum. (2) By fractional distillation of coal tar light oil.

Method of purification: Rectification.

Grade: (Usually defined in terms of boiling ranges) Pure, commercial, straw-colored, nitration, scintillation, industrial.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.27–7%. Toxic by ingestion, inhalation, and skin absorption. TLV: 50 ppm; not classifiable as a human carcinogen.

Use: Aviation gasoline and high-octane blending stock; benzene, phenol, and caprolactam; solvent for paints and coatings, gums, resins, most oils, rubber, vinyl organosols; diluent and thinner in nitrocellulose lacquers; adhesive solvent in plastic toys and model airplanes; chemicals (benzoic acid, benzyl and benzoyl derivatives, saccharin, medicines, dyes, perfumes); source of toluenediisocyanates (polyurethane resins); explosives (TNT); toluene sulfonates (detergents); scintillation counters.

toluene-2,4-diamine. (*m*-tolylenediamine; MTD; *m*-toluylenediamine; diaminotoluene).

CAS: 95-80-7. $\text{CH}_3\text{C}_6\text{H}_3(\text{NH}_2)_2$.

Properties: Colorless crystals. Mp 99C, bp 280C. Soluble in water, alcohol, and ether.

Derivation: Reduction of *m*-dinitrotoluene with iron and hydrochloric acid.

Hazard: A carcinogen.

Use: Chain extender and cross-linker, intermediate in organic synthesis of dyes, polymers, especially polyurethanes.

toluene-2,4-diisocyanate. (2,4-tolylene diisocyanate; *m*-tolylene diisocyanate; TDI).

CAS: 584-84-9. $\text{CH}_3\text{C}_6\text{H}_3(\text{NCO})_2$.

Properties: Water-white to pale-yellow liquid; sharp pungent odor. Bp 251C, 120C (10 mm Hg), flash p 270F (132C), mp 19.4–21.5C (pure isomer), d 1.22 (25/15.5C), vap press 0.01 mm Hg (20C). Reacts with water, producing carbon dioxide; reacts with compounds containing active hydrogen (may be violent). Soluble in ether, acetone, and other organic solvents. Combustible.

Derivation: Reaction of 2,4-diaminotoluene with phosgene.

Method of purification: Distillation to remove hydrogen chloride.

Grade: 100% 2,4-isomer; 80% and 65% 2,4-isomer both mixed with 2,6-isomer.

Hazard: Toxic by ingestion and inhalation; strong irritant to skin and tissue, especially to eyes. TLV: 0.005 ppm; STEL 0.02 ppm; not classifiable as a human carcinogen.

Use: Polyurethane foams, elastomers and coatings, cross-linking agent for nylon 6.

toluene-2,6-diisocyanate. See toluene-2,4-diisocyanate.

***p*-toluenesulfamine.** See *p*-toluenesulfonamide.

***p*-toluenesulfanilide.** $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{C}_6\text{H}_5\text{NH}_2$.

Properties: White to pink crystalline solid. Mp 103C. Soluble in most lacquer solvents. Combustible.

Derivation: *p*-Toluene sulfonylchloride treated with aniline in the presence of lime or carefully regulated amounts of alkalis.

Grade: Technical.

Use: Softener for acetylcellulose in proportions up to 50%, dyestuff intermediate.

***o*-toluenesulfonamide.**

CAS: 88-19-7. $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: Colorless crystals. Mp 156.3C. Soluble in alcohol; slightly soluble in water and ether. Combustible.

Use: Plasticizer.

***p*-toluenesulfonamide.** (*p*-toluenesulfamine; PTSA).

CAS: 70-55-3. $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: White leaflets. Mp 137C. Soluble in alcohol; very slightly soluble in water. Combustible.

Derivation: By amination of *p*-toluene sulfonylchloride.

Use: Organic synthesis, plasticizers and resins, fungicide and mildewicide in paints and coatings.

***p*-toluenesulfondichloroamide.** See dichloramine-T.

***o*-toluenesulfonic acid.** (*o*-toluenesulfonate).

CAS: 104-15-4. $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.

Properties: Colorless crystals. Mp 67.5C, bp 129C. Soluble in alcohol, water, and ether. Combustible.

Derivation: By sulfonating toluene with concentrated sulfuric acid at 100C.

Grade: Anhydrous, monohydrate, 40% aqueous solution.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue.

Use: Dyes, organic synthesis, acid catalyst.

***p*-toluenesulfonic acid.** (*p*-toluenesulfonate).

CAS: 104-15-4. $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.

Properties: Colorless leaflets. Mp 107C, bp 140C (20 mm Hg). Soluble in alcohol, ether, and water. Combustible.

Derivation: By action of chlorosulfonic acid on toluene at a low temperature.

Grade: Anhydrous, monohydrate; 40% aqueous solution.

Hazard: Skin irritant.

Use: Dyes, organic synthesis, organic catalyst.

***o*-toluenesulfonyl chloride.** (*o*-toluenesulfonylchloride; *o*-toluenesulfonylchloride).

CAS: 98-59-9. $\text{H}_3\text{CC}_6\text{H}_4\text{SO}_2\text{Cl}$.

Properties: Oily liquid. D 1.3383 (20/4C), mp 10.2C, bp 154C (36 mm Hg). Insoluble in water; soluble in hot alcohol and in ether and benzene. Combustible.

Derivation: Action of chlorosulfonic acid on toluene.

Use: Intermediate in the synthesis of saccharin and dyestuffs.

***p*-toluenesulfonyl chloride.** (tosyl chloride; *p*-toluenesulfonylchloride; *p*-toluenesulfonylchloride).

$\text{H}_3\text{CC}_6\text{H}_4\text{SO}_2\text{Cl}$.

Properties: Solid. Mp 71C, bp 145–146C (15 mm Hg). Insoluble in water; soluble in alcohol, ether, and benzene. Combustible.

Use: Organic synthesis.

4-toluenesulfonyl isocyanate. See 4-methylbenzenesulfonyl isocyanate.

***p*-toluenesulfonyl semicarbazide.**

Properties: Fine, white powder. D 1.428, decomposes at 440F (226C dry), 415–430F (212–221C compounded).

Use: Blowing agent for polyolefins, impact polystyrene, polypropylene, ABS, etc.

toluenethiol. (thiocresol; tolyl mercaptan).

Properties: Cream to white, moist crystals; musty odor. Bp 195C. Insoluble in water; soluble in alcohol or ether. There are three isomers with different boiling points.

Hazard: Skin irritant.

Use: Intermediate, bacteriostat.

α -toluenethiol. See benzyl thiol.

toluene trichloride. See benzotrichloride.

toluene trifluoride. See benzotrifluoride.

toluhydroquinone. $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})_2$.

Properties: Pink to white crystals. Mp 125–127C. Slightly soluble in water; soluble in alcohol and acetone.

Use: Antioxidant, polymerization inhibitor.

α -toluic acid. See phenylacetic acid.

***m*-toluic acid.** (*m*-toluyllic acid; 3-methylbenzoic acid). $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: White to yellowish crystals. D 1.0543, mp 109C, bp 263C, ionization constant 5.3×10^{-5} . Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: Oxidation of *m*-xylene with nitric acid.

Use: Organic synthesis, to form *N,N*-diethyl-*m*-toluamide, a broad-spectrum insect repellent.

***o*-toluic acid.** (*o*-toluyllic acid; 2-methylbenzoic acid). $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: White crystals. D 1.0621, mp 103.5–104C, bp 256C, refr index 1.512 (114.6C), ionization constant 1.2×10^{-5} . Slightly soluble in water; soluble in alcohol and chloroform. Combustible.

Derivation: Oxidation of *o*-xylene with dilute nitric acid.

Use: Bacteriostat.

***p*-toluic acid.** (*p*-toluyllic acid; 4-methylbenzoic acid). $\text{C}_6\text{H}_4\text{CH}_3\text{COOH}$.

Properties: Transparent crystals. Mp 180C, bp 275C, ionization constant 4.3×10^{-5} . Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: By treating cymene or turpentine with nitric acid.

Use: Agricultural chemicals, animal feed supplement.

α -toluic aldehyde. See phenylacetaldehyde.

***m*-toluidine.** (*m*-aminotoluene).

Properties: Colorless liquid. D 0.980, fp –31.5C, bp 203.3C, flash p 187F (86.1C). Slightly soluble in water; soluble in alcohol or ether. Combustible.

Derivation: Reduction of *m*-nitrotoluene.

Hazard: Toxic by inhalation and ingestion, absorbed by skin. TLV: 2 ppm; not classifiable as a human carcinogen.

Use: Dyes, manufacture of organic chemicals.

***o*-toluidine.** (*o*-aminotoluene).

Properties: Light-yellow liquid, becomes reddish-brown on exposure to air and light. Volatile with steam, d 1.008 (20/20C), fp –16C, bp 200C, flash p 185F (85C). Soluble in alcohol and ether; very slightly soluble in water. Combustible.

Derivation: By the reduction of *o*-nitrotoluene or obtained mixed with *p*-toluidine by the reduction of crude nitrotoluene.

Grade: Technical.

Hazard: Toxic by inhalation and ingestion, absorbed by skin. TLV: 2 ppm; animal carcinogen.

Use: Textile printing dyes, vulcanization accelerator, organic synthesis.

***p*-toluidine.** (*p*-aminotoluene).

Properties: White lustrous plates or leaflets. D 1.046 (20/4C), mp 45C, bp 200.3C, flash p 189F (87.2C). Soluble in alcohol and ether; very slightly soluble in water. Combustible.

Derivation: By the reduction of *p*-nitrotoluene with iron and hydrochloric acid.

Grade: Technical, flake, or cast.

Hazard: Toxic by inhalation and ingestion, absorbed by skin. TLV: 2 ppm; animal carcinogen.

Use: Dyes, organic synthesis, reagent for lignin, nitrite, chlorogluconol.

toluidine maroon. $\text{CH}_3\text{C}_6\text{H}_3\text{NO}_2\text{N}_2\text{C}_{10}\text{H}_7\text{OH}\text{-CONHC}_6\text{H}_4\text{NO}_2$. An organic azo pigment obtained by the azo coupling of *m*-nitro-*p*-toluidine with the *m*-nitroanilide of β -hydroxynaphthoic acid.

Properties: Good lightfastness and weather resis-

tance, excellent acid and alkali resistance, poor resistance to bleeding.

Use: Air-dried and baked enamels, truck body finishes.

toluidine red. Any of a class of pigments based on couplings of β -naphthol and *m*-nitro-*p*-toluidine. See toluidine maroon.

tolu oil. (tolu balsam oil).

Properties: Yellow liquid; hyacinth-like odor. D 0.945–1.09. Soluble in alcohol, ether, chloroform, and carbon disulfide. Chief known constituents: A terpene, C₁₀H₁₆, and esters of cinnamic and benzoic acid.

Derivation: From tolu balsam by distillation.

Grade: Technical.

Use: Medicine (expectorant), cough syrups. See balsam.

toluol. Obsolete name for toluene.

toluquinone. (2-methylquinone; *p*-toluquinone). CH₃C₆H₄O₂.

Properties: Yellow leaflets or needles. Mp 65–67°C. Soluble in hot water; very soluble in alcohol, ether, acetone, ethyl acetate, and benzene.

“Tolu-Sol” [Shell]. TM for a series of solvents, predominantly C₇ hydrocarbons, low in naphthenic hydrocarbons and containing 3–50% aromatics, the balance being essentially paraffinic.

Use: Lacquer diluents and gravure ink solvents.

Hazard: May be flammable.

toluyl aldehyde. See tolylaldehyde.

toluylene. See stilbene.

***m*-toluylenediamine.** See toluene-2,4-diamine.

toluylene red. See neutral red.

***m*-, *o*-, and *p*-toluyllic acid.** See corresponding toluic acid.

tolyl acetate. See cresyl acetate.

***p*-tolylaldehyde.** (*p*-toluylaldehyde; *p*-tolualdehyde; *p*-methylbenzaldehyde). CAS: 1334-78-7. CH₃C₆H₄CHO.

Properties: Colorless liquid. Refr index 1.54693 (16.6°C), d 1.020, bp 204°C. Slightly soluble in water; soluble in alcohol and ether. There are also *o*- and *m*-isomers. Combustible.

Grade: Technical, pure.

Use: Perfumes, pharmaceutical and dyestuff intermediate, flavoring agent.

α -tolylaldehyde dimethylacetal. See phenylacetaldehyde dimethylacetal.

4-*o*-tolylazo-*o*-diacetotoluide. See diacetylaminoozotoluene.

***o*-tolyl biguanide.** NH₂(CNHNH)₂C₆H₄CH₃. **Properties:** White to off-white powder. Mp 138°C (min). Combustible.

Use: Antioxidant for soaps produced from animal or vegetable oil.

***p*-tolyl-diethanolamine.** (HOC₂H₄)₂NC₆H₄CH₃. **Properties:** Crystals. Mp 62°C, bp 297.1°C, vap press <0.1 (20°C), d 1.0723 (20/20°C), solubility in water 1.67% by weight (20°C), viscosity 155 cP (20°C), flash p 385°F (196°C). Very soluble in acetone, ethanol, ethyl acetate, benzene. Combustible.

Use: Emulsifier, dyestuff intermediate.

2-*p*-tolyl-5,6-dihydroimidazo(2,1-a)isoquinoline.

CAS: 61001-19-2. mf: C₁₈H₁₆N₂.

Hazard: A reproductive hazard.

***m*-tolylenediamine.** See toluene-2,4-diamine.

***m*-tolylenediaminesulfonic acid.** [4,6-diamino-*m*-toluenesulfonic acid (SO₃H = 1)]. CH₃C₆H₂(NH₂)₂SO₃H.

Properties: White, crystalline solid. Soluble in alkalis.

Derivation: By addition of *m*-toluylenediamine sulfate to oleum and heating.

Use: Dyes.

***m*-tolylenediisocyanate.** See toluene-2,4-diisocyanate.

2-*p*-tolylimidazo(2,1-a)isoquinoline.

CAS: 61001-04-5. mf: C₁₈H₁₄N₂.

Hazard: A reproductive hazard.

***p*-tolyl isobutyrate.** See *p*-cresyl isobutyrate.

2-tolyl isocyanate. See 1-isocyanato-2-methylbenzene.

4-tolyl isocyanate. See 1-isocyanato-4-methylbenzene.

***p*-tolyl-1-naphthylamine-8-sulfonic acid.** (tolylperi acid). C₁₇H₁₅NO₃S.

Properties: Greenish-gray needles. Soluble in alcohol; rather insoluble in water. Combustible.

Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with *p*-toluidine.

Grade: Technical, mostly as sodium salt.

Use: Azo colors.

4-(*p*-tolyl)-6h-1,3,5-oxathiazine. See 4-(4-methylphenyl)-6h-1,3,5-oxathiazine.

***p*-tolyl phenylacetate.** See *p*-cresyl phenylacetate.

3-(*p*-tolylsulfonyl)acrylonitrile.CAS: 1424-48-2. mf: $C_{10}H_9NO_2S$.**Hazard:** Moderately toxic by ingestion. A moderate eye irritant.**tolyl-*p*-toluenesulfonate.** See cresyl-*p*-toluenesulfonate.**tomatidine.** $C_{27}H_{45}NO_2$. A steroid secondary amine, the nitrogenous aglycone of tomatine. Isolated from the roots of the Rutgers tomato plant as the hydrochloride, $C_{27}H_{45}NO_2 \bullet HCl$.**Properties:** Crystals. Decomposes at 275–280C.**tomatine.**CAS: 17406-45-0. $C_{50}H_{83}NO_{21}$. A glycosidal alkaloid prepared from the dried leaves and stems of the tomato plant. White crystals used as plant fungicide and as a specific precipitating agent for cholesterol and other sterols. The crude extract is referred to as tomatin.**tomatine hydrochloride.**CAS: 17605-83-3. mf: $C_{50}H_{83}NO_{21} \bullet ClH$.**Hazard:** A poison. An eye irritant.**“Tone” [Dow].** TM for caprolactone-based monomers and polymers.**Use:** For high-performance urethane elastomers and adhesives.**toner.** An organic pigment that does not contain inorganic pigment or inorganic carrying base (ASTM). Important toners are Pigment Green 7, Pigment Blue 15, Pigment Yellow 12, and Pigment Blue 19.

See lake.

tonka. (tonka bean; coumarouna bean; dip-teryx).**Properties:** Black-brownish seeds with wrinkled surface and brittle shining or fatty skins, aromatic bitterish taste, balsamic vanilla-like odor, efflorescences of coumarin often appear on the surface. Combustible.**Use:** Production of natural coumarin, flavoring extracts, toilet powders.**tonka bean camphor.** See coumarin.**“Tonox” [Uniroyal].** TM for a blend of aromatic primary amines, the main component of which is *p,p*-diaminodiphenylmethane.**Use:** Epoxy and urethane curative.**Topfer’s reagent.** Dimethylaminoazobenzene 0.5 g in 100 cc 95% ethanol.**Use:** To test acidity of stomach contents.**topical.** A medical term meaning “applied to the surface of the skin.”**TOPO.** Abbreviation for trioctylphosphinic oxide.**topochemical reaction.** Any chemical reaction that is not expressible in stoichiometric relationships. Such reactions are characteristic of cellulose; they can take place only at certain sites on the molecule where reactive groups are available, i.e., in the amorphous areas or on the surfaces of the crystalline areas.**topoisomerases.** Enzymes that introduce positive or negative supercoils in closed, circular duplex DNA.**“Tordon” [Dow].** TM for picloram.**torr.** A pressure unit used chiefly in vacuum technology; it is the pressure required to support 1 mm Hg at 0C.**torsion balance.** A balance having equal arms and using horizontal steel bands for pivots and bearings.**torula yeast.** A yeast that utilizes fermentable sugar in industrial wastes, such as fruit cannery refuse and sulfite liquor from pulp mills. The dried yeast is high in protein and vitamin content, enabling it to be used for enriching animal feeds. The enzymes present are destroyed during drying. It is now being made by a new process utilizing petroleum-derived ethanol.**torus.** A doughnut-shaped vacuum chamber that is an essential part of a nuclear fusion reactor. See tokamak; JET.**tosyl.** (Ts).CAS: 302-17-0. $CH_3C_6H_4SO_2^-$. The *p*-toluenesulfonyl radical. Esters of *p*-toluenesulfonic acid are known as tosylates.**Toth process.** A process for production of aluminum metal that utilizes kaolin and other high-alumina clays. The clay is chlorinated after calcination, and the aluminum chloride resulting is reacted with metallic manganese to yield aluminum and manganese chloride. The reaction occurs at the comparatively low temperature of 260C. The manganese chloride is recovered as manganese metal and chlorine by oxidation and subsequent reduction, the manganese being recycled. This is a much cheaper and more efficient method than the Hall process, because it requires less energy input and does not utilize imported bauxite.**tourmaline.** $(Na,Ca)(Al,Fe)B_3Al_3(AlSi_2O_9)(O,OH,F)_4$. A complex borosilicate of aluminum.**Use:** Pressure gauges, optical equipment, oscillator plates, source of boric acid.

tower, distillation. A metal cylinder from 6 inches to 20 ft in diameter located between the boiler and the condenser in distillation units. The vapors rise through the tower, some of the liquid condensate flowing back down through the tower (reflux). Horizontal plates at intervals of 2 ft are used to achieve contact between countercurrent liquid and the vapor stream. Vapor passes through the liquid on the plate through several apertures, each covered by a cap, an arrangement called a bubble cap plate. Various types of packings are used in smaller columns, e.g., metal chains, tubes, glass beads, Raschig rings, etc.

See HETP (2).

Possibly supplanting distillation towers in the future is a circular metal drum that rotates at 1800 rpm and contains conventional packing materials. The centrifugal force separates the liquid and vapor components as they pass through the drum. This novel distillation technique has been developed by ICI in England and is called Hige, i.e., high gravity.

toxaphene. (generic name for technical chlorinated camphene).

CAS: 8001-35-2. $C_{10}H_{10}Cl_8$. Formula is approximate, contains 67–69% chlorine.

Properties: Amber, waxy solid; mild odor of chlorine and camphor. Melting range 65–90°C, d 1.66 (27°C). Soluble in common organic solvents.

Hazard: Toxic by ingestion, inhalation, skin absorption; most uses prohibited. TLV: 0.5 mg/m³; STEL 1 mg/m³; animal carcinogen.

toxicity. The ability of a substance to cause damage to living tissue, impairment of the central nervous system, severe illness, or, in extreme cases, death when ingested, inhaled, or absorbed by the skin. The amounts required to produce these results vary widely with the nature of the substance and the time of exposure to it. "Acute" toxicity refers to exposure of short duration, i.e., a single brief exposure; "chronic" toxicity refers to exposure of long duration, i.e., repeated or prolonged exposures. The toxicity hazard of a material may depend on its physical state and on its solubility in water and acids. Some metals that are harmless in solid or bulk form are quite toxic as fume, powder, or dust. Many substances that are intensely poisonous are actually beneficial when administered in micro amounts, as in prescription drugs, e.g., strychnine.

Toxicity is objectively evaluated on the basis of test dosages made on experimental animals under controlled conditions. Most important of these are the LD₅₀ (lethal dose, 50%) and the LC₅₀ (lethal concentration, 50%) tests, which include exposure of the animal to oral ingestion and inhalation of the material under test. A substance having an LD₅₀ of less than 400 mg/kg of body weight is considered very toxic.

toxicogenomics. The study of how genomes respond to environmental stressors or toxicants. Combines expression profiling of genome-wide mRNA

with protein expression patterns using bioinformatics to understand the role of gene-environment interactions in disease and dysfunction.

toxicology. The branch of medical science devoted to the study of poisons, including their mode of action, effects, detection, and countermeasures. The subject may be subdivided into (1) clinical, (2) environmental, (3) forensic, and (4) occupational (industrial). The Institute of Chemical Toxicology was formed in 1975, its members comprising a number of the larger chemical companies.

See toxicity; poison (1).

toxic substances. The following list includes a number of chemical individuals and groups that are generally regarded as having toxic properties by ingestion, inhalation, or absorption via the skin. There is considerable variation in the degree of toxicity among these, and the listing is by no means exhaustive.

See toxicity.

<i>Individuals</i>	<i>Groups</i>
aniline	aldehydes
asbestos (carcinogen)	alkaloids
benzidine (carcinogen)	allyl compounds
benzpyrene (carcinogen)	arsenic and compounds
carbon monoxide	barium and soluble compounds
chlorine	barbiturates
coal tar pitch (carcinogen)	beryllium and soluble compounds
cresol	chlorinated hydrocarbons
hydrogen peroxide	chromium (hexavalent carcinogenic compounds)
hydrogen sulfide	corrosive materials
methanol	cyanides
nickel carbonyl	cadmium and compounds
osmium tetroxide	fluorine and compounds
oxalic acid	lead compounds
ozone	mercury and compounds
phenol	organic phosphate esters
pyrene	radioactive substances
pyridine	selenium and compounds
phosphine	thallium and compounds
stibine	
sulfur dioxide	
vinyl chloride monomer (carcinogen)	tin (organic compounds)

The Toxic Substances Control Act (TSCA) passed by the U.S. Congress in 1976 provides the legal basis for regulations concerning all aspects of the manufacture of such products. Establishment and enforcement of such regulations are carried out by the Environmental Protection Agency (EPA). The American Conference of Governmental Industrial Hygienists issues a periodically revised list of Threshold Limit Values for substances in workroom air, upon which the industrial safety standards of the

Occupational Safety and Health Administration (OSHA) are based. The Food and Drug Administration (FDA) is responsible for the enforcement of the Food, Drug, and Cosmetic Act. Decisions made by these agencies are arrived at only after extensive testing by both manufacturers and independent groups. Effective control of toxic materials has assumed increasing importance in recent years and may be expected to become still more rigorous.

See poison (1); NIOSH.

A Toxicology Data Bank (TDB) has been established by the National Library of Medicine of NIH. The data are set up in a computer-based on-line file available for public use. Extensive physical data are included.

Additional information can be found in *Dangerous Properties of Industrial Materials, 11th Edition*, Richard J. Lewis, Sr., Editor, published by John Wiley & Sons, Inc. This book contains 25,000 entries, each of which gives physical, chemical, and toxicological data about potentially hazardous materials.

Toxic Substances Control Act. (TSCA).

See toxic substances; Environmental Protection Agency.

toxins. Proteins produced by some organisms and toxic to some other species.

TPA. Abbreviation for terephthalic acid.

TPB. Abbreviation for tetraphenylbutadiene.

TPG. Abbreviation for triphenylguanidine.

TPN. Abbreviation for triphosphopyridine nucleotide.

See nicotinamide adenine dinucleotide phosphate.

TPO rubber. Abbreviation for thermoplastic polyolefin rubber.

See elastomer.

Tpp. (1) Abbreviation for triphenyl phosphate. (2) Abbreviation for thiamine pyrophosphate.

See cocarboxylase.

TPT. (1) Abbreviation for triphenyltetrazolium chloride.

See tetrazolium chloride. (2) Abbreviation for tetraisopropyl titanate.

trace element. (micronutrient). An element essential to plant and animal nutrition in trace concentration, i.e., minute fractions of 1% (1000 ppm or less). Plants require iron, copper, boron, zinc, manganese, potassium, molybdenum, sodium, and chlorine. Animals require iron, copper, iron, manganese, cobalt, selenium, and potassium. Such elements are also called micronutrients. Do not confuse with *tracer*.

tracer. A chemical entity (almost invariably radioactive and usually an isotope) added to the reacting elements or compounds in a chemical process, which can be traced through the process by appropriate detection methods, e.g., Geiger counter. Compounds containing tracers are often said to be "tagged" or "labeled." Carbon-14 is a commonly used tracer, and radioactive forms of iodine and sodium are also used. Many complex biochemical reactions have been examined in this way (e.g., photosynthesis). Nonradioactive deuterium (hydrogen isotope) is sometimes used, the detection being by molecular weight determination. Radioactive enzymes are also available for tracer studies, e.g., ribonuclease, pepsin, trypsin, and others. See labeling (2).

"Tra-Cide" [Nalco]. TM for testing service.

Use: To determine biocide toxicity and microbiological activity in industrial process waters.

trademark. (TM). A word, symbol, or insignia designating one or more proprietary products or the manufacturer of such products, that has been officially registered with the government trademark agency. The accepted designation is a superior capital *R* enclosed in a circle; however, quotation marks may also be used, as in this dictionary. The term *trade name*, though widely used, is not applicable to such products; according to the U.S. Trade Mark Association, a trade name is the name under which a company does business, e.g., the Blank Chemical Company. Use of a trademark without proper indication of its proprietary nature places the name in jeopardy; a number of trademarks have been invalidated as a result of this practice.

trade name. See trademark.

trade sales. In the paint industry this term is applied to paints intended for sales to the general public, as in hardware stores and similar outlets.

tragacanth gum.

CAS: 9000-65-1.

Properties: Dull white, translucent plates or yellowish powder. Soluble in alkaline solutions, aqueous hydrogen peroxide solution; strongly hydrophilic; insoluble in alcohol. Combustible.

Chief constituents: Polysaccharides of galactose, fructose, xylose, and arabinose with glucuronic acid.

Occurrence: Southwestern Europe, Greece, Turkey, Iran.

Grade: USP, FCC, No. 1, 2, 3.

Use: Pharmacy (emulsions), adhesives, leather dressing, textile printing and sizing, thickener and emulsifier, dyes, food products (ice cream, desserts), toothpastes, coating soap chips and powders, hair-wave preparations, confectionery, printing inks, tablet binder.

tranquillizer. See psychotropic drug

trans-. See *cis-*.

transalkylation. A type of disproportionation reaction by which toluene is hydrogenated to benzene and mixed xylene isomers free from ethylbenzene, avoiding the formation of methane resulting from the conventional hydrodealkylation process. Transalkylation of toluene to benzene involves the use of a catalyst; the yield is claimed to be 97%, based on toluene feed.

transaminase. (aminopherase). An enzyme that facilitates the reversible transfer of an amino group from an α -amino acid to an α -keto acid. See aminotransferases.

transamination. The use of nitrogen of one amino acid for synthesizing another amino acid *in vivo*.

transcription. The enzymatic process whereby the genetic information contained in one strand of DNA is synthesized into a complementary sequence of bases in an mRNA chain.

transcriptional control. The regulation of the rate of a protein's synthesis by regulation of the formation of its mRNA.

transcription factor. A protein which is involved in the transcription of genes. These usually bind to DNA as part of their function (but not necessarily). A transcription factor may be general (i.e., acting on many or all genes in all tissues) or tissue-specific (i.e., present only in a particular cell type and activating the genes restricted to that cell type). Its activity may be constitutive or may depend on the presence of some stimulus; for example, the glucocorticoid receptor is a transcription factor which is active only when glucocorticoids are present.

transcription unit. The sequence from the transcriptional start site to the site of termination, inclusive of introns.

transcriptome. The full complement of activated genes, mRNAs, or transcripts in a particular tissue at a particular time

transduction. (1) The conversion of energy from one form to another (ATP synthesis by a chemiosmotic mechanism). (2) The conversion of information from one form to another (epinephrine outside a liver cell causing cAMP inside the cell). (3) The transfer of genetic information from one cell to another by means of a viral vector.

trans effect. Bond holding a group *trans* to the more electronegative or other labilizing group is weakened.

transesterification. See ester interchange.

transfection. The introduction of foreign DNA into a host cell. See cloning vector; gene therapy.

transferase. An enzyme whose activity causes a transfer of a radical from one molecule to another. Examples are transaminases, transacetylases, and transmethylases, which effect the transfer of amino, acetyl, and methyl groups respectively. See enzyme.

transference number. That portion of the total current carried by any species of ion in an electrolyte in the fluid state. The symbol t^+ is usually used for a positive ion and t^- for a negative ion.

transfermium element. An elements with an atomic number greater than 100, the atomic number of fermium. See periodic table; atomic number.

transfer mold. A chamber in which a thermo-setting plastic is softened by heat and pressure and from which it is forced by high pressure through a suitable orifice into a closed mold for final curing.

transferrin. A 90 kDa protein responsible for the transport of iron and uptake by the liver.

transfer RNA. See ribonucleic acid.

transformation. A process by which the genetic material carried by an individual cell is altered by incorporation of exogenous DNA into its genome.

transformer oil. A liquid having the property of insulating the coils of transformers, both electrically and thermally. There are two broad classes, (1) natural and (2) synthetic. The natural type includes refined mineral oils (petroleum fractions), which have low viscosities and high chemical and oxidative stability. The synthetic types are (1) chlorinated aromatics (chlorinated biphenyls and trichlorobenzene) known collectively as askarels; (2) silicone oils; and (3) ester liquids such as dibutyl sebacate. All these types are nonflammable but combustible. Flash points are 250–300F (121–148C). See dielectric.

Note: Use of PCB (chlorinated biphenyls) has been discontinued because of their ecologically damaging effects.

transgenic. An organism that has genes from another organism incorporated within its genome as a result of recombinant DNA procedures.

transgenic mouse. A mouse which carries experimentally introduced DNA. The procedure by which one makes a transgenic mouse involves the injection of DNA into a fertilized embryo at the pro-

nuclear stage. The DNA is generally cloned and may be experimentally altered. It will become incorporated into the genome of the embryo. That embryo is implanted into a foster mother, who gives birth to an animal carrying the new gene. Various experiments are then carried out to test the functionality of the inserted DNA.

transient transfection. When DNA is transfected into cultured cells, it is able to stay in those cells for about 2-3 days, but then it will be lost unless steps are taken to ensure that it is retained—see stable transfection). During those 2-3 days, the DNA is functional and any functional genes it contains will be expressed. Investigators take advantage of this transient expression period to test gene function.

“Transist AR” [Mallinckrodt]. A grade of reagent-quality chemicals, specially controlled for use in the manufacture of semiconductors and other electronic devices and precision instruments.

transition element. (transition metal). Any of a number of elements in which the filling of the outermost shell to eight electrons within a period is interrupted to bring the penultimate shell from 8 to 18 or 32 electrons. Only these elements can use penultimate shell orbitals as well as outermost shell orbitals in bonding. All other elements, called “major group” elements, can use only outermost shell orbitals in bonding. Transition elements include elements 21 through 29 (scandium through copper), 39 through 47 (yttrium through silver), 57 through 79 (lanthanum through gold), and all known elements from 89 (actinium) on. All are metals. Many are noted for exhibiting a variety of oxidation states and forming numerous complex ions, as well as possessing extremely valuable properties in the metallic state.

See orbital theory.

transition point The temperature at which two crystalline forms of a polymorphic substance are in equilibrium.

transition state. An activated form of a molecule in which the molecule has undergone a partial chemical reaction and has bond characteristics of both reactant and product.

transition state theory. (TSS). Gives approximate descriptions of chemical reaction rates based on the on the properties of two potential wells and a transition state between them.

transition-type system. See peritectic system.

translation. The process of decoding a strand of mRNA, thereby producing a protein based on the code. This process requires ribosomes (which are composed of rRNA along with various proteins) to

perform the synthesis, and tRNA to bring in the amino acids.

translational control. The regulation of the rate of a protein’s synthesis by regulation of the rate of translocation of the ribosome.

translational repressor. A repressor that blocks translation of a mRNA.

transmix. See 3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylic.

transmutation. The natural or artificial transformation of atoms of one element into atoms of a different element as the result of a nuclear reaction. The reaction may be one in which two nuclei interact, as in the formation of oxygen from nitrogen and helium nuclei (β -particles), or one in which a nucleus reacts with an elementary particle such as a neutron or proton. Thus a sodium atom and a proton form a magnesium atom. Radioactive decay, e.g., of uranium, can be regarded as a type of transmutation. The first transmutation was performed by the English physicist Rutherford in 1919.

transpiration. Passage of water from the roots of a plant to the atmosphere via the vascular system and the stomata of the leaves.

transposable element. A class of DNA sequences that can move from one chromosomal site to another.
See transposon.

transposition. The movement of a gene or set of genes (transposon) from one site in the genome to another.

transportation label. See label (1).

transporters. Proteins that span a membrane and transport specific molecules across the membrane.

“Transport-Plus” [Nalco]. TM for boiler water treatment program.

transposon. (transposable element). A segment of DNA that can move from one position in the genome to another.

transuranic element. An element of higher atomic number than uranium, not found naturally, and produced by nuclear bombardment. The highest discovered are 105 and 106. They are all radioactive. See actinide; periodic table.

“Trasar” [Nalco]. TM for technology that uses information from a chemical trace to enhance program value such as automation and diagnostics.

Traube purine synthesis. Preparation of an appropriate 4,5-diaminopyrimidine by introduction of the amino group into the 5 position of 4-amino-6-hydroxy- or 4,6-diaminopyrimidines by nitrosation and ammonium sulfide reduction, followed by ring closure with formic acid or chlorocarbonic ester.

Traube's rule. The adsorption from aqueous solution on carbon increases with increase in molecular weight of a homologous series of fatty acids.

tremolite.

CAS: 1332-21-4. $\text{Ca}_2\text{Mg}_5\text{Si}_8(\text{OH})_2$. A variety of asbestos. Some tremolite is sold as "fibrous talc."

Properties: White to light-green color, vitreous to silky luster. Mohs hardness 5–6, d 3.0–3.3, resistant to acids. Noncombustible.

Occurrence: New York, California, Maryland, South Africa.

Hazard: Inhalation of dust or fine particles is dangerous. Carcinogenic.

Use: As asbestos, particularly in acid-resisting applications, ceramics, paint.

tremorine dichlorohydrate.

CAS: 300-68-5. mf: $\text{C}_{12}\text{H}_{20}\text{N}_2 \cdot 2\text{ClH}$.

Hazard: A poison.

treemoss concrete.

CAS: 68648-41-9.

Hazard: Low toxicity by ingestion and skin contact. A mild skin irritant.

Source: Natural product.

trenbolone.

mf: $\text{C}_{18}\text{H}_{22}\text{O}_2$.

Properties: Crystals. Mp: 186° .

Use: Drug (veterinary); food additive.

"Trendcheck" [Nalco]. TM for real-time statistical process control system.

tretamine. (generic name for 2,4,6-tris(1-aziridinyl)-s-triazine).

See triethylenemelamine.

triacetate fiber. See acetate fiber.

triacetin. (glyceryl triacetate).

CAS: 102-76-1. $\text{C}_9\text{H}_{18}(\text{OCOCH}_3)_3$.

Properties: Colorless liquid; slight fatty odor; bitter taste. D 1.160 (20C), bp 258–260C, sets to a glass at -37C , refr index 1.4312 (20C), flash p 300F (149C), bulk d 9.7 lb/gal. Slightly soluble in water; very soluble in alcohol, ether, and other organic solvents. Combustible.

Derivation: Action of acetic acid on glycerol.

Method of purification: Vacuum distillation.

Grade: Technical, CP, ND, FCC.

Use: Plasticizer, fixative in perfumery, manufacture of cosmetics, specialty solvent, to remove carbon dioxide from natural gas, medicine (topical antifungal).

triacontanoic acid. See melissic acid.

1-triacontanol. $\text{CH}_3(\text{CH}_2)_{28}\text{CH}_2\text{OH}$. A 30-carbon, straight-chain fatty alcohol.

Properties: Colorless needles from ether. Mp 85–88C, d at mp 0.777. Soluble in most organic solvents; insoluble in water. Combustible.

Occurrence: Beeswax, carnauba wax, leaf wax.

Use: Biochemical research, growth promoter, fertilizer supplement.

triacylglycerol. An ester of glycerol with three molecules of fatty acid; also called a triglyceride or neutral fat.

"Triadine" [Olin]. TM for industrial bactericide/fungicide.

Use: As a preservative in inhibiting growth of bacteria and fungi in aqueous-based metal working fluids, aqueous analytical and diagnostic reagents.

trialkyl boranes. R_3B . (where R = alkyl radical).

See tributylborane; triethylborane.

trialkylsilanol. An alcohol derivative of silane.

Hazard: May be flammable.

Use: Short-stopping agent for silicone polymers.

triallylamine.

CAS: 102-70-5. $(\text{H}_2\text{C}:\text{CHCH}_2)_3\text{N}$.

Properties: Liquid. D 0.800 (20/4C), fp -70C , bp 150–151C, refr index 1.4501 (20C), flash p 103F (39.4C) (TOC).

Hazard: Fire risk. Irritant.

Use: Intermediate.

triallyl cyanurate.

CAS: 101-37-1. $(\text{CH}_2:\text{CHCH}_2\text{OC})_3\text{N}_3$.

Properties: Colorless liquid or solid. Mp 27.32C, flash p above 176F (80C) (TOC), d 1.1133 (30C), refr index 1.5049 (25C). Miscible with acetone, benzene, chloroform, dioxane, ethyl acetate, ethanol, and xylene. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Polymers as monomer and modifier, organic intermediate.

triallyl cyanurate coagent. See "Perkalink" [Akzo].

triallyl phosphate. $(\text{CH}_2:\text{CHCH}_2\text{O})_3\text{PO}$.

Properties: Water-white liquid. Fp -50C , bp 80C (0.5 mm Hg), refr index 1.448 (25C), d 1.064 (25/15C). Combustible.

Use: Intermediate.

triallyl phosphite. See phosphorous acid, triallyl ester.

triamcinolene. (α -fluoro-16(α)-hydroxyprednisolone).

CAS: 124-94-7. $C_{21}H_{27}FO_6$.

Properties: White, crystalline powder. Mp 264–268C. Insoluble in water; slightly soluble in usual organic solvents; soluble in dimethylformamide.

Grade: ND.

Use: Medicine. Also available as the acetone.

1,3,5-triaminobenzene.

CAS: 108-72-5. $C_6H_3(NH_2)_3$.

Properties: Solid. Mp (anhydrous) 129C, (hydrate) 84–86C (1.5 moles water). Soluble in water, acetone, and alcohol; insoluble in ether, cold benzene, carbon tetrachloride, and petroleum ether. Combustible.

Use: Ion-exchange resin intermediate, wetting and frothing agents, photographic developers, organic reactions.

2,4,6-triaminotoluene trihydrochloride.

$C_6H_2(NH_2HCl)_3 \cdot CH_3 \cdot H_2O$.

Properties: Light-tan to cream crystals. Mp 119C (free base). Very soluble in water; soluble in alcohol and acetone; insoluble in benzene.

Use: Nongelatin photographic emulsion with ethylenediamine for fixation, ion-exchange resins, wetting and frothing agents, photographic developers, intermediate for varnishes and rubber chemicals.

2,4,6-triamino-sym-triazine. See melamine.

s-triaminotrinitrobenzene. See 2,4,6-trinitro-1,3,5-benzenetriamine.

triamminetrinitratatorhodium (III).

CAS: 41762-18-9. mf: $H_9N_6O_9Rh$.

Properties: IDLH 100 mg/m³ (as Rh).

Hazard: A poison. TWA 1 mg(Rh)/m³. Not Classifiable as a human carcinogen.

triamylamine. $(C_5H_{11})_3N$.

Properties: Colorless to yellow liquid. D 0.79–0.80 (20C), triamylamine content at least 98.0%, 95% boils between 225 and 260C, flash p 215F (101.6C), refr index 1.4374 (18C). Insoluble in water; soluble in gasoline. Combustible.

Derivation: Reaction of amyl chloride and ammonia.

Hazard: Irritant.

Use: Corrosion inhibitor, insecticidal preparations.

triamylbenzene. $(C_5H_{11})_3C_6H_3$.

Properties: Colorless liquid; odor faintly aromatic. D 0.87 (20C), boiling range 300–320C, flash p 270F (132.2C). Combustible.

Use: Chemical intermediate.

triamyl borate. $(C_5H_{11})_3BO_3$.

Properties: Colorless liquid; odor faintly alcoholic. D 0.845 (20C), boiling range 220–280C, flash p

180F (82.2C). Soluble in alcohol and ether. Combustible.

Derivation: direct heating of boric acid and amyl alcohol.

Use: Varnishes.

tri-*p-tert*-amylphenyl phosphate.

$(C_5H_{11}C_6H_4)_3PO$.

Properties: White solid; odorless. Liquid. Boiling range 305–345C (5 mm Hg), mp 62–63C. Insoluble in water. Combustible.

Use: Plasticizer.

triarylmethane dye. Any of a group of dyes whose molecular structure involves a central carbon atom joined to three aromatic nuclei. CI numbers range from 42000 to 44999. The color is due in part to the aromatic rings and to the chromophore groups $=C=NH$ and $=C=N-$. The members of this class function as basic dyes for cotton, using tannin as a mordant, or if they contain sulfonic acid groups, as acid dyes for wool and silk. Examples are malachite green and methyl violet.

See triphenylmethane dye.

s-triazine derivatives. See ammelide; ammeline; melamine.

s-triazine-3,5(2H,4H)dione riboside. See 6-azauridine.

s-triazine-2,4,6-triol. See cyanuric acid.

triazole. $C_2H_3N_3$. A five-membered ring compound containing three nitrogens in the ring.

Use: Suggested as photoconductors in copying systems.

(1,2,4)triazolo(1,5-a)pyrimidine.

CAS: 275-02-5. mf: $C_5H_4N_4$.

Hazard: A poison.

(1,2,4)triazolo(4,3-a)pyrimidine.

CAS: 274-98-6. mf: $C_5H_4N_4$.

Hazard: A poison by ingestion.

(1,2,4)triazolo(4,3-a)quinoline.

CAS: 235-06-3. mf: $C_{10}H_7N_3$.

Hazard: A poison by ingestion.

(1h-1,2,4-triazolyl-1-yl)tricyclohexylstannane.

CAS: 41083-11-8. mf: $C_{20}H_{35}N_3Sn$.

Hazard: A poison by ingestion. Moderately toxic by skin contact. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triazone resin. One of a class of amino resins produced from urea, formaldehyde, and a primary amine.

Use: Textile and fabric treatment.

See dimethylolethyltriazone.

tribasic. See monobasic.

tribenzoside. See ethyl-3,5,6-tri-*o*-benzyl-*d*-glucofuranoside.

tribenzylchlorostannane. See chlorotribenzylstannane.

tribenzyltin chloride. See chlorotribenzylstannane.

tribenzyltin formate. See formyloxytribenzylstannane.

tribrominated polystyrene. See ethenylbenzene tribromo deriv. homopolymer.

tribromoacetaldehyde. (bromal). CBr_3CHO .
Properties: Oily, yellowish liquid. D 2.66, bp 174C. Soluble in water, alcohol, or ether. Combustible.
Derivation: (1) By adding bromine to a solution of paraldehyde in ethylacetate. (2) By adding bromine to absolute alcohol, fractionating, treating the fraction boiling at 165C with water, and distilling.
Hazard: As for bromine.
Use: Organic synthesis.

tribromoacetic acid. CBr_3COOH .
Properties: Colorless crystals. Mp 135C, bp 245–250C. Soluble in water, alcohol, or ether. Combustible.
Derivation: By oxidizing tribromoacetaldehyde with nitric acid.
Hazard: As for bromine.
Use: Organic synthesis.

tribromo-*tert*-butyl alcohol. (acetone-bromoform). $\text{CBr}_3\text{C}(\text{CH}_3)_2\text{OH}$.
Properties: Fine, white, prismatic crystals; camphor odor and taste. Mp 176C. Slightly soluble in water; soluble in alcohol and ether. Combustible.
Derivation: Reaction of acetone and bromoform with solid potassium hydroxide.
Hazard: As for bromine.
Use: Vinyl chloride polymerization.

tribromoethanol. (1,1,1-tribromoethyl alcohol).
 CAS: 75-80-9. $\text{CBr}_3\text{CH}_2\text{OH}$.
Properties: White crystals or powder; slight aromatic odor and taste. Mp 79–82C, bp 94C (11 mm Hg), unstable in air and light. Slightly soluble in water; soluble in alcohol, ether, benzene, and amylene hydrate; aqueous and alcoholic solutions decompose on exposure to light. Combustible.
Grade: NF.
Derivation: By reduction of tribromoacetaldehyde with aluminum isopropylate.
Use: Medicine (basal anesthetic).

tribromomethane. See bromoform.

1,1,1-tribromo-2-methyl-2-propanol.

Properties: Fine, white crystals. Mp 176–177C. Soluble in water, methanol, ether. Combustible.
Use: Organic synthesis.

tribromonitromethane. See bromopicrin.

tribromophenol. See bromol.

1,2,3-tribromopropane. (allyl tribromide).
 CAS: 96-11-7. $\text{BrCH}_2\text{CHBrCH}_2\text{Br}$.
Properties: Colorless liquid. D 2.43, mp 16C, bp 220C, refr index 1.584. Soluble in alcohol and ether; insoluble in water.
Derivation: Gamma-ray initiated reaction of bromotrichloromethane with allyl bromide.
Use: Nematocide.

3,4',5-tribromosalicylanilide. (tribromosalan).
 CAS: 87-10-5. $\text{Br}_2\text{C}_6\text{H}_3(\text{OH})\text{C}(\text{O})\text{NHC}_6\text{H}_4\text{Br}$. An active antiseptic.
Use: Soaps.
Hazard: A suspected carcinogen. Use in cosmetics prohibited (FDA).

tributoxyethyl phosphate.
 $[\text{CH}_2(\text{CH}_2)_3\text{O}(\text{CH}_2)_2\text{O}]_3\text{PO}$.
Properties: Slightly yellow, oily liquid. D 1.020 (20C), fp –70C (viscous liquid), boiling range 215–228C (4 mm Hg), flash p 435F (223C), refr index 1.434 (25C). Insoluble or limited solubility in glycerol, glycols, and certain amines; soluble in most organic liquids. Combustible.
Use: Primary plasticizer for most resins and elastomers, floor finishes and waxes, flame-retarding agent.

tri-*n*-butyl aconitate. $\text{C}_3\text{H}_7(\text{COOC}_4\text{H}_9)_3$.
Properties: Colorless, odorless liquid. D 1.018 (20C), refr index 1.4500–1.4530 (25C), bp 190C (3 mm Hg). Insoluble in water; soluble in organic solvents. Combustible.
Use: Plasticizer-stabilizer for vinylidene chloride polymers, synthetic rubbers and cellulosic lacquers, insecticides.

tri-*n*-butylaluminum. $(\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2)_3\text{Al}$.
Properties: Colorless, pyrophoric liquid. Bulk d 0.823 g/mL (20C), fp –26.7C.
Derivation: Exchange reaction of butene-1 and isobutyl aluminum.
Hazard: Highly flammable, dangerous fire risk, ignites spontaneously.
Use: Production of organo-tin compounds.

tri-*n*-butylamine.
 CAS: 102-82-9. $(\text{C}_4\text{H}_9)_3\text{N}$.
Properties: Pale-yellow liquid; amine odor. Bp 214C, fp –70C, d 0.8 (20/20C), bulk d 6.5 lb/gal, refr index 1.4297 (20C), flash p 185F (85C) (OC).

Slightly soluble in water; soluble in most organic solvents. Combustible.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grade: Technical.

Hazard: Skin irritant, CNS stimulant.

Use: Solvent, inhibitor in hydraulic fluids, intermediate.

tri-*n*-butylborane. (tri-*n*-butylborine).
(CH₃CH₂CH₂CH₂)₃B.

Properties: Colorless pyrophoric fluid. Fp -34C, bp 170C (222 mm Hg), d 0.747 (25C), vap press 0.1 mm Hg (20C), refr index 1.4285 (20C), flash p -32F (-35.5C). Insoluble in water; soluble in most organic solvents.

Hazard: Flammable, dangerous fire risk, store and use in inert atmosphere, ignites spontaneously in air.

Use: Petrochemical industry, organic reactions, catalyst.

tributyl borate. (butyl borate). (C₄H₉)₃BO₃.

Properties: Water-white liquid. D 0.8550-0.8570, bp 232.4C, distillation range, 85% distills between 135C and 140C (40 mm Hg), refr index 1.4071 (25C), fp below -70C, viscosity 1.601 cP (25C), flash p 200F (93.3C) (OC). Hydrolyzes rapidly; miscible with common organic liquids. Combustible.

Derivation: From butanol and boric acid.

Use: Welding fluxes, intermediate in preparation of borohydrides, flame retardant for textiles (with boric acid).

tri-*n*-butylborine. See tri-*n*-butylborane.

tributylchlorostannane. See chlorotributylstannane.

tri-*n*-butylchlorostannate. See tributyltin chloride.

tributyl citrate. (butyl citrate).

Properties: Colorless or pale-yellow, stable, odorless, nonvolatile liquid. Fp -20C, bp 233.5C (22.5 mm Hg), flash p 315F (157C) (COC), refr index 1.4453 (20C), d 1.042 (25/25C), bulk d 8.7 lb/gal at 20C, pour p viscosity 31.9 cP (25C). Practically insoluble in water. Combustible.

Grade: Technical.

Use: Plasticizer, antifoam agent, solvent for nitrocellulose.

tri-*n*-butyl citrate. See tributyl citrate; "Citroflex 4" [Reilly]; "TBC" [Reilly].

***n,n,n*-tributyl-2,4-dichlorobenzenemethaninium chloride.**

Hazard: A severe eye irritant.

tributyl(2,4-dichlorobenzyl)phosphonium chloride.

Properties: White, crystalline solid; mild aromatic odor. Technical grade melts at 114-120C. Soluble in water, acetone, ethanol, isopropanol and hot benzene; insoluble in hexane and ether.

Use: Growth retardant for ornamental plants.

tributyl(glycoloyloxy)tin. See (glycoloyloxy)tributylstannane.

tributylisosocyanatostannane.

Hazard: A poison. Flammable liquid. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyl(methacryloxy)stannane.

Hazard: A poison by ingestion and intravenous routes. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyl(oleoyloxy)stannane.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

2,4,6-tri-*tert*-butylphenol.

Properties: Solid. Mp 131C. Insoluble in water; soluble in most organic solvents. Combustible.

Use: Permissible antioxidant for aviation gasolines (when mixed with other butylphenols) (ASTM).

tributyl-*o*-phenylphenoxytin. See (2-biphenyloxy)tributyltin.

tri-*p-tert*-butylphenyl phosphate.

Properties: Solid. Bp 320C (5 mm Hg), mp 102-105C, flash p 545F (285C). Insoluble in water. Combustible.

Use: Plasticizer.

tributyl phosphate. (TBP).

Properties: Stable, colorless liquid; odorless. Refr index 1.4226 (25C), bp 292C, latent heat of vaporization 55.1 cal/g (289C), fp below -80C, flash p 295F (146C) (COC), Saybolt viscosity 38.6 sec at 29.4C, bulk d 8.19 lb/gal, d 0.978 (20/20C). Miscible with most solvents and diluents; soluble in water. Combustible.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation, irritant to skin. TLV: 0.2 ppm.

Use: Heat-exchange medium, solvent extraction of metal ions from solution of reactor products, solvent for nitrocellulose, cellulose acetate, plasticizer, pigment grinding assistant, antifoam agent, dielectric.

tri-*n*-butyl phosphine. (CH₃CH₂CH₂CH₂)₃P.

Properties: Colorless liquid; garlic odor. D 0.8100 (min at 25/4C), fp -60 to -65C, bp 240C, flash p 104F (40C), autoign temp 392F (200C), refr index 1.463 (20C). Almost insoluble in water; miscible with ether, methanol, ethanol, benzene. An organic base and strong reducing agent. Combustible.

Use: Polymerization cross-linking catalyst, organic intermediate, fuels.

tributyl phosphite.

CAS: 102-85-2. (C₄H₉O)₃P.

Properties: Water-white liquid. Bp 120C (8 mm Hg), d 0.911 (25C), refr index 1.4301 (25C), flash p 250F (121C). Decomposes in water; soluble in common organic solvents. Combustible.

Use: Additive for greases and extreme-pressure lubricants, stabilizer for fuel oils and polyamides, gas-line additive.

***O,O,O*-tributyl phosphorothioate.** (tributyl thiophosphate). (C₄H₉O)₃PS.

Properties: Colorless liquid; characteristic odor. Bp 142-145C (4.5 mm Hg), d 0.987, flash p 295F (146C) (COC). Insoluble in water; soluble in most organic solvents. Combustible.

Hazard: Highly toxic, cholinesterase inhibitor.

Use: Plasticizer, lubricant additive, antifoam agent, hydraulic fluid, intermediate.

***S,S,S*-tributyl phosphorotrithioate.**

("DEF") [Bayer].

CAS: 78-48-8. (C₄H₉S)₃PO.

Properties: Liquid. Bp 150C (0.3 mm Hg). Insoluble in water; soluble in aliphatic, aromatic, and chlorinated hydrocarbons.

Hazard: Cholinesterase inhibitor.

Use: Cotton defoliant.

tributylphosphorotrithioate.

CAS: 150-50-5. (C₄H₉S)₃P.

Properties: Nearly colorless liquid. Bp 115-134C (0.08 mm Hg), d 1.02 (20C), refr index 1.542 (25C). Insoluble in water; soluble in a variety of organic solvents.

Derivation: Reaction of butyl mercaptan with phosphorus trichloride.

Hazard: Cholinesterase inhibitor.

Use: Cotton defoliant.

***n*-(tributylplumbyl)benzimidazole.**

CAS: 23188-89-8. mf: C₁₉H₃₂N₂Pb.

Hazard: A poison.

tributyl(8-quinolinolato)tin.

CAS: 5488-45-9. mf: C₂₁H₃₃NOSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributylstannanecarbonitrile.

CAS: 2179-92-2. mf: C₁₃H₂₇NSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tri-*n*-butylstannane hydride.

CAS: 688-73-3. mf: C₁₂H₂₈Sn.

Properties: A liquid. D: 1.103 @ 20°, bp: 112.5-113.5° @ 8 mm.

Hazard: Moderately toxic by inhalation. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributylstannic hydride. See tri-*n*-butylstannane hydride.

tributyl thiophosphate. See tributyl phosphorothioate.

tributyltin-*p*-acetamidobenzoate.

CAS: 2857-03-6. mf: C₂₁H₃₅NO₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin acetate.

CAS: 56-36-0. (C₄H₉)₃SnOOCCH₃.

Properties: White, crystalline solid.

Derivation: Reaction of sodium acetate with tributyltin chloride.

Hazard: Toxic material. TLV: 0.1 mg(Sn)/m³.

Use: Fungicide and bactericide.

tributyltin benzoate. See benzoyloxytributylstannane.

tri-*n*-butyltin bromide.

CAS: 1461-23-0. mf: C₁₂H₂₇Sn•Br.

Properties: Liquid. D: 1.3365, bp: 163°/12 mm, refr index: 1.5000.

Hazard: A poison by ingestion. Moderately toxic by skin contact and inhalation. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin chloride. (tri-*n*-butylchlorostannate). (C₄H₉)₃SnCl.

Properties: Colorless liquid. D 1.20 (20/4C); refr index 1.4903 (25C); bp 145-147C (5 mm Hg). Soluble in the common organic solvents; including alcohol, heptane, benzene, and toluene; insoluble in cold water, but hydrolyzes in hot water

Derivation: Reaction of tetrabutyltin with dibutyltin chloride.

Hazard: Toxic material. TLV: 0.1 mg(Sn)/m³.

Use: Rodenticide, intermediate, rodent-repellent cable coatings.

tributyltin chloroacetate.

CAS: 5847-52-9. mf: C₁₄H₂₉ClO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin- γ -chlorobutyrate.

CAS: 33550-22-0. mf: C₁₆H₃₃ClO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin cyanate. See cyanatotributylstannane.

tri-*n*-butyltin cyanide. See tributylstannane-carbonitrile.

tributyltin cyclohexanecarboxylate.

CAS: 2669-35-4. mf: C₁₉H₃₈O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

tributyltin-*s,s'*-dibutyldithiocarbamate.

See 2,2-dibutyl-1,3,2-oxathiastannolane.

tributyltin dimethyldithiocarbamate.

CAS: 20369-63-5. mf: C₁₅H₃₃NS₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

tributyltin-2-ethylhexanoate.

CAS: 5035-67-6. mf: C₂₀H₄₂O₂Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin hydroxide.

CAS: 1067-97-6. mf: C₁₂H₂₈OSn.

Properties: Waxy solid or oil. Mp: 15–16°.

Hazard: Moderately toxic. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical.

tri-*n*-butyltin iodide. See iodotributylstannane.

tributyltin iodoacetate.

CAS: 73927-91-0. mf: C₁₄H₂₉IO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin-*o*-iodobenzoate.

CAS: 73927-93-2. mf: C₁₉H₃₁IO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin-*p*-iodobenzoate.

CAS: 73940-88-2. mf: C₁₉H₃₁IO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin-β-iodopropionate.

CAS: 73927-95-4. mf: C₁₅H₃₁IO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin isopropylsuccinate.

CAS: 53404-82-3. mf: C₁₉H₃₈O₄Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

tributyltin isothiocyanate. See tributylisocyanatostannane.

tributyltin laurate.

CAS: 3090-36-6. mf: C₂₄H₅₀O₂Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyl tin linoleate. See (linoleoyloxy)tributylstannane.

tributyltin methacrylate. See tributyl(methacryloxy)stannane.

tri-*n*-butyltin methanesulfonate.

CAS: 13302-06-2. mf: C₁₃H₃₀O₃SSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin neodecanoate.

CAS: 28801-69-6. mf: C₂₂H₄₆O₂Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyltin nonanoate.

CAS: 4027-14-9. mf: C₂₁H₄₄O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tri-*n*-butyltin oleate. See tributyl(oleoyloxy)stannane.

tributyltin-*o*-phenylphenoxide. See (2-biphenyloxy)tributyltin.

tributyltin salicylate. See salicyloyloxytributylstannane.

tributyltin sulfide. See 1,1,1,3,3,3-hexabutyl-distanthiane.

tri-*n*-butyltin undecylate. See tributyl(undecanoyloxy)stannane.

tributyltin-α-(2,4,5-trichlorophenoxy)propionate.

CAS: 73940-89-3. mf: C₂₁H₃₃Cl₃O₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tri-*n*-butyl tricarballylate.

(C₄H₇OCOCH₂)₂CHCOOC₄H₉.

Properties: Liquid. D 1.004 (24C), refr index 1.4388 (26.5C). Insoluble in water. Combustible.

Use: Plasticizer.

tributyl(2,4,5-trichlorophenoxy)tin.

CAS: 73927-98-7. mf: C₁₈H₂₉Cl₃O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyl(undecanoyloxy)stannane.

CAS: 69226-47-7. mf: C₂₃H₄₈O₂Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tributyrin. See glyceryl tributyrate.

tricalcium aluminate. See calcium aluminate.

tricalcium citrate. See calcium citrate.

tricalcium orthoarsenate. See calcium arsenate.

tricalcium orthophosphate. See calcium phosphate, tribasic.

tricalcium phosphate. See calcium phosphate, tribasic.

tricalcium silicate.

Use: Anticaking agent in foods (up to 2%). See cement, Portland.

tricamba. (3,5,6-trichloro-*o*-anisic acid).

CAS: 2307-49-5. $C_6HCl_3(COOH)(OCH_3)$.

Properties: Crystals. Mp 137–139C. Very slightly soluble in water; moderately soluble in xylene; freely soluble in alcohol.

Hazard: Toxic by ingestion.

Use: Herbicide.

tricarbimide. See cyanuric acid.

tricarboxylic acid cycle. See TCA cycle.

trichlohexyltin hydroxide. See cyhexatin.

trichlorfon. (*O,O*-dimethyl[2,2,2-tri-chloro-1-hydroxyethyl]phosphonate).

CAS: 52-68-6. $(CH_3O)_2P(O)CH(OH)CCl_3$.

Properties: White, crystalline solid. Mp 83–84C, bp 100C (1 mm Hg), d 1.73 (20/4C). Soluble in water, benzene, chloroform, ether; insoluble in oils.

Hazard: Cholinesterase inhibitor, absorbed by skin, use may be restricted.

Use: Systemic insecticide, medicine (anthelmintic).

trichloroacetaldehyde. See chloral.

trichloroacetaldehyde, hydrated. See chloral hydrate.

trichloroacetic acid. (TCA).

CAS: 76-03-9. CCl_3COOH .

Properties: Deliquescent, colorless crystals; sharp, pungent odor. D 1.6298, mp 57.5C, bp 197.5C, flash p none. Soluble in water, alcohol, and ether. Non-flammable.

Derivation: (1) By treating chloral hydrate with fuming nitric acid. (2) From glacial acetic acid by the action of chlorine in the presence of sunlight, UV radiation, or catalysts.

Grade: Technical, CP, USP.

Hazard: Toxic by ingestion and inhalation, strong

irritant to skin and tissue. TLV: 1 ppm; not classifiable as a human carcinogen.

Use: Organic synthesis, reagent for detection of albumin, medicine, pharmacy, herbicides.

trichloroacetic acid tripropylstannyl ester.

See tripropyltin trichloroacetate.

trichloroacetonitrile.

CAS: 545-06-2. CCl_3CN .

Properties: Colorless liquid. Bp 85C, d 1.44, refr index 1.440.

Derivation: Reaction of methyl nitrile, hydrochloric acid, and chlorine.

Hazard: Strong irritant to tissue.

Use: Insecticide.

trichloroacetyl chloride. CCl_3COCl .

Properties: Liquid. D 1.654 (0/4C), bp 118C. Decomposes in water; soluble in alcohol.

Hazard: Toxic by ingestion and inhalation, strong irritant to skin and tissue.

S-2,3,3-trichloroallyl-N,N-diisopropylthiolcarbamate.

CAS: 2303-17-5.

$[(CH_3)_2CH]_2NC(O)SCH_2CCl_2$.

Properties: Oily liquid. Bp 148–149C (9 mm Hg), mp 29–30C. Practically insoluble in water; soluble in alcohol, acetone, ether, and heptane. Combustible.

Use: Herbicide.

trichloro-*o*-anisic acid. See tricamba.

2,4,6-trichloroanisole. $C_6H_3Cl_3O$.

Properties: Acicular crystals. Mp 60C, bp 240C (238 mm Hg). Insoluble in water; soluble in benzene, methanol, and dioxane; gradually sublimes at room temperature.

Use: Dyeing auxiliary for polyester fabrics.

1,2,3-trichlorobenzene.

CAS: 87-61-6. $C_6H_3Cl_3$.

Properties: White crystals. D (solid) 1.69, refr index 1.5776 (19C), bp 221C, mp 52.6C, flash p 235F (112.7C) (CC). Insoluble in water; slightly soluble in alcohol; soluble in ether. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Organic intermediate.

1,2,4-trichlorobenzene.

CAS: 120-82-1. $C_6H_3Cl_3$.

Properties: Colorless, stable liquid; odor similar to that of *o*-dichlorobenzene. D 1.4634 (25C), bp 213C, mp 17C, flash p 210F (98.9C). Miscible with most organic solvents and oils; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Grade: Technical, 99%, mixture of 1,2,4- and 1,2,3-isomers distilling at 213–219C.

Hazard: Toxic by ingestion and inhalation. TLV: ceiling 5 ppm.

Use: Solvent in chemical manufacturing, dyes and intermediates, dielectric fluid, synthetic transformer oils, lubricants, heat-transfer medium, insecticides.

2,3,6-trichlorobenzoyloxypropanol.

(Cl)₃C₆H₂CH₂OCH₂CH(CH₂)OH.

Properties: Liquid. Bp 121–124C (0.1 mm Hg). Almost insoluble in water; soluble in most organic solvents. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Herbicide.

((2,3,6-trichlorobenzyl)oxy)-2-propanol.

CAS: 34314-31-3. mf: C₁₀H₁₁Cl₃O₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1,1,1-trichloro-2,2-bis(chlorophenyl)ethane.

See DDT.

1,1,1-trichloro-2,2-bis(*p*-methoxyphenyl)ethane. See methoxychlor.

B-trichloroborazole.

BCINHCINHCINH.

Properties: White, crystalline solid. Mp 84.5–85.5C, bp 96.5–98C (37 mm Hg). Soluble in many organic solvents; highly reactive.

Use: Intermediate, gelling agent, catalyst complexing agent.

trichlorobromomethane. See bromotrichloromethane.

trichlorobutylene oxide. (TCBO).

A reactive liquid epoxide used as an organic solvent and surfactant intermediate; its polymers can be used for polyester, polyurethane, and polyacrylic resins, polyether polyols, flame-retardants, etc.

3,4,4'-trichlorocarbanilide.

C₈H₃Cl₂NHCONHC₆H₄Cl.

Properties: Heat-resistant white powder. Mp 250C.

Use: Bacteriostat in soaps and detergents, plastics.

1,2,4-trichloro-5-(2,6-dichlorophenoxy)benzene.

CAS: 130892-67-0. mf: C₁₂H₅Cl₅O.

Hazard: A reproductive hazard.

trichloroethane. See "Extrema" [Schumacher].

1,1,1-trichloroethane. (methyl chloroform).

CAS: 71-55-6. CH₃CCl₃.

Properties: Colorless liquid. D 1.325, bp 75C, fp -38C, flash p none. Insoluble in water; soluble in alcohol and ether. Nonflammable.

Hazard: Irritant to eyes and tissue. TLV: 350 ppm.

Use: Solvent for cleaning precision instruments, metal degreasing, pesticide, textile processing.

See "Aerothernet TT" [Dow]; "Tri-Ethane" [PPG].

1,1,2-trichloroethane. (vinyl trichloride; β-trichloroethane).

CAS: 79-00-5. CHCl₂CH₂Cl.

Properties: Clear, colorless liquid; characteristic sweet odor. Bp 113.7C, d 1.4432 (20C/4C), refr index 1.4458, vap press 16.7 mm Hg (20C), bulk d 12.0 lb/gal (20C), fp -36.4C, flash p none. Miscible with alcohols, ethers, esters, and ketones; insoluble in water. Nonflammable.

Grade: Technical.

Hazard: Irritant, absorbed by skin. TLV: 10 ppm.

Use: Solvent for fats, oils, waxes, resins, other products; organic synthesis.

trichloroethanol.

CAS: 115-20-8. CCl₃CH₂OH.

Properties: Viscous liquid; etherlike odor; hygroscopic. Bp 150C, fp 13C, d 1.541 (25/4C). Slightly soluble in water; miscible with alcohol, ether, and carbon tetrachloride. Combustible.

Use: Intermediate, anesthetic.

trichloroethylene. (tri).

CAS: 79-01-6. CHCl=CCl₂.

Properties: Stable, low-boiling, colorless, photo-reactive liquid; chloroform-like odor. Will not attack the common metals even in the presence of moisture. Bp 86.7C, fp -73C, d 1.456–1.462 (25/25C), refr index 1.4735 (27C). Miscible with common organic solvents; slightly soluble in water. Nonflammable.

Derivation: From tetrachloroethane by treatment with lime or alkali in the presence of water, or by thermal decomposition, followed by steam distillation.

Grade: USP, technical, high purity, electronic, metal degreasing, extraction.

Hazard: Toxic by inhalation. Use as solvent not permitted in some states. FDA has prohibited its use in foods, drugs, and cosmetics. TLV: 50 ppm.

Use: Metal degreasing; extraction solvent for oils, fats, waxes; solvent dyeing; dry-cleaning; refrigerant and heat-exchange liquid; fumigant; cleaning and drying electronic parts; diluent in paints and adhesives; textile processing; chemical intermediate; aerospace operations (flushing liquid oxygen).

trichloroethylene epoxide. See epoxy-1,1,2-trichloroethane.

trichloroethyltin. See ethyltin trichloride.

trichlorofluoroethylene.CAS: 359-29-5. mf: C_2Cl_3F .**Hazard:** Moderately toxic by ingestion and inhalation.**trichlorofluoromethane.** (fluorotrichloromethane; fluorocarbon-11).CAS: 75-69-4. CCl_3F .**Properties:** Colorless, volatile liquid; nearly odorless. Bp 23.7C, fp $-111C$, d 1.494 (17.2C), critical press 43.2 atm. Noncombustible.**Derivation:** From carbon tetrachloride and hafnium, in the presence of fluorinating agents such as antimony tri- and pentafluoride.**Grade:** Technical, 99.9% min.**Hazard:** TLV: Ceiling of 1000 ppm.**Use:** Solvent, fire extinguishers, chemical intermediate, blowing agent.**3,5,6-trichloro-2-hydroxypyridine.** See 2-hydroxy-3,5,6-trichloropyridine.**trichloroisocyanuric acid.** (1,3,5-trichloro-*s*-triazine-2,4,6-trione).

CAS: 87-90-1.

OCN[C]C(=O)N1C(=O)NC(=O)N1

Properties: White, slightly hygroscopic, crystalline powder or granules. Loose bulk d 31 lb/cu ft, granular 60 lb/cu ft; available chlorine 85%; decomposes at 225C.**Hazard:** Fire risk in contact with organic materials, strong oxidizing agent. Toxic by ingestion.**Use:** Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, detergent sanitizers, commercial laundry bleaches, swimming-pool disinfectant, bactericide, algicide, bleach, and deodorant.**trichloroisocyanuric acid-potassium dichloroisocyanurate (1:4).** See monochloro-tetra(monopotassium dichloro)-penta-*s*.**trichloromelamine.** (*N,N,N'*-trichloro-2,4,6-triamine-1,3,5-triazine).

NC(NHCl)NC(NHCl)NC(NHCl)

Properties: Fine, white powder. Autoign temp 320F (160C). Slightly soluble in water and glacial acetic acid; insoluble in carbon tetrachloride and benzene; pH of saturated aqueous solution 4.**Derivation:** By chlorination of melamine.**Grade:** 89% available chlorine.**Hazard:** Dangerous fire risk, can ignite spontaneously in contact with reactive organic materials.**Use:** Chlorine bleach and bactericide.**trichloromethane.** See chloroform. **α -(trichloromethyl)benzyl acetate.** See trichloromethylphenylcarbonyl acetate.**trichloromethyl chloroformate.** (diphosgene). $CICOOCCl_3$.**Properties:** Colorless liquid; odor similar to phosgene (newly mown hay). D 1.65 (15C), bp 127–128C, fp $-57C$, vap d 6.9 (air = 1), refr index 1.45664 (22C). Decomposed by heat, porous substances, activated carbons (with evolution of phosgene), also by alkalis, hot water. Soluble in alcohol, benzene, and ether. Noncombustible.**Derivation:** (1) By chlorinating methyl formate, (2) by chlorinating methyl chloroformate. In both methods the mixture of chloro-derivatives is then separated by fractionation.**Grade:** Technical.**Hazard:** Toxic by inhalation and ingestion, strong irritant to tissue.**Use:** Organic synthesis, military poison gas.**trichloromethyl ether.** $CHCl_2OCH_2Cl$.**Properties:** Liquid; pungent odor. D 1.5066 (10C), bp 130–132C. Soluble in alcohol, benzene, and ether; insoluble in water.**Hazard:** Strong irritant to eyes and skin, evolves lachrymatory fumes.***N*-(trichloromethylmercapto)-tetrahydrophthalimide.** See captan.**trichloromethylphenylcarbonyl acetate.** $(\alpha$ -[trichloromethyl]benzyl acetate).CAS: 90-17-5. $C_6H_4CH_2(CCl_3)OOCCH_3$.**Properties:** White, crystalline solid; intense rose odor. Mp 86–88C. Soluble in 18 parts of 95% alcohol.**Use:** Perfumes, fixative for essential oils and perfumes.**trichloromethylphosphonic acid.** $CCl_3PO(OH)_2$. Strong dibasic acid.**Properties:** Soluble in water and alcohol; insoluble in benzene and hexane.**Use:** Catalyst and condensation agent.**1,1,1-trichloro-2-methyl-2-propanol.** See chlorobutanol.**trichloromethylsulfenyl chloride.** (perchloromethyl mercaptan).CAS: 594-42-3. $CISCCl_3$.**Properties:** Yellow, oily liquid; disagreeable odor. Mildly decomposed by moist air, subject to the action of oxidizing agents, reducing agents, chlorine, etc. D 1.722 (0C), bp 148–149C (decomposes), vap d 6.414, volatility 18,000 mg/cu m (20C). Insoluble in water. Nonflammable but supports combustion.**Derivation:** Chlorination of carbon disulfide, thiophosgene, or methyl thiocyanate.**Grade:** Technical.**Hazard:** Toxic by ingestion and inhalation, strong irritant to eyes and skin. TLV: 0.1 ppm.**Use:** Organic synthesis, dye intermediate, fumigant.

3-trichloromethylthiobenzothiazolone.CAS: 3567-79-1. mf: $C_8H_4Cl_3NOS_2$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**trichloronaphthalene.** (halowax).CAS: 1321-65-9. $C_{10}H_5Cl_3$.**Properties:** A white solid. Mw 231.50.**Hazard:** A poison. TLV: 5 mg/m³ (skin).**Use:** Wire coating, electrical insulations.**trichloronitromethane.** See chloropicrin.**trichloronitrosomethane.** CCl_3NO .**Properties:** Dark-blue liquid; unpleasant odor. D 1.5 (20C); bp 5C (70 mm Hg). Slowly decomposes, but is more stable in solution. Soluble in alcohol, benzene, ether; insoluble in water.**Derivation:** Interaction of sulfuric acid, sodium trichloromethylsulfinate, and sodium nitrate.**Grade:** Technical.**Hazard:** Strong irritant to eyes and tissue.**Use:** Organic synthesis, military poison gas (lachrymator).**trichlorononylsilane.** See nonyl trichlorosilane.**trichlorooctadecylsilane.** See octadecyltrichlorosilane.**trichlorooctylsilane.** See octyl trichlorosilane.**2,4,5-trichlorophenol.**CAS: 95-95-4. $C_6H_3Cl_3OH$.**Properties:** Gray flakes in sublimed mass; strong phenolic odor. D 1.678 (25/4C), bp 252C, mp 68–70C, no flash p. Soluble in alcohol, ether, and acetone. Nonflammable.**Hazard:** May cause skin irritation.**Use:** Fungicide, bactericide.**2,4,6-trichlorophenol.** (2,4,6-T).CAS: 88-06-2. $C_6H_3Cl_3OH$.**Properties:** Yellow flakes; strong phenolic odor. D 1.675 (25/4C), fp 61C, bp 248–249C. Soluble in acetone, alcohol, and ether. Nonflammable.**Hazard:** May cause skin irritation.**Use:** Fungicide, herbicide, defoliant.**3,4,5-trichlorophenol.**CAS: 609-19-8. mf: $C_6H_3Cl_3O$.**Hazard:** A poison.**2,4,5-trichlorophenoxyacetic acid.** (2,4,5-T).CAS: 93-76-5. $C_8H_5Cl_3OCH_2CO_2H$.**Properties:** Light-tan solid. Mp 151–153C. Soluble in alcohol; insoluble in water; available as sodium and amine salts.**Hazard:** Use has been restricted. TLV: 10 mg/m³.**Use:** Plant hormone, herbicide, defoliant. See dioxin.**2-(2,4,5-trichlorophenoxy)ethyl-2,2-dichloropropionate.** See erbon.**2-(2,4,5-trichlorophenoxy)propionic acid.**

See silvex.

2,4,6-trichlorophenyl acetate.CAS: 23399-90-8. $C_8H_5Cl_3OOCCH_3$.**Use:** Fungicide, especially on cotton seed.**1-((2,3,6-trichlorophenyl)methoxy)-2-propanol.**CAS: 1861-44-5. mf: $C_{10}H_{11}Cl_3O_2$.**Hazard:** A mild eye irritant.**1,2,3-trichloropropane.**CAS: 96-18-4. $CH_2ClCHClCH_2Cl$.**Properties:** Colorless liquid. D 1.3888 (20/4C), fp –15C, bp 156.17C, refr index 1.4822 (20C), flash p 180F (82.2C) (COC). Slightly soluble in water; dissolves oils, fats, waxes, chlorinated rubber, and numerous resins. autoign temp 580F (304C). Combustible.**Derivation:** Chlorination of propylene.**Hazard:** Toxic by inhalation and skin absorption; strong irritant. TLV: 10 ppm.**Use:** Paint and varnish remover, solvent, degreasing agent.**tri(chloropropyl) phosphate.**CAS: 26248-87-3. mf: $C_9H_{15}Cl_3O_4P$.**Hazard:** Moderately toxic by ingestion. A reproductive hazard.See "Antiblaze" [*Albermarle*].**trichlorosilane.** (1) (silicochloroform).CAS: 10025-78-2. $SiHCl_3$.**Properties:** Colorless volatile liquid. D 1.336, fp –127C, bp 32C, refr index 1.3990, flash p 7F (–13.9C). Soluble in benzene, ether, heptane, perchloroethylene; decomposed by water. Purity of 99.9999% is commercially attainable.**Hazard:** Flammable, dangerous fire risk.**Use:** Intermediate, purification of silicon.(2) Generic name for compounds of the formula $RSiCl_3$ of which methyl trichlorosilane, CH_3SiCl_3 is most important.***N,N',N''*-trichloro-2,4,6-triamine-1,3,5-triazine.** See trichloromelamine.**2,4,6-trichloro-1,3,5-triazine.** See cyanuric chloride.**1,3,5-trichloro-s-triazine-2,4,6-trione.** See trichloroisocyanuric acid.**trichloromethyltin.** See methyltrichlorostannane.

trichlorotrifluoroacetone. (1,1,3-trichloro-1,3,3-trifluoroacetone). $\text{CCl}_2\text{FCOCCF}_3$.

Properties: Colorless liquid. Bp 84.5C, fp -78C. Miscible with water and most organic solvents; stable to acid but not alkalis. Nonflammable.

Hazard: Strong irritant to eyes.

Use: Solvent in acid media, complexing agent.

1,1,2-trichloro-1,2,2-trifluoroethane. (trifluorotrichloroethane).

CAS: 76-13-1. $\text{CCl}_2\text{FCClF}_2$.

Properties: Colorless, volatile liquid; nearly odorless. Bp 47.6C, fp -35C, critical press 33.7 atm, d 1.42 (25C). Noncombustible.

Derivation: From perchloroethylene and hafnium.

Grade: Technical, spectrophotometric.

Hazard: TLV: 1000 ppm.

Use: Dry-cleaning solvent, fire extinguishers, to make chlorotrifluoroethylene, blowing agent, polymer intermediate, solvent drying, drying electronic parts and precision equipment.

trichocyst. Organelle in ciliates and dinoflagellates which releases long filamentous proteins when the cell is disturbed. Used as a defense against would-be predators.

tricholine citrate. (tris[2-hydroxyethyl]trimethylammonium citrate).

$[(\text{CH}_3)_3\text{NCH}_2\text{CH}_2\text{OH}]_3 \bullet \text{C}_6\text{H}_5\text{O}_7$.

Use: Medicine, nutrition.

trichotecene. See mycotoxin.

tricobalt tetraoxide. See cobalto-cobaltic oxide.

tricosane. $\text{CH}_3(\text{CH}_2)_{21}\text{CH}_3$.

Properties: Glittering leaflets. D 0.779 (48C), bp 234C (15 mm Hg), mp 48C. Soluble in alcohol; insoluble in water. Combustible.

Grade: Technical.

Use: Organic synthesis.

***n*-tricosanoic acid.** $\text{CH}_3(\text{CH}_2)_{21}\text{COOH}$. A saturated fatty acid not normally found in natural fats or oils.

Properties: Synthetic compound is a white crystalline solid. Mp 79.1C.

Use: Purified product is used in medical research and as reference standard for gas chromatography.

tri-*m,p*-cresyl borate. $(\text{CH}_3\text{C}_6\text{H}_4)_3\text{BO}_3$.

Properties: Light-amber liquid. D 1.065 (25C), bp 385-395C, refr index 1.5480 (24C), flash p 240F (115.5C) (COC). Miscible with acetone, benzene, chloroform; hydrolyzes on contact with water. Combustible.

Use: Plasticizer, organic synthesis.

tricresyl phosphate. (tritoyl phosphate; TCP).

CAS: 78-30-8. $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_3\text{PO}$. A mixture of isomers.

Properties: Practically colorless liquid; odorless. Stable, nonvolatile. Bp 420C, refr index 1.556 (25C), d 1.162 (25/25C), bulk d 9.7 lb/gal, crystallizing p -35C, flash p 437F (225C), autoign temp 770F (410C). Miscible with all the common solvents and thinners, also with vegetable oils; insoluble in water. Combustible.

Derivation: From cresol and phosphorus oxychloride.

Hazard: Toxic by ingestion and skin absorption. The *o*- isomer is highly toxic. TLV: 0.1 mg/m³ (skin); Not Classifiable as a Human Carcinogen.

Use: Plasticizer for polyvinyl chloride, polystyrene, nitrocellulose; fire-retardant for plastics; air-filter medium; solvent mixtures; waterproofing; additive to extreme pressure lubricants; hydraulic fluid; heat-exchange medium.

tri-*o*-cresylphosphate. See tricresyl phosphate.

tricresyl phosphite. $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_3\text{P}$.

Properties: Colorless liquid; slight phenolic odor. Bp 191C (0.11 mm Hg), d 1.115 (20/4C), flash p 440F (226.6C) (OC). Insoluble in water; miscible with acetone, alcohol, benzene, ether, and kerosene. Combustible.

Grade: Technical.

Use: Stabilizer and plasticizer for plastics and resins.

tricyanic acid. See cyanuric acid.

tricyclic. An organic compound composed of only three-ring structures, which may be identical or different, e.g., anthracene.

***sym*-tricyclodecane.** See adamantane.

tricyclodecanedimethanol.

CAS: 26160-83-8. mf: $\text{C}_{12}\text{H}_{20}\text{O}_2$.

Hazard: Moderately toxic by ingestion.

tricyclohexyl borate. See boric acid ester.

1-(tricyclohexylstannyl)-1h-1,2,4-triazole.

See (1h-1,2,4-triazolyl-1-yl)tricyclohexylstannane.

***n*-tridecane.** $\text{CH}_3(\text{CH}_2)_{11}\text{CH}_3$.

Properties: Colorless liquid. D 0.755 (20/4C), bp 225.5C, fp -5.45C, refr index 1.4250 (20C), flash p 175F (79.4C). Soluble in alcohol; insoluble in water. Combustible.

Grade: 95%, 99%, research.

Use: Organic synthesis, distillation chaser.

***n*-tridecanoic acid.** (tridecyclic acid; tridecoic acid). $\text{CH}_3(\text{CH}_2)_{11}\text{COOH}$. A saturated fatty acid usually prepared synthetically.

Properties: Colorless crystals. Mp 44.5C, d 0.8458

(80/4C), bp 312.4C, 192.2C (16 mm Hg), refr index 1.4328 (50C). Slightly soluble in water; soluble in alcohol and ether. Combustible.

Grade: 99% pure.

Use: Organic synthesis, medical research.

tridecanol. See tridecyl alcohol.

2-tridecenal.

CAS: 7774-82-5. mf: C₁₃H₂₄O.

Properties: White to yellow liquid; oily, citrus odor. D: 0.842–0.862, refr index: 1.457. Sol in alc, fixed oils; insol in water.

Hazard: Low toxicity by ingestion and skin contact.

Use: Food additive.

tridecoic acid. See *n*-tridecanoic acid.

tridecyl alcohol. (tridecanol). C₁₂H₂₅CH₂OH. A commercial mixture of isomers.

Properties: Low-melting white solid; pleasant odor. Bp 274C, mp 31C, d 0.845 (20/20C), bulk d 7.0 lb/gal, flash p 180F (82.2C) (TOC). Combustible.

Derivation: Oxo process from C₁₅ hydrocarbons.

Grade: Technical.

Use: Esters for synthetic lubricants, detergents, anti-foam agent, other tridecyl compounds, perfumery.

tridecylbenzene. (1-phenyltridecane).

C₆H₅(CH₂)₁₂CH₃.

Properties: Colorless liquid. D 0.85–0.86 (60/60F), refr index 1.4815–1.4830. Combustible.

Use: Detergent intermediate.

tridecyl acid. See *n*-tridecanoic acid.

tri(decyl)orthoformate. CH(OC₁₀H₂₁)₃.

Properties: Liquid. Bp 194C, fp –15 to –20C, refr index 1.448. Insoluble in water; soluble in benzene, naphtha, ether, and alcohol.

Use: To remove small quantities of water from ethers or other solvents in which acid catalysts can be employed.

tri(decyl) phosphite. (C₁₀H₂₁O)₃P.

Properties: Water-white liquid; decyl alcohol odor. D 0.892 (25/15.5C), mp below 0C, refr index 1.4565 (25C), flash p 455F (235C). Combustible.

Use: Chemical intermediate, stabilizer for polyvinyl and polyolefin resins.

2,4,6-tri(dimethylaminomethyl)phenol.

[(CH₃)₂NCH₂]₃C₆H₂OH.

Properties: Liquid. Refr index 1.5181. Combustible.

Use: Antioxidants, acid neutralizers, stabilizers, and catalysts for epoxy and polyurethane resins.

tri(dimethylphenyl)phosphite. (trixylenyl phosphate). [(CH₃)₂C₆H₄O]₃PO.

Properties: Liquid. D 1.155, refr index 1.5535, bp 243–265C (10 mm Hg), flash p 450F (232C). Solu-

bility in water 0.002% (85C) by weight. Combustible.

Use: Plasticizer.

tridodecyl amine. See trilauryl amine.

tridodecyl borate. See boric acid ester.

tridymite. (christensenite; crystalline silica).

CAS: 15468-32-3. SiO₂. A vitreous, colorless, or white native form of pure silica, found variously but not so commonly as quartz. Quartz will change into tridymite with a 16.2% increase in volume at 870C. Unlike quartz, it is soluble in boiling sodium carbonate solution; d 2.28–2.3; Mohs hardness 7.

Hazard: TLV: (silica, crystalline) Respirable Fraction: 0.05 mg/m³.

trietazine. (generic name for 2-chloro-4-diethylamino-6-ethylamino-*s*-triazine).

CAS: 1912-26-1. ClC₂N₃[N(C₂H₅)₂]NHC₂H₅.

Properties: Solid. Practically insoluble in water; partially soluble in benzene and chloroform.

Use: Herbicide, plant growth regulator.

“Tri-Ethane” [PPG].

CAS: 71-55-6. TM for 1,1,1-trichloroethane solvent.

Use: Cold cleaning, vapor degreasing, resins application, dry-film photoresist processing, adhesive solvent, in aerosols as solvent and vapor-pressure depressant.

triethanolamine. (TEA; tri[2-hydroxyethyl]amine).

CAS: 102-71-6. (HOCH₂CH₂)₃N.

Properties: Colorless, viscous, hygroscopic liquid; slight ammoniacal odor. Mp 21.2C, bp 335C (decomposes), vap press below 0.01 mm Hg (20C), d 1.126, flash p 375F (190.5C) (OC), bulk d 9.4 lb/gal. Miscible with water, alcohol; soluble in chloroform; slightly soluble in benzene and ether; slightly less alkaline than ammonia, commercial product contains up to 25% diethanolamine and up to 5% monoethanolamine. Combustible.

Derivation: Reaction of ethylene oxide and ammonia.

Grade: Technical, regular, 98%, USP.

Use: Fatty acid soaps used in dry-cleaning, cosmetics, household detergents, and emulsions. Wool scouring, textile antifume agent and water-repellent, dispersion agent, corrosion inhibitor, softening agent, emulsifier, humectant and plasticizer, chelating agent, rubber accelerator, pharmaceutical alkalinizing agent.

triethanolamine dodecylbenzene sulfonate.

CAS: 27323-41-7. mf: C₁₈H₃₀O₃S•C₆H₁₅NO₃.

Hazard: Low toxicity by ingestion and skin contact.

Use: Food additive.

triethanolamine lauryl sulfate.

CAS: 139-96-8. $(\text{HOC}_2\text{H}_4)_3\text{NOS}(\text{O})_2\text{OC}_{12}\text{H}_{25}$. A liquid or paste.

Use: Detergent; wetting, foaming, and dispersing agent for industrial, cosmetic and pharmaceutical applications, especially shampoos.

triethanolamine methanearsonate.

CAS: 5902-97-6. mf: $\text{C}_6\text{H}_{15}\text{NO}_3 \cdot x\text{CH}_3\text{AsO}_3$.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

triethanolamine oleate. See trihydroxyethylamine oleate.

triethanolamine stearate. See trihydroxyethylamine stearate.

triethanolamine titanate. See titanium chelate.

1,1,3-triethoxybutane.

CAS: 5870-82-6. mf: $\text{C}_{10}\text{H}_{22}\text{O}_3$.

Hazard: A poison by ingestion and skin contact. Low toxicity by inhalation. A mild skin irritant.

1,1,3-triethoxyhexane.

$\text{CH}(\text{OC}_2\text{H}_5)_2\text{CH}_2\text{CH}(\text{OC}_2\text{H}_5)\text{C}_3\text{H}_7$.

Properties: Colorless liquid. D 0.8746 (20/20C), bp 133C (50 mm Hg), fp -100C, bulk d 7.3 lb/gal, flash p 210F (98.9C). Insoluble in water. Combustible.

Use: Synthesis of aldehydes, acids, esters, chlorides, amines, etc.

triethoxymethane. See triethyl-*o*-formate.

1,1,3-triethoxy-3-methoxypropane.

(triethylmethyl malonaldehyde diacetal). $(\text{CH}_3\text{O})(\text{C}_2\text{H}_5\text{O})\text{CHCH}_2\text{CH}(\text{OC}_2\text{H}_5)_2$.

Properties: Colorless liquid. D 0.9300 (25/4C), bp 86C (6 mm Hg). Combustible.

Grade: 99%.

Use: Intermediate, cross-linking, and insolubilizing agent.

triethylaconitate.

$\text{C}_2\text{H}_5\text{OOCCHC}(\text{COOC}_2\text{H}_5)\text{CH}_2\text{COOC}_2\text{H}_5$.

Properties: Liquid. D 1.096 (25C), refr index 1.4517 (26C), bp 154-156 (5 mm Hg). Combustible.

Use: Plasticizer.

triethylaluminum. (ATE; TEA; aluminum triethyl).

CAS: 97-93-8. $(\text{C}_2\text{H}_5)_3\text{Al}$.

Properties: Colorless liquid. D 0.837, fp -52.5C, bp 194C, sp heat 0.527 (33C), flash p -63F (-53C). Miscible with saturated hydrocarbons.

Derivation: By introduction of ethylene and hydrogen into an autoclave containing aluminum. The reaction proceeds at moderate temperature and varying pressures.

Grade: 88-94%.

Hazard: Flammable, dangerous fire risk, ignites spontaneously in air. Reacts violently with water, acids, alcohols, halogens, and amines. Destructive to tissue.

Use: Catalyst intermediate for polymerization of olefins, especially ethylene; pyrophoric fuels; production of α -olefins and long-chain alcohols; gas plating of aluminum.

triethylamine.

CAS: 121-44-8. $(\text{C}_2\text{H}_5)_3\text{N}$.

Properties: Colorless liquid; strong ammoniacal odor. Bp 89.7C, fp -115.3C, d 0.7293 (20/20C), bulk d 6.1 lb/gal, flash p 10F (-6.67C) (OC). Soluble in water and alcohol.

Derivation: From ethyl chloride and ammonia with heat and pressure.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.2-8.0%. Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 10 ppm.

Use: Catalytic solvent in chemical synthesis; accelerator activators for rubber; wetting, penetrating, and waterproofing agents of quaternary ammonium types; curing and hardening of polymers (e.g., core-binding resins); corrosion inhibitor; propellant.

triethyl(3-aminopropyl)silane. See (3-aminopropyl)triethylsilane.

triethylborane. (triethylborine; boron triethyl). $(\text{C}_2\text{H}_5)_3\text{B}$.

Properties: Colorless liquid. D (25C), flash p -32F (35.5C), fp -93C, bp 95C, refr index 1.3971, heat of combustion 20,000 Btu/lb. Miscible with most organic solvents; immiscible with water.

Derivation: Reaction of triethylaluminum and boron halide or diborane and ethylene.

Hazard: Flammable, dangerous fire risk, ignites spontaneously in air. Reacts violently with water and oxidizing materials. Toxic by inhalation, strong irritant.

Use: Igniter or fuel for jet and rocket engines, fuel additive, olefin polymerization catalyst, intermediate.

triethyl borate. (ethyl borate). $(\text{C}_2\text{H}_5)_3\text{BO}_3$.

Properties: Colorless liquid; mild odor. Hydrolyzes rapidly depositing boric acid in finely divided crystalline form. Bp 120C, d 0.863-0.864 (20/20C), flash p 51.8F (11C) (CC), bulk d 7.20 lb/gal (20C), refr index 1.37311 (20C).

Hazard: Flammable, dangerous fire risk.

Use: Antiseptics, disinfectants, antiknock agent.

triethylborine. See triethylborane.

triethyl citrate. (ethyl citrate).

CAS: 77-93-0. $\text{C}_3\text{H}_5(\text{COOC}_2\text{H}_5)_3$.

Properties: Colorless, mobile liquid; bitter taste. Bp 294C, bp 126-127C (1 mm Hg), d 1.136 (25C), pour p -46C, flash p 303F (150.5C) (COC). Solubility in

water 6.5 g/100 cc; solubility in oil 0.8 g/100 cc. Combustible.

Derivation: Esterification of citric acid.

Grade: Technical, refined, FCC.

Use: Solvent and plasticizer for nitrocellulose and natural resins, softener, paint removers, agglutinant, perfume base, food additive (not over 0.25%).

See "TEC" [Reilly].

triethylene diamine. (1,4-diazobicyclo[2,2,2]octane).

CAS: 280-57-9. $N(CH_2CH_2)_3N$.

Properties: Colorless, hygroscopic crystals. Mp 158C, bp 174C.

Hazard: Skin irritant.

Use: Catalyst for polyurethane foams, oxidation and polymerization catalyst, chemical intermediate (metal complexes, quaternary ammonium compounds, etc.), bromine and iodine addition compounds.

triethylene glycol. (TEG).

CAS: 112-27-6. $HO(C_2H_4O)_3H$.

Properties: Colorless, hygroscopic liquid; practically odorless. D 1.1254 (20/20C), bp 287.4C, vap press below 0.01 mm Hg (20C), flash p 350F (176.6C) (CC), bulk d 9.4 lb/gal (20C), fp -7.2C, viscosity 0.478 cP (20C), autoign temp 700F (371C). Soluble in water; immiscible with benzene, toluene, and gasoline. Combustible.

Derivation: From ethylene and oxygen as a by-product of ethylene glycol manufacture.

Grade: Technical, CP.

Use: Solvent and plasticizer in vinyl, polyester, and polyurethane resins; dehydration of natural gas; humectant in printing inks; extraction solvent.

triethylene glycol diacetate.

CAS: 111-21-7.

$CH_3COOCH_2CH_2OCH_2CH_2OCH_2CH_2OOCCH_3$.

Properties: Colorless liquid. D 1.112 (25C), refr index 1.437 (25C), bp 300C, fp below -60C. Combustible.

Use: Plasticizer.

triethylene glycol dibenzoate.

$C_6H_5CO(OCH_2CH_2)_3OOC C_6H_5$.

Properties: Crystals. Bp 210-223C, mp 46C, flash p 457F (236C) (TOC), d 1.168. Combustible.

Use: Plasticizer for vinyl resins, adhesives.

triethylene glycol dicaprylate. (triethylene glycol dioctate).

$C_7H_{15}COO(CH_2CH_2O)_3OCC_7H_{15}$.

Properties: Clear liquid. D 0.973 (20C), acidity 0.3% max (caprylic), moisture 0.05% max, fp -3C, bp 243C (5 mm Hg), soluble in most organic solvents. Combustible.

Use: Low-temperature plasticizer for elastomers.

triethylene glycol dichloride. See triglycol dichloride.

triethylene glycol didecanoate.

$C_{10}H_{19}COO(C_2H_4O)_3OCC_9H_{19}$.

Properties: Colorless liquid. Bp 237 (2.0 mm Hg), d 0.9584 (20/20C), viscosity 28.6 cP (20C). Combustible.

Use: Plasticizer.

triethylene glycol di(2-ethylbutyrate).

$C_5H_{11}OCOCH_2(CH_2OCH_2)_2CH_2OCOC_3H_7$.

Properties: Light-colored liquid. D 0.9946 (20/20C), bulk d 8.3 lb/gal (20C), bp 196C (5 mm Hg), vap press 5.8 mm Hg (200C), viscosity 10.3 cP (20C), flash p 385F (196C). Solubility in water 0.02% by weight (20C). Combustible.

Use: Plasticizer.

triethylene glycol di(2-ethylhexoate).

$C_7H_{15}OCOCH_2(CH_2OCH_2)_2CH_2OCOC_7H_{15}$.

Properties: Light-colored liquid. D 0.9679 (20/20C), bulk d 8.1 lb/gal (20C), bp 219C (5 mm Hg), vap press 1.8 mm Hg (200C), viscosity 15.8 cP (20C), flash p 405F (207C). Insoluble in water. Combustible.

Use: Plasticizer.

triethylene glycol dihydroabietate.

$C_{19}H_{31}COO(C_2H_4O)_3OCC_{19}H_{31}$.

Properties: Liquid. D 1.080-1.090 (25C), refr index 1.5180 (20C), vap press 2.5 (225C), flash p 438F (226C). Insoluble in water. Combustible.

Use: Plasticizer.

triethylene glycol dimethyl ether. (tri-glyme). $CH_3(OCH_2CH_2)_3OCH_3$.

Properties: Water-white liquid; mild ether odor. D 0.9862 (20/20C), refr index 1.4233 (20C), flash p 232F (111C), bp 216.0C (760 mm Hg), 153.6C (100 mm Hg), fp -46C. Completely soluble in water and hydrocarbons at 20C. May contain peroxides. Combustible.

Use: Solvent for gases, coupling immiscible liquids.

triethylene glycol dioctate. See triethylene glycol dicaprylate.

triethylene glycol dipelargonate.

$C_8H_{17}COO(C_2H_4O)_3OCC_8H_{17}$.

Properties: Clear liquid. D 0.964 (20/20C), bp 251C (5 mm Hg), fp +1 to -4C, refr index 1.4470 (23C), flash p 410F (210C). Almost insoluble in water; soluble in most organic solvents. Combustible.

Use: Plasticizer.

triethylene glycol dipropionate.

$C_2H_5CO(OCH_2CH_2)_3OOC C_2H_5$.

Properties: Colorless liquid. D 1.066 (25C), refr index 1.436 (25C), bp 138-142C (2 mm Hg), fp below -60C. Solubility in water 6.70% by weight. Combustible.

Use: Plasticizer.

- triethylene glycol monobutyl ether.** See butoxytriglycol. mp sets to a glass at low temperature, refr index 1.451 (25C), flash p 340F (171C) (COC). Combustible.
- triethylene glycol monoethyl ether.** See 2-(2-(2-(hexyloxy)ethoxy)ethoxy)ethanol. Use: Plasticizer, intermediate.
- triethylenemelamine.** (tretamine; TEM; 2,4,6-tris(1-aziridinyl)-s-triazine). CAS: 51-18-3.
- $\text{NC}[\text{N}(\text{CH}_2)_2]\text{NC}[\text{N}(\text{CH}_2)_2]\text{NC}[\text{N}(\text{CH}_2)_2]$.
- Properties:** White, crystalline, powder; odorless. Mp 160C (polymerizes); polymerizes readily with heat or moisture. Soluble in alcohol, water, methanol, chloroform, and acetone.
- Grade:** NF.
- Hazard:** Highly toxic.
- Use:** Medicine (antineoplastic), insecticide, chemosterilant.
- triethylenephosphoramidate.** (tepa; tris-(1-aziridinyl)-phosphine oxide; APO). CAS: 545-55-1.
- $(\text{NCH}_2\text{CH}_2)_3\text{PO}$.
- Properties:** Colorless crystals. Mp 41C. Soluble in water, alcohol, and ether. Combustible.
- Derivation:** From ethyleneimine.
- Hazard:** Highly toxic, strong irritant to skin and tissue.
- Use:** Medicine (antineoplastic), insect sterilant. Also used with tetrakis(hydroxymethyl)phosphonium chloride (THPC) to form a condensation polymer suitable for flame-proofing cotton.
- See tris[1-(2-methyl)aziridinyl]phosphine oxide.
- triethylenetetramine.** CAS: 112-24-3. $\text{NH}_2(\text{C}_2\text{H}_4\text{NH})_2\text{C}_2\text{H}_4\text{NH}_2$.
- Properties:** Moderately viscous, yellowish liquid, less volatile than diethylenetriamine but resembles it in many other properties. Bp 277.5C, d 0.9818 (20/20C), mp 12C, flash p 275F (135C) (CC), bulk d 8.2 lb/gal (20C), autoign temp 640F (337.7C). Soluble in water. Combustible.
- Grade:** Technical, anhydrous.
- Hazard:** Strong irritant to tissue, causes skin burns and eye damage.
- Use:** Detergents and softening agents; synthesis of dyestuffs, pharmaceuticals, and rubber accelerators.
- tri(2-ethylhexyl)phosphate.** CAS: 78-42-2. $[\text{C}_8\text{H}_{17}\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2]_3\text{PO}_4$.
- Properties:** Light-colored liquid. D 0.9260 (20/20C), bulk d 7.70 lb/gal (20C), bp 220C (5 mm Hg), vap press 1.9 mm Hg (200C), viscosity 14.1 cP (20C), pour p -74C, flash p 405F (207C). Insoluble in water. Combustible.
- Use:** Plasticizer.
- tri(2-ethylhexyl) phosphite.** ($\text{C}_8\text{H}_{17}\text{O}$)₃P.
- Properties:** Straw-colored liquid. D 0.897 (25/15C), mp sets to a glass at low temperature, refr index 1.451 (25C), flash p 340F (171C) (COC). Combustible.
- tri(2-ethylhexyl) trimellitate.** $\text{C}_6\text{H}_3(\text{COOC}_8\text{H}_{17})_3$.
- Properties:** Clear liquid; mild odor. D 0.992 (20/20C), distillation range 278–284C (3 mm Hg) (5–95%), fp a gel at -35C, refr index 1.4846 (23C), bulk d 8.26 lb/gal (20C). Combustible.
- Use:** Plasticizer.
- triethylhydroxytin sulfate.** See bis(triethyltin) sulfate.
- triethylmethane.** See 3-ethylpentane.
- triethylmethyl malonaldehyde diacetal.** See 1,1,3-triethoxy-3-methoxypropane.
- triethylorthoformate.** (triethoxymethane). CAS: 122-51-0. $\text{CH}(\text{OC}_2\text{H}_5)_3$.
- Properties:** Colorless liquid; pungent odor. Bp 145.9C, refr index 1.39218 (18.8C), d 0.895 (20/20C), flash p 86F (30C) (CC). Soluble in alcohol, ether; decomposes in water.
- Derivation:** Reaction of sodium ethylate with chloroform or reaction of hydrochloric acid with hydrocyanic acid in ethanol solution.
- Hazard:** Flammable, moderate fire risk. Toxic.
- Use:** Organic synthesis, pharmaceuticals.
- triethyl phosphate.** (TEP). CAS: 78-40-0. $(\text{C}_2\text{H}_5)_3\text{PO}_4$.
- Properties:** Colorless, high-boiling liquid; mild odor. Fp -56.4C, bp 216C, flash p 240F (115.5C), refr index 1.4055 (20C), bulk d 8.90 lb/gal (20C). Very stable at ordinary temperatures, compatible with many gums and resins, soluble in most organic solvents, miscible with water. When mixed with water is quite stable at room temperature, but at elevated temperatures it hydrolyzes slowly. Combustible.
- Grade:** Technical, 97%.
- Hazard:** May cause nerve damage but to a lesser extent than other cholinesterase-inhibiting compounds.
- Use:** Solvent; plasticizer for resins, plastics, gums; manufacture of pesticides; catalyst; lacquer remover.
- triethyl phosphite.** CAS: 122-52-1. $(\text{C}_2\text{H}_5)_3\text{PO}_3$.
- Properties:** Colorless liquid. D 0.9687 (20C), bp 156.6C, refr index 1.413 (25C), flash p 130F (54.4C). Insoluble in water; soluble in alcohol and ether. Combustible.
- Hazard:** Moderate fire risk.
- Use:** Synthesis, plasticizers, stabilizers, lubricant and grease additives.

O,O,O-triethyl phosphorothioate. (triethyl thiophosphate).

CAS: 126-68-1. (C₂H₅O)₃PS.

Properties: Colorless liquid; characteristic odor. Bp 93.5–94C (10 mm Hg), d 1.074, flash p 225F (107.2C) (COC). Combustible.

Hazard: Toxic by ingestion, cholinesterase inhibitor.

Use: Plasticizer, lubricant additive, antifoam agent, hydraulic fluid, intermediate.

triethylstannium bromide. See bromotriethylstannane.

triethyltin acetate. See acetoxytriethylstannane.

triethyltin bromide. See bromotriethylstannane.

triethyltin bromide-2-pipecoline.

CAS: 73926-90-6. mf: C₆H₁₃BrSn•C₆H₁₃N.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

triethyltin chloride.

CAS: 994-31-0. mf: C₆H₁₅ClSn.

Properties: Colorless liquid. D: 1.440 @ 20%4°, mp: 15.5°, bp: 210°. Insol in water; sol in org solv.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triethyltin phenoxide.

CAS: 1529-30-2. mf: C₁₂H₂₀OSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triethyltin sulphate. See bis(triethyltin) sulfate.

triethyl tricarballylate.

(C₂H₅OCOCH₂)₂CHCOOC₂H₅.

Properties: Colorless liquid. D 1.087 (20C), refr index 1.4234 (26C), bp 158–160C (5 mm Hg). Solubility in water 0.62% (20C) by weight. Combustible.

Use: Plasticizer.

triethyl(trifluoroacetoxy) stannane. See trifluoroacetic acid triethylstannyl ester.

trifluoroacetic acid.

CAS: 76-05-1. CF₃COOH.

Properties: Colorless, fuming liquid; hygroscopic; pungent odor. Bp 72.4C, d 1.535, fp –15.25C, index of refr 1.2850 (20C). Very soluble in water. Non-flammable.

Hazard: Irritant to skin.

Use: Strong nonoxidizing acid, laboratory reagent, solvent, catalyst.

trifluoroacetic acid triethylstannyl ester.

CAS: 429-30-1. mf: C₈H₁₅F₃O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

trifluoroamine oxide.

CAS: 13847-65-9. (F₃NO). A perfluorated amine obtained by fluorination of nitrosyl fluoride with UV light or high temperature or pressure. An alternate process is by burning nitric oxide and fluorine, rapidly quenching the gaseous mixture as it leaves the flame zone.

trifluorobromomethane. (bromotrifluoromethane; Halon 1301).

CAS: 75-63-8. CBrF₃.

Properties: Nonflammable colorless gas. Mw 148.92, mp –167.7C, bp –58C, vap d 5 (air = 1) at –58C. Very soluble in chloroform.

Hazard: TLV: 1000 ppm.

Use: Fire-extinguisher agent.

trifluorochloroethylene. Legal label name (Rail) for chlorotrifluoroethylene.

trifluorochloromethane. See chlorotrifluoromethane.

1,1,1-trifluoro-2,6-dinitro-N,N-dipropyl-p-toluidine. See trifluralin.

trifluoroethene.

CAS: 359-11-5. mf: C₂HF₃.

Hazard: Low toxicity by inhalation.

trifluoromethane. See fluoroform.

4-trifluoromethoxy-n-chloro-carboxyphenylurethan. See methyl (chlorocarbonyl)(4-(trifluoromethoxy)phenyl)carbamate.

trifluoromethylbenzene. See benzotrifluoride.

2-trifluoromethyl benzimidazole.

CAS: 312-73-2. mf: C₈H₅F₃N₂.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

3-trifluoromethyl-4-nitrophenol. (1,1,1-trifluoro-4-nitro-*m*-cresol). CF₃C₆H₃(NO₂)OH.

Properties: Crystals. Mp 74–76C.

Use: To exterminate lampreys, especially in the Great Lakes. It is placed in tributary streams, where it kills the lamprey larvae.

4-(3-(trifluoromethyl)phenyl)-1-piperazineethanol mono(2-(acetyloxy)benzoate) (salt).

CAS: 54851-13-7. mf: C₁₃H₁₇F₃N₂O•C₉H₈O₄.

Hazard: Moderately toxic by ingestion.

trifluoronitrosomethane. CF₃NO.

Properties: Midnight blue, fairly stable gas; disagreeable odor. Bp -84°C , fp -150°C . Nonflammable.

Derivation: (1) Interaction of fluorine and silver cyanide in the presence of silver nitrate; (2) from nitric oxide and iodotrifluoromethane or bromotrifluoromethane in the presence of UV light.

Hazard: Strong irritant to mucous membranes and tissue.

Use: Monomer for nitroso rubber.

trifluorostyrene. $\text{C}_8\text{H}_5\text{F}_3$. A monomer designed for the production of polytrifluorostyrene and for copolymerization with vinyl monomers.

Properties: Liquid. Bp 68°C , fp -23°C , refr index 1.474, d 1.22, dipole moment 1.98 (D). The polymer is soluble in toluene, chloroform, and methyl ethyl ketone and has dielectric constant of 2.56. Nonflammable.

Use: Membranes for fuel tanks and water purification.

trifluorotrichloroethane. See trichlorotrifluoroethane.

4,4'-(2,2,2-trifluoro-1-(trifluoromethyl)ethylidene)bis(4,1-phenyleneoxy))bisbenzenamine.

CAS: 69563-88-8. mf: $\text{C}_{27}\text{H}_{20}\text{F}_6\text{N}_2\text{O}_2$.

Hazard: Moderately toxic by ingestion and skin contact. An eye irritant.

trifluorovinylchloride. See chlorotrifluoroethylene.

trifluralin. (generic name for 1,1,1-trifluoro-2,6-dinitro-*N,N*-dipropyl-*p*-toluidine).

CAS: 1582-09-8. $\text{F}_3\text{C}(\text{NO}_2)_2\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Yellowish-orange solid. Mp $48.5-49^{\circ}\text{C}$, bp $139-140^{\circ}\text{C}$ (4.2 mm Hg). Insoluble in water; soluble in xylene, acetone, and ethanol.

Hazard: Toxic by ingestion.

Use: Herbicide, especially for cotton plant.

triforine.

CAS: 26644-46-2. mf: $\text{C}_{10}\text{H}_{14}\text{Cl}_6\text{N}_4\text{O}_2$.

Properties: White crystals. Mp: 155° . Sol in water, CMF, DMSO.

Hazard: Low toxicity by ingestion, inhalation, and skin contact. Human systemic effects.

Use: food additive; fungicide; agricultural chemical.

triformol. See *sym*-trioxane.

triglyceride. Any naturally occurring ester of a normal acid (fatty acid) and glycerol. The chief constituents of fats and oils, they have the general formula: $\text{CH}_2(\text{OOCR}_1)\text{CH}(\text{OOCR}_2)\text{CH}_2(\text{OOCR}_3)$, where R_1 , R_2 , and R_3 are usually of different chain length. Refining processes often yield commercial products in which the R chain lengths are the same.

Derivation: Extraction from animal, vegetable, and marine matter.

Use: Fatty acids and derivatives, manufacture of edible oils and fats, manufacture of monoglycerides.

triglycerol monolinolenate. See polyglycerol ester.

triglycerol trilinoleate. See polyglycerol ester.

triglycine. See nitilotriacetic acid.

triglycol dichloride. (triethylene glycol dichloride). $\text{Cl}(\text{C}_2\text{H}_4\text{O})_2\text{C}_2\text{H}_4\text{Cl}$.

Properties: Colorless liquid. D 1.1974 (20/20C), bp 241.3°C , flash p 250°F (121C), bulk d 10.0 lb/gal (20C), fp -31.5°C . Insoluble in water. Combustible.

Grade: Technical.

Use: Solvent for hydrocarbons, oils, etc.; extractant; intermediate for resins and insecticides; organic synthesis.

triglycollamic acid. See nitilotriacetic acid.

triglyme. See triethylene glycol dimethyl ether.

trigonelline. (caffearine; caffeine; gynesine; *N*-methylnicotinic acid betaine).

$\text{C}_5\text{H}_4\text{NCOOCH}_3 \cdot \text{H}_2\text{O}$. A base formed in the seeds of many plants.

Properties: Colorless prisms. Mp 218°C (decomposes). Very soluble in water; soluble in alcohol; nearly insoluble in ether, benzene, and chloroform.

Derivation: Plant seeds, coffee beans, synthetically by heating nicotinic acid with methyl iodide and treatment with silver oxide.

Use: Biochemical research.

“Trigonox 22-8880” [Akzo]. TM for mixture of 80% 1,1-bis(*tert*-butylperoxy)cyclohexane in butyl benzoyl phthalate.

Available forms: Liquid.

Use: Initiator for SMC and BMC formulations.

tri-*n*-hexylaluminum. $(\text{C}_6\text{H}_{13})_3\text{Al}$.

Properties: Colorless, pyrophoric liquid. Bp 105°C (0.001 mm Hg).

Derivation: Exchange reaction between hexene and isobutyl aluminum.

Hazard: Ignites in air at room temperature.

Use: Polyolefin catalyst.

trihexylene glycol biborate. $(\text{C}_6\text{H}_{12}\text{O}_2)_3\text{B}_2$. A cyclic borate.

Properties: Colorless liquid. D 0.982 (21C), boiling range $314-326^{\circ}\text{C}$, refr index 1.4375 (25C), flash p 345°F (173.9C). Soluble in most organic solvents; hydrolyzes slowly in water. Combustible.

Derivation: Reaction of hexylene glycol with boric oxide.

Use: Gasoline additive, chemical intermediate.

trihexyl phosphite. (C₆H₁₃O)₃P.

Properties: Mobile, colorless liquid; characteristic odor. D 0.897 (20/4C), bp 135–141C (0.2 mm Hg), flash p 320F (160C) (COC). Miscible with most common organic solvents; insoluble in water; hydrolyzes very slowly, high degree of thermal stability; exposure to air should be minimum. Combustible.

Use: Intermediate for insecticides, component of vinyl stabilizers, lubricant additive, specialty solvent.

trihexyltin acetate. See acetoxytrihexylstannane.

tri-*n*-hexyl trimellitate. See "Morflex 560" [Reilly].

trihydric. Any alcohol in which three hydroxyl groups are present.
See polyol; glycerol.

trihydrochloride.

CAS: 146714-97-8. mf: C₂₅H₃₄N₄O₂.

Hazard: A poison.

1,2,3-trihydroxyanthraquinone. See anthragallol.

1,2,4-trihydroxyanthraquinone. See purpurin.

1,2,7-trihydroxyanthraquinone. See anthrapurpurin.

1,2,3-trihydroxybenzene. See pyrogallol.

1,3,5-trihydroxybenzene. See phloroglucinol.

3,4,5-trihydroxybenzoic acid. See gallic acid.

2,4,5-trihydroxybutyrophenone.

C₆H₄(OH)₃COC₃H₇.

Properties: Yellow-tan crystals. Mp 149–153C, bulk d 6.0 lb/gal (20C). Very slightly soluble in water; soluble in alcohol and propylene glycol.

Use: Antioxidant for polyolefins and paraffin waxes, food additive.

4,5,7-trihydroxycoumarin.

CAS: 17575-26-7. mf: C₉H₆O₅.

Hazard: Moderately toxic by ingestion.

tri(2-hydroxyethyl)amine. See triethanolamine.

trihydroxyethylamine oleate. (triethanolamine oleate). (HOCH₂CH₂)₃•HOOC₁₇H₃₃. Sur-

factant made by reaction of triethanolamine with oleic acid. Combustible.

Use: Emulsifying agent.

trihydroxyethylamine stearate. (triethanolamine stearate). (HOCH₂CH₂)₃N•HOOC₁₇H₃₅.

Properties: Cream-colored, waxlike solid; faint fatty odor. D 0.968, pH 8.8–9.2 (25C) (5% aqueous dispersion), mp 42–44C. Soluble in methanol, ethanol, mineral oil, vegetable oil; dispersible in hot water. Combustible.

Use: Emulsifying agent for cosmetic and pharmaceutical industries.

1,3,8-trihydroxy-6-methylanthraquinone.

See emodin.

2,4,6-trihydroxytoluene. See methylphloroglucinol.

2,3,5-triiodobenzoic acid. C₆H₂I₃COOH. A plant growth regulator used as a growth retardant.

2,3,5-triiodobenzoic acid sodium salt. See sodium 2,3,5-triiodobenzoate.

triiodoisopropylgermane.

CAS: 21342-26-7. mf: C₃H₇GeI₃.

Hazard: A poison.

triiodomethane. See iodoform.

triiodopropylgermane.

CAS: 13904-39-7. mf: C₃H₇GeI₃.

Hazard: A poison by ingestion.

triiodothyronine. (liothyronine; 3,5,3'-triiodothyronine). HOC₆H₃IOC₆H₄I₂CH(NH₂)COOH. Either a derivative or precursor of thyroxine. Triiodothyronine increases the metabolic rate and oxygen consumption of animal tissues.

Use: Biochemical research, medicine (metabolic insufficiency).

triisobutylaluminum. (TIBAL).

[(CH₃)₂CHCH₂]₃Al.

Properties: Colorless liquid. D 0.7876 (20C), fp –5.6C, bp 114C (30 mm Hg), flash p 32F (0C), autoign temp 39F (4C).

Derivation: Reaction of isobutylene and hydrogen with aluminum under moderate temperature and varying pressures.

Hazard: Highly toxic, destroys tissue. Flammable; dangerous fire risk; ignites spontaneously in air; reacts violently with water, acids, alcohols, amines, and halogens.

Use: Polyolefin catalyst, manufacture of primary alcohols and olefins, pyrophoric fuel.

triisobutylene. (C₄H₈)₃. A mixture of isomers readily prepared by polymerizing isobutylene. A typical mixture is 2,2,4,6,6-pentamethylheptane-3

and 2-neopentyl-4,4-dimethylpentene-1. May be depolymerized to simpler isobutylene derivatives.

Properties: Liquid. D 0.764 (60F), boiling range 175.5–178.9C. Combustible.

Use: Synthesis of resins, rubbers, and intermediate organic compounds; lubricating-oil additive; raw material for alkylation in producing high-octane motor fuels.

triisobutyltin chloride. See chloro(triisobutyl)stannane.

triisodecyl phosphite. See isodecyl phosphite.

trioctyl phosphite. (C₈H₁₇O)₃P.

Properties: Colorless liquid; characteristic odor. D 0.891 (20/4C), bp 161–164C (0.3 mm Hg), flash p 385F (196C) (COC). Miscible with most common organic solvents; insoluble in water, hydrolyzes very slowly; exposure to air should be minimum; high thermal stability. Combustible.

Use: Intermediate for insecticides, component of vinyl stabilizers, lubricant additive, specialty solvent.

O,O,O-trioctyl phosphorothioate. (trioctyl thiophosphate). (C₈H₁₇O)₃PS.

Properties: Colorless liquid; characteristic odor. Bp 160–170C (0.2 mm Hg), d 0.933, flash p 410F (210C) (COC). Insoluble in water; soluble in most organic solvents. Combustible.

Hazard: Highly toxic, cholinesterase inhibitor.

Use: Plasticizer, lubricant additive, hydraulic fluid, intermediate.

trioctyl trimellitate. C₈H₇(COOC₈H₁₇)₃.

Properties: Clear liquid; mild odor. D 0.992 (20/20C), distillation range 272–286C (5–95%), fp a gel at –45C, refr index 1.4852 (23C). Practically insoluble in water. Combustible.

Use: Plasticizer.

triisopropanolamine. N(C₃H₇OH)₃.

Properties: Crystalline, white solid. Mild base (a mixture of isopropanolamines that has density of 1.004–1.010 and is liquid at room temperature is also marketed). D 0.9996 (50/20C), mp 45C, bp 305C, vap press below 0.01 mm Hg (20C), viscosity 1.38 cP (60C), flash p 320F (160C) (OC). Soluble in water. Combustible.

Grade: Technical.

Hazard: Irritant to skin and eyes.

Use: Emulsifying agents.

triisopropyl borate. [(CH₃)₂CH]₃BO₃.

Properties: Colorless liquid. Bp 138–140C, fp –59C, d 0.8138, flash p 82F (27.7C) (TCC).

Derivation: Reaction of isopropyl alcohol with boric oxide.

Hazard: Flammable, moderate fire risk.

triisopropyl phosphite. [(CH₃)₂CH]₃PO₃.

Properties: Colorless liquid; characteristic odor. D 0.914 (20/4C), bp 94–96C (50 mm Hg), flash p 165F (73.9C) (COC). Miscible with most common organic solvents; insoluble in water; hydrolyzes slowly in water; exposure to air should be minimum; high thermal stability. Combustible.

Use: Intermediate for insecticides, component of vinyl stabilizers, lubricant additive, specialty solvent.

triisopropyltin acetate.

CAS: 19464-55-2. mf: C₁₁H₂₄O₂Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triisopropyltin chloride.

CAS: 14101-95-2. mf: C₉H₂₁ClSn.

Hazard: A poison by ingestion.

triisopropyltin undecylenate.

CAS: 73928-00-4. mf: C₂₀H₄₂O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

triketohydrindene hydrate. See ninhydrin.

trilaurin. The glyceride of lauric acid (glyceryl trilaurate).

trilaurylamine. (tridodecyl amine). (C₁₂H₂₅)₃N.

Properties: Colorless liquid. D 0.82, mp 14C. Soluble in organic solvents; insoluble in water. Combustible.

Use: Chemical intermediate, metal complexes.

trilauryl phosphite. (C₁₂H₂₅O)₃P.

Properties: Water-white liquid. D 0.866 (25/15C), refr index 1.456 (25C), mp 10C. Combustible.

Use: Stabilizer in polymers, chemical intermediate.

trilauryl trithiophosphite. (C₁₂H₂₅S)₃P.

Properties: Pale yellow liquid. D 0.915 (25/15C), mp 20C, refr index 1.502 (25C), flash p 430F (221C) (COC). Combustible.

Use: Stabilizer, lubricant, chemical intermediate.

“Trilene” [Great Lakes/Asia Pacific]. TM for liquid EPDM.

trimagnesium phosphate. See magnesium phosphate, tribasic.

trimec.

CAS: 8077-38-1.

mf: C₁₀H₁₁ClO₃•C₈H₆Cl₂O₃•C₈H₆Cl₂O₃•C₂H₇N.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

trimedlure. (generic name for *tert*-butyl 4(or 5)-chloro-2-methylcyclohexanecarboxylate).

H₃C(Cl)C₆H₅COOC(CH₃)₃.

Properties: Liquid. Bp 90–92C (0.6 mm Hg). Soluble in most organic solvents; insoluble in water.
Use: Insect attractant.

trimellitic acid. (1,2,4-benzenetricarboxylic acid).

CAS: 528-44-9. $C_6H_4O_6$.

Properties: Colorless crystals. Mp 220C. Partially soluble in DMF and alcohol; insoluble in benzene and carbon disulfide; slightly soluble in water.

Derivation: Oxidation of pseudocumene.

Use: Organic synthesis (plasticizers, polymers, and similar products).

trimellitic anhydride. (TMA; 1,2,3-benzenetricarboxylic acid-1,2-anhydride).

CAS: 552-30-7.

$\text{HOCOC}_6\text{H}_3\text{COOCO}$.

Properties: Solid. Mp 164–166C. Combustible.

Derivation: From pseudocumene.

Hazard: Toxic by inhalation. TLV: 0.005 ppm.

Use: Plasticizer for polyvinylchloride, alkyd coating resins, high-temperature plastics, wire insulation, gaskets, automotive upholstery.

“Trimene Base” [Uniroyal]. TM for a reaction product of ethyl chloride, formaldehyde, and ammonia.

Properties: Dark-brown, viscous liquid. D 1.10. Soluble in water and acetone; insoluble in gasoline and benzene.

Use: Rubber accelerator.

trimer. An oligomer whose molecule is comprised of three molecules of the same chemical composition. Examples are trioxane and tripropylene. See polymer; dimer.

trimercuric orthophosphate. See mercuric phosphate.

trimercurous orthophosphate. See mercurous phosphate.

trimesoyl trichloride. (benzene-1,3,5-tricarboxylic acid chloride). $C_6H_3(COCl)_3$.

Use: Specialty organic.

trimethadione. (3,5,5-trimethyl-2,4-oxazolidinedione).

CAS: 127-48-0.

C_6H_9NO or $OC(O)N(CH_3)C(O)C(CH_3)_2$.

Properties: White, granular, crystalline substance; camphorlike odor. Mp 45–47C. Soluble in water; freely soluble in alcohol, chloroform, and ether; pH 6.0 (5% solution).

Grade: USP.

Hazard: May have adverse side effects; toxic in overdose.

Use: Medicine (anticonvulsant).

trimethoxyborine. See trimethyl borate.

trimethoxyboroxine. (methyl metaborate). $(CH_3O)_3B_3O_3$. A cyclic compound.

Properties: Colorless liquid. Mp 10–11C, bp (disassociates), d 1.216 (25C), refr index 1.3986. Non-flammable.

Derivation: Reaction of methyl borate with boric acid.

Grade: 99%.

Use: Metal-fire extinguishing fluid.

trimethoxymethane. See methyl orthoformate.

3,4,5-trimethoxyphenethylamine. See mescaline.

2,4,5-trimethoxy-1-propenylbenzene. (asarone). $(CH_3O)_3C_6H_2CH:CHCH_3$.

Properties: Crystals. Mp 67C. Insoluble in water; soluble in alcohol.

Derivation: Either extracted from calamus oil or synthesized (Wittig reaction).

Use: Grain fumigant, insect chemisterilant.

3,4,5-trimethoxy-*n*-(4-propylcyclohexyl)benzamide.

CAS: 315706-65-1. mf: $C_{19}H_{29}NO_4$.

Hazard: A poison by ingestion.

3-(trimethoxysilyl)propyl chloride.

CAS: 2530-87-2. mf: $C_6H_{15}ClO_3Si$.

Hazard: A poison by ingestion and skin contact.

***n*-(3-(trimethoxysilyl)propyl)-1,3-propanediamine.**

CAS: 25147-91-5. mf: $C_9H_{24}N_2O_3Si$.

Hazard: A poison by ingestion and skin contact. A mild skin and severe eye irritant.

3-(trimethoxysilyl)-*n*-(3-(trimethoxysilyl)propyl)-1-propanamine.

CAS: 82985-35-1. mf: $C_{12}H_{31}NO_6S_{12}$.

Hazard: A poison by ingestion and skin contact. A moderate skin and severe eye irritant.

trimethylacetylhydrazide ammonium chloride. See Girard's T Reagent.

trimethylacetic acid. (pivalic acid; neopentanoic acid).

CAS: 75-98-9. $(CH_3)_3CCOOH$.

Properties: Colorless crystals. D 0.905 (50C), refr index 1.3931 (36.5C), mp 35.5C, bp 163.8C. Soluble in water, alcohol, and ether. Combustible.

Use: Intermediate, as a replacement for some natural materials.

trimethylacetic acid sodium salt. See sodium 2,2-dimethylpropanoate.

trimethyladipic acid. $C_9H_{16}O_4$.

Properties: Powder. Combustible.

Use: Esterification agent for plasticizers, lubricants, alkyd resins, polyurethane, polyester, special polyamides; intermediate for the production of glycols.

trimethylaluminum. (aluminum trimethyl; ATM).

CAS: 75-24-1. $(CH_3)_3Al$.

Properties: Colorless, pyrophoric liquid. Bp 126C, mp 15.4C, d 0.752.

Derivation: By sodium reduction of dimethylaluminum chloride.

Hazard: Highly flammable; dangerous fire risk; flames instantly on contact with air; reacts violently with water, acids, halogens, alcohols, and amines.

Use: Catalyst for olefin polymerization, pyrophoric fuel, manufacture of straight-chain primary alcohols and olefins, to produce luminous trails in upper atmosphere to track rockets.

trimethylamine. (TMA).

CAS: 75-50-3. $(CH_3)_3N$.

Properties: Colorless gas at room temperature; fishy ammoniacal odor; readily liquefied. Anhydrous form shipped as liquefied compressed gas. D 0.6621 (-5C), bp -4C, fp -117.1C, autoign temp 374F (190C), flash p 10F (-12.2C) (CC), flash p (25% solution) 38F (3.3C) (TOC). Soluble in water, alcohol, and ether.

Derivation: Interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di-, and trimethylamines are produced, and yields are regulated by conditions.

Method of purification: Azeotropic or extractive distillation.

Grade: Anhydrous 99% min, aqueous solution 25, 30, 40%.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2–11.6%. Toxic by inhalation, vapor highly irritating. TLV: 10 ppm; STEL 15 ppm.

Use: Organic synthesis, especially of choline salts, warning agent for natural gas, manufacture of disinfectants, flotation agent, insect attractant, quaternary ammonium compounds, plastics.

trimethylamine sulfur trioxide.

$(CH_3)_3N \cdot SO_3$.

Properties: White powder. Mp 232–238C (decomposes). Soluble in hot water, ethanol; soluble with difficulty in cold water and acetone; not dissociated in benzene and chloroform solutions; distinctly different from the isomeric adduct of trimethylamine oxide and sulfur dioxide.

Use: Separation of isomers, soil sterilant, catalyst for thermosetting resins.

2,4,5-trimethylaniline. See pseudocumidine.

***n,n*,4-trimethylaniline.**

CAS: 99-97-8. mf: $C_9H_{13}N$.

Hazard: A poison.

trimethyl benzene.

CAS: 25551-13-7. $(CH_3)_3C_6H_3$.

Properties: Liquid. Mw 120.9. Insoluble in water.

Hazard: TLV: 25 ppm.

Use: Raw material for chemical synthesis.

1,2,3-trimethylbenzene. See hemimellitene.

1,2,4-trimethylbenzene. See pseudocumene.

1,3,5-trimethylbenzene. See mesitylene.

(trimethylbenzyl)dodecyldimethyl ammonium chloride.

$[(CH_3)_3C_6H_4CH_2N(CH_3)_2C_{12}H_{25}]Cl$. A quaternary ammonium salt.

Properties: White to slightly yellow, crystalline powder; mild odor and taste. Mp 162–163C, bulk d 4.62 lb/gal. Soluble in water, alcohol, glycerol, acetone; pH of 10% solution in distilled water 4.4.

Use: Germicide.

trimethyl borate. (methyl borate; trimethoxyborine).

CAS: 121-43-7. $(CH_3O)_3B$.

Properties: Water-white liquid. Bp 67–68C, d 0.915, fp -29C. Miscible with ether, methanol, hexane, tetrahydrofuran; decomposes in presence of water; flash p 80F (26.6C).

Derivation: Reaction of boric acid and methanol.

Hazard: Flammable, fire risk, reacts with water and oxidizing agents.

Use: Solvent, dehydrating agent, fungicide for citrus fruit, neutron scintillation counters, brazing flux, boron compounds, catalyst.

2,2,3-trimethylbutane. (isopropyltrimethylmethane; triptane). $CH_3C(CH_3)_2C(CH_3)CH_3$.

Properties: Colorless liquid. D 0.691, bp 81.0C, fp -24.96C, refr index 1.3895 (20C). Soluble in alcohol; insoluble in water.

Hazard: Flammable, moderate fire risk.

Use: Organic synthesis, aviation fuel.

β,γ,γ -trimethylcaproaldehyde thiosemicarbazone.

CAS: 63884-77-5.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

trimethyl carbinol. See *tert*-butyl alcohol.

1,1,3-trimethyl-5-carboxy-3-(*p*-carboxyphenyl)indane. An aromatic di-acid used as an intermediate in the manufacture of polyester fibers, polyamides, and alkyd resins; hot-melt adhesives; engineering thermoplastics.

trimethylchlorosilane.CAS: 75-77-4. $(\text{CH}_3)_3\text{SiCl}$.**Properties:** Colorless liquid. Bp 57C, d 0.854 (25/25C), refr index 1.3893 (25C), flash p -18F (-27.7C). Readily hydrolyzed with liberation of hydrogen chloride; soluble in benzene, ether and perchloroethylene.**Derivation:** By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.**Hazard:** Flammable, dangerous fire risk, reacts violently with water. Strong irritant to tissue.**Use:** Intermediate for silicone fluids, as a chain-terminating agent, imparting water repellency.**trimethylchlorostannane.** See chlorotrimethylstannane.**trimethylchlorotin.** See chlorotrimethylstannanechlorotrimethylstannane.**3,3,5-trimethyl-5-cyanocyclohexanone.**
See isophoronenitrile.**trimethylcyclododecatriene.** (TMCDT). A cyclic hydrocarbon.**Use:** Intermediate in making derivatives useful in the perfume and pharmaceutical industries, as well as catalysts.**3,3,5-trimethylcyclohexanol-1.**CAS: 116-02-9. $\text{C}_6\text{H}_8(\text{CH}_3)_3\text{OH}$.**Properties:** Colorless liquid. D 0.878 (40/20C), mp 35.7C, bp 198C, flash p 165F (73.9C) (OC). Soluble in most organic solvents, hydrocarbons, oils; insoluble in water. Combustible.**Hazard:** Toxic by inhalation, strong irritant.**Use:** Menthol and camphor substitute, antifoaming agent, hydraulic fluids and textile soaps, odor masking, esterification agent, pharmaceuticals, wax additive, printing inks.**3,5,5-trimethyl-2-cyclohexen-1-one.** See isophorone.**3,3,5-trimethylcyclohexyl salicylate.** See homomenthyl salicylate.**1,7,7-trimethyl-*o*-(3-(diethylamino)-2-hydroxypropyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.**CAS: 314238-30-7. mf: $\text{C}_{17}\text{H}_{32}\text{N}_2\text{O}_2$.**Hazard:** A poison by ingestion.**1,7,7-trimethyl-*o*-(3-(2,6-dimethyl-4-morpholinyl)-2-hydroxypropyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.**CAS: 316172-59-5. mf: $\text{C}_{19}\text{H}_{34}\text{N}_2\text{O}_3$.**Hazard:** A poison by ingestion.**1,7,7-trimethyl-*o*-(3-(3,5-dimethyl-1-piperidinyl)-2-hydroxypropyl)oxime****(1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.**CAS: 316172-58-4. mf: $\text{C}_{20}\text{H}_{36}\text{N}_2\text{O}_2$.**Hazard:** A poison.**trimethyl dihydroquinoline polymer.**(TDQP). $(\text{C}_{12}\text{H}_{15}\text{N})_n$ (probably three or more quinoline groups).**Properties:** Amber pellets. D 1.08, softening p 75C. Insoluble in water; miscible with ethanol, acetone, benzene, monochlorobenzene, isopropyl acetate, and gasoline.**Use:** Antioxidant, stabilizer or polymerization inhibitor.**3,7,11-trimethyl-1,6,10-dodecatrien-3-ol.**
See nerolidol.**3,7,11-trimethyl-2-6-10-dodecatrien-1-ol.**
See farnesol.**trimethylene.** See cyclopropane.**trimethylene bromide.** (1,3-dibromopropane).CAS: 109-64-8. $\text{CH}_2\text{BrCH}_2\text{CH}_2\text{Br}$.**Properties:** Colorless liquid; sweet odor. D 1.979 (20/4C), bp 166C, fp -34.4C. Insoluble in water; soluble in organic solvents. Combustible.**Grade:** Technical, CP.**Use:** Intermediate for dyestuff and pharmaceutical industries, cyclopropane manufacture.**trimethylene chlorobromide.** See 1-bromo-3-chloropropane.**trimethylene chlorohydrin.** (3-chloro-1-propanol). $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{OH}$.**Properties:** Colorless to pale-yellow liquid; characteristic odor. D 1.130-1.150 (25/25C), refr index 1.445-1.447 (25C). Soluble in water, alcohols, and ethers; insoluble in hydrocarbons. Combustible.**Use:** Intermediate.**trimethylenedicyanide.** See glutaronitrile.**trimethylene glycol.** (1,3-propylene glycol; 1,3-propanediol).CAS: 504-63-2. $\text{CH}_2\text{OHCH}_2\text{CH}_2\text{OH}$.**Properties:** Colorless liquid; odorless. D 1.0537 (25C), bp 210-211C, autoign temp 752F (400C). Soluble in water, alcohol, and ether. Combustible.**Derivation:** From acrolein.**Grade:** Technical 95%, pure 99%.**Use:** Intermediate, especially for polyesters.**trimethylene oxide.** See oxetane.***sym*-trimethylene trinitramine.** See cyclonite.**trimethylethylene.** See 3-methyl-2-butene.

trimethylglycine. See betaine.

trimethylheptanoic acid. See isodecanoic acid.

1,7,7-trimethyl-*o*-(3-(hexahydro-1*h*-azepin-1-yl)-2-hydroxypropyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.

CAS: 314238-35-2. mf: C₁₉H₃₄N₂O₂.

Hazard: A poison by ingestion.

2,2,5-trimethylhexane.

CAS: 3522-94-9. (CH₃)₃CCH₂CH₂CH(CH₃)₂.

Properties: Colorless liquid. Fp -105.84C, bp 124.06C, d 0.711 (15.5/15.5C), refr index 1.399 (20C), flash p 55F (12.7C).

Grade: 95%, 99%; research.

Hazard: TLV: 200 ppm. Flammable, dangerous fire risk; the 2,3,3-, 2,3,4-, and 3,3,4-isomers are less flammable.

Use: Synthesis, motor-fuel additive.

3,5,5-trimethylhexan-1-ol. C₉H₂₀O.

Properties: Colorless liquid; mild odor. Bp 194C, d 0.8236 (25/4C), bulk d 6.86 lb/gal (25C), refr index 1.4300 (25C), flash p 200F (93.3C) (OC). Insoluble in water. Combustible.

Derivation: High-pressure synthesis.

Use: Synthetic lubricants, additives to lubricating oils, wetting agent, softener in manufacture of various plastics, disinfectants and germicides.

1,7,7-trimethyl-*o*-(2-hydroxy-3-((1-methylethyl)amino)propyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.

CAS: 314238-31-8. mf: C₁₆H₃₀N₂O₂.

Hazard: A poison by ingestion.

1,7,7-trimethyl-*o*-(2-hydroxy-3-(4-morpholinyl)propyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.

CAS: 314238-34-1. mf: C₁₇H₃₀N₂O₃.

Hazard: A poison by ingestion.

1,7,7-trimethyl-*o*-(2-hydroxy-3-(1-piperidinyl)propyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.

CAS: 314238-33-0. mf: C₁₈H₃₂N₂O₂.

Hazard: A poison by ingestion.

1,7,7-trimethyl-*o*-(2-hydroxy-3-(1-pyrrolidinyl)propyl)oxime (1*r*,4*r*)-bicyclo(2.2.1)heptan-2-one.

CAS: 314238-32-9. mf: C₁₇H₃₀N₂O₂.

Hazard: A poison by ingestion.

trimethylmethane. See isobutane.

trimethyl nitilotripropionate.

N(CH₂CH₂COOCH₃)₃.

Properties: Weakly basic tertiary amine and organic ester.

Use: Plasticizer for PVC, intermediate for pharmaceutical and agricultural chemicals, high-boiling solvents, low-temperature lubricants.

trimethylnonanol. See 2,6,8-trimethylnonyl-4 alcohol.

2,6,8-trimethyl-4-nonanone. (isobutyl heptyl ketone).

CAS: 123-17-1. C₁₂H₂₆O.

Properties: Water-white liquid; pleasant odor. D 0.8165 (20/20C), bulk d 6.8 lb/gal, fp -75C, bp 211-219C, viscosity 1.91 cP (20C), flash p 195F (90.5C) (COC). High solvent power for vinyl resins, the cellulose esters and ethers and many difficultly soluble substances; insoluble in water. Combustible.

Use: Solvent, dispersant, intermediate, lubricating-oil dewaxing.

2,6,8-trimethylnonyl-4-alcohol. (trimethyl-nonanol).

(CH₃)₂CHCH₂CH₂OCH₂CH(CH₃)CH₂CH(CH₃)₂.

Properties: Colorless liquid; characteristic odor. D 0.8913 (20/20C), bulk d 6.9 lb/gal (20C), bp 225.2C, fp -60C (sets to a glass), viscosity 21.4 cP, flash p 200F (93.3C) (COC). Insoluble in water. Combustible.

Derivation: Oxo process.

Use: Surface-active and flotation agents, lubricant additives, rubber chemicals.

trimethylolethane. (pentaglycerine; methyltrimethylolmethane). CH₃C(CH₂OH)₃.

Properties: Colorless, hygroscopic crystals. Soluble in water and alcohol. Combustible.

Use: Conditioning agent, manufacture of varnishes, alkyd and polyester resins, synthetic drying oils.

trimethylmelamine.

CAS: 1017-56-7. C₃N₃(NHCH₂OH)₃. The first stage in making melamine resins.

trimethylolpropane. (hexaglycerol).

C₂H₅C(CH₂OH)₃.

Properties: Colorless, hygroscopic crystals. Soluble in water and alcohol. Combustible.

Use: Conditioning agent, manufacture of varnishes, alkyd resins, synthetic drying oils, urethane foams and coatings, silicone lubricant oils, lactone plasticizers, textile finishes, surfactants, epoxidation products.

trimethylolpropane monooleate.

C₂H₅C(CH₂OH)₂CH₂OOCC₁₇H₃₃ (theoretically).

The commercial product is a mixture of mono-, di-, and triesters, free polyol, and free oleic acid. Combustible.

Properties: Oily liquid. D 0.954 (25C), fp <-20C. Insoluble in water; soluble in most organic solvents.

Use: Water-in-oil emulsifier, corrosion inhibitor,

low-temperature plasticizer, deicing agent for gasoline.

trimethylolpropane triacetoacetate. See 2-ethyl-2-(hydroxymethyl)-1,3-propanediol triacetoacetate.

trimethylolpropane tris(mercapto-propionate). $C_7H_5C(CH_2OOCCH_2CH_2SH)_3$.
Properties: Liquid. D 1.21 (25°C), refr index 1.5151 (25°C), insoluble in water and hexane, soluble in acetone, benzene, and alcohol. Combustible.

Use: Curing or cross-linking agents for polymers, especially epoxy resins, intermediate for stabilizers and antioxidants.

trimethylolpropane trithioglycolate.

Properties: Liquid. D 1.28, refr index 1.5292 (25°C). Combustible.

Use: Curing or cross-linking agent for polymeric systems, especially epoxy resins; intermediate for stabilizers and antioxidants.

2,4,5-trimethyl δ -3-oxazoline. mf: $C_6H_{11}NO$.

Properties: Yellow-orange liquid; powerful, musty, nut-like odor. D: 0.911–0.932, refr index: 1.414–1.435. Sol in alc, propylene glycol, water; insol in fixed oils.

Use: Food additive.

3,5,5-trimethyl-2,4-oxazolidinedione. See trimethadione.

2,4,8-trimethyl-5-oxo-6-oxa-3,9-dithia-2,4,7-triazadec-7-enoic acid ethyl ester.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2,2,4-trimethylpentane.

Properties: Liquid. Fp –109.43C, bp 113C, d 0.723 (60/60F), refr index 1.4042 (20C), flash p 41F (5C).

Grade: 95%, 99%; research.

Hazard: Flammable, dangerous fire risk.

Use: Intermediate, azeotropic distillation entrainer.

2,2,4-trimethyl-1,3-pentanediol.

Properties: (96% pure): White solid. D 0.928 (55/15C), mp 46–55C, bp 215–235C, flash p 235F (112.7C). Slightly soluble in water; soluble in alcohol, acetone, ether, and benzene. Combustible.

Use: Polyester resins, plasticizers, lubricants, surface coatings and printing inks, insect repellent.

2,2,4-trimethyl-1,3-pentanediol monoisobutyrate.

Properties: Liquid. D 0.945–0.955 (20/20C), bp 180–182C (125 mm Hg), pour p –57C, refr index

1.4423 (20C), flash p 245F (118.3C) (COC). Insoluble in water; soluble in benzene, alcohol, acetone, and carbon tetrachloride. Combustible.

Use: Intermediate in the manufacture of plasticizers, surfactants, pesticides, and resins.

2,4,4-trimethylpentene-1 (α -diisobutylene).

Properties: Colorless liquid. Bp 101.44C, fp –93.5C, refr index 1.4086 (20C), d 0.7150 (20C), flash p 35F (1.67C).

Derivation: Polymerization of isobutene.

Grade: 95%, 99%; research.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis; motor-fuel synthesis, particularly isooctane; peroxide reactions.

2,4,4-trimethylpentene-2. (β -diisobutylene).

Properties: Colorless liquid. Bp 104.55C, d 0.724 (60/60F), fp –106.4C, refr index 1.416 (20C), flash p 35F (1.67C) (TOC).

Grade: 95%.

Hazard: Flammable, dangerous fire risk. Irritant and narcotic in high concentration.

Use: Organic synthesis.

tri-2-methylpentylaluminum.

Properties: Colorless liquid.

Derivation: Reaction of 2-methylpentene and isobutylaluminum.

Hazard: Flammable.

Use: Polyolefin catalyst.

n,n, α -trimethylphenethylamine.

Hazard: Moderately toxic by ingestion.

2,4,6-trimethyl phenol. See mesitol.

trimethyl phosphate.

Properties: Colorless liquid, 22.1% phosphorus. D 1.210 (68F), flash p above 300F (148C), bp 193C, refr index 1.397 (20C), pour p –46C. Soluble in both gasoline and water. Combustible.

Hazard: Toxic by ingestion and inhalation, strong irritant to skin and eyes.

Use: For controlling spark plug fouling, surface ignition and rumble in gasoline engines.

trimethyl phosphite.

Properties: Colorless liquid. Bp 108–108.5C, pour p below –60C, d 1.046 (20/4C), flash p 100F (37.7C) (COC). Insoluble in water; soluble in hexane, benzene, acetone, alcohol, ether, carbon tetrachloride, and kerosene.

Hazard: Flammable, moderate fire risk. TLV: 2 ppm.

Use: Chemical intermediate, especially for insecticides.

trimethyl phosphorotriothioate.

CAS: 816-80-8. mf: $C_3H_9PS_3$.

Properties: Water-white liquid. Bp 78C (12 mm Hg).

Hazard: A poison by ingestion. Moderately toxic by skin contact. A severe eye irritant.

Use: Extraction of mineral salts from alkyl acid phosphate solvent solutions, plasticizer.

1,2,4-trimethylpiperazine. ($(CH_3)_3C_4H_7N_2$).

Properties: Colorless liquid. D 0.851 (25/25C), fp -44C, bp 151C, refr index 1.4480 (20C), flash p 257F (125C) (OC). Miscible with water. Combustible.

Use: Polymerization catalyst.

trimethylpropylmethane. See 2,2-dimethylpentane.

2,4,6-trimethylpyridine. See 2,4,6-collidine.

trimethylstannane sulphate. See trimethyltin sulphate.

3,3,6-trimethyl-2,5-thiomorpholinedione-2-(o-((methylamino)carbonyl)oxime).

CAS: 66637-26-1. mf: $C_9H_{15}N_3O_3S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

trimethyltin acetate.

CAS: 1118-14-5. mf: $C_5H_{12}O_2Sn$.

Properties: White crystals. Mp: 196–197°. Spar sol in $CHCl_3$ and CCl_4 .

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

trimethyltin cyanate.

CAS: 73940-86-0. mf: C_4H_9NOSn .

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg/ m^3 (skin)

trimethyltin hydroxide.

CAS: 56-24-6. mf: $C_3H_{10}OSn$.

Properties: Colorless, white crystals. Mp: 118° (decomp). Sol in water and many org solv.

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

Use: Drug.

trimethyltin iodide. See iodotrimethyltin.

trimethyltin isothiocyanate. See isothiocyanatotrimethyltin.

trimethyltin sulphate.

CAS: 63869-87-4. mf: $C_3H_9O_4SSn$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

trimethyltin thiocyanate.

CAS: 4638-25-9. mf: C_3H_9NSSn .

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

2,4,6-trimethyl-1,3,5-trioxane. See paraldehyde.

1,3,5-trimethyl-2,4,6-tris(3,5-di-tert-butyl-4-hydroxybenzyl)benzene.

Properties: Free-flowing, white, crystalline powder; no odor. Mp 244C. Partially soluble in benzene and methylene chloride; insoluble in water. Permissible in contact with food products. Combustible.

Use: Antioxidant for polypropylene, high-density polyethylene, spandex fibers, polyamides and specialty rubbers.

2,6,10-trimethyl-9-undecen-1-al.

$(CH_3)_2C:CHC_2H_4CH(CH_3)C_4H_8CH(CH_3)CHO$.

Properties: Clear, yellow liquid; strong, pungent, ozonelike odor. D 0.850–0.860 (25/25C), refr index 1.4530–1.4630 (20C). Combustible.

Use: Perfume.

trimethylvinylammonium hydroxide. See neurine.

trimethylxanthine. See caffeine.

(+)-trimipramine.

CAS: 3564-66-7. mf: $C_{20}H_{26}N_2$.

Hazard: A poison by ingestion.

“Trimmit” [Syngenta].

CAS: 76738-62-0. mf: $C_{15}H_{20}ClN_3O$. TM for a plant growth regulator for turfgrass.

Hazard: Moderately toxic by ingestion. A reproductive hazard.

Use: Agricultural chemical.

trimyristin. The glyceride of myristic acid, glyceryl trimyristate.

trineophyltin acetate.

CAS: 1636-70-0. mf: $C_{32}H_{42}O_2Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/ m^3 . STEL 0.2 mg/ m^3 (skin) Not classifiable as a human carcinogen

trinickelous orthophosphate. See nickel phosphate.

trinitite. Green glazed glass material produced by the 100 million degree fahrenheit heat from an atomic explosion. It was named for Trinity, New Mexico, a sand-covered site 80 miles from the Almagordo atomic bomb test site.

trinitroaniline. (picramide).

CAS: 489-98-5. $C_6H_2NH_2(NO_2)_3$.

Properties: Orange-red crystals. Mp 188C, bp (explodes), d 1.762.

Derivation: Nitrating aniline in glacial acetic acid solution or by the use of mixed nitric-sulfuric acid in limited amounts.

Hazard: Dangerous, explodes by heat or shock.

Use: Explosive compositions.

trinitroanisole. (methyl picrate; 2,4,6-trinitrophenyl methyl ether). $\text{CH}_3\text{OC}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Crystals, mp 68.4C, d 1.408 (20/4C).

Hazard: High. Dangerous, explodes by heat or shock.

Derivation: Interaction of methyl iodide and silver picrate, nitration of anisic acid.

Use: Explosive compositions.

1,3,5-trinitrobenzene. (TNB).

CAS: 99-35-4. $\text{C}_6\text{H}_3(\text{NO}_2)_3$.

Properties: Yellow crystals. D 1.688 (20/4C), mp 122C. Soluble in alcohol and ether; insoluble in water.

Derivation: From trinitrotoluene by removal of the methyl group.

Hazard: Dangerous, explodes by heat or shock.

Use: Explosive compositions.

2,4,6-trinitrobenzoic acid. (trinitrobenzoic acid).

CAS: 129-66-8. $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{COOH}$.

Properties: Orthorhombic crystals. Mp 228.7C. Sublimes with decomposition, forming carbon dioxide and trinitrobenzene; slightly soluble in water and benzene; soluble in alcohol, ether, and acetone.

Derivation: Oxidation of 2,4,6-trinitrotoluene with chromic acid.

Hazard: Dangerous, explodes by heat or shock.

Use: Explosive compositions.

2,4,6-trinitrobenzenesulfonic acid.

CAS: 2508-19-2. mf: $\text{C}_6\text{H}_3\text{N}_3\text{O}_9\text{S}$.

Hazard: A poison.

2,4,6-trinitro-1,3,5-benzenetriamine.

CAS: 3058-38-6. mf: $\text{C}_6\text{H}_6\text{N}_6\text{O}_6$.

Hazard: Low toxicity by ingestion and inhalation. A mild eye irritant.

4,4,4-trinitrobutyric acid.

CAS: 5029-46-9. mf: $\text{C}_4\text{H}_5\text{N}_3\text{O}_8$.

Hazard: A poison by inhalation. Moderately toxic by ingestion.

2,4,6-trinitro-*m*-cresol. (cresolite; cresylite). $(\text{NO}_2)_3\text{C}_6\text{H}(\text{CH}_3)\text{OH}$.

Properties: Yellow crystals. Mp 106C. Readily soluble in alcohol, ether, and acetone.

Derivation: Prepared from *m*-cresol by a process similar to that in picric acid is prepared from phenol.

Hazard: Explodes at 300F (148.8C), severe explosion risk when shocked or heated.

Use: Bursting charges and other high explosive uses.

2,4,7-trinitrofluoren-9-one.

CAS: 129-79-3. mf: $\text{C}_{11}\text{H}_5\text{N}_3\text{O}_7$.

Properties: Pale-yellow needles from AcOH or C_6H_6 . Mp: 176°.

Hazard: Suspected carcinogen. Mildly toxic by ingestion. A skin and eye irritant.

trinitroglycerin. See nitroglycerin.

trinitromethane.

CAS: 517-25-9. $\text{CH}(\text{NO}_2)_3$.

Properties: White crystals. Mp 15C, d 1.469 (25C), decomposes above 25C, heat of combustion 746 cal/g. Soluble in water.

Derivation: Reaction of acetylene with nitric acid.

Hazard: Explodes on heating, concentrations above 50% in air may explode.

Use: Manufacture of propellants and explosives.

1,3,5-trinitronaphthalene. (naphite).

$\text{C}_{10}\text{H}_5(\text{NO}_2)_3$. Commercial preparation is a mixture of isomers that melts at 110C.

Hazard: Explosion risk when shocked or heated.

Use: Explosive, stabilizer for nitrocellulose.

trinitrophenol. See picric acid.

2,4,6-trinitrophenyl methyl ether. See trinitroanisole.

trinitrophenylmethylnitramine. See tetryl.

2,4,6-trinitroresorcinol. Legal label name for styphnic acid.

2,4,6-trinitrotoluene. (TNT; methyltrinitrobenzene).

CAS: 118-96-7. $\text{CH}_3\text{C}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Yellow, monoclinic needles. D 1.654, mp 80.9C. Soluble in alcohol and ether; insoluble in water.

Derivation: Nitration of toluene with mixed acid. Small amounts of the 2,3,4- and 2,4,5-isomers are produced that may be removed by washing with aqueous sodium sulfite solution.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, moderate explosion risk, will detonate only if vigorously shocked or heated to 450F (232C). Toxic by ingestion, inhalation, and skin absorption. TLV: 0.1 ppm.

Use: Explosive, intermediate in dyestuffs and photographic chemicals.

trinitrotrimethylenetriamine. See cyclonite.

trioctadecyl phosphite. $(C_{18}H_{37}O)_3P$.

Properties: White, waxy solid. Mp 45–47C, d 0.940 (25/25C).

Use: Stabilizer in polymers; intermediate.

tri-*n*-octylaluminum. $(C_8H_{17})_3Al$.

Properties: Colorless, pyrophoric liquid.

Derivation: Reaction between octene and isobutylaluminum.

Hazard: Flammable, ignites in air.

Use: Polyolefin catalyst.

trioctyl(butylthio)stannane. See (butylthio)trioctylstannane.

trioctyl(ethylthio)stannane. See (ethylthio)trioctylstannane.

trioctyl phosphate. (octyl phosphate). $(C_8H_{17})_3PO_4$.

Properties: Liquid, d 0.924 (26C), bp 220–30 (8 mm Hg). Soluble in alcohol, acetone, and ether. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Solvent, antifoaming agent, plasticizer.

tri-*n*-octylphosphine oxide.

CAS: 78-50-2. mf: $C_{24}H_{51}OP$.

Hazard: A severe eye and moderate skin irritant.

trioctylphosphinic oxide. (TOPO).

$(C_8H_{17})_3PO$.

Properties: Solid. Mp 55C, min purity 95%.

Use: Reagent for extraction of metals from aqueous and nonaqueous solutions, including fissionable actinide elements.

trioctyl phosphite. See tris-2-ethyl-hexyl phosphite.

tri-*n*-octyltin chloride.

CAS: 2587-76-0. mf: $C_{24}H_{51}ClSn$.

Hazard: Moderately toxic by ingestion.

triolein. See olein.

triose. A simple sugar with a backbone containing three carbon atoms.

sym-trioxane. (triformol; trioxin; metaformaldehyde).

$(CH_2O)_3$ or $CH_2OCH_2OCH_2O$. A trimer of formaldehyde, not to be confused with paraformaldehyde, which consists of eight or more formaldehyde units.

Properties: White crystals; formaldehyde odor. Mp 62C, sublimates at 115C, flash p 113F (45C) (OC),

autoign temp 777F (413C). Soluble in water, alcohol and ether.

Derivation: By distillation of formaldehyde with an acid catalyst and extraction with solvent.

Hazard: Moderate fire risk, explosive limits in air 3.6–29%.

Use: Organic synthesis; disinfectant; nonluminous, odorless fuel.

See formaldehyde.

2,6,8-trioxypurine. See uric acid.

tripalmitin. (palmitin; glyceryl tripalmitate).

$C_3H_5(OOCC_{15}H_{31})_3$.

Properties: White, crystalline powder. Mp 65.5C, d 0.866 (80/4C). Soluble in ether and chloroform; insoluble in water. Combustible.

Derivation: From glycerol and palmitic acid.

Grade: Technical.

Use: Soap, leather dressing.

trip balance. Stabilized pan balance in which plates or pans are positioned above an equal arm beam.

tripelennamine citrate.

CAS: 91-81-6. $C_{16}H_{21}N_3 \cdot C_6H_8O_7$. 2-[benzyl-(2-dimethylaminoethyl)amino]pyridine dihydrogen citrate.

Properties: White, bitter, crystalline powder. Solutions are acid to litmus. Mp 107C. Soluble in water and alcohol; very slightly soluble in ether; practically insoluble in chloroform and benzene; 1% solution in water has a pH of 4.3.

Grade: USP.

Hazard: Toxic by ingestion.

Use: Medicine (antihistamine, sunburn treatment).

tripentaerythritol. $C_{15}H_{32}O_{10}$.

Properties: White to ivory powder; has eight primary hydroxyl groups, all esterifiable. Melting range 225–240C. Combustible.

Use: Hard resins, varnishes, and fast-drying tall-oil vehicles.

tri-*n*-pentyltin bromide. See bromotripentylstannane.

triphenol phosphorus. See 1,1,3-tris(hydroxyphenyl)-propane.

triphenylamine.

CAS: 603-34-9. $C_{18}H_{15}N$.

Properties: Monoclinic crystals from EtOAc. D 0.774 @ 0°C, mp 127°C, bp 195–205°C @ 10–22 mm, mw 245.34.

Hazard: TLV: 5 mg/m³.

triphenylantimony. (triphenylstibine).

CAS: 603-36-1. $Sb(C_6H_5)_3$.

Properties: White, crystalline solid. D 1.434 (25C), mp 46–53C, bp below 360C. Insoluble in water;

slightly soluble in alcohol; soluble in most organic solvents. Combustible.

Derivation: Reaction of antimony trichloride with phenyl magnesium bromide or phenyl sodium.

Use: Stibonium salts, cocatalyst in converting trienes to aromatics and hydroaromatics, reacts with nitric-sulfuric acid to give trinitro derivatives, polymerization inhibitor, lubricating-oil additive.

triphenylborane.

CAS: 960-71-4. mf: $C_{18}H_{15}B$.

Hazard: A severe eye irritant.

triphenylboron. $B(C_6H_5)_3$. A type of Lewis acid used as catalyst and intermediate.

triphenyl formazan. $CN_4H(C_6H_5)_3$. Red, insoluble derivative of tetrazolium chloride, formed when the latter comes into contact with viable portions of a seed.

Use: Germination and viability tests.

triphenylguanidine. (TPG).

$C_6H_5NC(C_6H_5NH)_2$.

Properties: White, crystalline powder. D 1.10, mp 144C. Soluble in alcohol. Combustible.

Derivation: Desulfurization of thiocarbonyl in the presence of aniline.

Use: Accelerator for vulcanization of rubber.

triphenylmethane dyes. Any of a group of dyes whose molecular structure is basically derived from $(C_6H_5)_3CH$, usually by substitution of NH_2 , OH , HSO_3 , or other groups or atoms for some of the hydrogen of the C_6H_5 groups. Many coal tar and synthetic dyes are of this class, including rosaniline, fuchsin, malachite green, and crystalline violet. See triarylmethane dye.

triphenylmethane triisocyanate. Available as a brown 20% solution in methylene chloride.

Use: Bonding uncured rubber to metal or other surfaces.

triphenylmethylhexafluorophosphate.

Properties: Orange-colored, free-flowing, crystalline powder.

Use: Catalyst in the manufacture of polyoxymethylenes (polymers of formaldehyde and trioxane). See acetal resin.

triphenyl phosphate. (TPP).

CAS: 115-86-6. $PO(OC_6H_5)_3$.

Properties: Colorless, crystalline powder; odorless. Mp 50C, bp 245C (11 mm Hg mercury), d 1.268 (60C), bulk d 10.5 lb/gal, refr index 1.550 (60C), flash p 428F (220C) (CC). Soluble in most lacquers, solvents, thinners, oils; insoluble in water. Combustible.

Derivation: Interaction of phenol and phosphorus oxychloride.

Grade: Technical.

Hazard: Toxic by inhalation. TLV: 3 mg/m³; not classifiable as a human carcinogen.

Use: Fire-retarding agent, plasticizer for cellulose acetate and nitrocellulose.

triphenylphosphine. See triphenylphosphorus.

triphenylphosphine monosulfide.

CAS: 3878-45-3. mf: $C_{18}H_{15}PS$.

Hazard: A poison.

triphenyl phosphite.

CAS: 101-02-0. $(C_6H_5O)_3P$.

Properties: Water-white to pale-yellow solid or oily liquid; pleasant odor. D 1.184 (25/25C), mp 22–25C, bp 155–160C (0.1 mm Hg), refr index 1.589 (25C), flash p 425F (218.3C) (COC). Combustible.

Use: Chemical intermediate, stabilizer systems for resins, metal scavenger, diluent for epoxy resins.

triphenylphosphorus. (triphenylphosphine).

$(C_6H_5)_3P$.

Properties: White, crystalline solid. Mp 79–82C, bp above –360C, d 1.132 (25C), flash p 356F (180C) (OC). Insoluble in water; slightly soluble in alcohol; soluble in benzene, acetone, carbon tetrachloride. Combustible.

Derivation: By a modified Grignard synthesis.

Use: Synthesis of organic compounds, phosphonium salts, other phosphorus compounds, polymerization initiator.

triphenyl-2-propenyl-stannane. See allyl-triphenyltin.

triphenylstannane sulfate (2:1). See bis(triphenyltin)sulfate.

triphenylstannyl benzoate.

CAS: 910-06-5. mf: $C_{25}H_{20}O_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triphenylstibine. See triphenylantimony.

triphenyltetrazolium chloride. See tetrazolium chloride.

triphenylthiocyanatostannane.

CAS: 7224-23-9. mf: $C_{19}H_{15}NSSn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triphenyltin *p*-acetamidobenzoate.

CAS: 2847-65-6. mf: $C_{27}H_{23}NO_3Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

triphenyltin acetate.

CAS: 900-95-8. $(C_6H_5)_3SnOOCCH_3$. An agricultural

biocide, white crystalline solid, made by reaction of sodium acetate with triphenyltin chloride.

Hazard: Irritant to skin. TLV: 0.1 mg (Sn)/m³.

triphenyltin benzoate. See triphenylstannyl benzoate.

triphenyltin chloride.

CAS: 639-58-7. (C₆H₅)₃SnCl.

Properties: White, crystalline solid. Mp 106C, bp 240C (13.5 mm Hg). Insoluble in water; soluble in organic solvents.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Hazard: An irritant to skin. TLV: 0.1 mg (Sn)/m³.

Use: Biocidal intermediate.

triphenyltin cyanoacetate.

CAS: 73927-89-6. mf: C₂₁H₁₇NO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

triphenyltin hydroxide.

CAS: 76-87-9. (C₆H₅)₃SnOH.

Properties: White solid. Mp 118–120C. Insoluble in water; soluble in ether, benzene, and alcohol.

Hazard: Irritant to skin. TLV: 0.1 mg (Sn)/m³.

Use: Insect chemisterilant, fungicide.

triphenyltin iodide. See iodotriphenylstannane.

triphenyltin levulinate.

CAS: 23292-85-5. mf: C₂₃H₂₂O₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triphenyltin methanesulfonate.

CAS: 13302-08-4. mf: C₁₉H₁₈O₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triphenyltin propiolate.

CAS: 67410-20-2. mf: C₂₁H₁₆O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

triphenyltin thiocyanate. See triphenylthiocyanatostannane.

triphenyl-1h-1,2,4-triazol-1-yl tin.

CAS: 974-29-8. mf: C₂₀H₁₇N₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triphosgene. See hexachloromethylcarbonate.

triphosphoric acid. See polyphosphoric acid.

triple bond. A highly unsaturated linkage between the two carbon atoms of acetylenic com-

pounds (alkynes), typified by acetylene (HC≡CH). See double bond; chemical bonding.

triple point. The temperature and pressure at which the solid, liquid, and vapor of a substance are in equilibrium with one another. Also applied to similar equilibrium between any three phases, i.e., two solids and a liquid, etc. The triple point of water is +0.072C at 4.6 mm Hg; it is of special importance because it is the fixed point for the absolute scale of temperature.

See Plait point.

triple superphosphate. A dry, granular, free-flowing product, gray in color. Produced by addition of phosphoric acid to phosphate rock, thus avoiding formation of insoluble gypsum, as in superphosphate, and achieving three times the amount of available phosphate (as P₂O₅). Typical analysis: moisture 2%, available P₂O₅ 50%, water solution P₂O₅ 45%, free phosphoric acid 1%, also minor ingredients.

Use: Fertilizer.

See superphosphate; nitrophosphate.

triplet. An electronic state of a molecule in which two spins are aligned. This term is derived from spectroscopy: a system of two aligned spins has three possible orientations with respect to a magnetic field; each has a different energy, resulting in sets of three field-dependent spectral lines

See doublet; singlet.

tripoli. (amorphous silica; cristobalite; rottenstone; silicon dioxide).

CAS: 1317-95-9.

Properties: Soft, porous granules resulting from natural decomposition of siliceous rock.

Grade: Various grades according to fineness for polishing; rose, cream, white.

Hazard: TLV: Respirable Fraction: 0.05 mg/m³.

Use: Abrasive, polishing powder, filtering material, absorbent for insecticidal chemicals, paints (inert filler, wood filler), rubber filler, base for scouring soaps and powders, oil-well drilling muds.

tripolyphosphate. See sodium tripolyphosphate.

tripotassium dicitratobismuthate. See bis-muth subcitrate.

tripotassium orthophosphate. See potassium phosphate, tribasic.

tripotassium phosphate. See potassium phosphate, tribasic.

tripropionin. See glyceryl tripropionate.

tri-*n*-propylaluminum. (C₃H₇)₃Al.

Properties: Colorless, pyrophoric liquid. D 0.820; fp -84C.

Derivation: Reaction of propylene and isobutyl-aluminum.

Hazard: Flammable, dangerous fire risk, ignites spontaneously in air.

Use: Polyolefin catalyst.

tripropylamine.

CAS: 102-69-2. (CH₃CH₂CH₂)₃N.

Properties: Water-white liquid; amine odor. Fp -94C, boiling range 150–156C, d 0.754 (20/20C), refr index 1.417 (20C), flash p 105F (40.5) (OC). Combustible.

Hazard: Moderate fire risk. Toxic by inhalation and ingestion.

tripropyl(butylthio)stannane.

CAS: 67445-50-5. mf: C₁₃H₃₀SSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

tripropylene. (propylene trimer). (C₃H₆)₃.

Properties: Colorless liquid. D 0.738 (20/20C), boiling range 133.3–141.7C, bulk d 6.17 lb/gal (60F), flash p 75F (23.9C) (TOC).

Derivation: Catalytic polymerization of propylene.

Hazard: Flammable, dangerous fire risk.

Use: Oxo feed stock, lubricant additive, plasticizers, nonyl phenol.

tripropylene glycol.

CAS: 24800-44-0. HO(C₃H₆O)₂C₃H₆OH.

Properties: Colorless liquid. Supercools instead of freezing, bp 268C, d 1.019 (25/25C), bulk d 8.51 lb/gal, refr index 1.442 (25C), flash p 285F (140.5C). Soluble in water, methanol, ether. Combustible.

Use: Intermediate in resins, plasticizers, pharmaceuticals, insecticides, dyestuffs, mold lubricants.

tripropylene glycol monomethyl ether.

CAS: 20324-33-8. HO(C₃H₆O)₂C₃H₆OCH₃.

Properties: Colorless liquid. D 0.961 (25C), bp 242C, 116C (10 mm Hg), viscosity 5.5 cP (25C), refr index 1.427 (25C), flash p 250F (121C). Miscible with water, VM&P naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, and monochlorobenzene. Combustible.

Use: Ingredient in hydraulic fluids.

tripropyltin acetate.

CAS: 3267-78-5. mf: C₁₁H₂₄O₂Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tri-*n*-propyltin bromide. See bromotripropylstannane.

tripropyltin chloride. See chlorotripropylstannane.

tripropyltin iodide.

CAS: 7342-45-2. mf: C₉H₉ISn.

Properties: Colorless liquid. D: 1.692 @ 16°, mp: -53°, bp: 262°. Sol in org solv.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tripropyltin iodoacetate.

CAS: 73927-92-1. mf: C₁₁H₂₃IO₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tripropyltin-*o*-iodobenzoate. See (*o*-iodobenzoyloxy)tripropylstannane.

tripropyltin isothiocyanate.

CAS: 31709-32-7. mf: C₁₀H₂₁NSSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

tripropyltin trichloroacetate.

CAS: 73927-99-8. mf: C₁₁H₂₁Cl₃O₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

triptane. See 2,2,3-trimethylbutane.

triptolide 12,13-chlorhydrin.

CAS: 132368-08-2. mf: C₂₀H₂₅ClO₆.

Hazard: A reproductive hazard.

tris- A prefix indicating that a certain chemical grouping occurs three times in a molecule, e.g., tris(hydroxymethyl)aminomethane (CH₂OH)₃CNH₂.
See bis-

tris amine buffer. See tris(hydroxymethyl)aminomethane.

tris(aminoethyl)amine. See 2,2',2''-nitriolo-tris(ethylamine).

tris(1-aziridinyl)phosphine oxide. Legal label name for triethylenephosphoramidate.

2,4,6-tris(1-aziridinyl)-*s*-triazine. See triethylenemelamine.

trisazo dye. One of the four kinds of azo dyes, characterized by the presence of three azo couplings (-N=N-) in each molecule. (CI 30000 to 34999).

tris(2-chloroethyl) phosphate.

CAS: 115-96-8. (ClC₂H₄O)₃PO.

Properties: Clear, transparent liquid. D 1.425 (20/20C), bp 214C (25 mm Hg), refr index 1.4721 (20C), flash p 421F (216C) (COC). Combustible.

Use: Flame-retardant plasticizer.

tris(2-chloroisopropyl) thionophosphate.

[CH₂(CH₂Cl)CHO]₃PS.

Properties: Liquid. Phosphorus content 9.0%, d 1.282 at (20C), flash p above 347F (175C) (OC),

pour p below -50C . Readily soluble in gasoline; insoluble in water. Combustible.

Use: To extend spark plug life, to control deposit-induced knocking in gasoline engines.

tris(2-chloroethyl) phosphite.

CAS: 140-08-9. $(\text{ClC}_2\text{H}_4\text{O})_3\text{P}$.

Properties: Colorless liquid; characteristic odor. D 1.353 (20/4C), bp 119C (0.15 mm Hg), flash p 280F (137.7C) (OC). Miscible with most common organic solvents; insoluble in water and hydrolyzes in water. Undergoes intramolecular isomerization at higher temperatures, exposure to air should be minimum. Combustible.

Use: Intermediate, component of vinyl stabilizers, grease additives, flameproofing compositions.

tris(*p*-chlorophenyl)tin fluoride.

CAS: 427-45-2. mf: $\text{C}_{18}\text{H}_{12}\text{Cl}_3\text{FSn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin),

tris(2,3-dibromopropyl) phosphate.

$(\text{CH}_2\text{BrCHBrCH}_2\text{O})_3\text{PO}$.

Properties: Viscous, pale-yellow liquid. Bulk d 18.5 lb/gal, refr index 1.5772 (20C). Combustible.

Hazard: A carcinogen; use restricted.

Use: Flame-retardant for plastics and synthetic fibers.

tris(2,3-dichloropropyl) phosphate.

$(\text{CH}_2\text{ClCHClCH}_2\text{O})_3\text{PO}$. Combustible.

Use: Flame-retardant in plastics and as a secondary plasticizer.

Hazard: A carcinogen.

tris(diethyldithiocarbamate)iron. See

iron(III) diethyldithiocarbamate.

tris(diethylene glycol monoethyl ether) citrate.

$\text{C}_{19}\text{H}_{26}\text{O}_3$.

Properties: Solid. D 1.28 (25C), mp 16–19C. Soluble in water. Combustible.

Use: Plasticizer.

tris((2-ethylhexanoyl)oxy)methylsilane.

CAS: 70682-61-0. mf: $\text{C}_{25}\text{H}_{48}\text{O}_6\text{Si}$.

Hazard: Moderately toxic by ingestion.

tris(2-ethylhexyl) phosphate.

$[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{O}]_3\text{PO}$.

Properties: Colorless liquid. D 0.9260 (20/20C), fp -90C (sets to a glass), pour p -74C , mid-boiling p 216C (4 mm Hg), refr index 1.441 (25C), flash p 420F (215.5C). Insoluble in water; soluble in mineral oil and gasoline. Combustible.

Use: Low-temperature plasticizer for PVC resins, imparting flame and fungus resistance.

tris-2-ethylhexyl phosphite. (trioctyl phosphite). $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{O}]_3\text{P}$.

Properties: Colorless liquid. D 0.902, bp 163–164C

(0.3 mm Hg). Insoluble in water; soluble in alcohol and ether, flash p 340F (171C). Combustible.

Use: Synthesis, plasticizers, stabilizers, lubricant and grease additives, flameproofing compositions.

tris(2-hydroxyethyl)isocyanurate. (THEIC; tris(2-hydroxyethyl)-*s*-triazine-2,4,6-trione).

$\text{C}_3\text{N}_3\text{O}_3(\text{CH}_2\text{CH}_2\text{OH})_3$.

Properties: White solid. Mp 135C, bp (dissociates) 180C (3 mm Hg). Very soluble in water; somewhat soluble in alcohol and acetone; insoluble in chloroform and benzene. Combustible.

Use: Additive to plastics, especially to impart thermal stability.

tris(hydroxymethyl)acetic acid.

$\text{HOCH}_2\text{C}(\text{CH}_2\text{OH})_2\text{COOH}$. A photographic chemical made by bacterial oxidation of pentaerythritol.

tris(hydroxymethyl)aminomethane.

(tri[hydroxymethyl]-aminomethane; THAM; 2-amino-2-hydroxymethyl-1,3-propanediol; tris amine buffer). $(\text{CH}_2\text{OH})_3\text{CNH}_2$.

Properties: White, crystalline solid. Mp 171–172C, bp 219–220C (10 mm Hg), pH (0.1M aqueous solution) 10..6, corrosive to copper, brass, aluminum. Solubility in water 80 g/100 cc (20C). Combustible.

Hazard: Irritant to eyes and skin.

Use: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis; buffer; medicine.

tris(hydroxymethyl)nitromethane. (2-hydroxymethyl-2-nitro-1,3-propanediol).

CAS: 126-11-4. $(\text{CH}_2\text{OH})_3\text{CNO}_2$.

Properties: White crystals or amorphous solid. Mp 175C (decomposes). Soluble in water and alcohol.

Hazard: Moderate fire risk. Irritant to skin and eyes.

Use: Bactericide and slimicide for aqueous systems, cutting oil emulsions, industrial water systems, drilling muds.

tris(hydroxymethyl)phosphine.

CAS: 2767-80-8. mf: $\text{C}_3\text{H}_9\text{O}_3\text{P}$.

Hazard: A poison by ingestion. A severe skin and eye irritant.

tris(4-hydroxyphenyl)ethane. See 4,4',4''-ethylidynetrisphenol.

1,1,3-tris(hydroxyphenyl)propane. (triphenol P). $(\text{C}_6\text{H}_4\text{OH})_2\text{CHCH}_2\text{CH}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: White solid. Mp 84C, d 1.226 (20/20C), fp 90–110C, sets to glass below this temperature. Combustible.

Use: Antioxidant, intermediate for polyester and alkyd resins.

trisilane. Si_3H_8 .

Properties: Colorless liquid. Bp 53C, mp -117C , d 0.74.

Hazard: Explodes on contact with air, reacts violently with carbon tetrachloride and chloroform.

trisiloxane. See siloxane.

1,1,1-tris(4-isocyanatophenoxy)methyl propane.

CAS: 121514-80-5. mf: $C_{27}H_{23}N_3O_6$.

Hazard: Moderately toxic by ingestion. A mild eye irritant.

tris[1-(2-methyl)aziridinyl]phosphine oxide.
(C_3H_6N)₃PO.

See metepa.

tris(nictinato)aluminum. See aluminum nictinate.

“Tris Nitro” [Angus]. TM for 2-hydroxy-methyl-2-nitro-1,3-propanediol.

Available forms: Solid and liquid.

Use: A water-soluble antimicrobial agent for use in cutting fluids and other aqueous alkaline systems; formaldehyde donor with controlled rate of release and minimum odor.

trisodium (carboxymethoxy)propanedioate.
See sodium *o*-carboxymethyltartronate.

trisodium citrate. See sodium citrate.

trisodium dipotassium tripolyphosphate.
 $Na_3K_2P_3O_{10}$.

Properties: White, crystalline solid. Mp 620–640C, d 2.48. Solubility in water 80 g/100 cc (26C).

Use: Sequestrant.

trisodium EDTA. (ethylenediaminetetraacetic acid trisodium salt).

CAS: 150-38-9. $C_{10}H_{13}N_2Na_3O_8 \cdot H_2O$.

Properties: White powder. Freely soluble in water.

Use: Chelating agent.

trisodium hydroxyethylethylenediamine-triacetate. ($NaOOCCH_2$)₂NC₂H₄N(CH₂COONa)C₂H₄OH.

Properties: Liquid. D 1.285, fp below –5C.

Use: Chelating agent.

trisodium nitrilotriacetate.

CAS: 5064-31-3. N(CH₂COONa)₃. A sodium salt of nitrilotriacetic acid.

Use: Sequestrant.

trisodium orthophosphate. See sodium phosphate, tribasic.

trisodium orthovanadate. See sodium orthovanadate.

trisodium phosphate. See sodium phosphate, tribasic.

trisodium phosphate, chlorinated.

$4(Na_3PO_4 \cdot 12H_2O) \cdot NaOCl$. Active ingredients 3.25% min sodium hypochlorite and 91.75% min trisodium phosphate dodecahydrate. Inert ingredients below 5% sodium chloride.

Properties: White, crystalline solid. Water soluble; stable under normal storage conditions; in solution has the properties of both trisodium phosphate and sodium hypochlorite.

Derivation: By reacting sodium phosphate, caustic soda, and sodium hypochlorite.

Hazard: Irritant to skin and eyes.

Use: Cleaner and bactericide in dairies, food plants, dishwashing compounds, and scouring powders.

trisodium phosphate monohydrate. See sodium phosphate, tribasic, monohydrate.

trisodium trithiocyanuric acid. See sodium trithiocyanurate.

trisomy. Possessing three copies of a particular chromosome instead of the normal two copies. See cell; gene; gene expression; chromosome.

tristearin. See stearin.

tris(tetrahydrofurfuryl) phosphate.
($C_4H_6OCH_2O$)₃PO.

Properties: Yellow liquid. Fp –75C, refr index 1.4759 (20C). Soluble in water and aromatic solvents.

Use: Plasticizer, solvent.

tris(tridecyl)amine.

CAS: 5910-77-0. mf: $C_{39}H_{81}N$.

Hazard: A poison by ingestion and skin contact.

“Tritac” [Occidental]. TM for a group of herbicides whose active ingredient is 2,3,6-trichlorobenzoyloxypropanol.

triticonazole.

CAS: 131983-72-7. mf: $C_{17}H_{20}ClN_3O$.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

tritium. T. Radioactive isotope of hydrogen, mass number 3, isotopic weight 3.017 (two neutrons and one proton in the nucleus).

Properties: Half-life 12.5 years, radiation β , radioactive material.

Derivation: Bombardment of lithium with low-energy neutrons.

Available forms: Gas packaged in ampules and in tagged compounds such as water, streptomycin, cortisone, epinephrine, octadecane, stearic acid, etc.

Use: Bombarding particle in cyclotrons, activator in self-luminous phosphors, in cold cathode tubes, tracer in biochemical research and various special problems in chemical analysis, luminous instrument

dials, thermonuclear power research.
See fusion.

tritoyl phosphate. See tricresyl phosphate.

“Triton” [Dow]. TM for specialty surfactants that are alcohol and ethoxylates, alkoxylates, sulfates, sulfonates, sulfosuccinates, or phosphate esters.

Use: Industrial and institutional cleaners, various detergents, emulsions polymerization processes, paper, and textile processing.

“Triton RW 20” [Dow].

CAS: 119823-35-7. TM for a surfactant.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin irritant.

“Triton RW 50” [Dow].

CAS: 119823-36-8. TM for a surfactant.

Hazard: Moderately toxic by ingestion and skin contact. A moderate skin and severe eye irritant.

“Triton RW 75” [Dow].

CAS: 86924-47-2. TM for a surfactant.

Hazard: Low toxicity by ingestion and skin contact. A severe eye irritant.

“Triton RW 100” [Dow].

CAS: 83383-01-1. TM for a surfactant.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A severe eye irritant.

“Triton RW 125” [Dow].

CAS: 86924-48-3. TM for a surfactant.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A severe eye irritant.

“Triton RW 150” [Dow].

CAS: 86924-49-4. TM for a surfactant.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A severe eye irritant.

triton. The nucleus of the T atom (one proton, two neutrons).

tritopine. See laudanidine.

triturate. To reduce to a powder by rubbing or grinding, to pulverize.

triuranium octoxide. (uranous-uranic oxide; uranyl uranate). U_3O_8 .

Properties: Olive-green to black solid, crystals, or granules. D 8.39, decomposes when heated to 1300C to uranium dioxide. Insoluble in water; soluble in nitric acid and sulfuric acid.

Source: The naturally occurring uranium oxide found in pitchblende.

Derivation: (1) As one of the forms of uranium produced from the ores, often by a solvent extraction process. The solvent used is dodecylphosphoric

acid. (2) A common form of triuranium octoxide is yellow cake, the powder obtained by evaporating an ammonia solution of the oxide.

Hazard: Radioactive poison. Use appropriate protection in handling.

Use: Nuclear technology, preparation of other uranium compounds.

trivial name. The name applied by early chemists to a number of simple organic compounds, usually based on their sources or properties, e.g., acetone and acetic acid, from Latin *acetum* (vinegar), urea from urine, glucose and glycerol from Greek *glyc-* (sweet). Such names remained in common use regardless of the systematic nomenclature later developed.

trivinyln tin chloride. See chloro(trivinyln)stannane.

trixylenyl phosphate. See tri(dimethylphenyl)phosphate.

troclozene potassium. See potassium dichloroisocyanurate.

trona. (urao).

CAS: 497-19-8. $Na_2CO_3 \bullet NaHCO_3 \bullet 2H_2O$. A natural sodium sesquicarbonate and the most important of the natural sodas.

Properties: White, gray, or yellow with vitreous, glistening luster. Noncombustible. See trona process.

Occurrence: Hungary, Egypt, Africa, Venezuela, and U.S. (Wyoming, California, especially Searles Lake, Owens Lake).

Use: Source of sodium compounds, especially the sodium carbonates.

trona process. The method used for separation and purification of soda ash, anhydrous sodium sulfate, boric acid, borax, potassium sulfate, bromine, and potassium chloride from Searles Lake (California) brine.

tropacocaine hydrochloride.

$C_{15}H_{19}NO_2 \bullet HCl$. An alkaloidal salt.

Properties: White crystals. Mp 271C. Soluble in water, alcohol, and ether.

Derivation: From a variety of *Erythroxylon coca*.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine (spinal anesthetic).

tropaeolin D. See methyl orange.

tropaeolin OO. (Orange IV).

$NaSO_3C_6H_4NNC_6H_4NHC_6H_5$. (*p*-diphenylaminoazobenzene-sodium sulfonate). A biological stain and acid-base indicator, red at pH 1.4, yellow at pH 2.6. CI 13080.

tropisetron.CAS: 89565-68-4. mf: $C_{17}H_{20}N_2O_2$.**Hazard:** Human systemic effects.**Use:** A substance that is used to prevent nausea and vomiting caused by chemotherapy.

Trouton's rule. The molal heat of vaporization of normal liquids, at the boiling point and under atmospheric pressure, divided by the absolute boiling temperature is a constant, about 22.

"Troysan 395" [Troy]. TM for 1,3-bis(hydroxymethyl)-5,5-dimethyl hydantoin.

Available forms: Liquid.**Use:** Bactericide for water-based systems, paints and coatings, adhesives, joint cements, caulks, and printing inks.

Trp. Abbreviation for tryptophan.

true solution. See solution (true).

truth serum. See scopolamine.

trutline. A protein obtained from fish of the trout family.

"Trycite" [Dow]. TM for an oriented polystyrene film.

Use: Packaging and in envelope windows.

tryparsamide. (sodium-*N*-phenylglycineamide-*p*-arsenate).

CAS: 618-25-7.
NaOAs(OOH) $C_6H_4NHCH_2CONH_2 \cdot 1/2H_2O$.**Properties:** White, crystalline powder; odorless. Contains 24.6% arsenic, may affect eyes. Soluble in water; almost insoluble in alcohol; insoluble in ether, chloroform, benzene.**Grade:** Medicinal, USP.**Hazard:** Highly toxic by ingestion and inhalation.**Use:** Medicine (treatment of syphilis).**trypsin.**

CAS: 9002-07-7. The proteolytic enzyme of pancreatic juice, yellow to grayish powder, soluble in water, insoluble in alcohol or glycerol. It acts on albuminoid material, producing amino acids. The maximum result is obtained in a neutral or slightly alkaline medium. Trypsins or similar materials are found not only in the pancreas but also in the spleen, leucocytes, and urine, as well as in beer yeast, molds, and bacteria.

Grade: NF (crystallized).**Hazard:** Irritant to skin.**Use:** Dehairing of hides.

trypsinogen. An inactive precursor of trypsin.

tryptophan. (indole- α -aminopropionic acid; 1- α -amino-3-indolepropionic acid).

CAS: 54-12-6.

One of the essential amino acids occurring naturally in the L(-)-form.

Properties: (DL-) White crystals. Slightly soluble in water; stable in alkaline solution; decomposed by strong acids. (D(+)-) Characteristic sweet taste. Mp 275–290C (decomposes). Soluble in water, hot alcohol, alkali hydroxides; insoluble in chloroform. (L(-)-) Flat taste (other properties identical with D(+)-tryptophan).

Derivation: (1) Synthetic tryptophan can be made by the conversion of indole to gramine followed by methylation, interaction with acetylaminomalonic ester and hydrolysis, (2) hydrolysis of proteins.

Grade: Reagent, technical, FCC.**Use:** Nutrition and research, medicine, dietary supplement, cereal enrichment. Available commercially in all three forms, as well as acetyl-DL-tryptophan.

"Trysben" 200 [Du Pont]. TM for a weed killer based on aqueous solution of the dimethylamine salt of trichlorobenzoic acid, containing two pounds of acid equivalent per gallon.

Use: Control of broadleaf weeds.

Ts. Abbreviation for tosyl.

TSA. Abbreviation for toluenesulfonic acid.

Tscherniac-Einhorn reaction. Introduction of the amidomethyl group into aromatic rings or activated methylene groups in the presence of sulfuric acid.

TSH. See thyrotropic hormone.

TSP. Abbreviation for trisodium phosphate. See sodium phosphate, tribasic.

TSPA. Abbreviation for triethylenethiophosphoramide.

TSPP. Abbreviation for tetrasodium pyrophosphate. See sodium pyrophosphate.

TSS. See transition state theory.

TTC. Abbreviation for tetrazolium chloride.

TTD. Abbreviation for tetraethylthiuram disulfide.

tubatoxin. See rotenone.

tube mill. A fine-grinding machine composed of a rotating steel cylinder that may be from 15 to 50 ft long and 6 to 8 ft in diameter, within which are steel balls from 1 to 5 inches in diameter. Depending on

its construction it may be either batch or continuous. Some types have several compartments, each containing balls of different sizes. Its function is finish-grinding of particulates; it is usually fed with 20-mesh material, which it reduces to 325-mesh. See ball mill.

tuberose oil.

Properties: Colorless to very-light-colored oil. D 1.007–1.035 (15C).

Method of purification: Taken from *Polianthes tuberosa*, by enfleurage.

Use: Perfume, flavoring.

d-tubocurarine chloride.

Properties: White to light-tan crystalline alkaloid; odorless. Mp 270C with decomposition. Soluble in water and alcohol; insoluble in acetone, chloroform, and ether; aqueous solution is strongly dextrorotatory (specific rotation for 1% solution of anhydrous –208 to +218 degrees).

Grade: USP.

Hazard: Highly toxic.

Use: Medicine (muscle relaxant).

“**Tuex**” [*Uniroyal*]. TM for tetramethylthiuram disulfide.

Available forms: Pellets as “Tuex Naugets.”

Use: Sulfur donor accelerator for EV and semi-EV systems.

See thiram.

“**Tuffak**” [*Rohm & Haas*]. TM for colored or colorless polycarbonate resin.

Available forms: Sheet material of various thickness; film.

Use: Skylights, display fixtures, signs, lighting fixtures, safety guards, car mats, and chair mats.

“**Tuflin**” [*Dow*]. TM for linear low-density polyethylene film resins.

Use: For trash bags, packaging and stretch wrap, and shipping sacks.

tumor suppressor. A gene that inhibits progression towards neoplastic transformation. The best known examples of tumor suppressors are the proteins p53 and Rb.

tung oil. (China-wood oil).

Properties: Yellow drying oil. D 0.9360–0.9432, saponification value 193, iodine value 150–165, refr index 1.5030, flash p 552F (288.9C), autoign temp 855F (457C). Soluble in chloroform, ether, carbon disulfide, and oils. Combustible.

Derivation: From the seeds of *Aleurites cordata*, a tree indigenous to China. It is now produced in China, Argentina, and Paraguay; U.S. production has been virtually discontinued.

Chief constituents: Eleostearic acid (80%).

Hazard: Toxic by ingestion. Contact causes dermati-

tis. Ingestion causes nausea, vomiting, cramps, diarrhea and tenesmus, thirst, dizziness, lethargy, and disorientation. Large doses can cause fever, tachycardia, and respiratory effects. Combustible when exposed to heat or flame. Can react with oxidizing materials.

Use: Food additive; wood finish.

tungstated pigment. See phosphotungstic pigment.

tungstate white. See barium tungstate.

tungsten. (wolfram).

CAS: 7440-33-7. W. Metallic element, atomic number 74, group VIB of periodic system, aw 183.85, valences of 2, 4, 5, 6; five isotopes.

Properties: Hard, brittle, gray solid; not found native; the ores are scheelite and wolframite. D 19.3 (20C), mp 3410C (highest of all the metals), bp 5927C, high electrical conductivity, soluble in a mixture of nitric acid and hydrogen fluoride, corroded by seawater, oxidizes in air at 400C, the rate increases rapidly with temperature.

Derivation: (1) Aluminothermic reduction of tungstic oxide, (2) hydrogen reduction of tungstic acid or its anhydride. The metal can be plated onto objects by vapor deposition from tungsten hexafluoride or hexacarbonyl and can bond metal parts together. Tungsten powder (produced by carbon reduction) is converted into solid metal by powder metallurgical techniques. Large single crystals are grown by an arc-fusion process. Granules obtained by reduction of the hexafluoride.

Occurrence: Canada, Bolivia, Peru, Thailand, China, the former U.S.S.R., U.S. (Arizona, California, Colorado, Nebraska, Nevada, New Mexico, and Texas).

Grade: Technical, powder, single crystals, ultrapure granules of 50–600 microns.

Hazard: Finely divided form is highly flammable and may ignite spontaneously. TLV: (W) (Insoluble compounds) 5 mg/m³; (soluble compounds) 1 mg/m³.

Use: High-speed tool steel, ferrous and nonferrous alloys, ferrotungsten, filaments for electric light bulbs, contact points, X-ray and electron tubes, welding electrodes, heating elements in furnaces and vacuum-metallizing equipment, rocket nozzles and other aerospace applications, shell steel, chemical apparatuses, high-speed rotors as in gyroscopes, solar energy devices (as vapor-deposited film that retains heat at 500C).

tungsten boride. WB₂.

Properties: Silvery solid. D 10.77, mp 2900C. Insoluble in water; soluble in aqua regia and concentrated acids; decomposed by chlorine at 100C.

Derivation: Heating tungsten and boron in electric furnace.

Use: Refractory.

tungsten carbide.

CAS: 12070-12-1. WC. A ditungsten carbide, W_2C , with similar physical properties is also known. WC is said to be the strongest of all structural materials.

Properties: Gray powder. D 15.6, mp 2780C, bp 6000C, Mohs hardness of 9+ in solid form. Insoluble in water but readily attacked by a nitric acid-hydrofluoric acid mixture. Stable to 400C with chlorine, burns in fluorine at room temperature, oxidizes on heating in air.

Derivation: Heating tungsten and lampblack at 1500-1600C.

Hazard: Toxic by inhalation. TLV: 5 mg(W)/m³.

Use: Cemented carbide, dies and cutting tools, wear-resistant parts, cermets, electrical resistors. An abrasive in liquids.

tungsten carbide, cemented. A mixture consisting of tungsten carbide 85-95% and cobalt 5-15%.

Properties: Hardness about that of corundum; not affected by high temperatures. D 12-16.

Derivation: Ball milling of powdered tungsten carbide with metallic cobalt, followed by sintering.

Hazard: As for tungsten carbide.

Use: Machine tools and abrasives for machining and grinding metals, rocks, molded products, porcelain, and glass; in gauges, blast nozzles, knives, drill bits.

tungsten carbonyl. See tungsten hexacarbonyl.

tungsten diselenide. WSe_2 . Lamellar-structured, dry, solid lubricant with exceptionally high temperature and high vacuum stability. Retains its lubricity to temperatures as low as -265C.

Grade: 1-2 micron and 40 micron.

Hazard: TLV: 5 mg(W)/m³.

tungsten disulfide. WS_2 .

Properties: Grayish-black solid. Mp above 1480C, can lubricate at temperatures above 2400F (1316C). Attacked by fluorine and hot sulfuric and hydrogen fluoride.

Grade: 0.40, 0.70, and 1-2 micron grades.

Use: Solid lubricant for many applications, including use as an aerosol.

tungsten hexacarbonyl. (tungsten carbonyl). $W(CO)_6$.

Properties: White, volatile, highly refractive, crystalline solid. Decomposes without melting at 150C. One of the more stable carbonyls. D 2.65, vap press 0.1 mm Hg (20C). Insoluble in water; soluble in organic solvents.

Derivation: Reaction of tungsten with carbon monoxide at high pressures, reduction of tungsten hexachloride with iron alloy powders in carbon monoxide atmosphere.

Hazard: TLV: 5 mg(W)/m³.

Use: Tungsten coatings on base metals by deposition and decomposition of the carbonyl.

tungsten hexachloride. WCl_6 .

Properties: Dark-blue or violet hexagonal crystals, volatile. Mp 275C, bp 347C, d 3.52, vap press 43 mm Hg (215C). Electrical conductivity (fused state) poor. Soluble in organic solvents including ligroin and ethanol; decomposed by moist air and water; reduced by hydrogen to the metal.

Derivation: Heating tungsten with dry chlorine at red heat.

Hazard: TLV: 5 mg(W)/m³.

Use: Tungsten coatings on base metals, vapor deposition for bonding metals, single crystal tungsten wire, additive to tin oxide to produce electrically conducting coating for glass, catalyst for olefin polymers.

tungsten hexafluoride.

CAS: 7783-82-6. WF_6 .

Properties: Colorless gas or light-yellow liquid. D (liquid) 3.44, mp 2.5C, bp 19.5C. Decomposes in water.

Derivation: Direct fluorination of powdered tungsten, purified by distillation under pressure.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue. TLV: 1 mg(W)/m³.

Use: Vapor-phase deposition of tungsten, fluorinating agent.

tungsten lake. See phosphotungstic pigment.

tungsten oxychloride. $WOCl_4$.

Properties: Dark-red, acicular crystals. Decomposed by water and moist air. Keep in sealed glass container. Bp 227.5C, mp 211C, d 11.92. Soluble in carbon disulfide.

Derivation: By the action of chlorine on tungsten or tungstic oxide at elevated temperatures.

Method of purification: Vacuum distillation.

Grade: Technical.

Hazard: Irritant. TLV: 1 mg(W)/m³.

Use: Incandescent lamps.

tungsten silicide. A ceramic, probably WSi_2 .

Properties: Blue-gray, very hard solid. D 9.4, mp above 900C. Insoluble in water; attacked by fused alkalis and mixture of nitric and hydrofluoric acids.

Grade: Cylindrical shapes, lumps, standard sieve sizes.

Hazard: Dust flammable. TLV: 5 mg(W)/m³.

Use: Oxidation-resistant coatings, electrical resistance and refractory applications.

tungsten steel. In many of its alloying effects, tungsten is similar to molybdenum. Tungsten increases the density of alloys to which it is added.

Use: To obtain steels with great wear resistance and special resistance to tempering, as in high-speed steels, hot-work steels, finishing steels that maintain keen cutting edge and great wear resistance, creep-resisting steels, and oxidation-resistant, high-temperature, high-strength alloys.

tungsten trioxide. See tungstic oxide.

tungstic acid. (wolframic acid; orthotungstic acid).

CAS: 11105-11-6. H_2WO_4 .

Properties: Yellow powder. D 5.5. Insoluble in water; soluble in hydrogen fluoride and alkalis. A white form of tungstic acid exists, having the formula $\text{H}_2\text{WO}_4 \cdot \text{H}_2\text{O}$. This is formed by acidifying tungsten solutions in the cold.

Derivation: Decomposition of sodium tungstate with hot sulfuric acid.

Grade: Technical, CP, reagent.

Hazard: Toxic material. TLV: 5 mg(W)/m³.

Use: Textiles (mordant, color resist), plastics, tungsten metal, wire, etc.

tungstic acid anhydride. See tungstic oxide.

tungstic anhydride. See tungstic oxide.

tungstic oxide. (tungstic acid anhydride; tungstic anhydride; tungsten trioxide; wolframic acid, anhydrous). WO_3 .

Properties: Canary-yellow, heavy powder, dark-orange when heated and regains original color on cooling. Mp 1473C, d 7.16. Insoluble in water, soluble in caustic alkalis, soluble with difficulty in acids. Noncombustible.

Derivation: Scheelite ore is treated with hydrochloric acid and the resulting product dissolved out with ammonia. The complex ammonium tungstate can then be ignited to tungstic oxide.

Hazard: Toxic material. TLV: 5 mg(W)/m³.

Use: To form metal by reduction, alloys, preparation of tungstates for X-ray screens, fireproofing fabrics, yellow pigment in ceramics.

tungstophosphate. Structure and properties are similar to molybdophosphate.

12-tungstophosphoric acid. See phosphotungstic acid.

tungstosilicate. One of a group of complex inorganic compounds of high molecular weight, containing a central silicon atom surrounded by tungsten oxide octahedra. They have high molecular weight, high degree of hydration, strong oxidizing action in aqueous solutions; decompose in strongly basic aqueous solutions to give simple tungstate solutions; form highly colored anions or reaction products.

See silicotungstic acid; sodium-12-tungstosilicate.

12-tungstosilicic acid. See silicotungstic acid.

turinabol. See 4-chlorotestosterone 17-acetate.

turkey brown. (turkey umber). Natural earth used as permanent pigment. Contains iron and manganese oxide with some clay.

Turkey red. See iron oxide red.

Turkey red oil. (castor oil, sulfonated; castor oil, soluble).

CAS: 72-48-0. It is also known as alizarin assistant and alizarin oil because of its use in dyeing with alizarin.

Properties: Viscous liquid. D 0.95, iodine No. 82.1, acid No. 174.3, saponification No. 189.3, autoign temp 833F (445C). Soluble in water. Combustible.

Derivation: By sulfonating castor oil with sulfuric acid and washing.

Grade: Sulfonated castor oil graded as to moisture and color.

Use: Textiles, leather, manufacture of soaps, alizarin dye assistant, paper coatings.

Turnbull's Blue. An inorganic blue pigment made by the reaction of a ferrous salt and potassium ferricyanide $[\text{Fe}_3\text{Fe}(\text{CN})_6]_2$. One of its important uses is in making blueprints, in which sensitized paper containing ferric ammonium citrate and potassium ferricyanide is exposed to light, the ferric ions being thus reduced to ferrous ions.

See iron blue.

turnover number. The number of times an enzyme molecule transforms a substrate molecule per sec, under conditions giving maximal activity at substrate concentrations that are saturating.

turpentine (gum). The oleoresin or pitch obtained from living pine trees.

Properties: Sticky, viscous, balsamic liquid comprising a mixture of rosin and turpentine oil; strong, piney odor. Soluble in alcohol, ether, chloroform, and glacial acetic acid. Combustible.

Use: Source of turpentine oil and gum rosin.

See rosin.

turpentine (oil).

CAS: 8006-64-2. $\text{C}_{10}\text{H}_{16}$. A volatile essential oil whose chief constituents are pinene and diterpene.

Derivation: Steam-distillation of the turpentine gum exuded from living pine trees (gum turpentine), naphtha-extraction of pine stumps (wood turpentine), destructive distillation of pine wood.

See rosin; rosin oil.

Properties: Colorless liquid; penetrating odor. Immiscible with water; lighter than water. Considerable variation appears in constants reported; the following are based on tests made by the Forest Products Laboratory: d 0.860–0.875 (15C), refr index 1.463–1.483 (20C), flash p 90–115F (32–46C) (CC), no acidity, bulk d 7.18 lb/gal, autoign temp 488F (253C).

Hazard: Moderate fire risk. Toxic by ingestion. TLV: 100 ppm.

Use: Solvent; thinner for paints, varnishes, and lacquers; rubber solvent and reclaiming agent; insecticide; synthesis of camphor and menthol; wax-based polishes; medicine (liniments); perfumery.

tutocaine hydrochloride. (γ -dimethylamino- α,β -dimethylpropyl-*p*-aminobenzoate hydrochloride).

CAS: 532-62-7. $C_{14}H_{22}O_2N_2 \cdot HCl$.

Use: Local anesthetic.

tuyere. A duct or pipe through which a stream of hot air is introduced into a blast furnace or cupola to support combustion.

Tw. Abbreviation for Twaddell, used in reporting specific gravities for densities greater than water, as degrees Tw. A twaddell reading, multiplied by five and added to 1000, gives specific gravity with reference to water as 1000.

TWA See time-weighted average.

twinning axis. Axis around which one part of a twin crystal may be viewed as having been rotated 180 degrees relative to the other part.

Twitchell process. Commercial process for splitting fats to glycerol and fatty acids by heating the sulfuric acid-washed fat 20–48 hours in an open tank with steam in a mixture of 25–50% water, 0.5% sulfuric acid, and 0.75–1.25% Twitchell reagent. The original Twitchell catalyst was prepared by sulfonation of a mixture of fatty acid and benzene, but today sulfonated petroleum products are used.

Twitchell reagent. Catalyst for the Twitchell process (acid hydrolysis of fats). It is a sulfonated addition product of naphthalene and oleic acid, a naphthalenestearosulfonic acid.

“Tygon.” TM for a series of vinyl compounds used as linings, coatings, adhesives, tubing, and extruded shapes applied to chemical process equipment as corrosion protection.

“Tylac” [Reichhold]. TM for a series of synthetic latexes and elastomers. (BL) High-strength, film-forming, nitrile rubber latexes and rubbers and carboxylated polymers characterized by exceptional oil, solvent, and abrasion resistance.

(SBL) Butadiene/styrene and carboxylated butadiene/styrene and high styrene latexes of various monomer ratios. Modified versions are available.

Use: Paper, textiles, adhesives, Portland cement, molded products, and polyvinyl chloride and phenolic resin blends.

“Tylenol” [Ortho-McNeil]. TM for *p*-acetylamino-phenol (acetaminophen).

tylosin and sulfamethazine.

Use: Drug (veterinary); food additive.

tyloxapol. (USAN).

CAS: 25301-02-4. An oxyethylated-*tert*-octylphe-

nolpolymethylene polymer and low toxicity, non-ionic surfactant.

tyloxin. Antibiotic substance isolated from a strain of *Streptomyces fradiae*.

Properties: Crystals. Mp 128–130C. Solutions are stable between pH 4 to 9.

Use: Veterinary medicine.

Tyndall effect. A colloidal phenomenon in which particles too small to be resolved in an optical microscope suspended in a gas or liquid reveal their presence by scattering a beam of light as it passes through the suspension, the extent of reflection being dependent on the position of the irregularly shaped particles relative to the incident light. The effect causes the appearance of a visible cone of light through the suspension. This principle is utilized in the ultramicroscope.

“Tynex” [Du Pont]. TM for nylon filament. Available tapered, with an essentially uniform taper from butt to tip, and also level, i.e., in a wide range of constant diameters. The tapered form is used primarily in paint brushes, the level form in other brushes.

type metal. Alloy of 75–95% lead, 2.5–18% antimony, with a little tin and sometimes copper, which expands slightly upon solidification and produces sharp castings.

Tyr. Abbreviation for tyrosine.

Tyrer sulfonation process. Sulfonation of benzene in the vapor phase with sulfuric acid at 170–180C with passage of benzene vapor and azeotropic removal of the water of reaction.

“Tyrez” [Reichhold]. TM for a series of impact modifiers for plastics.

tyrian brilliant blue i 3g. See 6,15-dihydroxy-5,9,14,18-anthrazinetetrone.

“Tyril” [Dow]. TM for a group of styrene-acrylonitrile copolymers.

“Tyrilfoam” 80 [Dow]. TM for expanded styreneacrylonitrile for flotation uses under conditions of gasoline spillage, petroleum scum from outboard motors, and stagnant water.

tyrocidine. Antibiotic produced by the metabolic processes of the bacteria *Bacillus brevis*. It is a cyclic polypeptide that is active against most Gram-positive pathogenic bacteria. It is one of the two antibiotic components of tyrothricin but has been isolated and used alone.

Properties: (Probably the hydrochloride) Fine, crystalline needles that decompose at 240C; soluble in 95% alcohol, acetic acid, and pyridine; slightly solu-

ble in water, acetone, and absolute alcohol; insoluble in ether, chloroform, and hydrocarbons; depresses surface tension; forms fairly stable colloidal emulsion in distilled water.

Use: Medicine (usually as component of tyrothricin), possible fungistat and bacteriostat.

tyrosinase. An enzyme containing copper that occurs in plant and animal tissue and is responsible for turning peeled potatoes black when exposed to air.

Use: Medicine (antihypertensive).

tyrosine. (β -*p*-hydroxyphenylalanine; α -amino- β -*p*-hydroxyphenylpropionic acid).

CAS: 60-18-4. $C_6H_4OHCH_2CHNH_2COOH$. A non-essential amino acid.

Properties: White crystals. *dl*-Tyrosine mp 316C, *d*(+)-tyrosine mp 310–314C, *l*(-)-tyrosine mp 295C (with decomposition), *d* 1.456 (20/4C). Soluble in water; slightly soluble in alcohol; insoluble in ether. Optically active. Readily oxidized by animal organisms.

Derivation: Hydrolysis of protein (casein), organic synthesis.

Grade: FCC.

Use: Growth factor in nutrition, biochemical research, dietary supplement. Available commercially as *dl*-tyrosine.

tyrothricin. An antibiotic produced by growth of *Bacillus brevis*. It consists of a mixture of antibiotics, principally gramicidin and tyrocidine. Gramicidin is the more active component. Use is generally limited to local external applications. It is active against some Gram-positive bacteria, including species of pneumococci, streptococci, and staphylococci.

"Tyzor" [Du Pont]. TM for a group of simple and chelated esters of ortho-titanic acid, such as tetrabutyltitanate, of varying reactivity.

Use: Chemical intermediates, primers for adhesion promotion in extrusion coating, dispersants, scratch-resistant finishes on glass, masonry water repellents, cross-linking agents, esterification and olefin polymerization catalyst.

U

U. Symbol for uranium.

“Ucar” [Dow]. TM for various synthetic organic chemicals including solvents, coatings, resins, and deicing fluids. Also applied to synthetic latexes and water-soluble polymers.

“Ucarcide” [Dow]. TM for glutaraldehyde-based antimicrobials.

Use: Preservative and sanitizing applications; oil fields.

See glutaraldehyde.

“Ucare” [Dow]. TM for cationic hydroxyethyl cellulose, conditioning polymer.

Use: Shampoos and body washes.

“Ucarsan” [Dow]. TM for a blend of glutaraldehyde and a surfactant.

Use: As a sanitizer for agricultural equipment, such as poultry hatcheries and farm-animal housing facilities; industrial equipment.

See glutaraldehyde.

“Ucon” [Dow]. (1) TM for a series of non-flammable fluorocarbon solvents and solvent blends with high chemical stability and extremely low residue levels.

Use: Cleaning electronic and mechanical instruments and controls, degreasing motors, cleaning liquid oxygen equipment, and motion-picture and television film and magnetic tape.

(2) TM for polyalkylene glycols and diesters. Available as water-soluble or insoluble products.

Grade: LB-Series, 50-HB Series, 75-H Series, DLB Series, and Hydrolube Series.

Use: High-temperature lubricants, low-temperature fluids, compressor lubricants, hydraulic brake fluids, quenchant fluid, heat-transfer fluids, textile lubricants, rock drill lubricants, leather and paper-treating compounds, rubber lubricants, plasticizers and solvents, chemical intermediate, stationary phase in gas chromatography.

See fluorocarbon.

“Uconex” [Dow]. TM for a biocide that is an aqueous solution of glutaraldehyde.

Use: In controlling bacteria and fungi in aqueous metalworking fluids.

See glutaraldehyde.

“Ucure” [Dow]. TM for polyvinyl acetate reactive modifiers.

Use: Promoting reinforcement and improving dispersion, dimensional control, and surface quality in molded reinforced plastic automotive exterior pan-

els, bathroom fixtures, and business machine housings.

UDP. Abbreviation for uridine diphosphate. See uridine phosphate.

UDPG. Abbreviation for uridine diphosphate glucose.

“Uformite” [Rohm & Haas]. TM for synthetic resins based on urea-formaldehyde, melamine-formaldehyde, and triazine condensates. Supplied as colorless or light-colored aqueous solutions or solutions in volatile solvents. Solvent type produces hard, alkali-resistant, colorless coatings on curing with adhesion to a variety of surfaces.

Use: With alkyd resins in coatings, industrial finishes on appliances, automobiles, etc; adhesives for paperboard boxes, paper coatings, wet-strength paper, textile pigment binding.

“Ulano Fotocoat” [Ulano]. TM for a solvent resistant emulsion.

Use: For use with weak light sources.

ulexite. (cotton balls). $\text{NaCaB}_5\text{O}_9 \cdot 8\text{H}_2\text{O}$. A natural hydrated borate of sodium and calcium.

Properties: White color; silky luster. Mohs hardness 1–2.5, d 1.96. Usually found as rounded, loose-textured masses of fine crystals.

Occurrence: Chile, Argentina, California, Nevada.

Use: Source of borax.

ullage. (1) The loss by evaporation or leaking. (2) The amount a vessel lacks of being full.

See head space.

Ullman reaction. Synthesis of biaryls by copper-induced coupling of aryl halides. Similar coupling of aryl halides with aroxides yields diaryl ethers. (A modification of the Fittig synthesis in which copper powder is used instead of sodium.)

ulmin. One of a class of amorphous substances resulting from the decomposition of the cellulose and lignite tissues of plants. Ulmins represent one of the initial changes by which vegetable matter is converted into coal.

ulmin brown. See Van Dyke brown.

“Ultimate” [Velocity]. TM for a lime calcium and rust remover.

“Ultimer” [Nalco]. TM for oil-free, water-soluble polymers.

Use: Water and waste-treatment processes.

“Ultimet” [Haynes]. TM for a high-strength, cobalt-based alloy designed with excellent resistance to pitting and general corrosion, especially in oxidizing acids, coupled with exceptional wear resistance (cavitation erosion, galling, and abrasion). **Available forms:** Sheet, plate, castings, bars, rods, welding electrodes and wire. **Use:** Fabrication into all types of process equipment.

“ULTI-PRO 100” [Indespec]. TM for a rubber processing aid. **Use:** A reactive viscosity modifier for difficult to process rubber compounds.

“Ultisil” [Ametek]. TM for specially processed silica textiles having improved temperature properties of higher strength retention and flexibility after long exposures to temperatures as high as 2000F (1050C). **Use:** Furnace curtains, stress-relief blankets, expansion joints, insulations involving encapsulation of refractory wools, aerospace composites, seals, and gaskets.

ultraaccelerator. An unusually powerful accelerator of rubber vulcanization, typified by thiuram sulfides and dithiocarbamates.

ultracentrifuge. A high-speed rotational separating device, usually of laboratory size, capable of developing a force of 250,000 times gravity. Its major uses are in research on molecular weight distribution, macromolecular structure and properties (proteins, nucleic acids, viruses) and separation of solutes from solutions. See centrifugation.

“Ultra and Super Shield” [Ferro]. TM for gelcoat liquid. **Use:** For boats, recreational vehicles, trucks, sanitary ware, pools.

“Ultra-Clor” [Mallinckrodt]. TM for a turf fungicide whose active ingredients are mercuric dimethylthiocarbamate, potassium chromate, and cadmium succinate. **Hazard:** Highly toxic by ingestion.

“Ultraflex” [Baker Petrolite]. TM for microcrystalline wax. **Available forms:** Prills, slab, or molten. **Use:** Hot-melt adhesives for coatings and packaging, chewing-gum base, cosmetics, pharmaceuticals, lubricants, ceramics, processing aids, laminants, textiles, paints, rubber and elastomers, and water-proofing.

ultramarine blue. (CI 77007). **Properties:** Inorganic pigment, blue powder, good alkali and heat resistance, low hiding power, poor

acid resistance, poor outdoor durability. Noncombustible.

Derivation: Heating a mixture of sulfur, clay, alkali, and a reducing agent to high temperatures.

Use: Colorant for machinery and toy enamels, white baking enamels, printing inks, rubber products, soaps and laundry blues, cosmetics, textile printing. **Note:** Used in very low percentages to intensify whiteness of white enamels, rubber compounds, laundered clothing, etc. by offsetting yellowish undertones, gives a “blue” rather than a “yellow” white.

ultramicroscope. A development of the compound optical microscope invented in 1903 by Zsigmondy and Siedentopf. Its essential feature is a strong light beam from an arc lamp, focused by passing through two lenses, which illuminates the specimen at right angles to the axis of observation. The presence of suspended colloidal particles as small as 5 microns is detectable because of the light-scattering effect of the particles as they move about in the suspension (Tyndall effect). Since the light reflected or scattered by the particles is the only light that enters the microscope, the particles appear as points of light against a dark background (dark-field illumination). There is no resolution of individual particle shape or size; the instrument shows only that particles are present. The ultramicroscope has been of great value in the study of colloidal suspensions, such as rubber latex, and of various biological phenomena; its usefulness has diminished since the advent of the electron microscope. See Tyndall effect.

“Ultraray” [Air Products]. TM for laser pure gases. **Use:** Excimer, chemical, and gas lasers are available, as are gases for surgical lasers.

“Ultra-San” [Milliken]. TM for antibacterial in mats used by workers in the food processing or preparation, food service or related industry. **Use:** To prevent microbial, unsanitary and odorous build up.

ultrasonics. The science of effects of sound vibrations beyond the limit of audible frequencies. Used for dust, smoke, and mist precipitation; preparation of colloidal dispersions; cleaning of metal parts, precision machinery, fabrics, etc. Friction welding, formation of catalysts, degassing and solidification of molten metals, extracting flavor oils in brewing, electroplating, drilling hard materials, fluxless soldering, nondestructive testing. Also used for investigation of physical properties, determination of molecular weights of liquid polymers, degree of association of water, and for inducing chemical reaction. A developing application is the use of ultrasonic vibration in diagnostic medicine.

ultrastructure. (fine structure). The detailed structure of a specimen, such as a cell, tissue, or

organ, that can be observed only by electron microscopy.

“**Ultratex**” [*Novartis*]. TM for a group of silicone elastomeric finishes for natural and synthetic textile fabrics.

“**Ultrathene**” [*Quantum*]. TM for a series of ethylenevinyl acetate copolymer resins for adhesives, conversion coatings, and thermoplastic modifiers. Wide range of melt indexes. Improves specific adhesion of hot-melt, solvent-based, and pressure-sensitive adhesives.

ultraviolet. (UV). Radiation in the region of the electromagnetic spectrum including wavelengths from 100 to 3900 Å. UVA covers the region 315 to 400 Å. UVB covers the region 280 to 315 Å. See radiation.

Hazard: Dangerous to eyes, overexposure causes severe skin burns (sunburn).

Use: Air sterilization in hospitals, microscopy.

ultraviolet absorber. A substance that absorbs radiant energy in the wavelength of UV. The radiant energy absorbed is converted to heat (thermal energy). UV absorbers are added to unsaturated substances (plastics, rubbers, etc.) to decrease light sensitivity and consequent discoloring and degradation. Among compounds used are benzophenones, benzotriazoles, substituted acrylonitriles, and phenol-nickel complexes.

See absorption (2).

“**Ultrawet**” [*Crompton & Knowles*]. TM for a series of biodegradable linear alkylate sulfonate (LAS) anionic detergents or surface-active agents (linear dodecylbenzene type).

Available forms: Sodium or triethanolamine salts in liquid, slurry, flake, or bead form.

“**Ultrion**” [*Nalco*]. TM for coagulant program.

Use: In water and wastewater treatment.

umbelliferic acid. See anisic acid.

umbelliferone.

CAS: 93-35-6. C₉H₆O₃.

Properties: Colorless needles. Mp 225C. Soluble in alcohol, acetic acid, weak alkalis, and boiling water.

Derivation: Distillation of plant resins (umbelliferae).

Use: Cosmetics, sunscreen preparations.

umber. A naturally occurring brown earth containing ferric oxide together with silica, alumina, manganese oxides, and lime. Raw umber is umber that is ground and then levigated. Burnt umber is umber calcined at low heat.

Use: Paint pigment, lithographic inks, wallpaper (pigment), artists' color.

UMP. Abbreviation for uridine monophosphate. See uridine phosphates; uridylic acid.

uncertainty principle. The conclusion of Heisenberg based on quantum mechanical theory that the precise position of a specific electron in an atomic orbit cannot be determined and that consequently the ultimate nature of matter is not susceptible to objective measurement. The result of this concept was development of the orbital theory in which electron behavior is dealt with on a statistical basis. Its validity was confirmed by 1930 by the work of other mathematical physicists such as DeBroglie, Fermi, and Schrodinger.

See orbital theory; Heisenberg, Werner, P.

uncoupling agent. A substance that uncouples phosphorylation of ADP from electron transfer by disrupting the pH gradient; for example, 2,4-dinitrophenol.

γ-undecalactone. (peach aldehyde; γ-undecyl lactone; 4-hydroxy-undecanoic acid, γ-lactone). CAS: 710-04-3.

Properties: Colorless to light-yellow liquid; peach-like odor. D 0.941–0.944, refr index 1.450–1.454. Soluble in 4–5 volumes of 60% alcohol; soluble in benzyl alcohol, benzyl benzoate, and most fixed oils. Combustible.

Derivation: By heating undecylenic acid in the presence of sulfuric acid.

Grade: Chlorine-free, FCC.

Use: Perfumery, flavoring agent.

undecanal. (*n*-undecylic aldehyde; hendecanal).

CAS: 112-44-7. CH₃(CH₂)₉CHO.

Properties: Colorless liquid; sweet odor. D 0.825–0.832 (25C), refr index 1.4310–1.4350 (20C), flash p 235F (112.7C). Soluble in oils and alcohol; insoluble in glycerol and water. Combustible.

Derivation: By oxidation of 1-undecanol or reduction of undecanoic acid.

Grade: FCC.

Hazard: Toxic by ingestion and inhalation, irritant to tissue.

Use: Perfumery, flavors.

***n*-undecane.** (hendecane).

CAS: 1120-21-4. CH₃(CH₂)₉CH₃.

Properties: Colorless liquid. D 0.7402 (20/4C), fp -25.75C , bp 195.6C , refr index 1.41725 (20C), flash p 149F (65C). Combustible.

Grade: 95%, 99%, research.

Use: Petroleum research, organic synthesis, distillation chaser.

undecanoic acid. (*n*-undecylic acid; hendecanoic acid). $\text{CH}_3(\text{CH}_2)_9\text{COOH}$. Small amounts occur in castor oil. It is best derived from undecylenic acid by hydrogenation.

Properties: Colorless crystals. D 0.8505 (80/4C), mp 28.5C , bp 284.0C , 222.2C (128 mm Hg), refr index 1.4319 (40C). Insoluble in water; soluble in alcohol and ether.

Grade: Technical, 99%.

Use: Organic synthesis.

1-undecanol. (*n*-undecyl alcohol; decyl carbinol; 1-hendecanol).

CAS: 112-42-5. $\text{CH}_3(\text{CH}_2)_{10}\text{CH}_2\text{OH}$.

Properties: Colorless liquid; citrus odor. D 0.829–0.834, refr index 1.435–1.443, mp 19C , flash p 200F (93.3C). Soluble in 60% alcohol. Combustible.

Use: Perfumery, flavoring.

2-undecanol. (2-hendecanol).

$\text{CH}_3(\text{CH}_2)_8\text{CH}_2\text{OCH}_3$.

Properties: Colorless liquid. D 0.8363 (20C), mp 12C , bp $228\text{--}229\text{C}$, flash p 235F (112.7C). Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Antifoaming agent, intermediate, perfume fixatives, plasticizer.

2-undecanone. See methyl nonyl ketone.

undecenal. (undecylenic aldehyde; hendecen-1-al). Listed by different authorities as 10-undecenal, $\text{CH}_2\text{:CH}(\text{CH}_2)_9\text{CHO}$, and 9-undecenal. $\text{CH}_3\text{CH}_2\text{:CH}(\text{CH}_2)_8\text{CHO}$.

Properties: Colorless liquid; strong odor suggesting rose. D 0.840–0.850 (25/25C), refr index 1.4410–1.4470 (20C). Soluble in 80% alcohol. Combustible.

Use: Perfumery, flavoring.

10-undecenoic acid. See undecylenic acid.

2-undecenol. mf: $\text{C}_{11}\text{H}_{22}\text{O}$.

Properties: White to sltly yellow liquid; oily, sweet, floral odor. D: 0.847, refr index: 1.450 @ 22° . Insol in water.

Use: Food additive.

10-undecen-1-ol. See undecylenic alcohol.

***n*-undecyl alcohol.** See 1-undecanol.

undecylenic acid. (10-undecenoic acid).

CAS: 112-38-9. $\text{CH}_2\text{:CH}(\text{CH}_2)_8\text{COOH}$.

Properties: Light-colored liquid; fruity-rosy odor.

Congealing p 21C , d 0.910–0.913 (25/25C), refr index 1.4475–1.4485 (25C), flash p 295F (146C). Almost insoluble in water; miscible with alcohol, chloroform, ether, benzene, and fixed and volatile oils. Combustible.

Derivation: Destructive distillation of castor oil.

Grade: Technical, NF.

Use: Perfumery, flavoring, plastics, modifying agent (plasticizer, lubricant additive, etc.), medicine (antifungal agent).

undecylenic alcohol. (*n*-undecylenic alcohol; 10-undecen-1-ol; alcohol C-11).

CAS: 112-43-6. $\text{CH}_2\text{:CH}(\text{CH}_2)_8\text{CH}_2\text{OH}$.

Properties: Colorless liquid; citrus odor. D 0.842–0.847, refr index 1.449–1.454; fp -3.0C . Soluble in 70% alcohol. Combustible.

Use: Perfumes.

undecylenic aldehyde. See undecenal.

undecylenyl acetate. (10-hendecenyl acetate).

CAS: 112-19-6. $\text{CH}_3\text{COO}(\text{CH}_2)_9\text{CH:CH}_2$.

Properties: Colorless liquid; floral-fruity odor. D 0.876–0.883, refr index 1.438–1.442. Soluble in 80% alcohol. Combustible.

Use: Perfumery, flavoring.

***n*-undecylic acid.** See undecanoic acid.

γ -undecyl lactone. See γ -undecalactone.

undulipodium. See flagellum.

UNH. Abbreviation for uranyl nitrate hydrated. See uranyl nitrate.

unhairing. (dehairing). Removal of hair from hides and skins as practiced on a commercial scale in the leather industry. Several methods are used, involving application of hydrated lime, dimethylamine, trypsin, and other enzymes.

“Unicarb” [Dow]. TM for spray-coatings system employing supercritical fluid technology that significantly reduces VOC and HAP emissions.

“Unicel” [Du Pont]. TM for blowing agents for natural and synthetic rubber sponge.

“Unichrome” [ATOTECH]. (copper pyrophosphate). TM for electroplating.

Use: Printed circuit boards.

“Unilin” [Baker Petrolite]. TM for an alcohol.

unimolecular. Occurring to or within a single molecule like intramolecular, but can refer to fragmentation reactions.

“Unipol” [*Dow*]. TM for low pressure, gas-phase process technology.

Use: Production of polyethylene and polypropylene.

uniport. A transport system that carries only one solute. Contrast with cotransport.

“UniSeal” [*Unitex*]. TM for a high end hardening and dustproofing compound that is chemically reactive.

Use: To permanently bond concrete.

United States Department of Agriculture.

(USDA). The federal regulatory authority for meats and meat products. It attempts to support production of agriculture, ensure a safe, affordable, nutritious, and accessible food supply, care for agricultural, forest, and range lands, support sound development of rural communities, provide economic opportunities for farm and rural residents, expand global markets for agricultural and forest products and services, and work to reduce hunger in America and throughout the world. Its central office is at 14th & Independence Ave., SW, Washington, DC 20250. Website: <http://www.usda.gov>.

United States Pharmacopeia. (USP). An independent, science-based public health organization and the official public standards-setting authority for all prescription and over-the-counter medicines, dietary supplements, and other healthcare products manufactured and sold in the United States. USP sets standards for the quality of these products and works with healthcare providers to help them reach the standards. USP’s standards are also recognized and used in more than 130 countries. These standards have been helping to ensure good pharmaceutical care for people throughout the world for more than 185 years.

The USP is a self-sustaining nonprofit organization and is funded through revenues from the sale of products and services that help to ensure good pharmaceutical care. USP’s contributions to public health are enriched by the participation and oversight of volunteers representing pharmacy, medicine, and other healthcare professions as well as academia, government, the pharmaceutical industry, health plans, and consumer organizations. Website: <http://www.usp.org>.

“Unithox” [*Baker Petrolite*]. TM for ethoxylated grade alcohol.

unit operation. A particular kind of physical change used in the industrial production of various chemicals and related materials. Filtration, evaporation, distillation, fluid flow, and heat transfer are examples.

See chemical engineering.

unit process. A process characterized by a particular kind of chemical reaction; oxidation, hydroly-

sis, esterification, and nitration are examples. See kinetics, chemical; chemical engineering.

“Unival” [*Dow*]. TM for high-density polyethylene resins.

Use: Milk, juice, and water bottles.

uns-. (unsym). Abbreviation for unsymmetrical. A prefix denoting the structure of organic compounds in which substituents are disposed unsymmetrically with respect to the carbon skeleton or to a functional group, such as a double bond. For example, unsdichloroethane is CH_3CHCl_2 .

unsaponifiable matter. The weight of matter extracted by ether from the aqueous alkaline solution after complete saponification of a fat or oil.

unsaturated fatty acid. A fatty acid containing one or more double bonds.

unsaturation. Of a chemical compound, the state in which not all the available valence bonds along the alkyl chain are satisfied; in such compounds the extra bonds usually form double or triple bonds (chiefly with carbon). Thus, unsaturated compounds are more reactive than saturated compounds because other elements readily add to the unsaturated linkage. An unsaturated compound (ethylene, C_2H_4 ; butadiene, C_4H_6 ; benzene, C_6H_6) has fewer hydrogen atoms or equivalent groups than the corresponding saturated compound (ethane, C_2H_6 ; butane, C_4H_{10} ; cyclohexane, C_6H_{12}). In structural formulas unsaturation may be represented by parallel lines joining the carbon atoms (ethylene, $\text{H}_2\text{C}=\text{CH}_2$; butadiene $\text{H}_2\text{C}=\text{CHCH}=\text{CH}_2$) or by colons or triple dots, $\text{H}_2\text{C}:\text{CH}_2$, $\text{H}_2\text{C}:\text{CH}_2:\text{CH}_2$ (ethylene) and $\text{HC}\dots\text{CH}$ (acetylene). See carboxyl group.

unstable compound system. See peritectic system.

UPS. Abbreviation for ultraviolet photoelectron spectroscopy.

upstream activator sequence. A binding site for transcription factors, generally part of a promoter region. A UAS may be found upstream of the TATA sequence (if there is one), and its function is (the same as an enhancer) to increase transcription. Unlike an enhancer, it can not be positioned just anywhere or in any orientation.

upstream/downstream. In an RNA, anything towards the 5’ end of a reference point is “upstream” of that point. This orientation reflects the direction of both the synthesis of mRNA and its translation—from the 5’ end to the 3’ end. In DNA, the situation is a bit more complicated. In the vicinity of a gene (or in a cDNA), the DNA has two strands, but one strand is virtually a duplicate of the RNA, so its 5’ and 3’

ends determine upstream and downstream, respectively.

Note: that in genomic DNA two adjacent genes may be on different strands and thus oriented in opposite directions. Upstream or downstream is only used on conjunction with a given gene.

“Urac” [Cytex]. TM for products based on urea-formaldehyde condensates used mainly as adhesives for the production of moisture-proof bonds in plywood manufacture, plywood assembly, and furniture manufacture.

uracil. (2,4-dioxypyrimidine).
CAS: 66-22-8. HNC(O)NHC(O)CHCH. A pyrimidine that is a constituent of ribonucleic acids and the coenzyme, uridine diphosphate glucose.

Properties: Crystalline needles. Mp 335C (decomposes). Soluble in hot water, ammonium hydroxide, and other alkalis; insoluble in alcohol and ether.
Derivation: Hydrolysis of nucleic acids, precipitation from urea and ethyl formylacetate. Radioactive forms available.

Use: Biochemical research.

uracil-6-carboxylic acid. See orotic acid.

“Uracil Mustard” [Pfizer]. TM for 5-[bis(2-chloroethyl)amino]uracil. An antineoplastic.

uracil, D-riboseyl. See uridine.

“Uramite” [Du Pont]. TM for a fertilizer derived from ureaformaldehyde containing 38% nitrogen.

“Uramon” [Du Pont]. TM for solutions of urea in aqueous ammonia.

Use: Manufacture of mixed fertilizers.

urania. See uranium dioxide.

urania-thoria. Crystals of the mixed oxides of uranium and thorium are available. The crystals are denser and cheaper than the pellet form.

Use: Nuclear fuel.

uranic chloride. See uranium tetrachloride.

uranic oxide. See uranium dioxide.

uranine. (uranine yellow; sodium fluorescein; resorcinolphthalein sodium; CI 45350).

CAS: 518-47-8. Na₂C₂₀H₁₀O₅.

Properties: Orange-red powder; odorless. Hygroscopic soluble in water; sparingly soluble in alcohol.

Derivation: By treatment of fluorescein with sodium carbonate solution and crystallizing.

Method of purification: Recrystallization.

Grade: Technical, USP (as sodium fluorescein).

Use: Dyeing silk and wool yellow; tracing subterra-

nean waters; marking water for air-sea rescues; clinical test solution.

uraninite. UP₂. A natural phosphide of uranium usually partly oxidized to UO₃ with variable amounts of lead, radium, thorium, rare-earth metals, helium, argon, nitrogen. Pitchblende is an important variety.

Occurrence: Colorado, Utah, South Africa, Canada, Europe, the former U.S.S.R., Australia, Zaire.

Use: Source of uranium and radium.

uranium.

CAS: 7440-61-1. U. Metallic element number 92; a member of the actinide series; aw 238.029; valences of 3, 4, 6; three natural radioactive isotopes: uranium-234 (0.006%), uranium-235 (0.7%), and uranium-238 (99%).

Properties: Dense, silvery solid. D 19.0, mp 1132C, bp 3818C, heat of fusion 4.7 kcal/mole, heat capacity 6.6 cal/mole/C. Strongly electropositive, ductile and malleable, poor conductor of electricity. Forms solid solutions (for nuclear reactors) with molybdenum, niobium, titanium, and zirconium. The metal reacts with nearly all nonmetals. It is attacked by water, acids, and peroxides, but is inert toward alkalis. Green tetravalent uranium and yellow uranyl ion (UO₂⁺⁺) are the only species that are stable in solution.

Occurrence: Pitchblende (essentially UO₂), a variety of uraninite, coffinite (USiO₄) and carnotite (Colorado, New Mexico, France, Zaire, Canada, South Africa, Australia, the former U.S.S.R.). U.S. resources of uranium oxide in the 1970s were estimated at 150,000–175,000 tons; there is about the same amount in Canada.

Derivation: Finely ground ore is leached under oxidizing conditions to give uranyl nitrate solution. The uranyl nitrate, purified by solvent extraction (ether, alkyl phosphate esters), is then reduced with hydrogen to uranium dioxide. This is treated with hydrogen fluoride to obtain uranium tetrafluoride, followed by either electrolysis in fused salts or by reduction with calcium or magnesium. Uranium can also be recovered from phosphate sand.

Available forms: Solid pure metal, alloys, powder (99.7%).

Hazard: (Powder) Dangerous fire risk, ignites spontaneously in air. Highly toxic, radioactive material, source of ionizing radiation. TLV: (including metal and all compounds, as uranium) 0.2 mg/m³; STEL 0.6 mg(U)/m³.

Use: Source of fissionable isotope uranium-235, source of plutonium by neutron capture, electric power generation.

See enrichment (2); uranium compounds.

uranium-233. (²³³U). A fissionable isotope of uranium produced artificially by bombarding thorium-232 with neutrons. Used as an atomic fuel in molten salt reactor and is a possible fuel in breeder reactors. Half-life 1.62 × 10⁵ years.

uranium-234. (^{234}U). A natural isotope of uranium with half-life of 2.48×10^5 years; it is separated by extraction with triethylphosphine oxide.

Use: Nuclear research, with potential use in fission detectors for counting fast neutrons.

uranium-235. (^{235}U). The readily fissionable isotope of uranium used to enrich natural uranium in nuclear fuels. It is present in uranium only to the extent of 0.7% and can be separated from it by any of several methods: the gaseous diffusion process using uranium hexafluoride, the gas centrifuge process, and the electromagnetic separation method. Its half-life is 7.13×10^8 years. It was the energy source used in the original atomic bomb. Its critical mass is about 33 lb.

See fission; uranium.

uranium-238. (^{238}U). The abundant isotope of uranium of which it comprises 99%. It is not fissionable but will form plutonium-239 as a result of bombardment by neutrons in a reactor. Its half-life is 4.51×10^9 years. It will be used in breeder reactors, together with plutonium, where its energy potential will be exploited by transmuting it to fissionable plutonium.

See breeder.

uranium carbide. See uranium dicarbide.

uranium compounds. Before the advent of nuclear energy, uranium had very limited uses. It had been suggested for filaments of lamps. A small tube of uranium dioxide, UO_2 , connected in series with the tungsten filaments of large incandescent lamps used for photography and motion pictures, tends to eliminate the sudden surge of current through the bulbs when the light is turned on, thereby extending their lives. Compounds of uranium have been used in photography for toning, and in the leather and wood industries uranium compounds have been used for stains and dyes. Uranium salts are mordants of silk or wool. In making special steels, a little ferrouanium has been utilized, but its value is questionable in this connection. Such alloys have not proved commercially attractive. In the production of ceramics, sodium and ammonium diuranates have been used to produce colored glazes. Uranium carbide has been suggested as a good catalyst for the production of synthetic ammonia. Uranium salts in small quantities are claimed to stimulate plant growth, but large quantities are clearly poisonous to plants.

By far the most important use of uranium lies in its application for nuclear (or atomic) energy.

uranium decay series. (uranium-radium series). The series of elements produced as successive intermediate products when the element uranium undergoes spontaneous natural radioactive disintegration into lead. Radium and radon are members of this series.

uranium, depleted. Uranium from which most of the uranium-235 isotope has been removed.

Properties: Uranium metal wherein uranium-235 isotopic content has been reduced below 0.7% as found in normal uranium. Has high structural strength coupled with high density of 18.9 g/cc.

Derivation: Processed from uranium hexafluoride as tailing from gaseous diffusion plants.

Use: Balance weights for aircraft, high-speed rotors in gyro-compasses, γ -radiation shielding, radio-isotope transportation casks and fuel element transfer casks, in general as structural material applicable to radiation shielding.

See uranium-238.

uranium dicarbide. (uranium carbide). UC_2 .

Properties: Gray crystals. D 11.28 (18C), mp 2350C, bp 4370C. Decomposes in water; slightly soluble in alcohol.

Hazard: Highly toxic, radiation risk.

Use: Crystals, pellets, or microspheres for nuclear reactor fuel.

uranium dioxide. (uranium oxide; uranic oxide; urania; yellowcake).

CAS: 1344-57-6. UO_2 .

Properties: Black crystals. D 10.9, mp 3000C. Insoluble in water; soluble in nitric acid and concentrated sulfuric acid.

Derivation: (pure oxide) Powdered uranium ore is digested with hot nitric-sulfuric acid mixture and filtered to remove the insoluble portion. Sulfate is precipitated from the solution with barium carbonate, and uranyl nitrate is extracted with ether. After re-extraction into water, it is heated to drive off nitric acid, leaving uranium trioxide. The latter is reduced with hydrogen to the dioxide. Can be prepared from uranium hexafluoride by treating with ammonia and subsequent heating of the ammonium diuranate. It is also recovered from phosphoric acid.

Hazard: High radiation risk. Ignites spontaneously in finely divided form.

Use: A crystalline (or pellet) form is used to pack nuclear fuel rods.

uranium, enriched. Natural uranium to which a few percent of the fissionable 235-isotope has been added.

See enrichment.

uranium hexafluoride.

CAS: 7783-81-5. UF_6 .

Properties: Colorless, volatile crystals. Sublimes, triple point 64.0C (1134 mm Hg), mp 64.5C (2 atm), d 5.06 (25C). Soluble in liquid bromine, chlorine, carbon tetrachloride, *sym*-tetrachloroethane, and fluorocarbons. Reacts vigorously with water, alcohol, ether, and most metals. Vapor behaves as nearly perfect gas.

Derivation: (1) Triuranium octoxide (U_3O_8) and nitric acid react to form a solution of uranyl nitrate; this is decomposed to UO_3 and reduced to the diox-

ide with hydrogen. The dioxide as a fluidized bed is reacted with hydrogen fluoride. The resulting tetrafluoride is fluorinated to the hexafluoride. (2) Triuranium octoxide is converted directly to the hexafluoride with hydrogen fluoride and fluorine, then purified by fractional distillation.

Hazard: Highly corrosive; radiation risk.

Use: Gaseous diffusion process for separating isotopes of uranium.

uranium hydride. UH_3 .

Properties: Brown-gray to black powder. D 10.92, conductor of electricity.

Derivation: Action of hydrogen on hot uranium.

Hazard: Highly toxic. Ignites spontaneously in air.

Use: Preparation of finely divided uranium metal by decomposition, separation of hydrogen isotopes, reducing agent, laboratory source of pure hydrogen.

uranium monocarbide. UC .

Properties: Lumps or powder that can be formed into desired shapes by powder metallurgy or arc-melt casting. Mp 2375C, d 13.63, thermal conductivity 0.08 cal/sec/cm²/C/cm. Must be stored in inert atmosphere.

Hazard: Radioactive poison.

uranium nitrate.

CAS: 15905-86-9. mf: $\text{HNO}_3 \cdot x\text{U}$.

Properties: IDLH 10 mg/m³ (as U).

Hazard: A poison.

uranium oxide. See uranium dioxide.

uranium tetrafluoride. (green salt).

CAS: 10049-14-6. UF_4 .

Properties: Green, nonvolatile, crystalline powder. D 6.70, mp 1036C. Insoluble in water.

Derivation: Treatment of uranium dioxide with hydrogen fluoride.

Hazard: Highly corrosive, radioactive poison.

Use: Intermediate in preparation of uranium metal. See uranium hexafluoride.

uranocene. (bis-cyclooctatetraenyluranium). A synthetic metallocene "sandwich" molecule whose unique feature is that the pi-molecular orbitals of the large organic rings share electrons with f-atomic orbitals of the uranium.

See metallocene.

uranyl acetate.

CAS: 541-09-3. $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: (Dihydrate) Yellow crystals. D 2.89. Soluble in water plus acetic acid; slightly soluble in alcohol.

Use: Bacterial oxidation activator, copying inks, reagent.

uranyl nitrate. (uranium oxynitrate; UNH; yellow salt).

CAS: 10102-06-4. $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow, rhombic crystals. D 2.807, mp 60.2C, bp 118C. Soluble in water, alcohol, and ether.

Derivation: Action of nitric acid on uranium octoxide (U_3O_8).

Hazard: Strong oxidizer. Corrosive and irritating.

Use: Source of uranium dioxide, extraction of uranium into nonaqueous solvents.

urban waste. Solid waste materials including garbage, cellulose, glass, metals, etc., but not sewage (municipal waste). Garbage is being used both directly as fuel and fermented to yield proteins; the cellulose portion can be hydrolyzed to glucose, which is in turn converted to methane by anaerobic fermentation. A continuous process for this operation utilizing newspapers or sawdust has been reported.

See waste control; biomass.

urea. (carbamide).

CAS: 57-13-6. $\text{CO}(\text{NH}_2)_2$.

Occurs in urine and other body fluids. The first organic compound to be synthesized (Wohler, 1824).

Properties: White crystals or powder; almost odorless; saline taste. D 1.335, mp 132.7C, decomposes before boiling. Soluble in water, alcohol, and benzene; slightly soluble in ether; almost insoluble in chloroform. Noncombustible.

Derivation: Liquid ammonia and liquid carbon dioxide at 1750–3000 psi and 160–200C react to form ammonium carbamate, $\text{NH}_4\text{CO}_2\text{NH}_2$, which decomposes at lower pressure (about 80 psi) to urea and water. Several variations of the process include once-through, partial recycle, and total recycle.

Method of purification: Crystallization.

Grade: Technical, CP, USP, fertilizer (45–46% nitrogen), feed grade (about 42% nitrogen).

Use: Fertilizer, animal feed, plastics, chemical intermediate, stabilizer in explosives, medicine (diuretic), adhesives, separation of hydrocarbons (as urea adducts), pharmaceuticals, cosmetics, dentifrices, sulfamic acid production, flameproofing agents, viscosity modifier for starch or casein-based paper coatings, preparation of biuret.

See urea-formaldehyde resin.

urea adduct. See inclusion complex.

urea ammonia liquor. A solution of crude urea in aqueous ammonia containing ammonium carbamate.

Use: Reaction with superphosphate in preparation of fertilizers, furnishing combined nitrogen.

urea-ammonium orthophosphate. A fertilizer developed especially for food-deficient regions, particularly rice-dependent areas. Several grades

contain all three primary plant nutrients (nitrogen, phosphorus, and potassium). Contains up to 60% nitrogen, phosphoric anhydride, and potassium oxide.

urea-ammonium polyphosphate. A fertilizer similar to urea-ammonium orthophosphate except that about half the phosphorus is in polyphosphate form, which gives improved sequestering action and solubility. It is excellent for use as a liquid fertilizer.

urea cycle. A metabolic pathway in vertebrates for the synthesis of urea from amino groups and carbon dioxide; occurs in mitochondrial and cytoplasmic compartments of the liver.

ureaform. A urea-formaldehyde reaction product that contains more than one molecule of urea per molecule of formaldehyde. It can be used as a fertilizer because of its high nitrogen content, its insolubility in water, and its gradual decomposition in the soil during the growing season to yield soluble nitrogen.

urea-formaldehyde resin. An important class of amino resin. Urea and formaldehyde are united in a two-stage process in the presence of pyridine, ammonia, or certain alcohols with heat and control of pH to form intermediates (methylolurea, dimethylolurea) that are mixed with fillers to produce molding powders. These are converted to thermosetting resins by further controlled heating and pressure in the presence of catalysts. These were the first plastics that could be made in white, pastel, and colored products.

Use: Scale housings, dinnerware, interior plywood, foundry core binder, flexible foams, insulation. See amino resin; melamine resin.

urea hydrogen peroxide. See urea peroxide.

urea nitrate.

CAS: 124-47-0. $\text{CO}(\text{NH}_2)_2 \bullet \text{HNO}_3$.

Properties: Colorless crystals. Decomposes at 152°C. Slightly soluble in water; soluble in alcohol.

Derivation: By adding an excess of nitric acid to a strong aqueous solution of urea.

Hazard: Dangerous fire and explosion risk.

Use: Explosives, manufacture of urethane.

urea peroxide. (urea hydrogen peroxide; percarbamide; carbamide peroxide).

CAS: 124-43-6. $\text{CO}(\text{NH}_2)_2 \bullet \text{H}_2\text{O}_2$.

Properties: White crystals or crystalline powder. Mp (decomposes) 75–78°C, decomposed by moisture at temperatures around 40°C. Soluble in water, alcohol, and ethylene glycol; solvents such as ether and acetone extract hydrogen peroxide and may form explosive solutions. Active oxygen (min) 16%.

Grade: Technical, sometimes compounded with waxes in pellet form.

Hazard: Dangerous fire risk in contact with organic materials; strong oxidizing agent. Irritant.

Use: Source of water-free hydrogen peroxide, bleaching disinfectant, cosmetics, pharmaceuticals, blueprint developer, modification of starches.

urea phosphoric acid. See carbamide phosphoric acid.

urease. Enzyme present in low percentages in jack bean and soybean; watersoluble, its action is inhibited by heavy-metal ions. Its principal use is in the determination of urea in urine, blood, and other body fluids; it splits urea into ammonia and carbon dioxide or ammonium carbonate.

Urech cyanohydrin method. Cyanohydrin formation by addition of alkali cyanide to the carbonyl group in the presence of acetic acid (Urech); or by reaction of the carbonyl compound with anhydrous hydrogen cyanide in the presence of a basic catalyst (Ultee).

Urech hydantoin synthesis. Formation of hydantoins from α -amino acids by treatment with potassium cyanate in aqueous solution and heating of the salt of the intermediate hydantoic acid with 25% hydrochloric acid.

ureotelic. Organisms which excrete excess nitrogen in the form of urea.

urethane. (ethyl carbamate; ethyl urethane).

CAS: 51-79-6. $\text{CO}(\text{NH}_2)\text{OC}_2\text{H}_5$. Its structure is typical of the repeating unit in polyurethane resins.

Properties: Colorless crystals or white powder; odorless, saltpeter-like taste. D 0.9862, mp 49°C, bp 180°C. Solutions neutral to litmus. Soluble in water, alcohol, ether, glycerol, and chloroform; slightly soluble in olive oil. Combustible.

Derivation: (1) By heating ethanol and urea nitrate to 120–130°C; (2) by action of ammonia on ethyl carbonate or ethyl chloroformate.

Grade: Technical, NF.

Hazard: Toxic by ingestion.

Use: Intermediate for pharmaceuticals, pesticides, and fungicides; biochemical research; medicine (antineoplastic).

See polyurethane.

urethane alkyd. (uralkyd). A urethane resin modified with a drying oil (linseed or safflower) for use in high-quality paints.

“UrethHall” [Hall]. TM for polyester polyols for urethane systems that are fluid and pourable at room temperature and are based on chemistry completely different from the traditional adipate polyesters. Available in 25 different variations of glycol base, hydroxyl number, or molecular weight.

Use: All forms of polyurethanes made from polyesters, especially those where improved hydrolytic stability and flexibility without external plasticizers are valued.

Urey, Harold C. (1894–1981). An American chemist who received the Nobel Prize in chemistry in 1934 for his discovery of the heavy isotopes of hydrogen and oxygen. His discovery that became an important factor in the development of nuclear fission and fusion and made possible the production of the first transuranic element Pu. He was one of the leaders of the Manhattan Project, which constructed the first nuclear reactor at the University of Chicago and eventually produced the first atomic bomb. After obtaining his doctorate at the University of California in 1923, he taught at several leading universities, including Columbia, where he discovered deuterium D oxide (heavy water), used as a moderator in early types of nuclear reactors. Later he devoted much study to the origin of the universe and the origin of life on earth. He was the author of many scientific treatises and made notable contributions to the cosmological theories.

uric acid. (lithic acid; uric oxide; 2,6,8-trioxypurine).

CAS: 69-93-2.

$\text{OCNHC(O)NHCCNHC(O)NH}$ (keto form).

May also be written in enolic form. The end product of purine metabolism in human and other primates, birds, and some dogs and reptiles.

Properties: Odorless, white crystals; tasteless. D 1.855–1.893, mp (decomposes). Soluble in hot concentrated sulfuric acid; very slightly soluble in water; insoluble in alcohol and ether; soluble in glycerol, solutions of alkali hydroxides, sodium acetate, and sodium phosphate.

Derivation: From guano.

Grade: Technical, reagent.

Hazard: Evolves a highly toxic hydrogen cyanide when heated.

Use: Organic synthesis.

uricotelic. Organisms which excrete excess nitrogen in the form of uric acid (urate at physiological conditions).

uridine. (D-riboseyl uracil).

CAS: 58-96-8. $\text{C}_9\text{H}_{12}\text{N}_2\text{O}_6$. The nucleoside of uracil. It is a constituent of ribonucleic acid and some coenzymes (such as uridine diphosphate glucose).

Properties: White powder; odorless; slightly acid and faintly sweet taste. Mp 165C. Soluble in water; slightly soluble in dilute alcohol; insoluble in strong alcohol.

Derivation: From nucleic acid hydrolyzates from yeast. Radioactive forms available.

Use: Biochemical research.

uridine diphosphate glucose. (UDPG). A coenzyme that acts in the transfer of glucose from the coenzyme to another chemical compound during the reaction for which the coenzyme is a catalyst.

Use: Biochemical research.

uridine monophosphate. See uridylic acid.

uridine phosphate. A nucleotide used by the body in growth processes; important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (UMP), the diphosphate (UDP), and the triphosphate (UTP).

See uridine diphosphate glucose (UDPG).

uridylic acid. (uridine phosphoric acid;

UMP; uridine monophosphate).

CAS: (5') 58-97-9. ($\text{C}_9\text{H}_{13}\text{N}_2\text{O}_6\text{P}$). The monophosphoric ester of uracil, i.e., the nucleotide containing uracil-d-ribose and phosphoric acid. The phosphate may be esterified to either the 2, 3, or 5 carbon of ribose, yielding uridine-2'-phosphate, uridine-3'-phosphate, and uridine-5'-phosphate, respectively.

Properties: (Uridine-3'-phosphate) Crystallizes in prisms from methanol. Mp 202C (decomposes). Freely soluble in water and alcohol; dextrorotatory in solution.

Derivation: (of commercial product) From yeast ribonucleic acid. Also made synthetically; radioactive forms available.

Use: Biochemical research.

uroformine. (urotropin, formin, crystogen, cystamine).

See hexamethyltetramine.

uronic acid. Any of a class of compounds similar to sugars but differing from them in that the terminal carbon has been oxidized from an alcohol to a carboxyl group. The most common are galacturonic acid and glucuronic acid.

ursin. See arbutin.

urushiol. Mixture of catechol derivatives.

Properties: Pale-yellow liquid. D 0.968, bp 200C. Soluble in alcohol, ether, and benzene.

Derivation: Poison ivy (*Rhus toxicodendron*).

Hazard: The toxic principle of poison ivy. Causes severe allergic dermatitis.

urylon. A polyurea synthetic fiber made by condensation of nonamethylenediamine and urea.

Properties: D 1.07, softening p 205C, mp 235C, weakens on heating to 150C or long exposure to light.

Use: Fiber blends, fishing gear, and the like.

USAN. Abbreviation for United States Adopted Name, a nonproprietary name approved by the American Pharmaceutical Association, American

Medical Association, and the U.S. Pharmacopeia. Such names applied to pharmaceutical products do not imply endorsement; their use in advertising and labeling is required by law.

USDA. Abbreviation for United States Department of Agriculture.

USP. Abbreviation for United States Pharmacopeia.

usnic acid. (usnic acid).

CAS: 125-46-2. $C_{18}H_{16}O_7$. A tricyclic compound. A constituent of many lichens. Known in *d*, *l*, and *dl* forms.

Properties: Crystalline, yellow solid. Melting range 192–203C. Insoluble in water; slightly soluble in alcohol and ether.

Derivation: From *Usnea barbata*, a lichen growing on trees.

Use: Medicine (antibiotic).

USP. Abbreviation for United States Pharmacopeia, the official publication for drug product standards.

USRDA. Abbreviation for United States Recommended Dietary Allowances for food and nutrition, established by the Food and Drug Administration (FDA) to serve as a basis for regulations on nutri-

tional labeling of food products. They are based on the Recommended Dietary Allowances previously established by the Food and Nutrition Board, and the National Research Council of the National Academy of Sciences, and they are revised periodically. See RDA.

UTP. See uridine phosphate.

UV. See ultraviolet.

UVA. See ultraviolet.

UVB. See ultraviolet.

“UV-Chek” [Ferro]. TM for light stabilizers.

“Uvinul” [BASF]. TM for 2-ethylhexyl-2-cyano-3',3'-diphenyl acrylate.

Use: In sunscreen products.

“Uvitex” [Novartis]. TM for a group of fluorescent whitening agents used on natural and synthetic textile fabrics and yarn.

17- α -uzarigenin.

CAS: 663-97-8. mf: $C_{23}H_{34}O_4$.

Hazard: A poison.

Source: Natural product.

V

V. Symbol for vanadium.

vacancy. (1) A defect in a crystal due to the absence of an atom in the lattice.

See hole. (2) The absence of one or more electrons in the outer shell of an atom.

vacuole. Membrane-bound fluid-filled space within a cell. In most plant cells, there is a single large vacuole filling most of the cell's volume. Some bacterial cells contain gas vacuoles.

vacuum deposition. The process of coating a base material by evaporating a metal under high vacuum and condensing it on the surface of the material to be coated, which is usually another metal or a plastic. Aluminum is most commonly used for this purpose. The coatings obtained range in thickness from 0.01 to as many as 3 mils. A vacuum of about one-millionth atmosphere is necessary. The process is used for jewelry, electronic components, decorative plastics, etc. Thermally evaporated metals and dielectric coatings can be effectively applied to glass by this method. It is also called vacuum coating and vacuum metallizing.

vacuum distillation. Distillation at a pressure below atmospheric but not so low that it would be classed as molecular distillation. Since lowering the pressure also lowers the boiling point, vacuum distillation is useful for distilling high-boiling and heat-sensitive materials such as heavy distillates in petroleum, fatty acids, vitamins, etc.

vacuum forming. See thermoforming (2).

val. Abbreviation for value.

valacidin.

CAS: 3930-19-6. $C_{26}H_{24}N_4O_8$.

Properties: Brown to red solid. Soluble in polar solvents and alkaline solutions; insoluble in most nonpolar solvents and acid solutions.

Use: Antibiotic (used as a preservative for biological specimens); embalming fluids.

“Valclene” [Du Pont]. TM for clear fluoro-carbon formulations with slight ethereal odor. Non-flammable.

Use: Dry-cleaning fluids.

valence. A whole number that represents or denotes the combining power of one element with another. By balancing these integral valence numbers in a given compound, the relative proportions of the elements present can be accounted for. If

hydrogen and chlorine both have a valence of 1, oxygen a valence of 2, and nitrogen 3, the valence-balancing principle gives the formulas HCl, H_2 , NH_3 , Cl_2O , NCl_3 , and N_2O_3 , which indicate the relative numbers of atoms of these elements in compounds that they form with each other. In inorganic compounds it is necessary to assign either a positive or negative value to each valence number, so that valence balancing will give a zero sum by algebraic addition. Negative numbers are called polar valence numbers (-1 and -2). The valence of chlorine may be -1, +1, +3, +5, or +7, depending on the type of compound in which it occurs. In organic chemistry only nonpolar valence numbers are used.

See chemical bonding; oxidation; oxidation number; coordination number.

valence electrons. The electrons in the outermost shell of an atom determining chemical properties.

valentinite. (antimony trioxide [ortho-rhombic]; white antimony).

CAS: 1309-64-4. Sb_2O_3 .

Properties: White or gray mineral, sometimes pale red, white streak and adamantine or silky luster. D 5.57-5.76, Mohs hardness 2-3.

Occurrence: Algeria, the former Yugoslavia, Italy, Germany.

Use: Ore of antimony.

valepotriate.

CAS: 18296-44-1. mf: $C_{22}H_{30}O_8$.

Hazard: A poison.

valeral. See valeraldehyde.

n-valeraldehyde. (valeric aldehyde; valeral; amyl aldehyde; pentanal).

CAS: 110-62-3. $CH_3(CH_2)_3CHO$.

Properties: Colorless liquid. D 0.8095 (20/4C), fp -91C, bp 102-103C, refr index 1.3944 (20C), flash p 54F (12.2C) (CC). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Oxidation of amyl alcohol, also by the Oxo process.

Hazard: Flammable, dangerous fire risk. TLV: 50 ppm.

Use: Flavoring, rubber accelerators.

See isovaleraldehyde.

valeranonone.

CAS: 55528-90-0. mf: $C_{15}H_{26}O$.

Hazard: A poison.

valerenal.CAS: 4176-16-3. mf: C₁₅H₂₂O.**Hazard:** A poison.**valeric acid.**CAS: 3569-10-6. mf: C₁₅H₂₂O₂.**Hazard:** A poison.**valerianic acid.** See valeric acid.**valerian oil.****Properties:** Yellowish or brownish liquid; penetrating odor. D 0.903–0.960, refr index 1.486 (20C). Soluble in alcohol, ether, chloroform, acetone, benzene, and carbon disulfide. Combustible. Chief constituents: Pinene, camphene, borneol, and esters of borneol and valeric acid.**Derivation:** Distilled from roots and rhizome of *Valeriana officinalis*.**Use:** Tobacco perfume, industrial odorant, flavors.**valeric acid.** (valerianic acid; *n*-pentanoic acid).CAS: 109-52-4. CH₃(CH₂)₃COOH.**Properties:** Colorless liquid; penetrating odor and taste. D 0.9394 (20/4C), bp 185.4C, refr index 1.4081 (20C), vap press 0.08 mm Hg (20C), fp –34C, flash p 205F (96C) (OC). Soluble in water, alcohol and ether. Undergoes reactions typical of normal monobasic organic acids. Combustible.**Derivation:** With other C₅ acids by distillation from valerian, by oxidation of *n*-amyl alcohol, numerous essential oils.**Grade:** Technical, reagent.**Hazard:** Toxic by ingestion, strong irritant to skin and tissue.**Use:** Intermediate for flavors and perfumes, ester-type lubricants, plasticizers, pharmaceuticals, vinyl stabilizers.

See isovaleric acid.

valeric aldehyde. See *n*-valeraldehyde.**γ-valerolactone.**

CAS: 108-29-2.

**Properties:** Colorless liquid. D 1.0518 (25/25C), bp 205–206.5C, crystallizing point –37C, flash p 205F (96C) (COC), refr index 1.4301 (25C), surface tension 30 dynes/cm (25C), viscosity 2.18 cP (25C), pH (anhydrous) 7.0 (pH of 10 solution in distilled water 4.2). Miscible with water and most organic solvents, resins, waxes, etc.; slightly miscible with zein, beeswax, petrolatum; immiscible with anhydrous glycerin, glue, casein, arabic gum, and soybean protein. Combustible.**Use:** Dye baths (coupling agent), brake fluids, cutting

oils, and as solvent for adhesives, insecticides, and lacquers.

valine. (α-aminoisovaleric acid).CAS: (D-) 72-18-4. (CH₃)₂CHCH(NH₂)COOH. An essential amino acid.**Properties:** White, crystalline solid. Soluble in water; verghtly soluble in alcohol; insoluble in ether; shows the following optical isomers: (DL-valine) Mp 298C with decomposition. (D-valine (natural isomer): Mp 315C with decomposition. (L-valine) Mp 293C with decomposition.**Derivation:** Hydrolysis of proteins, synthesized by the reaction of ammonia with α-chloroisovaleric acid. Available commercially as D-, L-, or DL-valine.**Use:** Dietary supplement, culture media, biochemical and nutritional investigations.**“Valium” [Hoffmann-La Roche].** TM for diazepam.**valone.** (2-isovaleryl-1,3-indanedione).C₁₄H₁₄O₃.**Properties:** Yellow, crystalline solid. Mp 68C. Insoluble in water; soluble in common organic solvents. A blood anticoagulant.**Hazard:** Toxic by ingestion.**Use:** Pesticide, rodenticide.**vanadic acid.** (1) meta-HVO₃, (2) ortho-H₃VO₄, (3) pyro-H₄V₂O₇. These acids apparently do not exist in the pure state but are represented in the various alkali and other metal vanadates. Ordinarily, vanadic acid implies vanadium pentoxide (vanadic acid anhydride).**vanadic acid anhydride.** See vanadium pentoxide.**vanadic(II) acid, trisodium salt.** See sodium orthovanadate.**vanadic sulfate.** See vanadyl sulfate.**vanadic sulfide.** See vanadium sulfide.**vanadinite.** Pb₃Cl(VO₃). A natural chlorovanadate of lead.**Properties:** Ruby-red, orange-red, brown, yellow solid; resinous to adamantine luster. Mohs hardness 3, d 6.7–7.1. Soluble in strong nitric acid.**Occurrence:** New Mexico, Arizona, Africa, Scotland, the former U.S.S.R..**Use:** Ore of vanadium and lead.**vanadium.**

CAS: 7440-62-2. V. Metallic element having atomic number 23, group VB of the periodic table, aw 50.9414, valences of 2, 3, 4, 5; two natural isotopes.

Properties: Silvery-white ductile solid. D 6.11, mp 1900C, bp 3000C. Insoluble in water; resistant to corrosion, but soluble in nitric, hydrofluoric, and

concentrated sulfuric acids; attacked by alkali, forming water-soluble vanadates. Acts as either a metal or a nonmetal and forms a variety of complex compounds.

Source: Not found native; principal ores are patronite, roscelite, carnotite and vanadinite. Also from phosphate rock (Idaho, Montana, Arkansas).

Occurrence: Colorado, Utah, New Mexico, Arizona, Mexico, and Peru.

Derivation: (1) Calcium reduction of vanadium pentoxide yields 99.8+% pure ductile vanadium; (2) aluminum, cerium, etc. reduction produces a less pure product; (3) solvent extraction of petroleum ash or ferrophosphorus slag from phosphorus production; (4) electrolytic refining using a molten salt electrolyte containing vanadium chloride.

Grade: 99.99% pure (electrolytic process), single crystals.

Use: Target material for X rays, manufacture of alloy steels, vanadium compounds, especially catalyst for sulfuric acid and synthetic rubber.

See ferrovanadium.

vanadium acetylacetonate.

Properties: Blue to blue-green crystals. Decomposes before melting.

Derivation: Reaction of vanadyl sulfate with acetylacetonate and sodium carbonate.

Use: Catalyst.

vanadium carbide. VC .

Properties: Crystal. Mohs hardness 2800 kg/sq mm, d 5.77, mp 2800C, bp 3900C, resistivity 150 microhm-cm (room temperature).

Use: Alloys for cutting tools, steel additive.

vanadium dichloride. (vanadous chloride).

CAS: 10213-09-9. VCl_2 .

Properties: Apple-green hexagonal plates. D 3.23 (18C). Soluble in alcohol and ether; decomposes in hot water.

Derivation: From vanadium trichloride by heating in atmosphere of nitrogen.

Method of purification: Sublimation in nitrogen.

Grade: CP.

Hazard: Strong irritant to tissue.

Use: Strong reducing agent, purification of hydrogen chloride from arsenic.

vanadium disulfide. V_2S_2 .

Properties: Solid. D 4.20, mp (decomposes). Soluble in hot sulfuric or nitric acids; insoluble in alkalies.

Use: Solid lubricant, electrode in lithium-based batteries (experimental).

vanadium ethylate. $(C_2H_5O)_2V$.

Properties: Dark-reddish-brown solid.

Derivation: Reaction of vanadium chloride with sodium ethylate.

Use: Polymerization catalyst.

vanadium hexacarbonyl. $V(CO)_6$.

Properties: Blue-green powder. Sublimes easily at 50C (15 mm Hg), paramagnetic, decomposes without melting at 60–70C.

Hazard: Strong irritant to tissue; store under inert gas.

Use: Chemical intermediate, production of plating compounds and fuel additives.

vanadium hexacarbonyl, sodium salt.

(bisdiglymesodium hexacarbonyl vanadate).

$Na(C_6H_{14}O_3)_2V(CO)_6$. A convenient though incomplete name for the complex compound.

Properties: Yellow solid. Mp 173–176C (with decomposition). Soluble in water, alcohol, and ether; slightly soluble in hydrocarbons; relatively inert to air but is stored and shipped under nitrogen.

Hazard: Strong irritant to tissue.

Use: Source of vanadium hexacarbonyl by treatment with phosphoric acid under special conditions.

vanadium nitride. VN .

Properties: Black solid. D 6.13, mp 2320C. Insoluble in water; slightly soluble in aqua regia.

Use: Refractory.

vanadium oxydichloride. See vanadyl chloride.

vanadium oxytrichloride.

CAS: 7727-18-6. $VOCl_3$.

Properties: Lemon-yellow liquid. D 1.811 (32C), fp –78.9C, bp 125–127C, nonionizing solvent. Dissolves most nonmetals; dissolves and/or reacts with many organic compounds; hydrolyzes in moisture.

Hazard: Strong irritant to tissue.

Use: Catalyst in olefin polymerization (ethylenepropylene rubber) organovanadium synthesis.

vanadium pentoxide. (vanadic acid anhydride).

CAS: 1314-62-1. V_2O_5 .

Properties: Yellow to red crystalline powder. D 3.357 (18C), mp 690C, bp (decomposes) 1750C. Soluble in acids and alkalies; slightly soluble in water.

Derivation: (1) Alkali or acid extraction from vanadium minerals. (2) By igniting ammonium metavanadate. (3) From concentrated ferrophosphorus slag by roasting with sodium chloride, leaching with water and purification by solvent extraction followed by precipitation and heating.

Method of purification: Alkali solution, precipitation as ammonium metavanadate and ignition to V_2O_5 .

Grade: Commercial air-dried, commercial fused, CP air-dried, CP fused.

Hazard: Toxic by inhalation. TLV: 0.05 mg(V_2O_5)/ m^3 ; not classifiable as a human carcinogen.

Use: Catalyst for oxidation of sulfur dioxide in sulfuric acid manufacture, ferrovanadium, catalyst for many organic reactions, ceramic coloring material,

vanadium salts, inhibiting UV transmission in glass, photographic developer, dyeing textiles.
See contact process.

vanadium sesquioxide. See vanadium trioxide.

vanadium sulfate. See vanadyl sulfate.

vanadium sulfide. (vanadium pentasulfide; vanadic sulfide). V_2S_5 .

Properties: Black-green powder. D 3.0, decomposes on heating. Soluble in acids, alkali-metal sulfides and alkalis; insoluble in water.

Derivation: Action of hydrogen sulfide on vanadium chloride solution.

Hazard: Toxic by inhalation (especially to animals).

Use: Vanadium compounds.

vanadium tetrachloride.

CAS: 7632-51-1. VCl_4 .

Properties: Red liquid. D 1.816 (20C), fp $-28C$, bp $154C$. Decomposes slowly to vanadium trichloride and chlorine below $63C$. Soluble in absolute alcohol and ether. Nonflammable.

Derivation: Chlorination of ferrovandium.

Method of purification: Distillation and fractionation.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Open containers only in dry, oxygen-free atmosphere or inert gas; wear goggles and protective clothing; corrosive to tissue.

Use: Preparation of vanadium trichloride, vanadium dichloride, and organovanadium compounds.

vanadium tetraoxide. V_2O_4 .

Properties: Blue-black powder. D 4.339, mp $1967C$.

Insoluble in water; soluble in alkalis and acids.

Derivation: (1) From vanadium pentoxide by oxalic acid reduction. (2) From vanadium pentoxide by carbon reduction.

Hazard: Toxic and irritating.

Use: Catalyst at high temperature.

vanadium trichloride.

CAS: 7718-98-1. VCl_3 .

Properties: Pink, deliquescent crystals. D 3.0 (18C), decomposes on heating. Soluble in absolute alcohol and ether; decomposes in water.

Derivation: From vanadium tetrachloride boiling under reflux condenser.

Hazard: Irritant.

Use: Preparation of vanadium dichloride and organovanadium compounds.

vanadium trioxide. (vanadium sesquioxide).

CAS: 1314-34-7. V_2O_3 .

Properties: Black crystals. D 4.87 (18C), mp $1970C$. Soluble in alkalis and hydrogen fluoride; slightly soluble in water.

Derivation: From vanadium pentoxide by either hydrogen or carbon reduction.

Hazard: Irritant.

Use: Catalyst for conversion of ethylene to ethanol.

vanadous chloride. See vanadium dichloride.

vanadyl chloride. (vanadium oxydichloride; vanadyl dichloride; divanadyl tetrachloride).
CAS: 10213-09-9. $V_2O_2Cl_4 \cdot 5H_2O$.

Properties: Green, deliquescent crystal. Usual technical product is a dark-green, syrupy mass 76–82% pure, or a solution. Slowly decomposed by water; soluble in water, alcohol, and acetic acid; may react violently with potassium.

Grade: Technical.

Hazard: Irritant.

Use: Mordanting textiles.

vanadyl sulfate. (vanadic sulfate; vanadium sulfate).

CAS: 27774-13-6. $VOSO_4 \cdot 2H_2O$.

Properties: Blue crystals. Soluble in water.

Derivation: Reduction of cold solution of concentrated sulfuric acid and vanadium pentoxide by sulfur dioxide gas.

Hazard: Irritant.

Use: Mordant, catalyst, aniline black preparation, reducing agent, colorant in glasses and ceramics.

“Vanaquat” [Evans Vanodine]. TM for a cleaner and disinfectant for food processing equipment.

“Vanason” [Evans Vanodine]. TM for a tank sanitizer for dairy farm equipment.

vancomycin hydrochloride.

Properties: Tan to brown powder; odorless; bitter taste. Soluble in water; moderately soluble in dilute methanol; insoluble in higher alcohols, acetone, ether.

Derivation: Produced by *Streptomyces orientalis* from Indonesian and Indian soil.

Grade: USP.

Use: Medicine (antibiotic).

“Vancote 2K” [Vanderbilt]. TM for a waterborne epoxy fast dry shop primer.

van der Waals forces. (London dispersion force). Weak attractive forces acting between molecules. They are somewhat weaker than hydrogen bonds and far weaker than interatomic valences. They are involved in the van der Waals equation of state for gases, which compensates for the actual volume of the molecules and the forces acting between them. “Information regarding the numerical values of van der Waals forces is mostly semiempirical, derived with the aid of theory from an analysis of chemical or physical data. Attempts to calculate the forces from first principles have had a measure of success only for the simplest systems, such as

H-H, He-He and a few others. When judging the difficulties of such calculations, one must bear in mind that the energies sought are of the same order of magnitude as those in the best atomic energy calculations." (Henry Margenau).

See hydrogen bond; chemical bonding.

Van Dyke brown. (Cassel brown; Cologne brown; Cologne earth; ulmin brown). A naturally occurring pigment.

Derivation: Indefinite mixture of iron oxide and organic matter. Obtained from bog-earth, peat deposits, or others that contain bituminous matter.

Use: Pigment for artists' colors and stains.

Van Dyke red. A brownish-red pigment consisting of copper ferrocyanide; sometimes used to refer to red varieties of ferric oxide.

Use: Pigment.

See iron oxide red.

vanillin. (3-methoxy-4-hydroxybenzaldehyde; vanillic aldehyde).

CAS: 121-33-5. $(\text{CH}_3\text{O})(\text{OH})\text{C}_6\text{H}_3\text{CHO}$. The methyl ether of protocatechuic aldehyde.

Properties: White, crystalline needles; sweetish smell. D 1.056, mp 81–83°C, bp 285°C. Soluble in 125 parts water, in 20 parts glycerol, and in 2 parts 95% alcohol; soluble in chloroform and ether. Combustible.

Derivation: (1) By extraction from the vanilla bean, (2) from lignin contained in sulfite waste pulp liquor.

Method of purification: Crystallization.

Grade: Technical, USP, FCC.

Use: Perfumes, flavoring, pharmaceuticals, laboratory reagent, source of L-dopa.

van Leeuwenhoek, Anton. (1632–1723). A native of Holland, van Leeuwenhoek was a professional lens grinder. He developed the compound optical microscope, which had been invented in 1590, to a point where he was able to obtain magnifications up to 275 times. He was the first to observe bacteria, spermatozoa, and other unicellular animals, which he described to the Royal Society of London.

See optical microscope.

"Vansil" [Vanderbilt]. TM for a calcium metasilicate filler mineral.

Van Slyke determination. Treatment of primary aliphatic amines and α -amino acids with nitrous acid and volumetric determination of evolved nitrogen.

van't Hoff, Jacobus H. (1852–1911). A Dutch chemist who received the first Nobel Prize for chemistry in 1901. A father of physical chemistry, he did research on decomposition and formation of double salts. He related optically active carbon com-

pounds to three-dimensional and asymmetrical molecular structure. This led to the development of stereochemistry. He was educated at the Universities of Paris and Utrecht, where he received a doctorate in 1874. He was a professor at Amsterdam, Leipzig, and Berlin.

"Vapona" [Shell]. TM for an insecticide that contains more than 93% 2,2-dichlorovinyl dimethyl phosphate and less than 7% active, related compounds.

See DDVP.

Hazard: As for dichlorovos.

vapor. An air dispersion of molecules of a substance that is liquid or solid in its normal state, i.e., at standard temperature and pressure. Examples are water vapor and benzene vapor. Vapors of organic liquids are also loosely called fumes.

See evaporation; gas.

vapor density. Weight of a vapor per unit volume at any given temperature and pressure.

vapor-phase chromatography. See gas chromatography.

vapor pressure. (vap press; vap p; v.p.).

The pressure (often expressed in millimeters of mercury, mm Hg) characteristic at any given temperature of a vapor in equilibrium with its liquid or solid form.

vapor tension. See vapor pressure.

varnish. (1) An organic protective coating similar to a paint except that it does not contain a colorant. It may be composed of a vegetable oil (linseed, tung, etc.) and solvent or of a synthetic or natural resin and solvent. In the first case the formation of the film is due to polymerization of the oil and in the second to evaporation of the solvent. "Long-oil" varnishes such as spar varnish have a high proportion of drying oil; "short-oil" types have a lower proportion, i.e., furniture varnishes. Spirit varnishes contain such solvents as methanol, toluene, ketones, etc. and often also thinners such as naphtha or other light hydrocarbon. Flammable. (2) A hard, tightly adherent deposit on the metal surfaces of automobile engines resulting from resinous oxidation products of gasoline and lubricating oils.

varnish remover. See paint remover.

"Varonic" [Crompton & Knowles]. TM for ethoxylated primary amines. 2- to 30-mole adducts of primary fatty amines based on coco, soya, tallow, and oleic acid.

Properties: Oil and water soluble.

Use: In textile industry and other emulsifier applications.

Varrentrapp reaction. Cleavage of oleic acid into palmitic and acetic acids by heating with molten potassium hydroxide. The procedure has been extended to olefinic acids in general.

vasopressin. (β -hypophamine; antidiuretic hormone). One of the hormones secreted by the posterior lobe of the pituitary gland. It causes in blood pressure and an increase in water retention by the kidney. Vasopressin is an octapeptide consisting of eight amino acids.

Derivation: Synthetic, or from the posterior lobe of the pituitary of food animals.

Grade: USP as an aqueous solution for injection.

Use: Medicine (antidiuretic).

vasopressin, 8-*l*-arginine-. See arginine vasopressin.

vat dye. A class of water-insoluble dyes that can be easily reduced, i.e., vatted to a water-soluble and usually colorless leuco form in which they can readily impregnate fibers. Subsequent oxidation then produces the insoluble colored form that is remarkably fast to washing, light, and chemicals. Examples are indigo (CI 73000) and Indanthrene Blue BFP (CI 69825). The reducing agents are usually an alkaline solution of sodium hydrosulfite ($\text{Na}_2\text{S}_2\text{O}_4$). Oxidation is by air, perborate, dichromate, etc.

Use: For cotton, wool, and cellulose acetate.

vat printing assistant. A mixture of gums and reducing and wetting agents used to carry the dye in printing fabrics with vat dyes. They assist in securing penetration of the fabric and in converting the dyes from a semileuco to a leuco state.

“Vatsol” [Cytex]. TM for a series of wetting agents made in several different grades and types: OS, sodium isopropyl naphthalene sulfonic acid; OT, sodium dioctyl sulfosuccinate.

vatting The process of solubilizing vat dyes in an aqueous solution of caustic soda and sodium hydrosulfite.

Vauquelin’s salt. $(\text{Pd}(\text{NH}_3)_4)\text{Cl}_2 \cdot \text{PdCl}_2$. A compound obtained by treating palladium chloride with ammonia.

VC. Abbreviation for vinyl chloride or vinylidene chloride.

vector. (1) In biochemistry, an animal (insect, rodent, etc.) that carries or transports infectious microorganisms. Typical vectors are rats and mosquitoes. (2) A DNA molecule known to replicate autonomously in a host cell, to which a segment of DNA may be spliced to allow its replication. The current types are plasmids, cosmids, YAC’s or a temperate-phage DNA.

vegetable black. In general, any form of more or less pure carbon produced by incomplete combustion or destructive distillation of vegetable matter, wood, vines, wine lees.

vegetable dye. A colorant derived from a vegetable source, i.e., logwood, indigo, madder, etc.

vegetable gum. See dextrin.

vegetable oil. An oil extracted from the seeds, fruit, or nuts of plants and generally considered to be a mixture of glycerides (e.g., cottonseed, linseed, corn, coconut, babassu, olive, tung, peanut, perilla, oiticica, etc.). Many types are edible. Being plant-derived products, vegetable oils are a form of biomass. Some are reported to be convertible to liquid fuels by passing them over zeolite catalysts.

Use: Paints (as drying oils), shortenings, salad dressings, margarine, soaps, rubber softeners, dietary supplements, pesticide carriers.

vegetable tanning. The tanning of leather by plant extracts.

See tannic acid; tanning; wattle bark; quebracho.

vehicle. A term used in paint technology to indicate the liquid portion of a paint, composed of drying oil or resin, solvent, and thinner, in which the solid components are dissolved or dispersed.

See paint.

Venetian red. A high-grade ferric oxide pigment of a pure red hue. It is obtained either native as a variety of hematite red or more often artificially by calcining copperas (ferrous sulfate) in the presence of lime. The composition ranges from 15 to 40% ferric oxide and from 60 to 80% calcium sulfate. The 40% ferric oxide is the “pure” grade and has a d 3.45.

Grade: 20–40% ferric oxide.

See iron oxide red.

venturi. A type of flowmeter used for liquids or fine particulates. It is a tube like device having broad, flaring ends and a narrow central portion, or throat; this so constricts the passage of the fluid that its rate of flow increases while the pressure decreases. The difference in pressure thus created is a measure of the flow. Venturis are used in scrubbers, liquid and solid conveying systems, pipelines, and aircraft instrument control, as well as in numerous chemical process techniques such as hydrogenation, chlorination, and oxidation. The hydrogenation technology involves hydrogen entrainment by rapid flow of a liquid catalyst through the venturi nozzle.

veratraldehyde. (vertraldehyde; 3,4-dimethoxybenzaldehyde).

CAS: 120-14-9. $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CHO}$.

Properties: Mp 42–45C, bp 281C, flash p 235F (112C), mw 166.18.

veratric acid. (3,4-dimethoxybenzoic acid).

CAS: 93-07-2. $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{COOH}$.

Properties: Mw 182.18, mp 179–82C.

veratrole. (1,2-dimethoxybenzene; pyrocatechol dimethyl ether).

CAS: 91-16-7. $\text{C}_6\text{H}_4(\text{OCH}_3)_2$.

Properties: Colorless crystals or liquid. Mp 21–22C, bp 206–207C, d 1.084 (25/25C). Soluble in alcohol and ether; slightly soluble in water.

Derivation: Treatment of catechol in methanol with dimethyl sulfate and caustic.

Use: Medicine (antiseptic).

veratrum alkaloid. One of a group of alkaloids used in medicine to relieve hypertension. They include *Veratrum viride* (American hellebore).

Hazard: May have severe side effects. See alkaloid.

verdigris. See copper acetate, basic.

vermiculite. Hydrated magnesium-iron-aluminum silicate capable of expanding 6–20 times when heated to 1093C. The platelets exhibit an active curling movement when heated, hence the name.

Occurrence: Montana, North Carolina, South Carolina, Wyoming, Colorado, South Africa.

Properties: Platelet-type crystalline structure. High porosity, high void volume to surface area ratio, low density, large range of particle size. Insoluble in water and organic solvents; soluble in hot concentrated sulfuric acid. Water vapor adsorption capacity of expanded vermiculite less than 1%, liquid adsorption dependent on conditions and particle size, ranges 200–500%. Noncombustible.

Grade: Unexpanded (ore concentrate), expanded (also called exfoliated), flake, activated.

Use: Lightweight concrete aggregate, insulation, sound conditioning, fireproofing, plaster, soil conditioner, additive for fertilizers, seed bed for plants, refractory, lubricant, oil-well drilling mud. Filler in rubber, paint, plastics. Wallpaper printing, removal of strontium-90 from milk, absorption of oil spills on seawater, animal feed additive, packing, carrier for insecticides, catalyst and catalyst support, litter for hatcheries, adsorbent.

See verxite.

vermifuge. An agent used in veterinary medicine to eliminate intestinal worms; an anthelmintic.

vermilion, natural. See cinnabar.

vernolepin. A sesquiterpene dilactone extracted from leaves of an African plant *Veronia hymenolepis*.

Use: Biochemical research (inhibits tumor growth in rats and reversibly retards plant growth).

"Versaflex" [Grace]. TM for polymer emulsion.

Use: In latex paint formulations.

"Versa Guma" [Cargill]. TM for a xanthan gum specialty ingredient.

Use: In food formulation in a broad range of pH and temperatures.

"Versamag" [Morton]. See "Novogel".

"Versene" [Ashland].

CAS: 62-33-9. TM for calcium disodium EDTA chelating agent.

Use: Pharmaceuticals, foods, and biological applications to control oxidation, and chelate metal ions.

"Versene Fe-3 Specific" [Dow]. TM for an iron specialty chelating agent; active ingredient is sodium dihydroxyethylglycine; available as straw-colored liquid or white powder.

"Versenex" 80 [Dow]. TM for pentasodium salt of diethylenetriaminepentaacetic acid.

"Versenol" 120 [Dow]. TM for the trisodium salt of *N*-hydroxyethylethylenediaminetriacetic acid ($\text{C}_{10}\text{H}_{15}\text{O}_7\text{N}_2\text{Na}_3$).

Use: Organic chelating agent.

verxite. (exfoliated hydrobiotite).

Properties: Thermally expanded (exfoliated) magnesium-iron-aluminum silicate having a minimum of 98% purity and a bulk d of 5–7 lb/cu ft. Expansion occurs by heating at 793C. Sponglike structure that absorbs liquids and permits reexpansion after compression to 70–80% of the original heat-expanded volume.

Use: Poultry feed in quantities less than 5% as a nonnutritive bulking agent, pelleting or anti-caking agent and nutrient carrier in dog and ruminant feeds. For dog feeds the maximum permitted is 1.5%. Labeling must state content when in excess of 1%. See vermiculite.

"Vespel" [Du Pont]. TM for fabricated parts, based on polyimide resin and diamond abrasive wheels formulated with a high-temperature polyimide binder.

vetiver oil. An essential oil with violetlike odor, strongly dextrorotatory.

Use: Perfumery and fragrances.

"Vexar" [Du Pont]. TM for both low and high-density polyethylene and polypropylene plastic netting. Available in a wide variety of forms and colors for use in packaging.

"V-G-B" [Uniroyal]. TM for reaction product of acetaldehyde and aniline.

Properties: Brown resinous powder. D 1.152, mp 60–80C. Soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Use: Rubber antioxidant.

“**Viagra**” [*Pfizer*]. (sildenafil citrate).
CAS: 171599-83-0. mf: $C_{22}H_{30}N_6O_4S \cdot C_6H_8O_7$.
Use: A treatment for male erectile dysfunction.

“**Vibrathane**” [*Great Lakes/Asia Pacific*].
TM for a liquid castable, urethane prepolymer.

“**Vibrin**” [*Uniroyal*]. TM for resin compositions of polyesters and cross-linking monomers that when catalyzed, will polymerize to infusible solid resins without evolving water or other by-products.
Use: Molding, laminating, impregnating, casting, automotive and aircraft structural parts, wall panels, table tops, coating for paper, boat hulls, chemically inert tanks, large-diameter pipe.

vic-. Prefix meaning vicinal.

vicariance. Speciation which occurs as a result of the separation and subsequent isolation of portions of an original population.

vicinal. (vic-). Neighboring or adjoining positions on a carbon ring or chain; the term is used in naming derivatives with substituting groups in such locations in a structural formula or molecule. For example, vicinal locations in the molecule shown are occupied by the hydrogen atoms and the hydroxyl groups:

Victoria blue. (CI 44045). $C_{33}H_{31}N_3 \cdot HCl$.
Properties: Bronze colored, crystalline powder. Soluble in hot water, alcohol, or ether.
Derivation: Michler’s ketone is condensed with phenyl- α -naphthylamine.
Use: Dyeing silk, wool, and cotton; biological stain; dye intermediate for complex acid pigment toners.

Victoria green. See malachite green.

“**Victory**” [*Baker Petrolite*]. TM for a plastic grade of petroleum microcrystalline wax.

vicuna. A soft, wool-like fiber obtained from a South American animal similar to the llama.
Use: Specialty high-grade coats, sweaters, etc. Combustible.

vidarabine. Generic name for ara-A.

“**Vigofac 6**” [*Pfizer*]. TM for an unidentified growth factor for addition to animal feeds. Derived from dried streptomyces fermentation solubles.

“**Vikane**” [*Dow*]. TM for sulfuryl fluoride.

Vilsmeier-Haack reaction. Formulation of activated aromatic or heterocyclic compounds with disubstituted formamides and phosphorus oxychloride.

vinyl fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 50% by weight of vinyl alcohol units, $-\text{CH}_2\text{CH}_2\text{O}-$, and in which the total of the vinyl alcohol units and any one or more of the various acetal units is at least 85% by weight of the fiber (Federal Trade Commission). It has good chemical resistance, low affinity for water, good resistance to mildew and fungi. Combustible.

Use: Fishing nets, stockings, gloves, hats, rainwear, swimsuits.

vinegar.
Properties: Brownish or colorless liquid. Dilute aqueous solution containing 4–8% acetic acid, depending on source. Legal minimum is 4%. Also contains low percentages of alcohols and mineral salts. Nonflammable.

Derivation: (1) Bacterial fermentation of apple cider, wine, or other fruit juice. (2) Fermentation of malt or barley. The fermenting agent is usually a mold, e.g., *Mycoderma aceti*, generally known as “mother.” Either type can be distilled to remove color and other impurities and is then called white vinegar.

Use: Mayonnaise, salad dressings, pickled foods, preservative, medicine (antifungal agent), latex coagulant.

“**Vinoflex**” [*BASF*]. TM for vinyl chloride homo- and copolymers.

“**Vinsol**” [*Aqualon*]. TM for a series of low-cost, dark, brittle, thermoplastic resins; ruby-red by transmitted light, dark-brown by reflected light. Available in solid form, flakes, fine powder, and aqueous dispersion.

Use: Adhesives, asphalt emulsions, electrical insulation, inks, plastics.

vinyl. See vinyl compound.

vinyl acetate.
CAS: 108-05-4. $\text{CH}_3\text{COOCH}:\text{CH}_2$. Raw material for polyvinyl resins.

Properties: Colorless liquid stabilized with either hydroquinone or diphenylamine inhibitors. The hydroquinone stabilized material can be polymerized without redistillation. The DPA-stabilized material must be distilled before polymerization. D 0.9345 (20/20C), fp -100.2C , bp 73C , refr index 1.3941, bulk d 7.79 lb/gal, flash p 30F (-1.1C) (TOC), autoign temp 800F (426.6C). Soluble in most organic

solvents including chlorinated solvents; insoluble in water.

Derivation: (1) Vapor-phase reaction of ethylene, acetic acid, and oxygen, with a palladium catalyst. (2) Vapor-phase reaction of acetylene, acetic acid, and oxygen, with zinc acetate catalyst. (3) From synthesis gas.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Flammable limits in air 2.6–13.4%. Toxic by inhalation and ingestion. TLV: 10 ppm, STEL: 15 ppm; animal carcinogen.

Use: Polyvinyl acetate, polyvinyl alcohol, polyvinyl butyral, and polyvinyl chloride-acetate resins, used particularly in latex paints, paper coating, adhesives, textile finishing, safety glass interlayers. A vinyl acetate-ethylene copolymer is available for specialty products.

See polyvinyl acetal; polyvinyl acetate; polyvinyl alcohol; polyvinyl chloride-acetate.

vinylacetonitrile. See allyl cyanide.

vinylacetylene. C_4H_4 or $H_2C:CHC:CH$. The dimer of acetylene, formed by passing it into a solution of cuprous and ammonium chlorides in hydrochloric acid.

Properties: Colorless gas or liquid. D 0.6867 (20C), bp 5C. Combustible.

Use: Intermediate in manufacture of neoprene and for various organic syntheses.

See divinyl acetylene.

vinyl acrylate. See ethenyl 2-propenoate.

vinyl alcohol. (ethenol). $CH_2:CH_2O$. Unstable liquid; isolated only in the form of its esters or the polymer, polyvinyl alcohol.

vinylation. The formation of a vinyl derivative by reaction with acetylene. Thus vinylation of alcohols yields vinyl ethers such as vinyl ethyl ether, $C_2H_5OC_2H_5$.

vinyl bromide.

CAS: 593-60-2. CH_2CHBr .

Properties: Gas. Fp $-138C$, bp 15.6C, d 1.51.

Hazard: A carcinogen. TLV: 5 ppm; suspected human carcinogen.

Use: Flame-retarding agent for acrylic fibers.

vinyl-*n*-butyl ether. (*n*-butyl vinyl ether; BVE).

CAS: 111-34-2. $CH_2:CHOCH_2C_4H_9$.

Properties: Liquid. D 0.7803 (20C), bp 94.1C, fp $-113C$, refr index 1.3997, flash p 15F ($-9.4C$) (OC), bulk d 7.45 lb/gal (20C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Reaction of acetylene with *n*-butyl alcohol.

Grade: Technical (98%).

Hazard: Flammable, dangerous fire risk.

Use: Synthesis, copolymerization.

vinyl butyrate.

CAS: 123-20-6. $CH_2:CHOOC_4H_9$.

Properties: Liquid. D 0.9022 (20/20C), bp 116.7C, fp $-86.8C$, flash p 68F (20C) (OC). Very slightly soluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Polymers, emulsion paints.

***n*-vinylcarbazole.** $C_2H_5NHC:CH_2$.

Properties: Liquid. Combustible.

Derivation: From acetylene and carbazole.

Use: Polymerizes to form heat-resistant and insulating resins somewhat similar to mica in dielectric properties.

See polyvinyl carbazole.

vinyl cetyl ether. See cetyl vinyl ether.

vinyl chloride. (VC; chloroethene; chloroethylene).

CAS: 75-01-4. $CH_2:CHCl$. The most important vinyl monomer.

Properties: Compressed gas, easily liquefied, ethereal odor, usually handled as liquid. Phenol is added as a polymerization inhibitor. D 0.9121 (liquid at 20/20C), bp $-13.9C$, fp $-159.7C$, vap press 2300 mm Hg (20C), flash p $-108F$ ($-77C$), autoign temp 882F (472C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: (1) Dehydrochlorination of ethylene dichloride; (2) reaction of acetylene and hydrogen chloride, either as liquids or gases.

Grade: Technical, pure 99.9%.

Hazard: Explosive limits in air 4–22% by volume. An extremely toxic and hazardous material by all avenues of exposure. A carcinogen. TLV: TWA 5 ppm. Use in aerosol sprays prohibited.

Use: Polyvinyl chloride and copolymers, organic synthesis, adhesives for plastics.

vinyl-2-chloroethyl ether.

CAS: 110-75-8. $CH_2:CHOCH_2CH_2Cl$.

Properties: Liquid. D 1.0498 (20C), bp 109.1C, fp $-69.7C$, flash p 80F (26.6C) (OC). Very slightly soluble in water.

Hazard: Flammable, dangerous fire risk.

vinyl compound. A compound having the vinyl grouping ($CH_2=CH-$), specifically vinyl chloride, vinyl acetate, and similar esters but also referring more generally to compounds such as styrene $C_6H_5CH=CH_2$, methyl methacrylate $CH_2=C(CH_3)COOCH_3$, and acrylonitrile $CH_2=CHCN$. The vinyl compounds are highly reactive, polymerize easily, and the basis of a number of important plastics.

vinyl cyanide. See acrylonitrile.

vinylcyclohexene. (1-vinylcyclohexene-3; 4-vinylcyclohexene-1; cyclohexenylethylene).

CAS: 100-40-3. $\text{CH}_2\text{:CHCH}_2\text{CH}_2\text{CH:CHCH}_2\text{CH}_2$. A butadiene dimer.

Properties: Liquid. D 0.8303 (20/4C), fp -108.9C , bp 128C , refr index 1.464 (20C), flash p 70F (21.2C) (TOC), autoign temp 517F (269C). Temperatures above 80F (26.6C) and prolonged exposure to oxygen-containing gases should be avoided because these conditions lead to discoloration and gum formation.

Grade: Technical 95%, pure 99%, research.

Hazard: TLV: 0.1 ppm (skin); Animal Carcinogen. Flammable, dangerous fire risk. Narcotic in high concentration.

Use: Polymers, organic synthesis.

vinylcyclohexene dioxide. (vinylcyclohexane dioxide).

CAS: 106-87-6.

$\text{CH}_2\text{CHOC}_6\text{H}_9\text{O}$.

Properties: Colorless liquid. D 1.098 (20/20C), bp 227C , refr index 1.4782 (20C), viscosity 7.77 cP (20C), flash p 230F (110C). Combustible.

Hazard: Toxic by ingestion and skin absorption, strong irritant to skin and tissue. TLV: 0.1 ppm; animal carcinogen.

Use: Polymers, organic synthesis.

vinylcyclohexene monoxide. (vinylcyclohexane monoxide). $\text{CH}_2\text{:CHC}_6\text{H}_9\text{O}$.

Properties: Liquid. D 0.9598 (20/20C), bp 169C , fp -100C , flash p 136F (57.8C), viscosity 1.69 cP (20C). Very slightly soluble in water. Combustible.

Hazard: Moderate fire risk. Irritant.

Use: Polymers, organic synthesis.

vinyl ether. (divinyl ether; divinyl oxide).

CAS: 109-93-3. $\text{CH}_2\text{:CHOCH:CH}_2$.

Properties: Colorless liquid; characteristic odor. D 0.769, bp 39C , refr index 1.3989 (20C), flash p -22F (-30C), autoign temp 680F (360C). Slightly soluble in water; miscible with alcohol, acetone, chloroform, and ether. Must be protected from light.

Derivation: Treatment of dichloroethyl ether with alkali.

Grade: NF (contains 96–97% vinyl ether, remainder dehydrated alcohol).

Hazard: Flammable, severe fire and explosion risk; explosive limits in air 1.7–27%. Toxic by inhalation, overexposure may be fatal.

Use: Copolymer with 3–5% polyvinyl chloride for plastic products such as clear plastic bottles; medicine (anesthetic, for brief operations only).

vinyl- β -ethoxyethyl sulfide.

$\text{CH}_2\text{:CHSCH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; pungent, camphorlike odor. D 0.9532 (15C), bp 65C (8 mm Hg).

Use: Organic synthesis.

vinylethylene. See butadiene.

vinyl ethyl ether. (ethyl vinyl ether; EVE).

CAS: 109-92-2. $\text{CH}_2\text{:CHOC}_2\text{H}_5$.

Properties: Colorless liquid. Extremely reactive, can be polymerized in liquid or vapor phase. D 0.754 (20/20C), bulk d 6.28 lb/gal (20C), fp -115.0C , viscosity 0.22 cP (20C), refr index 1.3739, flash p -50F (-46C), autoign temp 395F (201.6C). Slightly soluble in water (0.9% by weight). Commercial material contains inhibitor to prevent premature polymerization. Often stored underground to minimize vapor losses.

Derivation: Reaction of acetylene with ethanol.

Grade: Technical.

Hazard: Highly flammable, severe fire and explosion risk, explosive limits in air 1.7–28%.

Use: Copolymerization, intermediate.

vinyl ethyl ether polymer. See 5-(3 or 6-oxo-1-cyclohexen-1-yl)-5-ethylbarbituric acid.

vinyl-2-ethylhexoate.

CAS: 94-04-2. $\text{CH}_2\text{=CHOOCCH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Liquid. D 0.8751 (20/20C), bp 185.2C , fp -90C , flash p 165F (73.9C) (OC). Insoluble in water. Combustible.

Use: Polymers, emulsion paints.

vinyl-2-ethylhexyl ether.

CAS: 103-44-6. $\text{CH}_2\text{=CHOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Liquid. D 0.8102 (20/20C), bp 177.7C , fp -100C , flash p 135F (57.2C) (OC), autoign temp 395F (201.6C). Insoluble in water. Combustible.

Hazard: Moderate fire and explosion risk.

Use: Intermediate for pharmaceuticals, insecticides, adhesives, viscosity index improver.

2-vinyl-5-ethylpyridine.

$(\text{CH}_2\text{=CH})\text{C}_5\text{H}_7\text{N}(\text{C}_2\text{H}_5)$.

Properties: Liquid. D 0.9449 (20/20C), bp 138C (100 mm Hg), vap press 0.1 mm Hg (20C), fp -50.9C , flash p 200F (93.3C) (COC). Insoluble in water. Combustible.

Use: Copolymer, synthesis.

vinyl fluoride. (fluoroethylene).

CAS: 75-02-5. $\text{CH}_2\text{=CHF}$.

Properties: Colorless gas. Bp -72C . Insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, dangerous fire and explosion risk. Toxic by inhalation. TLV: 2.6 mg(F)/m³.

Use: Monomer.

See polyvinyl fluoride.

vinylheptacyclotetrasiloxane.

CAS: 3763-39-1. mf: $\text{C}_9\text{H}_{24}\text{O}_4\text{Si}_4$.

Hazard: Low toxicity by ingestion. A severe skin irritant.

vinylidene chloride. (VC).

CAS: 75-35-4. $\text{CH}_2\text{=CCl}_2$.

Properties: Colorless liquid. Fp -122.53C , bp 37C , flash p 14F (-10C) (OC), autoign temp 856F

(457C), readily polymerizes. Insoluble in water. Commercial product contains small proportion of inhibitor.

Hazard: Flammable, dangerous fire risk, explosive limits in air 5.6–11.4%. Toxic by inhalation. TLV: 5 ppm; STEL 20 ppm; animal carcinogen.

Use: Copolymerized with vinyl chloride or acrylonitrile to form various kinds of saran. Other copolymers are also made. Adhesives; component of synthetic fibers.

See saran.

vinylidene chloride-butyl acrylate copolymer.

CAS: 9011-09-0. mf: $(C_7H_{12}O_2 \cdot C_2H_2Cl_2)_x$

Hazard: Low toxicity by ingestion.

vinylidene fluoride. (1,1-difluoroethylene).

CAS: 75-38-7. $H_2C=CF_2$. A monomer.

Properties: Colorless gas; faint ethereal odor. Bp $-83C$ (1 atm), fp $-144C$ (1 atm), d (liquid) 0.617 (24C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Interaction of hydrogen with dichlorodifluoroethane.

Grade: 99% min purity.

Hazard: Flammable, dangerous fire risk, explosive limits in air 5.5–21%. Toxic by inhalation. TLV: 2.5 mg(F)/m³.

Use: Polymers and copolymers, chemical intermediate.

See polyvinylidene fluoride.

vinylidene resin. (polyvinylidene resin). A polymer in which the unit structure is $(-H_2CCX_2-)$, in which X is usually chlorine, fluorine, or cyanide radical. Examples are saran and "Vitron" A.

vinyl isobutyl ether. (isobutyl vinyl ether; IVE).

CAS: 109-53-5. $CH_2=CHOCH_2CH(CH_3)_2$.

Properties: Colorless liquid. D 0.7706 (20/20C), bp 83.3C, vap press 68 mm Hg (20C), fp $-132C$, refr index 1.3938, flash p 15F ($-9.4C$) (OC). Very slightly soluble in water; soluble in alcohol and ether; easily polymerized.

Derivation: Catalytic union of acetylene and isobutyl alcohol.

Method of purification: Washing with water, drying in the presence of alkali, and distillation from metallic sodium.

Grade: Technical.

Hazard: Flammable, dangerous fire risk.

Use: Polymer and copolymers used in surgical adhesives, coatings, and lacquers; modifier for alkyd and polystyrene resins; plasticizer for nitrocellulose and other plastics; chemical intermediate.

vinylmagnesium chloride. $CH_2=CHMgCl$.

Usually supplied dissolved in tetrahydrofuran.

Use: Grignard reagent.

vinyl methyl ether. (methyl vinyl ether; methoxyethylene; MVE).

CAS: 107-25-5. $CH_2=CHOCH_3$.

Properties: Colorless compressed gas, or colorless liquid. D 0.7500 (20/20C), bp 6.0C, vap press 1052 mm Hg (20C), flash p $-60F$ ($-51C$), fp $-121.6C$. Slightly soluble in water; soluble in alcohol and ether; easily polymerized. Commercial material contains a small proportion of polymerization inhibitor.

Derivation: Catalytic reaction of acetylene and methanol.

Grade: Technical (95% min), pure.

Hazard: Highly flammable, severe fire and explosion risk, explosive limits in air 2.6–39%.

Use: Copolymers used in coatings and lacquers; modifier for alkyl, polystyrene, and ionomer resins; plasticizer for nitrocellulose and adhesives.

See polyvinyl methyl ether.

vinyl methyl ketone. (3-buten-2-one; methyl vinyl ketone).

CAS: 78-94-4. $CH_3COCH=CH_2$.

Properties: Colorless liquid. D 0.8636 (20/4C), bp 80C, flash p 20F ($-6.6C$) (CC). Soluble in water and alcohols.

Hazard: Flammable, dangerous fire risk. Skin and eye irritant.

Use: Monomer for vinyl resins, component of ionomer resins, intermediate in steroid and vitamin A synthesis, alkylating agent.

2-(vinylloxy)ethyl nitrate. See ethylene glycol mononitrate vinyl ether.

vinyl plastics. See polyvinyl resins.

vinyl propionate. $CH_2=CHOCC_2H_5$.

Properties: Liquid. D 0.9173 (20/20C), bp 95.0C, fp $-81.1C$, flash p 34F (1.1C) (OC). Almost insoluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Polymers, emulsion paints.

vinylpyridine. $C_5H_5NCH=CH_2$.

Properties: Colorless liquid. Boils with resinification at 159C, d 0.9746 (20C), refr index 1.5509 (20C). Dissolves in water to extent of 2.5%; water dissolves in it to 15%; soluble in dilute acids, hydrocarbons, alcohols, ketones, esters. Commercial material contains inhibitor. Combustible.

Hazard: Irritant to skin and eyes.

Use: Elastomers and pharmaceuticals. Latex used as tire cord binder (41% solids). The latex is copolymerized with butadiene-styrene.

n-vinyl-2-pyrrolidone.

CAS: 88-12-0.

$CH_2=CHNCH_2CH_2CH_2CO$.

Properties: Colorless liquid. Bp 148C (100 mm Hg),

mp 13.5C, flash p 209F (98.3C) (COC), d 1.04. Combustible.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Hazard: Irritant and narcotic.

Use: Polyvinylpyrrolidone, organic synthesis.

1-vinyl-2-pyrrolidone crosslinked insoluble polymer. See polyvinylpyrrolidone.

vinyl stabilizer. A substance added to vinyl chloride resins during compounding, to retard the rate of deterioration caused by formation of hydrogen chloride. Many combine readily with hydrogen chloride but do not otherwise interfere with the properties and uses of the final product. Amines, basic oxides, and metallic soaps are commonly used.

vinyl stearate. $\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}=\text{CH}_2$.

Properties: White waxy solid. Mp 28–30C, bp 175C (3 mm Hg), d 0.9037 (20/20C), refr index 1.4355–1.4362 (55C), iodine no. 80–82. Insoluble in water and alcohol; moderately soluble in ketones and vegetable oils; soluble in most hydrocarbon and chlorinated solvents. Combustible.

Use: Plasticizer (copolymerizer), lubricant.

vinylstyrene. See divinyl benzene.

vinyl toluene. (methyl styrene).

CAS: 25013-15-4. $\text{CH}_2=\text{CHC}_6\text{H}_4\text{CH}_3$.

Properties: Colorless liquid. Fp –76.8C, bp 170–171C, d 0.890 (25/25C), bulk d 7.41 lb/gal, refr index 1.534 (34C), flash p 130F (54.4C) (CC), autoign temp 921F (494C). Very slightly soluble in water; soluble in methanol, ether. Combustible.

Hazard: Moderate fire risk. TLV: 50 ppm; STEL 100 ppm; not classifiable as a human carcinogen.

Use: Solvent, intermediate.

vinyl trichloride. See 1,1,2-trichloroethane.

vinyltrichlorosilane.

CAS: 75-94-5. $\text{CH}_2\text{CHSiCl}_3$.

Properties: Colorless or pale-yellow liquid. Bp 90.6C, d 1.265 (25/25C), refr index 1.432 (20C), flash p 16F (–8.89C). Readily hydrolyzed with liberation of hydrogen chloride; polymerizes easily; soluble in most organic solvents; reacts with alcohol.

Derivation: Reaction of acetylene and trichlorosilane (peroxide catalyst), reaction of trichlorosilane with vinyl chloride.

Grade: Technical.

Hazard: High by ingestion and inhalation, strong irritant to tissue. Flammable, dangerous fire risk.

Use: Intermediate for silicones, coupling agent in adhesives and bonds.

vinylon. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85% by

weight of vinyl chloride units, $-\text{CH}_2\text{CHCl}-$ (Federal Trade Commission). It has good resistance to chemicals, bacteria, moths; unaffected by water and sunlight; low softening point. Tenacity 3.1 g/denier, difficult to ignite, self-extinguishing.

See polyvinyl chloride.

vioform. (iodochloroxyquinoline). Odorless, nonirritant, sterilizable substitute for iodoform.

violanthrone. See dibenzanthrone.

Violet #1. An FD&C color used for meat grading, cosmetics, beverages, etc. It is a triphenylmethane dye banned by the FDA in 1973 because of carcinogenic risk.

violet gentian. See methyl violet.

viomycin. An antibiotic produced by *Streptomyces puniceus*. Unique among antibiotics in that it is more active against acid-fast organisms than against other groups. Mycobacteria are most sensitive to viomycin, and the antibiotic is active against strains of *Mycobacterium tuberculosis*, which are resistant to other antibiotics. Available commercially as sulfate.

viosterol. Irradiated ergosterol.

“Vipex 19” [Crowley]. TM for a specialty formulated high viscosity oil.

Use: In asphalt pavement emulsified rejuvenation.

viral vector. A viral DNA altered so that it can act as a vector for recombinant DNA.

viridogrisein. See etamycin.

virion. A single virus particle.

Virtanen, Artruri I. (1895–1973). A Finnish biochemist who won the Nobel Prize in 1945. His work was primarily concerned with research in nutrition and agriculture. He made important discoveries regarding prevention of fodder spoilage and bacterial fermentation as well as nitrogen metabolism in plants. His Ph.D. was awarded at the University of Helsinki and followed by an illustrious career that included awards throughout Scandinavia.

virus. An infectious agent composed almost entirely of protein and nucleic acids (nucleoprotein). Viruses can reproduce only within living cells and are so small that they can be resolved only with an electron microscope. Since they pass through filters that retain bacteria, they are often called filterable viruses. Tobacco mosaic was the first virus to be crystallized and isolated (Dr. W. M. Stanley, 1935); it contains some 2000 protein molecules in a sequence of 158 amino acids (mw 40,000,000). Bushy stunt virus found in tomato plants has a molecular

weight of 7,600,000. First synthesis of a virus was reported in 1967.

Viruses differ from organisms in that they are only half alive; they lack metabolism, are unable to utilize oxygen, to synthesize macromolecules, to grow, or to die. They are parasites, relying on a living host cell. They account for many diseases, including mumps, measles, scarlet fever, smallpox, influenza, and possibly the common cold. Their shapes are similar to those of bacteria (rods, spheres, filaments). They have the ability to mutate; they are also antigenic and thus initiate formation of antibodies. Some act as bacteriophages. A direct relation between virus and cancer has been shown, the DNA of the virus becoming irreversibly bound to the DNA of the affected cells. See bacteria; deoxyribonucleic acid.

viscometer. (viscosimeter). A device for measuring the viscosity of a liquid. The types most widely used are the Engler, Saybolt, and Redwood, which indicate viscosity by the rate of flow of the test liquid through an orifice of standard diameter or the flow rate of a metal ball through a column of the liquid; other types utilize the speed of a rotating spindle or vane immersed in the test liquid. The liquids commonly measured are lubricating oils and the like; heavier (non-Newtonian) liquids such as paints and paper coatings require more complex devices, e.g., Brookfield and Krebs-Stormer. See viscosity.

viscose process. The best-known process for making regenerated cellulose (rayon) by converting cellulose to the soluble xanthate, which can be spun into fibers and then reconverted to cellulose by treatment with acid. Wood pulp is steeped with 17–20% caustic soda; the resulting alkali cellulose is pressed to remove excess liquor and the soluble β - and γ -cellulose, and then shredded and aged. It is then treated with carbon disulfide and sodium hydroxide to form an orange, viscous solution of cellulose xanthate. After filtration and deaeration, this solution (viscose) is forced through minute spinnerette openings (or long slit dies in the case of cellophane) into a bath containing sulfuric acid and various salts such as sodium and zinc sulfate. The salts cause the viscose to gel immediately, forming a fiber or film of sufficient strength to permit it to be drawn through the bath under tension. At the same time the sulfuric acid decomposes the xanthate, converting the fibers to cellulose, in which form they are washed and dried.

See rayon; cellophane.

viscosification. Increasing the viscosity of a liquid.

viscosimeter. See viscometer.

viscosity. The internal resistance to flow exhibited by a fluid; the ratio of shearing stress to rate of

shear. A liquid has a viscosity of one poise if a force of 1 dyne/square centimeter causes two parallel liquid surfaces one square centimeter in area and one centimeter apart to move past one another at a velocity of 1 cm/second. One poise equals 100 centipoises. Viscosity in centipoises divided by the liquid density at the same temperature gives kinematic viscosity in centistokes (cs). One hundred centistokes equal one stoke. To determine kinematic viscosity, the time is measured for an exact quantity of liquid to flow by gravity through a standard capillary.

Water is the primary viscosity standard with an accepted viscosity at 20C of 0.010019 poise. Hydrocarbon liquids such as hexane are less viscous. Molasses may have a viscosity of several hundred centistokes, while for a very heavy lubrication oil the viscosity may be 100 centistokes. There are many empirical methods for measuring viscosity. See Saybolt Universal Viscosity; viscometer.

viscosity index improver. A lubricating-oil additive that has the effect of increasing the viscosity of the oil in such a way that it is greater at high temperature than at low temperature. Agents used for this purpose are polymers of alkyl esters of methacrylic acid, polyisobutylenes, etc.

viscosity, kinematic. See viscosity.

“Vistac A” [AKZO]. TM for a series of synthetic hydrocarbon polymers.

Use: Rubber-base adhesives and cements; latex and asphalt emulsions.

visual purple. See rhodopsin.

vitamin. Any of a number of complex organic compounds, present in natural products or made synthetically, which are essential in small proportions in the diet of animals and humans. Some are fat soluble (A, D, K); others are water soluble (B complex, C). Their precursors are called provitamins. A normal diet usually contains sufficient vitamins for health, although older people, the ill, young, or infirm may require different standards. Their usual use in medicine is restricted to correction of specific metabolic deficiencies. Some authorities believe that habitual intake of standard vitamin preparations readily available on the market is of little if any nutritional benefit. The following list of cross-references will serve to locate technical information about the various vitamin entries in this book:

Vitamin A. See carotene; cryptoxanthin; retinol; 3-dehydroretinol; provitamin.

Vitamin B. See vitamin B complex; thiamine; riboflavin; niacin; panthothenic acid; biotin; cyanocobalamin; pyridoxine; folic acid; inositol.

Vitamin C. See ascorbic acid.

Vitamin D. See ergosterol; ergocalciferol; cholecalciferol.

Vitamin E. See tocopherol.

Vitamin K. See phytonadione; menadione; phthiocol.

vitamin A₁, anhydrous. See all-*trans*-*anhydroretinol*.

vitamin B complex. A group of closely interrelated vitamins found in rice bran, yeast, wheat germ, etc., originally thought to be one substance. Studies carried out by R. J. Williams and associates later revealed the astonishing complexity of this group. He states as follows: "The physiological activity originally observed was due to the *additive* effect of a considerable number of substances, *each one* of which is of itself essential. If and when the designations B₁, B₂, B₃, etc., are used, they have an entirely different meaning from the parallel use of D₁, D₂, D₃ or K₁ and K₂ because in the case of the D and K vitamins one form can replace another. In the case of the B vitamins each form is a distinctly different substance with different functions, and each member of the family is separately indispensable. No one B vitamin can replace any other."

vitamin B₆ tripalmitate. See pyridoxine tripalmitate.

vitamin E acetate. See *d*- α -*tocopheryl acetate*.

vitexin. See 8- β -D-glucopyranosyl-apigenin.

"Viton" [Du Pont]. TM for a series of fluoroclastomers based on the copolymer of vinylidene fluoride and hexafluoropropylene with the repeating structure possibly $-\text{CF}_2-\text{CH}_2-\text{CF}_2-\text{CF}(\text{CF}_3)-$.

Properties: White transparent solid. D 1.72–1.86. Resistant to corrosive liquids and chemicals up to 315C. Useful continuous service at 204–232C. Resistant to ozone, weather, flame, oils, fuels, lubricants, many solvents; radiation resistance good. Nonflammable.

Use: Gaskets, seals, diaphragms, tubing, aerospace and automotive components, high-vacuum equipment, low-temperature and radiation equipment.

vitreous. Descriptive of a material having the appearance and properties of a glass, i.e., a hard, amorphous, brittle structure, as in porcelain enamel. See vitrification; glass.

vitreous enamel. See porcelain enamel.

vitrification. The process of converting a siliceous material into an amorphous, glassy form by melting and cooling. As applied to radioactive waste disposal, it refers to incorporation of the waste in glassy materials for permanent storage.

vitriol. An obsolete term once used to refer to a number of sulfates (lead, copper, zinc) because of

their glassy appearances. Sulfuric acid was called oil of vitriol. Derived from *vitrum* (glass).

Vmax. The maximum velocity of an enzymatic reaction when the binding site is saturated with substrate.

VM&P naphtha. See naphtha (1a).

VOC. See volatile organic compound.

voids. Empty spaces of molecular dimensions occurring between closely packed solid particles, as in powder metallurgy. Their presence permits barriers made by powder metallurgy techniques to act as diffusion membranes for separation of uranium isotopes in the gaseous diffusion process. See diffusion, gaseous.

Voight amination. Amination of benzoin with amines in the presence of phosphorus pentoxide or hydrochloric acid.

"Volan" [Du Pont]. (methacrylatochromic chloride). TM for bonding agent.

Use: Applied to glass fibers used in reinforced plastic laminates to improve adhesion between glass and resin.

volatile organic compound. (VOC). Any hydrocarbon, except methane and ethane, with vapor pressure equal to or greater than 0.1 mm Hg.

volatility. The tendency of a solid or liquid material to pass into the vapor state at a given temperature. Specifically the vapor pressure of a component divided by its mole fraction in the liquid or solid.

Volhard-Erdmann cyclization. Synthesis of alkyl and aryl thiophenes by cyclization of disodium succinate or other 1,4-difunctional compounds (γ -oxo acids, 1,4-diketones, chloroacetyl-substituted esters) with phosphorus heptasulfide.

Volhard's solution. A solution of potassium thiocyanate.

Use: Analytical chemistry.

voltaic cell. Two conductive metals of different potentials, in contact with an electrolyte, which generate an electric current. The original voltaic cell was composed of silver and zinc, with brine-moistened paper as electrolyte. Semisolid pastes are now used; electrodes may be lead, nickel, zinc, or cadmium.

See solar cell.

volumetric analysis. See titration.

Von Baeyer, Adolf. (1835–1917). A German chemist who received the Nobel Prize for chemistry in 1905. His work concerned organic dyes and hy-

droaromatic compounds. He was educated in Berlin under the direction of Bunsen and Kekule. He was a professor in Strasbourg and Munich. Von Baeyer made many discoveries, including barbituric acid and the molecular structure of indigo.

Von Braun reaction. The reaction between phosphorous pentahalide and an *N*-substituted benzamide to give an alkylene dihalide and benzonitrile.

von Richter reaction. Carboxylation of substituted aromatic nitro compounds with ethanolic potassium cyanide at 120-270C, the carboxyl group entering a position ortho to that previously occupied by the eliminated nitro group.

von Richter synthesis. Formation of cinnoline derivatives by diazotization of *o*-aminoarylpropionic acids or *o*-aminoarylacetylenes followed by hydration and cyclization. The method is applicable to preparation of cinnolines substituted in the benzenoid ring.

"Voramate" [Dow]. TM for a series of urethane intermediates that are the reaction products of polyols and isocyanates. They are adducts or quasiprepolymers to be used in combination with "Voranol" products to obtain rigid urethane foams.

"Vorane" [Dow]. TM for a group of polyurethane chemicals, raw materials for polyurethane elastomers, coatings, and foams.

"Voranol" [Dow]. TM for a series of polyols used as intermediates in urethane elastomers, coatings, and flexible and rigid foams.

VPC. Abbreviation for vapor-phase chromatography.
See gas chromatography.

"VPM" [Du Pont]. TM for a solution containing 32.7% sodium methylthiocarbamate used as a soil fumigant.

vulcanization. A physicochemical change resulting from cross-linking of the unsaturated hydrocarbon chain of polyisoprene (rubber) with sulfur, usually with application of heat. The precise mechanism that produces the network structure of the cross-linked molecules is still not completely known. Sulfur is also used with unsaturated types of synthetic rubbers; some types require use of peroxides, metallic oxides, chlorinated quinones, or nitrobenzenes. Natural rubber can be vulcanized with selenium, organic peroxides, and quinone derivatives but these have limited industrial use; high-energy radiation curing is an important innovation. Vulcanization can be effected with sulfur alone in high percentage, but the time required is too long to be economical and the properties obtained are poor.

Inorganic accelerators and metallic oxides (usually zinc) are essential for satisfactory cure. Organic accelerators, introduced in the early 1920s, notably shortened vulcanization time.

Three factors affect the properties of a vulcanizate: (1) the percentage of sulfur and accelerator used, (2) the temperature, and (3) the time of cure. Sulfur is usually from 1 to 3%; with strong acceleration the time can be as short as three minutes at high temperature (150C). Vulcanization can also occur at room temperature with specific formulations (self-curing cements).

Vulcanization was discovered in 1846 by Charles Goodyear in the U.S. and simultaneously by Thomas Hancock in England. Its overall effect is to convert rubber hydrocarbon from a soft, tacky, thermoplastic to a strong, temperature-stable thermoset having unique elastic modulus and yield properties.

See rubber; rubber, synthetic.

"Vulcosa" [Dow]. TM for the industrial grade of salicylic acid.

Use: Stabilizer and retarder of vulcanization.

"Vulklor" [Uniroyal]. TM for tetrachloro-*p*-benzoquinone.

Use: Vulcanizing agent.

"Vultex." TM for a vulcanized rubber or synthetic rubber latex.

Use: Health care workers' gloves, drug sundries, dipped products, adhesives.

"Vybar" [Baker Petrolite]. TM for a grade of petroleum microcrystalline wax.

Use: Hardening and upgrading paraffins, coatings, polishes, adhesives, cosmetics, color dispersants, paper coatings, lubricants, floor wax, ski wax inks, ozone barriers for elastomers, and anticaking treatments.

"Vycel P" [Crowley]. TM for a polyester modifier.

Use: Improves impact resistance.

"Vycor" Brand Glass No. 7900 [Corning].

TM for a glass made by a process in which an article fabricated by conventional methods is chemically leached to remove substantially all of the ingredients except silica. When fired at high temperatures a transparent glass of high softening point and extremely low expansion coefficient is produced.

Properties: Softening point 1500C, temp limit in service 900C, linear coefficient of expansion per degree C = 0.0000008, d 2.18, refr index 1.458 (a similar glass, No. 7910, will transmit over 60% radiation at 254 millimicrons in a 2-mm section).
Use: Laboratory and industrial glassware, including beakers, crucibles, flasks, dishes, tubes, cylinders, containers, flat glass rods.

W

W. Symbol for tungsten.
See tungsten, wolfram.

Wacker reaction. The oxidation of ethylene to acetaldehyde in the presence of palladium chloride and cupric chloride.

Wagner-Jauregg reaction. Addition of maleic anhydride to diarylethylenes with formation of bis adducts that can be converted to aromatic ring systems.

Wagner-Meerwin rearrangement. Carbon-to-carbon migration of alkyl, aryl, or hydride ions. The original example is the acid-catalyzed rearrangement of camphene hydrochloride to isobornyl chloride.

Waksman, Selman A. (1888–1973). American microbiologist (Nobel Prize winner in 1952) and professor at Rutgers University. He was the first to use the term *antibiotic* to designate the mold-produced antibacterial substances discovered by Fleming in 1928. He became the outstanding authority in this field.

Walden inversion. Inversion of configuration of a chiral center in bimolecular nucleophilic substitution reactions.

Walker, John E. (1941–). An English chemist who won the Nobel Prize in 1997 for his work on elucidating the enzymatic mechanism by which ATP synthase (ATPase) catalyzes the synthesis of adenosine triphosphate (ATP), the energy source of living cells. He is a senior scientist at the Medical Research Council Laboratory of Molecular Biology, Cambridge, England. He received his Ph.D. from Oxford University, Great Britain.
See Boyer, Paul D., Skou, Jens C.

Wallach, Otto. (1847–1931). A German chemist who received the Nobel Prize for chemistry in 1910 for his work in alicyclic compounds. His mentors were Hofmann and Wahler, and he worked at the University of Bonn under Kekule. He studied pharmacy and did work on terpenes, camphors, and essential oils. This was followed by research in aromatic oils, perfumes, and spices. He studied thuja oil and fenchone. His research on terpenes revealed their significance in sex hormones and vitamins. Ethereal oils and industrial uses were made possible by his work.

Wallach rearrangement. Acid-catalyzed rearrangement of azoxybenzenes to *p*-hydroxyazo-benzenes.

“Wallpol” [Reichhold]. TM for a series of vinyl acetate/acrylate and vinyl acetate emulsions.

“Warfarin” [Velsicol]. (3-(α -acetonylbenzyl)-4-hydroxycoumarin).
CAS: 81-81-2.
 $C_6H_4C_3O(OH)(O)CH(CH_2COCH_3)C_6H_5$.

Properties: Colorless crystals; odorless; tasteless. Mw 308.35, mp 161C. Soluble in acetone, dioxane; slightly soluble in methanol, ethanol; very soluble in alkaline aqueous solution; insoluble in water and benzene.

Hazard: A poison. TLV: 0.1 mg/m³.

Use: Anticoagulant rodenticide.

warning odor. A distinctive odor imparted to fuel gases for safety purposes, because they have little or no odor of their own. Ethanethiol and other malodorous mercaptan derivatives are added to natural gas, SNG, LPG, etc., for this purpose.

warp. The lengthwise threads or strands of a textile fabric.

wash-and-wear fabric. See aminoplast resin.

washing soda. (soda crystals).
 $Na_2CO_3 \cdot 10H_2O$.
See soda ash; sodium carbonate monohydrate.

waste, chemical. See chemical waste.

waste control. Waste materials can be classified by type, as gaseous, liquid, solid, and radioactive; and by source, as chemical, municipal, agricultural, urban, and nuclear. Many methods of treating wastes, either by converting them to useful by-products or by disposing of them, are in operation or under experimentation. Dumping in streams and rivers has long been illegal and ocean dumping has been prohibited since 1973. Methods of disposal or treatment include incineration (garbage, paper, plastics), precipitation (smoke, solid-in-liquid suspensions), adsorption (gases and vapors), chemical treatment (neutralization, ion-exchange, chlorination), reclamation of sulfite liquors (paper industry), reclaiming (paper, metals, rubber), compaction (urban wastes), bacterial digestion (sewage), comminution, and melting (glass, metals). Some cases may involve a combination of these methods.

The following procedures should also be mentioned: (1) Flash pyrolysis of certain solid wastes yields synthetic fuel oil and other useful products. (2) Urban, animal, and agricultural wastes can be fermented by anaerobic bacteria to yield proteins, fuel oil, etc.; the possibilities of converting cannery and other food-processing wastes into protein-rich foods and feeds are being investigated. (3) Catalytic oxidation of exhaust emission gases; devices have been installed in cars since 1973 for air-pollution control. (4) Recovery of methane from manures. (5) Incorporation of special additives to certain plastics (polystyrene bottles) to render them biodegradable. (6) High-pressure hydrogenation of garbage to yield a low-sulfur combustible oil. (7) Deactivating radioactive wastes by adsorption or ion exchange, as well as by solidification and hydraulic fracturing; high-activity wastes are buried in steel-lined concrete tanks. (8) Catalytic oxidation of waste chlorinated hydrocarbons, with partial recovery of chlorine. (9) Incineration of semisolid and liquid wastes at sea in ships designed for that purpose. See radioactive waste; chemical waste; sewage sludge; urban waste.

waste, hazardous. See chemical waste; radioactive waste.

waste, radioactive. See radioactive waste.

waste wool, wet. See wool waste.

“Watchung” [Du Pont]. TM for precipitated diazo red pigments.

water. (ice, steam). H_2O or HOH.

Properties: Colorless liquid; odorless; tasteless. Allotropic forms are ice (solid) and steam (vapor). Water is a polar liquid with high dielectric constant (81 at 17C), which largely accounts for its solvent power. It is a weak electrolyte, ionizing as H_3O^+ and OH^- . At atmospheric pressure it has d 1.00 (4C), fp 0C (32F), and expands about 10% on freezing. Viscosity 0.010019 poise (20C), sp heat 1 cal/g, vap press 760 mm Hg (100C), triple p 273.16K (4.6 mm), surface tension 73 dynes/cm (20C), latent heat of fusion (ice) 80 cal/g, latent heat of condensation (steam) 540 cal/g, bulk d 8.337 lb/gal, 62.3/lb/cu ft, refr index 1.333. Water may be superheated by enclosing in an autoclave and increasing pressure; it may be supercooled by adding sodium chloride or other ionizing compound. It has definite catalytic activity, especially of metal oxidation. Physiologically water is classed as a nutrient substance.

Derivation: (1) Oxidation of hydrogen; (2) end product of combustion; (3) end product of acid-base reaction; (4) end product of condensation reaction. Purification: (1) Distillation; (2) ion exchange reaction (zeolite); (3) chlorination; (4) filtration.

Use: Suspending agent (papermaking, coal slurries), solvent (extraction, scrubbing), diluent, beer and carbonated beverages, hydration of lime, paper

coatings, textile processing, moderator in nuclear reactors, debarking logs, industrial coolant, filtration, washing and scouring, sulfur mining, hydrolysis, Portland cement, hydraulic systems, power source, steam generation, food industry, source of hydrogen by electrolysis and thermochemical decomposition.

See hydrogen; ice; steam; heavy water; ocean water; water, hard.

“Water Based Ink Wash” [Ulano]. TM for liquid cleaner.

Use: To remove all solvent based inks from screen after printing, leaving film stencil intact.

water, bound. See bound water.

water of crystallization. Water chemically combined in many crystallized substances; it can be removed at or near 100C, usually with loss of crystalline properties.

water gas. (blue gas). A mixture of gases made from coke, air, and steam. The steam is decomposed by passing it over a bed of incandescent coke or by high-temperature reaction with natural gas or similar hydrocarbons. Approximate composition: carbon monoxide 40%, hydrogen 50%, carbon dioxide 3%, and nitrogen 3%.

Hazard: Flammable, dangerous fire and explosion risk. Explosive limits 7–72% in air. Toxic by inhalation.

Use: Organic synthesis, fuel gas, ammonia synthesis. See synthesis gas.

water glass. See sodium silicate.

water, hard. Water containing low percentages of calcium and magnesium carbonates, bicarbonates, sulfates, or chlorides as a result of long contact with rocky substrates and soils. Degree of hardness is expressed either as grains per gallon or parts per million (ppm) of calcium carbonate (1 grain of $CaCO_3$ per gal is equivalent to 17.1 ppm). Up to 5 grains is considered soft; more than 30 grains is very hard. Hardness may be temporary (carbonates and bicarbonates) or permanent (sulfates, chlorides). Treatment with zeolites is necessary to soften permanently hard water. Temporary hardness can be reduced by boiling. These impurities are responsible for boiler scale and corrosion of metals on long contact. Hard waters require use of synthetic detergents for satisfactory sudsing. See zeolite.

watermark. See dandy roll.

water pollution. Contamination of fresh- or saltwater with materials that are toxic, noxious, or otherwise harmful to fish and other animals and to humans, including thermal pollution. Disposal of untreated chemical and municipal wastes in streams

and rivers has been illegal since the early 1900s; in 1973 the EPA prohibited dumping of all types of wastes into the ocean. Unintentional pollution results from runoff containing toxic insecticidal residues. Oil spills at sea are a continual problem and probably will remain so.

See waste treatment; Environmental Protection Agency; environmental chemistry.

waterproofing agent. (1) Any film-forming substance that coats a substrate with a water-repellent layer, such as paint, a rubber or plastic film, a wax, or an asphaltic compound. These are used on a wide variety of surfaces, including cement, masonry, metals, textiles, etc.

(2) Any metal salt or other chemical that impregnates textile fibers in such a way as to give an air-permeable, water-resistant product. There are three types of these: renewable, semidurable, and durable. Renewable repellents are water dispersions containing aluminum acetate or formate, emulsifying agents and protective colloids in the continuous phase, and a blend of waxes in the disperse phase. Semidurable repellents involve precipitation of insoluble metal salts on the fibers; water-soluble soaps and waxes are usually added to the mixture, which is especially effective on synthetic fibers. Durable repellents coat each fiber with a protective film without bonding them together or sealing the apertures.

water purification. (water conditioning).

Any process whereby water is treated in such a way as to remove or reduce undesirable impurities. The following methods are used: (1) sedimentation, in which coarse suspended matter is allowed to settle by gravity in special tanks or reservoirs; (2) coagulation of aggregates (called "floc") by means of aluminum sulfate, ferric sulfate, or sodium aluminate (the aggregates are formed from colloiddally dispersed impurities activated by the coagulant); (3) filtration through a bed of fine sand, either by gravity flow or by pressure, to remove suspended particles; (4) chlorination, which is effective in sterilizing potable water, swimming pools, etc.; (5) adsorption on activated carbon for removal of organic contaminants causing unpleasant taste and odor; (6) hardness removal by ion-exchange or zeolite process.

The USDA has reported that mercury can be removed from water by treatment with low concentrations of black liquor from kraft papermaking.

water-soluble gum. See gum, natural.

water-soluble oil. Ammonia, potash, or sodium soaps of oleic, rosin, or naphthenic acids dissolved in mineral oils.

Use: Boring, lathe-cutting, milling, polishing lubricants, dressing textile fibers, dust laying.

See soluble oil.

water-soluble resin. See polymer, water-soluble.

wattle bark. (Australian bark; mimosa bark).

Derivation: From the Australian and South African wattles and South African acacias. Bark contains 25–35% tannin.

Grade: Based on tannin content.

Use: Source of wattle bark extract, used in vegetable tanning of leather, especially retannage of upper leathers and production of heavy leathers.

wave function. In quantum mechanics, a complex function extending over the configuration space of a system; its complex conjugate yields the probability density function, and other mathematical operations yield other physical quantities.

wax. A low-melting organic mixture or compound of high molecular weight, solid at room temperature and generally similar in composition to fats and oils except that it contains no glycerides. Some are hydrocarbons, others are esters of fatty acids and alcohols. They are classed among the lipids. Waxes are thermoplastic, but since they are not high polymers, are not considered in the family of plastics. Common properties are water repellency, smooth texture, low toxicity, freedom from objectionable odor and color. They are combustible and have good dielectric properties; soluble in most organic solvents; insoluble in water. The major types are as follows:

I. Natural

1. Animal (beeswax, lanolin, shellac wax, Chinese insect wax)
2. Vegetable (carnauba, candelilla, bayberry, sugar cane)
3. Mineral
 - (a) Fossil or earth waxes (ozocerite, ceresin, montan)
 - (b) Petroleum waxes (paraffin, microcrystalline) (slack or scale wax)

II. Synthetic

1. Ethylenic polymers and polyol ether-esters ("Carboxwax," sorbitol)
2. Chlorinated naphthalenes ("Halowax")
3. Hydrocarbon type, i.e., Fischer-Tropsch synthesis

Use: Polishes, candles, crayons, sealants, sun-cracking protection of rubber and plastic products, abherent, cosmetics, paper coating, packaging food products, electrical insulation, waterproofing and cleaning compounds, carbon paper, precision investment casting.

wax, chloronaphthalene.

Properties: Translucent, black, light and varied colors. D 1.40–1.7 (300F), mp 87.7–129.4C, bp 287–371C. Soluble in many organic solvent liquids and oils (when heated together).

Derivation: By chlorinating naphthalene.

Hazard: Toxic by ingestion and skin contact.

Use: Condenser impregnation, moisture-, flame-, acid-, insect-proofing of wood, fabric, and other

fibrous bodies; moisture- and flameproofing covered wire and cable; solvent (for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, and other waxes when mixed in the molten state).

wax, microcrystalline. A wax, usually branched-chain paraffins, characterized by a crystalline structure much smaller than that of normal wax and also by much higher viscosity. Obtained by dewaxing tank bottoms, refinery residues, and other petroleum waste products; they have an average molecular weight of 500–800 (twice that of paraffin). Viscosity 45–120 sec (SUS at 98.9C), penetration value 3–33. Petroleum-derived products are used for adhesives, paper coating, cosmetic creams, floor wax, electrical insulation, heat-sealing, glass fabric impregnation, leather treatment, emulsions, etc. Some natural products, notably chlorophyll, are classed as microcrystalline waxes.

wax, polymethylene. White, odorless solid with congealing point of 96.1C. Offered in flaked form. Approved by FDA.

wax tailings. Brown, sticky, semiasphalt product obtained in the destructive distillation of petroleum tar just before formation of coke.

Use: Wood preservative, roofing paper.

“Weatherometer.” See aging (c).

web. A roll of paper as it comes from the fourdrinier machine and used to feed a rotary printing press.

weedkiller. See herbicide.

Weerman degradation. Formation of an aldehyde with one less carbon atom from an aldonic acid by a Hoffmann-type rearrangement of the corresponding amide. This is a general reaction of α -hydroxy carboxylic acids.

weight. See mass.

weighting agent. (1) In soft drink technology, an oil or oil-soluble compound of high specific gravity, such as a brominated olive oil, which is added to citrus flavoring oils to raise the specific gravity of the mixture to about 1.00, so that stable emulsions with water can be made for flavoring. (2) In the textile industry a compound used both to deluster and lower the cost of a fabric, at the same time improving its “hand” or feeling. Zinc acetylacetonate, clays, chalk, etc. are used.

welding. Joining or bonding of metals or thermoplastics by application of temperatures high enough to melt the materials so that they fuse to a permanent union on cooling. In general, the temperatures used for thermoplastics are considerably lower than required for metals. The following methods are used

for metals: (1) An oxyacetylene flame is applied with a torch to the butted ends or edges of the pieces to be joined. (2) A method called brazing is similar to (1), except that a nonferrous filler alloy is inserted between the pieces. A number of alloys are used, e.g., Ag/Cu/Zn; the filler cannot be remelted. It forms an intermetallic compound at the interfaces. (3) In resistance welding, the heat is provided by the resistance to an electric current as it passes through the material. No filler metal is used. (4) In ultrasonic welding, the heat source is the friction resulting from ultrasonic vibrations. It is a type of friction welding. (5) Electron-beam welding is a comparatively recent technique in which energy is supplied by a stream of electrons focused by a magnetic field under high vacuum. It is used for complicated weldments of tool steels.

The following methods are used for welding such thermoplastics as polyvinyl chloride, HDPE, polypropylene, and polycarbonates: (1) Hot gas technique, in which an electrically or gas-heated “gun” melts a rod of the same material as the parts to be joined. (2) Friction welding, in which heat is generated by rapid rubbing together of the two surfaces, one of which is held stationary while the other is rubbed against it at a speed great enough to cause softening. (3) Ultrasonic welding, which is also used for metals. See (4) above. See solder.

“Wellbrom” [Albemarle]. TM for sodium bromide solution, completion fluid.

Use: Completion, work-over and packer fluid in oil-field applications.

Werner, A. (1866–1919). A native of Switzerland, Werner was awarded the Nobel Prize for his development of the concept of the coordination theory of valence, which he advanced in 1893. His ideas revolutionized the approach to the structure of inorganic compounds and in recent years have permeated this entire area of chemistry. The term *Werner complex* has largely been replaced by “coordination compound.”

Wessely-Moser rearrangement. Rearrangement of flavones and flavanones possessing a 5-hydroxyl group, through fission of the heterocyclic ring and reclosure of the intermediate diarylmethanes in the alternate direction.

Western blot. A technique for analyzing mixtures of proteins to show the presence, size, and abundance of one particular type of protein. See DNA; Northern blot; protein; RNA; Southern blot.

Weston cell. An electrical cell used as a standard that consists of an amalgamated cadmium anode covered with crystals of cadmium sulfate dipping into a saturated solution of the salt, and a mercury cathode covered with solid mercury sulfate.

Westphalen-Lettre rearrangement. Dehydration of 5-hydroxycholesterol derivatives accompanied by C-10 to C-5 methyl migration in compounds with a β -substituent in C-6.

wet deposition. See acid precipitation.

wetting agent. A surface-active agent that, when added to water, causes it to penetrate more easily into, or to spread over the surface of, another material by reducing the surface tension of the water. Soaps, alcohols, and fatty acids are examples. See detergent.

WFNA. Abbreviation for white fuming nitric acid.
See nitric acid, fuming.

Wharton reaction. Reduction of α,β -epoxy ketones by hydrazine to allylic alcohols.

wheat germ oil. Light-yellow, fat-soluble oil extracted from wheat germ.
Use: A food supplement.
See tocopherol.

whhey. The serum remaining after removal of the solids (fat and casein) from milk. Dried whey contains about 13% protein, 71% lactose, 2.3% lactic acid, 4.5% water, and 8% ash, including a low concentration of phosphoric anhydride. Besides its value as an inexpensive source of protein for animal feeds, whey is used as a source of lactose and lactic acid, as well as for the synthesis of riboflavin, acetone, butanol, and fuel-grade ethanol by fermentation processes. Some types of cheese are made from whey, and it is also a possible culture medium. Dried whey may be used to replace up to 75% of the polyol component of rigid polyurethane foams.
See lactose.

whiskers. Single, axially oriented, crystalline filaments of metals (iron, cobalt, aluminum, tungsten, rhenium, nickel, etc.), refractory materials (sapphire, aluminum oxide, silicon carbide), carbon, boron, etc. They have tensile strengths of 3–6 million psi and very high elastic moduli. Their upper temperature limit in oxidizing atmospheres may be as high as 1700C and in inert atmospheres up to 2000C. Length may be up to two inches, with diameter up to 10 microns. Their chief use is in the manufacture of composite structures with plastics, glass, or graphite that have many applications in the aircraft and space vehicle field, where their high heat capacity and tremendous strength are invaluable, especially as ablative agents.

whiskey.

Properties: Light-yellow to amber liquid. D 0.923–0.935 (15.56C), 47–53% alcohol by volume, flash p 26.6C (CC).

Derivation: Distillation of fermented malted grains

(corn, rye, or barley). After distillation whiskey is aged in wooden containers for several years. The following changes occur during aging: extraction of wood components (acids and esters), oxidation of the components of the liquid, and reaction between organic compounds in the liquid, forming new flavors.

Hazard: Flammable, moderate fire risk. A noncumulative poison; usually harmless in moderate amounts but may be toxic when habitually taken in large amounts.

Use: Beverage, medicine (stimulant, antiseptic, vasodilator).

See ethanol; proof.

white acid. A mixture of ammonium bifluoride and hydrogen fluoride used for etching glass.

Hazard: Strong irritant to skin and tissue.

white arsenic. See arsenic trioxide.

white copperas. See zinc sulfate.

white dye. An optical bleach or, in general, any substance, such as bluing, that may be added to a white article to increase its apparent whiteness.

white gasoline. See gasoline.

white gold. Alloy of 90% gold and 10% palladium, or 59% nickel and 41% gold.

white lead. Name primarily applied to lead carbonate, basic, but also used for lead sulfate, basic (white lead sulfate), and lead silicate, basic (white lead silicate).

Hazard: Toxic by ingestion and skin absorption. Content in paints limited to 0.05% (FDA).

Use: Paint pigment.

white liquor. See liquor (c).

white metal. (1) Any of a group of alloys having relatively low melting points. They usually contain tin, lead, or antimony as the chief component. Type metal, Babbitt, pewter, and Britannia metal are of this group. (2) Copper matte containing about 75% copper, as obtained in copper smelting operations. See copper.

whitener. (1) Any of several oil-in-water emulsions in powder form that are dried and concentrated; when added to an aqueous medium they form stable emulsions, giving a white color and a cream-like body to coffee. A typical formulation contains vegetable fat, protein, sugar, corn syrup solids, plus emulsifier and stabilizers. (2) A white pigment or colorant used in the paper and textile industries.

white oil. Any of several derivatives of paraffinic hydrocarbons having moderate viscosity, low vol-

atility, and high flash point. Available in USP grade. Combustible.

Use: Textile lubricant and finishing agent, plastics modifier.

white phosphorus. See phosphorus.

white precipitate. See mercury, ammoniated.

white shellac. See shellac, bleached.

white vitriol. See zinc sulfate.

whitewash. A suspension of hydrated lime or calcium carbonate in water used for temporary anti-septic coatings of interiors of chicken houses and the like.

See calcimine.

whiting. Finely ground, naturally occurring calcium carbonate, CaCO_3 , 98% pure, contaminated with silica, iron, aluminum, or magnesium.

Properties: White or off-white powder. D 2.7. Insoluble in water; soluble in acids. It has no tinctorial power and hence is not a pigment.

Derivation: Traditionally from chalk, obtained from England, France, Belgium. A pure limestone or calcite is the principal commercial source. Crude chalk or limestone is ground dry or wet, air- or water-floated, and sieved. Grades are based on particle size, softness, and light reflectance. Dry ground, air-floated limestone whiting can be as fine as 99% through 300-mesh.

Grade: Various. Paris white is the finest; coarser grades are extra gilders whiting, gilders whiting, and commercial, the last being quite coarse and of poor color. A putty grade is also sold.

Use: Filler in rubber, plastics, and paper coatings; putty (with linseed oil); whitewashes; sealants. See calcium carbonate; chalk.

Whiting reaction. Alkynediols are reduced by lithium aluminum hydride in ether or tertiary amines to dienes.

Wichterle reaction. Modification of the Robinson annellation reaction in which 1,3-dichloro-*cis*-2-butene is used instead of methyl vinyl ketone.

Widman-Stoermer synthesis. Synthesis of cinnolines by cyclization of diazotized *o*-aminoarylethylenes at room temperature.

Wieland, Heinrich O. (1877–1957). A German chemist who won the Nobel Prize for chemistry in 1927. His research included work on bile acids, organic radicals, nitrogen compounds, toxic substances, and chemical oxidation, as well as the discovery of the structure of cholesterol. He received his Ph.D. from the University of Munich.

Wij's solution. ICl_3 and I_2 .

Source: Iodine chloride (9.4 g) and iodine (7.2 g) are dissolved separately in glacial acetic acid and the solutions added together.

Use: Determination of iodine values of fats and oils.

wild type. The form of an organism that occurs most frequently in nature.

Wilkinson, Geoffrey. (1921–1996). A British organic chemist who won the Nobel Prize for chemistry in 1973 with Fischer. Their work involved research on organometallic compounds. He was a professor at the University of California and Harvard before returning to University of London as professor of inorganic chemistry.

willemite. Zn_2SiO_4 . Natural zinc orthosilicate. Troostite is a manganese-bearing variety.

Properties: Color yellow, green, red, brown, white; luster vitreous to resinous; sometimes fluoresces in UV light. Mohs hardness 5.5, d 3.3.

Occurrence: New Jersey, New Mexico, Africa, Greenland.

Use: Ore of zinc, a phosphor.

Willgerodt reaction. Discovered in 1887, this reaction involves heating a ketone, e.g., ArCOCH_3 , with an aqueous solution of yellow ammonium sulfide (sulfur dissolved in ammonium sulfide). It results in formation of an amide derivative of an arylacetic acid and in some reduction of the ketone: $\text{ArCOCH}_3 + (\text{NH})_4\text{S}_x \rightarrow \text{ArCH}_2\text{CONH}_2 + \text{ArCH}_2\text{CH}_3$. The dark reaction mixture usually is refluxed with alkali to hydrolyze the amide, the arylacetic acid being recovered from the alkaline solution (L. & M. Fieser).

Williamson synthesis. An organic method for preparing ethers by the interaction of an alkyl halide with a sodium alcoholate (or phenolate).

Willstater, Richard. (1872–1942). A German chemist who won the Nobel Prize for chemistry in 1915 for his work with plant pigmentation. His education was at the University of Munich where he studied and taught before going to Zurich, Switzerland. He researched chlorophylls and pigments of plants and the relationship of cornflower blue to rose red. Work included the study of alkaloids including cocaine, tropine, and atropine. His work perfected the process of chromatographic partition.

"Wilube 139" [Wilube]. TM for a semisynthetic machine and grinding coolant with lubricating and pressure additives.

Use: As a machine and grinding coolant.

"Wilube 655" [Wilube]. TM for a synthetic fluid grinding lubrication.

Use: Provides hard water stability and low foam characteristics.

“Wilube Blue” [*Wilube*]. TM for a premium grade oil containing extreme pressure additives.
Use: To inhibit growth of bacteria and fungus in hard water.

Wilzbach procedure. Exposure of organic compounds to tritium gas yields tritiated products of high activity without extensive radiation damage. Concentrations of tritium ranging from 1 to 90 milluries per gram have been obtained with quite varied compounds.

Windaus, Adolf. (1876–1959.) A German chemist who won the Nobel Prize for chemistry in 1928. His work involved the study of steroids and the effect of ultraviolet light activity, ergosterol, and vitamin D₂. He also researched digitalis and histamine. Although he studied medicine, he received his doctorate in chemistry at the University of Freiburg.

wine. The fermented juice of grapes or other fruits or plants. Contains 7–20% alcohol (by volume). The higher percentages are obtained by addition of pure alcohol (fortifying). Coloring matter, sugars, and small amounts of acetic acid, salts, higher fatty acids, etc. give wines their distinctive appearance and flavor.

Hazard: Flammable, moderate fire risk.

wine ether. See ethyl pelargonate.

wine gallon. Same as U.S. gallon.

wine lees. A deposit or sediment formed in the bottom of wine casks during fermentation. Wine lees vary greatly in quality, but usually contain 20–35% potassium acid tartrate and up to 20% calcium tartrate. They also contain yeast cells, proteins, and other solid matter that was suspended in the grape juice.

Use: Source of tartaric acid and tartarates. See Pasteur, Louis; tartaric acid.

“Wingstay 29” [*Goodyear*]. TM for *p*-oriented styrenated diphenyl amine.

Available forms: Liquid or powder.

Use: Stabilizer for SBR and NBR, back-loaded compounds using diene polymer systems.

wintergreen oil. See methyl salicylate.

winterize. A process of refrigerating edible and lubricating oils to crystallize the saturated glycerides, which are then removed by filter pressing.

wire cloth. See screen; filter media.

Wiswesser Line-Formula notation. See WLN.

“Witepsol” [*Degussa*]. TM for fatty acid esters.

Derivation: Products from coconut oil.

Grade: Liquid, hard fats, flake, and powder form.

Use: As dispersants, cream bases, emollients, refatting agents, emulsifiers, suppository bases, and consistency regulators.

witherite. BaCO₃. A natural barium carbonate usually found in veins with lead ores.

Properties: White, yellowish, or grayish; vitreous, inclining to resinous, luster. D 4.27–4.35, Mohs hardness 3–3.75.

Occurrence: U.S. (Kentucky, Lake Superior region), England (most important source).

Hazard: Toxic by ingestion, skin irritant.

Use: Chemicals (barium dioxide, barium hydroxide, blanc fixe), plate glass and porcelain, brick making, rodenticide.

Wittig, George. (1897–1987). A University of Heidelberg professor who won the Nobel Prize for chemistry in 1979 along with Brown of Purdue. Wittig’s research showed that phosphorous ylids react with ketones and aldehydes to form alkenes. This reaction is used a great deal in the synthesis of pharmaceuticals and other complex organic substances.

Wittig reaction. Preparation of olefins from alkylidene phosphoranes (ylids) and carbonyl compounds.

Wittig rearrangement. Rearrangement of ethers with alkyl lithiums to yield alcohols via a 1,2 shift.

“Wizard” [*Velocity*]. TM for an aqueous solution for degreasing commercial kitchens.

WLN. (Wiswesser Line-Formula notation). A system for converting chemical structural diagrams to a linear string of symbols of letters and numbers.

wobble. The relatively loose base pairing between the base at the 3’ end of a codon and the complementary base at the 5’ end of the anticodon.

Wohl degradation. Method for the conversion of an aldose into an aldose with one less carbon atom by the reversal of the cyanohydrin synthesis. In the Wohl method, the nitrile group is eliminated by treatment with ammoniacal silver oxide.

Wohler, Friedrich. (1800–1882). A native of Germany, Wohler, working with Berzelius, placed the qualitative analysis of minerals on a firm foundation. In the early 19th century, chemists still thought it impossible to synthesize organic compounds. In 1828, Wohler publicized his laboratory synthesis of urea, which he had obtained four years previously by heating the inorganic substance ammonium cyanate; the synthesis is a result of intramolecular rearrangement:

This was the beginning of the science of synthetic organic chemistry.

Wohler synthesis. Classical synthesis of urea by heating an aqueous solution of ammonium cyanate extended to preparation of urea derivatives.

Wohlwill process. The official process of the U.S. mints for refining gold. It consists in subjecting gold anodes to electrolysis in a hot solution of hydrochloric acid containing gold chloride, the solution being continuously agitated with compressed air.

Wohl-Ziegler reaction. Allylic bromination of olefins with *N*-bromosuccinimide. Peroxides or ultraviolet light is used as initiators.

Wolffenstein-Boters reaction. Simultaneous oxidation and nitration of aromatic compounds to nitrophenols with nitric acid or the higher oxides of nitrogen in the presence of a mercury salt as catalyst. Hydroxynitration of benzene yields picric acid.

Wolff-Kishner reaction. This reduction reaction was discovered independently in Germany (Wolff, 1912) and in Russia (Kishner, 1911). A ketone (or aldehyde) is converted into the hydrazone, and this derivative is heated in a sealed tube or an autoclave with sodium ethoxide in absolute ethanol.

After preliminary technical improvements, Huang Minlon (1946) introduced a modified procedure by which the reduction is conducted on a large scale at atmospheric pressure with efficiency and economy (L. & M. Fieser).

Wolff rearrangement. Rearrangement of diazoketone to ketenes by action of heat, light or some metallic catalysts. The rearrangement is the key step in the Arndt-Eistert synthesis.

wolfram. Wolfram is the official international alternate name for tungsten. Tungsten is preferred in the U.S.
See tungsten.

wolframic acid, anhydrous. See tungstic oxide.

wolframite. $(\text{Fe}, \text{Mn})\text{WO}_4$. A natural tungstate of iron and manganese. Ferberite is the iron-rich member of the series, and huebnerite is the manganese-rich member.

Properties: Black to brown color, submetallic to resinous luster, black to brown streak. Mohs hardness 5–5.5, d 7.0–7.5.

Occurrence: Colorado, South Dakota, Nevada, Australia, Bolivia, Europe.

Use: Chief ore of tungsten.

wolfram white. See barium tungstate.

wollastonite.

CAS: 13983-17-0. CaSiO_3 . A natural calcium silicate found in metamorphic rocks.

Properties: White to brown, red, gray, yellow solid; vitreous to pearly luster. Mohs hardness 4.5–5, d 2.8–2.9.

Occurrence: New York, California.

Grade: Fine, medium paint grades.

Use: Ceramics; paint extender; welding rod coatings; rubber filler; silica gels; paper coating; filler in plastics, cements, and wallboard; mineral wool; soil conditioner.

“Women Plus” [Fu-E Life]. TM for a rich source of soybean protein essence with a wealth of vitamins.

wood. A mixture composed of 67–80% holocellulose and 17–30% lignin, together with low percentages of resins, sugars, a variable amount of water, and potassium compounds. Its fuel value varies widely around 3000–6000 Btu/lb according to variety, moisture, etc. Combustible.

Use: Pulp and paper, construction, packaging and cooperage, furniture, destructive distillation prod-

ucts (charcoal), extraction products (turpentine, rosin, tall oil, pine oil, etc.), methanol, plywood, fuel, rayon and cellophane, flock.

Note: Catalytic conversion of wood chips to fuel oil and methanol is under development.

See biomass.

wood alcohol. See methanol.

wood ash. The inorganic residue of wood combustion.

Use: Fertilizer for its potash content, which averages about 4% K_2O .

wood flour. (wood flock). Pulverized dried wood from either soft- or hardwood wastes. Graded according to color and fineness.

Grade: Domestic standard, domestic fine, imported 40–60 mesh, 70–80 mesh, etc.

Hazard: Flammable, dangerous fire risk, especially suspended in air.

Use: Extender and filler in dynamite, plastics, rubber,

paperboard; fur cleaning; polishing agents; Sorel cement.

wood, indurated. A wood hardened by impregnation with a phenol-formaldehyde product.

Use: Storage batteries.

wood, petrified. Wood in which the original chemical components have been replaced by silica. The change occurs in such a way that the original form and structure of the wood are preserved. The most famous instance is the Petrified Forest of Arizona.

wood pulp. See pulp, paper.

wood rosin. See rosin.

Wood's metal. A four-component fusible alloy used largely in sprinkler systems, it melts at 70C, the composition being bismuth 50%, cadmium 10%, tin 13.3%, lead 26.7%.

See alloy, fusible; eutectic.

wood sugar. See D(+)-xylose.

wood tar. See pine tar; creosote, coal tar; wood-tar.

wood turpentine. See turpentine (oil).

Woodward-Hoffmann rules. Rules that predict the stereochemical course of concerted reactions in terms of the symmetry of the interacting molecular orbitals.

Woodward *cis*-hydroxylation. The hydroxylation of an olefin with iodine and silver acetate in acetic acid to give *cis*-glycols. The method involves the trans addition of iodine and silver acetate to give a *trans*-iodo-acetoxy derivative. The latter is hydrolyzed to a *cis*-mono-glycol acetate with acetic acid and water. Alkaline hydrolysis results in the final *cis*-glycol.

Woodward, Robert B. (1917–1979). An American chemist born in Quincy, MA, and widely regarded as one of the world's leading synthetic organic chemists. After receiving his doctorate from M.I.T. (the youngest student in the history of the institute to do so), he joined the Harvard faculty in 1937 as instructor and attained full professorship in 1950. He was recipient of the Nobel Prize in 1965 for his brilliant work in synthesizing complex organic compounds, among them quinine, cholesterol, chlorophyll, reserpine, and cobalamin (vitamin B₁₂). When he died in 1979, his synthesis of the antibiotic erythromycin was virtually complete; it was finished by his associates two years later. He was director of the Woodward Research Institute in Basel, Switzerland, and a member of the governing board of the Weizmann Institute in Israel.

wool. Staple fibers, usually 2–8 in. long, obtained from the fleece of sheep (and also alpaca, vicuna, and certain goats). Physically, wool differs from hair in fineness and by the presence of prominent cortical scales and a natural crimp. The latter properties are responsible for the felting properties of wool and the ability of the fibers to cling together when spun into yarns. Chemically, wool consists essentially of protein chains (keratin) bound together by disulfide cross linkages.

Properties: Tenacity ranges from 1 to 2 g/denier; elongation 25–50%, d 1.32, moisture regain 16% (21.2C, 65% relative humidity), decomposes at 126C, scorches at 204C, resistant to most acids except hot sulfuric, destroyed by alkalis and chlorine bleach, resistant to mildew but attacked by insects, amphoteric to dyes. Combustible.

Source: Australia, Argentina, U.S., New Zealand, Uruguay, the former U.S.S.R., England.

Use: Outerwear, blankets, carpets, upholstery, felt, clothing source of lanolin.

wool fat. See lanolin.

wool waste. Wool from scrap materials cut up for remaking into cloth. Used as a fertilizer. Wool waste usually contains from 4 to 7% ammonia. Pure wool shoddy may contain as much as 15% nitrogen and is particularly valued by hop growers.

Hazard: Wet wool waste is flammable and a dangerous fire risk.

work function. The energy needed to transport electrons, ions, and molecules from the inside of one medium into an adjoining medium.

working draft DNA sequence. See Draft DNA Sequence.

work, internal. The work done by a system against internal forces or between its parts or upon the system by these forces.

work, theoretical. Ideal reversible work calculated from properties.

wormseed oil. See chenopodium oil.

wormwood. See absinthium.

wort. A clear infusion of grain extract (usually malt) used as the basis of fermentation in the brewing industry.
See brewing.

wove. (paper).
See dandy roll.

writing ink. A solution of colorant in water, usually containing also low concentrations of tannic or gallic acid. Washable inks contain glycerol. Various water-soluble dyes are used for colored inks;

dispersions of carbon black stabilized with a protective colloid are used for drawing inks. Fountain pen inks retain the fluidity of water; for ballpoint pens the mixture is of a pastelike consistency.

wrought iron. A ferrous material, aggregated from a solidifying mass of pasty particles of highly refined metallic iron into which 1–4% of slag is uniformly dispersed without subsequent melting. Wrought iron is distinguished by its low carbon and manganese contents. Carbon seldom exceeds 0.035%, and manganese content is held at 0.06% maximum. Phosphorus usually ranges from 0.10% to 0.15%; it adds about 1000 psi for each 0.01% above 0.10%. Sulfur content is normally low, ranging from 0.006% to less than 0.015%. Silicon content ranges from 0.075% to 0.15%; silicon content of base metals is 0.015% or less. Residuals such as chromium, nickel, cobalt, copper, and molybdenum are generally low, totaling less than 0.05%. Wrought iron is readily fabricated by standard methods and is quite corrosion resistant.

“WS-Extra 400” [Millenium]. TM for a cooling agent blend for oral products.

wulfenite. PbMoO_4 , sometimes with calcium, chromium, vanadium.

Properties: Yellow, orange, or bright-orange-red mineral of resinous luster. D 6.7–7.0, Mohs hardness 2.75–3.

Occurrence: Found in veins with ores of lead in U.S. (Massachusetts, New York, Pennsylvania, Nevada, Utah, New Mexico, Arizona), Europe, Australia.

Use: Ore of molybdenum.

Wulff process. Production of acetylene by treating a hydrocarbon gas with superheated steam in a regenerative type of refractory furnace at 1148–1371C. Contact times are very short. Acety-

lene and ethylene are produced in 1:1 ratio. See acetylene.

Wurtz reaction. A method of synthesizing hydrocarbons discovered by Wurtz in 1855. It consists in treatment of an alkyl halide with metallic sodium, which has a strong affinity for bound halogen and acts on methyl iodide in such a way as to strip iodine from the molecule and produce sodium iodide. The reaction involves two molecules of methyl iodide and two atoms of sodium.

The reaction probably proceeds through the formation of methylsodium, which interacts with methyl iodide:

The Wurtz reaction can be applied generally to synthesis of hydrocarbons by the joining together of hydrocarbon residues of two molecules of an alkyl halide (usually the bromide or iodide). With halides of high molecular weight the yields are often good and the reaction has been serviceable in the synthesis of higher hydrocarbons starting with alcohols found in nature.

Wuthrich, Kurt. (1938–). Born in Aarberg, Switzerland, Wuthrich won the Nobel Prize for chemistry in 2003 for his pioneering work concerning for the development of nuclear magnetic resonance spectroscopy for determining the three-dimensional structure of biological macromolecules in solution. He earned an undergraduate degree from the University of Bernborn in Aarberg and a Ph.D. in chemistry from the University of Basel, Switzerland. Currently a Professor of Biophysics in Eidgenrich, Switzerland and Cecil H. and Ida M. Green Visiting Professor of Structural Biology, The Scripps Research Institute, La Jolla, CA.

X

xanthan. A synthetic, water-soluble bipolymer made by fermentation of carbohydrates; it is a thickening and suspending agent that is heat stable, with good tolerance for strongly acidic and basic solutions. Viscosity remains stable over wide temperature range.

Use: In drilling fluids, ore flotation, and the food and pharmaceutical fields, especially in prepared mixed and high-protein fast foods. An experimental use is to flood oil fields as an aid to enhanced recovery.

xanthate. A salt (usually potassium or sodium) of a xanthic acid. Available as yellow pelletized solids having a pungent odor; soluble in water. Examples are potassium amyl xanthate, potassium ethyl xanthate, sodium isobutyl xanthate, sodium isopropyl xanthate.

Use: Collector agents in the flotation of sulfide minerals, metallic elements such as copper, silver, gold, and some oxidized minerals of lead and copper. See cellulose xanthate; viscose process.

xanthene. (dibenzopyran, tricyclic).

$\text{CH}_2(\text{C}_6\text{H}_4)_2\text{O}$. The central structure of the fluorescein, eosin, and rhodamine dyes.

Properties: Yellowish, crystalline leaflets. Mp 100.5C, bp 315C. Soluble in ether; slightly soluble in alcohol; very slightly soluble in water.

Derivation: By the condensation of phenol and *o*-cresol by means of aluminum chloride.

Use: Organic synthesis, fungicide.

xanthene dye. A group of dyes whose molecular structure is related to that of xanthene. The aromatic (C_6H_4) groups constitute the chromophore. CI ranges from 45000 to 45999. The dyes are closely related structurally to diaryl methane dyes. Eosin (CI 45380) is an example.

xanthanol. See xanthidrol.

xanthic acid. (xanthogenic acid). A substituted dithiocarbonic acid of the type ROC(S)SH , in which R is ordinarily an alkyl radical. Xanthic acid salts are called xanthates. Unless otherwise designated, xanthic acid is understood to be the ethyl derivative ($\text{C}_2\text{H}_5\text{OC(S)SH}$), also called ethylxanthic acid.

Properties: Liquid. Mp -53C , decomposing at room temperature.

xanthine. (dioxopurine).

CAS: 69-89-6. $\text{C}_5\text{H}_4\text{N}_4\text{O}_2$. A purine base occurring in the blood and urine and in some plants. Theophylline and theobromine, the alkaloids of tea and cocoa,

respectively, are both dimethylxanthines; caffeine in coffee is a trimethylxanthine.

Properties: Yellowish-white powder. Sublimes with partial decomposition; soluble in potassium hydroxide; insoluble in water and acid.

Derivation: By the action of nitrous acid on guanine.

Grade: Technical, CP, monohydrate, sodium salt, radioactive forms available.

Hazard: Toxic by ingestion.

Use: Organic synthesis, medicine.

xanthine oxidase. An enzyme found in animal tissues that acts upon hypoxanthine, xanthine, aldehydes, reduced coenzyme I, etc. producing, respectively, xanthine, uric acid, acids, oxidized coenzyme I, etc.

Use: Biochemical research.

xanthogenic acid. See xanthic acid.

xanthone. (benzophenone oxide; dibenzopyrone; xanthene ketone).

CAS: 90-47-1. $\text{CO}(\text{C}_6\text{H}_4)_2\text{O}$. Tricyclic; occurs in some plant pigments.

Properties: White needles or crystalline powder. Mp 173–4C, bp 350C, sublimes. Insoluble in water; soluble in alcohol, chloroform, and benzene, especially when hot.

Use: Larvicide; intermediate for dyes, perfumes, and pharmaceuticals.

xanthophyll. $\text{C}_{40}\text{H}_{56}\text{O}_2$.

Properties: Yellow pigment. An oxygenated carotenoid occurring in green vegetation and in some animal products, notably egg yolk. Mp 190–3C. Insoluble in water; slightly soluble in alcohol and ether.

See lutein; carotenoid.

xanthopterin. (2-amino-4,6-dihydroxypteridine). $\text{C}_6\text{H}_5\text{N}_5\text{O}_2 \cdot \text{H}_2\text{O}$. Pigment found in the wings of butterflies; can be converted by yeast into folic acid.

Properties: Orange-yellow crystals. Sinters at 360C, decomposes above 410C. Practically insoluble in water; freely soluble in dilute ammonium or sodium hydroxide giving yellow solutions and in 2*N* hydrochloric acid giving colorless solutions.

Use: Biochemical research.

xanthidrol. (xanthanol).

CAS: 90-46-0. $\text{HCOH}(\text{C}_6\text{H}_4)_2\text{O}$. A derivative of xanthene.

Properties: White powder. Mp 123C. Insoluble in water; soluble in alcohol.

Derivation: Reduction of xanthone with alcohol and sodium.

Grade: CP (analytical).

Use: Determination of urea and DDT.

xatral.

CAS: 81403-68-1. mf: $C_{19}H_{27}N_3O_4 \cdot ClH$.

Hazard: A poison.

X chromosome. One of the two sex chromosomes, X and Y.

See Y chromosome; sex chromosome.

Xe. Symbol for xenon.

xenograft. Tissue or organs from an individual of one species transplanted into or grafted onto an organism of another species, genus, or family. A common example is the use of pig heart valves in humans.

3-(2-xenolyl)-1,2-epoxypropane.

Use: Food additive; plasticizer.

xenon. Xe. Element of atomic number 54, noble gas group of the periodic table, aw 131.30, valences = 2, 4, 6, 8; nine stable isotopes.

Properties: Colorless, odorless gas or liquid. Gas (at STP) has d 5.8971 g/L (air = 1.29 g/L), dielectric constant 1.0012 (25C) (1 atm); liquid has bp $-108.12C$ (1 mm Hg), d (at bp) of 1.987 g/cc; liquefaction temp $-106.9C$. Chemically unreactive but not completely inert. Noncombustible.

Derivation: Fractional distillation of liquid air.

Use: Luminescent tubes, flash lamps in photography, fluorimetry, lasers, tracer studies, anesthesia.

See noble gas; xenon compounds.

xenon compounds. Xenon tetrafluoride, XeF_4 , is easily prepared by mixing fluorine and xenon in gaseous form, heating in a nickel vessel to $400C$, and cooling. The product forms large, colorless crystals. The difluoride and hexafluoride, XeF_2 and XeF_6 , also colorless crystals, can be obtained somewhat similarly. The hexafluoride melts to a yellow liquid at $50C$ and boils at $75C$. Many xenon fluorine complexes with other compounds are also known. Xenon oxytetrafluoride, $XeOF_4$, a volatile liquid at room temperature, is obtained from the reaction of xenon hexafluoride and silica. Gram amounts have been isolated and studied.

All these fluorides must be protected from moisture to avoid formation of xenon trioxide, XeO_3 , a colorless, nonvolatile solid that is dangerously explosive when dry. Its solution, the so-called xenic acid, is a stable weak acid but a strong oxidizing agent, which will even liberate chlorine from hydrochloric acid. In an alkaline solution, xenon trioxide reacts to give free xenon and perxenate, such as $Na_4XeO_6 \cdot 8H_2O$. Perxenates are probably the most powerful oxidizing agents known, just as the xenon fluorides are extremely effective fluorinating agents.

Complex compounds containing nitrogen bonded to xenon have also been prepared.

Hazard: Toxic by inhalation; oxidizing agents, strong irritant.

xenyl. The biphenyl group $C_6H_5C_6H_4-$.

p-xenylamine. See p-aminodiphenyl.

xerography. A "dry" method of photography or photocopying. A metal plate is covered with a layer of photoconductive powder, such as selenium; the surface of this plate is given an electric charge by passing it under a series of charged wires. An image of the material to be photographed is projected onto the charged plate through a camera lens. The electric charges disappear in the areas exposed to light, but elsewhere the surface retains its charge. A powder consisting of a coarse carrier and a fine developing resin is then spread over the plate. Adhesion between powder and plate occurs only at the charged areas. Elsewhere developing resin and carrier are not retained on the plate, which thus has become a negative of the original image. A positive is obtained by placing a piece of paper against the plate and applying an electric charge as in the first stage of the process. This causes adhesion of developing resin and its carrier to the paper. This positive print is fixed by heating in a press for a few seconds to melt the developing resin and fuse it to the paper. Colored prints are possible by use of suitable developing resins. Various materials other than paper can thus be printed.

xibornol. (6-isobornyl-3,4-xylenol). $C_{18}H_{26}O$.

Properties: Crystalline solid or viscous, yellowish liquid. D 1.02, refr index 1.538.

Use: Antibacterial agent, rubber antioxidant.

X-linked. Shortened form for cross-linked, e.g., X-linked polyethylene.

XLPE. Trade abbreviation for cross-linked polyethylene.

XPS. Abbreviation for X-ray photoelectron spectroscopy.

x-radiation. (Roentgen rays; x rays). Electromagnetic radiation of extremely short wavelength ($0.06-120 \text{ \AA}$), emitted as the result of electron transitions in the inner orbits of heavy atoms bombarded by cathode rays in a vacuum tube. Those of the shortest wavelength have the highest intensity and are called "hard" X rays. X-radiation was discovered by Roentgen in 1898. Its properties are (1) penetration of solids of moderate density, such as human tissue but retardation by bone, barium sulfate, lead, and other dense materials. (2) Action on photographic plates and fluorescent screens. (3) Ionization of the gases through which they pass. (4) Ability to damage or destroy diseased tissue; there is

also a cumulative deleterious effect on healthy tissue.

Hazard: Overexposure can permanently damage cells and tissue structures; effect is cumulative.

Use: Spectrometry; structure determination of molecules, cancer therapy, diagnostic medicine, nondestructive testing of metals, identification of original paintings, preservation of foods.

See radiation, ionizing; diffraction; roentgen.

“**Xydar**” *Solvay Advanced*. TM for liquid crystal polymer glass/mineral combination product.

Use: Microwave cabinets; cookware; automotive and electronic components.

xylene. (dimethylbenzene).

CAS: 1330-20-7. $C_6H_4(CH_3)_2$. A commercial mixture of the three isomers, *o*-, *m*-, and *p*-xylene. The last two predominate.

Properties: Clear liquid. D about 0.86. See under Grade for boiling range, flash p 81–115F (27.2–46.1C) (TOC). Soluble in alcohol and ether; insoluble in water.

Derivation: (1) Fractional distillation from petroleum (90%), coal tar, or coal gas, (2) by catalytic reforming from petroleum, followed by separation of *p*-xylene by continuous crystallization, (3) from toluene by transalkylation.

Grade: Nitration (bp range 137.2–140.5C), 4 degrees (bp range 138–134C), 5 degrees (bp range 137–142C, high in *m*-isomer), 10 degrees (bp range 135–145C), industrial (bp 90% 40C, complete 160C). Also other grades depending on use. In some cases one or another of the industrial isomers is partially removed for use in chemical production.

Hazard: Flammable, moderate fire risk. Toxic by ingestion and inhalation. TLV: 100 ppm; STEL 150 ppm; not classifiable as a human carcinogen.

Use: Aviation gasoline; protective coatings; solvent for alkyd resins, lacquers, enamels, rubber cements; synthesis of organic chemicals.

***m*-xylene.** (1,3-dimethylbenzene).

CAS: 108-38-3. $1,3-C_6H_4(CH_3)_2$.

Properties: Clear, colorless liquid. D 0.8684 (15C), fp –47.4C, bp 138.8C, refr index 1.4973 (20C), flash p 85F (29.4C), autoign temp 982F (527.7C). Soluble in alcohol and ether; insoluble in water.

Derivation: Selective crystallization or solvent extraction of *m*, *p*-mixture.

Grade: 95% (technical), 99%, 99.9% (research).

Hazard: Flammable, moderate fire risk. TLV: 100 ppm; STEL 150 ppm; not classifiable as a human carcinogen.

Use: Solvent; intermediate for dyes and organic syn-

thesis, especially isophthalic acid; insecticides; aviation fuel.

***m*-xylene- α,α' -diamine.** (MXDA; *m*-phenylenebis(methylamine)).

CAS: 1477-55-0. mf: $C_8H_{12}N_2$.

Properties: A liquid. Mw 136.22, bp 245–248C.

Hazard: Moderately toxic by skin contact and ingestion. Mildly toxic by inhalation. A severe skin and eye irritant. TLV: TWA ceiling of 0.1 mg/m³. Toxic by skin absorption.

Use: Manufacture of polyamide fibers and resins, as a curing agent.

***o*-xylene.** (1,2-dimethylbenzene).

CAS: 95-47-6. $1,2-C_6H_4(CH_3)_2$.

Properties: Clear, colorless liquid. D 0.880 (20/4C), fp –25C, bp 144C, refr index 1.505 (20C), flash p 115F (46.1C) (TOC), autoign temp 867F (463.8C). Soluble in alcohol and ether; insoluble in water. Combustible.

Grade: 99%, free of hydrogen sulfide and sulfur dioxide, technical 95%, research 99.9%.

Hazard: Moderate fire risk. TLV: 100 ppm; STEL 150 ppm; not classifiable as a human carcinogen.

Use: Manufacture of phthalic anhydride, vitamin and pharmaceutical syntheses, dyes, insecticides, motor fuels.

***p*-xylene.** (1,4-dimethylbenzene).

CAS: 106-42-3. $1,4-C_6H_4(CH_3)_2$.

Properties: Colorless liquid. D 0.8611 (20C), mp 13.2C, bp 138.5C, refr index 1.5004 (21C), flash p 81F (27.2C) (TOC). Crystallizes at low temperature. Soluble in alcohol and ether; insoluble in water.

Derivation: Selective crystallization or solvent extraction of *m*-, *p*-mixture; separation from mixed-xylene feedstocks by adsorption.

Hazard: Flammable, dangerous fire risk. TLV: 100 ppm; STEL 150 ppm; not classifiable as a human carcinogen.

Use: Synthesis of terephthalic acid for polyester resins and fibers (“Dacron,” “Mylar,” “Terylene”), vitamin and pharmaceutical syntheses, insecticides.

***p*-xylene- α,α' -diol.** $C_6H_4(CH_2OH)_2$.

Properties: White, crystalline solid. Mp 118C, bp 138–144C (0.8–1.0 mm Hg). Slightly soluble in water (25C).

Grade: 98%.

Use: Polyester resins.

xylenol. (dimethylphenol; hydroxydimethylbenzene; dimethylhydroxybenzene).

CAS: 1300-71-6. $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{OH}$. There are five isomers (2,4-; 2,5-; 2,6-; 3,4-; 3,5-). This entry describes the commercially offered mixture.

Properties: White, crystalline solid. D 1.02–1.03 (15C), mp 20–76C, bp 203–225C. Only slightly soluble in water; soluble in most organic solvents and caustic soda solution. Combustible.

Derivation: Cresylic acid or tar acid fraction of coal tar.

Hazard: Toxic by ingestion and skin absorption.

Use: Disinfectants, solvents, pharmaceuticals, insecticides and fungicides, plasticizers, rubber chemicals, additives to lubricants and gasolines, manufacture of polyphenylene oxide (2,6-isomer only), wetting agents, dyestuffs.

xylidine. (aminodimethylbenzene; aminoxylene).

CAS: 1300-73-8. $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{NH}_2$. A varying mixture of isomers (2,3-; 2,4-; 2,5-; 2,6-).

Properties: Liquid. D 0.97–0.99, bp 213–226C, flash p 206F (96.6C) (CC). Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: Nitration of xylene and subsequent reduction.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.5 ppm; animal carcinogen.

Use: Dye intermediate, organic syntheses, pharmaceuticals.

3,4-xylidino-2-oxazoline.

CAS: 23420-61-3. mf: $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}$.

Hazard: A poison.

xylocaine. Preparation of lignocaine hydrochloride.

Use: Local anesthetic.

xylo. Commercial-grade xylene, a mixture of isomers and other benzene derivatives.

xylopic acid.

Properties: *Xylopic aethiopica*. Family Annonacea.

CAS: 6619-97-2. mf: $\text{C}_{22}\text{H}_{32}\text{O}_4$.

Hazard: A poison by ingestion.

D(+)-xylose. (wood sugar).

CAS: 58-86-6. $\text{C}_5\text{H}_{10}\text{O}_5$, (not to be confused with phenylsazone of the same name).

Properties: White, crystalline, dextrorotatory powder; sweet taste. D 1.525 (20C), mp 144C (also given as 153C). Soluble in water and alcohol. Combustible.

Derivation: Hydrolysis with hot dilute acids of wood, straw, corncobs, etc.; wood pulp wastes.

Grade: Reagent, technical.

Use: Dyeing, tanning, diabetic food, source of ethanol.

xylyl bromide. (α -bromoxylene).

CAS: 35884-77-6. $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_2\text{Br}$. Mixed *o*-, *m*-, and *p*-isomers.

Properties: Colorless liquid; pleasant aromatic odor. Decomposed slowly by water, d 1.4, bp 210–220C. Combustible.

Derivation: Bromination of xylene.

Grade: Technical.

Hazard: Toxic by inhalation and ingestion; strong irritant to eyes, skin, and tissue.

Use: Organic synthesis, tear gas.

m-xylyl chloride. $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. Bp 196, d 1.064. Combustible.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin.

Use: Intermediate.

p-xylylene. $\text{CH}_2\text{:C}_6\text{H}_4\text{:CH}_2$. A monomer.

See parylene.

n-2,3-xylylmaimide.

CAS: 31581-09-6. mf: $\text{C}_{12}\text{H}_{11}\text{NO}_2$.

Hazard: Low toxicity by ingestion and inhalation. A severe eye irritant.

((2,6-xylyl)sulfinyl)methylcarbamic acid-2,3-dihydro-2,2-dimethyl-7-benzofuranyl ester.

CAS: 77248-44-3. mf: $\text{C}_{20}\text{H}_{23}\text{NO}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

Y

Y. Symbol for yttrium.

YAC. Abbreviation for yeast artificial chromosome.

Yankee machine. A papermaking machine similar to a fourdrinier but with much shorter wire. It is designed for lightweight papers such as toilet and facial tissues and operates at comparatively high speeds. It has a specialized cylindrical drying roll that effects drying of the web much more efficiently than felts.

See fourdrinier.

“Yarmor” [Aqualon]. TM for series of pine oils for widely varied uses. Total terpene alcohol contents from 55 to 91%.

Use: Disinfectants, textile specialties, wetting and flotation agents, special solvents, household and industrial cleaners, odorants.

Yb. Symbol for ytterbium.

Y chromosome. One of the two sex chromosomes, X and Y.

See X chromosome; sex chromosome.

yeast. (barm). Unicellular organisms known as *saccharomycetaceae*. The following description applies to the cultured commercial product and not to various wild varieties.

Properties: Yellowish-white, viscid liquid or soft mass, flakes, or granules, consisting of cells and spores of *Saccharomyces cerevisiae*.

Derivation: A ferment obtained in brewing. Yeasts induce fermentation by enzymes (zymases) that convert glucose and other carbohydrates into carbon dioxide and water in the presence of oxygen or into alcohol and carbon dioxide (or lactic acid) in the absence of oxygen.

Grade: Technical, brewers', cooking, compressed (contains about 74% moisture), dried, NF (contains no starch or filler, not more than 7% moisture nor more than 8% ash). Also graded according to vitamin B₁ content.

Use: Fermentation of sugars, molasses, and cereals for alcohol; brewing; baking; food supplement; protein biosynthesis from many carbonaceous and nitrogenous materials, including petroleum; source of vitamins, enzymes, nucleic acids, etc.; biochemical research.

See bacteria; fermentation.

yeast adenylic acid. See adenylic acid.

yeast artificial chromosome (YAC). Constructed from yeast DNA, it is a vector used to clone large DNA fragments; a method for cloning very large fragments of DNA. Genomic DNA in fragments of 200-500 kb are linked to sequences which allow them to propagate in yeast as a mini-chromosome (including telomeres, a centromere, and an ARS—an autonomous replication sequence). This technique is used to clone large genes and intergenic regions, and for chromosome walking.

See cloning vector; cosmid.

“Yellotone” [Ashland].

CAS: 7704-34-9. TM for a sulfur product.

Use: As a rubber vulcanizing agent, insecticide, and fungicide.

yellow AB. (1-(phenylazo)-2-naphthylamine; CI 11380).

CAS: 85-84-7. C₆H₅N₂C₁₀H₆NH₂.

Properties: Orange or red platelets. Mp 102–104C. Insoluble in water; soluble in alcohol and oils.

Hazard: Consult regulations before using in food products.

Use: Biological stain.

yellow brass. A brass containing 34–37% zinc; it has excellent fabrication properties and corrosion resistance.

Use: Structural and decorative purposes.

See brass.

yellowcake. See uranium dioxide.

yellow enzyme. See flavin enzyme.

yellow glass. A soda-lime glass.

yellow lake. Any of several pigments made by precipitating soluble yellow dyes on an aluminum hydrate base. They are transparent in oil and lacquer vehicles and are used for metal decorating.

yellow OB. (1-*o*-tolueneazonaphthylamine-2; CI 11390).

CAS: 131-79-3. CH₃C₆H₄N₂C₁₀H₆NH₂.

Properties: Orange or yellow powder. Mp 122–125C. Insoluble in water; soluble in alcohol and oils.

Hazard: Consult regulations before using in food products.

Use: Biological stain.

yellow phosphorus. See phosphorus.

yellow precipitate. See mercuric oxide, yellow.

yellow prussiate of potash. See potassium ferrocyanide.

yellow prussiate of soda. See sodium ferrocyanide.

yellow rain. See mycotoxin.

yellow salt. See uranyl nitrate.

-yl. The suffix of univalent radicals derived from aromatic hydrocarbons or heterocyclic compounds by the removal of one hydrogen atom from the ring.

ylang ylang oil. An essential, yellowish, volatile oil distilled from the flowers of *Cananga odorata*. Strongly levorotatory.

Use: Perfumery.
See cananga oil.

ylid. A substance in which a carbanion is attached to a heteroatom with a high degree of positive charge, i.e., $>C^+-X^-$. It is similar to a zwitterion and related to the Wittig reaction.

-ylidene. (-ylidyne). A suffix for bivalent or trivalent radicals derived from saturated hydrocarbons by the removal of two or three hydrogen atoms from the same carbon atom.

-ylidyne. See -ylidene.

yohimbine. (aprodine; corynine; quebrachine). CAS: 146-48-5. $C_{21}H_{26}O_3N_2$.

Properties: Glistening, needlelike alkaloid, mp 234C, soluble in alcohol and ether, very slightly soluble in water.

Derivation: By extraction from the bark of *Corynanthe yohimbe*, found in the Cameroons.

Hazard: Said to be an aphrodisiac. Toxic by ingestion.

β -yohimbine hydrochloride.

CAS: 75444-63-2. mf: $C_{21}H_{26}N_2O_3 \bullet ClH$.

Hazard: A poison by ingestion.

Young's modulus. See modulus of elasticity.

ytterbium.

CAS: 7440-64-4. Yb. A metallic element. A rare-earth metal of yttrium subgroup, atomic number 70, aw 173.04, valence of 2, 3; exists in α and β forms, the latter being semiconductive at pressures above 16,000 atm. There are seven natural isotopes.

Properties: Metallic luster, malleable. Mp 824C, bp 1427C, d 7.01. Reacts slowly with water; soluble in dilute acids and liquid ammonia.

Source: See rare-earth metals.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Grade: Regular high purity (ingots and lumps).

Use: Lasers, dopant for garnets, portable X-ray source, chemical research.

ytterbium chloride. $YbCl_3 \bullet 6H_2O$.

Properties: Green crystals. D 2.575, loses $6H_2O$ at 180C, mp 865C. Very soluble in water; hygroscopic.

ytterbium fluoride. YbF_3 .

Properties: Solid. Mp 1157C, bp 2200C. Insoluble in water; hygroscopic.

Hazard: TLV: 2.5 mg(F)/m³.

ytterbium oxide. (ytterbia). Yb_2O_3 .

Properties: Colorless mass when free of thulia, tinted brown or yellow when containing thulia. D 9.2, mp 2346C. The weakest base of the yttrium group, except scandia and lutetia. Slightly hygroscopic, absorbs water and carbon dioxide from the air. Soluble in hot, dilute acids; less so in cold acids.

Use: Special alloys, dielectric ceramics, carbon rods for industrial lighting, catalyst, special glasses.

ytterbium sulfate. $Yb_2(SO_4)_3 \bullet 8H_2O$.

Properties: Crystalline solid. D 3.286. Soluble in water.

yttria. See yttrium oxide.

yttrium.

CAS: 7440-65-5. Y. Metallic element of atomic number 39, group IIIB of the periodic table, aw 88.9059, valence of 3; no stable isotopes.

Properties: Dark-gray metal. D 4.47, mp 1500C, bp 2927C. Soluble in dilute acids and potassium hydroxide solution; decomposes water. Known only in the tripositive state. Low neutron capture cross section.

Source: See rare-earth metals.

Derivation: Reduction of the fluoride with calcium.

Grade: Regular high purity (ingots, lumps, turnings), metallurgical, low-oxygen, crystal sponge, powder.

Hazard: Flammable in finely divided form. TLV: 1 mg(Y)/m³.

Use: Nuclear technology, iron and other alloys, deoxidizer for vanadium and other nonferrous metals, microwave ferrites, coating on high-temperature alloys, special semiconductors.

yttrium acetate. $Y(C_2H_3O_2)_3 \bullet 9H_2O$.

Properties: Colorless crystals. Soluble in water.

Derivation: Action of acetic acid on yttrium oxide.

Use: Analytical chemistry.

yttrium antimonide. YSb. A high-purity binary semiconductor.

yttrium arsenide. YAs. A high-purity binary semiconductor.

Hazard: Highly toxic.

yttrium bromide. $\text{YBr}_3 \cdot 9\text{H}_2\text{O}$.

Properties: Colorless crystals. Hygroscopic, mp (anhydrous) 904C. Soluble in water; slightly soluble in alcohol; insoluble in ether.

yttrium chloride.

CAS: 10361-92-9. $\text{YCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Reddish-white, transparent, deliquescent prisms. D 2.18, decomposes at 100C. Soluble in water and alcohol; insoluble in ether.

Derivation: By the action of hydrochloric acid on yttrium oxide.

Grade: Purities to 99%.

Use: Analytical chemistry.

yttrium oxide. (yttria).

CAS: 1314-36-9. Y_2O_3 .

Properties: Yellowish-white powder. D 4.84, mp 2410C. Soluble in dilute acids; insoluble in water.

Derivation: By the ignition of yttrium nitrate.

Grade: Purities to 99.8%, electronic grade 99.999%.

Use: Phosphors for color TV tubes (alloy with europium), yttrium-iron garnets for microwave filters, stabilizer for high-temperature service materials (zirconia and silicon nitride refractories).

yttrium phosphide. YP.

Use: High-purity binary semiconductor.

yttrium sulfate. $\text{Y}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Small, reddish-white, monosymmetric crystals. D 2.558, loses $8\text{H}_2\text{O}$ at 120C, decomposes 700C. Soluble in concentrated sulfuric acid; sparingly soluble in water; insoluble in alkalis.

Derivation: Action of sulfuric acid on monazite sand.

Method of purification: Fractional crystallization.

Use: Reagent.

yttrium vanadate. YVO_4 .

Properties: White, crystalline solid.

Use: With europium vanadate as red phosphor in color television tubes.

Z

“Zaclon” [Du Pont]. TM for a series of fluxes based on active zinc ammonium chloride combined with additives; available in various forms.

“Zalba” [Du Pont]. TM for a rubber antioxidant containing a hindered phenol.

Properties: Yellow or cream-colored powder. D 1.30.

Use: Nondiscoloring antioxidant for natural and synthetic rubbers and latex; stabilizer in SBR manufacture.

Zanzibar gum. A hard, usually fossil type of copal.

Source: Found on the island of Zanzibar and the adjacent African mainland.

Properties: D 1.062–1.068, mp 240–250C. Insoluble in most solvents. Combustible.

Use: Varnishes.

“zaprinst” [A.G. Scientific].

CAS: 37762-06-4. mf: $C_{13}H_{13}N_5O_2$. TM for a specific cGMP-phosphodiesterase inhibitor.

Properties: White solid. Mp: 235–237°.

Hazard: A poison.

“Zar Exterior Polyurethane” [UGL]. TM for liquid additive containing ultra violet radiation absorbers.

Use: To resist UV rays.

“Zar Tung Oil” [UGL]. TM for oil coating for wood.

Use: For durable bartops to resist marks caused by hot and cold liquids.

“Zar Wood Patch” [UGL]. TM for a latex compound.

Use: To fill nail holes, cracks, or gouges. It accepts stains better than conventional wood.

ZDP. Abbreviation for zinc dithiophosphate.

“Zectran” [Dow]. TM for insecticides containing 4-dimethylamino-3,5-xylyl-*n*-methylcarbamate.

zedoarondiol.

CAS: 98644-24-7. mf: $C_{15}H_{24}O_3$.

Hazard: A poison by ingestion.

zein. The protein of corn, a prolamin.

Properties: White to slightly yellow powder; odorless; tasteless. D 1.226. Free of cystine, lysine, and tryptophane. A resinous material dispersible in water with neutral sulfonated castor oil; soluble in

dilute alcohol; insoluble in water, dilute acids, anhydrous alcohols, turpentine, esters, oils, fats. Nontoxic protein of the prolamine class, derived from corn; contains 17 amino acids. Combustible.

Derivation: By-product of corn processing, by extraction of gluten meal with 85% isopropanol, extraction of the zein from the extract with hexane, precipitation by water, and spray drying.

Use: Paper coating, grease-resistant coating, label varnishes, laminated board, solid-color prints, printing inks, food coatings, microencapsulation, fibers.

Zeisel determination. Cleavage of methoxy and ethoxy groups with boiling hydriodic acid, distillation of the alkyl iodide into alcoholic silver nitrate, and gravimetric determination as silver iodide. Alternatively, the alkyl iodide is oxidized to form iodate and the iodine liberated by addition of potassium iodide is titrated.

Zeise’s salt. $(Pt(C_2H_5)_2Cl_2)K$. Formed by adding potassium chloride to a solution of platinumous chloride saturated with ethylene.

“Zelan” [Du Pont]. TM for a line of durable, water-repellent textile finishes.

“Zelcon” SL [Du Pont]. TM for a quaternized, long-chain, complex amine condensation product used as a fabric softener and conditioner for compounding into home laundry softeners.

“Zelec” [Du Pont]. TM for a series of antistatic agents, both durable and nondurable.

“Zenite” [Du Pont]. TM for a group of rubber accelerators based on zinc salt of 2-mercaptobenzothiazole, with or without various modifying agents.

zeolite. A natural hydrated silicate of aluminum and either sodium or calcium or both, of the type $Na_xO \cdot Al_2O_3 \cdot xSiO_2 \cdot xH_2O$. Both natural and artificial zeolites are used extensively for water softening, as detergent builders, and cracking catalysts. For the former purpose the sodium or potassium compounds are required, since their usefulness depends on the cationic exchange of the sodium of the zeolite for the calcium or magnesium of hard water. When the zeolite has become saturated with calcium or magnesium ion it is flooded with strong salt solution, a reverse exchange of cations takes place and the material is regenerated. The natural zeolites are analcite, chabazite, heulandite, natrolite, stilbite, and thomsonite.

Synthetic zeolites are made either by a gel process (sodium silicate and alumina) or a clay process (ka-

olin), which forms a matrix to which the zeolite is added. These processes are quite complex, involving substitution of various rare-earth oxides. The effectiveness of zeolites depends on their pore size, which may be as small as 4–5 Å. Other applications of zeolites are as adsorbents, desiccants, and in solar collectors, where they function as both heating and cooling agent. See molecular sieve; aluminosilicate; ion-exchange resin; cage zeolite.

“Zepar” BP [Du Pont]. TM for a reducing agent based on sodium hydrosulfite.

Use: Bleaching agent for groundwood pulp, unbleached pulp, and old papers.

“Zepel” [Du Pont]. TM for a fluorocarbon textile finish used as a durable oil and water repellent.

Zerewitinoff determination. The reaction of methylmagnesium iodide with an active hydrogen-containing compound provides methane, which can be measured quantitatively by the increase in volume of the system at constant pressure.

Zerewitinoff reagent. Solution of methylmagnesium iodide in purified *n*-butyl ether. A clear, light-colored liquid that reacts rapidly with moisture and oxygen.

Use: Analytical reagent for active hydrogen atoms in organic compounds; also to determine water, alcohols, and amines in inert solvents.

“Zerlate” [Du Pont]. TM for a wettable fungicide powder containing 75% ziram.

Hazard: Irritant to eyes and mucous membranes.

“Zerlon” [Dow]. TM for a methyl methacrylate-styrene copolymer.

Use: Plastic molding material.

zero gravity. See space, chemistry in.

zero group. See group (1).

zereth law (of thermodynamics). Two bodies that have been shown to be individually in equilibrium with a third body will be in equilibrium when placed in contact with each other, that is, they will have the same temperature (H. Reiss).

“Zeset” [Du Pont]. TM for a fiber-reactant resin for crease resistance and dimensional stabilization of textiles.

zeta potential. (electrokinetic potential). The potential across the interface of all solids and liquids. Specifically, the potential across the diffuse layer of ions surrounding a charged colloidal particle, which is largely responsible for colloidal stability. Discharge of the zeta potential, accompanied by precipitation of the colloid, occurs by addition of

polyvalent ions of sign opposite to that of the colloidal particles. Zeta potentials can be calculated from electrophoretic mobilities, i.e., the rates at which colloidal particles travel between charged electrodes placed in the solution.

See electric double layer.

Zewail, Ahmed H. (1946–). Awarded Nobel Prize in chemistry in 1999 for showing that it is possible with rapid laser technique to see how atoms in a molecule move during a chemical reaction using femtosecond spectroscopy. He performs his research at the California Institute of Technology in Pasadena.

Ziegler catalyst. A type of stereospecific catalyst, usually a chemical complex derived from a transition metal halide and a metal hydride or a metal alkyl. The transition metal may be any of those in groups IV to VIII of the periodic table; the hydride or alkyl metals are those of groups I, II, and III. Typically, titanium chloride is added to aluminum alkyl in a hydrocarbon solvent to form a dispersion or precipitate of the catalyst complex. These catalysts usually operate at atmospheric pressure and are used to convert ethylene to linear polyethylene and also in stereospecific polymerization of propylene to crystalline polypropylene (Ziegler process). See Natta catalyst.

Ziegler, Karl. (1898–1973). A German chemist who won the Nobel Prize for chemistry in 1963 with Natta. A great deal of work was concerned with the chemistry of carbon compounds and development of plastics. A recipient of the Swinburne medal from the Plastics Institute of London in 1964. After studying at Marburg he was a professor at Heidelberg.

Ziegler method. Cyclization of dinitriles at high dilution in dialkyl ether in the presence of ether-soluble metal alkylamide and hydrolysis of the resultant imino-nitrile with formation of macrocyclic ketones in good yields.

Ziegler-Natta polymerization. Polymerization of vinyl monomers under mild conditions using aluminum alkyls and TiCl₄ (or other transition element halide) catalyst to give a stereoregulated, or tactic, polymer. These polymers, in which the stereochemistry of the chain is not random, have very useful physical properties.

“Zimate.” TM for zinc dimethyldithiocarbamate.

See ziram.

Zimmermann reaction. The reaction that occurs between methylene ketones and aromatic polynitro compounds in the presence of alkali. When applied to 17-oxosteroids, the colored compounds formed can be used for the quantitative determination of 17-oxosteroids.

zinc.

CAS: 7440-66-6. Zn. Metallic element of atomic number 30, group IIB of the periodic table, aw 65.38, valence of 2; five stable isotopes.

Properties: Shining white metal with bluish-gray luster (called spelter). Not found native. D 7.14, mp 419C, bp 907C, malleable at 100–150C, strongly electropositive, zinc foil will ignite in the presence of moisture. Soluble in acids and alkalis; insoluble in water.

Source: British Columbia, Mexico, U.S. (Colorado), Australia, Belgium.

Derivation: Extracted from ores by two distinct methods, both starting with zinc oxide formed by roasting the ores: (1) the pyrometallurgical or distillation process wherein the zinc oxide is reduced with carbon in retorts from which the resultant zinc is distilled and condensed; and (2) the hydrometallurgical or electrolytic process wherein the zinc oxide is leached from the roasted or calcined material with sulfuric acid to form zinc sulfate solution, which is electrolyzed in cells to deposit zinc on cathodes.

Grade: Special high-grade (99.990%), high-grade (99.95%), intermediate (99.5%), brass special (99%), prime western (98%).

Available forms: Slab, rolled (strip, sheet, rod, tubing), wire, mossy zinc, zinc dust powder (99% pure), single crystals, zinc anodes.

Hazard: (dust) Flammable, dangerous fire and explosion risk.

See zinc dust.

Use: Alloys (brass, bronze, and die-casting alloys), galvanizing iron and other metals, electroplating, metal spraying, automotive parts, electrical fuses, storage and dry-cell batteries, fungicides, nutrition (essential growth element), roofing, gutters, engravers' plates, cable wrappings, organ pipes.

See calamine; franklinite; hydrozincite; sphalerite; willemite.

zinc-65. Radioactive isotope of mass number 65.

Properties: Half-life 250 days, radiation β and γ .

Derivation: Pile irradiation of zinc metal and, in the cyclotron, by bombarding copper-65 with deuterons.

Available forms: Zinc metal and zinc chloride in hydrochloric acid solution.

Hazard: A radioactive poison.

Use: Tracer nuclide in study of wear in alloys, the nature of phosphor activators, galvanizing, function of traces of zinc in body metabolism, the functions of oil additives in lubricating oils, etc.

zinc abietate. See zinc resinatate.

zinc acetate.

CAS: 557-34-6. $\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, monoclinic, crystalline plates; pearly luster; faint acetous odor; astringent taste. D 1.735, loses $2\text{H}_2\text{O}$ at 100C, mp 200C (decomposes). Soluble in water and alcohol.

Derivation: Action of acetic acid on zinc oxide.

Use: Medicine (astringent), preserving wood, textile dyeing (mordant and resist), zinc chromate, laboratory reagent, cross-linking agent for polymers, ingredient of dietary supplements (up to 1 mg daily), feed additive, ceramic glazes.

zinc acetylacetonate.

$\text{Zn}[\text{OC}(\text{CH}_3)_2\text{CHCO}(\text{CH}_3)]_2$.

Properties: Crystalline solid. Mp 138C, bp (sublimes). Very soluble in benzene, acetone; decomposes in water.

Use: Catalyst in synthesis of long-chain alcohols and aldehydes, textile weighting agent.

“Zincalume” [ATOTECH]. TM for a bright zinc electroplating process for consumer's goods and military materials. The bath contains zinc cyanide, sodium cyanide, sodium hydroxide, and addition agents.

zinc ammonium chloride. $\text{ZnCl}_2 \cdot 2\text{NH}_4\text{Cl}$. A complex salt; double salts with 3–6 molecules of ammonium chloride have also been prepared.

Properties: White powder or crystals. D 1.8. Soluble in water.

Grade: Technical (foaming and nonfoaming).

Use: Welding, soldering flux, dry batteries, galvanizing.

zinc ammonium nitrite.

CAS: 63885-01-8. $\text{ZnNH}_4(\text{NO}_2)_3$.

Properties: White powder. Strong oxidizing agent. **Hazard:** Dangerous fire risk in contact with organic materials.

zinc antimonide. ZnSb_2 . Silvery-white crystals, d 6.33, mp 570C, decomposes in water.

Use: Thermoelectric devices.

Hazard: May be irritating to skin.

zinc arsenate. Various forms are known. The description following is for zinc orthoarsenate, $\text{Zn}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, odorless powder. D 3.31 (15C), loses $1\text{H}_2\text{O}$ at 100C. Insoluble in water; soluble in acids and alkalis.

Derivation: (1) Occurs in nature as mineral koettigite, (2) by reaction of a solution of sodium arsenate and a soluble zinc salt.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide, wood preservative.

zinc arsenite. (zinc metaarsenite; ZMA).

CAS: 10326-24-6. $\text{Zn}(\text{AsO}_2)_2$.

Properties: Colorless powder. Soluble in acids; insoluble in water. Federal specification TT-W-581 describes the composition of the solution used for wood preservation.

Hazard: Toxic by ingestion and inhalation. TLV: 10 mg/m³ of total dust when toxic impurities are not present, e.g., quartz <1%.

Use: Timber preservative, insecticide.

zinc bacitracin.

Properties: Creamy-white powder. Almost insoluble in water. Good thermal stability, usually has 50–60 units/mg of bacitracin activity.

Derivation: Action of zinc salts on bacitracin broth.

Grade: USP.

Use: Antibacterial agent in ointments, suppositories, etc.

zinc benzenesulfinate.

CAS: 24308-84-7. mf: $C_{12}H_{12}O_4S_2 \cdot Zn$.

Hazard: Moderately toxic by ingestion. A mild eye irritant.

zinc borate. **Typical composition:** zinc oxide 45%, B_2O_3 34%, may have 20% water of hydration.

Properties: White, amorphous powder. Zinc borate of composition $3ZnO \cdot 2B_2O_3$ has d 3.64, mp 980C. Soluble in dilute acids; slightly soluble in water. Nonflammable.

Derivation: Interaction of the oxides at 500–1000C or of zinc oxide slurries with solutions of boric acid or borax.

Use: Medicine, fireproofing textiles, fungistat and mildew inhibitor, flux in ceramics.

See "Firebrake ZB" [*U. S. Borax*].

zinc bromate. $Zn(BrO_3)_2 \cdot 6H_2O$.

Properties: White solid. D 2.566, mp 100C. Deliquescent, loses $6H_2O$ at 200C; very soluble in water.

Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.

zinc bromide. $ZnBr_2$.

Properties: White, hygroscopic, crystalline powder. D 4.219, mp 394C, bp 650C. Soluble in water, alcohol, and ether.

Derivation: Interaction of solutions of barium bromide and zinc sulfate, with subsequent crystallization.

Use: Photographic emulsions, manufacture of rayon. A solution of 80% zinc bromide is used as a radiation viewing shield.

zinc butylxanthate. $Zn(C_4H_9OCS_2)_2$.

Properties: White powder. D 1.45. Decomposes when heated; moderately soluble in benzene and ethylene dichloride; slightly soluble in acetone, insoluble in water and gasoline.

Use: Ultraaccelerator used in self-curing rubber cements.

See xanthate.

zinc cadmium sulfide. A fluorescent pigment, a phosphor.

Hazard: As for cadmium.

zinc caprylate. (zinc octanoate).

CAS: 557-09-5. $Zn(C_8H_{15}O_2)_2$.

Properties: Lustrous scales. Mp 136C, decomposes in moist atmosphere giving off caprylic acid. Slight-

ly soluble in boiling water; fairly soluble in boiling alcohol.

Derivation: By precipitation from a solution of ammonium caprylate with zinc sulfate.

Use: Fungicide.

zinc carbolate. See zinc phenate.

zinc carbonate.

CAS: 3486-35-9. $ZnCO_3$.

Properties: White, crystalline powder. D 4.42–4.45, evolves carbon dioxide at 300C. Soluble in acids, alkalis, and ammonium salt solutions; insoluble in water.

Derivation: (1) Grinding the mineral smithsonite, (2) action of sodium bicarbonate on a solution of a zinc salt.

Use: Ceramics, fireproofing filler for rubber and plastic compositions exposed to flame temperature, cosmetics and lotions, pharmaceuticals (ointments, dusting powders), zinc salts, medicine (topical anti-septic).

zinc chlorate.

CAS: 10361-95-2. $Zn(ClO_3)_2 \cdot 4H_2O$.

Properties: Colorless to yellowish crystals. Deliquescent, d 2.15, decomposes at 60C. Soluble in water, alcohol, glycerol, and ether.

Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.

zinc chloride.

CAS: 7646-85-7. $ZnCl_2$.

Properties: White, granular, deliquescent crystals or crystalline powder. D 2.91, mp 290C, bp 732C, a 10% solution is acid to litmus. Soluble in water, alcohol, glycerol, and ether.

Derivation: Action of hydrochloric acid on zinc or zinc oxide.

Method of purification: Recrystallization.

Grade: CP, technical; fused, crystals, granulated; 62.5% solution, 50% solution, USP.

Hazard: (Solid) skin irritant; (solution) severe irritant to skin and tissue. TLV: (fume) 1 mg/m³; STEL 2 mg/m³.

Use: Catalyst, dehydrating and condensing agent in organic synthesis, fireproofing and preserving food, soldering fluxes, burnishing and polishing compounds for steel, electroplating, antiseptic and deodorant preparations (up to 2% solution), textiles (mordant; carbonizing agent; mercerizing, sizing, and weighting compositions; resist for sulfur colors, albumin colors, and para red), adhesives, dental cements, glass etching, petroleum refining, parchment, dentifrices, embalming and taxidermists' fluids, medicine (astringent), antistatic, denaturant for alcohol.

zinc chloride, chromated. A mixture of zinc chloride and sodium dichromate used as a wood preservative. Federal specification TT-W-551 re-

quires that it contain no less than 77.5% zinc chloride and 17.5% sodium dichromate dihydrate.

zinc chloriodide. Mixture of zinc chloride and iodide.

Properties: White powder. Soluble in water.

Use: Disinfectant, pharmaceutical preparations.

zinc chromate. $\text{ZnCrO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Solid yellow pigment. Mw 307.6

Hazard: TLV: 0.01 mg/m³, confirmed human carcinogen.

Use: Pigments.

zinc cyanide.

CAS: 557-21-1. $\text{Zn}(\text{CN})_2$.

Properties: White powder. D 1.852, mp 800C (decomposes). Soluble in dilute mineral acids with production of hydrogen cyanide; soluble in alkalis; insoluble in water and alcohol.

Derivation: By precipitation of a solution of zinc sulfate or chloride with potassium cyanide.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation. TLV: 5 mg(CN)/m³.

Use: Metal plating, chemical reagent, insecticide.

zinc dialkyldithiophosphate. A lubricating-oil additive for corrosion resistance, wear resistance, antioxidant.

zinc dibenzylthiocarbamate.

$\text{Zn}[\text{SCS}(\text{C}_7\text{H}_7)_2]_2$.

Properties: White powder. D 1.41, melting range 165–175C. Moderately soluble in benzene and ethylene dichloride; insoluble in acetone, gasoline, and water.

Use: Accelerator for latex dispersions and cements.

zinc dibutylthiocarbamate.

CAS: 136-23-2. $\text{Zn}[\text{SC}(\text{S})\text{N}(\text{C}_4\text{H}_9)_2]_2$.

Properties: White powder; pleasant odor. D 1.24 (20/20C), melting range 104–108C. Soluble in carbon disulfide, benzene, and chloroform; insoluble in water.

Use: Accelerator for latex dispersions and cements, etc; ultra-accelerator for lubricating oil additive.

zinc *o,o*-dibutyl dithiophosphate.

CAS: 6990-43-8. mf: $\text{C}_{16}\text{H}_{36}\text{O}_4\text{P}_2\text{S}_4\text{Zn}$.

Hazard: Moderately toxic by ingestion. A mild skin and severe eye irritant.

zinc dichromate.

CAS: 7789-12-0. $\text{ZnCr}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Orange-yellow powder. Soluble in acids and hot water; insoluble in alcohol and ether.

Derivation: Action of chromic acid on zinc hydroxide.

Hazard: Toxic by ingestion and inhalation.

Use: Pigment.

zinc diethyl. See diethylzinc.

zinc diethyldithiocarbamate.

CAS: 14324-55-1. $\text{Zn}[\text{SC}(\text{S})\text{N}(\text{C}_2\text{H}_5)_2]_2$.

Properties: White powder. D 1.47 (20/20C), melting range 172–176C. Soluble in carbon disulfide, benzene, and chloroform; insoluble in water.

Hazard: Strong irritant to eyes and mucous membranes.

Use: Rubber vulcanization accelerator, especially for latex foam; heat stabilizer for polyethylene.

zinc dimethyldithiocarbamate. See ziram.

zinc dimethyldithiocarbamate

cyclohexylamine complex. (zinc dithioamine complex).

Properties: White powder or slurry of low solubility.

Hazard: Toxic by ingestion.

Use: Fungicide, rodent poison, deer and rabbit repellent.

zinc dioxide. See zinc peroxide.

zinc dithionite. See zinc hydrosulfite.

zinc dust. A gray powder.

Grade: Commercial, pigment.

Hazard: Dangerous fire risk; may form explosive mixture with air; in bulk when damp, may heat and ignite spontaneously on exposure to air.

Use: Zinc salts and other zinc compounds, reducing agent, precipitating agent, purifier, catalyst, rust-resistant paints, bleaches, pyrotechnics, soot removal, pipe-thread compounds, sherardizing, decorative effect in resins, autobody coatings.

zinc ethyl. See diethylzinc.

zinc ethylenebisdithiocarbamate. See zineb.

zinc-2-ethylhexoate. See zinc octoate.

zinc ethylsulfate. $\text{Zn}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, hygroscopic, crystalline leaflets. Soluble in water and alcohol.

Derivation: Interaction of zinc hydroxide and diethyl sulfate.

Use: Organic synthesis.

zinc-finger protein. A secondary feature of some proteins containing a zinc atom; a DNA-binding protein.

zinc fluoride.

CAS: 7783-49-5. ZnF_2 .

Properties: White powder. D 4.84 (15C), mp 872C, bp about 1500C. Soluble in hot acids; slightly soluble in water; insoluble in alcohol.

Derivation: (1) Action of hydrogen fluoride on zinc

hydroxide, (2) addition of sodium fluoride to a solution of zinc acetate.

Grade: Technical, 95% pure.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Phosphors, ceramic glazes, wood preserving, electroplating, organic fluorination.

zinc fluoroborate. $Zn(BF_4)_2$.

Properties: Colorless liquid. Handled as 40 or 48% solution.

Use: Plating and bonderizing, resin curing.

zinc fluorosilicate. (zinc silicofluoride).

CAS: 16871-71-9. $ZnSiF_6 \cdot 6H_2O$.

Properties: White crystals. D 2.104. Decomposes on heating; soluble in water.

Derivation: Reaction of zinc oxide and fluosilicic acid.

Use: Concrete hardener, laundry sour, preservative, moth-proofing agents.

zinc formaldehyde sulfoxylate.

$Zn(HSO_2 \cdot CH_2O)_2$ (normal);

$Zn(OH)(HSO_2 \cdot CH_2O)$ (basic).

Properties: Rhombic prisms. Very soluble in water (normal) (basic is insoluble in water); insoluble in alcohol; decomposes in acid.

Derivation: Reaction of formaldehyde and zinc sulfoxylate.

Grade: Basic, normal.

Hazard: Toxic by ingestion.

Use: Stripping and discharging agent for textiles. See hydrosulfite-formaldehyde.

zinc formate. $Zn(CH_2O)_2 \cdot 2H_2O$.

Properties: White crystals. D 2.207 (20C). Loses 2H₂O at 140C. Soluble in water; insoluble in alcohol.

Derivation: Action of formic acid on zinc hydroxide.

Hazard: Toxic by ingestion.

Use: Catalyst for production of methanol, water-proofing agent, textiles, antiseptic.

zinc gluconate.

CAS: 468-02-4. $C_{12}H_{22}O_4Zn$

Properties: White granular or crystalline powder. Sol in water; very sltly sol in alc.

Use: Dietary supplement and food additive, vitamin tablets.

zinc green. One of a group of brilliant green pigments consisting of a mixture of Prussian blue and zinc yellow. They are permanent to light but not to alkali or water.

Use: Flat wall paints and interior work.

zinc hydrosulfite. (zinc dithionite).

CAS: 7779-86-4. (ZnS_2O_4) .

Properties: White, amorphous solid. Soluble in water.

Grade: Technical.

Use: Brightening groundwood, kraft, and other paper

pulps; to treat beet and cane sugar juices; depressant in mining flotations; bleaching textiles, vegetable oils, straw, hemp, vegetable tannins, animal glue, etc.

zinc hydroxide. $Zn(OH)_2$.

Properties: Colorless crystals. D 3.053. Decomposes at 125C. Almost insoluble in water; forms both zinc salts and zincates.

Derivation: Addition of a strong alkali to a solution of a zinc salt.

Use: Intermediate, absorbent in surgical dressings, rubber compounding.

zinc hypophosphite. $Zn(H_2PO_2)_2 \cdot H_2O$.

Properties: White, hygroscopic crystals. Soluble in water and alkalis.

Derivation: Action of hypophosphorous acid on zinc hydroxide.

zinc iodide. ZnI_2 .

Properties: Hygroscopic, white, crystalline powder; sharp saline taste. Turns brown on exposure to light or air. D 4.67, mp 446C, bp 625C (decomposes). Soluble in water, alcohol, and alkalis.

Derivation: Interaction of barium iodide and zinc sulfate, with subsequent crystallization.

Use: Medicine (topical antiseptic), analytical reagent.

Zincke disulfide cleavage. Formation of sulphenyl halides by three essentially similar methods involving the action of chlorine or bromine on aryl disulfides, thiophenols, or arylbenzyl sulfides.

Zincke nitration. Replacement of *o*- or *p*-bromine or iodine atoms (but not fluorine or chlorine atoms) in phenols by a nitro group on treatment with nitrous acid or a nitrite in acetic acid.

Zincke-Suhl reaction. Phenol-dienone rearrangement of *p*-cresols by addition of carbon tetrachloride in the presence of aluminum chloride, with formation of 4-methyl-4-trichloromethylcyclohexa-2,5-dienone.

zinc lactate. $Zn(C_3H_5O_3)_2 \cdot 3H_2O$.

Properties: White crystals. Soluble in water. Combustible.

Derivation: Action of lactic acid on zinc hydroxide.

zinc laurate. $Zn(C_{12}H_{23}O_2)_2$.

Properties: White powder. Mp 128C. Almost insoluble in water and alcohol. Combustible.

Derivation: Precipitation of a soluble coconut oil soap with a solution of a zinc salt.

Use: Paints, varnishes, rubber compounding (softener and activator).

zinc linoleate. $Zn(C_{17}H_{31}COO)_2$.

Properties: Brown solid containing 8.5–9.5% zinc. Combustible.

Derivation: Precipitation from solutions of sodium linoleate and soluble zinc salt, or by fusion of the fatty acid and zinc oxide.

Use: Paint drier, especially with cobalt and manganese soaps.

zinc malate. $\text{Zn}(\text{OOCCH}_2\text{CH}_2\text{OCOO})\cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water. Combustible.

Derivation: Action of malic acid on zinc hydroxide.

zinc-2-mercaptobenzothiazole.

Use: Rubber accelerator, fungicide.

zinc methionine sulfate.

CAS: 56329-42-1.

Properties: White powder. Freely sol in water.

Use: Food additive.

zinc molybdate. $\text{ZnMoO}_4\cdot 2\text{H}_2\text{O}$.

Properties: Solid. D 3.3, mp 1650C. Insoluble in water.

Use: Anticorrosion agent, starting material for growing single crystals.

zinc naphthenate. $\text{Zn}(\text{C}_6\text{H}_5\text{COO})_2$.

Properties: Amber, viscous, basic liquid or basic solid. The liquid contains 8–10% zinc, the solid contains 16% zinc. Very soluble in acetone. Combustible.

Derivation: Fusion of zinc oxide or hydroxide and naphthenic acid or precipitation from mixture of soluble zinc salts and sodium naphthenate.

Use: Drier and wetting agent in paints, varnishes, resins; insecticide; fungicide; mildew preventive; wood preservative; waterproofing textiles; insulating materials.

zinc nitrate.

CAS: 7779-88-6. $\text{Zn}(\text{NO}_3)_2\cdot 6\text{H}_2\text{O}$.

Properties: Colorless lumps or crystals. D 2.065 (13C), mp 36.4C, loses water of crystallization between 105 and 131C. Soluble in water and alcohol.

Derivation: Action of nitric acid on zinc or zinc oxide.

Hazard: Dangerous fire and explosion risk, strong oxidizing agent.

Use: Acidic catalyst, latex coagulant, reagent, intermediate, mordant.

zinc octanoate. See zinc caprylate.

zinc octoate. (zinc-2-ethylhexoate).

Properties: Light-straw-colored, viscous liquid. D 1.16. Insoluble in water; soluble in hydrocarbon solvents. Combustible.

Use: Catalyst.

zinc oleate.

CAS: 557-07-3. $\text{Zn}(\text{C}_{17}\text{H}_{33}\text{COO})_2$.

Properties: Dry, white to tan, greasy, granular powder containing 8.5–10.5% zinc. Mp 70C. Soluble in alcohol, ether, carbon disulfide, ligroin; insoluble in water. Combustible.

Derivation: Interaction of solutions of zinc acetate and sodium oleate or by fusion of zinc oxide and oleic acid.

Use: Paints, resins, and varnishes (drier).

“Zinc Omadine” [Olin].

CAS: 13463-41-7. TM for zinc pyrrhione.

Properties: Powder.

Use: Additive in antidandruff preparations, preservation of cosmetics, metalworking fluids, inhibition of bacterial and fungal growth on fabric.

“Zincon” [LaMotte]. TM for 2-carboxy-2'-hydroxy-5'-sulfoformazylbenzene.

Use: In colorimetric determination of zinc and copper.

zinc orthoarsenate. See zinc arsenate.

zinc orthophosphate. See zinc phosphate.

zinc orthosilicate. See zinc silicate.

zinc oxalate. $\text{ZnC}_2\text{O}_4\cdot 2\text{H}_2\text{O}$.

Properties: White powder. D 2.562 (24C), mp 100C. Soluble in acids and alkalies; slightly soluble in water. (decomposes), combustible.

Derivation: Interaction of zinc sulfate and sodium oxalate.

Use: Zinc oxide, organic synthesis.

zinc oxide. (Chinese white; zinc white).

CAS: 1314-13-2. ZnO .

Properties: Coarse white or grayish powder; odorless; bitter taste. Absorbs carbon dioxide from the air. Has greatest UV absorption of all commercial pigments. D 5.47, mp 1975C. Soluble in acids and alkalies; insoluble in water and alcohol. Non-combustible.

Derivation: (1) Oxidation of vaporized pure zinc (French process), (2) roasting of zinc oxide ore (franklinite) with coal and subsequent oxidation with air, (3) similar treatment starting with other ores, (4) oxidation of vapor-fractionated die castings.

Grade: American process, lead-free; French process; lead-free; green seal; red seal; white seal (according to fineness); leaded (white lead sulfate); USP; single crystals.

Hazard: Zinc oxide fume is harmful by inhalation. Zinc oxide powder reacts violently with chlorinated rubber at 215C. TLV: (fume) 5 mg/m³.

Use: Accelerator activator, pigment and reinforcing agent in rubber, ointments, pigment and mold-growth inhibitor in paints, UV absorber in plastics, ceramics, floor tile, glass, zinc salts, feed additive, dietary supplement, seed treatment, cosmetics, photoconductor in office copying machines and in color

photography, piezoelectric devices, artists' colorant.

zinc oxychloride. A saturated solution of zinc chloride and zinc oxide.

Use: Dentistry.

zinc palmitate. $Zn(C_{16}H_{31}O_2)_2$.

Properties: White, amorphous powder. D 1.121, mp 100C. Insoluble in water and alcohol; slightly soluble in benzene and toluene. Combustible.

Use: Flattening agent in lacquer, pigment suspending agent for paints, rubber compounding, lubricant in plastics.

zinc perborate. $Zn(BO_3)_2$ with water of hydration.

Properties: Amorphous white powder. Insoluble in water but slowly decomposed by it, liberating hydrogen peroxide.

Derivation: Interaction of sodium peroxide, boric acid, and zinc salt, or of boric acid and zinc peroxide.

Hazard: Fire risk when wet, in contact with organic materials.

Use: Medicine, oxidizing agent.

zinc permanganate.

CAS: 23414-72-4. $Zn(MnO_4)_2 \cdot 6H_2O$.

Properties: Violet-brown or black, hygroscopic crystals. D 2.47, loses $5H_2O$ at 100C. Decomposes on exposure to light and air; soluble in water and acids; decomposes in alcohol.

Grade: Technical (95% pure).

Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.

Use: Oxidizing agent, medicine (antiseptic).

zinc peroxide. (zinc dioxide).

CAS: 1314-22-3. ZnO_2 .

Properties: White powder containing 45–60% ZnO_2 , balance ZnO. D 1.571, decomposes rapidly above 150C. Decomposes in acids, alcohol, acetone; insoluble in water but decomposed by it.

Derivation: Action of barium peroxide on zinc sulfate solution, followed by filtration.

Grade: USP (mixture of peroxide, carbonate, and hydroxide), technical 50–60%.

Hazard: Severe explosion risk when heated; explosive range 190–212C. Fire risk in contact with organic materials; strong oxidizing agent.

Use: Curative for rubber and elastomers, pharmaceuticals, high-temperature oxidation.

zinc-*o*-phenanthroline complex.

CAS: 16561-55-0. mf: $C_{12}H_8N_2 \cdot Zn$.

Hazard: A reproductive hazard.

zinc phenate. (zinc carbolate; zinc phenolate). $Zn(C_6H_5O)_2$. (May be only a mixture of zinc oxide and phenol).

Properties: White powder. Soluble in alcohol; slightly soluble in water. Combustible.

Derivation: By heating zinc hydroxide with phenol and extracting with alcohol.

Hazard: Toxic by ingestion.

Use: Insecticide.

zinc-1,4-phenolsulfonate. (zinc sulfophenate; zinc sulfocarbolate).

CAS: 127-82-2. $Zn(SO_3C_6H_4OH)_2 \cdot 8H_2O$.

Properties: Colorless, transparent crystals or white granular powder; odorless; astringent metallic taste. Effloresces in air, turns pink on exposure to air and light. Loses water of crystallization at 120C; soluble in water and alcohol.

Derivation: By heating zinc hydroxide with *p*-phenolsulfonic acid.

Grade: Technical.

Hazard: Toxic by ingestion.

Use: Insecticide, medicine (antiseptic).

zinc phosphate. (zinc orthophosphate; zinc phosphate, tribasic). $Zn_3(PO_4)_2$.

Properties: White powder. D 3.998 (15C), mp 900C. Soluble in acids and ammonium hydroxide; insoluble in water.

Derivation: Interaction of zinc sulfate and trisodium phosphate.

Grade: Technical, 98% pure.

Use: Dental cements; phosphors; conversion coating of steel, aluminum, and other metal surfaces.

zinc phosphide.

CAS: 1314-84-7. Zn_3P_2 .

Properties: Dark gray, gritty powder. D 4.55 (15C), mp above 420C, stable if dry. Insoluble in alcohol; soluble in acids; decomposes in water.

Derivation: By passing phosphine into a solution of zinc sulfate.

Grade: Technical, 80–85% pure.

Hazard: Reacts violently with oxidizing agents, produces toxic and flammable phosphine by reaction with acids. Toxic by ingestion. A deadly poison.

Use: Rodenticide.

zinc potassium chromate. See zinc yellow.

zinc potassium iodide. See potassium zinc iodide.

zinc propionate. $Zn(OOCC_2H_5)_2$.

Properties: Platelets, tablets, or needlelike crystals. Fairly soluble in water; slightly soluble in alcohol; decomposes in moist atmosphere liberating propionic acid. Combustible.

Derivation: By dissolving zinc oxide in dilute propionic acid and concentrating the solution.

Use: Fungicide on adhesive tape.

zinc-1,2-propylene bisdithiocarbamate.

See propineb.

zinc pyrithione. See "Zinc Omadine" [*Olin*].

zinc pyrophosphate. $\text{Zn}_2\text{P}_2\text{O}_7$.

Properties: White powder. D 3.756 (23C). Soluble in acids and alkalis; insoluble in water.

Use: Pigment.

zinc resinate.

Properties: Powder, clear amber lumps, or yellowish liquid. May be acidic, basic, or neutral; soluble in some organic solvents (ether, amyl alcohol). Combustible. Chief constituent: zinc abietate.

Derivation: By fusion of zinc oxide and rosin or by precipitation from solutions of zinc salts and sodium resinate.

Use: Wetting, dispersing, and hardening agent; drier in paints, varnishes, and resins.

zinc rhodanide. See zinc thiocyanate.**zinc ricinoleate.**

Properties: Fine white powder; faint fatty acid odor. Mp 92–95C, d 1.10 (25/25C). Combustible.

Use: Fungicide, emulsifier, greases, lubricants, waterproofing, lubricating-oil additive, stabilizer in vinyl compounds.

zinc salicylate. $\text{Zn}[\text{C}_6\text{H}_4(\text{OH})\text{COO}]_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystalline needles or powder. Soluble in water and alcohol. Combustible.

Derivation: By heating zinc hydroxide and salicylic acid.

Use: Medicine (antiseptic).

zinc selenide. ZnSe .

Properties: Yellowish to reddish crystals. D 5.42 (15/4C), mp above 1100C. Insoluble in water.

Hazard: Fire risk in contact with water or acids.

Use: Windows in infrared optical equipment, phosphor.

zinc silicate. (zinc orthosilicate). Zn_2SiO_4 .

Properties: White crystals. D 4.103, mp 1509C. Insoluble in water.

Use: Phosphors, spray ingredients, to remove traces of copper from gasoline.

See willemite.

zinc silicofluoride. See zinc fluorosilicate.

zinc-silver oxide battery. Primary or secondary battery used where space and weight are critical, i.e., in missiles. The battery has large energy output for its weight, but the components are expensive and the cycle life is short. To avoid deterioration, potassium hydroxide electrolyte is added just before use.

See battery.

zinc stearate.

CAS: 557-05-1. $\text{Zn}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$. Percentage of zinc may vary according to intended use, some products being more basic than others.

Properties: (Pure substance) White, hydrophobic powder free from grittiness; faint odor. D 1.095, mp 130C. Soluble in acids and common solvents when hot; insoluble in water, alcohol, and ether. Combustible.

Derivation: Action of sodium stearate on solution of zinc sulfate.

Grade: USP, technical, available free from chick edema factor.

Use: Cosmetics, lacquers, ointments, dusting powder, lubricant, mold-release agent, filler, antifoamer, heat and light stabilizer, medicine (dermatitis), tablet manufacture, dietary supplement.

zinc sulfate. (white vitriol; white copperas; zinc vitriol).

CAS: 7733-02-0. $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Colorless crystals, small needles, or granular, crystalline powder; without odor; astringent, metallic taste. Efflorescent in air. Solutions acid to litmus. D 1.957 (25/4C), mp 100C, loses $7\text{H}_2\text{O}$ at 280C. Soluble in water and glycerol; insoluble in alcohol.

Derivation: (1) Roasting zinc blend and lixiviating with subsequent purification, (2) action of sulfuric acid on zinc or zinc oxide.

Grade: Technical, USP, reagent.

Use: Rayon manufacture, dietary supplement, animal feeds, mordant, wood preservative, analytical reagent.

zinc sulfate monohydrate. $\text{ZnSO}_4 \cdot \text{H}_2\text{O}$.

Properties: White, free-flowing powder. Soluble in water; insoluble in alcohol.

Use: Rayon manufacture, agricultural sprays, chemical intermediate, dyestuffs, electroplating.

zinc sulfide. ZnS . Exists in two crystalline forms, α (wurtzite) and β (sphalerite).

Properties: Yellowish-white powder. Stable if kept dry. α : d 3.98. β : d 4.102, changes to α form at 1020C. Sublimes at 1180C. Soluble in acids; insoluble in water.

Derivation: By passing hydrogen sulfide gas into a solution of a zinc salt.

Grade: Technical, CP, fluorescent or luminous, single crystals.

Use: Pigment, white and opaque glass, base for color lakes, rubber, plastics, dyeing (hydrosulfite process), ingredient of lithopone, phosphor in X-ray and television screens, luminous paints, fungicide.

zinc sulfite. $\text{ZnSO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. Absorbs oxygen from the air to form sulfate. Loses $2\text{H}_2\text{O}$ at 100C; decomposes at 200C. Soluble in sulfurous acid; insoluble in cold water and alcohol; decomposes in hot water.

Derivation: Action of sulfurous acid on zinc hydroxide.

Use: Preservative for anatomical specimens.

zinc sulfocarbolate. See zinc phenolsulfonate.

zinc sulfocyanate. See zinc thiocyanate.

zinc sulfophenate. See zinc phenolsulfonate.

zinc sulfoxylate. ZnSO_2 .

Properties: White, crystalline powder. Decomposed by heat; salt of unstable sulfoxylic acid (H_2SO_2). A strong reducing agent.

Derivation: Action of zinc and sulfur dioxide in ethereal solution or of sulfur dioxide on granulated zinc in absolute alcohol.

Use: Stripping agent in dyeing.

zinc telluride. ZnTe .

Properties: Reddish crystals. D 6.34 (15C), mp 1238C. Decomposes in water. Single crystals available for phosphors.

Derivation: Reaction of zinc oxide and tellurium powder in alkaline solution.

Use: Semiconductor research, photoconductor.

zinc thiocyanate. (zinc rhodanide; zinc sulfocyanate). $\text{Zn}(\text{CNS})_2$.

Properties: White, hygroscopic powder or crystals. Soluble in water, alcohol, and ammonium hydroxide.

Derivation: Interaction of zinc hydroxide and ammonium thiocyanate.

Grade: Technical, solution, reagent, ACS.

Use: Analytical chemistry, swelling agent for cellulose esters, dyeing assistant.

zinc thiophenate. A coined name for a class of peptizing agents for natural and synthetic rubbers; a typical example is the *tert*-butylphenyl sulfide [$(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{S}$] $_2\text{Zn}$.

zinc undecylenate. $[\text{CH}_2\text{CH}(\text{CH}_2)_8\text{COO}]_2\text{Zn}$.

Properties: White, amorphous powder. Mp 115–116C. Nearly insoluble in water and alcohol. Combustible.

Grade: NF.

Use: Medicine (fungistat), cosmetics, chemical intermediate.

zinc white. See zinc oxide.

zinc yellow. (citron yellow; buttercup yellow; zinc potassium chromate; zinc chrome).

CAS: 11103-86-9. $4\text{ZnO}\cdot 4\text{CrO}_3\cdot \text{K}_2\text{O}\cdot 3\text{H}_2\text{O}$.

Properties: Greenish-yellow pigment of comparatively low tinting strength. Partially water soluble.

Derivation: Reaction of a solution of potassium dichromate with zinc oxide and sulfuric acid.

Hazard: Toxic by ingestion.

Use: Rust-inhibiting paints, artists' color.

zinc zirconium silicate. $\text{ZnO}\cdot \text{ZrO}_2\cdot \text{SiO}_2$.

Properties: White powder. D 4.8, bulk d 115 lb/cu ft,

mp 2100C. Soluble in hydrogen fluoride; insoluble in water and alkalis; slightly soluble in mineral acids and hot concentrated sulfuric acid. Noncombustible.

Use: Opacifier for ceramic glazes.

zineb. (zinc ethylenebis[dithiocarbamate]).

CAS: 12122-67-7. $\text{Zn}(\text{CS}_2\text{NHCH}_2)_2$.

Properties: Light-tan solid. Insoluble in water; soluble in pyridine; decomposes on heating.

Derivation: Reaction of sodium ethylenebisdithiocarbamate with zinc sulfate or other zinc salts. In practical application as a fungicide these reactants are mixed in the presence of lime; the zineb is not formed until after reaction of the carbon dioxide of the air with the film of the other chemicals on the leaf or fruit.

Grade: Commercial dusts and wettable powders usually contain 65% active material.

Hazard: Toxic by inhalation and ingestion; irritant to eyes and mucous membranes.

Use: Insecticide and fungicide.

zingerone. (4-[4-hydroxy-3-methoxyphenyl]-2-butanone).

CAS: 122-48-5. $\text{HOC}_6\text{H}_4(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{COCH}_3$.

Properties: Crystals. Mp 40–41C. Soluble in ether; sparingly soluble in water and petroleum ether.

Use: Flavoring.

“Zin-O-Lyte” [Du Pont]. TM for a series of electroplating products for use in zinc cyanide plating baths.

“Zinophos” [Cytec]. TM for a soil insecticide and nematocide whose active ingredient is thionazin.

“Zinpol” [Zinchem]. TM for shellac.

Available forms: Flake, powder, and solution.

Use: Ink, coatings, confectionary, pharmaceutical, and industrial processing.

ziram. (zinc dimethyldithiocarbamate).

CAS: 137-30-4. $\text{Zn}(\text{SCSNCH}_3\text{CH}_3)_2$.

Properties: White and odorless when pure. D 1.71, mp 246C. Almost insoluble in water; soluble in acetone, carbon disulfide, chloroform, dilute alkalis, and concentrated hydrochloric acid.

Derivation: Reaction of sodium dimethyldithiocarbamate with a soluble zinc salt in aqueous solution.

Grade: 76% wettable powder, 90% technical powder.

Hazard: Strong irritant to eyes and mucous membranes.

Use: Fungicide, rubber accelerator.

“Zircaloy.” TM for alloys of zirconium with low percentages of antimony, iron, chromium, and nickel.

Use: Cladding for nuclear fuel elements and other reactor applications.

“Zircat” [Degussa].

CAS: 7440-67-7. TM for a zirconium catalyst.

Use: Waterborne coatings.

“Zirco” [AKZO].

TM for an oil-soluble polymeric zirconyl complex in odorless mineral spirits. Not a paint drier in itself; has synergistic action on metallic driers.

“Zircofrax” [Carborundum].

TM for super-refractory products from zirconium oxide and zirconium silicate.

Properties: High heat resistance, great strength, high thermal conductivity, high resistance to attack by acids and acid slags, porosity about 25%, low permeability.

Use: Bricks and special shapes for ceramic kiln furniture and in chemical and metallurgical furnaces.

zircon.

CAS: 14940-68-2. $ZrSiO_4$ or $ZrO_2 \cdot SiO_2$. A natural zirconium silicate, represents 60–70% of all zirconium used.

Properties: Brown, gray, red, or colorless; adamantine luster. Mohs hardness 7.5, d 4.68. Insoluble in acids.

Occurrence: Georgia, Florida, Australia, Brazil.

Use: Source of zirconium oxide, metallic zirconium, and hafnium; abrasive; refractories; enamels; refractory porcelain; catalyst; silicone rubbers; foundry cores.

zirconia. See zirconium oxide.

zirconic anhydride. See zirconium oxide.

zirconium.

CAS: 7440-67-7. Zr. Metallic element of atomic number 40, group IVB of the periodic table, aw 91.22, valences of 2, 3 (halogens only) 4; five stable isotopes.

Properties: Hard, lustrous, grayish, crystalline scales or gray amorphous powder. D 6.4, mp 1850C, bp 4377C. Soluble in hot, very concentrated acids; insoluble in water and cold acids. Corrosion resistant, low neutron absorption.

Source: Zircon, baddeleyite (zirconia).

Derivation: The ore is converted to a cyanonitride and is chlorinated to obtain zirconium tetrachloride. This is reduced with magnesium (Kroll process) in inert atmosphere. The metal can be prepared in a highly pure and ductile form by vapor-phase decomposition of the tetraiodide. Hafnium must be removed for uses in nuclear reactors

See hafnium.

Grade: Plate, strip, bars, wire, sponge and briquettes, powder, foil, technical, pure (hafnium free), single crystals.

Hazard: Flammable and explosive as dust or powder and in form of borings, shavings, etc. A suspected carcinogen. Not permitted in cosmetics (FDA). TLV: 5 mg(Zr)/m³ (applies to all Zr compounds).

Powder should be kept wet in storage and protective clothing should be worn.

Use: Coating nuclear fuel rods, corrosion-resistant alloys, photo flashbulbs (foil), pyrotechnics, metal-to-glass seals, special welding fluxes, getter in vacuum tubes, explosive primers, acid manufacturing plants, deoxidizer and scavenger in steel manufacturing, laboratory crucibles, spinnerettes.

zirconium-95.

Radioactive zirconium of mass number 95.

Properties: Half-life 63 days, radiation β and γ .

Derivation: Obtained in a mixture with niobium from the fission products of nuclear reactor fuels.

Available forms: Zirconium oxalate complex in oxalic acid solution.

Hazard: Radioactive poison.

Use: To trace the flow of petroleum products in pipelines, to measure rate of catalyst circulation in petroleum cracking plants, to study the cracking and polymerization of hydrocarbons with various catalysts, etc.

zirconium acetate.

$H_2ZrO_2(C_2H_3O_2)_2$.

Properties: (1) Available as aqueous solution, 22% ZrO_2 . Clear to pale-amber liquid. D 1.46, pH 3.8–4.2 (20C), fp -7C, stable at room temperature. (2) Available as 13% ZrO_2 (aqueous solution). D 1.20 (approx.), pH 3.3–4.0 (20C), stable at room temperature but temperature of hydrolysis decreases with pH; undergoes exchange with anion-exchange resins but not with cation exchangers.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Preparation of water repellents, other chemicals.

zirconium acetylacetonate.

See zirconium tetraacetylacetonate.

zirconium ammonium fluoride.

(ammonium zirconifluoride). $Zr(NH_4)_2F_6$.

Properties: White crystals. Soluble in water.

Hazard: Irritant. TLV: 5 mg(Zr)/m³.

zirconium anhydride.

See zirconium oxide.

zirconium boride.

(zirconium diboride).

ZrB_2 .

Properties: Gray metallic crystals or powders. D 6.085, mp 3000C, Mohs hardness 8, electrical resistivity 9.2 micro-ohm-cm (20C), excellent thermal shock resistance, poor oxidation resistance above 1100C.

Hazard: TLV: 5 mg(Zr)/m³. Toxic.

Use: Refractory for aircraft and rocket applications, thermocouple protection tubes, high temperature electrical conductor, cutting tool component, coating tantalum, cathode in high-temperature electrochemical systems.

zirconium carbide.

ZrC.

Properties: Gray, crystalline solid. D 6.78, Mohs

hardness 8+, mp 3400C, bp 5100C. Insoluble in water and hydrochloric acid; soluble in oxidizing acids and attacked by oxidizers.

Derivation: By heating zirconium oxide and coke in an electric furnace.

Grade: Technical.

Hazard: Powder or dust will ignite spontaneously. TLV: 5 mg(Zr)/m³.

Use: Incandescent filaments, abrasive, cermet component, high-temperature electrical conductor, refractory, metal cladding, cutting tool component.

zirconium carbonate, basic. (zirconyl carbonate; zirconium carbonate). $ZrOCO_3$ or $ZrO \cdot CO_3 \cdot xH_2O$.

Properties: White, amorphous powder. Soluble in acids; insoluble in water.

Derivation: By adding sodium carbonate to a solution of zirconium salt.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Preparation of zirconium oxide.

zirconium chloride. See zirconium tetrachloride.

zirconium chloride, basic. See zirconium oxychloride.

zirconium diboride. See zirconium boride.

zirconium dioxide. See zirconium oxide.

zirconium disilicide. (zirconium silicide). $ZrSi_2$.

Properties: Gray solid. D 4.88 (22C). Soluble in hydrogen fluoride; insoluble in water and aqua regia.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Coatings resistant to flame or blast impingement, special alloys.

zirconium disulfide. ZrS_2 .

Properties: Gray, crystalline solid. D 3.87, mp 1550C. Insoluble in water.

Hazard: TLV: 5 mg(Zr)/m³.

Use: A solid lubricant.

zirconium fluoride. See zirconium tetrafluoride.

zirconium glycolate. $H_2ZrO(C_2H_2O_3)_2$.

Properties: Solid. Decomposes without melting on heating to 220C. Insoluble in water and organic solvents; soluble in alkali and sulfuric acid solutions. One or more of the acidic hydrogens may be replaced by alkali metals or ammonium to give water-soluble salts.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Cosmetic (deodorant), medicine, sequestrant.

zirconium hydride.

CAS: 7704-99-6. ZrH_2 . Contains 1.7–2.1% com-

bined hydrogen which can be driven off in a vacuum above 600C.

Properties: Gray-black metallic powder. Stable toward air and water. D 5.6, autoign temp 518F (270C).

Derivation: Reduction of zirconia with calcium hydride or magnesium in the presence of hydrogen, direct combination of hydrogen and zirconium.

Grade: Commercial (contains hafnium), reactor (hafnium free), electronic.

Hazard: Flammable, dangerous fire risk, especially in the presence of oxidizers. TLV: 5 mg(Zr)/m³.

Use: Vacuum-tube getter, powder metallurgy, source of hydrogen, metal-foaming agent, nuclear moderator, reducing agent, hydrogenation catalyst.

zirconium hydroxide. $Zr(OH)_4$.

Properties: White, bulky, amorphous powder. D 3.25, decomposes to ZrO_2 at 550C. Soluble in dilute mineral acids; insoluble in water and alkalis.

Derivation: Action of sodium hydroxide (solution) on a zirconium salt solution.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Source of zirconium oxide and zirconium sulfate, glass colorants.

zirconium hydroxychloride solution. See zirconyl hydroxychloride solution.

zirconium lactate.

CAS: 63919-14-2. $H_4ZrO(CH_2CHOCO_2)_3$.

Properties: White, slightly moist pulp. Decomposes without melting. Very slightly soluble in water and the common organic solvents; soluble in aqueous alkalis with formation of salts, decomposes to hydrous zirconia above pH 10.5, efficient odor absorber. Combustible.

Grade: Zirconia 25% (min).

Hazard: TLV: 5 mg(Zr)/m³.

Use: Body deodorants, source of zirconia.

zirconium naphthenate.

Properties: Amber-colored, heavy, transparent liquid. D 1.05. Viscosity equivalent to that of heavy lubricating oil. Very stable, unlike other metallic naphthenates, possesses no drying properties. Soluble in all common solvents. Combustible.

Derivation: By heating a mixture of naphthenic acid and zirconium sulfate.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Ceramics (enamels, glazes); lubricants; paints and varnishes (antichalking agent, minimizer of moisture and solar radiation effects).

zirconium nitrate.

CAS: 13746-89-9. $Zr(NO_3)_2 \cdot 5H_2O$.

Properties: White, hygroscopic crystals. Decomposes at 100C. Soluble in water and alcohol.

Derivation: Action of nitric acid on zirconium oxide.

Hazard: Dangerous fire and explosion risk in contact with organics, strong oxidizing agent. Hazard: TLV: 5 mg(Zr)/m³.

Use: Preservative.

zirconium nitride. ZrN . A brassy-colored powder produced by heating the metal in nitrogen.

Properties: Mohs hardness 8+, d 7.09, mp 2930C. Slightly soluble in dilute hydrochloric acid and sulfuric acid; soluble in concentrated acids.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Special crucibles, cermets, refractories.

zirconium orthophosphate. See zirconium phosphate.

zirconium oxide. (zirconia; zirconium dioxide; zirconic anhydride; zirconium anhydride). ZrO_2 . Occurs in nature as baddeleyite.

Properties: Heavy, white, amorphous powder. D 5.73, mp 2700C, Mohs hardness 6.5, refr index 2.2. Insoluble in water and most acids or alkalis at room temperature; soluble in nitric acid and hot concentrated hydrochloric, hydrofluoric, and sulfuric acids. Most heat resistant of commercial refractories; dielectric.

Derivation: By heating zirconium hydroxide or zirconium carbonate.

Grade: Reagent, technical, crystals, fused, whiskers, CP (99% zirconia), hydrous. The fused grade is reported to be harder than diamond (11 on Mohs scale).

Hazard: TLV: 5 mg(Zr)/m³.

Use: (Unstabilized) Production of piezoelectric crystals, high-frequency induction coils, colored ceramic glazes, special glasses, source of zirconium metal, heat-resistant fibers, (hydrous) odor absorbent, to cure dermatitis caused by poison ivy. (Stabilized with CaO refractory furnace linings, crucibles, solid electrolyte for batteries operating at high temperature.

zirconium oxychloride. (zirconium chloride, basic; zirconyl chloride). $ZrOCl_2 \cdot 8H_2O$.

Properties: White, silky crystals. Loses 6H₂O at 150C, 8H₂O at 210C, d 44 lb/cu ft. Soluble in water, methanol, and ethanol; insoluble in other organic solvents; aqueous solutions are acidic.

Derivation: Action of hydrochloric acid on zirconium oxide.

Grade: Technical, 36% ZrO_2 , HP.

Use: Textile, cosmetic and grease additive, antiperspirant, water repellents, chemical reagent, zirconium salts, in lakes and toners of acidic and basic dyes, oil-field acidizing aid.

zirconium phosphate. (zirconium phosphate, basic; zirconium orthophosphate).

$ZrO(H_2PO_4)_2 \cdot 3H_2O$.

Properties: White, dense, amorphous powder. Decomposes on heating. Soluble in acids; insoluble in water and organic solvents; extensively hydrolyzed in basic solution.

Derivation: Action of phosphoric acid on zirconium hydroxide.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Chemical reagent, cation scavenger, coagulant, carrier for radioactive phosphorus.

zirconium potassium chloride. (potassium zirconium chloride). $ZrCl_4 \cdot KCl$. A source of zirconium for magnesium alloys, to remove iron in an insoluble form.

zirconium potassium fluoride. (potassium fluozirconate; potassium zirconifluoride).

CAS: 16923-95-8. ZrK_2F_6 .

Properties: White crystals. Soluble in water (hot).

Hazard: Irritant. TLV: 2.5 mg(F)/m³.

Use: Grain refiner in magnesium and aluminum, welding fluxes, catalyst, optical glass.

zirconium potassium sulfate. (potassium zirconium sulfate). $2K_2SO_4 \cdot Zr(SO_4)_2 \cdot 3H_2O$.

Properties: White, crystalline powder. Slightly soluble in water.

Hazard: TLV: 5 mg(Zr)/m³.

zirconium pyrophosphate. ZrP_2O_7 .

Properties: White solid. Stable to 1550C. Insoluble in water and dilute acids other than hydrogen fluoride, coefficient of thermal expansion 5×10^{-6} at 1000C.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Refractory, olefin polymerization catalyst, phosphor.

zirconium silicate. See zircon.

zirconium silicide. See zirconium disilicide.

“Zirconium Spinel.” Trade designation for a synthetic complex containing 39–41% zirconium oxide, 20–22% silicon dioxide, 18.5–20.5% aluminum oxide, and 17–21% zinc oxide. Mp 1704C.
Use: Glaze opacifier in the ceramic industry.

zirconium sulfate.

CAS: 14644-61-2. $Zr(SO_4)_2 \cdot 4H_2O$.

Properties: White, crystalline powder. Bulk d 70 lb/cu ft, decomposes to monohydrate at 100C. Soluble in water; slightly soluble in alcohol; insoluble in hydrocarbons. Aqueous solutions are strongly acidic, will precipitate potassium ions and amino acids from solution, are decomposed by bases and heat.

Derivation: Action of sulfuric acid on zirconium hydroxide.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Chemical reagent, lubricants, catalyst support, protein precipitation, tanning of white leather.

zirconium sulfate, basic. (zirconyl sulfate).

$Zr_2O_8(SO_4)_2 \cdot xH_2O$. Similar in properties to the oxychloride and is prepared in a similar fashion, the end result being in cake form.

Use: Textile treatment and white leather tanning and retannage.

ZIRCONIUM TETRAACETYLACETONATE 1354

zirconium tetraacetylacetonate. (zirconium acetylacetonate). $\text{Zn}[\text{OC}(\text{CH}_3)_2\text{CHCO}(\text{CH}_3)_2]_4$.

Properties: A colorless, crystalline tetrachelate. D 1.415, mp 194–5°C (decomposition begins at 125°C). Soluble in pyridine, acetone, benzene, and other organic solvents having some polarity; slightly soluble in water.

Derivation: Reaction among zirconyl chloride, acetylacetone, and sodium carbonate.

Hazard: TLV: 5 mg(Zr)/m³.

Use: Cross-linking agent for polyol, polyester, and polyalkyloxy resins; lubricant and grease additive; reagent; catalyst.

zirconium tetrachloride. (zirconium chloride).

CAS: 10026-11-6. ZrCl_4 .

Properties: White, lustrous crystals. D 2.8, sublimes above 300°C. Soluble in alcohol; decomposes in water.

Derivation: Action of hydrochloric acid on zirconium hydroxide.

Grade: Technical.

Hazard: Irritant. TLV: 5 mg(Zr)/m³.

Use: Source of the pure metal (formed as intermediate in process), analytical chemistry, water repellents for textiles, tanning agent, zirconium compounds, special catalysts of the Friedel-Crafts and Ziegler types.

zirconium tetrafluoride. (zirconium fluoride).

CAS: 7783-64-4. ZrF_4 .

Properties: White powder. D 4.43, mp 600°C (sublimes), slightly soluble in water and hydrogen fluoride.

Hazard: Strong irritant. TLV: 2.5 mg(F)/m³.

Use: Component of molten salts for nuclear reactors.

zirconocene dichloride. (dicyclopentadienyl-zirconium dichloride). $(\text{C}_5\text{H}_5)_2\text{ZrCl}_2$.

Properties: White crystals. Mp 244°C. Soluble in polar organic solvents. Stable in dry air, very slowly hydrolyzes in moist air.

Hazard: Toxic by inhalation and skin contact, irritant to eyes and mucous membranes.

Use: Rubber accelerator, component of a catalyst system for polymerization of vinyl monomers, curing agent for water-repellent silicone materials, agent for plating with zirconium.

See metallocene.

zircon porcelain. See porcelain, zircon.

zircon sand. A sand containing considerable zirconium, titanium, and related metals.

Use: Source of these elements and also in foundries for casting of alloys.

zirconyl acetate.

CAS: 20645-04-9. $\text{Zr}(\text{OH})_2(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: (22% ZrO_2 solution) Tacky, resinous,

amorphous mass. D 1.46, fp –7°C. Becomes solid on heating.

Derivation: Addition of acetic acid to water suspension of carbonated zirconia.

Use: Waterproofing textiles, precipitation of proteins, starch, etc.; for textile and paper coatings.

zirconyl carbonate. See zirconium carbonate, basic.

zirconyl chloride. See zirconium oxychloride.

zirconyl hydroxychloride.

CAS: 10119-31-0. $\text{ZrOOHCl}\cdot x\text{H}_2\text{O}$.

Properties: Colorless or slightly amber liquid (aqueous solution). D 1.26. Forms a soluble glass on evaporation, pH of solution 0.8, reacts with alkalis to form hydrous zirconia; contains 20% zirconia.

Use: Pharmaceuticals, deodorants, precipitation of acid dyes, water repellents for textiles.

zirconyl nitrate (basic). (zirconyl hydroxynitrate). $\text{ZrO}(\text{OH})\text{NO}_3$.

Properties: Aqueous solution. D 1.35 (25°C).

Hazard: Fire risk in contact with organic materials.

Use: Gelatins and improving lamination bonds of polyvinyl alcohol.

zirconyl sulfate. See zirconium sulfate, basic.

“Zircotan” [Rohm & Haas]. TM for zirconium tanning agents that produce through-white leather.

Use: Tannage of white kid suede, glove leathers; retannage of chrome leather.

ZMA. Abbreviation for zinc metaarsenite. See zinc arsenite.

Zn. Symbol for zinc.

zoalene. (dinitolmide; 3,5-dinitro-*o*-toluamide). CAS: 148-01-6. $(\text{O}_2\text{N})_2\text{C}_6\text{H}_2(\text{CH}_3)\text{CONH}_2$.

Properties: Yellowish solid. Mp 177°C. Very slightly soluble in water; soluble in acetone, acetonitrile, dioxane, and dimethylformamide.

Hazard: TLV: 5 mg/m³; Not Classifiable as a Human Carcinogen.

Use: Coccidiostat, food additive.

“Zoamix” [Dow]. TM for poultry coccidiostats containing 3,5-dinitro-*o*-toluamide.

zoapatanolide a.

CAS: 84886-38-4. mf: $\text{C}_{20}\text{H}_{26}\text{O}_6$.

Hazard: A reproductive hazard.

“Zobar” [Du Pont]. TM for a weed killer based on an aqueous solution of the dimethylamine

salts of polychlorobenzoic acids, containing four pounds of acid equivalent per gallon.

"Zoldine" [Angus]. TM for bicyclic oxazolidines.

Grade: Industrial.

Available forms: Liquid.

Use: Catalysts, resin reactions, formaldehyde substitute, cross-linking agents, and tanning agents.

zone refining. A purification process that involves repeated melting and crystallization. The sample to be purified is placed in a relatively long, narrow tube and then passed slowly through a furnace having short, alternate hot and cold zones. Melting occurs opposite the hot zones and crystallization opposite the cold zones. As the rod moves through the furnace the zones move along the rod. Impurities remain in the molten zones and so are carried to one end of the rod. The process has been most used for relatively high-cost materials used in small quantities at very high purities, as for solid-state electronic purposes.

"Zonester" [Arizona]. TM for rosin esters.

Available forms: Solid or beaded grades.

Use: As a gum base, tackifier, resin for adhesives, printing inks and coatings.

"Zonolite" [Grace]. TM for verxite (expanded hydrobiotite).

"Zonyl" [Du Pont]. TM for a fluorosurfactant wetting agent that is superior to hydrocarbon surfactants because of greater surface tension reduction.

"Zoxamide technical" [BIOMOL].

CAS: 156052-68-5. mf: $C_{14}H_{16}Cl_3NO_2$. TM for a fungicide.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

Zr. Symbol for zirconium.

Zsigmondy, Richard. (1865–1929). A native of Austria, Zsigmondy received the Nobel Prize in chemistry in 1925 for his work in the field of colloid chemistry, which was initiated by his interest in ruby glass (a colloidal gold suspension). His most important contribution to chemistry was his invention of the ultramicroscope (with Siedentopf) in 1903. See ultramicroscope; Tyndall effect.

zwitterion. See isoelectric point.

zygote. The product of gamete fusion. In organisms with a haploid life cycle, the zygote immediately undergoes meiosis, but in organisms with a multicellular diploid stage, the zygote is merely the first stage in the diploid portion of the life cycle.

zymo-. (zymo-). Relating to a ferment or fermentation.

zymase. The enzyme present in yeast that converts sugars to alcohol and carbon dioxide.

zymo-. See zym-.

zymogen. An inactive precursor of an enzyme; for example, trypsinogen—the precursor of trypsin.

zymohexase. See aldolase.

zymose. Enzyme found in yeast. It hydrolyzes glucose to alcohol (fermentation).

zyprexa.

CAS: 132539-06-1. mf: $C_{17}H_{20}N_4S$.

Hazard: Human systemic effects.

"Zytel" [DuPont-Toray]. TM for engineering resins and high-end specialty polymers.

APPENDIX I

Origin of Some Chemical Terms

The etymology of chemical terms is not only of historical interest but is often of value in illuminating their meanings. Those listed here were selected chiefly on the basis of these two criteria.

The names of many elements (e.g., tin, sulfur, gold, zinc, lead) are merely transliterations from older languages; others are in honor of famous scientists (curium, fermium, einsteinium) or of countries (germanium, francium, polonium); still others are in honor of their place of discovery (berkelium, yttrium, strontium). The predominance of Latin (L.) and Greek (Gk.) origins and the many references to mythology reflect the importance of the classical tradition in the 19th century. The dates given in parentheses indicate the approximate year in which the term was introduced. Many common chemical words were in literary use long before the development of modern chemistry in the late 1700s. For dates before 1750, the editor is indebted to the *Oxford Universal Dictionary*; however, some of these (e.g., petroleum, 1526) appear open to question.

abrasive (1656) L. *ab-* (away) + *ras-* (scrape). From the same root as **erase**.

abscission L. *ab-* (from) + *sciss-* (cut). To detach, as fruit from a tree. From the same root as **abscissa**.

absorption See **sorb**.

accelerator (1900) L. *ad-* (*ac-*) (to) + *celer-* (speed). An agent that adds speed to a reaction.

acetic (1808) L. *acetum* (vinegar, a dilute solution of acetic acid). **Acetone** is from the same root.

acid (1626) L. *acidum*, from *acer* (sour, sharp tasting), referring to one of the characteristic properties of acids. **Acrid** is from the same root.

adhesive (1670) L. *ad-* (to) + *haes-* (stick, cling), referring to the clinging together of two dissimilar materials. See **coherent**.

adsorption See **sorb**.

agglomeration L. *ad-* (*ag-*) + *glomer-* (ball, sphere), i.e., a material made up of small, spherical aggregates.

aggregation (1547) L. *ad-* (to, together) + *greg-* (group, herd), i.e., of particulates. From the same root are **gregarious** (group-seeking) and **egregious** (out of the herd), i.e., noteworthy, outstanding in a deprecatory sense, as in an egregious error.

albumin L. *alba* (white). In the 1600s this term (spelled *albumen*) referred to egg white, as well as to a substance found in plants and seeds. Modern use as a class of proteins began in 1869.

alchemy (1514) Arabic *al* (the) + Gk. *kemia* (transmutation of lead to gold, which was the primary concern of the alchemists). See **chemistry**.

alcohol (1543) Arabic *al* (the) + *koh'l*, a cosmetic paste (antimony sulfide) used to paint the eyelids; later the term referred to any fine metal powder. By some inexplicable semantics, probably originating with the alchemists, it came to mean distilled spirits of wine (1753). The present sense originated about 1850.

aldehyde (1850) Coined from *al* (cohol) and *dehyd* (rogenation), describing the chemical derivation.

aliphatic Gk. *aliphatos* (oil, fat) from *aleiphein* (to rub

or smear with oil). Originated with early chemists who were familiar with animal and vegetable fats whose properties were determined by high molecular weight hydrocarbon groups.

alkali (1813) Arabic *al* (the) + *qalay* (pan-roast, calcine). As early as 1612 it referred to any soda like substance obtained by calcining plants and reducing them to ashes.

alkaloid (1831) See **alkali**. So-called because of their superficial resemblance to alkalis, i.e., bitter taste.

alkyd (1847) Coined from the words *al* (cohol) and *acid* (cid = kyd), describing their chemical derivation. First prepared by Berzelius.

aluminum L. *alumen* (alum). So named by Sir Humphry Davy in 1812.

amalgam (1471) L. *amalgma*, from Gk. *malessein* (a soft mixture or poultice); hence, a mix softened with mercury.

ammonia (1799) From the name of the Egyptian deity Ammon, to whom a temple was built in the North African desert. It refers to the gas evolved by camel excreta in the vicinity of the temple. The ammonium group, NH_4^+ , was named by Berzelius in 1808.

amorphous (1801) Gk. *a-* (not, without) + *morph-* (shape), referring to a material that lacks crystal structure, usually a liquid.

amphoteric (1849) Gk. *ampho-* (both), i.e., both acidic and alkaline.

analysis (1581) Gk. *ana-* (up) + *lyein* (loosen, set free), i.e., to separate. It was applied to chemistry in 1655. **Dialysis** is from the same root.

anesthesia (1846) Gk. *an-* (not) + *aisthesis* (feeling, sense). This term was coined by Dr. Oliver Wendell Holmes soon after the first successful use of ether.

anhydride (1863) Gk. *an-* (not, without) + *hydr-* (water), in the sense of a compound that forms an acid on combining with water, e.g., SO_3 is the anhydride of H_2SO_4 .

anhydrous (1819) Same roots as for anhydride but used in the sense of absence of water of crystallization in a salt or similar compound.

- aniline** (1850) Arabic *anil* (indigo), from which aniline was originally made.
- anthracene** (1863) *anthrac-* (coal), from which it is obtained by distillation.
- anthracite** See **anthracene**.
- antibiotic** Term coined by Selman A. Waksman for mold-derived antibacterial agents.
- argon** (1894) Gk. *argos* (inactive), referring to the chemical nature of this element.
- aromatic** (1869) L. *aroma* (spice, fragrance). Applied to benzenoid compounds derived from balsams because of their characteristic odor.
- asbestos** Gk. *a-* (not) + *sbestos* (quench, extinguish). The meaning as derived is the exact opposite of the unique property of this material.
- asphalt** (1650?) Gk. *asphaltos*, used in ancient times as an illuminant.
- atom** Gk. *a* (not) + *tom* (divide, cut). The original use goes back to the Greek philosopher Democritus (465 BC) who first conceived of matter as composed of small indivisible particles. In about 1650 Boyle came to a similar conclusion, but it was not until 1807 that Dalton advanced his atomic theory, and the word entered the scientific vocabulary. However, the etymological meaning was proved to be inapplicable by Rutherford's discovery of atomic disintegration in 1910.
- auxiliary** L. *auxilia* (help, aid).
- azo** Gk. *a* (not) + *zo-* (alive), referring to the presence of nitrogen, which Lavoisier had named azote in 1791 because of its nonreactive nature. Related words are **zoology**, **zoo**.
- barbiturate** L. *barba* (beard), presumably in reference to the original plant source of these substances, namely, a lichen characterized by a beard-like structure (*Usnea barbata*).
- barium, barytes** (1808, 1789) Gk. *barus* (heavy, referring to the characteristic property of these substances). The same occurs in **barometer**.
- base** (1810) Gk. *basis* from root *ba-* (go). The reason for the selection of this term in its present chemical sense is not clear.
- bauxite** Named for a town in southern France, Les Baux, where it was discovered.
- bentonite** Named for Fort Benton, Wyoming, where it was discovered.
- benzene** See **benzoin**.
- benzoin** (1560) Probably from French *benjoin*, said to be derived from Arabic *ban jawi*, an aromatic gum of Java (frankincense?). The term was later corrupted to *benjamin*. *Benz-* is the root responsible for the word benzol (Liebig, 1838), later modified to **benzene**, and for **benzoic**, an acid present in gum benzoin.
- bromine** (1827) Gk. *bromos* (stench), after one of its characteristic properties.
- butyric** (1826) L. *butyrum* (butter). The term butyl, from the same source, was introduced in 1868.
- cadmium** (1917) L. *cadmia* (calamine = zinc ore); this in turn was derived from the legendary hero Cadmus, founder of the Greek city of Thebes, though the connection is obscure.
- calcium** (1808) L. *calx* (lime). Related is the term *calcine*, used by the alchemists to mean reduction of a metal to a powder (calx) by heat; also to desiccate by fire (1640).
- calender** (1688) L. *cylindrus* (cyliner), descriptive of the major feature of this machine.
- carbon** (1789) L. *carbo* (coal); so named by Lavoisier, as the chief constituent of coal.
- casein** (1841) L. *caseus* (cheese), of which it is a major component.
- catalysis** Gk. *kata-* (completely) + *lyein* (loosen, set free). Adopted by Berzelius (1836) to describe this type of reaction. The term dates back to 1660 in the nontechnical sense of dissolution or destruction.
- cement** (1490) L. *caed-* (cut), in reference to the comminuted or crushed materials that are the basis of this product. **Cementation** (finely divided metal powders) has the same origin.
- ceramic** (1850) Gk. *keramos* (pottery, potters' clay) Contrary to general belief, this term is *not* derived from Latin *cera* (wax).
- ceresin** See **ozocerite**.
- cerium** (1804) Named by Berzelius from the then recently discovered asteroid Ceres, which in turn was named after the Greek goddess of the harvest. **Cereal** has the same derivation.
- cesium** (1860) L. *caesius* (sky-blue). So named by Kirchhof and Bunsen because of the blue lines in its spectrum.
- chelate** (1930) Gk. *chela* (claw of a crab or lobster). So named by G. T. Morgan and H. D. K. Drew because of the tenacity with which the coordinating group holds the metal ion.
- chemistry** Gk. *kemia* (transmutation). *Oxford Universal Dictionary* states that this relates to "the Egyptian art" associated with the "black earth" (*khem*) of the Nile delta, but the exact etymology is obscure. Early writers referred to chemistry as an art rather than a science. Use in its present sense probably began with Robert Boyle about 1650. See **alchemy**.
- chiral** (1950?) Gk. *chiro* (hand), referring to the right- and left-handed structure of optical isomers. See **enantiomorph**.
- chlorine** (1810) Gk. *chloros* (green). So named from its greenish-yellow color by Sir Humphry Davy.
- chlorophyll** (1819) Gk. *chloros* (green) + *phyl-* (leaf).
- cholesterol** (1827) Gk. *chol-* (bile) + *stereo-* (hard, solid).
- chromatography** (1906) Gk. *chroma* (color) + *graph-* (write, draw). So named by Tswett, its inventor, who used it to analyze plant pigments, which produced bands of characteristic color.
- chromium** (1797) Gk. *chroma* (color), in reference to the distinctive colors of its compounds. Many other chemical terms have the same derivation, e.g., **chromosome**, **chromatin**, **chromatography**; also **chromatic**.
- chromophore** Gk. *chroma* (color) + *phor-* (carry, bear), i.e., a chemical group that imparts color to a compound.
- chromosome** (1890) Gk. *chroma* (color) + *soma* (body), the reference to color being due to the ex-

- treme ease with which this nucleoprotein accepts biological stains. The sense of the word *body* here is probably the same as that in *antibody*.
- clathrate** Gk. *klathra* (a grating of metal bars), suggestive of the cage-like structure of these compounds (also called inclusion compounds). The term was known in the 19th century in a botanical sense, but its chemical use did not appear till about 1940.
- coagulate** (1610) L. *co-* (together) + *ag-* (drive), i.e., a natural forcing together of dissolved substances to form a clot.
- cobalt** (1735) German *kobold* (goblin). The extreme difficulty of separating Co from Ni ore during extraction operations led miners in Saxony to endow it with an evil spirit that interfered with obtaining the nickel, which they considered the valuable material. See **nickel**.
- coherent** L. *co-* (together) + *haer-* (stick, cling), referring to sticking together of identical or closely similar materials, e.g., coherent light. See **adhesive**.
- colloid** (1861) Gk. *kolla* (glue). Introduced by Thomas Graham to describe suspensions whose disperse phase did not pass readily through a parchment membrane. **Collagen** and **collodion** have the same derivation.
- component** L. *con-* (together) + *pon-* (place), i.e., a material that is blended with other materials in a mixture. Compound has the same derivation but a different chemical meaning.
- composite** L. *con-* (together) + *pos-* (place), i.e., a combination or placing together of two or more materials, usually in a laminar structure. See **component**.
- compound** See **component**.
- conjugated** L. *con-* (together) + *jugum* (yoke for oxen). An organic compound "yoked together" by alternate double bonds.
- copper** L. *cuprum* or *Cyprium*, because originally found in Cyprus. Also German *Kupfer*.
- corrode** (1610) L. *con-* (completely) + *rod-* (gnaw). From the same root as erode and rodent.
- crucible** (1460) L. *cruc-* (cross), referring to the practice of the alchemists of placing a cross on their experimental equipment to ward off evil spirits. **Crucil** has the same derivation, e.g., a crossroad.
- desiccate** L. *de-* (out, away) + *siccus* (dry). From the same root as **siccative**, a drying agent.
- detergent** (1620) L. *de-* (away) + *terg-* (wipe), no doubt because of the cleaning action of these compounds.
- dextrose** See **levulose**.
- dialysis** See **analysis**.
- diffusion** L. *dis-* (*dif-*) (apart) + *fusus* (melt), i.e., gradual dispersal of one substance in another.
- disintegrate** L. *dis-* (apart) + *in-* (not) + *teg-* (touch), i.e., division of an untouched whole (integer) into many parts. An integer is an "untouched" whole number.
- dissociation** L. *dis-* (apart) + *socius* (friend, ally), i.e., a separation of substances previously united. Association is from the same root but with opposite meaning.
- distillation** L. *de-* (down) + *still-* (to fall as drops). The exact date is unknown, but the term was familiar to the alchemists in the Middle Ages. It was also used by poets in the 16th century, e.g., "leperous distillation" (Shakespeare).
- dysprosium** (1886) Gk. *dysprositos* (hard to get at), because of the difficulty of its isolation.
- electrode** Gk. *elektron* (amber) + *-ode* (road, pathway), i.e., a highway for electricity.
- electron** (1890) Gk. *elektron* (amber), referring to the ability of amber to accumulate a static charge by being rubbed. Similarly, electric and related terms.
- enantiomorph** (about 1900) Gk. *enantio-* (opposite, contrary) + *morph-* (form, shape), descriptive of the mirror-image structure of optical isomers. Also called **enantiomer**.
- enzyme** (1881) Gk. *zyme* (ferment, leaven), in reference to the catalytic activity of these compounds.
- equilibrium** (1608) L. *aequus* (the same) + *libra* (weight, balance); hence any stabilized condition regardless of whether weight is involved.
- ether** (1587) Gk. *aether* (the sky or upper atmosphere), from a root meaning to glow or burn. The term was long used to mean simply "the air"; it was also applied to a supposed elastic medium that filled all space and by which light was transmitted. This was disproved by Michelson and Morley in 1887. The chemical sense originated about 1838, doubtless because of the highly volatile (airlike) nature of ether.
- ethyl** See **ether**.
- eutectic** (1884) Gk. *eu-* (well) + *tek-* (melt), i.e., well or ideally melting.
- evolve, evolution** L. *e-* (out) + *volv-* (roll), e.g., a gas given off by a chemical reaction. In general, the "rolling out" of any development over a long time span.
- extract** L. *ex-* (out) + *tract-* (draw, drag). From the same root as **contract** (draw together) and **retract** (draw back).
- extrude** L. *ex-* (out) + *trud-* (thrust), descriptive of the action of an extrusion machine.
- ferment** (1605) L. *fermentum* (yeast), from the root *ferv-* (boil), in reference to the apparent similarity to boiling. The chemical meaning did not appear until Pasteur's studies, about 1850. From the same root as **effervescent**.
- filter** (1791) L. *filtrum* (felt, which was originally used for liquid-solid separations).
- flavone** L. *flavus* (yellow), for the predominant color produced in flowers by this class of plant pigments.
- flocculation** (1877) L. *floccus* (a tuft of wool), referring to the appearance of such aggregates.
- fluorine** (1813) L. *flu-* (flow). So named by Ampere, after Scheele's earlier naming of hydrofluoric acid.
- flux** (1800) L. *flu-* (flow), originally applied to excretory processes of the body; later it referred to flow-inducing materials in ceramics and metallurgy, as well as to neutron emanations.
- fossile** L. *foss-* (dig), e.g., fossil fuels.
- fractionate** L. *fract-* (break), i.e., separation of a liquid

- mixture into its components by distillation. From the same root as **refraction** ("breaking" of a light ray).
- fumigant, fume** *L. fumus* (smoke).
- fuse, fusion** *L. fusus* (melt). The original meaning (1681) was to melt by application of heat, e.g., fused salts, electric fuse. This was later (1817) extended to include blending or joining, as in welding. Since 1940 the term has been applied to the union of hydrogen nuclei with release of energy. In this sense the connection with melting has disappeared.
- gas** (1600) Adapted by van Helmont from Gk. *chaos*, the letter *g* replacing the *ch*. The Gk. term meant "a yawning gulf or abyss; the formless void of primordial matter" (*Oxford Universal Dictionary*). Modern usage dates from the late 1700s.
- gasoline** (1871) Standard dictionaries give the etymology as gas + ol + ine, but no clue as to how the term originated. It was probably coined from "gas oil", "a heavy petroleum fraction from which the first" gasoline was made.
- glycerol** (1838) Gk. *glyc-* (sweet). From the same root are glycol, glycogen (sweet-maker), glycine, etc.
- graphite** (1789) Gk. *graph-* (write, draw); so named by Werner in reference to its marking ability, as in pencils. **Graph** is from the same root.
- halogen** Gk. *halo-* (salt) + *L. gen-* (create), from the tendency of these elements to form salts with metals.
- helium** (1868) Gk. *helios* (the sun), where it was originally discovered by spectrographic analysis.
- heterogeneous** (1630) Gk. *hetero-* (different) + *L. gen-* (kind). Descriptive of mixtures and solutions, which are made up of two or more different components. Its opposite is homogeneous (*homo-* = the same).
- homologous** (1850) Gk. *homo-* (the same) + *log-* (proportion), i.e., compounds having the same proportion of certain constituents in an ascending series.
- hormone** (1906) Gk. *ormon* (to excite, stimulate), in reference to the physiological activity of these compounds.
- hydrogen** (1783) Gk. *hydro-* (water) + *L. gen-* (create), i.e., water producer. Named by Lavoisier.
- hydrolysis** (1880) Gk. *hydro-* (water) + *lysis-* (loosen, dissolve), in reference to the cleavage of the water molecule in this reaction.
- hydrophilic** Gk. *hydro-* (water) + *phil-* (love). The term describes the chief property of vegetable gums, seaweeds, gelatin, etc., which absorb many times their weight of water. Hydrophobic (*phob* = hate) has the opposite meaning.
- hygroscopic** (1775) Gk. *hygro-* (moisture) + *skopos* (observe, measure). Hygroscopic materials "observe" the presence of atmospheric moisture by absorbing it.
- iferous** *L. fer-* (carry, bear). A common suffix as in **carboniferous, coniferous**, etc.
- inhibitor** *L. in-* (in) + *hab-* (*hib-*) (have, hold), i.e., an agent that holds in or restrains a reaction.
- insulin** (1925) *L. insula* (island). So named by Banting, its discoverer, because it is formed in the isles of Langerhans in the pancreas. From the same word as **insulation**.
- iodine** (1814) Gk. *iodos* (violet-colored), so named from the color of its vapor by Gay-Lussac.
- ion** (1834) *L. i-* (go, move), in reference to the extreme mobility of these particles.
- iridium** (1804) Named by Tennant from Iris, goddess of the rainbow, because of "the striking color it gives while dissolving in marine acid."
- isomer** (1838) Gk. *iso-* (the same) + *mer-* (part, share), i.e., compounds that (usually) share their constituent atoms equally, though their arrangements are different.
- isotope** (1913) Gk. *iso-* (the same) + *topos* (place), i.e., in the periodic table.
- kerosene** (1854) *L. cer-* (wax), referring to the Pennsylvania paraffinic crude from which it was derived.
- ketone** (1851) A German modification of **acetone**.
- krypton** (1898) Gk. *kryptos* (hidden). Named by Sir William Ramsay in reference to the difficulty of its separation.
- laser** Coined from the first letters of "light amplification by stimulated emission."
- latent** *L. lat-* (lie hidden), e.g., a latent solvent.
- levulose** *L. laev-* (the left) + *-ose* (sugar suffix), descriptive of optical isomers that rotate light to the left. The opposite meaning is dextrose from *L. dextro-* (the right).
- ligand** *L. lig-* (bind), referring to the capacity of certain molecules to attach themselves to metal atoms in coordination compounds. Discovered by Werner in 1893.
- lignin, lignite** (1820) *L. lignus* (wood). Lignin is a component of wood, and lignite is formed from it.
- linoleic** *L. linum* (flax) + *oleum* (oil). The principal fatty acid in linseed (flaxseed) oil.
- litharge** (1800) Gk. *lithos* (stone) + *argyros* (silver); so named because it was once thought to be a product of the separation of silver from lead.
- lithium** (1818) Gk. *lithos* (stone), probably because of the rocklike nature of petalite, the mineral complex in which it was discovered.
- lysis** Gk. *lysis* (decompose, loosen, break down). A suffix in many chemical terms, e.g., **analysis, hydrolysis, catalysis**, etc.
- magnesia** (1610) Gk. for Magnesian Stone, which was thought to have magnetic properties and which the alchemists believed to be a component of the Philosopher's Stone. The element magnesium was so named by Sir Humphry Davy in 1808. See **manganese**.
- manganese** (1775) *L. magnes* (magnet) = German *Mangan*, because of the magnetic nature of its ore, pyrolusite. A corrupted form of magnesium.
- mercaptan** (1835) *L. mer* (curium) (mercury) + *captans* (seizing), in reference to the ability of such compounds to form relatively insoluble salts of mercury and other heavy metals. Has been replaced by *thiol*.
- mercury** *L. Mercurius*, in Roman mythology the messenger of the gods, noted for his quickness and agility.
- microscope** (1656) Gk. *micro-* (small) + *skopos* (observe).

- molecule** (1794) L. *moles* (mass) + diminutive suffix *-cule*, i.e., a little mass.
- molybdenum** (1816) Gk. *molybdos* (a soft, leadlike mineral). Scheele had used the term *molybdic acid* in 1778.
- mordant** L. *morsus* (bite), i.e., an agent that bites (binds) a dye to a fiber.
- nano** Gk. *nanos* - dwarf, *Lithos* - rock, and *grapho* - to write.
- naphtha** (1572) Transliteration of Gk. *naphtha*; a component of asphalt. Both naphtha and asphalt were used as illuminants in ancient times.
- nascent** (1790?) L. *nasc-* (arise, be born), referring to the active state of an element as it is liberated from a compound, e.g., nascent oxygen. Now obsolete.
- neon** (1898) Named by Sir William Ramsay from Gk. *neos* (new).
- neutron** (1932) L. *neuter* (neither). So named by its discoverer Chadwick because it has neither a positive nor a negative charge. Neutral has the same derivation (neither acidic nor basic).
- nickel** (1751) Swedish *koppernickel*, from German *Kupfer* (copper) + *nickel* (demon, devil). So called because the ore niccolite (NiAs), being reddish in color, resembled copper, and was thus supposed the trick of an evil spirit. See **cobalt**.
- niobium** (1644) Named by H. Rose after the lachrymose goddess Niobe, though his reason for doing so is not clear.
- nitrogen** (1790) L. *nitrum* (nitre) + *gen-* (create). The term was used by Chaptal to indicate that the element is a constituent of nitre. It had previously been recognized as an element by Lavoisier.
- nucleus** (1762) L. *nuc-* (nut, kernel).
- olefin** (1860) L. *ole-* (oil). Ethylene was originally called olefin gas because on combination with chlorine it formed an oily liquid, ethylene dichloride, also called Dutch oil. See **aliphatic**.
- oleum** L. *ole-* (oil). Fuming H_2SO_4 , probably so called because of its oily appearance.
- oligomer** Gk. *oligo-* (a few) + *mer-* (part). Originally used in botany; adopted by chemists to describe polymers composed of fewer than five monomer units.
- organic** (1807) First used by Berzelius to designate substances derived from living organisms. The Greek word *organon* meant implement, instrument, machine, part of the body. The semantics of its transfer from inanimate matter to living entities is not clear.
- oxygen** (1790) Gk. *oxy-* (sharp, acidic) + L. *gen-* (create). Thus the literal but erroneous meaning is "acid maker" because of the belief of Lavoisier, who named it, that oxygen is the characteristic element of acids. In 1774 it had been discovered by Priestley, who called it dephlogisticated air.
- ozocerite** (1834) Gk. *ozo-* (bad odor) + *keros* (wax), i.e., a malodorous earth wax. From the latter root is **ceresin**.
- ozone** (1840) Gk. *ozo-* (bad odor), a characteristic property of this gas.
- pladium** (1803) Named by its discoverer, Wollaston, after the then recently discovered asteroid Pallas, which in turn was so named because of its pale-white color associated with the goddess Pallas.
- paper** (1670) Gk. and L. *papyrus*, a plant used by the ancients for writing. Thin strips were cut from the stem, soaked in water, and pressed together after drying.
- paraffin** (1830) L. *parum* (little) + L. *affinis* (relationship). The literal meaning is "having little affinity," in reference to the low reactivity of saturated hydrocarbons. Introduced by the German chemist Reichenbach.
- periodic** (1870) Gk. *peri-* (around) + *odos* (way, road), i.e., a circuit; any system having repeated beginnings and endings, e.g., the periodic table.
- petroleum** (1526) L. *petr-* (rock) + *ole-* (oil), from its early discovery in rock formations.
- pH** (1909) Abbreviation of *pouvoir hydrogene* (hydrogen power), the term used by Sorenson, who invented this scale. The word power is used in its mathematical sense.
- phen-** The root that characterizes derivatives of benzene. Gk. *phaino* (shine, show, appear). First used by Laurent (1841) in *hydrate de phenyle* and *acid phenique*, which were names for a coal tar product (later called phenol) from which illuminating gas could be made. Hence, this root was used to name all compounds derived from benzene, e.g., phenanthrene *phen* + *anthrac-* (coal); **phenol**; **phenyl**; **phenacetin**, etc. **Phenomenon** (i.e. "what appears") is from the same root.
- phosphorus** (1669) Gk. *Phos-* (light) + *phor-* (bear, carry). So named by H. Brand because of its property of glowing in the dark.
- phthalic** (1857) Coined from **naphthalene**, from which phthalic anhydride is made.
- pigment** L. *pigmentum* (paint) from the root *ping-* (paint a picture), implying use of a colorant.
- platinum** (1803) Originally called *platina* from the Spanish *plata* (silver), because of its color.
- plutonium** (1941) Named after the former most remote planet, Pluto, because plutonium was the last element in the periodic system at the time of its discovery. See **uranium**.
- polymer** (1866) Gk. *poly-* (many) + *mer-* (part); similarly for monomer, dimer, etc.
- polyunsaturated** See **saturated**.
- precipitation** L. *prae-* (first) + *caput* (head). Literally, headfirst, in the sense of falling directly downward.
- protein** (1868) Gk. *proteios* (first, primary), in reference to its fundamental part in nutrition. **Proton** is from the same root.
- racemic** (1890) L. *racemus* (grapes). Refers back to Pasteur's discovery of optical isomers in the tartaric acid of wine lees.
- radical** (1560) L. *radic-* (root). First used in the chemical sense in 1816, but the connection is obscure.
- reaction, reagent** (1797) L. *re-* (back) + *act-, ag-* (do, drive). The same root is responsible for such common words as **action**, **activity**, **agent**, etc. See **coagulate**.
- retort** (1605) L. *re-* (back) + *tort-* (twist), referring to

- the shape of a type of simple distillation unit characterized by a glass neck twisted downward.
- rhodium** (1803) Gk. *rhodon* (rose), so named by Wollaston from the rosy color of its chloro salt. Rhodopsin, the red pigment of the eye, is from the same root.
- rubber** (1788) So named by Joseph Priestley, when he found that the crude product obtained by coagulation of latex was able to erase pencil marks by rubbing.
- salt** L. *sal*; present chemical meaning (acid-base reaction), 1790. Its original use cannot be dated accurately; it goes back at least to the alchemists and Chaucer ("salte teeres"), about 1400. Historically its economic value was unique. Roman soldiers accepted salt as payment for their services. Hence, the word *salary* and the expression "earn your salt."
- saponification** (1821) L. *sapo*- (soap). The term *soap* has the same derivation, with vowels transposed.
- saturated** L. *satis* (enough), i.e., an element with which enough constituents are united to fill (satisfy) its valence bonds. Thus *polyunsaturated* literally means "many times not enough" constituents (i.e., two or more double bonds). Similarly, any material that has absorbed all the liquid it can retain.
- scan** L. *scand*- (climb over), i.e., as a light beam moves over an irregular surface.
- scintillation** (1809) L. *scintilla* (spark).
- scleroscope** Gk. *sclero*- (hard) + *skopos* (measure, observe), i.e., a type of metal-hardness tester.
- selenium** (1818) Named by Berzelius from Gk. *selēnon* (the moon), because its chemical similarity to tellurium (from L. *tellus*, the earth) suggested an analogical relationship between the two elements similar to that of the moon to the earth.
- silicon** (1823) L. *silic*- (flint).
- silvicide** L. *silva* (trees, forest) + *caed*- (kill), i.e., a special type of herbicide.
- solder** L. *solid*- (to make firm), descriptive of the metal-joining function of these alloys.
- solvent** L. *solv*- (free, loosen), i.e., a liquid that "frees" solids from their confined state. Related words from the same root are **solve**, **solution**, **dissolve**, **resolve**.
- sorb**, **sorption** L. *sorb*-, *sorp*- (suck in, swallow). **Absorption** describes the swallowing action of a porous material; **adsorption** means attraction to the surface only (*at*, *ad* = to, toward). **Sorb** is used when the distinction is not clear.
- sparger** (1839) L. *sparg*- (sprinkle). **Sparse** (thinly scattered) is from the same root.
- ster**-, **stereo**- Gk. *stereo* (solid), i.e., three-dimensional. This root occurs in many chemical terms, e.g., **sterol** (solid alcohol), **stearic**, **steroid**, **steric**, **stereospecific**, **cholesterol** (hard bile alcohol).
- synthesis** (1611) Gk. *syn*- (together) + *tithenai* (place). The chemical meaning did not appear until 1733.
- tacticity** Gk. *tax*- (arrange), referring to the arrangement of atoms in the molecular structure of high polymers. This and related terms (**syndiotactic**, **atactic**, etc.) were introduced in the 1930s when stereospecific catalysts were developed by Ziegler and Natta.
- tall** Derived from the Swedish word for pine, to distinguish tall oil from the U.S. meaning of **pine oil**.
- tall oil** See **tall**.
- tantalus** (1802) For the mythological punishment of Tantalus for revealing the secrets of the gods. He was condemned to stand in water, which always receded as he tried to drink. Isolation of the element was apparently attended by equally frustrating difficulties.
- tellurium** See **selenium**.
- tension**, **tensile** L. *ten*- (hold, as against strain). From the same root as *retension* (holding back) and *tenter* (a machine for holding fabric taut).
- tetrahedral** Gk. *tetra* (four) + *hedron* (side), i.e., a pyramidal structure characteristic of certain molecules.
- thallium** (1861) L. *thallus* (budding leaf). Named by Sir William Crookes because of a pronounced green line in its spectrum.
- thiol** (1899) Gk. *thio*- (sulfur) + *-ol*, a sulfur alcohol in which SH has replaced the OH group. From the same root as **thiamine**, **dithiocarbamate**, etc.
- tincture** (1648) L. *tinct*- (color, dye) The term is obsolete in this sense; the connection with alcoholic solutions is not clear, though possibly some were colored. From the same root are **tinctorial** and **tint**.
- titanium** (1800) So named by Klaproth after the Titans, legendary giants supposed to have originally inhabited the earth. His reason for naming this substance thus is not clear.
- transfer**, **transference** L. *trans*- (across) + *fer*- (carry, bear). There is no connection between this root and the L. *ferrum* (iron) from which **ferric** is derived.
- transition** L. *trans*- (across) + *i*- (go, move), e.g., transition elements that "move across" the periodic table, making a bridge from electropositive to electronegative.
- transmutation** L. *trans*- (across) + *mut*- (change), i.e., changing one element into another. In the Middle Ages alchemists tried to change lead into gold with little success.
- tungsten** (1781) Swedish *tung* (heavy) + *sten* (stone); named in honor of Swedish chemist Scheele.
- turpentine** Gk. *terebinthos* (turpentine tree). **Terpene** is undoubtedly related.
- uranium** (1789) Named by Klaproth after the then recently discovered planet Uranus, believed to be the most distant member of the solar system. This planet in turn was named from the Greek word for sky (heavens). See **plutonium**.
- valence** (1869) L. *val*- (be strong), referring to the binding strength of interatomic attraction. From the same root as **valid**.
- vanadium** (1830) For the Scandinavian goddess Vanadis, because of its multicolored compounds. So named by its discoverer, Sefstrom.
- vermiculite** (1824) L. *vermis* (worm), so called because of the worm-like writhing motion of the material as it expands on exposure to high temperature.
- vitamin** (1921) L. *vita* (life) + *amin*(e). Originally named *vitamine* by Funk (1911); the terminal *-e* was

- later dropped when the nonnitrogenous carotene (vitamin A) was discovered.
- vitriol** L. *vitrum* (glass). An old name for concentrated H_2SO_4 , because of its glassy appearance. **Vitrification** (conversion to a glassy state) is from the same root.
- vulcanization** (1846) Named by Charles Goodyear after Vulcan, the Roman god of fire and forging, to describe Goodyear process for heat curing of rubber with sulfur.
- xenon** (1898) Gk. *xenos* (strange); so named by Sir William Ramsay.
- X ray** (1896) Named by Roentgen, the discoverer of this form of radiation, because its nature was at that time unknown.
- xylene** Gk. *hyle*, a suffix meaning stuff or material, as in **ethyl** = ether material (Liebig).
- zein** L. *zea* (grain). The protein occurring in corn.
- zymase** See enzyme.

APPENDIX II

Highlights in the History of Chemistry

A. Chronology of Notable Achievements

Democritus (465 B.C.) First to conceive matter in the form of particles, which he called atoms.

alchemists (about 1000–1650). Attempted to (1) change lead and other base metals to gold; (2) discover a universal solvent; and (3) discover a life-prolonging elixir. Used plant products and arsenic compounds to treat diseases.

Boyle, Sir Robert (1637–1691). Formulated fundamental gas laws. First to conceive the possibility of small particles combining to form molecules; distinguished between compounds and mixtures; studied air and water pressures, desalination, crystals, and electrical phenomena.

Priestley, Joseph (1733–1804). Discovered oxygen, carbon monoxide, and nitrous oxide.

Scheele, C. W. (1742–1786). Discovered chlorine, tartaric acid, sensitivity of silver compounds to light (photochemistry) and oxidation of metals.

Le Blanc, Nicholas (1742–1806). Invented a process for making soda ash from sodium sulfate, limestone, and coal.

Lavoisier, A. L. (1743–1794). Discovered nitrogen, studied acids, and described the composition of many organic compounds. Generally regarded as the father of chemistry.

Volta, A. (1745–1827). Invented the electric battery, a series of “piles” or stacks of alternating layers of silver and zinc, or copper and zinc, separated by paper soaked in brine (electrolyte). See activity (1).

Berthollet, C. L. (1748–1822). Corrected Lavoisier’s theory of acids; discovered bleaching power of chlorine; studied combining weights of atoms (stoichiometry).

Jenner, Edward (1749–1823). Discoverer of vaccination for prevention of smallpox (1776).

Dalton, John (1766–1844). The first great chemical theorist; proposed atomic theory (1807); stated law of partial pressure of gases. His ideas led to laws of multiple proportions, constant composition, and conservation of mass.

Avogadro, A. (1776–1856). Proposed principle that equal volumes of gases contain the same number of molecules. The number (6.02×10^{23} for 22.41 l of any gas) is a fundamental constant that applies to all chemical units.

Davy, Sir Humphry (1778–1829). Laid foundation of electrochemistry; studied electrolysis of salts in water and other electrochemical phenomena; isolated Na and K.

Gay-Lussac, J. L. (1778–1850). Discovered boron

and iodine; studied acids and bases and discovered indicators (litmus); improved production method for H_2SO_4 ; did basic research on behavior of gases versus temperature and on the ratios of gas volumes in chemical reactions.

Berzelius, J. J. (1779–1848). Classified minerals chemically; discovered and isolated many elements (Se, Th, Si, Ti, Zr); coined the terms *isomer* and *catalyst*; noted existence of radicals; anticipated discovery of colloids.

Faraday, Michael (1791–1867). Extended Davy’s work in electrochemistry; he developed theories of electrical and mechanical energy, electrolysis, corrosion, batteries, and electrometallurgy.

Wohler, F. (1800–1882). First to synthesize an organic compound—a rearrangement reaction (urea, 1828). This discovery was the beginning of synthetic organic chemistry.

Goodyear, Charles (1800–1860). Discovered vulcanization of rubber (1844) by sulfur, inorganic accelerator, and heat. Hancock in England made a parallel discovery.

Liebig, J. von (1803–1873). Fundamental investigation of plant life (photosynthesis) and soil chemistry; first to propose use of fertilizers. Discovered chloroform and cyanogen compounds.

Graham, Thomas (1805–1869). Studied diffusion of solutions through membranes; established principles of colloid chemistry.

Pasteur, Louis (1822–1895). (1) First to recognize infective bacteria as disease-causing agents; (2) developed concept of immunochemistry; (3) initiated heat sterilization of wine and milk (pasteurization); (4) observed optical isomers (enantiomers) in tartaric acid.

Lister, Joseph (1827–1912). Initiated use of antiseptics in surgery, e.g., phenols, carbolic acid, cresols.

Kekul, A. (1829–1896). Laid foundations of aromatic chemistry; conceived of four-valent carbon and structure of benzene ring; predicted isomeric substitutions (ortho-, meta-, para-).

Nobel, Alfred (1833–1896). Invented dynamite, smokeless powder, blasting gelatin. Established international awards for achievements in chemistry, physics, and medicine.

Mendeleev, D. I. (1834–1907). Discovered periodicity of the elements and compiled the first periodic table.

Hyatt, J. W. (1837–1920). Initiated plastics industry (1869) by invention of celluloid (nitrocellulose modified with camphor).

Perkin, Sir W. H. (1838–1907). Synthesized first

- organic dye (mauveine, 1856) and first synthetic perfume (coumarin). His work on dyes was continued and expanded by Hofmann in Germany.
- Beilstein, F. K.** (1838–1906). Compiled *Handbuch der Organischen Chemie*, a multivolume compendium of properties and reactions of organic chemicals.
- Gibbs, Josiah W.** (1839–1903). Stated three principal laws of thermodynamics; expounded on the nature of entropy and phase rule and the relation between chemical, electric, and thermal energy.
- Chardonnet, H.** (1839–1924). First to produce a synthetic fiber (nitrocellulose) with properties similar to rayon.
- Boltzmann, L.** (1844–1906). Developed kinetic theory of gases; their viscosity and diffusion properties are summarized in Boltzmann's law.
- Roentgen, W. K.** (1845–1923). Discovered x-radiation (1895). Awarded Nobel Prize in 1901.
- Le Chatelier, H. L.** (1850–1936). Fundamental research on equilibrium reactions (Le Chatelier's Law), combustion of gases, and metallurgy of iron and steel.
- Becquerel, H.** (1851–1908). Discovered radioactivity, deflection of electrons by magnetic fields, and gamma radiation. Nobel Prize 1903 (with the Curies).
- Moisson, H.** (1852–1907). Developed electric furnace for making carbides and preparing pure metals; isolated fluorine (1886). Nobel Prize 1906.
- Fischer, Emil** (1852–1919). Basic research on sugars, purines, uric acid, enzymes, nitric acid, ammonia. Pioneer work in stereochemistry. Nobel Prize 1902.
- Thomson, Sir J. J.** (1856–1940). Conducted research on cathode rays; resulted in proof of existence of electrons (1896). Nobel Prize 1906.
- Arrhenius, Svante** (1859–1927). Fundamental research on rates of reaction versus temperature, expressed by the Arrhenius equation, and on electrolytic dissociation. Nobel Prize 1903.
- Hall, Charles Martin** (1863–1914). Invented method of aluminum manufacture by electrochemical reduction of alumina. Parallel discovery by Heroult in France.
- Bakeland, Leo H.** (1863–1944). Invented phenolformaldehyde plastic (1907), the first completely synthetic resin (Bakelite).
- Nernst, Walther Hermann** (1864–1941). Awarded Nobel Prize in 1920 for his work in thermochemistry; did basic research in electrochemistry and thermodynamics.
- Werner, A.** (1866–1919). Introduced concept of coordination theory of valence (complex chemistry). Nobel Prize 1913.
- Curie, Marie** (1867–1934). Discovered and isolated radium; research on radioactivity of uranium. Nobel Prize 1903 (with Becquerel) in physics; in chemistry 1911.
- Haber, F.** (1868–1934). Synthesized ammonia from nitrogen and hydrogen, the first industrial fixation of atmospheric nitrogen (the process was further developed by Bosch). Nobel Prize 1918.
- Rutherford, Sir Ernest** (1871–1937). First to prove radioactive decay of heavy elements and to carry out a transmutation reaction (1919). Discovered half-life of radioactive elements. Nobel Prize 1908.
- Lewis, Gilbert N.** (1875–1946). Proposed electron-pair theory of acids and bases; authority on thermodynamics.
- Aston, F. W.** (1877–1945). Pioneer work on isotopes and their separation by mass spectrograph. Nobel Prize 1922.
- Fischer, Hans** (1881–1945). Basic research on porphyrins, chlorophyll, carotene; synthesized hemin. Nobel Prize 1930.
- Langmuir, Irving** (1881–1957). Fundamental research on surface chemistry, monomolecular films, emulsion chemistry. Also electric discharges in gases, cloud seeding, etc. Nobel Prize 1932.
- Staudinger, Hermann** (1881–1965). Fundamental research on high-polymer structure, catalytic synthesis, polymerization mechanisms, resulting eventually in development of stereospecific catalysts by Ziegler and Natta (stereoregular polymers). Nobel Prize 1963.
- Fleming, Sir Alexander** (1881–1955). Discovered penicillin (1928); initiated antibiotics. Nobel Prize 1945. The science was developed in the U.S. by Selman A. Waksman.
- Moseley, Henry G. J.** (1887–1915). Discovered the relation between frequency of X rays emitted by an element and its atomic number, thus indicating the element's true position in the periodic table.
- Adams, Roger** (1889–1971). Noted educator and contributor to industrial research in catalysis and structural analysis. Priestley Medal.
- Midgley, Thomas** (1889–1944). Discovered tetraethyllead and antiknock treatment for gasoline (1921) and fluorocarbon refrigerants; early research on synthetic rubber.
- Ipatieff, Vladimir N.** (1890?–1952). Basic research and development of catalytic alkylation and isomerization of hydrocarbons (with Herman Pines).
- Banting, Sir Frederick** (1891–1941). Isolated the insulin molecule. Nobel Prize 1923.
- Chadwick, Sir James** (1891–1974). Discovered the neutron (1932). Nobel Prize 1935.
- Urey, Harold C.** (1894–1981). Discovered heavy isotope of hydrogen (deuterium). Nobel Prize 1934. A leader of the Manhattan Project. Made original contributions to theories of the origin of the universe and of life processes.
- Carothers, Wallace** (1896–1937). Polymerization research resulting in synthesis of neoprene (polychloroprene) and of nylon (polyamide).
- Kistiakowsky, George B.** (1900–1982). Developed the detonating device used in the first atomic bomb.
- Heisenberg, W. K.** (1901–1976). Research in quantum mechanics resulting in development of the or-

bital theory of chemical bonding; stated uncertainty principle. Nobel Prize 1932.

Fermi, Enrico (1901–1954). First to achieve a controlled nuclear fission reaction (1939); basic research on subatomic particles. Nobel Prize 1938.

Lawrence, Ernest O. (1901–1958). Invented the cyclotron in which first synthetic elements were created. Nobel Prize 1939.

Libby, Willard F. (1908–1980). Developed radiocarbon dating technique based on carbon-14. Nobel Prize 1960.

Crick, F. H. C. (1916—) with Watson, J. D., elucidated structure of DNA molecule (1953) resulting in development of gene-splicing (recombinant DNA) techniques.

Woodward, Robert W. (1917–1979). Nobel Prize 1965 for his brilliant syntheses of such compounds as cholesterol, quinine, chlorophyll, and cobalamin.

B. American Chemical Society

(The following is based in part on an article prepared by Alden H. Emery, then secretary of the ACS, for the first edition of *Encyclopedia of Chemistry*.)

At a meeting held at Priestley's old home in Northumberland, Pennsylvania, in 1874 to celebrate the centennial of the discovery of oxygen, plans were laid to organize an American Chemical Society. The first official meeting was held two years later in New York City. It was attended by 35 chemists, out of a membership list of 133. Contrasted with these figures are the current attendance of about 15,000 at national meetings, from a membership of more than 125,000.

The society was originally incorporated in New York State; a national charter was granted by Congress as of January 1, 1938. The objectives of the Society are

“to encourage in the broadest and most liberal manner the advancement of chemistry in all its branches; the promotion of research in chemical science and industry; the improvement of the qualifications and usefulness of chemists . . . ; the increase and diffusion of chemical knowledge; and to promote scientific interests and inquiry; thereby fostering public welfare and education, aiding the development of our country's industries, and adding to the material prosperity and happiness of our people.”

These objectives are pursued by several means: (1) Meetings at the national, regional, and local levels, at which papers devoted to advanced chemical theory and practice are presented; several hundred of these are delivered at a single national meeting. (2) Publication of 24 journals in major areas of chemistry, including *Chemical Abstracts*, *Journal of the American Chemical Society*, *Industrial and Engineering Chemistry*, *Chemical Reviews*, and *Chemical and Engineering News*. The society also publishes reports of chemical symposia, *Advances in Chemistry*, and numerous chemical treatises, including the Monograph Series. (3) Strong and positive interest in chemical education,

evidenced by a series of intensive short courses, radio broadcasts on special topics, and tape recordings of symposia. (4) Maintenance of the general well-being of its membership by conservative management and the highest ethical and professional standards, as well as by many adjunctive functions such as employment service: “it has protected its members against legal encroachments on their rights and has acted positively to gain recognition for their proper status.”

The Priestley Medal, considered the highest award in chemistry, was established by the ACS in 1923. The Society also administers or sponsors many other awards.

C. Chemical Abstracts (CA)

The following is adapted from a *Chemical and Engineering News* report of the 75th anniversary of the first issue of *CA*, January 1, 1907. *CA* came into being primarily because U.S. chemists felt that European abstracting journals were neglecting U.S. chemical research.

From the beginning, the American Chemical Society charged *CA* with abstracting the complete world's literature of chemistry. The exponential growth of chemical research and publication in the ensuing years led to a parallel growth in *CA* and the organization that produces it.

The first year's issues of *CA* contained just under 12,000 abstracts. It now abstracts, indexes, or cites more than one and a half million scientific papers and patents annually, and each weekly issue contains almost 9,000 abstracts. The 13th-millionth abstract was published in 1997.

The early issues were edited by William A. Noyes, Sr., chairman of the ACS committee on papers and publications. Noyes was assisted by two part-time editors, a secretary, and 129 unpaid volunteer abstractors.

Staff members monitor more than 12,000 scientific journals and other periodicals from more than 150 nations, patents issued by 26 nations and two international bodies, and conference proceedings, reports, dissertations, and books from around the world in search of new information of chemical interest.

Document analysts abstract papers and patents published in more than 50 languages. They also thoroughly index each paper or patent using both key words and phrases from the titles and abstracts of the document as well as highly controlled and structured index entries to subjects covered and chemical substances mentioned.

Abstracts fill almost 35,000 pages in *CA* annually. Weekly indexes add another 8000 pages each year, and the more detailed and comprehensive volume indexes published every six months total almost 30,000 pages per year.

CA has become thoroughly international both in terms of the information it covers and the audience it serves. Nearly two-thirds of its circulation is abroad.

Noyes was succeeded as editor of *CA* in 1908 by Austin M. Patterson. Patterson retired in 1914 but made a major contribution after his retirement. When it was decided to publish a 10-year collective index to *CA* in 1916, it became evident that some systematic means of naming and indexing chemical substances was necessary. Patterson and Carleton E. Curran devised a naming scheme that had a profound effect on chemical nomenclature in general.

In 1915, E. J. Crane took over as editor and remained at the helm for 43 years, becoming the first director of Chemical Abstracts Service when the *CA* editorial organization was renamed and made a division of ACS in 1956. Crane made *CA* the model and pacesetter for all scientific abstracting and indexing services. He was succeeded as director of CAS in 1958 by Dale B. Baker, who led it through a difficult transition to financial self-sufficiency and a major growth in staff and facilities, and moved it into the computer age. An extensive, in-depth systems approach to the storage and handling of chemical information has enabled CAS to assemble a vast computerized body of knowledge, typified by its Chemical Compound Registry, a collection of some six million structural formulas, any of which can be instantaneously retrieved and displayed. This unique system is known as CAS On-Line.

D. Center for History of Chemistry

The Center for History of Chemistry was established in January 1982 under the joint sponsorship of the American Chemical Society and the University of Pennsylvania. It is located at the Van Pelt Library on the campus of the university in Philadelphia. The long-range purpose of the Center is to increase general appreciation of the significance of chemistry as a creative enterprise resulting from a more adequate history of U.S. chemistry. The short-range goal of the Center is to locate, catalog, preserve, publicize, and make available the historical records that illuminate the development of chemistry, chemical engineering, and the chemical industry.

E. Brief History of Five Major Industries

1. Drug and Pharmaceutical

The use of drugs and medicines as curative agents began with the Hindus, who successfully practiced vaccination techniques as early as 550 A.D., and continued with the alchemists in the Middle Ages. They experimented with a wide range of plant principles, as well as with arsenic compounds and various metals. The first compilation of drugs, the *Nuremberg Pharmacopeia*, appeared in 1542, just a year after the death of Paracelsus, a Swiss physician and chemist. He modernized the approach of the alchemists to diseases and ridiculed the ancient ideas that were still current in the 16th century. Plant products such as cinchona bark, ipecac, and chaulmoogra oil were used for many years. In 1805, morphine was obtained from the opium pop-

py, paving the way for the introduction of an extensive series of alkaloid drugs, many of which are still in use.

The first notable breakthrough in disease treatment was Jenner's successful inoculation for smallpox (1775) that initiated the science of immunochemistry. Because this disease had ravaged Europe for centuries, Jenner's brilliant work is a landmark in medical history. Pasteur adopted this technique; he was the first to inoculate for anthrax and rabies (1880) and to establish the antigen-antibody relationship. Still more important was his identification of many types of infective microorganisms (germs) as disease-causing agents. Almost simultaneously, Lister introduced surgical antiseptics, such as mercury compounds, carbolic acid, and phenol, and Robert Koch discovered the germs of anthrax, cholera, and tuberculosis.

Chemotherapy may be said to have begun when Ehrlich developed his arsphenamine treatment of syphilis (1910), the so-called "magic bullets" that killed microorganisms with minimum damage to the host. This practice has been broadly applied to cancer therapy in recent years but without positive results. Another significant event was Funk's discovery (1911) of the ability of certain plant products to cure a disease called beri-beri; these soon were named vitamins. Their classification, metabolic functions, and curative properties were established by many researchers, including McCollum, Szent-Gyorgyi, Sherman, and R. J. Williams (B complex).

The science of endocrinology was developing rapidly at this time. Outstanding was the isolation of insulin for treatment of diabetes by Banting in the early 1920s. Continuing research in this field led to the development of many hormones for treatment of a wide variety of disorders, especially the adrenal cortical steroid hormone (ACTH), cortisone, and thyroxine.

In 1928, Fleming in England noted the antimicrobial action of certain plant molds that produced penicillin. Some years later, Waksman in the U.S. initiated the development of these mold products, which he called antibiotics. These were so effective against many infectious diseases that they soon displaced the sulfa drugs that had been introduced a few years earlier. Antibiotics have proliferated in recent years and have been the most significant addition to curative drugs in the history of medicine. Coincidental with this development was the discovery of the tobacco mosaic virus by Stanley in 1935, which resulted in new concepts of the nature and behavior of infective microorganisms. The early 1940s saw the introduction of antimalarials as substitutes for quinine and of antihistamines for treatment of allergic diseases.

Significant breakthroughs are by no means confined to the past. Current research on gene-splicing techniques has already resulted in "programming" bacteria to produce insulin and interferon, as well as the creation of wholly new forms of bacteria that have great potential not only in medicine but also in chemistry and agriculture.

2. Paper

Paper owes its name to papyrus, a plant from which the ancient Egyptians made rolls of tissue on which they inscribed historical records. The actual manufacture of paper from plant fibers originated in China about 100 A.D.. The primitive technology traversed Asia and the Middle East over a period of several centuries. By 1400, it had reached Europe. The first use of paper for bookmaking was in the Gutenberg Bible (1455). Papermaking began in England about 1500. The first mill in the U.S. was installed in 1690 in Philadelphia. Scheele's discovery of the bleaching power of chlorine (1774) was an important advance; another was the invention of vat sizing with alum and rosin (1800).

On the mechanical side, the invention of the fourdrinier machine was largely responsible for the future development of the industry. Patented in 1807, it was built in England and installed in the U.S. in 1827. Soda pulp was first made in 1854. The principles of sulfite pulping were disclosed by Tilghman in America (1867), and the process was developed in Germany by Mitscherlich in 1874. Groundwood pulp entered commercial use for newsprint about 1870. The sulfate or kraft process, invented by Dahl in Germany in 1884, was first used in the U.S. in 1909. The technique of machine coating was developed in 1875. Continual improvement of the fourdrinier and similar machines by the 1920s resulted in paper speeds of 1000 feet a minute and continuous operation over a period of several days.

Developments since 1920 include multistage bleaching of kraft; bleaching with peroxides, chlorine dioxide, and sodium hypochlorite; use of synthetic resins for wet-strength paper for bags, maps, etc.; and use of soluble bases for sulfite pulping, which allow the use of more species of wood.

The official organization of papermakers in the U.S. is the Technical Association of the Pulp and Paper Industry (TAPPI), founded in 1915. Basic research is carried out at the Institute of Paper Chemistry in Appleton, Wisconsin.

3. Plastics

The first plastic was a mixture of cellulose nitrate and camphor invented in the 1860s by John Wesley Hyatt; it was given the TM "Celluloid." In 1899 Spitteler developed a method of hardening casein with formaldehyde and thus founded the casein plastics industry, e.g., small items such as buttons. The earliest high-volume plastic, a condensation product of phenol and formaldehyde, was introduced by Leo Baekeland in 1907. Trademarked "Bakelite," it was the first truly synthetic high polymer. Its chief use was as engineering material since its dark color limited its application to items in which color was not a factor.

In 1927 cellulose returned to the scene with the development of cellulose esters in the form of the acetate and butyrate produced as sheet, fibers, and molded items. At this time an important mechanical development occurred: compression molding began to give way to injection molding, a greatly improved

technique in which the pelleted plastic is introduced into the mold in semiliquid form under pressure. This was a landmark in the growth of the industry.

During the period 1920–1930, the German chemist Hermann Staudinger was deeply involved in fundamental research on polymerization mechanisms that was to profoundly affect the future of plastics. The importance of his work can not be overestimated.

Several notable events took place during the 1930s, when the field was crowded with significant developments that occurred almost simultaneously. One of these was the introduction of amino resins (catalyzed reaction products of urea or melamine with formaldehyde). These had a great advantage over phenol-formaldehyde because they made possible white or light-colored products suitable for scale housings and domestic items such as dinnerware. Two other achievements were due to the genius of Wallace Carothers, from whose research came neoprene (polychloroprene), the first approach to synthetic rubber (1930), and soon after the polyamide nylon, the first wholly synthetic fiber. Two other notable polymers were polystyrene (about 1932) and polyethylene, the latter developed in England (1939).

Other important developments were the technique of emulsion polymerization, in which two or more monomers can be copolymerized; reinforced plastics (glass fibers impregnated with phenolic and other resins); foamed or cellular plastics, both flexible and rigid; silicone resins originally researched by Kipping and developed in the 1940s; the invention of block and graft polymers; and the extremely important stereospecific catalysts devised by Ziegler and Natta and based on the earlier research of Staudinger. These permit selective control of polymer structure and resulted in the development of polypropylene and polyisoprene (the first actual synthetic rubber), among other products.

The industry is represented by the Society of the Plastics Industry; the Society of Plastics Engineers is chiefly concerned with the engineering aspects of plastics technology.

4. Petroleum

Petroleum was found in many locations throughout the world before its discovery in the U.S. The first well was drilled by Drake in Pennsylvania in 1859; its depth was a mere 70 feet, in contrast to the 20,000 feet that can be attained with modern equipment. For many years, production was confined to the eastern states, the oil being used chiefly for lubrication and illumination (kerosene). Around the turn of the century, the great strikes in the southwest and California coincided with the expanding demand for motor fuels. Production figures (in millions of gallons) were: 1880, 26; 1900, 64; 1920, 443; 1940, 1300; 1960, 2470; and 1970, 3327. Since 1970, U.S. production has declined substantially in spite of new methods of secondary extraction, such as chemical flooding and hydraulic fracturing.

Notable advances in refining techniques occurred at an increasing rate after 1910, when thermal cracking

was introduced as a result of research by Burton. This did not yield gasoline of high quality. Its performance was greatly improved by Midgley's discovery in 1921 of the octane-boosting power of tetraethyllead from about 60 to 100 octane or more. An outstanding achievement was the development of catalytic methods over the next 20 years. Early catalysts were activated clays or silica-alumina. In recent years, these have given way to zeolites (molecular sieves) and to metals of the platinum group. The processing techniques include the fixed-bed method, later replaced by moving-bed and fluidized-bed continuous crackers. The exhaustive study and evaluation of catalysts largely accounted for the present sophisticated techniques that characterize the industry. Many catalytic reforming processes (alkylation, isomerization, hydrocracking, etc.) were researched and developed between 1940 and 1960. Important contributions to this development were being made by Ipatieff and Egloff.

All questions relating to the industry, including production statistics, reserves, and exploitation of alternative sources can be referred to the American Petroleum Institute, 275 7th Ave., New York, NY 10001.

5. Rubber

While exploring the Amazon in 1735, French scientist LaCondamine noted a resilient material that the natives obtained by tapping certain trees (*Hevea*) and coagulating the sap (latex) over fires. This they used for making waterproof shoes and large balls with which they played games. He took samples of this substance to Europe, where it aroused great interest, especially among chemists such as Priestley. Its ability to erase pencil marks by rubbing was the origin of the word *rubber*. The *Hevea* forests of Brazil remained the primary source of rubber for 150 years. In 1875 an English botanist, Henry Wickham, was requested by his government to obtain a supply of *Hevea* seeds. He helped himself to several thousand of these; they were planted in Kew Gardens in London, and the seedlings were transplanted to Malaya. Thus began the commercial production of plantation rubber, which soon displaced Brazilian sources and gave Great Britain control of the world rubber market until World War II.

The rubber industry began in 1844 with the simultaneous discovery of vulcanization with sulfur and inorganic accelerators (metallic oxides) by Goodyear in the United States and by Hancock in England. But it was not until the early years of the 20th century that it became a major industry, as a result of three important developments: (1) the discovery in 1906 of the much more efficient organic accelerators (nitrogenous compounds), which were used for some years by one company before being widely accepted (1920); (2) the fortuitous discovery of the reinforcing and abrasion-resistant properties of carbon black; and (3) the introduction of age resisters (antioxidants), which greatly prolonged the life of rubber by inhibiting oxidation. As a result of these advances, the mileage of tires suddenly increased by a factor of ten, with comparable reduction in risk of failure, and thus made possible the vast growth of the automobile industry.

An efficient method of reclaiming vulcanized scrap was developed about 1900, involving digestion of the scrap with NaOH plus a hydrocarbon softener. This separated the cotton insertions from the rubber and partially reversed the effect of vulcanization. Use of reclaim has long been an important adjunct to the industry, especially for low-cost, high-volume products.

Methods of concentrating latex sufficiently by centrifugation to make long-distance transportation economically possible were introduced in the early 1930s, thus simplifying the manufacture of thin and irregularly shaped items, either by dipping or electrodeposition, as well as of cellular rubber (foamed or sponge products).

Significant developments in synthetic rubber began at this time. Outstanding were the introduction of polychloroprene (neoprene) by Carothers, and of the oil-resistant polysulfide rubber Thiokol by Patrick. These were soon followed by styrene-butadiene copolymers, nitrile rubber, butyl rubber, and various other types, some of which were rushed into production for the war effort in the early 1940s. The stereospecific catalysts researched by Ziegler and Natta aided this development, including synthesis of true rubber hydrocarbon (polyisoprene). Since 1935 synthetic rubbers have been referred to as elastomers.

APPENDIX III

Manufacturers of Trademarked Products

Alphabetical List

- 3M
3M Center Bldg.
223-6s-04
St. Paul, MN 55144
Website: <http://www.3m.com>
- Abbott Laboratories
Chemical Division
100 Abbott Park Rd.
Abbott Park, IL 60064
Website: <http://www.abbott.com>
- Accepta
Quay West
Trafford Wharf Road
Manchester M17 1HH
England
Website: <http://www.accepta.com>
- ACC Silicones Europe
Bridgewater, Somerset
South West England, UK
Website: <http://www.accsilicones.com>
- Accurate Chemical and Scientific Corp.
300 Shames Drive
Westbury, NY 11590
Website: <http://www.accuratechemical.com>
- Ace Chemical Products
8415 N. 87th St.
Milwaukee, WI 53224
Website: <http://www.acechemicalproducts.com>
- ACH Food Companies, Inc.
7171 Goodlet Farms Parkway
Memphis, TN 38018
Website: <http://www.achumko.com>
- Active Organics, Inc.
1097 Yates Street
Lewisville TX 75057
Website: <http://www.activeorganics.com>
- Advanced Ingredients
331 Capitola Ave.
Ste. F
Capitola, CA 95010
Website: <http://www.advancingredients.com>
- Afrocare International Limited
5 Knight House
Lenthall Road
Loughton
Essex,
1G10 3UD
United Kingdom
