Introduction

The First Edition of the *Condensed Chemical Dictionary* appeared in 1919 when the chemical industry in the United States was entering a huge expansion program as a result of World War I. The urgent need for such a reference book became apparent to Francis M. Turner, president of the Chemical Catalog Company, predecessor of the Reinhold Publishing Corporation. Under his supervision a succession of editors developed and expanded the *Condensed Chemical Dictionary* to meet the growing needs of the chemical industry. Since his death this development has continued, with the result that the work has achieved worldwide recognition in its field.

The *Condensed Chemical Dictionary* is a unique publication. It is not a dictionary in the usual sense of an assemblage of brief definitions, but rather a compendium of technical data and descriptive information covering many thousands of chemicals and chemical phenomena, organized in such a way as to meet the needs of those who have only minutes to devote to any given substance or topic.

Three distinct types of information are presented: (1) descriptions of chemicals, raw materials, processes, and equipment; (2) expanded definitions of chemical entities, phenomena, and terminology; and (3) descriptions or identifications of a wide range of trademarked products used in the chemical industries. Supplementing these are listings of accepted chemical abbreviations used in the literature, short biographies of chemists of historic importance, and winners of the Nobel prize in chemistry. Also included are descriptions or notations of the nature and location of many U.S. technical societies and trade associations. In special cases editorial notes have been supplied where it was felt necessary to clarify or amplify a definition or description. A few entries written by specialists are acknowledged by use of the author's name.

In a work of this nature, selection of topics for inclusion can hardly fail to be influenced by current interests and developing concerns within the topic area. The growing importance to chemists, and to the general public as well, of environmental and health hazards, which came to the forefront so quickly in the 1960s, was reflected in the eighth edition, which greatly increased its coverage of this aspect of chemistry.

Since then, the magnitude of the energy problem has been uppermost in the thinking of a broad spectrum of engineers, chemists, and physicists because it is certainly the most important technical problem confronting this country.

Both the Ninth and Tenth Editions, while retaining emphasis on environmental considerations, were expanded in the area of energy and its sources, as far as permitted by available information. The goal of the editors was to provide condensed, authoritative, factually oriented statements and descriptions, and to resist prognostications as to the future potential of any particular energy source. At the same time, continuing

attention has been devoted to common hazards, such as flammable and explosive materials, poisons, pesticides, carcinogens, corrosive agents, and radioactive wastes, in line with the practice followed in earlier editions, and with the increasing public concern over these matters.

The Eleventh Edition added new chemicals, revised the format for chemical entries, and added new trademarked products and definitions. Chemical Abstract Services (CAS) numbers were included for many chemical entries to facilitate recourse to computerized databases.

In the Twelfth Edition all trademarked entries were revised. The method of referencing was changed from superscripted numbers to the company names, facilitating access to the addresses of the manufacturers of trademarked products. Many additional definitions and cross-references were added to make the work current with the constantly growing field of chemistry.

In the Thirteenth Edition all trademarked entries were revised and all CAS numbers verified. Many additional chemical entries, definitions, and cross-references were added to make the work current with the constantly growing field of chemistry.

In the Fourteenth Edition links to the internet were added. Worldwide web page addresses were added for manufacturers and associations in the appropriate entries and in Appendix III. Trademarked entries and their associated manufacturers were updated to reflect the constant flux in the modern chemical industry. Many additional chemical entries, definitions, and cross-references were added to make the work current with the constantly growing field of chemistry.

This Fifteenth Edition contains over 4,200 new or updated entries. Special effort was directed to add definitions and terms of art for biochemistry. Over 700 entries reflecting the great interest in biochemistry are now included. Over 90 terms relating to nano technology were added. Almost 3,000 new chemicals were added, including trade named products. Links to worldwide web page addresses for manufacturers and associations in the appropriate entries and in Appendix III were verified or added. Trademarked entries and their associated manufacturers were updated to reflect the constant flux in the modern chemical industry.

In connection with certain classifications of substances, particularly pesticides and carcinogens, which have caused the most controversy, the statement "Use may be restricted" indicates that a state or local regulation may exist, even though a product has not been officially banned, or that a definitive ruling on its use is pending. When a product has been banned outright, the statement "Use has been prohibited" is used. A number of disputed cases have arisen in recent years; although some have been definitely settled, others are still being evaluated or are in the process of litigation.

In such a work as this, in view of the many materials in various stages of evaluative testing, court procedures, appeals, hearings, and so forth, it is impossible to keep abreast of every development. The user should check the current status of any questionable products before making decisions that involve them (see *Hazard*, below).

Arrangement of Entries

The entries are listed in strict letter-by-letter alphabetical order, that is, those comprising two or more words are alphabetized as if they were a single word. For example, "acidimetry" precedes "acid lining," and "waterproofing agent" precedes "water softener." Many of the prefixes used in organic chemistry are disregarded in alphabetizing because they are not considered an integral part of the name; these include *ortho* (*o-*), *meta* (*m-*), *para* (*p-*), alpha (α), beta (β), gamma (γ), *sec-*, *tert-*, *sym-*, *as-*, *uns-*, *cis-*, *trans-*, *endo-*, *exo-*, *d-*, *l-*, *dl-*, *n-*, *N-*, *O-*, as well as all numerals. However, there are certain prefixes that are an integral part of the name (*iso-*, *di-*, *tri-*, *tetra-*, *cyclo-*, *bis-*, *neo-*, *pseudo-*), and in these cases the name is placed in its normal alphabetical position. For example, dimethylamine is under "D" and isobutane is under "I." The same is true of mono- (used as little as possible) and *ortho-*, *meta-*, and *para-* in inorganic compounds such as sodium orthophosphate.

Chemicals and Raw Materials

The information in the categories listed next is given for each substance in the sequence indicated; where entries are incomplete, it may be presumed that no reliable data were provided by the reference systems utilized.

Name: The commonly accepted name is the key entry.

Terminological variations are indicated where necessary. In virtually all cases, the name is given in the singular number. A name having initial caps and enclosed in quotes is a trademark (TM). The manufacturers of trademarked products are indicated directly after the name in italics and within brackets (e.g., [*Du Pont*]). The addresses of the manufacturers are given in Appendix III.

Synonym: Alternative names (IUPAC and others), as well as trivial names, are indicated. Obsolete and slang names have been eliminated as far as possible. Most synonyms are entered independently and cross-referenced, but space limitation has not permitted complete consistency in this regard.

Chemical Abstract Service Registry Number (CAS):

This universally used number permits use and comparison of data on a given material even though published under different synonyms. It will, in fact, permit absolute identification of a compound with all of its synonyms. CAS numbers also facilitate

extraction of information from computerized data bases.

Formula: The molecular (empirical or atomic) formula is regularly given. Structural formulas are used in special cases of unusual importance or interest.

Properties: The properties typically given are physical state, atomic number, atomic weight, valence, isotopes, odor, taste, density, boiling point (at 760 mm Hg unless otherwise stated), melting point (freezing point), refractive index, and solubility or miscibility. Various other properties are given where pertinent: flash point, autoignition temperature, electrical properties, tensile strength, hardness, expansion coefficient, and so forth.

Source or Occurrence: Geographical origins of metals, ores, essential oils, vegetable oils, and other natural products are given.

Derivation: The chemical reactions or other means of obtaining the product by current industrial methods are emphasized. Obsolete and "curiosity" methods have been largely eliminated.

Grade: Recognized grades are provided as reported in the industrial literature, including technical, CP, USP, refined, reactor, and semiconductor.

Hazard: This category includes flammability, toxicity characterization, explosion risks, and so on, based on authoritative data. Also given are the Threshold Limit Values (TLV) for workroom exposures established by the American Conference of Government Industrial Hygienists (ACGIH); and various rulings of the Food and Drug Administration.

The ACGIH rates carcinogens in five categories. *confirmed human carcinogen*, indicating the evidence is compelling for causing human cancer; *suspected human carcinogen*, indicating the substance is carcinogenic in animals but convincing evidence for human carcinogenesis is lacking; *animal carcinogen*, indicating the substance is carcinogenic in animals; *not classifiable as a human carcinogen*, indicating inadequate data are available to make a decision; and *not suspected as a human carcinogen*, indicating the available data do not suggest the likelihood the substance causes cancer.

It was not considered practical to include occupational exposure recommendations made by the National Institute for Occupational Safety and Health or exposure standards established by the Occupational Safety and Health Administration.

The toxicity ratings are intended to be used only as indications of the industrial hazard presented by a given material, as most of them are based on tests made on laboratory animals. Qualified toxicologists or physicians should be consulted for specific evaluations, dosages, exposure times, and concentrations. For further information regarding these hazards, the reader is referred to the following entries: combustible material; flammable material; dust, industrial;

corrosive material; oxidizing material; poison (1); toxicity; toxic materials; and carcinogen.

Use: These are primarily large-scale applications. Because of the rapidity of change in the chemical industries and the difficulty of obtaining reliable current data, no attempt has been made to list uses in the order of their tonnage consumption. The patent literature is not specifically represented.

Website: The worldwide web internet address is provided of the company or association.

General Entries

It is likely that no two editors would completely agree about what general subjects should be included in a dictionary of this kind. The major subdivisions of matter directly involved with chemical reactions, the various states of matter, and the more important groups of compounds would almost certainly be regarded as essential, but beyond these, the area of selectivity widens rapidly. The topics either added or expanded by the present editor were chosen chiefly because of their interest and importance, both industrial and biochemical, and secondarily because of the terminological confusion evidenced in the literature and in industrial practice. Regarding the latter, the reader is referred to the entries on gum, resin, pigment, dye, filler, extender, reinforcing agent, and homogeneous and combustible materials. In some cases a position has been taken that may not be accepted by all, but is defensible and certainly not arbitrary. Even editors must acknowledge that the meanings and uses of terms often change illogically, and that such changes are usually irreversible.

Among the general entries are important subdivisions of chemistry; short biographies of outstanding chemists of the past including winners of the Nobel prize for chemistry through 2000; numerous group definitions (barbiturate, peroxide); major chemical and physical chemical phenomena (polymerization, catalysis); functional names (antifreeze, heat-exchange agent); terms describing special material forms (aerosol, foam, fiber); energy sources (solar cell, fuel cell, fusion); the more important chemical processes; and various types of machinery and equipment used in the process industries. No general entry is intended to be encyclopedic or definitive, but rather a condensation of essential information, to be supplemented by reference to specialized sources. To present all this in useful and acceptably complete form has been a challenging, though often frustrating task, which the editor

leaves with the uneasy feeling that, like the bread-crumbs in the Hatter's butter, some mistakes may have got in as well.

Trademarks

Continuing the policy of previous editions, an essential component of the Dictionary comprises descriptions of proprietary industrial products. The information was either provided by the manufacturers of these materials or taken from announcements or advertisements appearing in the technical press. Each proprietary name is enclosed in quotation marks, is stated to be a trademark (or brand name), and is followed by a portion of the name of the manufacturer of the trademarked product. Manufacturer names are displayed in italics and within brackets (e.g., [*Du Pont*]). The addresses of the manufacturers are given in Appendix III. We wish to thank the owners of these trademarks for making the information available. The space devoted to these is necessarily limited, as the constant proliferation and changes in trademarked products make it impossible to list more than a small fraction of them in a volume such as this.

The absence of a specific trademark designation does not mean that proprietary rights may not exist in a particular name. No listing, description, or designation in this book is to be construed as affecting the scope, validity, or ownership of any trademark rights that may exist therein. Neither the editor nor the publisher assumes any responsibility for the accuracy of any such description or for the validity or ownership of any trademark.

A Request

Many corrections and suggestions have been made by readers from around the world during the long history of the earlier editions. The editors have always tried to acknowledge these to the best of their ability. They have welcomed this correspondence, for it has been an important source of information about the acceptance of the Dictionary by its readers. The present editor and publisher wish to encourage this reaction from the field, not only to permit corrections to be made in reprinted issues, but also to establish a basis for preparing future editions. All letters addressed to the publisher will be forwarded.

Acknowledgments

I extend thanks to Bob Esposito for his management and encouragement of this effort and to Shirley Thomas for her attention to all phases of the production of this book. I also thank Rita Perez for her editing. Her comments and corrections were to the point and very helpful.

Dedicated to Grace Ross Lewis, who makes this work possible and enjoyable.

CONDENSED CHEMICAL DICTIONARY	1
Appendix I: Origin of Some Chemical Terms	1357
Appendix II: Highlights in the History of Chemistry	1364
Appendix III: Manufacturers of Trademarked Products (Alphabetical List)	1370

A

α. See alpha.

A. Abbreviation for absolute temperature.

Å. Abbreviation for Ångstrom.

a. Abbreviation for atto-, a prefix meaning 10^{-18} unit.

AAAS. See American Association for the Advancement of Science.

AATCC. See American Associates of Textile Chemists and Colorists.

abaca. (Manila hemp). The strongest vegetable fiber, obtained from the leaves of a tree of the banana family. The fibers are 4–8 feet long, light in weight, soft, lustrous, and nearly white; they do not swell or lose strength when wet. Denier ranges from 300 to 500. Combustible, but self-extinguishing.

Source: Philippines, Central America, Sumatra.

Use: Heavy cordage and twine, especially for marine use; manila paper.

See hemp.

abate. (O,O-dimethyl phosphorothioate-O,O-diester with 4,4'-thiodiphenol; temephos).

CAS: 3383-96-8. $[(\text{CH}_3\text{O})_2\text{PSOC}_6\text{H}_4]_2\text{S}$.

Properties: Colorless crystals. Mp 30C.

Hazard: Toxic by ingestion and inhalation. Cholinesterase inhibitor. TLV: 10 mg/m³.

Use: Pesticide.

Abbé condenser. Substage two-lens condenser giving numerical aperture of 1:20–1:25. Three-lens versions give numerical aperture of 1:40.

Abbé number. (1) The reciprocal of dispersive power. (2) The measure of optical dispersion of a glass; the measure of two planes not displacing the axis.

Abegg's rule. The solubility of salts of alkali metals decreases in strong acids and increases in weak acids as atomic weight increases. This is an empirical rule; sodium chloride is an exception.

Abel-Pensky flash-point apparatus. Instrument used for the determination of the flash point of petroleum.

aberration. Deviation from the ideal in an optical system, the image points being imperfect or improperly located.

aberration, spherical. The aberration by which light passing through the edge of a lens with spherical surfaces comes to focus in a different image plane from that passing through the lens center.

abherent. Any substance that prevents adhesion of a material to itself or to another material. It may be in the form of a dry powder (a silicate such as talc, mica, or diatomaceous earth); a suspension (bentonite-water); a solution (soap-water); or a soft solid (stearic acid, tallow waxes). Abherents are used as dusting agents and mold washes in the adhesives, rubber, and plastics industries. Fats and oils are used as abherents in the baking industry. Fluorocarbon resin coatings on metals are widely used on cooking utensils.

See antiblock agent; dusting agent.

Abies Siberica oil. See fir needle oil.

abietic acid. (abietinic acid; sylvic acid).

CAS: 514-10-3. $\text{C}_{19}\text{H}_{29}\text{COOH}$ (having a phenanthrene ring system). A major active ingredient of rosin, where it occurs with other resin acids. The term is often applied to these mixtures, separation of which is not achieved in technical grade material.

Properties: Yellowish, resinous powder. Mp 172–175C, optical rotation -106 . Soluble in alcohol, ether, chloroform, and benzene; insoluble in water. Combustible.

Derivation: Rosin, pine resin, tall oil.

Method of purification: Crystallization.

Grade: Technical.

Use: Abietates (resinates) of heavy metals as varnish driers, esters in lacquers and varnishes, fermentation industries, soaps.

“Abitol” [Aqualon]. TM for a colorless, tacky, very viscous liquid; mixture of tetra-, di-, and dehydroabietyl alcohols made from rosin.

Use: Plasticizers, tackifiers, adhesive modifiers.

ablation experiment. An experiment designed to produce an animal deficient in one or a few cell types in order to study cell lineage or cell function. The idea is to make a transgenic mouse with a toxin gene (often a diphtheria toxin) under control of a specialized promoter which activates only in the target cell type. When embryo development progresses to the point where it starts to form the target tissue, the toxin gene is activated, and the target tissue dies. Other tissues are unaffected.

ablative material. Any material that possesses a capability for rapidly dissipating heat from a substrate. Specialized ceramic tiles developed since

1980 for protection of the space shuttle have proved successful. The materials used are of two major types: (1) Fibers made from white silica, fused in an oven, cut into blocks, and coated with borosilicate glass; these are extremely efficient at temperatures up to 2300F. (2) An all-carbon composite (called reinforced carbon-carbon) made by laminating and curing layers of graphite fiber previously coated with a resin, which is pyrolyzed to carbon. The resulting tile is then treated with a mixture of alumina, silicon, and silicon carbide. Such composites are used for maximum-temperature (nose-cone) exposure up to 3000F. Both types are undamaged by the heat and are reusable. The tiles are adhered to the body of the spacecraft with a silicone adhesive. Ablative materials used on early spaceship trials were fluorocarbon polymers and glass-reinforced plastics, but these were wholly or partially decomposed during reentry.

Abram's law. The strength of concrete depends on the water/cement ratio.

abrasion. Gradual erosion of the surface of a material both by physical forces (simultaneous cutting, shearing, and tearing) and by chemical degradation, chiefly oxidation. Temperature is a significant factor: friction may raise the temperature of the surface layers to the point where they become subject to chemical attack. Abrasion causes deterioration of many materials, especially of rubber (tire treads), where it can be offset by a high percentage of carbon black; other materials subjected to abrasion in their service life are textiles (laundrying), leather and plastics (shoe soles, belting), and house paints and automobile lacquers (airborne dust, grit, etc.).

See abrasive.

abrasive. A finely divided, hard, refractory material, ranging from 6 to 10 on the Mohs scale, used to reduce, smooth, clean, or polish the surfaces of other, less hard substances, such as glass, plastic, stone, wood, etc. Natural abrasive materials include diamond dust, garnet, sand (silica), corundum (aluminum oxide, emery), pumice, rouge (iron oxide), and feldspar; the more important synthetic types are silicon carbide, boron carbide, cerium oxide, and fused alumina. Abrasive in powder form may be (1) applied directly to the surface to be treated by mechanical pressure or compressed-air blast, as in cleaning building stone; (2) affixed to paper or textile backing after the particles have been coated with an adhesive; or (3) mixed with a bonding agent such as sodium silicate or clay, the particles being compressed into a wheel rotated by a power-driven shaft. Aluminum grinding wheels are fabricated by bonding industrial diamonds with fluorocarbon polymer ("Teflon"). The process involves reaction of fluorine with the surfaces of the diamonds, chemical bonding of the fluorinated diamonds to the fluorocarbon, and further chemical bonding of the result-

ing material to the aluminum, with application of heat and pressure.

abrasive, coated. See abrasive (2).

ABS. Abbreviation for (1) alkyl benzene sulfonate (detergent); (2) acrylonitrile-butadiene-styrene copolymer.

See ABS resin.

abscisic acid.

CAS: 21293-29-8. $C_{15}H_{20}O_4$. A plant growth regulator that promotes detachment of leaves and fruit.

Properties: Colorless crystals. Mp 160C. Sublimes at 120C. Soluble in acetone, ether, chloroform; slightly soluble in water. Optically active.

Occurrence: In plants, fruits, and vegetables from which it can be extracted. Also made synthetically.

Use: In orchard sprays to facilitate fruit harvesting, defoliant, growth inhibitor.

absinthium. (wormwood). $C_{30}H_{40}O_7$. An essential oil with intensely bitter taste due to presence of absinthin.

Hazard: Toxic by ingestion.

Use: A flavoring in liqueurs, vermouth.

absolute. (1) Free from admixture of other substances; pure. Example: absolute alcohol is dehydrated ethanol, 99% pure. (2) The pure essential oil obtained by double solvent extraction of flowers in the manufacture of perfumes.

See concrete (2). (3) absolute temperature.

absolute configuration. The configuration of four different substituent groups around an asymmetric carbon atom. The absolute configurations of molecules in biochemistry are compared to the configuration of d- and l-glyceraldehyde.

absolute error. The actual difference between the approximate and the exact value in any calculation.

absolute temperature. The fundamental temperature scale used in theoretical physics and chemistry, and in certain engineering calculations, such as the change in volume of a gas with temperature. Absolute temperatures are expressed either in degrees Kelvin or in degrees Rankine, corresponding respectively to the centigrade and Fahrenheit scales. Temperatures in Kelvins are obtained by adding 273 to the centigrade temperature (if above 0C) or subtracting the centigrade temperature from 273 (if below 0C). Degrees Rankine are obtained by subtracting 460 from the Fahrenheit temperature.

absolute zero. Temperature at which the volume of a perfect gas theoretically becomes zero and all thermal motion ceases: $-273.15C$ or $-459.4F$.

absorbent. (1) Any substance exhibiting the property of absorption, e.g., absorbent cotton, so made by removal of the natural waxes present. (2) A material that does not transmit certain wavelengths of incident radiation.

See absorption (1); absorption (2).

absorptiometer. An instrument for determining the solubility of a gas in a liquid.

absorption. (1) In chemical terminology, the penetration of one substance into the inner structure of another, as distinguished from adsorption, in which one substance is attracted to and held on the surface of another. Physicochemical absorption occurs between a liquid and a gas or vapor, as in the operation known as scrubbing, in which the liquid is called an absorption oil; sulfuric acid, glycerol, and some other liquids absorb water vapor from the air under certain conditions. Physiological absorption takes place via porous tissues, such as the skin and intestinal walls, which permit passage of liquids and gases into the bloodstream.

See adsorption; hygroscopic. (2) In physical terminology, retention by a substance of certain wavelengths of radiation incident upon it, followed either by an increase in temperature of the substance or by a compensatory change in the energy state of its molecules. The UV component of sunlight is absorbed as the light passes through glass and some organic compounds, the radiant energy being transformed into thermal energy. The radiation-absorptive capacity of matter is utilized in analytical chemistry in various types of absorption spectroscopy. (3) In physical chemistry, the ability of some elements to pick up or "capture" thermal neutrons produced in nuclear reactors as a result of fission. This is due to the capture cross section of their atoms, which is measured in units called barns; elements of particularly high neutron absorption capability are cadmium and boron.

absorption (biology). Transport of the products of digestion from the intestinal tract into the blood.

absorption band. The range of wavelengths absorbed by a molecule; for example, absorption in the infrared band from 2.3 to 3.2 μm indicates the presence of OH and NH groups, while in the band from 3.3 to 3.5 indicates aliphatic structure. Atoms absorb only a single wavelength, producing lines, such as the sodium D line.

See spectroscopy; resonance (2); ultraviolet absorber; excited state.

absorption oil. See absorption (1).

absorption spectroscopy. An important technique of instrumental analysis involving measurement of the absorption of radiant energy by a substance as a function of the energy incident upon it.

Absorption processes occur throughout the electromagnetic spectrum, ranging from the γ region (nuclear resonance absorption or the Mossbauer effect) to the radio region (nuclear magnetic resonance). In practice, they are limited to those processes that are followed by the emission of radiant energy of greater intensity than that which was absorbed. All absorption processes involve absorption of a photon by the substance being analyzed. If it loses the excess energy by emitting a photon of less energy than that absorbed, fluorescence or phosphorescence is said to occur, depending on the lifetime of the excited state. The emitted energy is normally studied. If the source of radiant energy and the absorbing species are in identical energy states (in resonance) the excess energy is often given up by the nondirectional emission of a photon whose energy is identical with that absorbed. Either absorption or emission may be studied, depending upon the chemical and instrumental circumstances. If the emitted energy is studied, the term *resonance fluorescence* is often used. However, if the absorbing species releases the excess energy in small steps by intermolecular collision or some other process, it is commonly understood that this phenomenon falls within the realm of absorption spectroscopy. The terms *absorption spectroscopy*, *spectrophotometry*, and *absorptimetry* are often used synonymously. Most absorption spectroscopy is done in the ultraviolet, visible, and infrared regions of the electromagnetic spectrum. See emission spectroscopy; infrared spectroscopy.

absorption tower. (scrubber; Paulson tower). A device used for gas purification by absorption of gas impurities in a liquid.

ABS resin. Any of a group of tough, rigid thermoplastics that derive their name from the initial letters of the monomers which produce them.

abstraction reaction. A reaction that removes an atom from a structure.

abundance. The relative amount (% by weight) of a substance in the earth's crust, including the atmosphere and the oceans. (1) The abundance of the elements in the earth's crust is:

Rank	Element	% by wt.
1	Oxygen	49.2
2	Silicon	25.7
3	Aluminum	7.5
4	Iron	4.7
5	Calcium	3.4
6	Sodium	2.6
7	Potassium	2.4
8	Magnesium	1.9
9	Hydrogen	0.9
10	Titanium	0.6
11	Chlorine	0.2
12	Phosphorus	0.1

Rank	Element	% by wt.
13	Manganese	0.1
14	Carbon	0.09
15	Sulfur	0.05
16	Barium	0.05
	all others	0.51

(2) The percentages of inorganic compounds in the earth's crust, exclusive of water, are:

- (1) SiO₂ 55 (2) Al₂O₃ 15 (3) CaCO₃ 8.8
 (4) MgO 1.6 (5) Na₂O 1.6 (6) K₂O 1.9

(3) The most abundant organic materials are cellulose and its derivatives, and proteins.

Note: In the universe as a whole, the most abundant element is hydrogen.

“Abzol” [*Albemarle*]. TM for a solvent cleaner that can be used in place of chlorinated solvents. The main ingredient is n-propyl bromide and is an acceptable substitute for ozone-depleting substances. **Use:** Electronic equipment and close tolerance metal parts.

AC. Abbreviation for allyl chloride.

Ac. Symbol for actinium; abbreviation for acetate.

acacia gum. See arabic gum.

acaricide. A type of pesticide effective on mites and ticks (acarides).

ACC. See the American Chemistry Council.

accelerator. (1) A compound, usually organic, that greatly reduces the time required for vulcanization of natural and synthetic rubbers, at the same time improving the aging and other physical properties. Organic accelerators invariably contain nitrogen, and many also contain sulfur. The latter type are called ultra-accelerators because of their greater activity. The major types include amines, guanidines, thiazoles, thiuram sulfides, and dithiocarbamates. The amines and guanidines are basic, the others acidic. The normal effective concentration of organic accelerators in a rubber mixture is 1% or less depending on the rubber hydrocarbon present. Zinc oxide is required for activation, and in the case of acidic accelerators, stearic acid is required. The introduction of organic accelerators in the early twenties was largely responsible for the successful development of automobile tires and mechanical products for engineering uses. A few inorganic accelerators are still used in low-grade products, e.g., lime, magnesium oxide, and lead oxide.

See vulcanization; rubber. (2) A compound added to a photographic developer to increase its activity, such as certain quaternary ammonium compounds and alkaline substances. (3) A particle accelerator.

“Accepta” [*Accepta*]. TM for a rig wash concentrated detergent miscible with fresh or sea waters.

Use: Cleaning in the shipping industry.

“Accepta 3538” [*Accepta*]. TM for an emulsifying bilge cleaner and degreaser.

“Accepta 3547” [*Accepta*]. TM for a water stain and scale remover.

Use: For steel, wood, glazed surfaces, toilet bowls, baths and terrazo.

acceptability (foods). See organoleptic.

acceptable risk. A concept that has developed in recent years, especially in connection with toxic substances (insecticides, mercurials, carcinogens), food additives, air and water pollution, and related environmental concerns. It may be defined as a level of risk at which a seriously adverse result is highly unlikely to occur, “but at which one *cannot* prove whether *or not* there is 100% safety. It means living with reasonable assurance of safety and acceptable uncertainty.” (Schmutz, J. F., *Chemical and Engineering News*, Jan. 16, 1978). Examples of acceptable risk that might be cited are diagnostic X rays, fluoridation of water, and ingestion of saccharin in normal amounts. The acceptability of the risks involved in nuclear power generation is controversial. The weight of the evidence has tended to shift toward the negative side since 1975 when an official safety study estimated the risk of a serious accident to be 1 in 20,000 years of reactor operation. An investigation made by the Oak Ridge National Laboratory based on data collected from 1969 to 1979 concluded that the risk of a major accident is 1 in 1000 years of reactor operation.

acceptor. See donor.

acceptor control. (electron transport chain). The regulation of the rate of respiration by the availability of ADP as a phosphate group acceptor.

accessory pigments. Visible light-absorbing pigments, such as carotenoids and xanthophyll in green plants and photosynthetic bacteria that trap energy from sunlight and pass it on to “special pairs.”

“Accosoft” [*Stepan*]. TM for a product that adds softening, lubricity and heat resistance.

Use: In household and commercial textile industries.

“Accuchem” [*Accurate*]. TM for a series of research biochemical compounds.

“Accudenz” [*Accurate*]. TM for an autoclavable, universal centrifugation medium.

“AccuGel” [*Norben*]. TM for a native pea starch.

Use: Gives excellent gel strength, improved body and mouth feel without adding flavors.

acenaphthene. (1,8-dihydroacenaphthalene; ethylenenaphthalene).

CAS: 83-32-9. $C_{10}H_6(CH_2)_2$ (a tricyclic compound).

Properties: White needles. D 1.024 (99/4C), fp 93.6C, bp 277.5C, refr index (100C) 1.6048. Soluble in hot alcohol; insoluble in water. Combustible.

Derivation: From coal tar.

Grade: Technical, 98%.

Use: Dye intermediate, pharmaceuticals, insecticide, fungicide, plastics.

acenaphthenequinone. (1,2-acenaphthene-dione). $C_{10}H_6(CO)_2$ (a tricyclic compound).

Properties: Yellow needles. Mp 261–263C. Insoluble in water; soluble in alcohol.

Derivation: By oxidizing acenaphthene, using glacial acetic acid and sodium or potassium dichromate.

Grade: Technical.

Use: Dye synthesis.

acenocoumarin. (3-(α -acetonyl-4-nitrobenzyl)-4-hydroxycoumarin).

CAS: 152-72-7. $C_{19}H_{15}NO_6$.

Properties: White, crystalline powder; tasteless and odorless. Mp 197C. Slightly soluble in water and organic solvents.

Use: Medicine (anticoagulant).

acephate. (acetylphosphoramidothioic acid ester).

CAS: 30560-19-1. $C_4H_{10}NO_3PS$.

Properties: White crystals. Mp 65C. Soluble in water; slightly soluble in acetone and alcohol.

Hazard: Moderately toxic by ingestion.

Use: Insecticide.

ACerS. See American Ceramic Society.

acetadol. See aldol.

acetal. (diethylacetal; 1,1-diethoxyethane; ethylenediethyl ether).

CAS: 105-57-7. $CH_3CH(OC_2H_5)_2$.

Properties: Colorless, volatile liquid; agreeable odor; nutty aftertaste. D 0.831, bp 103–104C, vap press 20.0 mm (20C), flash p –5F (CC) (–20.5C), specific heat 0.520, refr index 1.38193 (20C), wt (lb/gal) 6.89, autoign temp 446F (230C). Stable to alkalis but readily decomposed by dilute acids. Forms a constant-boiling mixture with ethanol. Soluble in alcohol, ether, and water.

Derivation: Partial oxidation of ethanol, the acetaldehyde first formed condensing with the alcohol.

Grade: Technical.

Hazard: Highly flammable, dangerous fire risk. Ex-

plosive limits in air 1.65 to 10.4%. Moderately toxic and narcotic in high concentrations.

Use: Solvent, cosmetics, organic synthesis, perfumes, flavors.

See acetal resin.

acetaldehyde. (acetic aldehyde; aldehyde;

ethanal; ethyl aldehyde).

CAS: 75-07-0. CH_3CHO .

Properties: Colorless liquid; pungent, fruity odor. D 0.783 (18/4C), bp 20.2C, mp –123.5C, vap press 740.0 mm (20C), flash p –40F (–40C) (OC), specific heat 0.650, refr index 1.3316 (20C), wt 6.50 lb/gal (20C). Miscible with water, alcohol, ether, benzene, gasoline, solvent naphtha, toluene, xylene, turpentine, and acetone.

Derivation: (1) Oxidation of ethylene; (2) vapor phase oxidation of ethanol; (3) vapor-phase oxidation of propane and butane; (4) catalytic reaction of acetylene and water (chiefly in Germany).

Grade: Technical 99%.

Hazard: Highly flammable, toxic (narcotic). Dangerous fire, explosion risk, explosive limits in air 4–57%. TLV: 100 ppm.

Use: Manufacture of acetic acid and acetic anhydride, *n*-butanol, 2-ethylhexanol, peracetic acid, aldol, pentaerythritol, pyridines, chloral, 1,3-butylene glycol, and trimethylolpropane; synthetic flavors.

acetaldehyde ammonia. See aldehyde ammonia.

acetaldehyde cyanohydrin. See lactonitrile.

acetal resin. (polyacetal). A polyoxymethylene thermoplastic polymer obtained by ionically initiated polymerization of formaldehyde + CH_2 to obtain a linear molecule of the type $-O-CH_2-O-CH_2=CH_2-$. Single molecules may have over 1500 $-CH_2-$ units. As the molecule has no side chains, dense crystals are formed. Acetal resins are hard, rigid, strong, tough, and resilient; dielectric constant 3.7; dielectric strength 1200 volts/mil, 600 volts/mil (80-mil); dimensionally stable under exposure to moisture and heat; resistant to chemicals, solvents, flexing, and creep, and have a high gloss and low friction surface. Can be chromium plated, injection-molded, extruded, and blow-molded. Not recommended for use in strong acids or alkalis. They may be homopolymers or copolymers.

Properties: D 1.425, thermal conductivity 0.13 Btu ft/(hr)(sq ft)(degree F), coefficient of thermal expansion 4.5×10^{-5} /degree F, specific heat 0.35 Btu/(lb)(degree F), water absorption 0.41%/24 hour, tensile strength 10,000 psi, elongation 15%, hardness (Rockwell) R120, impact strength (notched) 1.4 ft-lb/inch, flexural strength 14,100 psi, shear strength 9500 psi. Combustible, but slow burning.

Use: An engineering plastic, often used as substitute for metals, as in oil and gas pipes; automotive and appliance parts; industrial parts; hardware; communication equipment; aerosol containers for cosmet-

ics.

See "Delrin"; "Celcon."

acetamide. (acetic acid amine; ethanamide).

CAS: 60-35-5. CH_3CONH_2 .

Properties: Colorless, deliquescent crystals; mousy odor. D 1.159, mp 80C, bp 223C, refr index 1.4274 (78.3C). Soluble in water and alcohol; slightly soluble in ether. Combustible.

Derivation: Interaction of ethyl acetate and ammonium hydroxide.

Grade: Technical, CP (odorless), intermediate, reagent.

Hazard: An experimental carcinogen.

Use: Organic synthesis (reactant, solvent, peroxide stabilizer), general solvent, lacquers, explosives, soldering flux, hygroscopic agent, wetting agent, penetrating agent.

acetamidine hydrochloride. $\text{C}_2\text{H}_6\text{N}_2\text{HCl}$.

Properties: Crystalline solid. Slightly deliquescent. Mp 166C. Soluble in water and alcohol; insoluble in acetone. Keep stoppered.

Derivation: Alcohol solution of acetonitrile + HCl + ammonia.

Hazard: Skin irritant, moderately toxic by ingestion.

Use: Synthesis of pyrimidines and related groups of biochemically active compounds.

acetamido- Prefix indicating the group $\text{CH}_3\text{CONH-}$. Also called acetamino- or acetylamino-.

3-acetamido-5-aminobenzoic acid.

Use: Intermediate in the manufacture of X-ray contrast media.

5-acetamido-8-amino-2-naphthalenesulfonic acid. (acetyl-1,4-naphthalenediamine-7-sulfonic acid; acetylamino-1,6-Cleve's acid).

$\text{C}_{10}\text{H}_5\text{NHCOC}_2\text{H}_5(\text{NH}_2)(\text{SO}_3\text{H})$. A reddish-brown paste.

Hazard: Toxic.

Use: Chemical intermediate, dyes.

8-acetamido-5-amino-2-naphthalenesulfonic acid. (acetyl-1,4-naphthalenediamine-6-sulfonic acid; acetylamino-1,7-Cleve's acid).

$\text{C}_{10}\text{H}_5\text{NHCOC}_2\text{H}_5(\text{NH}_2)(\text{SO}_3\text{H})$. A paste.

Hazard: Toxic.

Use: Chemical intermediate, dyes.

***p*-acetamidobenzenesulfonyl chloride.** See *N*-acetylsulfanilyl chloride.

((*p*-acetamidobenzoyl)oxy)tributylstannane.
See tributyltin-*p*-acetamidobenzoate.

acetamidocyanoacetic ester. See ethyl acetamidocyanoacetate.

4-acetamido-2-ethylbenzoic acid methyl ester. See ethopabate.

8-acetamido-2-naphthalenesulfonic acid magnesium salt. (acetyl-1,7-Cleve's acid). $[\text{C}_{10}\text{H}_6(\text{CH}_3\text{CONH})(\text{SO}_3)_2]\text{Mg}$.

Properties: Brownish-gray paste containing approximately 80% solids.

Use: Intermediate for dyes.

***p*-acetamidophenol.** See *p*-acetylamino-phenol.

"Acetamine" [Du Pont]. TM for a group of azo dyes and developers made for application to acetate yarn, and especially suited to nylon.

acetamino- See acetamido-.

acetaminophen. See *p*-acetylamino-phenol.

acetanilide. (*N*-phenylacetamide).

CAS: 103-84-4. $\text{C}_6\text{H}_5\text{NH}(\text{COCH}_3)$.

Properties: White, shining crystalline leaflets or white, crystalline powder; odorless; slightly burning taste. Stable in air. D 1.2105, mp 114–116C, bp 303.8C. Soluble in hot water, alcohol, ether, chloroform, acetone, glycerol, and benzene. Flash p 345F (174C); autoign temp 1015F (545C). Combustible.

Derivation: Acetylation of aniline with glacial acetic acid.

Grade: Technical, CP.

Hazard: Toxic by ingestion.

Use: Rubber accelerator, inhibitor in hydrogen peroxide, stabilizer for cellulose ester coatings, manufacture of intermediates (*p*-nitroaniline, *p*-nitroacetanilide, *p*-phenylenediamine), synthetic camphor, pharmaceutical chemicals, dyestuffs, precursor in penicillin manufacture, medicine (antiseptic), acetanilole.

See *p*-methoxyacetophenone.

acetate. (1) A salt of acetic acid in which the terminal hydrogen atom is replaced by a metal, as in copper acetate, $\text{Cu}(\text{CH}_3\text{COO})_2$. (2) An ester of acetic acid where the substitution is by a radical as in ethyl acetate, $\text{CH}_3\text{COOC}_2\text{H}_5$. In cellulose acetate the hydroxyl radicals of the cellulose are involved in the esterification.

See cellulose acetate; vinyl acetate.

acetate dye. One group consists of water insoluble azo or anthraquinone dyes that have been highly dispersed to make them capable of penetrating and dyeing acetate fibers. A second class group comprises water-insoluble amino azo dyes that are made water soluble by treatment with formaldehyde and bisulfite. After absorption by the fiber, the resulting sulfonic acids hydrolyze and regenerate the insoluble dyes.

acetate fiber. A manufactured fiber in which the fiber-forming substance is cellulose acetate. Where not less than 92% of the hydroxyl groups are acetylated, the term *triacetate* may be used as a generic description of the fiber (Federal Trade Commission). This fiber was formerly called acetate rayon or acetate silk. The term rayon is not permissible for this type.

Properties: Thermoplastic; becomes tacky at 350F (176C). Moisture absorption 6%. Tenacity 1.4 g/denier (dry); about 1 g/denier (wet). Elongation 50% dry, 40% wet. Soluble in acetone and glacial acetic acid; decomposed by concentrated solutions of strong acids and alkalis. Combustible.

Use: Wearing apparel, industrial fabrics. See cellulose acetate; cellulose triacetate.

acetate fiber, saponified. Regenerated cellulose fibers obtained by complete saponification of highly oriented cellulose acetate fibers.

Properties: Tensile strength (psi) 136,000–155,000; elongation 6%; d 1.5–1.6; moisture regain 9.6–10.7%; decomposes at about 149C. Similar to cotton in chemical resistance, dyeing, and resistance to insects and mildew. Combustible.

Available forms: Available in continuous filament form having a high degree of crystallinity and great strength.

Use: Cargo parachutes, typewriter ribbons, belts, webbing, tapes, carpet backing.

acetate film. A durable, highly transparent film with nondeforming characteristics produced from cellulose acetate resin. It is grease, oil, dust, and air proof and hygienic. Combustible.

Available forms: Rolls and cut-to-size sheets.

Use: Laminates, support for photographic film, document preservation, pressure-sensitive tape, magnetic sound-recording tape, window cartons, envelopes packaging.

acetate of lime. Commercial term for calcium acetate made from pyroligneous acid and milk of lime. There are brown and gray acetates of lime. See calcium acetate.

acetate process. See cellulose acetate.

acetate rayon. The yarn made from refined wood cellulose by the acetate process. See acetate fiber

acetate rayon process. In this process cellulose is combined with acetic anhydride to make cellulose acetate, which is dissolved in acetone and forced through spinnerette holes into a precipitating bath.

See acetate fiber.

acethydrazidepyridinium chloride. See Girard's reagent.

acetic acid. (ethanoic acid; vinegar acid; methanecarboxylic acid).

CAS: 64-19-7. (CH_3COOH). Glacial acetic acid is the pure compound (99.8% min), as distinguished from the usual water solutions known as acetic acid.

Properties: Clear, colorless liquid; pungent odor. Mp 16.63C, bp 118C (765 mm Hg), 80C (202 mmHg), d 1.0492 (20/4C), wt/gal (20C) 8.64 lb, viscosity (20C) 1.22 cP, flash p 110F (43C) (OC), refr index 1.3715 (20C), autoign temp 800F (426C). Combustible. Miscible with water, alcohol, glycerol, and ether; insoluble in carbon disulfide.

Derivation: (a) Liquid- and vapor-phase oxidation of petroleum gases (with catalyst), (b) oxidation of acetaldehyde, (c) reaction of methanol and carbon monoxide (with catalyst; this is the most cost-efficient method and has been in general use for some years), (d) fermentative oxidation of ethanol.

Grade: USP (glacial, 99.4 wt %, and dilute, 36–37 wt %), CP, technical (80, 99.5%), commercial (6, 28, 30, 36, 56, 60, 70, 80, and 99.5%), NF (diluted 6.0 g/100 mL).

Hazard: Moderate fire risk. Pure acetic acid is moderately toxic by ingestion and inhalation, but dilute material is approved by FDA for food use. Strong irritant to skin and tissue. TLV: 10 ppm.

Use: Manufacturing of acetic anhydride, cellulose acetate, and vinyl acetate monomer; acetic esters; chloroacetic acid; production of plastics, pharmaceuticals, dyes, insecticides, photographic chemicals, etc.; food additive (acidulant); latex coagulant; oil-well acidizer; textile printing. See vinegar.

acetic acid amine. See acetamide.

acetic acid benzyl ester. See benzyl acetate.

acetic acid, glacial. See acetic acid.

acetic acid, ((octylstannylidyne)trithio)tris-, tris(2-ethylhexyl) ester. See octyltris(2-ethylhexyloxycarbonylmethylthio)stannane.

acetic acid phenylmethyl ester. See benzyl acetate.

acetic aldehyde. See acetaldehyde.

acetic anhydride. (acetyl oxide; acetic oxide).

CAS: 108-24-7. (CH_3CO)₂O.

Properties: Colorless, mobile, strongly refractive liquid; strong odor. D 1.0830 (20/20C), bp 139.9C, fp -73.1C, flash p 121F (49.4C) (CC), autoign temp 732F (385C), wt/gal 9.01 lb (20C). Miscible with alcohol, ether, and acetic acid; soluble in cold water; decomposes in hot water to form acetic acid. Combustible.

Derivation: (1) Oxidation of acetaldehyde with air or oxygen with catalyst; (2) by catalyzed thermal de-

composition of acetic acid to ketone; (3) reaction of ethyl acetate and carbon monoxide; (4) from carbon monoxide and methanol.

Grade: CP, technical (75, 85, 90–95%).

Hazard: Strong irritant and corrosive; may cause burns and eye damage. TLV: ceiling 5 ppm. Moderate fire risk.

Use: Cellulose acetate fibers and plastics; vinyl acetate; dehydrating and acetylating agent in production of pharmaceuticals, dyes, perfumes, explosives; etc., aspirin. Esterifying agent for food starch (5% max).

acetic ester. See ethyl acetate.

acetic ether. See ethyl acetate.

acetic oxide. See acetic anhydride.

acetin. (monoacetin; glyceryl monoacetate).

CAS: 102-76-1. $C_3H_7(OH)_2OOCCH_3$. Acetin may also refer to glyceryl di- or triacetate, also known as diacetin and triacetin.

Properties: Colorless, thick liquid. Hygroscopic. D 1.206 (20/4C), bp 158C (165 mm), 130C (3 mm). Soluble in water, alcohol; slightly soluble in ether; insoluble in benzene. Combustible.

Derivation: By heating glycerol and strong acetic acid, distilling off the weak acetic acid formed, and again heating with strong acetic acid and distilling.

Method of purification: Rectification.

Hazard: Moderately toxic, irritant.

Use: Tanning; solvent for dyes, food additive, gelatinizing agent in explosives.

acetoacetanilide. (acetylacetanilide).

CAS: 102-01-2. $CH_3COCH_2CONHC_6H_5$.

Properties: White, crystalline solid. Mp 85C, d 1.26, flash p 325F (162.7C). Resembles ethyl acetoacetate in chemical reactivity. Slightly soluble in water; soluble in dilute sodium hydroxide, alcohol, ether, acids, chloroform, and hot benzene. Combustible.

Derivation: By reacting ethyl acetoacetate with aniline, and eliminating ethanol. Acetoacetanilide may also be prepared from aniline and diketene.

Grade: Technical.

Use: Organic synthesis; dyestuffs (intermediate in the manufacture of the dry colors generally referred to as Hansa and benzidine yellows).

acetoacet-o-anisidide.

$CH_3COCH_2CONHC_6H_4OCH_3$.

Properties: White, crystalline powder. Mp 86.6C, d 1.1320 (86.6/20C), flash p 325F (162.7C) (OC). Combustible.

Use: Intermediate for azo pigments.

acetoacet-o-chloranilide.

CAS: 93-70-9. $CH_3COCH_2CONHC_6H_2Cl$.

Properties: White, crystalline powder. Mp 107C, bp (decomposes), d 1.1920 (107/20C), flash p 350F

(176.6C) (OC). Almost insoluble in water. Combustible.

Hazard: Toxic by ingestion.

Use: Intermediate for azo pigments.

acetoacet-p-chloranilide.

$CH_3COCH_2CONHC_6H_4Cl$.

Properties: White, crystalline powder. Mp 133C, bp (decomposes), flash p 320F (160C) (OC). Combustible. Very slightly soluble in water.

Hazard: Toxic by ingestion.

Use: Intermediate for azo pigments.

acetoacetic acid. (acetylacetic acid; diacetic acid; acetone carboxylic acid).

CH_3COCH_2COOH .

Properties: Colorless, oily liquid. Soluble in water, alcohol, and ether; decomposes below 100C into acetone and carbon dioxide.

Hazard: Irritant to eyes and skin.

Use: Organic synthesis.

acetoacet-p-phenetide.

$CH_3COCH_2CONHC_6H_4OCH_2CH_3$.

Properties: Crystalline powder. Mp 108.5C, bp (decomposes), d 1.0378 (108.5/20C), flash p 325F (162.7C) (OC). Combustible.

Hazard: Moderately toxic by ingestion.

Use: Intermediate for azo pigments.

acetoacet-o-toluidide.

$CH_3COCH_2CONHC_6H_4CH_3$.

Properties: Fine, white, granular powder. Mp 106C, bp (decomposes), d 1.062 (106C). Slightly soluble in water. Flash p 320F (160C). Combustible.

Grade: Technical.

Hazard: Moderately toxic.

Use: Intermediate in the manufacture of Hansa and benzidine yellows.

acetoacet-p-toluidide.

$CH_3COCH_2CONHC_6H_4CH_3$.

Properties: White, crystalline powder. Mp 93.0–96.0C, purity 99% min.

Hazard: Moderately toxic.

Use: Light-fast yellow pigment intermediate; diazo coupler.

acetoacet-m-xylylide. (AAMX).

$(CH_3)_2C_6H_3NHCOCH_2COCH_3$.

Properties: White to light-yellow crystals. Mp 89–90C, d 1.238 (20C). Water solubility 0.5% (25C). Flash p 340F (171C); combustible.

Use: Intermediate for yellow pigments.

acetoaminofluorene. A pesticide. May not be used in food products or beverages (FDA).

Hazard: Toxic by ingestion.

p-acetoanisole. See p-methoxyacetophenone.

acetoglyceride. Usually an acetylated monoglyceride, although commercial acetoglycerides will contain di- and triglycerides.
See acetostearin.

acetoin. See acetylmethylcarbinol.

acetol. See hydroxy-2-propanone.

acetolysis. The procedure whereby acetyl compounds are treated with alcoholic or aqueous alkalis to remove the acetyl groups.

acetomerocitol.

Properties: White solid. Mp 155–157°C. Freely soluble in alcohol; soluble in ether, chloroform; sparingly soluble in benzene; insoluble in water.

Hazard: Toxic by ingestion.

Use: Medicine (antiseptic, solution 1:1000).

acetone. (dimethylketone; 2-propanone).

Properties: Colorless, volatile liquid; sweetish odor. Mp -94.3°C, bp 56.2°C, refr index 1.3591 (20°C), d 0.792 (20/20°C), wt/gal 6.64 lb (15°C), flash p 15F (-9.4°C) (OC), autoign temp 1000F (537°C). Miscible with water, alcohol, ether, chloroform, and most oils.

Derivation: (1) Oxidation of cumene; (2) dehydrogenation or oxidation of isopropyl alcohol with metallic catalyst; (3) vapor-phase oxidation of butane; (4) by-product of synthetic glycerol production.

Grade: Technical; CP; NF; electronic; spectrophotometric.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 2.6–12.8%. TLV: 750 ppm. Narcotic in high concentrations. Moderately toxic by ingestion and inhalation.

Use: Chemicals (methyl isobutyl ketone; methyl isobutyl carbinol; methyl methacrylate; bisphenol-A); paint, varnish, and lacquer solvent; cellulose acetate, especially as spinning solvent; to clean and dry parts of precision equipment; solvent for potassium iodide and permanganate; delusterant for cellulose acetate fibers; specification testing of vulcanized rubber products.

acetone bromoform. See tribromo-*tert*-butyl alcohol.

acetonecarboxylic acid. See acetoacetic acid.

acetone chloroform. See chlorobutanol.

acetone cyanohydrin. (α -hydroxyisobutyronitrile; 2-methylacetonitrile).
CAS: 75-86-5. $(\text{CH}_3)_2\text{COHCN}$.

Properties: Colorless liquid. Bp 82°C (23 mm), mp -20°C, d 0.932 (19°C), refr index 1.3996 (20°C), flash p 165F (73.9°C), autoign temp 1270F (685°C). Soluble in alcohol and ether. Combustible.

Derivation: Condensing acetone with hydrocyanic acid.

Grade: Technical (97–98% pure).

Hazard: Toxic. TLV: CL 4.7 ppm (skin). Readily decomposes to hydrocyanic acid and acetone.

Use: Insecticides; intermediate for organic synthesis, especially methyl methacrylate.

acetonedicarboxylic acid. See β -ketoglutaric acid.

acetone number. The degree of polymerization of a bodied vegetable oil, measured by the amount of matter that is insoluble in acetone.

acetone oxime. See acetoxime.

acetone semicarbazone.

Properties: White powder. Mp 188°C.

acetone sodium bisulfate. See sodium acetone bisulfate.

acetonitrile. (methyl cyanide).

Properties: Colorless, limpid liquid; aromatic odor. D 0.783; mp -41°C; bp 82°C; flash p 42F (5.56°C). Soluble in water and alcohol; high dielectric constant; high polarity; strongly reactive.

Derivation: By-product of propylene-ammonia process for acrylonitrile.

Grade: Technical; nanograde; spectrophotometric.

Hazard: Flammable, dangerous fire risk. TLV: 40 ppm; toxic action by skin absorption and inhalation.

Use: Solvent in hydrocarbon extraction processes, especially for butadiene; specialty solvent; intermediate; catalyst; separation of fatty acids from vegetable oils; manufacturing of synthetic pharmaceuticals.

acetylacetone. (1,2-diacetylene; hexanedione-2,5; 2,5-diketohexane).

Properties: Colorless liquid. D 0.9734 (20/20°C); bp 192.2°C; vap press 0.43 mm at 20°C; fp -5.4°C; flash p 185F (85°C); bulk d 8.2 lb/gal (20°C). Combustible; autoign temp 920F (493°C). Soluble in water.

Derivation: By-product in the production of acetaldehyde from acetylene.

Grade: Technical.

Hazard: Irritant to eyes and skin.

Use: Solvent for cellulose acetate, roll-coating inks, lacquers, stains; intermediate for pharmaceuticals and photographic chemicals; electroplating.

acetonyl alcohol. See hydroxy-2-propanone.

3-(α -acetylbenzyl)-4-hydroxycoumarin.
See "Warfarin."

3-(α -acetylfulfuryl)-4-hydroxycoumarin.
(sodium salt also used). A rodenticide.

Hazard: Highly toxic by ingestion and inhalation.

3-(α -acetyl-4-nitrobenzyl)-4-hydroxycoumarin. See acenocoumarin.

(s)-**acetophan.** See sinorphan.

acetophenetidin. (*p*-acetylphenetidin; acetophenetidide; phenacetin; *p*-ethoxyacetanilide).
CAS: 62-44-2. $\text{CH}_3\text{CONHC}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: White crystals or powder; odorless and stable in air. Mp 135C. Soluble in alcohol, chloroform, and ether; slightly soluble in water; has slightly bitter taste.

Derivation: By the interaction of *p*-phenetidin and glacial acetic acid or of ethyl bromide and *p*-acetaminophenol.

Method of purification: Crystallization.

Grade: Technical; USP, as phenacetin.

Hazard: Toxic by ingestion.

Use: Medicine (analgesic); veterinary medicine.

acetophenone. (phenylmethylketone; hypnone; acetylbenzene).
CAS: 98-86-2. $\text{C}_6\text{H}_5\text{COCH}_3$.

Properties: Colorless liquid; sweet, pungent odor and taste. Bp 201.7, fp 19.7C, d 1.030 (20/20C), bulk d 8.56 lb/gal (20C), refr index 1.5363 (20C), flash p 180F (82.2C) (COC). Slightly soluble in water; soluble in organic solvents and sulfuric acid. Combustible.

Derivation: (1) Friedel-Crafts process with benzene and acetic anhydride or acetyl chloride; (2) by-product from the oxidation of cumene; (3) oxidation of ethylbenzene.

Method of purification: Distillation and crystallization.

Grade: Technical, refined, perfumery.

Hazard: Narcotic in high concentrations, hypnotic.

Use: Perfumery; solvent; intermediate for pharmaceuticals, resins, etc.; flavoring; polymerization catalyst; organic synthesis.

acetophenone oxime.

Properties: Crystals.

Use: Antiozonant properties, antioxidant, antiskinning agent, piezoelectric properties, emulsifier-water/oleoresinous systems, end blocker, polymerization short stopper.

acetostearin.

$\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}_2\text{CH}_2\text{OCH}_2\text{OOCCH}_3$. Acetylated glyceryl monostearate. Solid with peculiar combination of flexibility and nongreasiness. Derived from glyceryl monostearate or mixed glycerides by acetylation with acetic anhydride.

Use: Protective coating for food and as a plasticizer.

acetotoluidide. See acetyl-*o*-toluidine; acetyl-*p*-toluidine.

acetoxime. (acetone oxime; 2-propanone oxime). $(\text{CH}_3)_2\text{CNOH}$.

Properties: Colorless crystals; chloral-like odor. Both basic and acidic in properties. Volatilizes in air. D 0.97 (20/20C), bp 136.3C, mp 61C. Fairly easily hydrolyzed by dilute acids; soluble in alcohols, ethers, water. Combustible.

Derivation: Reaction of hydroxylamine in water solution with acetone, followed by ether extraction.

Grade: Technical.

Use: Organic synthesis (intermediate); solvent for cellulose ethers; primer for diesel fuels.

***o*-acetoxybenzoic acid.** See aspirin.

acetoxylation. A method of synthesizing ethylene glycol in which ethylene is reacted with acetic acid in the presence of a catalyst, such as tellurium bromide, resulting in the formation of mixed mono- and diacetates; this is followed by hydrolysis to ethylene glycol and acetic acid, with up to 95% yield of the glycol. It is thus considerably more efficient than the ethylene oxide method.

acetoxydiethylphenylstannane. See diethyl phenyltin acetate.

acetoxydiphenylethylstannane. See ethyldiphenyltin acetate.

4-(*p*-acetoxyphenyl)-2-butanone. See culture.

(*p*-**acetoxyphenyl**)methyl carbinol. See 4-acetoxyphenyl methyl carbinol-4-acetoxyphenyl methyl carbinol.

4-acetoxyphenyl methyl carbinol-4-acetoxyphenyl methyl carbinol.

CAS: 53744-50-6. mf: $\text{C}_{10}\text{H}_{12}\text{O}_3$.

Hazard: Toxic by ingestion. A severe skin irritant.

α -acetoxytoluene. See benzyl acetate.

acetoxytriethylstannane.

CAS: 1907-13-7. mf: $\text{C}_8\text{H}_{18}\text{O}_2\text{Sn}$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

acetoxytriethyltin. See acetoxytriethylstannane.

acetoxytrihexylstannane.

CAS: 2897-46-3. mf: C₂₀H₄₂O₂Sn.

Hazard: A poison by skin contact. Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

acetoxytrihexyltin. See acetoxytrihexylstannane.

acetoxytriisopropylstannane. See triisopropyltin acetate.

acetoxytrimethylstannane. See trimethyltin acetate.

acetoxytripropylstannane. See tripropyltin acetate.

acetoxytris(β,β-dimethylphenethyl)stannane. See trineophyltin acetate.

acetozone. See acetylbenzoyl peroxide.

“Acetulan” [Dow]. TM for a special fraction of acetylated lanolin alcohols.

Properties: Anhydrous; pale-straw color; nearly odorless, low-viscosity liquid. Miscible with ethanol, mineral oil, and other common formulating materials; insoluble in water. Combustible.

Use: Hydrophobic penetrant, emollient, plasticizer, cosolvent, pigment dispersant, cosmetics.

acetylacetanilide. See acetoacetanilide.

acetylacetic acid. See acetoacetic acid.

acetylacetonatobis(ethylene)rhodium(1).

Properties: Orange crystal; air stable. Soluble in chloroform and ether.

Use: Reactive ethylene complex.

acetylacetonatodicarbonylrhodium(1).

Properties: Green crystal grades (dichroic red when crushed); air stable. Soluble in acetone, benzene, and chlorinated solvents.

Use: Homogeneous catalyst for hydroformylation reactions.

acetylacetone. (diacetylmethane; pentanedione-2,4).

CAS: 123-54-6. CH₃COCH₂OCCH₃.

Properties: Mobile, colorless or yellowish liquid. When cooled, solidifies to lustrous, pearly spangles. The liquid is affected by light, turning brown and forming resins. Bp 140.5°C; d 0.9753 (20/20°C); bulk d 8.1 lb/gal; fp -23.5°C; flash p 105F (40.5°C) (TOC).

Soluble in water (acidified by hydrochloric acid); fairly soluble in neutral water, alcohol, chloroform, ether, benzene, acetone, and glacial acetic acid. Combustible.

Derivation: By condensing ethyl acetate with acetone.

Hazard: Moderately toxic; moderate fire risk.

Use: Solvent for cellulose acetate, intermediate, chelating agent for metals, paint driers, lubricant additives, pesticides.

3-acetylacrolein. See 4-ketopentenal.

N-acetyl-l-(+)-alanine. See alanine.

acetylamino-. See acetamido-.

p-acetylaminobenzenesulfonyl chloride.

See N-acetylsulfanyl chloride.

o-acetylaminobenzoic acid. See acetylanthranilic acid.

p-acetylaminophenol. (APAP; N-acetyl-p-aminophenol; acetaminophen; p-acetamidophenol; p-hydroxyacetanilide).

CAS: 103-90-2. CH₃CONHC₆H₄OH.

Properties: Crystals; odorless; slightly bitter taste. D 1.293 (21/4°C), mp 168°C. Slightly soluble in water and ether; soluble in alcohol; pH saturated aqueous solution 5.5–6.5.

Derivation: Interaction of p-aminophenol and an aqueous solution of acetic anhydride.

Use: Intermediate for pharmaceuticals and azo dyes, stabilizer for hydrogen peroxide, photographic chemicals, medicine (analgesic).

p-acetylaminophenyl salicylate. (phenet-sal). C₆H₄(NHCOCH₃)OOCOC₆H₄OH.

Properties: Fine, white, crystal scales; odorless; tasteless. Mp 187–188°C. Soluble in alcohol, ether, and hot water; insoluble in light hydrocarbon solvents; decomposed by strong alkalis.

Derivation: By reducing p-nitrophenol salicylate to p-aminophenol salicylate and acetylating the latter.

Hazard: See aspirin.

Use: Medicine (analgesic).

p-acetylanisole. See p-methoxyacetophenone.

N-acetylanthranilic acid. (o-acetylaminobenzoic acid). CH₃CONHC₆H₄COOH.

Properties: Needles, plates, rhombic crystals (from glacial acetic acid). Mp 185°C. Slightly soluble in water; soluble in hot alcohol, ether, and benzene. Combustible.

Derivation: Oxidation of o-acetyl-toluidine with potassium permanganate in the presence of magnesium sulfate or potassium chloride.

Grade: Technical.

Use: Chemical (organic synthesis, anthranilic acid).

acetylated monoglycerides.

Properties: Esters of glycerin with acetic acid and edible fat-forming fatty acids. (FCC III) May be white to pale yellow liquids or solids; bland taste. Sol in alc, acetone; insol in water.

Use: Food additive.

acetylation. Introduction of an acetyl radical ($\text{CH}_3\text{CO}-$) into the molecule of an organic compound having OH or NH_2 groups. The usual reagents for this purpose are acetic anhydride or acetyl chloride. Thus, ethanol ($\text{C}_2\text{H}_5\text{OH}$) may be converted to ethyl acetate ($\text{C}_2\text{H}_5\text{OCOCH}_3$). Cellulose is similarly converted to cellulose acetate by treatment with a mix containing acetic anhydride. Acetylation is commonly used to determine the number of hydroxyl groups in fats and oils.

See acetyl value.

acetylbenzene. See acetophenone.

acetylbenzoyl aconine. See aconitine.

acetylbenzoyl peroxide. (acetozone; benzozone).

CAS: 644-31-5. $\text{C}_6\text{H}_5\text{CO}\cdot\text{O}_2\cdot\text{OCCH}_3$.

Properties: White crystals. Decomposed by water, alkaloids, organic matter, and some organic solvents; decomposes slowly and evaporates when gently heated, and instantaneously (possibly explosively) if quickly heated, ground, or compressed. Mp 36.6C; bp 130C (19 mm). Moderately soluble in ether, chloroform, carbon tetrachloride, and water; slightly soluble in mineral oils and alcohol. The commercial product is mixed with a neutral drying powder and contains 50% acetyl benzoyl peroxide.

Hazard: Toxic by ingestion. Strong irritant to skin and mucus membranes. Strong oxidizing agent; dangerous in contact with organic materials. Moderate explosion risk when shocked or heated.

Use: Medicine (active germicide); disinfectant; bleaching flour.

acetyl bromide.

CAS: 506-96-7. CH_3COBr .

Properties: Colorless, fuming liquid; turns yellow in air. Bp 81C; mp -96C; d 1.663 (16/4C). Soluble in ether, chloroform and benzene.

Derivation: Interaction of acetic acid and phosphorus pentabromide.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin. Reacts violently with water or alcohol.

Use: Organic synthesis, dye manufacture.

α -acetylbutyrolactone. (α -acetobutyrolactone).

Properties: Liquid; ester-like odor. D 1.18-1.19

(20C), bp 142-144 (30 mm). Partially soluble in water. Combustible.

Derivation: Sodium acetoacetate and ethylene oxide in absolute alcohol.

Hazard: Strong irritant to skin and mucus membranes.

Use: Organic synthesis.

acetyl carbinol. See hydroxy-2-propanone.

acetyl carbromal. (*N*-acetyl-*N*-bromodiethylacetylurea). $(\text{C}_2\text{H}_5)_2\text{CBrCONHCONHCOCH}_3$.

Properties: Crystals; slightly bitter taste. Mp 109C. Slightly soluble in water; freely soluble in alcohol and ethyl acetate.

Hazard: Overdoses may be fatal.

Use: Medicine (sedative).

acetyl chloride. (ethanoyl chloride).

CAS: 75-36-5. CH_3COCl .

Properties: Colorless, highly refractive, fuming liquid; strong odor. D 1.1051, mp -112C, bp 51-52C, flash p 40F (4.4C) (CC). Soluble in ether, acetone, acetic acid.

Derivation: By mixing glacial acetic acid and phosphorus trichloride in the cold and heating a short time to drive off hydrochloric acid. The acetyl chloride is then distilled.

Hazard: Corrosive to skin and mucous membranes; toxic; strong eye irritant. Flammable, dangerous fire risk. Reacts violently with water and alcohol.

Use: Organic preparations (acetylating agent); dye-stuffs; pharmaceuticals.

acetylcholine.

(acetylthanoltrimethylammonium hydroxide).

CAS: 51-84-3.

A derivative of choline; important because it acts as the chemical transmitter of nerve impulses in the autonomic system. It has been isolated and identified in brain tissue. The enzyme cholinesterase hydrolyzes acetylcholine into choline and acetic acid, and is necessary in the body to prevent acetylcholine poisoning.

Use: Medicine (as bromide and chloride); biochemical research.

See nerve gas; cholinesterase inhibitor.

acetylcholinesterase. See cholinesterase.

***N*-acetyl-L-cysteine (USAN).**

$\text{HSCH}_2\text{CH}(\text{NHCOCH}_3)\text{COOH}$. The *N*-acetyl derivative of the naturally occurring amino acid, L-cysteine.

Use: Medicine, biochemical research.

α -acetyldigoxin (anhydrous). $\text{C}_{43}\text{H}_{66}\text{O}_{14}$.

Properties: Crystals. Sparingly soluble in water,

ether, petroleum ether; soluble in most organic solvents.

Derivation: Obtained by enzymatic hydrolysis of a *digitalis* extract.

Hazard: Toxic.

Use: Medicine (heart disease).

3-acetyl-2,5-dimethylfuran.

CAS: 10599-70-9. mf: $C_8H_{10}O_2$.

Properties: Yellow liquid; strong roasted nutlike odor. D: 1.027–1.048, refr index: 1.475–1.496 (25°).

Sol in alc, propylene glycol, fixed oils; sltly sol in water.

Use: Food additive.

10-acetyldithranol.

CAS: 117568-24-8. mf: $C_{16}H_{12}O_3$.

Hazard: A poison. A skin irritant.

acetyl dipterox. See chloracetophos.

acetylene. (ethyne).

CAS: 74-86-2. $HC\equiv CH$.

Properties: Colorless gas; ethereal odor. D 0.91 (air=1), mp $-81.8C$ (890 mm); bp $-84C$, flash p 0F ($-17.7C$) (CC), autoign temp 635F (335C). Soluble in alcohol and acetone; slightly soluble in water. An asphyxiant gas.

Derivation: (a) By the action of water on calcium carbide; (b) by cracking petroleum hydrocarbons with steam (Wulff process), or natural gas by partial oxidation (BASF process); (c) from fuel oil by modified arc process.

Grade: Technical, containing 98% acetylene and not more than 0.05% by volume of phosphine or hydrogen sulfide; 99.5%.

Hazard: Very flammable, dangerous fire risk; burns with intensely hot flame; explosive limits in air 2.5–80%. Forms explosive compounds with silver, mercury, and copper, which should be excluded from contact with acetylene in transmission systems. Copper alloys may be used with caution. Piping used should be electrically bonded and grounded.

Use: Manufacture of vinyl chloride; vinylidene chloride; vinyl acetate; acrylates; acrylonitrile; acetaldehyde; per- and trichloroethylene; cyclooctatetraene; 1,4-butanediol; carbon black; and welding and cutting metals.

acetylene black. The carbon black resulting from incomplete combustion of or thermal decomposition of acetylene.

Properties: High liquid adsorption, retention of high bulk volume, high electrical conductivity.

Use: Dry cell batteries, component of explosives, reinforcing agent in rubber and in thermal and sound insulation, gloss suppressor in paints, carburizing agent in hardening of steel, pigment in printing inks, filler in electroconductive polymers.

See carbon black.

(acetylenecarbonyloxy)triphenyltin. See triphenyltin propiolate.

acetylene dichloride. See *sym*-dichloroethylene.

acetylene hydrocarbon. (alkyne). One of a class of unsaturated hydrocarbons of the homologous series having the generic formula C_nH_{2n-2} and a structural formula containing a triple bond.

acetylene polymer. See polyacetylene; 1,3,5,7-cyclooctatetraene.

acetylene tetrabromide. (*sym*-tetrabromethane).

CAS: 79-27-6. $CHBr_2CHBr_2$.

Properties: Yellowish liquid. D 2.98–3.00, bp 239–242C with decomposition, 151C (54 mm), mp 0.1C, refr index 1.638. Soluble in alcohol and ether, insoluble in water. Combustible.

Derivation: Interaction of acetylene and bromine and subsequent distillation.

Method of purification: Rectification.

Grade: Technical.

Hazard: Irritant by inhalation and ingestion. TLV: 1 ppm.

Use: Separating minerals by specific gravity; solvent for fats, oils, and waxes; fluid in liquid gauges; solvent in microscopy.

acetylene tetrachloride. See *sym*-tetrachloroethane.

acetylenogen. Calcium carbide.

***N*-acetyethanolamine.** (hydroxyethylacetamide). $CH_3CONHC_2H_4OH$.

Properties: Brown, viscous liquid. D 1.122 (20/20C); boiling range 150–152C (5 mm); decomposes (10 mm); bulk d 9.34 lb/gal; refr index 1.4730 (20C); flash p 350F (176.6C); fp 15.8C. Soluble in alcohol, ether, and water. Combustible.

Grade: Technical (75% solution in water).

Use: Plasticizer for polyvinyl alcohol and for cellulosic and proteinaceous materials; humectant for paper products, glues, cork, and inks; textile conditioner.

acetyethanoltrimethylammonium hydroxide. See acetylcholine.

acetylferrocene. (ferrocenyl methyl ketone). $C_5H_5FeC_5H_4COCH_3$.

Properties: Orange crystals. Mp 85–86C.

Use: Intermediate.

See ferrocene.

acetylformic acid. See pyruvic acid.

6-acetyl-grayanotoxin i. See grayanotoxin iii 6,14-diacetate.

acetylde. A salt-like carbide formed by the reaction of acetylene and an alkali or alkaline-earth metal in liquid ammonia, or with silver, copper, and mercury salts in aqueous solution. The latter are explosive when shocked or heated.

See carbide; calcium carbide.

acetyl iodide.

CAS: 507-02-8. CH_3COI .

Properties: Colorless, transparent, fuming liquid; suffocating odor; turns brown on exposure to air or moisture. D 1.98; bp 105–108C; refr index 1.55. Soluble in ether and benzene; decomposed by water and alcohol.

Derivation: Reaction of acetic acid, iodine, and phosphorus; reaction of acetyl chloride and hydrogen iodide.

Method of purification: Distillation.

Grade: Technical.

Hazard: Strong irritant to eyes and skin.

Use: Organic synthesis.

acetylisoeugenol. (isoeugenol acetate).

$\text{C}_6\text{H}_3(\text{CHCHCH}_3)(\text{OCH}_3)(\text{OCOCH}_3)$.

Properties: White crystals; spicy, clove-like odor. Congealing point 77C, soluble in 27 parts of 95% alcohol. Combustible.

Method of purification: Crystallization.

Grade: Technical.

Use: Perfumery, particularly for carnation-type odors; flavoring.

acetyl ketene. See diketene.

***n*-acetyllooline.**

CAS: 4914-36-7. mf: $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_2$.

Hazard: A poison.

Source: Natural product.

acetylmethionine. See *n*-acetyl-*l*-methionine.

***n*-acetyl-*l*-methionine.**

CAS: 65-82-7. mf: $\text{C}_7\text{H}_{13}\text{NO}_3\text{S}$.

Properties: Colorless or white crystals or powder; odorless. Sol in water, alc, alkali and mineral acids; insol in ether.

Hazard: A poison.

Use: Food additive; drug.

acetylmethylcarbinol. (acetoin; 3-hydroxy-2-butanone; dimethylketol).

CAS: 513-86-0. $\text{CH}_3\text{COCOC}_2\text{H}_5$.

Properties: Slightly yellow liquid or crystals (dimer), oxidizes gradually to diacetyl on exposure to air. D 1.016, bp 140–148C, mp 15C. Soluble in alcohol; miscible with water; slightly soluble in ether. Combustible.

Derivation: Reduction of diacetyl.

Grade: Technical, FCC (as acetoin).

Use: Aroma carrier; preparation of flavors and essences.

acetyl nitrate. $\text{CH}_3\text{COONO}_2$.

Properties: Colorless, fuming liquid. Hygroscopic. D 1.24.

Derivation: Reaction of acetic anhydride and nitrogen pentoxide.

Hazard: Corrosive to skin and mucous membranes. Explodes above 55C (130F) or in presence of mercuric oxide.

Use: Nitrating agent for organic compounds.

acetyl oxide. See acetic anhydride.

10-(acetyloxy)-1,8-dihydroxy-9(10h)-anthracenone. See 10-acetyldithranol.

4(or 6)-(acetyloxy)-5(or 4)-hexenoic acid.

CAS: 83145-58-8. mf: $\text{C}_8\text{H}_{12}\text{O}_4$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and severe eye irritant.

***o*-(4-(1-(acetyloxy)imino)ethyl)-3-methylphenyl) *o,o*-diethylphosphorothioate.**

CAS: 22936-44-3. mf: $\text{C}_{15}\text{H}_{22}\text{NO}_2\text{PS}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

acetyl peroxide. (diacetyl peroxide).

CAS: 110-22-5. $(\text{CH}_3\text{CO})_2\text{O}_2$.

Properties: Colorless crystals. Mp 30C. Slightly soluble in cold water; soluble in alcohol and ether, flash p 113 (45C) (OC), fp approx –8C, d 1.18 (20C). Combustible.

Available forms: A 25% solution in dimethyl phthalate.

Hazard: (25% solution) Moderate fire risk; strong irritant to skin and eyes. The pure material is a strong oxidizer and severe explosion hazard; should not be stored after preparation, nor heated above 30C.

Use: Initiator and catalyst for resins.

acetylphenetidin. See acetophenetidin.

acetylphenol. See phenyl acetate.

***N*-acetyl-*p*-phenylenediamine.** See *p*-aminoacetanilide.

acetylpropionic acid. See levulinic acid.

acetyl propionyl. (2,3-pentanedione; methyl ethyl glyoxal; methyl ethyl diketone).

CAS: 600-14-6. $\text{CH}_3\text{COCOC}_2\text{H}_5$.

Properties: Yellow liquid. Mp –52C, bp 106–110C, d 0.955–0.959 (15/4C). Partly soluble in water. Combustible.

Grade: 99%.

Use: Flavors of butterscotch and chocolate type.

2-acetyl pyrazine.

CAS: 22047-25-2. mf: $\text{C}_6\text{H}_6\text{N}_2\text{O}$.

Properties: Colorless to pale-yellow crystals or liq-

uid; sweet popcorn-like odor. Mp: 75–78°, d: 1.100–1.115 @ 20°, refr index: 1.530–1.540 @ 25°. Sol in acids, alc, ether, and water @ 230°.

Hazard: A skin and eye irritant.

Use: Food additive.

2-acetylpyrrole.

CAS: 1072-83-9. mf: C₆H₇NO.

Properties: Light beige to yellow crystals from petroleum ether; bread-like odor. Mp: 90°, bp: 220°. Sol in acids, alc, ether, water @ 230°.

Use: Food additive.

4-acetylresorcinol. (2,4-dihydroxyacetophenone). C₆H₃(OH)₂COCH₃.

Properties: Light tan crystals. Mp 146–148C. High absorptivity in UV region. Slightly soluble in water; soluble in most organic solvents except benzene and chloroform.

Use: UV absorber in plastics; dye intermediate; fungicide; plant growth promoter.

acetylsalicylic acid. See aspirin.

N-acetylsulfanilyl chloride. (*p*-acetamidobenzenesulfonyl chloride; *p*-acetylaminobenzene-sulfonyl chloride). (CH₃CONH)C₆H₄(SO₂Cl).

Properties: Light tan to brownish powder or fine crystals. Mp 149C. Soluble in chloroform and ethylene dichloride.

Hazard: Irritant to skin and mucous membranes.

Use: Intermediate in the manufacture of sulfa drugs.

2-(acetylthioglycolic amide)benzothiazole.

CAS: 63123-39-7. mf: C₁₁H₁₀N₂O₂S₂.

Hazard: A poison by ingestion.

2-acetylthiophene. (methyl-2-thienyl ketone). CH₃COC₂H₃S.

Properties: Yellowish, oily liquid. Mp 10–11C, bp 213.5C, 88–90C (10 mm). Very slightly soluble in ether.

Use: Organic intermediate.

acetyl-*o*-toluidine. (*o*-acetotoluidide).

CH₃CONHC₆H₄CH₃.

Properties: Colorless crystals. Mp 110C, bp 296C, d 1.168 (15C). Soluble in alcohol, ether, benzene, chloroform, glacial acetic acid; slightly soluble in cold water; insoluble in hot water.

Derivation: By boiling glacial acetic acid with *o*-toluidine and distilling the product.

Grade: Technical.

Use: Organic synthesis.

acetyl-*p*-toluidine. (*p*-acetotoluidide).

CH₃CONHC₆H₄CH₃.

Properties: Colorless needles. Mp 153C, bp 307C, d 1.212 (15/4C). Slightly soluble in water; soluble in alcohol, ether, ethyl acetate, glacial acetic acid.

Grade: Technical.

Use: Dyes.

acetyl triallyl citrate.

CH₃COOC₃H₆(COOCH₂CH:CH₂)₃.

Properties: Liquid. Boiling range 142–143C (0.2 mm), d 1.140 (20C), refr index 1.4665 (25C), flash p 365F (185C). Combustible.

Use: Cross-linking agent for polyesters; monomer for polymerization.

acetyl tributyl citrate.

CH₃COOC₃H₇(COOC₄H₉)₃.

Properties: Colorless, odorless liquid. Distillation range 172–174C (1 mm), pour p –60C, d 1.046 (25C), bulk d 8.74 lb/gal (25C), refr index 1.4408 (25C), viscosity 42.7 cP (25C), flash p 400F (204C). Insoluble in water. Combustible.

Derivation: Esterification and acetylation of citric acid.

Grade: Technical.

Use: Plasticizer for vinyl resins.

See “Citroflex A-4” [Reilly].

acetyl triethyl citrate.

CH₃COOC₃H₇(COOC₂H₅)₃.

Properties: Colorless liquid; odorless. Distillation range 131–132C (1 mm), pour p –47C, d 1.135 (25C), bulk d 9.47 lb/gal (25C), refr index 1.4386 (25C), viscosity 53.7 cP (25C), flash p 370F (187C). Slightly soluble in water. Combustible.

Derivation: Esterification and acetylation of citric acid.

Grade: Technical.

Use: Plasticizer for cellulose, particularly ethyl cellulose.

See “Citroflex A-2” [Reilly]; “ATEC.” [Reilly].

acetyl tri-2-ethylhexyl citrate.

CH₃COOC₃H₇(COOC₈H₁₇)₃.

Properties: Liquid. Bp 225C (1 mm), flash p 430F (222C). Insoluble in water. Combustible.

Grade: Technical.

Use: Low-volatility plasticizer for vinyl resins.

acetyltri-*n*-hexyl citrate. See “Citroflex A-6” [Reilly].

***N*-acetyltryptophan.** Available commercially as *N*-acetyl-*l*-tryptophan, mp 185–186C; *N*-acetyl-*dl*-tryptophan, mp 205C.

Use: Nutrition and biochemical research; medicine.

acetyl valeryl. (heptadione-2,3).

CH₃COCOC₄H₉.

Properties: Yellow liquid. Combustible.

Grade: 92% pure.

Use: Cheese, butter, and miscellaneous flavors.

acetyl value. The number of milligrams of potassium hydroxide required for neutralization of acetic acid obtained by the saponification of 1 g of acetylated fat or oil sample. Acetylation is carried out by boiling the sample with an equal amount of acetic anhydride, washing, and drying. Saponifica-

tion values on acetylated and on untreated fat are determined. From the results the acetyl value is calculated. It is a measure of the number of free hydroxyl groups in the fat or oil.

ACGIH. See American Conference of Governmental Industrial Hygienists.

“Achromycin” [Cytec]. TM for tetracycline hydrochloride.

acicular. Used to describe needle-shaped crystals or the particles in powders.

acid. One of a large class of chemical substances whose water solutions have one or more of the following properties: sour taste, ability to make litmus dye turn red and to cause other indicator dyes to change to characteristic colors, ability to react with and dissolve certain metals to form salts, and ability to react with bases or alkalis to form salts. All acids contain hydrogen. In water, ionization or splitting of the molecule occurs so that some or most of this hydrogen forms H_3O^+ ions (hydronium ions), usually written more simply as H^+ (hydrogen ion). Acids are referred to as strong or weak according to the concentration of H^+ ion that results from ionization. Hydrochloric, nitric, and sulfuric are strong or highly ionized acids; acetic acid (CH_3COOH) and carbonic acid (H_2CO_3) are weak acids. Tenth normal hydrochloric acid is 100 times as acid ($pH = 1$) as tenth normal acetic acid ($pH = 3$). The pH range of acids is from 6.9 to 1.

See pH . When dealing with chemical reactions in solvents other than water, it is sometimes convenient to define an acid as a substance that ionizes to give the positive ion of the solvent. The common definitions of acid have been extended as more detailed studies of chemical reactions have been made. The Lowry-Brønsted definition of an acid as a substance that can give up a proton is more useful in connection with an understanding of bases (see base). Perhaps the most significant contribution to the theory of acids was the electron-pair concept introduced by G. N. Lewis around 1915.

See Lewis electron theory. The terms *hard* and *soft* acids and bases refer to the ease with which the electron orbitals can be disturbed or distorted. Hard acids have a high positive oxidation state, and their valence electrons are not readily excited; soft acids and bases have little or no positive charge and easily excited valence electrons. Hard acids combine preferentially with hard bases, and soft acids with soft bases. Soft acids tend to accept electrons and form covalent bonds more readily than hard acids. For example, the halogen acids arranged in a series by increasing atomic weight (and decreasing chemical activity) show a progression from hard (HF) to soft (HI). A brief outline of the major groups of acids is as follows:

Inorganic

Mineral acids: sulfuric, nitric, hydrochloric, phosphoric.

Hazard: All mineral acids are highly irritant and corrosive to human tissue.

Organic

Carboxylic (contain $-COOH$ group)

aliphatic: acetic, formic

aromatic: benzoic, salicylic

Dicarboxylic (contain two $-COOH$ groups)

oxalic, phthalic, sebacic, adipic

Fatty acids (contain $-COOH$ group)

aliphatic: oleic, palmitic, stearic

aromatic: phenylstearic

Amino acids: N-containing protein components

See Lewis acid; carboxylic acid; fatty acid;

amino acid; specific compounds.

1,2,4-acid. (1-amino-2-naphthol-4-sulfonic acid). $C_{10}H_7NH_2OHSO_3H$.

Properties: Pinkish-white to gray needles. Soluble in hot water; but almost insoluble in cold water.

Derivation: β -naphthol is nitrated to nitroso- β -naphthol by reaction with nitrous acid and the product treated with sodium bisulfite. Upon acidification the free sulfurous acid effects simultaneous reduction and sulfonation.

Use: Aniline dye intermediate.

1,8,2,4-acid. See Chicago acid.

acid amide. See amide.

acid ammonium sulfate. See ammonium bisulfate.

acid ammonium tartrate. See ammonium bitartrate.

acid anhydride. An oxide of a nonmetallic element or of an organic radical that is capable of forming an acid when united with water, or which can be formed by the abstraction of water from the acid molecule, or can unite with basic oxides to form salts.

acid anthraquinone brilliant blue. See C.I. acid blue 80.

“AcidAway” [Rectorseal]. TM for a system to neutralize air conditioning and refrigeration systems that have experienced burnout.

Acid Black 2.

Use: Hair color, reagent, biological stain.

acid butyl phosphate. See *n*-butyl acid phosphate.

acid calcium phosphate. See calcium phosphate, monobasic.

acid chrome orange gr. See C.I. mordant orange 6, disodium salt.

acid dye. An azo, triarylmethane, or anthraquinone dye with acid substituents such as nitro-, carboxy-, or sulfonic acid. These dyes are most frequently applied in acid soluble to wool and silk, and no doubt combine with the basic groups of the proteins of those animal fibers. Orange II (CI 15,510), black 10B, and acid alizarine blue B are examples.

acid ethylsulfate. See ethylsulfuric acid.

acid fungal protease. (fungal protease enzyme).

Properties: Highly off-white powder.

Use: As a replacement for pepsin; chill-proofing agent for beer; in cereal treatment; feed supplement for baby pigs; rennet extender.

γ -acid. (2-amino-8-naphthol-6-sulfonic acid; aminonaphtholsulfonic acid-2,8,6).

Properties: White crystals. Soluble in alcohol and ether; slightly soluble in water.

Derivation: β -naphthylamine sulfate is sulfonated with 66% oleum; the precipitate, 2-naphthylamine-6,8-disulfonic acid, is heated with 65% sodium hydroxide solution at 210C and 210 psi.

Use: Azo dye intermediate.

acid glaucine blue. See peacock blue.

acid, hard. See Lewis electron theory; acid.

acid hydrolyzed proteins.

Properties: Liquid, paste or powder. Sol in water.

Use: Food additive.

acidic oxide. An oxide of a nonmetal, e.g., SO_2 , CO_2 , P_2O_5 , SO_3 , that forms an acid when combined with water.

See acid anhydride.

acidimetry. The determination of the concentration of acid solutions or of the quantity of acid in a sample or mixture. This is usually done by titration with a solution of base of known strength (standard solution); an indicator is used to establish the end point.

See pH.

acid lining. Silica brick lining used in steel-making furnaces.

acid magnesium citrate. See magnesium citrate, dibasic.

acid magnesium phosphate. See magnesium phosphate, monobasic.

acid methyl sulfate. See methylsulfuric acid.

acid mine drainage. (AMD). Water from both active and inactive coal mines that has become contaminated with sulfuric acid as a result of hydrolysis of ferric sulfate, the oxidation product of pyrite. This is a factor in water and stream pollution, which can be corrected by use of appropriate ion-exchange resins.

acid number. (acid value). Determined by the number of milligrams of potassium hydroxide required for the neutralization of free fatty acids present in 1 g of fat or oil. Also the measure of free acids present in a substance.

acidolysin. See glycoprotease.

acidolysis. A chemical reaction that is comparable to hydrolysis or alcoholysis, in which water or alcohol is used in place of the acid. It involves the decomposition of a molecule with the addition of the elements of an acid to the molecule.

acidosis. A condition in which blood pH decreases, either for metabolic or respiratory reasons.

acid phosphatase. An enzyme found in blood serum that catalyzes the liberation of inorganic phosphate from phosphate esters. Optimum pH 5; it is less active than alkaline phosphatase.

Use: Biochemical research.

acid phosphate. An acid salt of phosphoric acid such as NaH_2PO_4 , CaHPO_4 , etc. Also used to refer specifically to calcium phosphate monobasic, $\text{Ca}(\text{H}_2\text{PO}_4)_2$, or superphosphate of lime.

acid potassium oxalate. See potassium binoxalate.

acid potassium sulfate. See potassium bisulfate.

acid precipitation. (acid rain). Any form of precipitation (wet deposition) having a pH of 5.6 or less, the most important deleterious components being the sulfur dioxide and oxides of nitrogen, either emitted as stack gases in highly industrialized areas or resulting from volcanic activity. The most sensitive sections of the U.S. are the East and the extreme Northwest; southeastern Canada is also affected. Acid precipitation is not only destructive to fish and other freshwater life, but also kills certain species of trees (especially spruce) and corrodes metal and

cement structures. Industrial use of coal is largely responsible for the incidence of acid rain, especially in the Northeast.

See dry deposition.

acid rain. See acid precipitation.

acid, soft. See Lewis electron theory; acid.

acidulant. Any of a number of acids (chiefly organic) either occurring naturally in fruits and vegetables or used as additives in food processing. They function in the following ways: (1) as bacteriostats in processed foods; (2) as aids to the sterilization of canned foods by lowering the pH; (3) as chelating agents for metal ions such as iron and copper, which catalyze rancidity reactions in fats; (4) as flavor enhancers by offsetting excessive sweetness by their tart taste. Commonly used acidulants are citric, acetic, fumaric, ascorbic, propionic, lactic, adipic, malic, sorbic, and tartaric acids.

“Acidulin” [Lilly]. TM for glutamic acid hydrochloride acid value. The number of milligrams of potassium hydroxide required to neutralize the free acids present in 1 g of oil, fat, or wax. The determination is made by titrating the sample in hot 95% ethanol using phenolphthalein as indicator.

acid value. See acid number.

Acid Yellow 9. See 4-aminoazobenzene-3,4'-disulfonic acid.

acifluorfen, sodium salt. (Blazer).

Use: Postemergent herbicide for soybeans, peanuts, and rice.

“ACL 60” [Occidental]. TM for a product line of chlorinated isocyanurates that are an effective economical disinfectant, germicide, and algicide.

Use: Sanitizing swimming pools and spas.

“Aclar” [General Electric]. TM for a series of fluorohalocarbon films.

Properties: Useful properties from -200 to +198C.

Use: In packaging applications where a transparent, vapor, and/or gas barrier is required, as in packaging of foods for astronauts. Used in electronic and electrical applications because of insulating and heat-resistant properties. Extreme chemical resistance and ability to seal make it useful as a tank lining, etc.

“A-C-M” [Pfizer]. TM for a balanced mixture of ascorbic acid (vitamin C) and citric acid.

Use: As an antioxidant that protects flavor and prevents browning of fruits exposed to air. Used in home freezing and canning of fresh fruits.

“Acofor” [Reichhold]. TM for pale, distilled tall oil fatty acids.

Properties: D 0.907 (25/25C), refr index 1.471 (20C), flash p 380F (193C) (OC), acid number 192, saponification number 194, unsaponifiable matter 2.5%, rosin acids 4.5%. Combustible.

Use: Paint and varnish, inks, soaps, disinfectants, textile oils, core oils, etc.

“Aconew” [Reichhold]. TM for pale, distilled tall oil fatty acids with low rosin acid contents.

aconite. (monkshood; wolfsbane; friar's cowl).

Hazard: Antipyretic drug, alkaloid poison.

aconitic acid. (propene-1,2,3-tricarboxylic acid). $H(COOH)C:C(COOH)CH_2(COOH)$.

Properties: White to yellowish, crystalline solid. Mp approx 195C (decomposes). Soluble in water and alcohol. Combustible.

Derivation: (a) By dehydration of citric acid with sulfuric acid; (b) extraction from sugar cane bagasse, *aconitum napellus*, and other natural sources.

Use: Preparation of plasticizers and wetting agents; antioxidant; organic syntheses; itaconic acid manufacture; synthetic flavors.

aconitine. (acetyl benzoyl aconine).

CAS: 302-27-2. $C_{34}H_{49}NO_{11}$.

Hazard: Highly toxic alkaloid, antipyretic drug, readily absorbed by skin.

acquired genetic mutation. See somatic cell genetic mutation.

acquired mutations. See somatic cell genetic mutation.

“Acrafix” [Lanxess]. TM for a processing chemical for high quality pigment prints.

acraldehyde. See acrolein.

“Acrawax” [Lonza]. TM for *N,N'*-ethylenebis-stearamide.

CAS: 110-30-5.

Grade: Atomized powdered, prilled, and beaded grades.

Use: In plastics and metal powder lubricants, varnishes, lacquers, defoamers, and mar-resistant anti-block paints.

Acree's reaction. A test for protein in which a violet ring appears when concentrated sulfuric acid is introduced below a mixture of the unknown solution and a formaldehyde solution containing a trace of ferric oxide.

acridine (tricyclic).

CAS: 260-94-6. $C_{13}H_9N$.

Properties: Small, colorless needles. Sublimes at 100C, mp 111C, bp above 360C. Soluble in alcohol, ether, or carbon disulfide; sparingly soluble in hot water.

Derivation: (a) By extraction with dilute sulfuric acid from the anthracene fraction from coal tar and adding potassium dichromate. The acridine chromate precipitated is recrystallized, treated with ammonia, and recrystallized. (b) Synthetically.

Hazard: Strong skin irritant.

Use: Manufacture of dyes; derivatives, especially acriflavine, proflavine; analytical reagent.

acridine orange. (*N,N,N',N'*-tetramethyl-3,6-acridinediamine monohydrochloride).

CAS: 65-61-2. $C_{17}H_{19}N_3 \bullet Cl$.

Hazard: An in vitro mutagen.

Use: Selective biological stain for tumor cells, *intra-vitam*; causes retardation of tumor growth.

2-(1-(9-acridinyl)hydrazino)ethanol monohydrochloride.

CAS: 28846-44-8. mf: $C_{15}H_{15}N_3O \bullet ClH$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-(9-acridinyl)-2-methyl-3-thiosemicarbazide.

CAS: 28846-37-9. mf: $C_{15}H_{14}N_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-(9-acridinyl)-2-methyl-3-thiosemicarbazone acetone.

CAS: 29023-85-6. mf: $C_{18}H_{18}N_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-(9-acridinyl)-3-thiosemicarbazide.

CAS: 29023-84-5. mf: $C_{14}H_{12}N_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

acriflavine. $C_{14}H_{14}N_3Cl$. A mixture of 3,6-diamino-10-methylacridinium chloride and 3,6-diaminoacridine.

Properties: Brownish or orange, odorless, granular powder. Soluble in 3 parts of water; incompletely soluble in alcohol; nearly insoluble in ether and chloroform. The aqueous solutions fluoresce green on dilution. Also available as the hydrochloride.

Use: Antiseptic and bacteriostat.

"Acrilan" [Solutia]. TM for an acrylic fiber.

acrinathrin. See 2,2-dimethyl-3-(3-oxo-3-(2,2,2-trifluoro-1-(trifluoromethyl)).

acroleic acid. See acrylic acid.

acrolein. (2-propenal; acrylaldehyde; allyl aldehyde; acraldehyde).

CAS: 107-02-8. CH_2CHCHO .

Properties: Colorless or yellowish liquid; disagreeable, choking odor. Bp 52.7C, mp -87.0C, d 0.8427 (20/20C), bulk d 7.03 lb/gal (20C). Flash p below 0F (-17C) (COC), autoign temp 532F (277C). Soluble in water, alcohol, and ether. Polymerizes readily unless inhibitor (hydroquinone) is added. Very reactive.

Derivation: (1) Oxidation of allyl alcohol or propylene; (2) by heating glycerol with magnesium sulfate; (3) from propylene with bismuth-phosphorus-molybdenum catalyst.

Method of purification: Rectification.

Grade: Technical.

Hazard: Very irritant to eyes and skin. Toxic by inhalation and ingestion. TLV: 0.1 ppm. Dangerous fire risk. Explosive limits in air 2.8 to 31%.

Use: Intermediate for synthetic glycerol, polyurethane and polyester resins, methionine, pharmaceuticals; herbicide; warning agent in gases.

acrolein dimer. (2-formyl-3,4-dihydro-2H-pyran).

$OCH:CHCH_2CH_2CHCHO$.

Properties: Liquid. D 1.0775 (20C), bp 151.3C, fp -100C, flash p 118F (47.7C) (OC), bulk d 8.96 lb/gal (20/20C). Soluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Intermediate for resins, pharmaceuticals, dye-stuffs.

acrolein test. A test for the presence of glycerine or fats. A sample is heated with potassium bisulfate. Acrolein is released for a positive test.

"Acronal" [BASF]. TM for dispersions, solutions, and solids of acrylate homo- and copolymers.

ACR process. Abbreviation for advanced cracking reactor.

See ethylene.

acrylaldehyde. See acrolein.

acrylamide.

CAS: 79-06-1. $CH_2CHCONH_2$.

Properties: Colorless, odorless crystals. Mp 84.5C, bp 125C (25 mm), d 1.122 (30C). Soluble in water, alcohol, acetone; insoluble in benzene, heptane. The solid is stable at room temperature but may polymerize violently on melting.

Derivation: Reaction of acrylonitrile with sulfuric acid (84.5%) and neutralization.

Grade: Technical (approximately 97% pure).

Hazard: Toxic by skin absorption. Irritant to skin and mucous membranes. TLV: 0.03 mg/m³, suspected of carcinogenic potential for humans

Use: Synthesis of dyes, etc., cross-linking agent, adhesives, paper and textile sizes, soil-conditioning agents, flocculants, sewage and waste treatment, ore processing, permanent-press fabrics.

acrylamide gels. A polymer gel used for electrophoresis of DNA or protein to measure their sizes (in daltons for proteins, or in base pairs for DNA). See "Gel Electrophoresis". Acrylamide gels are especially useful for high resolution separations of DNA in the range of tens to hundreds of nucleotides in length.

***p*-acrylamidobenzoic acid 2-(diethylamino) ethyl ester.** See procaine acryloyl monomer.

2-acrylamido-2-methyl-1-propanesulfonic acid.

CAS: 15214-89-8. mf: C₇H₁₃NO₄S.

Hazard: Low toxicity by ingestion.

acrylate. (1) Any of several monomers used for the manufacture of thermosetting acrylic surface coating resins, e.g., 2-hydroxyethyl acrylate (HEA) and hydroxypropyl acrylate (HPA). (2) Polymer of acrylic acid or its esters, used in surface coatings, emulsion paints, paper and leather finishes, etc. See acrylic acid; acrylic resin.

acrylate-acrylamide resins.

Use: Food additive.

acrylic acid. (acroleic acid; propenoic acid).

CAS: 79-10-7. H₂C:CHCOOH.

Properties: Colorless liquid; acrid odor. Bp 140.9C, mp 12.1C, d 1.052 (20/20C), vap press 3.1 mm (20C), bulk d 8.6 lb/gal (20C), refr index 1.4224 (20C). Flash p 130F (54.5C) (OC). Polymerizes readily. Miscible with water, alcohol, and ether. Combustible.

Derivation: (1) Condensation of ethylene oxide with hydrocyanic acid followed by reaction with sulfuric acid at 320F; (2) acetylene, carbon monoxide, and water, with nickel catalyst; (3) propylene is vapor oxidized to acrolein, which is oxidized to acrylic acid at 300C with molybdenum-vanadium catalyst; (4) hydrolysis of acrylonitrile.

Grade: Technical (esterification and polymerization grades), glacial (97%).

Hazard: Irritant and corrosive to skin. Toxic by inhalation. May polymerize explosively. TLV: 2 ppm.

Use: Monomer for polyacrylic and polymethacrylic acids and other acrylic polymers.

See acrylic resin.

acrylic fiber. A manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85% (by weight) acrylonitrile units -CH₂CH(CN)- (U.S. Federal Trade Commission).

Properties: Tensile strength 2-3 g/denier, water absorption 1.5-2.5%, d approx 1.17. Combustible.

Hazard: Fumes are toxic.

Use: Modacrylic fibers; blankets; carpets.

See modacrylic fiber; acrylic resin.

acrylic polymers. See acrylic resin.

acrylic resin. (acrylic fiber; nitrile rubber).

Thermoplastic polymers or copolymers of acrylic acid, methacrylic acid, esters of these acids, or acrylonitrile. The monomers are colorless liquids that polymerize readily in the presence of light, heat, or catalysts such as benzoyl peroxide; they must be stored or shipped with inhibitors present to avoid spontaneous and explosive polymerization.

Properties: Acrylic resins vary from hard, brittle solids to fibrous, elastomeric structures to viscous liquids, depending on the monomer used and the method of polymerization. A distinctive property of cast sheet and extruded rods of acrylic resin is ability to transmit light.

Use: Bulk-polymerized: hard, shatterproof, transparent or colored material (glass substitute, decorative illuminated signs, contact lenses, dentures, medical instruments, specimen preservation, furniture components). Suspension-polymerized: beads and molding powders (headlight lenses, adsorbents in chromatography, ion-exchange resins). Solution polymers: coatings for paper, textiles, wood, etc. Aqueous emulsions: adhesives, laminated structures, fabric coatings, nonwoven fabrics. Compounded prepolymerized: exterior auto paints, applied by spray and baked. Acrylonitrile-derived acrylics are extruded into synthetic fibers and are also the basis of the nitrile family of synthetic elastomers. See acrylic acid; acrylonitrile; methyl methacrylate.

"Acryloid" coating resins [Rohm & Haas].

TM for acrylic ester polymers in organic solvent solutions or 100% solid forms; water-white and transparent. Films range from very hard to very soft.

Use: Exceptionally resistant surface coatings, such as heat-resistant and fumeproof enamels; vinyl and plastic printing; fluorescent coatings; clear and pigmented coatings on metals.

"Acryloid" Modifiers [Rohm & Haas].

TM for thermoplastic acrylic polymers in powder form. Various grades facilitate processing or improve physical properties of rigid or semi-rigid polyvinyl chloride formulations.

"Acryloid" oil additives [Rohm & Haas].

TM for acrylic polymers supplied in special oil solution or in diester lubricant.

Use: Viscosity-index improvement, pour-point de-

pression of lubricating oils and hydraulic fluids, sludge dispersancy in lubricating and fuel oils.

“Acrylon” [Borden]. TM for a group of acrylic rubbers outstanding in resistance to oil, grease, ozone, and oxidation.

Use: Gaskets and rubber parts for contact with oils and diester lubricants.

acrylonitrile. (propenenitrile; vinyl cyanide).

CAS: 107-13-1. $H_2C:CHCN$.

Properties: Colorless, mobile liquid; mild odor. Fp $-83C$; bp $77.3-77.4C$, d 0.8004 ($25C$), flash p $32F$ ($0C$) (TOC). Soluble in all common organic solvents; partially miscible with water.

Derivation: (1) From propylene oxygen and ammonia with either bismuth phosphomolybdate or a uranium-based compound as catalysts; (2) addition of hydrogen cyanide to acetylene with cuprous chloride catalyst; (3) dehydration of ethylene cyanohydrin.

Hazard: Toxic by inhalation and skin absorption. A carcinogen. Flammable, dangerous fire risk. Explosive limits in air 3 to 17%. TLV: 2 ppm, suspect of carcinogenic potential for humans.

Use: Monomer for acrylic and modacrylic fibers and high-strength whiskers; ABS and acrylonitrile styrene copolymers; nitrile rubber; cyanoethylation of cotton; synthetic soil blocks (acrylonitrile polymerized in wood pulp); organic synthesis; adiponitrile; grain fumigant; monomer for a semiconductive polymer that can be used like inorganic oxide catalysts in dehydrogenation of *tert*-butanol to isobutylene and water.

acrylonitrile-butadiene rubber. See nitrile rubber.

acrylonitrile-butadiene-styrene resin.

Most contemporary ABS resins are true graft polymers consisting of an elastomeric polybutadiene or rubber phase, grafted with styrene and acrylonitrile monomers for compatibility, dispersed in a rigid styrene-acrylonitrile (SAN) matrix. Mechanical polyblends of elastomeric and rigid copolymers, e.g., butadiene-acrylonitrile rubber and SAN, historically the first ABS resins, are also marketed. Varying the composition of the polymer by changing the ratios of the three monomers and use of other comonomers and additives results in ABS resins with a wide range of properties.

Properties: Dimensional stability over temperature range from -40 to $+71C$. Attacked by nitric and sulfuric acids and by aldehydes, ketones, esters, and chlorinated hydrocarbons. Insoluble in alcohols, aliphatic hydrocarbons, and mineral and vegetable oils. Processed by conventional molding and extrusion methods. D 1.04; tensile strength about 6500 psi, flexural strength 10,000 psi, good electrical resistance, water absorption 0.3–0.4%. Combustible but slow-burning; flame retardants may be added. Can be vacuum-metallized or electroplated.

Grade: High-, medium-, and low-impact; molding and extrusion.

Use: Engineering plastics used for automobile body parts and fittings; telephones; bottles; heels; luggage; packaging; refrigerator door liners; plastic pipe and building panels (subject to local building codes); shower stalls; boats; radiator grills; machinery housings; business machines. *Note:* Several trademarked types are “Cyclocac,” “Abson,” “Lustran.”

See ABS resin.

acrylonitrile dimer. See methylene glutaronitrile.

acrylonitrile-styrene copolymer. A thermoplastic blend of acrylonitrile and styrene monomers having good dimensional stability and suitable for use in contact with foods. Among its numerous applications is that of bottles for soft drinks (TM “Cyclesafe”).

Hazard: FDA regulations limit to 0.3 ppm the amount of acrylonitrile monomer that will be allowed to migrate from the container to the contents.

acryloyl chloride. (acrylyl chloride).

$H_2CCHCOCl$.

Properties: Liquid. Bp $75C$.

Use: Monomer, intermediate.

“Acrysol” [Rohm & Haas]. (1) TM for aqueous solutions of sodium polyacrylate or other polymeric acrylic salts. (2) TM for polyacrylic acid and copolymer products in aqueous solutions or dispersions. Some grades are solutions of sodium polyacrylate.

Use: (1) Thickeners in paints, fabric coatings and backings, adhesives. (2) Warp size for synthetic fibers, cotton and rayon, modifier of starch sizes.

ACS. See American Chemical Society; American Carbon Society.

ACTH. (adrenocorticotrophic hormone; corticotropin).

CAS: 9002-60-2. One of the hormones secreted by the anterior lobe of the pituitary gland. It stimulates an increase in the secretion of the adrenal cortical steroid hormones. It is a polypeptide consisting of a 39-unit chain of amino acids, the sequence varying in certain positions with the biological species. ACTH was synthesized in 1960.

Properties: White powder with molecular weight approximately 3500. Freely soluble in water; soluble in 60–70% alcohol or acetone. Solutions are stable to heat.

Source: Extracted from whole pituitary glands of swine, sheep, and oxen. Normally isolated from swine.

Grade: Pure; USP as corticotropin injections. Units: based on comparison with USP Corticotropin Reference Standard.

Hazard: May have damaging side effects.

Use: Medicine; biochemical research.

“Acti-Brom” [*Nalco*]. TM for chemical program used to control microbiological deposits.

Use: In cooling water systems.

“Acti-dione” [*Pfizer*]. TM for antibiotic cycloheximide, an agricultural fungicide.

“Actimoist” [*Active*]. (hyaluronic acid)

CAS: 9067-32-7. TM for active natural mucopolysaccharide.

Properties: Clear, colorless, viscous liquid.

Use: To help maintain long-lasting moisture balance on the skin.

actin. A protein making up the thin filaments of muscle and cytoskeleton of eukaryotic cells.

actinide series. (actinoid series). The group of radioactive elements starting with actinium and ending with element 105. All are classed as metals. Those with atomic number higher than 92 are called transuranic elements. The series includes the following elements: actinium, 89; thorium, 90; protoactinium, 91; uranium, 92; neptunium, 93; plutonium, 94; americium, 95; curium, 96; berkelium, 97; californium, 98; einsteinium, 99; fermium, 100; mendelevium, 101; nobelium, 102; and lawrencium 103. The isotopes of several of these elements are under study for possible use in such fields as radiography, neutron activation analysis, hydrology, and geophysics.

actinium. Ac. A radioactive metallic element; first member of the actinide series. Similar to lanthanum.

Properties: Atomic number 89, aw 227 (most stable isotope), silvery white metal. Mp 1050C, bp (est) 3200C, oxidation state +3. Eleven radioactive isotopes; 227 has half-life of 21.8 years.

Derivation: Uranium ores; neutron bombardment of radium. Several compounds have been prepared. Available commercially at 98% minimum purity.

Hazard: Radioactive bone-seeking poison.

Use: Radioactive tracer (225 isotope).

See lanthanum.

actinomycin. A family of antibiotics produced by Streptomyces; reported to be active against *E. coli*, other bacteria and fungi to have cytostatic and radiomimetic activity. There are many forms of actinomycin; two of commercial importance are cactinomycin and dactinomycin.

“Actitex” [*Pica*]. TM for an activated carbon fiber.

Available forms: Rolls.

Use: Removal of pesticides from drinking water and VOCs from process gases.

activated alumina. See alumina, activated.

activated carbon. See carbon, activated.

activated sludge. See sewage sludge (2).

activation. The process of treating a substance or a molecule or atom by heat or radiation or the presence of another substance so that the first-mentioned substance, atom, or molecule will undergo chemical or physical change more rapidly or completely. Common types of activation are: (1) Processing of carbon black, alumina, and other materials to impart improved adsorbent qualities. Subjecting the material to steam or carbon dioxide at high temperatures is the method usually used.

See alumina, activated; carbon, activated. (2) Heating or otherwise supplying energy to a substance (for example, ultraviolet or infrared radiation) to attain the necessary level of energy for the occurrence of a chemical reaction, or for emission of desired light waves, as in fluorescence or chemical lasers. The term *excitation* is also used. (3) An important variation of (2) is the process of making a material radioactive by bombardment with neutrons, protons, or other nuclear particles.

See activation analysis; energy, activation. (4) Catalytic processes in which the energy of activation for occurrence of a reaction is lowered by the presence of a nonreacting substance.

activation analysis. An extremely sensitive technique for identifying and measuring very small amounts of various elements. A sample is exposed to neutron bombardment in a nuclear reactor, for the purpose of producing radioisotopes from the stable elements. The characteristics of the induced radiations are sufficiently distinct that different elements in the sample can be accurately identified. The technique is particularly useful when concentration of the elements is too small to be measured by ordinary means. Trace elements have thus been determined in drugs, fertilizers, foods, fuels, glass, minerals, dusts, water, toxicants, etc.

activation energy. (1) Distinct energy states corresponding to minima of a potential energy surface in a configuration space. If tunneling is considered, lower energy paths become possible, but an activation energy can be associated with the reaction (at a given temperature) via the relationship between temperature and reaction rate. (2) The amount of energy (SI unit of joules) required to convert 1 mole of a reactant from the ground state to the transition state.

activator. (1) A metallic oxide that promotes cross-linking of sulfur in rubber vulcanization. By far the most widely used is zinc oxide; in rubber mixes where no organic accelerator is used, oxides of magnesium, calcium, or lead are effective. (2) A fatty acid that increases the effectiveness of acidic

organic accelerators; stearic acid is generally used, especially with thiazoles. (3) A substance necessary in trace quantities to induce luminescence in certain crystals. Silver and copper are activators for zinc sulfide and cadmium sulfide.

See initiator.

active amyl alcohol. See 2-methyl-1-butanol.

active carbon. See carbon, activated.

active pharmaceutical ingredient. (API).

The biologically active compound in a drug formulation that imparts the desired therapeutic effect.

active site. The region of an enzyme that binds a substrate molecule and catalytically transforms it, usually a small portion of the total enzyme molecule

active transport. Energy-requiring transport of a solute across a membrane in the direction of increasing concentration. Contrast with passive transport.

activin.

CAS: 114949-22-3.

Hazard: Moderately toxic by ingestion and skin contact. A moderate skin and mild eye irritant.

Source: Natural product.

activity. (1) Chemical activity (thermodynamic activity): a quantity replacing actual molar concentration in mathematical expressions for the equilibrium constant so as to eliminate the effect of concentration on equilibrium constant. (2) Activity coefficient: a fractional number which when multiplied by the molar concentration of a substance in solution yields the chemical activity. This term gives an idea of how much interaction exists between molecules at higher concentration. (3) Activity of metals or elements: an active element will react with a compound of a less active element to produce the latter as the free element, and the active element ends up in a new compound. Thus, magnesium, an active metal, will displace copper from copper sulfate to form magnesium sulfate and free metallic copper; chlorine will liberate iodine from sodium iodide and sodium chloride is formed. See electro-motive series. (4) Activity product: the number resulting from the multiplication of the activities of slightly soluble substances. This is frequently called the solubility product. (5) Catalytic activity: see catalysis. (6) Optical activity: the existence of optical rotation in a substance. (7) Radioactivity activity coefficient. (8) Biology: The true thermodynamic activity of a substance, as distinct from its molar concentration. Most of the time we call the activity equal to the molar concentration and ignore it. See activity (2).

activity series. (displacement series; electro-motive series). An arrangement of the metals in the

order of their tendency to react with water and acids, so that each metal displaces from solution those below it in the series and is displaced by those above it. The arrangement of the more common metals is: K Na Mg Al Zn Fe Sn Pb H Cu Hg Ag Pt Au.

“Actol” [General Electric]. TM for a series of polyoxypropylene diols, triols, and polyols. These vary in molecular weight from approximately 1000 to 3600; the diols and triols are almost insoluble in water, but the polyols are completely miscible with it.

Use: Urethane foams, elastomers, and coatings.

“Acumer 1000” [Mid South]. TM for an acrylic homopolymer.

Use: For water treatment, scale inhibitor, and as a dispersant.

“Acumist” [General Electric]. TM for homopolymer, and copolymer polyolefin waxes.

Use: For adhesives, coatings, color concentrates, cosmetics, inks, lubricants, paints, plastics, rubber, and textiles.

acyl. An organic acid group in which the OH of the carboxyl group is replaced by some other substituent (RCO-). Examples: acetyl, CH₃CO-; benzoyl, C₆H₅CO-.

ADA. Abbreviation for acetonedicarboxylic acid. See β-ketoglutaric acid.

1-adamantanamine hydrochloride. See amantadine hydrochloride.

adamantane. (*sym*-tricyclodecane). C₁₀H₁₆. Has unique molecular structure consisting of four fused cyclohexane rings.

Properties: White crystals. Mp 270C (sublimes), approximately 99% pure. Derivatives (alkyl adamantanes) have potential uses in imparting heat, solvent, and chemical resistance to many basic types of plastics. Synthetic lubricants and pharmaceuticals are also based on adamantane derivatives. Adamantane diamine is used to cure epoxy resins.

See “Symmetrel” [Du Pont].

adamsite. See diphenylamine chloroarsine.

Adams, Roger. (1889–1971). An American chemist, born in Boston; graduated from Harvard, where he taught chemistry for some years. After studying in Germany, he moved to the University of Illinois in 1916, where he later became chairman of the department of chemistry (1926–1954). During his prolific career, he made this department one of the best in the country, and strongly influenced the development of industrial chemical research in the U.S. His executive and creative ability made him an outstanding figure as a teacher, innovator, and administrator. Among his research contributions were

development of platinum-hydrogenation catalysts, and structural determinations of chaulmoogric acid, gossypol, alkaloids, and marijuana. He held many important offices, including president of the ACS and AAAS, and was a recipient of the Priestley medal.

addition polymer. A polymer formed by the direct addition or combination of the monomer molecules with one another. An example is the formation of polystyrene by stepwise combination of styrene monomer units (approximately 1000 per macromolecule).
See polymerization.

additive. A nonspecific term applied to any substance added to a base material in low concentrations for a definite purpose. Additives can be divided into two groups: (1) those which have an auxiliary or secondary function (antioxidants, inhibitors, thickeners, plasticizers, flavoring agents, colorants, etc.); and (2) those that are essential to the existence of the end product (leavening agents in bread, curatives in rubber, blowing agents in cellular plastics, emulsifiers in mayonnaise, polymerization initiators in plastics, and tanning agents in leather). It seems logical that the latter group should be regarded less as additives than as base materials, since the end products could not exist without them. In any case, a specific functional name is preferable to the neutral term *additive*.

See food additive.

additive genetic effects. When the combined effects of alleles at different loci are equal to the sum of their individual effects.
See anticipation.

adduct. See inclusion complex.

adenine. (6-aminopurine).
CAS: 73-24-5. $C_5H_5N_5$.

Properties: White, odorless, microcrystalline powder; sharp salty taste. Mp 360–365C (decomposes). Very slightly soluble in cold water; soluble in boiling water, acids, and alkalis; slightly soluble in alcohol; insoluble in ether and chloroform. Aqueous solutions are neutral.

Occurrence: Ribonucleic acids and deoxyribonucleic acids, nucleosides, nucleotides, and many important coenzymes.

Derivation: By extraction from tea; by synthesis from uric acid; prepared from yeast ribonucleic acid.

Use: Medicine and biochemical research.

adenosine. (adenine riboside; 9-β-D-ribofuranosyl-adenine).

CAS: 58-61-7. $C_5H_4N_5 \bullet C_5H_8O_4$. The nucleoside composed of adenine and ribose.

Properties: White, crystalline, odorless powder; mild, saline, or bitter taste. Mp 229C. Quite soluble in hot water; practically insoluble in alcohol.

Derivation: Isolation following hydrolysis of yeast nucleic acid.

Use: Biochemical research.

adenosine diphosphate. (5'-adenylphosphoric acid; ADP; adenosine-5'-pyrophosphate; adenosine diphosphoric acid).

CAS: 58-64-0. $C_{10}H_{15}N_5O_{10}P_2$. A nucleotide found in all living cells and important in the storage of energy for chemical reactions.

Derivation: (1) From adenosine triphosphate by hydrolysis with the enzyme adenosinetriphosphatase from lobster or rabbit muscle; (2) by yeast phosphorylation of adenosine.

Use: Biochemical research.

Available forms: Sodium or barium salt of adenosinediphosphoric acid.

See adenosine diphosphate.

adenosine monophosphate. See adenylic acid.

adenosine phosphate (USAN). (5'-adenyl-diphosphoric acid; ATP; adenosine triphosphate).

CAS: 56-65-5. $C_{10}H_{16}N_5O_{13}P_3$. A nucleotide that serves as a source of energy for biochemical transformations in plants (photosynthesis) and also for many chemical reactions in the body, especially those associated with muscular activity and replication of cell components.

Properties: White, amorphous powder; odorless; faint sour taste. Soluble in water; insoluble in alcohol, ether, and organic solvents; stable in acidic solutions; decomposes in alkaline solution.

Derivation: Isolation from muscle tissue; yeast phosphorylation of adenosine.

Use: Biochemical research.

Available forms: Disodium, dipotassium, and dibarium salts.

3'-adenylic acid. (yeast adenylic acid).

$C_{10}H_{14}N_5O_7P$.

Properties: Crystals. Mp 197C (decomposes). Almost insoluble in cold water; slightly soluble in boiling water. Gives quantitative yield of furfural when distilled with 20% hydrochloric acid.

Derivation: Extracted from nucleic acids of yeast; also made synthetically.

Use: Biochemical research.

5'-adenylic acid. (adenosine monophosphate; AA; adenosine phosphate; AMP; adenosine-phosphoric acid; cAMP).
CAS: 61-19-8. $C_{10}H_{14}N_5O_7P$. The monophosphoric ester of adenosine, i.e., the nucleotide containing adenine, *d*-ribose, and phosphoric acid. Adenylic acid is a constituent of many important coenzymes. Cyclic adenosine-3',5'-monophosphate is designated by biochemists as cAMP.

Properties: (Muscle adenylic acid) crystalline solid. Mp 196–200C. Readily soluble in boiling water. Gives only traces of furfural when boiled with 20% hydrochloric acid.

Derivation: Extracted from muscle tissue; phosphorylation of adenosine.

Use: Biochemical research.

adhesion. The state in which two surfaces are held together by interfacial forces, which may consist of valence forces or interlocking action, or both. (ASTM)

adhesion tension. The decrease in free surface energy that occurs when a unit liquid-solid interface is substituted for a unit air-solid interface. It is equal to the product of the surface tension of the liquid and the cosine of the liquid-solid angle of contact.

adhesive. Any substance, inorganic or organic, natural or synthetic, that is capable of bonding other substances together by surface attachment. A brief classification by type is as follows:

I. Inorganic

1. Soluble silicates (water glass)
2. Phosphate cements
3. Portland cement (calcium oxide-silica)
4. Other hydraulic cements (mortar, gypsum)
5. Ceramic (silica-boric acid)
6. Thermosetting powdered glasses ("Pyro-ceram")

II. Organic

1. Natural:

- (a) Animal: hide and bone glue, fish glue, blood and casein glues
- (b) Vegetable: soybean starch cellulose, rubber latex, and rubber-solvent (pressure-sensitive); gums, terpene resins (rosin), mucilages
- (c) Mineral asphalt, pitches, hydrocarbon resins

2. Synthetic

- (a) Elastomer-solvent cements
- (b) Polysulfide sealants
- (c) Thermoplastic resins (for hot-melts): polyethylene, isobutylene, polyamides, polyvinyl acetate
- (d) Thermosetting resins: epoxy, phenoformaldehyde, polyvinyl butyral, cyanoacrylates
- (e) Silicone polymers and cements

For further information, refer to Case Western Reserve University in Cleveland, Ohio, which maintains a fundamental research center for adhesives and coatings.

adhesive, high-temperature. (1) An organic polymer, e.g., polybenzimidazoles, that retains bonding strength up to 260C for a relatively long time (500–1000 hours); strength drops rapidly above 260C, 80% being lost after 10 minutes at 535C. (2) An inorganic (ceramic), e.g., silica-boric acid mixtures or cermets produce bonds having high strength above 2000F. Adhesive lap-bond strengths can be over 2000 psi at 1000F. These adhesives are used largely for aerospace service, and for metal-metal and glass-metal seals. A silicone cement is reported to have been used to adhere tiles to spacecraft.

See RTV.

adhesive, hot-melt. A solid, thermoplastic material that melts quickly upon heating, and then sets to a firm bond on cooling. Most other types of adhesives set by evaporation of solvent. Hot-melt types offer the possibility of almost instantaneous bonding, making them well suited to automated operation. In general, they are low-cost, low-strength products, but are entirely adequate for bonding cellulose materials. Ingredients of hot-melts are polyethylene, polyvinyl acetate, polyamides, hydrocarbon resins, as well as natural asphalts, bitumens, resinous materials, and waxes.

Use: Rapid and efficient bonding of low-strength materials, e.g., bookbinding, food cartons, side-seaming of cans, miscellaneous packaging applications.

See sealant.

adhesive, rubber-based. (cement, rubber).

(1) A solution of natural or synthetic rubber in a suitable organic solvent, without sulfur or other cur-

ing agent; (2) a mixture of rubber (often reclaimed), filler, and tackifier (pine tar, liquid asphalt) applied to fabric backing (pressure-sensitive friction tape); (3) a room-temperature curing rubber-solvent-curable mixture, often made up in two parts that are blended just before use; (4) rubber latex, especially for on-the-job repairing of such items as conveyor belts; (5) silicone rubber cement (see RTV and silicone).

Hazard: Those containing organic solvents, (1) and (3) above, are flammable.

adhesive working life. (pot life). The length of time an adhesive is usable after being mixed.

adiabatic. Descriptive of a system or process in which no gain or loss of heat is allowed to occur.

adigoside.

CAS: 14259-51-9. mf: C₃₅H₅₄O₉.

Hazard: A poison.

Source: Natural product.

adipic acid. (hexanedioic acid; 1,4-butanedicarboxylic acid).

CAS: 124-04-9.

COOH(CH₂)₃COOH.

Properties: White, crystalline solid. Mp 152C, bp 265C (100 mm), d 1.360 (20/4C), flash p 385F (196C) (CC). Slightly soluble in water; soluble in alcohol and acetone. Relatively stable. Combustible.

Derivation: Oxidation of cyclohexane, cyclohexanol, or cyclohexanone with air or nitric acid.

Grade: Technical; FCC.

Hazard: TLV: (Proposed) TWA 5 mg/m³)

Use: Manufacture of nylon and of polyurethane foams; preparation of esters for use as plasticizers and lubricants; food additive (acidulant); baking powders; adhesives.

adipocere. The grease material formed when animal fats decompose.

“Adipol” [FMC]. TM for a series of adipate plasticizers.

adipocyte. An animal cell specialized for the storage of triacylglycerols.

adiponitrile. (1,4-dicyanobutane).

CAS: 111-69-3. NC(CH₂)₂CN.

Properties: Water-white, odorless liquid. Mp 1–3C, refr index 1.4369 (20C), bp 295C, flash p 200F (93.3C) (OC). Slightly soluble in water, soluble in alcohol and chloroform. Combustible.

Derivation: Chlorination of butadiene to dichlorobu-

tylene, which is reacted with 35% sodium cyanide soluble to yield 1,4-dicyanobutylene, which is hydrogenated to adiponitrile. Also by electroorganic synthesis from acrylonitrile.

Hazard: Toxic by ingestion and inhalation. TLV: TWA 2 ppm (skin).

Use: Intermediate in the manufacture of nylon; organic synthesis.

adipose tissue. Connective tissue specialized for the storage of large amounts of triacylglycerols.

“Adiprene” [Du Pont]. TM for a polyurethane rubber, the reaction product of diisocyanate and polyalkylene ether glycol. In its raw polymer form, it is a liquid of honey-like color and consistency, which is compounded chemically (to polymerize it further) and converted into products by casting and other techniques.

See polyurethane.

“Adiprene” [Uniroyal]. See “Vibrathane.”

adjuvant. A subsidiary ingredient or additive in a mixture (medicine, flavoring, perfume, etc.) which contributes to the effectiveness of the primary ingredient.

Adkins catalyst. A catalyst containing copper chromite and copper oxide. It is used for the reduction of organic compounds, usually at high temperatures and pressures. It is likewise used as a catalyst for dehydrogenation and for decarboxylation reactions.

Adkins-Peterson reaction. Formation of formaldehyde by air oxidation of methanol in the vapor phase over metal oxide catalysts. A 40% aqueous formaldehyde solution is obtained.

“ADK STAB” [Ashai Denka]. TM for a line of organic and inorganic industrial chemicals, synthetic resins, synthetic rubber, high-compound fertilizers, coating materials, latexes, pharmaceutical and food additives, explosives, photopolymers and platemaking systems, separation and ion-exchange membranes, systems, and equipment.

(–)-adlumidine. See *l*-capnoidine.

***d*-adlumidine.**

CAS: 550-49-2. mf: C₂₀H₁₇NO₆.

Hazard: A poison.

Source: Natural product.

“ADMA” [Albemarle]. TM for a group of alkylidimethylamines composed of even-numbered carbon chains from C₈ to C₁₈.

ADME. The four steps a drug goes through when administered are absorption, dilution, metabolism, excretion.

admiralty metal. A nonferrous alloy containing 70–73% copper, 0.75–1.20% tin, remainder zinc.

Properties: Offers good resistance to dilute acids and alkalis, seawater, and moist sulfurous atmospheres. D 8.53 (20C), liquidus temp 935C, solidus temp 900C.

Use: Condenser, evaporator, and heat exchanger tubes, plates, and ferrules.

“Admox” [Albemarle]. (lauryl dimethylamine oxide). TM for foam stabilizer and viscosity builder.

Use: In janitorial products.

adocain. A mixture of cocaine hydrochloride and adonidin (a glucoside from *Adonis vernalis*).

Use: Heart stimulant and diuretic.

“Adogen” [Crompton & Knowles]. TM for primary fatty amines.

Use: Corrosion inhibitors and sludge dispersants for lube oil additives, textile intermediates, antistatic agents, down well corrosion inhibitors, and bactericides.

“Adogen” [Crompton & Knowles]. TM for dialkyl dimethyl quaternaries.

Use: Paper debonders, dye retarders, organophilic clays, antistatic agents, car-wash rinse aids, sugar clarification, fabric softeners, creme rinses. A high performance cationic quaternary fabric softener for retail, industrial, laundry, textile, and paper softener applications.

“Adogen 442” [Crompton & Knowles].

TM for ditallow dimethylammonium chloride, dihydrogenated.

Grade: 75% paste, 96% powder.

Use: High-performance cationic quaternary fabric softener for retail, industrial, laundry, textile, and paper softener applications.

adoMet. See S-adenosylmethionine.

ADP. Abbreviation for (1) adenosine diphosphate, (2) ammonium dihydrogen phosphate.

See ammonium phosphate, monobasic.

adrenaline. (epinephrine). $C_9H_{13}O_3N$. A hormone having a benzenoid structure. It is obtained by extraction from the adrenal glands of cattle and is also made synthetically. Its effect on body metabolism is pronounced, causing an increase in blood pressure and rate of heart beat. Under normal conditions, its rate of release into the system is constant; but emotional stresses such as fear or anger rapidly increase the output and result in temporarily heightened metabolic activity.

Hazard: Toxic by ingestion and injection.

adrenocorticotrophic hormone. See ACTH; corticoid hormone.

“Adripene” [Great Lakes/Asia Pacific].

TM for a synthetic resin.

Use: For soles of athletic footwear.

adsorbent. A substance that has the ability to condense or hold molecules of other substances on its surface. Activated carbon, activated alumina, and silica gel are examples.

adsorption. Adherence of the atoms, ions, or molecules of a gas or liquid to the surface of another substance, called the adsorbent. The best-known examples are gas-solid and liquid-solid systems. Finely divided or microporous materials presenting a large area of active surface are strong adsorbents and are used for removing colors, odors, and water vapor (activated carbon, activated alumina, silica gel). The attractive force of adsorption is relatively small, of the order of van der Waals forces. When molecules of two or more substances are present, those of one substance may be adsorbed more readily than those of the others. This is called preferential adsorption.

See absorption; chemisorption.

adsorption indicator. A substance used in analytical chemistry to detect the presence of a slight excess of another substance or ion in solution as the result of a color produced by adsorption of the indicator on a precipitate present in the solution. Thus, a precipitate of silver chloride will turn red in a solution containing even a minute excess of silver ion (silver nitrate solution) if fluorescein is present. In this example, fluorescein is the adsorption indicator.

“Advacide” [AKZO]. TM for TPLA; a free-flowing powder of triphenyl lead acetate containing 10% of a liquid aromatic hydrocarbon mixture.

Use: Antifouling paints.

“Advantage” [International Specialty].

TM for a variety of polymers.

Use: Hair care resins.

advection. The transfer of air and its characteristics by horizontal motion.

aeolotropic. (eolotropic). Displaying change of physical properties with change of position or direction, as in the change of refractive index on changing position of double refracting crystals: not isotropic.

AEPD. Abbreviation for 2-amino-2-ethyl-1,3-propanediol.

aerate. To impregnate or saturate a material (usually a liquid) with air or some similar gas. This is usually achieved by bubbling the air through the liquid, or by spraying the liquid into air.

“Aero” [Cytac]. TM; used as a combining form in naming a group of chemical products, e.g., “Aero-float.” They include the following:

case-hardening mixtures	metal heat-treating salts
catalysts	metallurgical additives
fertilizer additives	anticaking agents
flotation agents	sizing emulsions
flocculants	wetting agents
frothing/foaming agents	reinforcing agents

aerobe. An organism that uses oxygen as the terminal electron acceptor in respiration.

aerobic. Requiring or occurring in the presence of oxygen.
See bacteria.

aerogel. Dispersion of a gas in a solid or a liquid: the reverse of an aerosol. Flexible and rigid plastic foams are examples.
See foam; aerosol.

aerosol. A suspension of liquid or solid particles in a gas, the particles often being in the colloidal size range. Fog and smoke are common examples of natural aerosols; fine sprays (perfumes, insecticides, inhalants, antiperspirants, paints, etc.) are manufactured.

aerosols. Suspensions of various kinds may be formed by placing the components together with a compressed gas in a container (bomb). The pressure of the gas causes the mixture to be released as a fine spray (aerosol) or foam (aerogel) when a valve is opened. This technique is used on an industrial scale to spray paints and pesticides. It is also used in consumer items such as perfumes, deodorants, shaving cream, whipped cream, and the like. The propellant gas may be a hydrocarbon (propane, isobutane) or dimethyl ether. Admixture of 15% of methyl chloride with the hydrocarbons reduces their fire risk; for this purpose water can be used with dimethyl ether. Carbon dioxide generated in situ is a propellant which does away with the flammability problem.

“Aerothene” [Dow]. TM for a group of chlorinated solvents used as vapor pressure depressants, or with compressed gases to replace fluorocarbon propellant systems.

“Aerothenet TT” [Dow].
CAS: 71-55-6. TM for 1,1,1-trichloroethane solvent.
Use: Leather and suede cleaning.

aerugidiol.
CAS: 116425-35-5. mf: C₁₅H₂₂O₃.
Hazard: A poison by ingestion.

aerozine. A 1:1 mix of hydrazine and *uns*-dimethylhydrazine (UDMH).

Hazard: Flammable and explosive.

Use: Rocket fuels.
See hydrazine.

AES. Abbreviation for Auger electron spectroscopy.
See spectroscopy.

AET. See β-aminoethylisothiourea dihydrobromide.

AFCF. See ferric ammonium ferrocyanide.

affected relative pair. Individuals related by blood, each of whom is affected with the same trait. Examples are affected sibling, cousin, and avuncular pairs.
See avuncular relationship

affinin. (*N*-isobutyl-2,6,8-decatrienamide).
C₁₄H₂₃NO.

Properties: Yellowish, oily liquid. Bp 163C (0.5 mm), mp 23C, refr index 1.52. Soluble in alcohol; insoluble in alkalis and acids.

Derivation: From *Heliopsis longipes* or made synthetically.

Use: Insecticide activator.

affinity. The tendency of an atom or compound to react or combine with atoms or compounds of different chemical constitution. For example, paraffin hydrocarbons were so named because they are quite unreactive, the word *paraffin* meaning “very little affinity.” The hemoglobin molecule has a much greater affinity for carbon monoxide than for oxygen. The free energy decrease is a quantitative measure of chemical affinity.

affinity constant. The reciprocal of the dissociation constant; a measure of the binding energy of a ligand in a receptor.

aflatoxins. A group of polynuclear molds (mycotoxins) produced chiefly by the fungus *Aspergillus flavus*; they are natural contaminants of a wide range of fruits, vegetables, and cereal grains.

Hazard: Highly toxic to many species of animals, including fish and birds. The B₂ and G₁ strains are known carcinogens. Aflatoxins fluoresce strongly under UV, and are soluble in methanol, acetone, and chloroform, but only slightly soluble in water and hydrocarbon solvents. Prevention of mold growth is the most effective protection; removal or inactivation is possible by physical or chemical means (hand-sorting, solvent refining, etc.). Complete elimination of aflatoxins from foods is not feasible; FDA sets an upper limit of 20 ppb in foods and feeds, and 0.5 ppb in milk.

See mycotoxin.

afterblow. In the Bessemer process, continuing the blast air flow in order to remove phosphorus after the removal of carbon.

after-chromed dye. A dye that is improved in color or fastness by treatment with sodium dichromate, copper sulfate, or similar materials, after the fabrics are dyed.

after-coppering dye. A dye that is improved in color or fastness by treatment with copper sulfate, after the fabrics are dyed.

after cure. Continuing the process of vulcanizing after the cure has been carried to the proper degree and the heat is cut off.

after-flow. The action of the plastic flow in solids continuing after external forces have stopped.

after-glow. (1) The remaining luminescence in rarefied gas after electrodeless charge has passed through. (2) The glow that remains after the extinguishing of a flame.

Ag. Symbol for silver.

agar. (agar-agar). A phycocolloid derived from red algae such as *Gelidium* and *Gracilaria*; it is a polysaccharide mixture of agarose and agarpectin.

Properties: Thin, translucent membranous pieces or pale buff powder. Strongly hydrophilic, it absorbs 20 times its weight of cold water with swelling; forms strong gels at approximately 40C.

Grade: Technical, USP, FCC.

Use: Microbiology and bacteriology (culture medium); antistaling agent in bakery products, confectionery, meats, and poultry; gelation agent in desserts and beverages; protective colloid in ice cream, pet foods, health foods, laxatives, pharmaceuticals, dental impressions, laboratory reagents, and photographic emulsions.

See algae; alginic acid.

agarose gels. A polysaccharide gel used to measure the size of nucleic acids (in bases or base pairs). See "Gel Electrophoresis". The gel of choice for DNA or RNA in the range of thousands of bases in length, or even up to 1 megabase when employing pulsed field gel electrophoresis.

agate-ware. An enameled iron or steel frequently used for kitchenware.

age hardening. The spontaneous hardening of alloys at room temperature within a of couple days after quenching as a result of grain structures.

Agent Orange. A toxic herbicide and defoliant containing 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) and 2,4-dichlorophenoxyacetic acid (2,4-

D), with trace amounts of dioxin. Its use has been restricted.

age-resister. See antioxidant.

agglomeration. (1) Combination or aggregation of colloidal particles suspended in a liquid into clusters or "flocs" of approximately spherical shape. It is usually achieved by neutralization of the electric charges which maintain the stability of the colloidal suspension. The terms *flocculation* and *coagulation* have a closely similar meaning.

(2) The food industry uses "agglomeration" in the sense of increasing the particle size of powdered food products. Because such powders tend to be hydrophobic because of the high surface tension of water, agglomeration causes them to be more readily dispersible in water—a process known as "instantizing." The agglomerates have varying degrees of open spaces (voids) and are loosely bound, foam-like structures. They are formed by mechanical means in chamber spray dryers, tubes, or fluidized beds, usually in the presence of moisture. See aggregation; agglutination; flocculation; coagulation.

agglutination. The combination or aggregation of particles of matter under the influence of a specific protein. The term is usually restricted to antigen-antibody reactions characterized by a clumping together of visible cells such as bacteria or erythrocytes. The antigen is called an agglutinin, and the antibody an agglutinin because of an apparent gluing or sticking action.

See aggregation.

aggregate. A collective term denoting any mixture of such particulates as sand, gravel, crushed stone, or cinders used in Portland cement formulations, road building, paving compositions, animal husbandry, trickle filters, horticulture, etc.

aggregation. A general term describing the tendency of large molecules or colloidal particles to combine in clusters or clumps, especially in solution. When this occurs, usually as a result of removal of the electric charges by addition of an appropriate electrolyte, by the action of heat, or by mechanical agitation, the aggregates precipitate or separate from the dissolved state. Included in this term are the more specific terms *agglutination*, *coagulation*, *flocculation*, *agglomeration*, and *coalescence*.

aggregation technique. A technique used in model organism studies in which embryos at the 8-cell stage of development are pushed together to yield a single embryo (used as an alternative to microinjection).

See model organisms.

aging. (1) *Deleterious*: gradual deterioration of a material due to long exposure to the environment. Aging characteristics of various materials:

(a) Vulcanized rubber and thermoplastic polymers lose strength and crack due to oxidation, sunlight, heat; this is retarded by antioxidants, e.g., phenyl- β -naphthylamine. For accelerated aging tests see bomb.

(b) Foods: spoilage and rancidity due to bacterial contamination, retarded by butylated hydroxyanisole and various propionates.

(c) Paints: cracking, fading, chalking due to exposure to weather and photochemical degradation. Retarded by proper selection of vehicles and pigments. Accelerated weathering tests are used.

(d) Metals: rusting, pitting, and scaling due to corrosion, especially in moist acid and alkaline environments. Avoided by use of alloys in which noncorrosive metals are incorporated (stainless steel) or by plating or cladding the base metal with chromium or nickel. See corrosion; exposure testing. (2) *Beneficial*: improvement of flavor by long storage. Cheeses develop a "sharp" flavor on ripening for 9–12 months, wines develop a "bouquet" after two or more years of storage. Whiskeys stored in oaken casks for several years modify their flavor by extracting components of the wood. Tobacco is aged from 3 to 5 years after curing to remove unpleasant odors and improve smoking qualities.

agitator. Any rotating device that induces motion in fluid mixtures over a wide range of viscosities, thus effecting uniform dispersion of their components. An important class of agitators comprises impellers which produce turbulent flow in liquids of low viscosity; their diameter is much less than that of the container. They may be either top-entering (vertical) or side-entering (at an angle of approximately 45°); medium-viscosity liquids are agitated by paddles attached to a central rotating member. Pastes and high-viscosity mixtures in which no turbulent flow is possible require agitators that closely fit the mixing chamber so as to provide the necessary shearing and squeezing action throughout the mass. These are kneading devices utilizing curved or helical rotors or sigma blades, either single or double. Screw-type agitators permit continuous mixing by means of multiple shearing and blending actions. So-called ribbon agitators are effective for dry powders, slurries, etc. A number of ingenious modifications and combinations of these types are widely used in the process industries. Most are available in laboratory sizes.

See impeller; mixing; kneading; screw.

aglucone. The nonsugarlike portion of a glucoside molecule.
See glycoside.

aglycone. A nonsugar hydrolytic product of a glycoside.
See glycoside.

Agre, Peter. (1949–). An American born in Northfield, Minnesota who won the Nobel Prize for chemistry in 2003 for his pioneering work concerning discoveries about water channels in cell membranes. Agre received an undergraduate degree from Augsburg College and an M.D. from Johns Hopkins University, where he continues his research.

agricultural chemical. (agrichemical). A chemical compound or mixture used to increase the productivity and quality of farm crops. Included are fertilizers, soil conditioners, fungicides, insecticides, herbicides, nematocides, and plant hormones.

agricultural waste. See biomass; waste control; gasohol.

agrimek. See avermectin b(sub 1).

"Agrisel Car bait 5 Insecticide" [Agrisel].

TM for a turf insecticide for ornamental and agricultural grass.

Use: Controls 120 pests.

agromet. See *n*-(2,6-dimethylphenyl)-*n*-(methoxy)alanine methyl ester.

"Agsolox" [International Specialty]. TM for chemical used as an agricultural solvent.

AHMT (perfume). See: ethanone, 1-(5,6,7,8-tetrahydro-3,5,5,6,8,8-hexamethyl-2-naphthalenyl)-.

AI3-36161.

CAS: 108910-63-0.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation. A severe skin and moderate eye irritant.

Use: Agricultural chemical.

AIC. See American Institute of Chemists.

AIChE. See American Institute of Chemical Engineers.

air. A mixture (or solution) of gases, the composition of which varies with altitude and other conditions at the collection point. Following is the composition of dry air at sea level:

Substance	% by wt.	% by vol.
Nitrogen	75.53	78.00
Oxygen	23.16	20.95
Argon		0.93
Carbon dioxide		0.033*
Neon		0.0018
Helium		0.0005
Methane		0.0002
Krypton		0.0001
Nitrous oxide		0.000,05
Hydrogen		0.000,05

Substance	% by wt.	% by vol.
Xenon		0.000,008
Ozone		0.000,001

*The CO₂ content of air has increased 12–15% since 1900 due to combustion of fossil fuels. See greenhouse effect. The density of dry air is 1.29 g/L at 0C and 760 mm Hg. It is noncombustible, but will support combustion. Liquid air is air that has been subjected to a series of compression, expansion, and cooling operations until it liquefies.

Use: Source of oxygen, nitrogen, and rare gases; coolant; power source (compressed); cryogenic agent (liquid); particle classification; blowing agent (asphalt, soap, ice-cream mixes, whipped cream, etc.); flotation.

air classification. The separation of solid particles according to weight and/or size, by suspension in and settling from an air stream of appropriate velocity, as in air-floated clays and other particulate products.

airedale brown md. See C.I. direct brown 2.

air floatation. See air classification.

air gas. See producer gas.

air knife. See doctor knife.

air pollution. (atmospheric pollution). Introduction of substances into the atmosphere that are not normally present therein and that have a harmful effect on humans, animals, or plant life. Photosynthesis is significantly inhibited by air pollutants, especially in urban areas. The worst offenders are sulfur dioxide (which forms sulfurous acid on contact with water vapor); automotive emission products; metal dusts from smelters, coal smoke, and other particulates; formaldehyde and acrolein; and radioactive emanations. Control of these is exercised by the Environmental Protection Agency. As conventionally used, the term does not apply to interior air spaces such as industrial workrooms. TLVs (Threshold Limit Values) for the latter are established by the American Conference of Governmental Industrial Hygienists (ACGIH) and by OSHA.

See environmental chemistry.

azen direct deep black eh. See apomine black gx.

Akabori amino acid reactions. (1) Formation of aldehydes by oxidative decomposition of α -amino acids when heated with sugars. (2) Reduction of α -amino acids and esters by sodium amalgam and ethanolic hydrochloric acid to the corresponding α -amino aldehydes. (3) Formation of alkamines by

heating mixtures of aromatic aldehydes and amino acids. No reaction has been observed with tertiary amino groups.

“Ajicure” [Ajinomoto]. TM for a line of epoxy curing agents.

“Ajisper” [Ajinomoto]. TM for a pigment dispersing agent.

aklomide.

CAS: 3011-89-0. mf: C₇H₅ClN₂O₃.

Properties: Crystals and gray scales from alc. Mp: 172°.

Use: Drug (veterinary); food additive.

“Akroflex” C [Du Pont]. TM for a rubber antioxidant containing 35% diphenyl-*p*-phenylenediamine C₆H₄(NHC₆H₅)₂ and 65% phenyl- α -naphthylamine (“Neozone” A).

Use: To improve the aging and service life of rubbers; anti-cross-linking agent for SBR (styrene-butadiene-rubber).

“Akucell” [Robeco].

CAS: 9004-32-4. TM for anionic water-soluble sodium carboxymethylcellulose polymer.

Use: As a binder, thickener, and suspension agent in food and pharmaceuticals.

Al. Symbol for aluminum.

alabaster. A fine-grained compact gypsum.

“Alamine 304” [Henkel]. (trilaurylamine)

TM for organic acid and metal extraction additive.

Use: For paints, plastics, and rubbers.

“Alanap” [Uniroyal]. TM for *N*-1-naphthylphthalamic acid.

Use: A herbicide.

alanine. (α -alanine; α -aminopropionic acid; 2-aminopropanoic acid). CH₃CH(NH₂)COOH. A nonessential amino acid.

Properties: Colorless crystals. Soluble in water; slightly soluble in alcohol; insoluble in ether. Optically active.

DL-alanine, mp 295C (decomposes), sublimes at 200C.

L(+)-alanine, mp 297C (decomposes).

D(-)-alanine, mp 295C (decomposes).

L(+)-alanine hydrochloride; prisms, mp 204C (decomposes).

L(+)-alanine, *N*-acetyl-, crystals, mp 116C.

L(+)-alanine, *N*-benzoyl-, crystals, mp 152–154C.

Derivation: Hydrolysis of protein (silk, gelatin, zein), organic synthesis.

Grade: Reagent, technical.

Use: Microbiological research, biochemical research, dietary supplement.

β-alanine. (3-aminopropanoic acid; β-amino-propionic acid). $\text{NH}_2\text{CH}_2\text{CH}_2\text{COOH}$. A naturally occurring amino acid not found in protein.

Properties: White prisms. Mp 198C (decomposes). Soluble in water; slightly soluble in alcohol, insoluble in ether. The pH of a 50% solution is 6.0–7.3. Hydrochloride plates and leaflets: mp 122.5C. Platinichloride: yellow leaflets, mp 210C (decomposes).

Derivation: Addition of ammonia to β-propiolactone, other processes based on the reaction of ammonia with acrylonitrile, etc.

Use: Biochemical research, organic synthesis, calcium pantothenate production, buffer in electroplating.

dl-alanine.

CAS: 302-72-7. mf: $\text{C}_3\text{H}_7\text{NO}_2$.

Properties: Needles or prisms, or white crystalline powder; odorless with a sweet taste. Mp: 295° (decomp). Slightly sol in water, insol in Et_2O .

Hazard: Low toxicity by ingestion.

Use: Food additive.

alanosine. $\text{C}_3\text{H}_7\text{N}_3\text{O}_4$.

Properties: Finely divided crystals. Decomposes at 190C, optically active. Can be prepared in *l*-, *d*-, and *dl*-forms. Insoluble in most organic solvents; slightly soluble in water.

Derivation: Fermentation of *Streptomyces alanosinus*; also synthetically.

Use: Inhibitor of insect reproduction, antineoplastic, antibiotic.

β-alanylhistidine. See carnosine.

“Alar” [Uniroyal]. TM for a plant growth regulator (succinic acid-2,2-dimethylhydrazide) that improves the color and texture of apples, grapes, and tomatoes, and prevents premature dropping; growth retardant; multiple-flower stimulator.

alarmona. One of a class of cell-growth regulating metabolites (nucleotides) that enable bacteria to respond to metabolic and environmental changes. They are thought to act by controlling or affecting several biochemical reactions simultaneously, but the exact mechanism of their behavior has not been elucidated. One such nucleotide, discovered in 1982, is known as ZTP (5-amino-4-imidazole carboximide riboside-5'-triphosphate). See nucleotide.

“Alathon” [Du Pont]. TM for a polyethylene resin. “Alathon” G-0530, designated as a reinforced polyethylene, contains 30% by weight of glass fiber treated with a proprietary coupling agent that optimizes its reinforcing properties.

albendazole sulfone. See 5-(propylsulfonyl)-2-benzimidazolecarbamic acid methyl ester.

Alberti furnace. A reverberatory furnace for roasting mercury ores, the mercury being condensed in iron tubes and brick chambers.

Albert-Precht effect. A technique used in photography to produce a reversed image. The exposed surface is immersed in chromic acid. It is then exposed to uniform light and developed over.

“Albigen” [BASF]. TM for a water-soluble polymer used in the textile industry for stripping vat and other dyestuffs. Has no affinity for the fiber and promotes the stripping effect of alkaline hydrosulfite solutions.

“Albone” [Du Pont]. TM for a series of hydrogen peroxide solutions which vary in hydrogen peroxide content from 35 to 90% by weight. See hydrogen peroxide.

albumen. A 66.3 kDa protein comprising most of the protein in serum and largely responsible for buffering pH and volume of blood. Commercial term for dried egg white used in the food industry. See albumin, egg.

albumin. Any of a group of water-soluble proteins of wide occurrence in such natural products as milk (lactalbumin), blood serum, and eggs (ovalbumin). They are readily coagulated by heat and hydrolyze to α-amino acids or their derivatives.

albumin, egg. (ovalbumin). Chief protein occurring in egg white as a viscous, colorless fluid; it becomes an amorphous solid when dried, which can be reconstituted with water. It is a heat-sensitive colloidal material that coagulates irreversibly at approximately 60C (140F). The dried product is available in commercial quantities.

Use: Protective colloid and emulsifying agent in bakery products (especially angel cake), clarification of wines, adhesives, paper coatings, pharmaceuticals, enzyme activation, lithography, analytical reagent, antidote for mercury poisoning, mordant in dyes. **Note:** A recombinant DNA technique has made possible the formation of ovalbumin by the bacterium *E. coli*.

albumin, milk. (lactalbumin). A component of skim milk protein (2–5%). Can be crystallized. Exact function is not known, but probably aids in stabilization of the fat particles. See milk.

ALCA. See American Leather Chemists' Association.

alchemy. The predecessor of chemistry, practiced from as early as 500 bc through the 16th century. Its two principal goals were transmutation of the baser metals into gold and discovery of a universal

remedy. Modern chemistry grew out of alchemy by gradual stages.

alchlor process. To remove the unstable components of lubricating oil, this process used aluminum chloride instead of sulfuric acid.

alcian blue.

Properties: Greenish-black crystals with metallic sheen. Soluble in ethanol, cellosolve, ethylene glycol.

Use: Gelling agent for lubricating fluids, bacterial stain for histiocytes and fibroblasts.

“Alcoa Mill Products” [Alcoa Kasei].

TM for a wide variety of aluminum sheet and formed products.

Alcoa process. A more efficient method of producing aluminum from bauxite that requires one-third less electric power than the Hall process. Alumina is reacted with chlorine, the resulting aluminum chloride yielding the metal and chlorine on electrolysis. No fluorine is required in the process. Prototype plants are under development.

“Alcoa Wheel Forged Products” [Alcoa Kasei]. TM for a wide variety of aluminum forged products.

alcohol. A broad class of hydroxyl-containing organic compounds occurring naturally in plants and made synthetically from petroleum derivatives such as ethylene. Many are manufactured in tonnage quantities.

- I. Monohydric (1 OH group)
 1. Aliphatic
 - (a) paraffinic (ethanol)
 - (b) olefinic (allyl alcohol)
 2. Alicyclic (cyclohexanol)
 3. Aromatic (phenol, benzyl alcohol)
 4. Heterocyclic (furfuryl alcohol)
 5. Polycyclic (sterols)
- II. Dihydric (2 OH groups): glycols and derivatives (diols)
- III. Trihydric (3 OH groups): glycerol and derivatives
- IV. Polyhydric (polyols) (3 or more OH groups)

Use: Organic synthesis for solvents, detergents, beverages, pharmaceuticals, plasticizers, and fuels. For further information, see monohydric, dihydric, trihydric, polyol, and specific alcohol.

alcohol, absolute. See ethyl alcohol.

alcohol dehydrogenase. An enzyme found in animal and plant tissue that acts upon ethanol and other alcohols producing acetaldehyde and other aldehydes.

Use: Biochemical research.

alcohol, denatured.

CAS: 64-17-5. Ethanol to which another liquid has been added to make it unfit to use as a beverage (chiefly for tax reasons). In the U.S., it may be either Completely Denatured (CDA) or Specially Denatured (SDA). At least 50 formulations are officially authorized for making denatured alcohol. They include the following denaturants: SDA 40B must contain brucine, brucine sulfate, or quassin plus *tert*-butanol; SDA 40A must contain sucrose octaacetate plus *tert*-butyl alcohol; SDA 40B must contain “Birtrex” [Macfarlan] and *tert*-butyl alcohol; SDA40C must contain only *tert*-butyl alcohol. For exact formulas, consult 27CFR Part 21 and the Alcohol and Tobacco Tax Division of IRS, Washington D.C.

Properties: See ethanol.

Hazard: Flammable, dangerous fire risk; TLV: 1000 ppm.

Use: Manufacture of acetaldehyde and other chemicals, solvents, antifreeze and brake fluids, fuels. See ethanol.

alcohol fermentation. The anaerobic conversion of glucose to ethanol via anaerobic glycolysis. See also fermentation.

alcohol, grain. Ethanol made from grain.

alcohol, industrial. A mixture of 95% ethanol and 5% water, plus additives for denaturing or special solvent purposes. See alcohol, denatured.

alcohols, C8-C10, ethoxylated propoxylated.

CAS: 68603-25-8.

Hazard: A severe eye irritant.

alcohols, C12-C6, ethoxylated.

CAS: 68551-12-2.

Hazard: A moderate eye irritant.

alcohols, C12-C13, ethoxylated.

CAS: 66455-14-9.

Hazard: Moderately toxic by ingestion and skin contact. A moderate skin irritant.

alcohols, C12-C15, ethoxylated.

CAS: 68131-39-5.

Hazard: Moderately toxic by ingestion.

alcohols, C14-C15, ethoxylated.

CAS: 68951-67-7.

Hazard: Moderately toxic by ingestion.

alcohols, C16-C18, ethoxylated.

CAS: 68439-49-6.

Hazard: Moderately toxic by ingestion and skin contact. A moderate skin and eye irritant.

alcohol, wood. See methyl alcohol.

alcoholysis. A chemical reaction between an alcohol and another organic compound analogous to hydrolysis. The alcohol molecule decomposes to form a new compound with the reacting substance the other reaction product is water. Both hydrolysis and alcoholysis may be considered as forms of solvolysis.

See solvolysis.

“Alconox” [Alconox]. TM for a powdered precision cleaner.

Use: For manual and ultrasonic systems for glassware, metal, ceramic and other materials in laboratories.

“Aldactazide” [Searle]. TM for a combination of spironolactone and hydrochlorothiazide.

Use: Drug.

“Aldactone” [Searle]. TM for spironolactone.

Use: Drug.

aldehyde. A broad class of organic compounds having the generic formula RCHO, and characterized by an unsaturated carbonyl group (C=O). They are formed from alcohols by either dehydrogenation or oxidation, and thus occupy an intermediate position between primary alcohols and the acids obtained from them by further oxidation. Their chemical derivation is indicated by the name *al*(alcohol) + *dehyd*(rogenation). Aldehydes are reactive compounds participating in oxidation, reduction, addition, and polymerization reactions. For specific properties, see individual compounds.

aldehyde ammonia. (acetaldehyde ammonia; 1-amino-ethanol). $\text{CH}_3\text{CH}_2\text{ONH}_2$.

Properties: White, crystalline solid. Mp 97C (partly decomposes). Stable in closed containers; resinifies on long exposure to air. Very soluble in water and alcohol.

Derivation: Action of acetaldehyde on ammonia.

Hazard: Irritant to eyes and skin; moderate fire risk.

Use: Accelerator for vulcanization of thread rubber, organic synthesis, source of acetaldehyde and ammonia.

aldehyde C-18. See δ -nonalactone.

aldehyde collidine. See 2-methyl-5-ethylpyridine.

aldehydine. See 2-methyl-5-ethylpyridine.

Alder, Kurt. (1902–1958). A German chemist who won the Nobel Prize for chemistry along with

Otto Diels in 1950 for a project involving a practical method for making ring compounds from chain compounds by forcing them to combine with maleic anhydride. This is known as the Diels-Alder reaction and provided a method for synthesis of complex organic compounds. Alder had degrees from the Universities of Berlin and Kiel.

Alder-Rickert rule. Adducts of 1,3-cyclohexadiene derivatives with acetylenedicarboxylic esters give phthalate ester and ethylene on heating. Similar adducts of cyclopentadiene revert on heating to starting materials (retro-Diels-Alder).

Alder-Stein rules. Set of rules governing the stereochemistry of the Diels-Alder reaction. The most important are that (1) the stereochemical relationship of groups attached to the diene and the dienophile is maintained in the product (*cis*-addition); and (2) the product resulting from maximum accumulation of unsaturated centers in the transition state is favored (endo rule).

aldicarb. $\text{CH}_3\text{SC}(\text{CH}_3)_2\text{HC:NOCONHCH}_3$.

Properties: Colorless crystals. Mp 100C (212F). Almost insoluble in water; slightly soluble in benzene and xylene; partly soluble in acetone and methylene chloride.

Hazard: Toxic by ingestion.

Use: Nematocide, insecticide.

aldol. (acetaldol; β -hydroxybutyraldehyde).

$\text{CH}_3\text{CH}_2\text{OCH}_2\text{CHO}$.

Properties: Water-white to pale yellow, syrupy liquid. Decomposes into crotonaldehyde and water on distillation under atmospheric pressure. Miscible with water, alcohol, ether, organic solvents. D 1.1098 (15.6/4C), bp 83C (20 mm), vap press less than 0.1 mm (20C), specific heat 0.737, bulk d 9.17 lb/gal (20C), fp below 0C. Flash p 150F (65.5C) (OC), autoign temp 530F (276.6C). Combustible.

Derivation: By condensation of acetaldehyde in sodium hydroxide solution.

Grade: Technical (98%).

Hazard: Moderate fire risk.

Use: Synthesis of rubber accelerators and age resisters, perfumery, engraving, ore flotation, solvent, solvent mixtures for cellulose acetate, fungicides, organic synthesis, printer's rollers, cadmium plating, dyes, drugs, dyeing assistant, synthetic polymers.

aldolase. (zymohehexase). An enzyme present in muscle involved in glycogenolysis and anaerobic glycolysis. It catalyzes production of dihydroxyacetone phosphate and phosphoglyceric aldehyde from fructose-1,6-diphosphate.

Use: Biochemical research.

aldol condensation. A reaction between two aldehyde or two ketone molecules in which the position of one of the hydrogen atoms is changed in such

a way as to form a single molecule having one hydroxyl and one carbonyl group. Since such a molecule is partly an alcohol (OH group) and partly an aldehyde (CHO group) and represents a union of two smaller molecules, the reaction is called an aldol condensation. It can be repeated to form molecules of increasing molecular weight. The condensation of formaldehyde to sugars in plants, which on repetition builds up the more complex carbohydrate structures such as starch and cellulose, is thought to be a reaction of this type. It occurs most effectively in an alkaline medium.

“Aldo MO” [Ashland]. (glycerol mono-
leate).

CAS: 25496-72-4. TM for antifog agent and dispersant.

Use: Bath oils, lotions, and creams; emulsifier for liquid and paste waxes, polish, and cleaners.

aldo- α -naphthylamine condensate.

Properties: Orange to dark red solid with characteristic odor. Softens at 64C min, d 1.16. Insoluble in water, gasoline; slightly soluble in alcohol and petroleum hydrocarbons; soluble in acetone, benzene, chloroform, and carbon disulfide.

Use: Antioxidant in tire carcasses, tubes, insulating tape, black soles.

aldose. Any of a group of sugars whose molecule contains an aldehyde group and one or more alcohol groups. An example is glyceraldehyde (HOCH₂•CH₂O•CHO), specifically called an aldotriose because it contains three carbon atoms.

aldosterone. (electrocortin). C₂₁H₂₈O₅,

An adrenal cortical steroid hormone that is the most powerful mineralocorticoid. Probably the chief regulator of sodium, potassium, and chlorine metabolism; approximately 30 times as active as deoxycorticosterone.

Properties: Crystals. Mp 108–112C.

Derivation: Isolated from adrenals; has been synthesized.

Use: Medicine.

aldoxime. The –CH:NOH radical resulting from reactions between aldehydes and hydroxylamine or by the oxidation of primary amines by persulfuric acid.

Properties: Colorless. Water soluble.

aldrin. (HHDN).

CAS: 309-00-2. C₁₂H₆Cl₆. The assigned common name for an insecticidal product containing 95% or more of 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-*endo,exo*-dimethanonaphthalene.

Properties: Brown to white, crystalline solid. Mp 104–105.5C. Insoluble in water; soluble in most organic solvents. Not affected by alkalis or dilute acids, compatible with most fertilizers, herbicides, fungicides, and insecticides.

Grade: Technical.

Hazard: TLV: 0.25 mg/m³. Toxic by skin absorption.

Use: Insecticide.

See dieldrin; endrin.

“Aldyl” [Du Pont]. TM for high-strength polyethylene pipe composed principally of “Alathon.”

ale. See brewing.

alendronic acid. See 4-amino-1-hydroxybutane-1,1-diylidiphosphonic acid.

aleuritic acid. (9,10,16-trihydroxyhexadecanoic acid).

CAS: 533-87-9.
HOCH₂(CH₂)CH(OHCH(OH)(CH₂)COOH.

Use: Perfumes.

alfin. A catalyst obtained from alkali alcoholates derived from a secondary alcohol which is a methyl carbinol and olefins possessing the grouping –CH=CH–CH₂–, which may be part of a ring, as in toluene. The interaction of the alkali alcoholate (sodium isopropoxide) with the olefin halide (allyl chloride) gives a slurry of sodium chloride on which sodium isopropoxide and allyl sodium are adsorbed. This slurry is a typical alfin catalyst used to convert olefins into polyolefins. The elastomers produced are called alfin rubbers.

alfuzosin hydrochloride. See xatral.

algae. Chlorophyll-bearing organisms occurring in both salt- and freshwater; they have no flowers or seeds, but reproduce by unicellular spores. They range in size from single cells to giant kelp over 100 feet long, and include most kinds of seaweed. There are four kinds of algae: brown, red, green, and blue-green. Blue-green algae are said to be the earliest form of life to appear on earth. The photosynthetic activity of algae accounts for the fact that over two-thirds of the world total of photosynthesis takes place in the oceans. Algae are harvested and used as food supplements (see carrageenan, agar), soil conditioners, animal feeds, and a source of iodine; they also contain numerous minerals, vitamins, proteins, lipids, and essential amino acids. Alginic acid is another important derivative. Blue-green algae are

water contaminants and are toxic to fish and other aquatic life. Phosphorus compounds in detergent wastes stimulate the growth of algae to such an extent that overpopulation at the water surface prevents light from reaching many of the plants; these decompose, removing oxygen and releasing carbon dioxide, thus making the water unsuitable for fish. Algae are being used in treatment of sewage and plant effluent in a proprietary flocculation process. See eutrophication; agar; biomass.

algae, brown.

Properties: Various seaweeds harvested in coastal waters of the northern Atlantic and the Pacific oceans.

Use: Food additive.

algae meal, dried.

Properties: Mixture of algae cells from *Spongiococcum*, molasses, corn steep liquor, and a maximum of 0.3% ethoxyquin.

Use: Food additive.

algae, red.

Properties: Various seaweeds harvested in coastal waters of Pacific ocean.

Use: Food additive.

alga-net.

Use: Food additive.

Algar-Flynn-Oyamada reaction. Alkaline hydrogen peroxide oxidation of *o*-hydroxyphenyl styryl ketones (chalcones) to flavonols via the intermediate dihydroflavonols.

“Algene” [Huntsman]. TM for quaternary ammonium compounds.

Use: As cationic surfactants.

algestone acetoneide. See progesterone 16,17-acetoneide.

algicide. Chemical agent added to water to destroy algae. Copper sulfate is commonly employed for large water systems.

algin. A hydrophilic polysaccharide (phycocolloid or hydrocolloid) found exclusively in the brown algae. It is analogous to agar. The seaweed (giant kelp) is sea harvested, water extracted, and refined. U.S. (California) and Great Britain are the chief producers.

See alginic acid; alginate.

alginate. Any of several derivatives of alginic acid (e.g., calcium, sodium, or potassium salts or propylene glycol alginate). They are hydrophilic colloids (hydrocolloids) obtained from seaweed. Sodium alginate is water soluble but reacts with calcium salts to form insoluble calcium alginate.

Use: Food additive (thickener, stabilizer), yarns and

fibers, medicine (first-aid dressings), meat substitute, high-protein food analogs.

alginic acid. $(C_6H_8O_6)_n$. A polysaccharide composed of β ,*d*-mannuronic acid residues linked so that the carboxyl group of each unit is free, while the aldehyde group is shielded by a glycosidic linkage. It is a linear polymer of the mannuronic acid in the pyranose ring form.

Properties: White to yellow powder possessing marked hydrophilic colloidal properties for suspending, thickening, emulsifying, and stabilizing. Insoluble in organic solvents, slowly soluble in alkaline solutions. Absorbs up to 300 times its weight of water.

Grade: Refined (food), technical (commercial), NF (sodium alginate), FCC.

Use: Food industry as thickener and emulsifier; protective colloid in ice cream, toothpaste, cosmetics, pharmaceuticals, textile sizing, paper coatings; waterproofing agent for concrete; boiler water treatment; oil-well drilling muds; storage of gasoline as a solid.

alicyclic. A group of organic compounds characterized by arrangement of the carbon atoms in closed ring structures sometimes resembling boats, chairs, or even birdcages. These compounds have properties resembling those of aliphatics and should not be confused with aromatic compounds having the hexagonal benzene ring. Alicyclics comprise three subgroups: (1) cycloparaffins (saturated); (2) cycloolefins (unsaturated, with two or more double bonds); and (3) cycloacetylenes (cyclynes) with a triple bond. The best-known cycloparaffins (sometimes called naphthenes) are cyclopropane, cyclohexane, and cyclopentane; typical of the cycloolefins are cyclopentadiene and cyclooctatetraene. Most alicyclics are derived from petroleum or coal tar. Many can be synthesized by various methods.

aliphatic. One of the major groups of organic compounds, characterized by straight- or branched-chain arrangement of the constituent carbon atoms. Aliphatic hydrocarbons comprise three subgroups: (1) paraffins (alkanes), all of which are saturated and comparatively unreactive, the branched-chain types being much more suitable for gasoline than the straight-chain; (2) olefins (alkenes or alkadienes), which are unsaturated and quite reactive; (3) acetylenes (alkynes), which contain a triple bond and are highly reactive. In complex structures, the chains may be branched or cross-linked.

See alicyclic; aromatic; chain.

aliquot. A part that is a definite fraction of a whole, as in aliquot samples for testing or analysis.

alizarin. (1,2-dihydroxyanthraquinone; CI 58000). $C_6H_4(CO)_2C_6H_2(OH)_2$. Parent form of many dyes and pigments including mordants.

Properties: Orange-red crystals; brownish-yellow powder. Mp 289C, bp 430C (sublimable). Soluble in aromatic solvents, hot methanol, and ether; sparingly soluble in water; moderately soluble in ethanol. Combustible.

Derivation: Anthracene is oxidized to anthraquinone, the sulfonic acid of which is then fused with caustic soda and potassium chlorate; the melt is run into hot water and the alizarin precipitated with hydrochloric acid. Occurs naturally in madder root.

Grade: Technical.

Use: Manufacture of dyes, production of lakes, indicators, biological stain.

alizarin blue. (CI 67410). $C_{17}H_9NO_4$.

Properties: Violet crystals. Mp 268C. Insoluble in water, soluble in glacial acetic acid and hot benzene.

Use: Indicator.

alizarin yellow R. (*p*-nitrophenylazosalicylate sodium; CI 14030). $O_2NC_6H_4NNC_6H_3OH-COONa$.

Properties: Yellow-brown powder. Soluble in water.

Use: Acid-base indicator, biological stain.

alkadiene. See diolefin.

alkali. Any substance which in water solution is bitter and is irritating or caustic to the skin and mucous membranes, turns litmus blue, and has a pH value greater than 7.0. The alkali industry produces sodium hydroxide, sodium carbonate (soda ash), sodium chloride, salt cake, sodium bicarbonate, and corresponding potassium compounds. See base; pH; alkali metal.

alkali blue. Class name for a group of pigment dry powders prepared by the phenylation of *p*-rosaniline or fuchsine, followed by drowning in hydrochloric acid, washing, and sulfonating. Alkali blue on a weight basis has the highest tinting strength of all blue pigments. The presscake may be “flushed” with vehicle to replace the water in the pulp.
Use: Printing inks, interior paints.

alkali cellulose. The product formed by steeping wood pulp with sodium hydroxide, the first step in the manufacture of viscose rayon and other cellulose derivatives.
See carboxymethylcellulose.

alkali metal. A metal in group IA of the periodic table, i.e., lithium, sodium, potassium, rubidium,

cesium, and francium. Except for francium, the alkali metals are all soft, silvery metals, which may be readily fused and volatilized; the melting and boiling points becoming lower with increasing atomic weight. The density increases with (but less rapidly than) the atomic weight, the atomic volume therefore becoming greater as the series is ascended. The alkali metals are the most strongly electropositive of the metals. They react vigorously, at times violently, with water; within the group itself, the basicity increases with atomic weight, that of cesium being the greatest.

alkalimetry. The measurement of the concentration of bases or of the amount of free base present in a solution by titration or some other means of analysis.

alkaline earth. An oxide of an alkaline earth metal (lime).

alkaline-earth metals. Calcium, barium, strontium, and radium (group IIA of the periodic table). In general they are white and differ by shades of color or casts; are malleable, extrudable, and machinable; may be made into rods, wire, or plate; are less reactive than sodium and potassium and have higher melting and boiling points.

alkaloid. A basic nitrogenous organic compound of vegetable origin. Usually derived from the nitrogen ring compounds pyridine, quinoline, isoquinoline, and pyrrole, designated by the ending -ine. Though some are liquids, they are usually colorless, crystalline solids, having a bitter taste, and which combine with acids without elimination of water. They are soluble in alcohol, insoluble or sparingly soluble in water. Examples are atropine, morphine, nicotine, quinine, codeine, caffeine, cocaine, and strychnine.

alkalosis. A metabolic condition in which blood pH decreases, usually the result of a metabolic condition or vomiting.

alkane. See paraffin (1).

alkanesulfonic acid, mixed. RSO_3H (R is methyl, ethyl, propyl, mixed). Trade designation for a mixture of methane-, ethane-, and propane sulfonic acids. A strong nonoxidizing, nonsulfonating liquid acid which is thermally stable at moderately high temperatures.

Properties: Light amber liquid; sour odor. Mp below -40C, bp 120–140C (1 mm), d 1.38 (20C), pH (1% solution) 1.15. Very corrosive. Miscible with water and saturated fatty acids.

Use: Catalyst; intermediate, reaction medium.

“Alkanol” [Du Pont]. TM for a series of fatty alcohol–ethylene oxide condensation products used as nonionic surface-active agents in detergents and

dispersing and emulsifying agents in paper, leather, and textiles. These include grades OA, OE, OJ, OP, and HC. 189-S is a saturated hydrocarbon sodium sulfonate. B and BG are sodium alkyl naphthalene sulfonates. Sulfur is tetrahydronaphthalene sodium sulfonate.

alkanolamine. (alkylolamine). A compound such as ethanolamine, $\text{HOCH}_2\text{CH}_2\text{NH}_2$, or triethanolamine, $(\text{HOCH}_2\text{CH}_2)_3\text{N}$, in which nitrogen is attached directly to the carbon of an alkyl alcohol. See specific compound.

alkene. See olefin.

alkoxyaluminum hydrides. ($\text{H}_n\text{AlOR}_{3-n}$). A group of reducing agents especially useful in converting epoxides to alcohols. Derived by reaction of aluminum hydride with the corresponding alcohol in tetrahydrofuran.

alkyd resin. A thermosetting coating polymer, chemically similar to polyester resins, conventionally made by condensation and polymerization of a dihydric or polyhydric alcohol (ethylene glycol or glycerol) and a polybasic acid (phthalic anhydride), usually with a drying oil modifier. The process requires heating at 230–250°C for up to 12 hours. A new and quite different method utilizes epoxy addition polymerization, in which a mixture of glycidyl esters and organic acid anhydrides is heated with a metallic catalyst at 100°C or less for only two to four hours. Cost and energy savings and improved application performance are realized by this process. **Use:** Alkyd resins are used as vehicles in exterior house paints, marine paints, and baking enamels. Molded alkyd resins are used for electrical components, distributor caps, encapsulation, and a variety of similar applications.

alkyl. A paraffinic hydrocarbon group which may be derived from an alkane by dropping one hydrogen from the formula. Examples are methyl CH_3 , ethyl C_2H_5 , propyl $\text{CH}_3\text{CH}_2\text{CH}_2$, isopropyl $(\text{CH}_3)_2\text{CH}$. Such groups are often represented in formulas by the letter R and have the generic formula $\text{C}_n\text{H}_{2n+1}$. See aryl.

alkyl(C12-C15) alcohol ethoxylated.

CAS: 58391-12-1.

Hazard: Low toxicity by ingestion and skin contact. A moderate skin and mild eye irritant.

alkylaryl polyethyleneglycol ether.

Use: In surface-active agents.

See isoctylphenoxy polyoxyethylene ethanol for a typical example of this class of compound.

alkylaryl sulfonate. An organic sulfonate of combined aliphatic and aromatic structure, e.g., alkylbenzene sulfonate.

alkylate. (1) A product of alkylation. (2) A term used in the petroleum industry to designate a branched-chain paraffin derived from an isoparaffin and an olefin, e.g., isobutane reacts with ethylene (with catalyst) to form 2,2-dimethylbutane (neohexane). The product is used as a high-octane blending component of aviation and civilian gasolines. (3) In the detergent industry, the term is applied to the reaction product of benzene or its homologs with a long-chain olefin to form an intermediate, e.g., dodecylbenzene, used in the manufacture of detergents. It also designates a product made from a long-chain normal paraffin that is chlorinated to permit combination with benzene to yield a biodegradable alkylate. The adjectives *hard* and *soft* applied to detergents refer to their ease of decomposition by microorganisms.

See biodegradability; detergent.

alkylation. (1) The introduction of an alkyl radical into an organic molecule. This was one of the early chemical processes used in Germany to furnish intermediates for improved dyes, e.g., dimethylaniline. Other alkylation products are cumene, dodecylbenzene, ethylbenzene, and nonylphenol. (2) A process whereby a high-octane blending component for gasolines is derived from catalytic combination of an isoparaffin and an olefin. See alkylate (2); neohexane.

alkylbenzene sulfonate. (ABS). A branched-chain sulfonate type of synthetic detergent, usually a dodecylbenzene or tridecylbenzene sulfonate. Such compounds are known as “hard” detergents because of their resistance to breakdown by microorganisms. They are being replaced by linear sulfonates. See alkyl sulfonate; linear molecule; detergent; sodium dodecylbenzene sulfonate.

alkyl diaryl phosphate ester. See “Santizer 141” [*Solutia*].

alkyldimethylbenzylammonium chloride.

General name for a quaternary detergent. See benzalkonium chloride.

alkylene. A phosphated long-chain alcohol.

alkyl fluorophosphate. See diisopropyl fluorophosphate.

alkylolamine. See alkanolamine.

alkyl sulfonate. (linear alkylate sulfonate; LAS). A straight-chain alkylbenzene sulfonate, a detergent specially tailored for biodegradability. The linear alkylates may be normal or iso (branched at the end only), but are C_{10} or longer. See sodium dodecylbenzene sulfonate.

alkyne. See acetylene hydrocarbon.

all-trans-anhydroretinol.CAS: 1224-78-8. mf: $C_{20}H_{28}$.**Hazard:** A reproductive hazard.

Allan-Robinson reaction. Preparation of flavones or isoflavones by condensing *o*-hydroxyaryl ketones with anhydrides of aromatic acids and their sodium salts.

allantoin. (glyoxyldiureide; 5-ureidohydantoin). $C_4H_6N_4O_3$. The end product of purine metabolism in mammals other than humans and other primates; it results from the oxidation of uric acid. **Properties:** White to colorless powder or crystals; odorless; tasteless. Mp 230C (decomposes). 1 g is soluble in 190 cc water or 500 cc alcohol; readily soluble in alkalis. Optically active forms are known.

Derivation: Produced by oxidation of uric acid. Also present in tobacco seeds, sugar beets, wheat sprouts.

Use: Biochemical research, medicine.

allele. One of two or more types of genes that may occur at a given position on a strand of DNA.

allelopathic chemical. Any of a wide range of natural herbicides of varying toxicity produced by many species of plants, as well as by soil microorganisms (bacteria, fungi). These compounds adversely affect other plants in the vicinity, either inhibiting germination and growth or killing them outright. They are extracted from the growing plant by leaching of its leaves, root exudates, and decomposition of dead tissue. Examples of plants found to be sources of these toxic compounds are sunflowers, oats, and soybeans. Among the products that have been identified are amygdalin, caffeine, gallic acid, and arbutin. Many types of chemical structure are represented. Research is directed toward breeding and cultivation of allelopathic plants to utilize their weed-killing ability.

allene. (propadiene; dimethylenemethane).

 $H_2C:C:CH_2$.

Properties: Colorless gas. Unstable. Fp -136.5C, bp 34.5C. Can be readily liquefied.

Derivation: (1) Action of zinc dust on 2,3-dichloropropene; (2) pyrolysis of isobutylene; (3) electrolysis of potassium itaconate.

Use: Organic intermediate.

Allen-O'Hara furnace. An horizontal double-hearth furnace that is used for calcining sulfide ores.

alleochemical. A substance that inhibits the growth of animals and plants. See allelopathic chemical.

allergen. Any substance that acts in the manner of an antigen on coming into contact with body tissues by inhalation, ingestion, or skin adsorption. The allergen causes a specific reagin to be formed in the

bloodstream. The ability to produce reagins in response to a given allergen is an inherited characteristic that differentiates an allergic from a nonallergic person. A reagin is actually an antibody. The specificity of the allergen-reagin reaction and its dependence on molecular configuration are similar to those of an antigen-antibody reaction.

The allergen molecule (often a protein such as pollen or wool) may be regarded as a key that precisely fits the corresponding structural shape of the reagin molecule. Allergies in the form of contact dermatitis can result from exposure to a wide range of plant products, some metals, and a few organic chemicals. Though they are alike in some ways, antigen-antibody reactions protect the individual, whereas allergen-reagin reactions are harmful. See antigen-antibody.

allethrin. $C_{19}H_{26}O_3$. Generic name for 2-allyl-4-hydroxycyclopenten-1-one ester of chrysanthemum monocarboxylic acid. A synthetic insecticide structurally similar to pyrethrin and used in the same manner. For other synthetic analogs, see barthrin, cyclothrin, ethythrin, furethrin. Pyrethrin I differs in having a 2,4-pentadienyl group in place of the allyl of allethrin.

Properties: Clear, amber-colored, viscous liquid. D 1.005-1.015 (20/20C), refr index (20C) 1.5040. Insoluble in water; incompatible with alkalis; soluble in alcohol, carbon tetrachloride, kerosene, and nitromethane. Combustible.

Derivation: Synthetically (glycerol, acetylene, and ethyl acetoacetate are the major raw materials).

Grade: 90%, technical (approximately 90% pure with 10% of isomers or related compounds), 20% technical, 2.5% technical.

Use: Insecticides, synergist.

"Allianz OPT" [Isp Europe]. TM for a polymer that makes sun screens water resistant.

allicin. ($C_6H_{10}OS_2$). An antibacterial substance extracted from garlic (allium).

Properties: Yellow, oily liquid; sharp garlic odor. Unstable; decomposes rapidly when heated; slightly soluble in water; very soluble in alcohol, benzene, and ether.

Use: Medicine.

alligating. Formation of cracks on the surface of thick paint layers, the underlying material remaining soft.

allo- A prefix designating the more stable of two geometrical isomers.

allochromatic. (1) Term used to refer to minerals whose color is a result of minute inclusions. (2) Term referring to crystals exhibiting photoconductivity.

allogeneic. Variation in alleles among members of the same species.

allomaleic acid. See fumaric acid.

allomeric. Having the same crystal form but different chemical composition.

allomerism. A constancy of crystalline form or structure with a variation in chemical composition. See polyallomer.

allomorphism. A physical change in a mineral without the gain or loss of components.

alloocimene. (2,6-dimethyl-2,4,6-octatriene). $(\text{CH}_3)_2\text{C}(\text{CH}_2)\text{CCH}_2\text{CHCH}_3$.

Properties: Clear, almost colorless liquid. Boiling range (5–95%) 89–91°C (20 mm), d 0.824 (15/15°C), refr index 1.5278 (20°C). Polymerizes and oxidizes readily. Combustible.

Derivation: Pyrolysis of α -pinene.

Use: Component of varnishes and a variety of polymers; fragrance.

allophanamide. See biuret.

allophanate. An unsaturated nitrogenous product made by reaction of an alcohol with two moles of isocyanic acid (a gas). Usually crystals, high-melting products that are easily isolated. Acid-sensitive and tertiary alcohols can be converted into allophanates.

Δ -allose. (β -*D*-allopyranose). $\text{C}_6\text{H}_{12}\text{O}_6$.

Properties: Crystals. Mp 128°C, mw 180.16. Soluble in water, insoluble in alcohol.

Derivation: Obtained from the leaves of *Protea rubropilosa*.

allosteric activator. Any molecule which positively modulates the activity of an allosteric enzyme.

allosteric enzyme. A regulatory enzyme, with catalytic activity modulated by the noncovalent binding of a specific molecule at a site other than the active site.

allosteric site. The specific site on the surface of an allosteric enzyme molecule (distinct from the active site) to which a modulator molecule binds.

allothreonine. See threonine.

allotrope. One of several possible forms of a substance. See allotropy.

allotropy. (polymorphism). The existence of a substance in two or more forms which are significantly different in physical or chemical properties.

The difference between the forms involves either (1) crystalline structure; (2) the number of atoms in the molecule of a gas; or (3) the molecular structure of a liquid. Carbon is a common example of (1), occurring in several crystal forms (diamond, carbon black, graphite) as well as several amorphous forms. Diatomic oxygen and triatomic ozone are instances of (2); and liquid sulfur and helium of (3). Uranium has three crystalline forms, manganese four, and plutonium no less than six. A number of other metals also have several allotropic forms which are often designated by Greek letters, e.g., α -, γ -, and Δ -iron.

allouzarigenin. See 17- α -uzarigenin.

alloxan. (mesoxalylurea). $\text{C}_4\text{H}_2\text{O}_4\text{N}_2 \cdot \text{H}_2\text{O}$ and $4\text{H}_2\text{O}$.

Properties: White crystals, become pink on exposure to air; colorless aqueous solution which imparts pink color to skin. Mp 170°C (decomposes) (various melting points in literature). Soluble in water and alcohol.

Derivation: Oxidation of uric acid in acid solution.

Use: Biochemical research, cosmetics, organic synthesis.

alloxan hydrate. See 5,5-dihydroxy barbituric acid.

alloy. A solid or liquid mixture of two or more metals, or of one or more metals with certain nonmetallic elements, as in carbon steels. The properties of alloys are often greatly different from those of the components. The purpose of an alloy is to improve the specific usefulness of the primary component—not to adulterate or degrade it. Gold is too soft to use without a small percentage of copper. The corrosion and oxidation resistance of steel is markedly increased by incorporation of from 15–18% of chromium and often a few percent of nickel (stainless steel). The presence of up to 1.5% carbon profoundly affects the properties of steels. Similarly, a low percentage of molybdenum improves the toughness and wear resistance of steel. The hundreds of special alloys available are the results of designs to meet specific operating conditions. Amorphous alloys for use in transformer coils are made by quick-quenching the melt. See alloy, fusible; amalgam; superalloy.

alloy, fusible. (low-melting alloy; fusible metal). An alloy melting in the range of approximately 51–260°C, usually containing bismuth, lead, tin, cadmium, or indium. Eutectic alloys are the particular compositions that have definite and minimum melting points compared. The compositions of a few fusible alloys are given below:

System	Eutectic Composition	Temperature (C)
Cd-Bi	60 Bi-40 Cd	144
In-Bi	33.7 Bi-66.3 In	72
	67.0 Bi-33 In	109
Pb-Bi	56.5 Bi-43.5 Pb	125
Sn-Bi	58 Bi-42 Sn	139
Pb-Sn-Bi	52 Bi-16 Sn-32 Pb	96
Pb-Cd-Bi	52 Bi-8 Cd-40 Pb	92
Sn-Cd-Bi	54 Bi-20 Cd-26 Sn	102
In-Sn-Bi	58 Bi-17 Sn-25 In	79
Pb-Sn-Cd-Bi	*50 Bi-10 Cd-13.3 Sn-26.7 Pb	70
In-Pb-Sn-Bi		49.4
	Bi-11.6 Sn-18	57
	Pb-21 In	
In-Cd-Pb-Sn-Bi	44.7 Bi-5.3 Cd-8.3 Sn-22.6 Pb-19.1 In	47

* Wood's metal.

alloy steel. A steel containing up to 10% of elements such as chromium, molybdenum, nickel, etc., usually with a low percentage of carbon. These added elements improve hardenability, wear resistance, toughness, and other properties. This term includes low-alloy steels in which the alloy content does not exceed 5%, but does not include stainless steel.

See steel.

allylacetone. (5-hexene-2-one).

Properties: Colorless liquid. D 0.846 (20/4C), bulk d 6.99 lb/gal (20C), 5% to 95% distills between 127-129C. Soluble in water and organic solvents.

Use: Intermediate in pharmaceutical synthesis, perfumes, fungicides, insecticides, fine chemicals.

allyl acrylate. $\text{CH}_2\text{CHCOOCH}_2\text{CHCH}_2$. Liquid, bp 122-134C. Used as monomer for resins.

allyl alcohol. (2-propen-1-ol; propenyl alcohol).

Properties: Colorless liquid; pungent mustardlike odor. Bp 96.9C, mp -129C, d 0.8520 (20/4C), bulk d 7.11 lb/gal (20C), refr index 1.4131, flash p 70F (21C) (TOC), autoign temp 713F (375C). Miscible with water, alcohol, chloroform, ether.

Derivation: (1) Hydrolysis of allyl chloride (from propylene) with dilute caustic, (2) isomerization of propylene oxide over lithium phosphate catalyst at 230-270C, (3) dehydration of propylene glycol.

Hazard: TLV: 2 ppm. Toxic by skin absorption. **Use:** Esters for use in resins and plasticizers, intermediate for pharmaceuticals and other organic chemicals, manufacture of glycerol and acrolein, military poison, herbicide.

allylamine. (2-propenylamine). $\text{C}_3\text{H}_5\text{NH}_2$.

Properties: Colorless to light yellow liquid; strong ammoniacal odor. Attacks rubber and cork. Bp 55-58C, d 0.759-0.761 (20/20C), refr index 1.4194 (22C). Soluble in water, alcohol, ether, and chloroform. Combustible.

Grade: CP, technical.

Use: Pharmaceutical intermediate, organic synthesis.

allyl bromide. (3-bromopropene; bromoallylene). $\text{H}_2\text{C}=\text{CHCH}_2\text{Br}$.

Properties: Colorless to light yellow liquid; irritating, unpleasant odor. D 1.398 (20/4C), mp -199C; bp 71.3C, refr index 1.4654, flash p 30F (-1.1C), autoign temp 563F (295C). Soluble in alcohol, ether, chloroform, carbon tetrachloride, carbon disulfide; insoluble in water.

Grade: Technically pure (95% min purity via bromine titration).

Hazard: Strong irritant to skin and eyes, flammable, high fire risk.

Use: Organic syntheses, preparation of resins, perfume intermediates.

allyl carbamate.

Use: Intermediate for fireproofing compound, emulsion, and solvent polymers.

allyl chloride.

Properties: Colorless liquid with a disagreeable pungent odor. D 0.938 at 20C, mw 76.53, vap press 295 at 20C, flash p -25F (CC). Slightly soluble in water; miscible with alcohol, chloroform, ether, and petroleum ether.

Hazard: TLV: 1 ppm. Skin and eye irritant.

Use: Synthesis of allyl compounds.

allyl diglycol carbonate. See diethylene glycol bis(allyl carbonate).

4-allyl-1,2-dimethoxybenzene. See methyl eugenol.

allylene. See methylacetylene.

2-allyl-2-ethyl-1,3-propanediol.

Properties: Off-white solid. Fp 31C, d 0.976 (35C).

Use: Suggested as polymer additive and chemical intermediate.

allyl glycidyl ether. (AGE).

Properties: Colorless liquid of pleasant odor. D 0.9698 at 20C, mw 114, fp -100C, bp 153.9C (760 mm), vap press 4.7 mm at 25C, flash p 135F (OC). Slightly soluble in water.

Hazard: TLV: 5 ppm. Skin and eye irritant.

Use: Resin intermediate, stabilizer of chlorinated compounds, vinyl resins, and rubber.

1-allyl-4-hydroxybenzene. See chavicol.

allylic rearrangements. Migration of a C=C double bond in a three-carbon (allylic) system on treatment with nucleophiles under S_N1 conditions (or under S_N2 conditions when the nucleophilic attack takes place at the γ -carbon).

allyl- α -ionone. $C_{16}H_{24}O$. Yellow liquid with fruity odor. D 0.928–0.935 (25/25C). Stable, soluble in 70% alcohol. Made synthetically.

Properties: Combustible.

Use: A perfume and flavoring.

5-allyl-5-isobutylbarbituric acid.

$C_{11}H_{16}N_2O_3$.

Properties: White, crystalline powder; odorless; slightly bitter taste. Mp 138–139C. Soluble in alcohol, ether, and chloroform; almost insoluble in water.

Use: Medicine (sedative).

See barbiturate.

allyl isocyanate. C_3H_5NCO .

Properties: Colorless liquid, turns yellow on standing. D 0.935–0.945 (20C), flash p 110F (43.3C), bp 85.5–86C, fp less than –80C. Combustible.

Grade: Purity, 98% min.

Hazard: Moderate fire risk. Toxic.

Use: Organic intermediate, cross-linking agent, polymer modifier.

allyl isothiocyanate. (allyl isosulfocyanate; mustard oil; 2-propenyl isothiocyanate).

$H_2C=CHCH_2NCS$.

Properties: Colorless to pale yellow, oily liquid; pungent, irritating odor; sharp, biting taste. D 1.013–1.016 (25C), bp 152C, flash p 115F (46.1C), refr index 1.527; optically inactive. Soluble in alcohol, ether, carbon disulfide; slightly soluble in water. Combustible.

Derivation: Distillation of sodium thiocyanate and allyl chloride, or of seed of black mustard.

Grade: Technical, FCC.

Hazard: Toxic via ingestion, inhalation, skin contact; fire risk.

Use: Fumigant, ointments, and mustard plasters.

allyl mercaptan. See allyl thiol.

allyl methacrylate. $CH_2C(CH_3)COOC_3H_5$.

Use: As monomer and intermediate.

4-allyl-2-methoxyphenol. See eugenol.

4-allyl-1,2-methylenedioxybenzene. See safrole.

2-(3-allyloxyphenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-16-9. mf: $C_{20}H_{16}N_2O$.

Hazard: A reproductive hazard.

allyl pelargonate. $C_3H_5OOC(CH_2)_7CH_3$. Properties: Liquid, fruity odor, bp 87–91C (3 mm), refr index 1.4332 (20.5C). Combustible.

Use: Flavors and perfumes, polymers.

2-allylpentanoic acid.

CAS: 1575-72-0. mf: $C_8H_{14}O_2$.

Hazard: Moderately toxic.

p-allylphenol. See chavicol.

allyl phosphite. See phosphorous acid, triallyl ester.

allyl propyl disulfide.

CAS: 2179-59-1. $CH_2=CHCH_2S_2C_3H_7$.

Properties: Liquid with a pungent, irritating odor. Mw 148.16, d 0.9289 at 15C. Soluble in ether, carbon disulfide, and chloroform.

Derivation: The chief volatile constituent of onion oil.

Hazard: TLV: 2 ppm. Eye irritant.

allyl resin. A special class of polyester resins derived from esters of allyl alcohol and dibasic acids. Common monomers are allyl diglycol carbonate, also known as diethylene glycol bis(allyl carbonate), diallyl chlorendate, diallyl phthalate, diallyl isophthalate, and diallyl maleate. Polymerization occurs through the unsaturated allyl double bond to form thermosetting resins that are highly resistant to chemicals, moisture, abrasion, and heat, and have low shrinkage and good electrical resistivity.

Use: As laminating adhesives and coatings, especially by impregnation of layered materials with prepolymers (called prepregs); allylic glass cloth, varnishes, applications requiring microwave transparency, encapsulation of electronic parts, vacuum impregnation of metal, casting of ceramics, molding compositions, heat-resistant furniture finishes.

allyl sulfide. (diallyl sulfide; thioallyl ether). $(CH_2CHCH_2)_2S$.

Properties: Colorless liquid with garlic odor. Bp 139C, d 0.888 (27/4C), refr index 1.4877 (27C). Insoluble in water; miscible with alcohol, ether, chloroform, and carbon tetrachloride. Combustible.

Use: Component of artificial oil of garlic.

allyl thiol. (allyl mercaptan; 2-propene-1-thiol). CH_2CHCH_2SH .

Properties: Water-white liquid (darkens on standing); strong garlic odor. D 0.925 (23/4C), bp 90C. Insoluble in water; soluble in ether and alcohol. Combustible.

Use: Pharmaceutical intermediate, rubber accelerator intermediate.

allylthiourea. (allylsulfocarbamide; thiosinamine; allyl sulfourea). $C_3N_5NHCSNH_2$.

Properties: White, crystalline solid; slight garlic odor; bitter taste. D 1.22; mp 78C. Soluble in water, ether, and solutions of borax, benzoates, urethane; insoluble in benzene; slightly soluble in 70% alcohol.

Derivation: Warming a mixture of equal parts of allyl isothiocyanate and absolute alcohol with an equal amount of 30% ammonia.

Use: Medicine, corrosion inhibitor, organic synthesis.

allyltrichlorosilane. $\text{CH}_2\text{CHCH}_2\text{SiCl}_3$.

Properties: Colorless liquid; pungent, irritating odor. Bp 117.5C; d 1.217 (27C); refr index 1.487 (20C); flash p 95F (35C) (COC). Readily hydrolyzed by moisture with the liberation of hydrochloric acid, polymerizes easily. Fire hazard.

Derivation: Reaction of allyl chloride with silicon (copper catalyst).

Use: Intermediate for silicones, fibrous glass finishes.

allyltriphenyl stannane. See allyltriphenyltin.

allyltriphenyltin.

CAS: 76-63-1. mf: $\text{C}_{21}\text{H}_{20}\text{Sn}$.

Properties: Needle-like crystals from alc. Mp: 73–74.5°. Sol in most org solvs.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

4-allyl veratrole. See methyl eugenol.

almond oil. The volatile essential oil distilled from ground kernels of bitter almonds.

Use: Cosmetic creams, perfumes, liqueurs, food flavors (hydrocyanic acid-free).

See amygdalin. *Note:* "Bitter almonds contain amygdalin together with an enzyme that catalyzes its hydrolysis. When the kernels are ground and moistened, a volatile oil produced by the hydrolysis can be distilled from them consisting mainly of benzaldehyde and hydrocyanic acid. This is the oil of bitter almond used in pharmacy as a food flavor after removal of the hydrocyanic acid" (Eckey, *Vegetable Fats and Oils*).

alnico. Coined word for an alloy containing chiefly iron, aluminum, nickel, and cobalt which has outstanding properties as a permanent magnet.

aloin. (barbaloin). A mixture of active principles obtained from aloe. Varies in properties according to variety used.

Properties: Yellow crystals; bitter taste; no or slight odor of aloe. Darkens on exposure to air. Approx 60% soluble in pyridine; slightly soluble in water and organic solvents.

Grade: Technical.

Use: Medicine, proprietary laxatives, electroplating baths, fermentation.

alpaca. A natural fiber obtained from a South American animal similar to the llama. Properties resemble those of wool. Used for specialty clothing and also blended with polyester. Combustible.

"Alpha" [Phillips]. TM for olefin (polypropylene) fiber.

Use: Automotive, home furnishings, and apparel.

alpha. (α). (1) A prefix denoting the position of a substituting atom or group in an organic compound. The Greek letters α , β , γ , etc., are usually not identical with the IUPAC numbering system 1, 2, 3, etc., since they do not start from the same carbon atom. However, α and β are used with naphthalene ring compounds to show the 1 and 2 positions, respectively. α , β , etc., are also used to designate attachment to the side chain of a ring compound. (2) Both a symbol and a term used for relative volatility in distillation. (3) Symbol for optical rotation. (4) A form of radiation consisting of helium nuclei. See alpha particle. (5) The major allotropic form of a substance, especially of metals, e.g., α -iron.

alpha-cellulose. See cellulose; α -cellulose.

Alpha helix. A helical conformation of a polypeptide chain, predominantly right-handed, with maximal intrachain hydrogen bonding of the peptide bonds; one of the most common secondary structures in proteins.

alpha-hydroxy acids. See: α -hydroxy acids

alpha particle. (α particle). A helium nucleus emitted spontaneously from radioactive elements both natural and manufactured. Its energy is in the range of 4–8 MeV and is dissipated in a very short path, i.e., in a few centimeters of air or less than 0.005 mm of aluminum. It has the same mass (4) and positive charge (2) as the helium nucleus. Accelerated in a cyclotron alpha-particles can be used to bombard the nuclei of other elements.

See helium; decay; radioactive.

Alrok process. The immersion of aluminum-base metals in a hot solution of alkali carbonate and chromate in order to form a corrosion-resistant oxide film on the surface.

"Alpha San" [Milliken]. TM for a nylon carpet yarn, polyamide 6 for hospital, child care, and office locations.

Use: Antimicrobial.

"AlsiloX" [Eagle-Picher]. TM for a fusion product of 1% alumina, 65% litharge, and 34% silica, used in ceramics. Available in various particle sizes.

alternating polymer. Polymer in which the molecules of different monomers alternate in the chain.

alternative splicing. Different ways of combining a gene's exons to make variants of the complete protein.

altheine. See asparagine.

Altman, Sidney. (1939–). Awarded Nobel Prize in Chemistry in 1989 jointly with Cech for the discovery that RNA acts as a biological catalyst as well as a carrier of genetic information. Doctorate in 1967 from the University of Colorado.

alugan. See bromomethylhexachlorobicycloheptene.

alum. See aluminum ammonium sulfate; aluminum potassium sulfate, aluminum sulfate.

alum, burnt. (alum, dried). $\text{AlK}(\text{SO}_4)_2$. Aluminum ammonium sulfate or aluminum potassium sulfate heated just sufficiently to drive off the water of crystallization.

Properties: White, odorless powder; sweetish taste. Absorbs moisture on exposure to air. Soluble in hot water; slowly soluble in cold water; insoluble in alcohol.

Use: Medicine (astringent).

alum, chrome. See chromium potassium sulfate.

alum, chrome ammonium. See chromium ammonium sulfate.

alumina. See aluminum oxide and following entries.

alumina, activated. A highly porous, granular form of aluminum oxide having preferential adsorptive capacity for moisture and odor contained in gases and some liquids. When saturated, it can be regenerated by heat (176–315C). The cycle of adsorption and reactivation can be repeated many times. Granules range in size from powder (7 microns for chromatographic work) to pieces approximately 1.5 inches in diameter. Average density approximately 50 lb/cu ft.

Use: An effective desiccant for gases and vapors in the petroleum industry. It is also used as a catalyst or catalyst carrier in chromatography, and in water purification.

See aluminum oxide.

alumina, fused. See aluminum oxide.

alumina gel. See aluminum hydroxide gel.

alumina-silica fiber.

Properties: Amorphous structure, excellent resistance to all chemicals except hydrochloric and phosphoric acids and concentrated alkalis. Available in both short and long staple. Low heat conductivity, high thermal shock resistance. Tensile strength 400,000 psi, elastic modulus 16 million psi, upper temperature limit in oxidizing atmosphere 800C. Noncombustible.

Derivation: The short fiber type is made by blasting a stream of molten alumina and silica with a steam jet. Long staple is spun from a molten mixture of alumina and silica modified with zirconium.

Available forms: Fibers, sheets, blankets.

Use: Nonwoven fabrics (short staple), woven fabric structures, cordage, thermal insulation, repair of furnace linings, piping molten metals, welding insulation (reusable), insulation for rocket and space applications. *Note:* In finely divided form, alumina-silica is also used as a catalyst.

alumina trihydrate. (aluminum hydroxide; aluminum hydrate; hydrated alumina; hydrated aluminum oxide). $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ or $\text{Al}(\text{OH})_3$.

Properties: White crystalline powder, balls, or granules. D 2.42. Insoluble in water; soluble in mineral acids and caustic soda. Releases water on heating.

Derivation: From bauxite. The ore is dissolved in strong caustic and aluminum hydroxide precipitated from the sodium aluminate solution by neutralization (as with carbon dioxide) or by autprecipitation (Bayer process).

Grade: Technical, CP.

Use: Glass, ceramics, iron-free aluminum and aluminum salts, manufacture of activated alumina, base for organic lakes, flame retardants, mattress batting. Finely divided form (0.1–0.6 microns) used for rubber reinforcing agent, paper coating, filler, cosmetics.

aluminium. British spelling of aluminum.

aluminon. (aurine tricarboxylic acid, ammonium salt).

Properties: Mw 473.44, mp 220.5C (decomposes).

Use: As a reagent for aluminum in solution.

aluminosilicate. A compound of aluminum silicate with metal oxides or other radicals.

Use: Catalyst in refining petroleum, to soften water, and in detergents. The sodium compound, $\text{Na}_{12}[(\text{AlO}_2)_{12}(\text{SiO}_2)_{12}]\cdot\text{H}_2\text{O}$, is typical.

See zeolite; molecular sieve.

aluminum. (Al; aluminium).

CAS: 7429-90-5. Metallic element of atomic number 13; group IIIA of the periodic table; aw 26.98154; valence 3; no stable isotopes. Monovalent in high-temperature compounds (AlCl and AlF). Most abundant metal in earth's crust; third most abundant of all elements. Does not occur free in nature.

Properties: Silvery white, crystalline solid. Tensile

strength (annealed) 6800 psi, cold-rolled 16,000 psi. D 2.708, mp 660C, bp 2450C. Forms protective coating of aluminum oxide approximately 50 Å thick, which makes it highly resistant to ordinary corrosion. Attacked by concentrated and dilute solutions of hydrochloric acid, hot concentrated sulfuric acid, and perchloric acid. Also violently attacked by strong alkalis. Rapidly oxidized by water at 180C. Not attacked by dilute or cold concentrated sulfuric acid or concentrated nitric acid. Can ignite violently in powder form. Electrical conductivity approximately two-thirds that of copper. Aluminum qualifies as both a light metal and a heavy metal, according to their definitions.

Derivation: From bauxite by Bayer process and subsequent electrolytic reduction by Hall process. There are several processes for obtaining ultrapure aluminum: (1) electrolytic (three-layer), (2) zone refining, and (3) chemical refining. Impurities as low as 0.2 ppm are possible.

More efficient processes are the Alcoa and Toth processes which require much less electric power than the Hall process. Another method, using no electricity, involves heating a mixture of aluminum ores with a coal-derived fuel in a closed furnace. Still another process called calssintering, using fly ash as a source of alumina, has been described (1978). See calssintering.

Available forms: Structural shapes of all types, plates, rods, wire foil flakes, powder (technical and USP). Aluminum can be electrolytically coated and dyed by the anodizing process (see anodic coating); it can be foamed by incorporating zirconium hydride in molten aluminum, and it is often alloyed with other metals or mechanically combined (fused or bonded) with boron and sapphire fibers or whiskers. Strengths up to 55,000 psi at 500C have been obtained in such composites. A vapor-deposition technique is used to form a tightly adherent coating from 0.2 to 1 mil thick on titanium and steel.

Hazard: Fine powder forms flammable and explosive mixtures in air. TLV: Metal and Oxide: TWA 10 mg/m³ (dust), Pyro Powders and Welding Fumes: TWA 5 mg/m³, Soluble Salts and Alkyls: TWA 2 mg/m³.

Use: Building and construction, corrosion-resistant chemical equipment (desalination plants), die-cast auto parts, electrical industry (power transmission lines), photoengraving plates, permanent magnets, cryogenic technology, machinery and accessory equipment, miscible food-processing equipment, tubes for ointments, toothpaste, shaving cream, etc. Also as a powder in paints and protective coatings, as rocket fuel, as an ingredient of incendiary mixtures (thermite) and pyrotechnic devices, as a catalyst, and for foamed concrete vacuum metallizing and coating. Other uses are as foil in packaging, cooking, and decorative stamping, and as flakes for insulation of liquid fuels.

See aluminum alloy.

aluminum acetate. A salt obtained by reaction of aluminum hydroxide and acetic acid with subsequent recrystallization. Its neutral form $\text{Al}(\text{C}_2\text{H}_3\text{O}_2)_3$ is a white, water-soluble powder used in solution as an antiseptic, astringent, and antiperspirant. Its basic form is $\text{Al}(\text{C}_2\text{H}_3\text{O}_2)_2\text{OH}$, also known as aluminum diacetate and aluminum subacetate. It is a crystalline solid, insoluble in water, used as a mordant in textile dyeing, as a flame retardant and waterproofing agent, and in manufacture of lakes and pigments. See mordant rouge.

aluminum acetylacetonate. $\text{Al}(\text{C}_5\text{H}_7\text{O}_2)_3$.
Properties: Solid. Mp 189C, bp 315C. Soluble in benzene and alcohol.

Use: Deposition of aluminum, catalyst.

aluminum alkyl. (Al trialkyl). Catalyst used in the Ziegler process.

Hazard: Pyrophoric liquid.

See triethylaluminum; triisobutylaluminum.

aluminum alloy. Aluminum containing variable amounts of manganese, silicon, copper, magnesium, lead, bismuth, nickel, chromium, zinc, or tin. A wide range of uses and properties is possible. Alloys may be obtained for casting or working, heat-treatable or non-heat-treatable, with a wide range of strength, corrosion resistance, machinability, and weldability.

See duralumin.

aluminum ammonium chloride. (ammonium aluminum chloride). $\text{AlCl}_3 \cdot \text{NH}_4\text{Cl}$.

Properties: White crystals. Mp 304C. Soluble in water.

Use: Fur treatment.

aluminum ammonium sulfate. (ammonium alum; alum NF). $\text{Al}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$ or $\text{AlNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; odorless; strong astringent taste. D 1.645, mp 94.5C, bp loses 20 waters at 120C. Soluble in water and glycerol; insoluble in alcohol.

Derivation: By crystallization from a mixture of ammonium and aluminum sulfates.

Method of purification: Recrystallization.

Grade: Technical, lump, ground, powdered, CP, NF, FCC.

Use: Mordant in dyeing, water and sewage purification, sizing paper, retanning leather, clarifying agent, food additive, manufacture of lakes and pigments, and fur treatment.

aluminum, anodized. See anodic coating.

aluminum antimonide. AlSb .

Properties: Crystalline solid. Mp 1050C.

Derivation: Fusion of the elements followed by zone refining to purify.

Use: Semiconductor technology.

aluminum arsenide. AlAs. A semiconductor used in rectifiers, transistors, thermistors.

Hazard: Poisonous by ingestion.

aluminum borate. $\text{Al}_2\text{O}_3 \cdot \text{B}_2\text{O}_3$.

Properties: White, granular powder; decomposed by water.

Derivation: Interaction of aluminum hydroxide and boric oxide.

Grade: Technical, CP.

Use: Glass and ceramic industries, polymerization catalyst.

aluminum boride.

Properties: Powder. Apparent bulk density, (fully settled, light) 0.6–0.8 g/cc; dense, 1.2–1.4 g/cc; high neutron absorption.

Use: Nuclear shielding.

aluminum borohydride. $\text{Al}(\text{BH}_4)_3$.

Properties: Volatile, pyrophoric liquid. Bp 44.5C; fp –64.5C.

Derivation: (1) By reaction of sodium borohydride and aluminum chloride in the presence of a small amount of tributyl phosphate; (2) by reaction of trimethylaluminum and diborane.

Hazard: Ignites spontaneously in air, reacts violently with water.

Use: Intermediate in organic synthesis, jet fuel additive, reducing agent.

aluminum brass. An alloy containing 76% copper, 21.5–22.25% zinc, and 1.75–2.50% aluminum.

Use: Condenser, evaporator, and heat exchanger tubes and ferrules.

aluminum bromide. (1) AlBr_3 ; (2) $\text{AlBr}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White to yellowish, deliquescent crystals. Exists as double molecules Al_2Br_6 in the vapor. (1) D 3.01, mp 97.5C, bp 265C; (2) d 2.54, mp 93C (decomposes). Soluble in alcohol, carbon disulfide, or ether.

Derivation: (1) By passing bromine over heated aluminum; (2) reaction of hydrogen bromide with aluminum hydroxide.

Hazard: The anhydrous form reacts violently with water; corrosive to skin.

Use: Anhydrous: bromination, alkylation, and isomerization catalyst in organic synthesis.

aluminum bronze. An alloy containing 88–96.1% copper, 2.3–10.5% aluminum, and small amounts of iron and tin. Characterized by high strength, ductility, hardness, and resistance to shock, fatigue, most chemicals, and seawater.

Grade: Powder that is also called gold bronze powder. An alloy of 90% copper and 10% aluminum reduced from leaf form to powder, polished mechanically, and coated with stearic acid. Available in

the following grades: litho, molding, printing-ink, and radiator.

Use: A pigment in paints and inks.

aluminum-*n*-butoxide. $\text{Al}(\text{OC}_4\text{H}_9)_3$.

Properties: Yellow to white crystalline solid. Mp 101.5C (pure) and 88–96C (commercial), d 1.0251 (20C), bp 290–310C (30 mm). Soluble in aromatic, aliphatic, and chlorinated hydrocarbons.

Use: Ester exchange catalyst, defoamer ingredient, hydrophobic agent, intermediate.

aluminum calcium hydride. (calcium aluminum hydride). Al_2CaH_8 .

Properties: Grayish solid. Soluble in tetrahydrofuran, insoluble in benzene.

Derivation: Reaction of AlCl_3 and CaH_2 in tetrahydrofuran.

Hazard: Flammable in contact with water and alcohols. Spontaneous ignition in moist air: store and handle in nitrogen.

Use: Versatile reducing agent.

aluminum calcium silicate.

Hazard: A nuisance dust.

Use: Food additive.

aluminum carbide. Al_4C_3 .

Properties: Yellow crystals or powder. D 2.36, stable to 1400C. Decomposes in water with liberation of methane.

Derivation: By heating aluminum oxide and coke in an electric furnace.

Grade: Technical.

Hazard: Dangerous fire risk in contact with moisture.

Use: Generating methane, catalyst, metallurgy, drying agent, reducing agent.

aluminum carbonate. A basic carbonate of variable composition; formula sometimes given as $\text{Al}_2\text{O}_3 \cdot \text{CO}_2$. White lumps or powder, insoluble in water; dissolves in hot hydrochloric acid or sulfuric acid. Formerly used as mild astringent, styptic. Normal aluminum carbonate $\text{Al}_2(\text{CO}_3)_3$ is not known as an individual compound.

aluminum chlorate. $\text{Al}(\text{ClO}_3)_3$.

Properties: Colorless crystals. Deliquescent; soluble in water and alcohol.

Hazard: Powerful oxidizing material: keep out of contact with combustibles.

Use: Disinfectant, color control of acrylic resins.

aluminum chloride, anhydrous. AlCl_3

Properties: White or yellowish crystals. D 2.44 (25C), mp 190C (2.5 atm), sublimes readily at 178C. The vapor consists of double molecules Al_2Cl_6 . Soluble in water.

Derivation: (1) By reaction of purified gaseous chlorine with molten aluminum; (2) by reaction of baux-

ite with coke and chlorine at approximately 875C. (This product is used to make the hydrate).

Impurities: Ferric chloride-free aluminum, insolubles.

Grade: Technical, reagent.

Hazard: Powerful irritant to tissue; moderately toxic by ingestion. Reacts violently with water, evolving hydrogen chloride gas.

Use: Ethylbenzene catalyst, dyestuff intermediate, detergent alkylate, ethyl chloride, pharmaceuticals and organics (Friedel-Crafts catalyst), butyl rubber, petroleum refining, hydrocarbon resins, nucleating agent for titanium dioxide pigments.

aluminum chloride hydrate. $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White or yellowish, deliquescent, crystalline powder; nearly odorless; sweet astringent taste. D 2.4, mp (decomposes). Soluble in water and alcohol. The water solution is acid.

Derivation: By crystallizing the anhydrous form from hydrochloric acid solution.

Grade: Technical, CP, NF. Aluminum chloride solution 32° Bé is a special grade consisting of a solution containing only 0.005% iron as impurity, and having an acid reaction but containing no free acid.

Use: Pharmaceuticals and cosmetics (antiperspirants), pigments, roofing granules, special papers, photography, textiles (wool).

aluminum chlorohydrate. $[\text{Al}_2(\text{OH})_5\text{Cl}]_x$. An ingredient of commercial antiperspirant and deodorant preparations. Also used for water purification and treatment of sewage and plant effluent.

aluminum dextran. See aluminum monosulfate.

aluminum diacetate. See aluminum acetate.

aluminum diethyl monochloride. See diethylaluminum chloride.

aluminum diformate. (aluminum formate, basic). $\text{Al}(\text{OH})(\text{CHO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White or gray powder. Soluble in water.

Derivation: Aluminum hydroxide is dissolved in formic acid and spray-dried. Solutions are also prepared by treating aluminum sulfate with formic acid, followed by lime.

Grade: Technical, solutions (12–20° Bé).

Use: Waterproofing, mordanting, antiperspirants, tanning leather, improving wet strength of paper.

aluminum distearate.

CAS: 300-92-5. $\text{Al}(\text{OH})(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White powder. Mp 145C, d 1.009. Insoluble in water, alcohol, ether. Forms gel with aliphatic and aromatic hydrocarbons.

Hazard: TLV: TWA 10 mg/m³

Use: Thickener in paints, inks, and greases; water repellent; lubricant in plastics and cordage; and in cement production.

aluminum ethylate. (aluminum ethoxide).

$\text{Al}(\text{OC}_2\text{H}_5)_3$.

Properties: Colorless liquid which gradually solidifies. Bp 200C (6 mm), mp 140C. Partly soluble in high-boiling organic solvents.

Derivation: Reaction of aluminum with ethanol, catalyzed by iodine and mercuric chloride.

Hazard: Strong irritant to eyes and skin.

Use: Reducing agent for aldehydes and ketones, polymerization catalyst.

aluminum ethylhexoate. (aluminum octoate). A metallic salt of 2-ethylhexoic acid.

Use: A gelling agent for liquid hydrocarbons, and a paint additive.

aluminum fluoride, anhydrous. AlF_3 .

Properties: White crystals. Sublimes at approximately 1250C, d 2.882. Slightly soluble in water; insoluble in most organic solvents.

Derivation: (1) Action of hydrogen fluoride gas on alumina trihydrate; (2) reaction of hydrogen fluoride on a suspension of aluminum trihydrate, followed by calcining the hydrate formed; (3) reaction of fluosilicic acid on aluminum hydrate.

Grade: Technical.

Hazard: Strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Production of aluminum to lower the melting point and increase the conductivity of the electrolyte, flux in ceramic glazes and enamels, manufacture of aluminum silicate, catalyst.

aluminum fluoride, hydrate. $\text{AlF}_3 \cdot 3.5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Slightly soluble in water.

Derivation: Action of hydrofluoric acid on alumina trihydrate and subsequent recovery by crystallization.

Grade: Technical, CP.

Hazard: See fluorine.

Use: Ceramics (production of white enamel).

aluminum fluorosilicate. See aluminum hexafluorosilicate.

aluminum fluosilicate. (aluminum silicofluoride). $\text{Al}_2(\text{SiF}_6)_3$.

Properties: White powder. Slightly soluble in cold water, readily soluble in hot water.

Grade: Technical.

Hazard: See fluorine.

Use: Artificial gems, enamels, glass.

aluminum formate. See aluminum triformate; aluminum diformate.

aluminum formate, basic. See aluminum diformate.

aluminum formate, normal. See aluminum triformate.

aluminum formoacetate.Al(OH)(OOCH)(OOCCH₃).**Properties:** White powder. Soluble in water and alcohol**Use:** Textile water repellents.**aluminum hexafluorosilicate.**CAS: 17099-70-6. mf: F₁₈Si₆•2Al.**Hazard:** Low toxicity by ingestion.**Source:** Natural product.**aluminum hydrate.** See alumina trihydrate.**aluminum hydride.** AlH₃.**Properties:** White to gray powder. Decomposes at 160C (100C if catalyzed). Evolves hydrogen on contact with water.**Hazard:** Dangerous fire and explosion risk.**Use:** Electroless coatings on plastics, textiles, fibers, other metals; polymerization catalyst; reducing agent.**aluminum hydroxide.** See alumina trihydrate.**aluminum hydroxide gel.** (hydrus aluminum oxide; alumina gel). Al₂O₃•xH₂O.**Properties:** White, gelatinous precipitate. Constants variable with the composition, d approx 2.4. Insoluble in water and alcohol, soluble in acid and alkali. Noncombustible.**Derivation:** By treating a solution of aluminum sulfate or chloride with caustic soda, sodium carbonate, or ammonia, by precipitation from sodium aluminate solution, by seeding or by acidifying (carbon dioxide is commonly used).**Grade:** Technical, CP, USP (containing 4% Al₂O₃), NF (dried containing 50% Al₂O₃).**Use:** Dyeing mordant, water purification, waterproofing fabrics, manufacture of lakes, filtering medium, chemicals (aluminum salts), lubricating compositions, manufacture of glass, sizing paper, ceramic glaze, antacid.**aluminum hydroxystearate.**Al(OH)[OOC(CH₂)₁₀CH₂O(CH₂)₅CH₃]₂.**Properties:** White powder. Mp 155C, d 1.045. Less soluble in nonpolar compounds than other aluminum stearates, and more soluble in polar compounds.**Use:** Waterproofing of leather and cements; lubricant for plastics and ropes; paints and inks.**aluminum hypophosphite.** AlH₆O₆P₃.**Properties:** Crystalline solid. Decomposes at 218C. Insoluble in water; soluble in hydrochloric acid, weak sulfuric acid, and sodium hydroxide solution.**Derivation:** By heating an aluminum salt solution with sodium hypophosphite.**Hazard:** Decomposes to toxic phosphine.**Use:** Finishing agent for polyacrylonitrile fiber.**aluminum iodide.** AlI₃ (anhydrous).**Properties:** Brown-black, crystalline pieces (white when pure). Mp 191C, bp 385C, d 3.9825. Soluble in alcohol, ether, carbon disulfide.**Derivation:** Heating aluminum and iodine in a sealed tube.**Method of purification:** Crystallization.**Grade:** Technical.**Hazard:** Reacts violently with water.**Use:** Catalyst in organic synthesis.**aluminum isopropoxide.** See aluminum isopropylate.**aluminum isopropylate.** (aluminum isopropoxide). Al(OC₃H₇)₃.**Properties:** White solid. D 1.035 (20C), mp 128–132C, bp 138–148C (10 mm). Soluble in alcohol and benzene; decomposes in water.**Derivation:** From isopropanol and aluminum.**Grade:** Distilled (purity approximately 100%).**Use:** Dehydrating agent, catalyst, waterproofing textiles, organic synthesis, paints.**aluminum lactate.** C₉H₁₅AlO₉.**Properties:** Colorless, water-soluble powder.**Use:** Fire foam.**aluminum metaphosphate.** Al(PO₃)₃.**Properties:** White powder. Mp approximately 1527C. Insoluble in water.**Use:** As a constituent of glazes, enamels, and glasses, and as a high-temperature insulating cement.**aluminum monobasic stearate.** See aluminum monostearate.**aluminum monopalmitate.** See aluminum palmitate.**aluminum monostearate.** (aluminum dextran; aluminum monobasic stearate).Al(OH)₂[OOC(CH₂)₁₆CH₃]. A complex containing aluminum and dextran, a chain of molecular weight 2500, corresponding to a chain of 15 anhydroglucose units.**Properties:** Fine, white to yellowish-white powder; faint characteristic odor. Mw 344.48, mp 155C, d 1.020. Insoluble in water, alcohol, and ether. Forms a gel with aliphatic and aromatic hydrocarbons.**Derivation:** Mixing solutions of a soluble aluminum salt and sodium stearate.**Grade:** USP, which describes it as a mixture of the monostearate and monopalmitate containing 14.5–16.0% Al₂O₃.**Hazard:** TLV: TWA 10 mg/m³.**Use:** Paints, inks, greases, waxes, thickening lubricating oils; waterproofing, gloss producer, stabilizer for plastics, food additive.**aluminum naphthenate.**

Properties: Yellow substance of rubbery consistency with high thickening power. Combustible.

Derivation: Reaction of an aluminum salt with an alkali naphthenate in aqueous solution.

Use: Paint and varnish drier and bodying agent, detergent in lube oils, the solution in organic solvents has been proposed for insecticides and siccatives. See soap (2).

aluminum nicotinate.

CAS: 1976-28-9. mf: $C_{18}H_{12}AlN_3O_6$.

Properties: Solid.

Use: Food additive.

aluminum nitrate. $Al(NO_3)_3 \cdot 9H_2O$.

Properties: White crystals. Mp 73C, decomposes at 150C. Soluble in cold water, alcohol and acetone; decomposes in hot water.

Derivation: Formed by the action of nitric acid on aluminum and crystallization.

Grade: Technical, CP (99.75%)

Hazard: Powerful oxidizing agent. Do not store near combustible materials.

Use: Textiles (mordant), leather tanning, manufacture of incandescent filaments, catalyst in petroleum refining, nucleonics, anticorrosion agent, antiperspirant.

aluminum nitride. AlN .

Properties: Crystalline solid. D 3.10, mp 2150C (4.3 atm), Mohs hardness 9+, decomposes when wet into aluminum hydroxide and ammonia.

Derivation: From coal and bauxite when heated in a stream of nitrogen.

Use: As semiconductor in electronics; nitriding of steel.

aluminum oleate. $Al(C_{18}H_{33}O_2)_3$.

Properties: Yellowish-white, viscous mass. Insoluble in water; soluble in alcohol, benzene, ether, oil, and turpentine. Combustible.

Derivation: By heating aluminum hydroxide, water, and oleic acid. The resultant mixture is filtered and dried.

Use: Waterproofing, drier for paints, etc.; thickener for lubricating oils; medicine; as lacquer for metals; lubricant for plastics; food additive.

aluminum orthophosphate. See aluminum phosphate.

aluminum oxalate. $Al_2C_6O_{12}$.

Properties: Finely divided solid (as hydrate), soluble in nitric and sulfuric acids, almost insoluble in water and alcohol.

Use: Mordant and dyeing assistant.

aluminum oxide. (alumina).

CAS: 1344-28-1. Al_2O_3 . The mineral corundum is natural aluminum oxide, and emery, ruby, and sapphire are impure crystalline varieties. The mixed mineral bauxite is a hydrated aluminum oxide.

Properties: Vary according to the method of preparation. White powder, balls, or lumps of various mesh. D 3.4–4.0, mp 2030C, insoluble in water, difficultly soluble in mineral acids and strong alkali. Noncombustible.

Derivation: (1) Leaching of bauxite with caustic soda followed by precipitation of a hydrated aluminum oxide by hydrolysis and seeding of the solution. The alumina hydrate is then washed, filtered, and calcined to remove water and obtain the anhydrous oxide. (2) Aluminum sulfate from coal mine wastewaters is reduced to alumina.

Grade: Technical, CP, fibers, high purity, fused, calcined.

Hazard: Toxic by inhalation of dust. TLV: 10 mg/m³.

Use: Production of aluminum, manufacture of abrasives, refractories, ceramics, electrical insulators, catalyst and catalyst supports, paper, spark plugs, crucibles and laboratory wares, adsorbent for gases and water vapors (see alumina, activated), chromatographic analysis, fluxes, lightbulbs, artificial gems, heat-resistant fibers, food additive (dispersing agent).

See alumina trihydrate; aluminum hydroxide gel; alumina, activated.

aluminum oxide, hydrated. See alumina trihydrate.

aluminum oxide, hydrous. See aluminum hydroxide gel.

aluminum palmitate. (aluminum monopalmitate). $Al(OH)_2(C_{16}H_{31}O_2)$.

Properties: White powder. Mp 200C, d 1.072. Insoluble in alcohol and water; forms gel with hydrocarbons. Combustible.

Derivation: By heating aluminum hydroxide and palmitic acid and water. The resultant mixture is filtered and dried.

Use: Waterproofing leather, paper, textiles; thickening for lubricating oils; thickening or suspending agent in paints and inks; production of high gloss on leather and paper; ingredient of varnishes; lubricant for plastics; food additive.

aluminum paste. Aluminum powder ground in oil.

Use: Aluminum paints.

aluminum phosphate. (aluminum orthophosphate). $AlPO_4$.

Properties: White crystals. D 2.566, mp 1500C. Insoluble in water and alcohol, slightly soluble in hydrochloric acid and nitric acid.

Derivation: Interaction of solutions of aluminum sulfate and sodium phosphate.

Hazard: Solutions are corrosive to tissue.

Use: Ceramics, dental cements, cosmetics, paints and varnishes, pharmaceuticals, pulp and paper.

aluminum phosphide. AlP.

Properties: Dark gray or dark yellow crystals. D 2.85.

Hazard: Dangerous fire risk. It evolves phosphine.

Use: Insecticide, fumigant, semiconductor technology.

aluminum picrate. $\text{Al}[(\text{NO}_2)_3\text{C}_6\text{H}_3\text{O}]_3$.

Hazard: Toxic by ingestion and inhalation, dangerous fire risk in contact with combustibles, severe explosion risk when shocked or heated; strong oxidizer.

Use: Explosive compositions.

aluminum potassium sulfate. (potash alum; alum NF; potassium alum).

CAS: 7784-24-9. $\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$, sometimes written $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: White; odorless crystals; astringent taste. D 1.75, mp 92C, bp loses 18 H₂O at 64.5C, anhydrous at 200C. Soluble in water; insoluble in alcohol. Solutions in water are acid. Noncombustible.

Derivation: (1) From alunite, leucite, or similar mineral. (2) Also derived by crystallization from a solution made by dissolving aluminum sulfate and potassium sulfate and mixing.

Grade: Technical, lump, ground, powdered, NF, FCC.

Use: Dyeing (mordant), paper, matches, paints, tanning agents, waterproofing agents, purification of water, aluminum salts, food additive, baking powder, astringent, cement hardener.

aluminum resinate.

Properties: Brown solid. Insoluble in water; soluble in oils.

Derivation: Heating together soluble aluminum salts and rosin.

Grade: Technical (fused, precipitated).

Use: Drier for varnishes.

Hazard: Flammable, dangerous fire risk.

aluminum rubidium sulfate. (rubidium alum). $\text{AlRb}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in hot water, insoluble in alcohol. D 1.867, mp 99C.

aluminum salicylate. $\text{Al}(\text{C}_6\text{H}_4\text{OHCOO})_3$.

Properties: Reddish-white powder. Odorless. Soluble in dilute alkalies; insoluble in water, and alcohol. Decomposed by acid.

Use: Medicine.

aluminum silicate. Any of the numerous types of clay which contain varying proportions of Al₂O₃ and SiO₂. Made synthetically by heating aluminum fluoride at 1000–2000C with silica and water vapor; the crystals or whiskers obtained are up to 1 cm long, have high strength, and are used in reinforced plastics.

Use: Same as for clay.

See mullite; kaolin; "Satintone" [Engelhard].

aluminum silicofluoride. See aluminum fluosilicate.

aluminum silicon. A light-weight alloy available as ingots or in powder form and used for automotive parts, construction, etc. For new manufacturing method, see aluminum derivation.

Hazard: Powder is flammable, dangerous fire risk.

aluminum soaps. See aluminum oleate; aluminum palmitate; aluminum resinate; aluminum stearate; soap (2).

aluminum sodium chloride. See sodium tetrachloroaluminate.

aluminum sodium sulfate. (SAS; sodium aluminum sulfate; soda alum; alum).

$\text{Al}_2(\text{SO}_4)_3 \cdot \text{Na}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$ or $\text{AlNa}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; saline, astringent taste; effloresces in air. D 1.675, mp 61C. Soluble in water, insoluble in alcohol. Noncombustible.

Derivation: By heating a solution of aluminum sulfate and adding sodium chloride. The solution is allowed to cool with constant stirring. The alum meal deposited is washed with water and centrifuged.

Method of purification: Recrystallization.

Grade: Pure crystals, technical, CP, FCC.

Use: Textiles (mordant, waterproofing), dry colors, ceramics, tanning, paper size precipitant, matches, inks, engraving, sugar refining, water purification, medicine, confectionery, baking powders, food additive.

aluminum stearate. (aluminum tristearate).

CAS: 637-12-7 C₅₄H₁₀₅O₆•Al.

Properties: White powder. D 1.070, mp 115C. Insoluble in water, alcohol, ether; soluble in alkali, petroleum, turpentine oil. Forms gel with aliphatic and aromatic hydrocarbons.

Derivation: Reaction of aluminum salts with stearic acid.

Grade: Technical.

Hazard: TWA 10 mg/m³

Use: Paint and varnish drier, greases, waterproofing agent, cement additive, lubricants, cutting compounds, flattening agent, cosmetics and pharmaceuticals, defoaming agent in beet sugar and yeast processing.

aluminum subacetate. See aluminum acetate.

aluminum sulfate. (alum; pearl alum; pickle alum; cake alum; filter alum; papermakers' alum; patent alum). (1) Al₂(SO₄)₃; (2) Al₂(SO₄)₃•18H₂O.

Properties: White crystals; sweet taste. Noncom-

bustible. Stable in air, *d* (1) 2.71, (2) 1.62, mp decomposes at 770C. Soluble in water; insoluble in alcohol.

Derivation: (1) By treating pure kaolin or aluminum hydroxide or bauxite with sulfuric acid. The insoluble silicic acid is removed by filtration, and the sulfate is obtained by crystallization. (2) Similarly, from waste coal-mining shale and sulfuric acid.

Grade: Iron-free, technical, CP, USP, FCC. A liquid form (49.7 H₂O) is also available.

Use: Sizing paper, lakes, alums, dyeing mordant foaming agent in fire foams, cloth fireproofing, white leather tannage, catalyst in manufacturing ethane, pH control in paper industry, waterproofing agent for concrete, clarifier for fats and oils, lubricating compositions, deodorizer and decolorizer in petroleum refining, sewage precipitating agent and for water purification, food additive.

aluminum sulfide. Al₂S₃.

Properties: Yellowish-gray lumps. Odor of hydrogen sulfide. Decomposes in moist air to hydrogen sulfide and a gray powder. D 2.02, mp 1100C.

Hazard: Irritant to skin and mucous membranes.

Use: To prepare hydrogen sulfide.

aluminum tartrate. C₁₂H₁₂Al₂O₁₈.

Properties: Crystalline powder. Soluble in hot water and ammonia.

Use: Textile dyeing auxiliary.

aluminum thiocyanate. (aluminum sulfocyanate). Al(SCN)₃.

Properties: Yellowish powder. Soluble in water; insoluble in alcohol and ether.

Use: Mordant for textile dyeing, manufacturing pottery.

aluminum trialkyl. See triethylaluminum; triisobutylaluminum.

aluminum tributyl. See *n*-tributyl aluminum.

aluminum triethyl. See triethyl aluminum.

aluminum triformate. (aluminum formate, normal). Al(HCOO)₃•3H₂O.

Properties: White, crystalline powder. Soluble in hot water; slightly soluble in cold water.

Use: Textile (delustering rayon, mordanting, waterproofing, after-treatment of dyeings), paper (sizing), fur dyeing (mordant), and medicine.

aluminum trimethyl. See trimethyl aluminum.

aluminum triricinoleate.

Properties: Yellowish to brown plastic mass. Mp 95C. Limited solubility in most organic solvents. Combustible.

Derivation: Castor oil.

Use: Gelling agent, waterproofing, solvent-resistant lubricants.

aluminum tristearate. See aluminum stearate.

alum, NF. May be either aluminum ammonium sulfate or aluminum potassium sulfate.

alum, papermakers. See aluminum sulfate.

alum, pearl. Specially prepared aluminum sulfate for the papermaking industry.

alum, pickle. Aluminum sulfate prepared to meet specifications of packers and preservers.

alum, porous. See aluminum sodium sulfate.

alum, potash. See aluminum potassium sulfate.

alum, soda. See aluminum sodium sulfate.

alunite. (alum stone).

CAS: 1344-28-1. KAl₃(OH)₆(SO₄)₃. A naturally occurring basic potassium aluminum sulfate usually found with volcanic and other igneous rocks.

Occurrence: Utah, Arizona, California, Colorado, Nevada, Washington, Italy, Australia.

Use: Production of aluminum potassium compounds, millstones, substitute for bauxite in aluminum manufacture, decolorizing and deodorizing agent, fertilizer.

Am. Symbol for americium.

“AMA-10” [Vinings].

CAS: 6317-18-6. TM for methylene bithiocyanate.

Grade: 99% dry powder, 10% solution.

Available forms: Powder, liquid.

Use: Pesticide, raw materials for use in paper mills, cooling towers, petroleum drilling, water treatment, leather processing.

Amadori rearrangement. Conversion of *N*-glycosides of aldoses to *N*-glycosides of the corresponding ketoses by acid or base catalysis.

amagat unit. A compressibility factor, equal to pressure in atmospheres times volume under standard conditions.

amalgam. A mixture or alloy of mercury with any of a number of metals or alloys, including cesium, sodium, tin, zinc, lithium, potassium, gold, and silver as well as with some nonmetals. Dental amalgams are mixtures of mercury with a silver tin alloy. A sodium amalgam is formed in the preparation of pure sodium hydroxide by electrolysis of brine.

Use: Dental fillings, silvering mirrors, catalysis, ana-

lytical separation of metals; to facilitate application of active metals such as sodium, aluminum, and zinc in the preparation of titanium, etc., or in reduction of organic compounds.

See sodium amalgam.

amanitin. (α) $C_{39}H_{54}N_{10}O_{13}S$. (β) $C_{39}H_{53}N_{9}O_{14}S$.

Toxic principle from a species of mushroom (*Amanita phalloides*). The β form has been obtained as acicular crystals which are soluble in water, methanol, and ethanol.

Hazard: A poison!! Ingestion may be fatal.

amantadine hydrochloride. (1-adamantamine hydrochloride). $C_{10}H_{17}\bullet HCl$. A derivative of adamantane. An anti-viral drug. Also used in treatment of Parkinson's disease.

See "Symmetrel" [Du Pont].

amaranth. (FDC Red No. 2; Red Dye No. 2).

CAS: 915-67-3.

$NaSO_3C_{10}H_5N=NC_{10}H_4(SO_3Na)_2OH$. An azo dye derived from naphthionic and R acids.

Properties: Dark red to purple powder. D approximately 1.50. Soluble in water, glycerol, propylene glycol; insoluble in most organic solvents.

Hazard: An experimental carcinogen. May not be used in foods, drugs, or cosmetics.

Use: Formerly a certified food and drug colorant. (Replaced for some applications by FDC Red No. 40.) Textile dye, color photography.

amatol. An explosive mixture of ammonium nitrate and TNT. The 50:50 mixture can be melted and poured for filling small shells; the 80% ammonium nitrate mixture is granular.

Hazard: Highly explosive. A powerful irritant to mucous membranes and by skin absorption.

amber. A polymerized fossil resin derived from an extinct variety of pine. Readily accumulates static electrical charge by friction; good electrical insulator.

ambergris. A waxy, opaque mass containing 80% cholesterol formed in the intestinal tract of the sperm whale and found on beaches or afloat in the ocean.

Use: A fixative in perfumes, now largely replaced by synthetic products.

"Amberlac" [Rohm & Haas]. TM for modified alkyd-type resins for quick-drying lacquers.

Use: Metal primers, bottle cap coatings, food can coatings, appliance coatings.

"Amberlite" [Rohm & Haas]. TM for several types of ion-exchange resins. Insoluble cross-linked polymers of various types in minute bead form. Strong acid, weak acid, strong base, and weak base forms, each having various grades differing in

exchange capacity and porosity, for removing simple and complex cations and anions from aqueous and nonaqueous solutions. Reversible in action; can be regenerated.

Grade: Laboratory, liquid, nuclear, mixed bed, pharmaceutical.

Use: Water conditioning (softening and complete deionization), recovery and concentration of metals, antibiotics, vitamins, organic bases, catalysis, decolorization of sugar, manufacture of chemicals, neutralization of acid mine-water drainage, analytical chemistry, water treatment in nuclear reactors, pharmaceuticals.

"Amberol" [Rohm & Haas]. TM for maleic-resin and resin-modified and unmodified phenol-formaldehyde-type polymers in solid form. They react with various oils to produce fast-drying, high-gloss protective coatings and vehicles for printing inks.

Use: Varnishes, enamels, can liners, nitrocellulose sanding sealers, printing inks, tackifying and vulcanization of butyl rubber.

"Ambien" [Searle]. TM for zolpidem tartrate.

Use: Drug.

ambient temperature. The temperature of the environment in which an experiment is conducted or in which any physical or chemical event occurs. See room temperature.

ambithion. See fenitrothion-malathion mixture.

"Ambitrol" [Dow]. TM for coolants used in stationary industrial engines.

amblygonite. $Li(AlF)PO_4$ or $AlPO_4\bullet LiF$. A natural fluorophosphate of aluminum and lithium.

Properties: White to grayish-white. Contains up to 10.1% lithia, sometimes with partial replacement by sodium. D 3.01–3.09, Mohs hardness 6.

Occurrence: California, Maine, Connecticut, South Dakota, Germany, Norway, France.

Use: A source of lithium used in glazes and coatings.

ambomycin (USAN). An antibiotic produced by *Streptomyces ambofaciens*.

ambrette seed oil.

Properties: Volatile oil from seeds of *Abelmoschus moschatus* Moench, syn. *Hibiscus Abelmoschus L.* (Fam. *Malvaceae*). Amber liquid; odor of ambrettolide. Sol in fixed oils; insol in glycerin, propylene glycol.

Use: Food additive.

ambrettolide. (ω ,6-hexadecenlactone; 6-hexadecenolide; 16-hydroxy-6-hexadecenoic acid; ω -lactone). $C_{16}H_{28}O_2$.

Properties: Colorless liquid having powerful musk-like odor. Found in ambrette-seed oil.

Use: Flavoring, perfume fixative.

“Amerchol” [Dow]. TM for a series of surface-active lanolin derivatives; most are soft solids.

Use: Emulsifiers and stabilizers for water and oil systems, emollients in pharmaceuticals and cosmetics.

American Association for the Advancement of Science. (AAAS). Founded in 1848. The

largest general scientific organization representing all fields of science. Membership includes 150,000 individuals and 300 societies. The interests of this association extend into all areas of natural and social science. Its leading publication is *Science*, established by Thomas Edison in 1880. It also publishes many symposium volumes based on papers presented at its annual meetings. One of its important activities in chemistry is sponsorship of the Gordon Research Conferences, which originated in 1931 under the leadership of Dr. Neil E. Gordon; these have since been expanded to more than 30 technical conferences attended by chemists from many foreign countries. Society headquarters are located at 1200 New York Ave., NW, Washington DC 20005. Website: <http://www/AAAS.org>

American Association of Textile Chemists and Colorists. (AATCC). Founded in 1921.

It has over 6500 members. A technical and scientific society of textile chemists and colorists in textile and related industries using colorants and chemical finishes. It is the authority for test methods. It is located at PO Box 12215, Research Triangle Park, NC 27709. Website: <http://aatcc.org>

American Carbon Society. (ACS). The

American Carbon Society (ACS), formally the American Carbon Committee, was established in 1957 with the express purpose of organizing U.S. conferences on carbon. The Society promotes interdisciplinary research and technology in the field of carbon science. Moreover, the Society sponsors a Biennial Conference on Carbon. The ACS promotes carbon science and technology through its Graffin Lecture series. It publishes *CARBON*, an international journal. Its mailing address is 217 Academic Projects Building, University Park, PA 16802 Website: <http://www.ems.psu.edu/carbon>

American Ceramic Society. (ACerS).

Founded 1899. It has 12,000 members. A professional society of scientists, engineers, plant operators, interested in glass, ceramics-metal systems, cements, refractories, nuclear ceramics, white wares, electronics, and structural clay products. It is located at P.O. Box 6136, Westerville, Ohio 43086-6136. Website: <http://www.ceramics.org/>

American Chemical Society. (ACS).

Founded in 1876. It has over 161,000 members. The nationally chartered professional society for chemists in the U.S. One of the largest scientific organizations in the world. Its offices are at 1155 16th St., NW, Washington DC 20036. For further information, see Appendix IIB. Website: <http://www.acs.org>

See *Chemical Abstracts*.

American Conference of Governmental Industrial Hygienists. (ACGIH). Founded

in 1938. Over 30,000 members. A society of persons employed by official government units responsible for programs of industrial hygiene, education, and research. It was founded for the purpose of determining standards of exposure to toxic and otherwise harmful materials in workroom air. The standards are revised annually and are available from the Secretary, 1330 Kemper Meadow Dr., Suite 600, Cincinnati, OH 45240. Website: <http://www.acgih.org>

See *Threshold Limit Value*.

American Institute of Chemical Engineers.

(AIChE). Founded in 1908. There are approximately 70,000 members. The largest society in the world devoted exclusively to the advancement and development of chemical engineering. Its official publication is *Chemical Engineering Progress*. It has over 50 local sections and many committees working in a wide range of activities. Its offices are located at 3 Park Ave., New York, NY 10016. Website: <http://www.aiche.org>

American Institute of Chemists. (AIC).

Founded in 1923, it is primarily concerned with chemists and chemical engineers as professional people rather than with chemistry as a science. Special emphasis is placed on the scientific integrity of the individual and on a code of ethics adhered to by all its members. It publishes a monthly journal, *The Chemist*. It is located at 515 King Street, Suite 420, Alexandria, Virginia 22314. Website: <http://www.theaic.org>

American Leather Chemists' Association.

(ALCA). Founded in 1903. This group works to devise and perfect methods for the analysis and testing of leathers and materials used in leather manufacturing. It is located at Texas Tech University PO Box 45300, Lubbock, Texas 79409-5300. Website: <http://www.leatherchemists.org/>

American National Standards Institute.

(ANSI). Founded in 1918. A federation of trade associations, technical societies, professional groups, and consumer organizations that constitutes the U.S. clearinghouse and coordinating body for voluntary standards activity on the national level. It eliminates duplication of standards activities and combines conflicting standards into single, nationally accepted standards. It is the U.S. member of the

International Organization for Standardization and the International Electrotechnical Commission. Over 1000 companies are members of the ANSI. One of its primary concerns is safety in such fields as hazardous chemicals, protective clothing, welding, fire control, electricity and construction operations, blasting, etc. Its address is 1819 L Street, NW, Washington, DC 20036. Website: <http://www.ansi.org/>

American Oil Chemist's Society. (AOCS).

Founded in 1909. It has over 5000 members. These members are chemists, biochemists, chemical engineers, research directors, plant personnel, and persons concerned with animal, marine, and regular oils and fats and their extraction, refining, safety, packaging, quality control, and use. The address is 2211 W. Bradley Ave., Champaign, Illinois, 61821-1827. Website: <http://www.aocs.org/>

American Petroleum Institute. (API).

Founded in 1919. It has 5500 members. The members are the producers, refiners, marketers, and transporters of petroleum and allied products such as crude oil, lubricating oil, gasoline, and natural gas. The address is 1212 L Street, N. W., Washington, DC, 20005. Website: <http://www.api.org/>

American Society for Testing and

Materials. (ASTM). This society, organized in 1898 and chartered in 1902, is a scientific and technical organization formed for "the development of standards on characteristics and performance of materials, products, systems and services, and the promotion of related knowledge." There are over 31,000 members. It is the world's largest source of voluntary consensus standards. The society operates via more than 125 main technical committees that function in prescribed fields under regulations that ensure balanced representation among producers, users, and general-interest participants. Headquarters of the society is at 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959. Website: <http://www.astm.org>

American Society of Pharmacology and Experimental Therapeutics. (ASPET).

Founded in 1908. It has over 3700 members. It is a scientific society of investigators in pharmacology and toxicology interested in research and promotion of pharmacological knowledge and its use among scientists and the public. The address is 9650 Rockville Pike, Bethesda, MD 20814-3995. Website: <http://www.faseb.org>

americium. Am. A synthetic radioactive element of atomic number 95, a member of the actinide series; Aw 241; 14 isotopes of widely varying half-life; valence 3, but divalent, tetravalent, and higher valencies exist. α and γ emitter, forms compounds with oxygen, halides, lithium, etc. Metallic ameri-

um is silver-white crystalline, d 13.6, mp approximately 100C. Half-life of ^{241}Am is 458 years.

Derivation: Multiple neutron capture in plutonium in nuclear reactors, plutonium isotopes yield ^{241}Am and ^{243}Am on β decay. The metal is obtained by reduction of the trifluoride with barium in a vacuum at 1200C.

Hazard: A radioactive poison.

Use: Gamma radiography, radiochemical research, diagnostic aid, electronic devices.

"Amerlate" phosphorus [Dow]. TM for the isopropyl ester of hydroxy, normal, and branched-chain acids of lanolin. A light yellow, soft solid that liquefies on contact with the skin. A hydrophilic emollient, moisturizer, conditioning agent, lubricant, pigment dispersant, and nonionic auxiliary without emulsifier.

Ames dial. A device used for measuring the thickness of paint film.

Ames test. A simple bacterial test for carcinogens, based on the assumption that carcinogens are mutagens. Named after its inventor Bruce Ames. Somewhat less favored than it used to be, because of the idea that compounds causing cells to grow more rapidly will sometimes result in cancer.

amethopterin. See methotrexate.

ametryn-atrazine mixture. See herbifert.

amiben. Generic name for 3-amino-2,5-dichlorobenzoic acid. $\text{C}_6\text{H}_2\text{NH}_2\text{Cl}_2\text{COOH}$.

Use: Herbicide or plant growth regulator.

amide. A nitrogenous compound related to or derived from ammonia. Reaction of an alkali metal with ammonia yields inorganic amides, e.g., sodium amide (NaNH_2). Organic amides are characterized by an acyl group ($-\text{CONH}_2$) usually attached to an organic group ($\text{R}=\text{CONH}_2$); formamide (HCONH_2) and carbamide (urea) $\text{CO}(\text{NH}_2)_2$ are common examples.

See polyamide.

amidinomycin. $\text{C}_9\text{H}_{18}\text{N}_2\text{O}$. An antibiotic that partially inhibits spore-forming bacteria.

4-amidino-1-(nitrosaminoamidino)-1-tetrazene. See tetrazene.

amidol. See 2,4-diaminophenol hydrochloride.

amidopropylamine oxide.

Use: Foamer, foam booster, foam stabilizer; scour for household, cosmetic, and industrial applications.

aminacrine hydrochloride. USAN name for 9-amino-acridine hydrochloride.

amination. The process of making an amine (RNH₂). The methods commonly used are (1) reduction of a nitro compound, and (2) action of ammonia on a chloro, hydroxy, or sulfonic acid compound.

amine. A class of organic compounds of nitrogen that may be considered as derived from ammonia (NH₃) by replacing one or more of the hydrogen atoms with alkyl groups. The amine is primary, secondary, or tertiary depending on whether one, two, or three of the hydrogen atoms are replaced. All amines are basic in nature and usually combine readily with hydrochloric or other strong acids to form salts.

See fatty amine.

amine 220. 2-(8-heptadecenyl)-2-imidazoline-1-ethanol).

Properties: D 0.9330 (20/20C), bulk d 7.76 (20C) lb/gal, bp 235C (1 mm), flash p 465F (240C). Combustible.

Use: Demulsifier used particularly in the recovery of tar from water-gas process emulsions. A powerful cationic wetting agent. Useful in flotation processes involving siliceous minerals and the formation of emulsions and dispersions under acidic conditions.

amine 248. Dark-colored liquid or paste consisting of a nonvolatile amine mixture with bis-(hexamethylene)triamine and its homologs as principal components. Disperses readily in water.

Use: Coagulant and flocculating agent, ingredient of antistripping agents for asphalt, corrosion inhibitor, anchoring agent, for making cationic amine salts.

amine absorption process. See Girbotol absorption.

aminimide. Any of a group of nitrogen compounds derived by reaction of 1,1-dimethylhydrazine with an epoxide in the presence of an ester of a carboxylic acid. A number of types of epoxides and esters may be used, providing a wide variety of products, including short- and long-chain aliphatics and aromatics. Their major uses are in tire-cord dips to increase adhesion of cord to rubber, in soil-removing detergents (nonionic), in coating formulations, and in cosmetic creams and shampoos. They are stated to be biodegradable and without toxic hazard. They also have elastomer and cross-linking applications from adhesives, caulks, and sealants to foams and mechanical goods. As isocyanate precursors, aminimides can be prepared in a large number of structural variations. Bisaminimides are especially valuable for producing stable, single-package prepolymer compositions for in situ generation of isocyanates in polyurethane applications.

p-aminoacetanilide. (4'-aminoacetanilide; *N*-acetyl-*p*-phenylenediamine). NH₂C₆H₄NHCOCH₃. **Properties:** Colorless or reddish crystals. Mp 162C, bp 267C. Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: Acetylation of *p*-phenylenediamine.

Hazard: Moderate toxicity by ingestion.

Use: Intermediate for azo dyes and pharmaceuticals.

aminoacetic acid. See glycine.

aminoacetophenetidide hydrochloride.

See phenocoll hydrochloride.

amino acid. An organic acid containing both a basic amino group (NH₂) and an acidic carboxyl group (COOH). Amino acids are amphoteric and exist in aqueous solution as dipolar ions. The 25 amino acids that have been established as protein constituents are α-amino acids (i.e., the -NH₂ group is attached to the carbon atom next to the -COOH group). Many other amino acids occur in the free state in plant or animal tissue. At least 22 amino acids with structures identical with those that exist today have been identified in pre-Cambrian sedimentary rock, indicating an age of at least 3 million years. Amino acids have been created in the laboratory by passing an electrical discharge through a mixture of ammonia, methane, and water vapor; it is believed that a similar reaction may have accounted for the original synthesis of amino acids on earth. Amino acids can be obtained by hydrolysis of a protein; or they can be synthesized in various ways, especially by fermentation of glucose. An essential amino acid is one that cannot be synthesized by the body and is necessary for survival, namely, isoleucine, phenylalanine, leucine, lysine, methionine, threonine, tryptophan, and valine. Nonessential amino acids (alanine, glycine, and about a dozen others) can be synthesized by the body in adequate quantities. Arginine and histidine are essential during periods of intensive growth. All the essential and most of the nonessential amino acids have one or more asymmetric carbon atoms and are optically active. Amino acids are the building blocks of molecular biology. Various combinations of amino acids form the proteins, which are highly complex molecules present in all living things. *Note:* Use of amino acids as fortification additives to foods is restricted by the FDA to foods containing proteins. See genetic code; deoxyribonucleic acid; chromatin; protein; life, origin.

amino acid activation. Enzymatic esterification of the carboxyl group of an amino acid to the 3'-hydroxyl group of its corresponding tRNA which requires 2 ATP-equivalents of energy.

amino acid oxidase. See amino oxidase.

aminoacyl-tRNA. An aminoacyl ester of a tRNA.

aminoacyl-tRNA synthetases. Enzymes that catalyze synthesis of an aminoacyl tRNA at the expense of ATP energy.

aminoamylene glycol. See 2-amino-2-ethyl-1,3-propanediol.

5-amino-2-anilobenzenesulfonic acid. See 4-amino-diphenylamine-2-sulfonic acid.

***o*-aminoanisole.** See *o*-anisidine.

***p*-aminoanisole.** See *p*-anisidine.

aminoanthraquinone. $C_6H_4(CO)_2C_6H_3NH_2$. Tricyclic: (1) 1-amino, (2) 2-amino.

Properties: (1) Red, iridescent needles. (2) Red or orange-brown needles. Soluble in alcohol, chloroform, benzene, and acetone; insoluble in water. Mp (1) 252C, (2) 302C, bp sublimes (both 1 and 2).

Derivation: By reduction of nitroanthraquinones, or by the substitution of the amino radical direct for the sulfonic acid.

Use: Dye and pharmaceutical intermediate.

4-aminoantipyrine. (4-amino-1,5-dimethyl-2-phenyl-3-pyrazolone; 1,5-dimethyl-2-phenyl-4-aminopyrazolone). $C_{11}H_{13}N_3O$.

Properties: Mp 107–109C.

Use: Analytical reagent.

***p*-aminoazobenzene.** (aniline yellow; phenylazoaniline).

CAS: 60-09-3. $C_6H_5NNC_6H_4NH_2$.

Properties: Yellow to tan crystals. Mp 126–128C, bp above 360C. Soluble in alcohol and ether; slightly soluble in water.

Derivation: (1) Heating diazoaminobenzene with aniline hydrochloride as catalyst. (2) Diazotization of a solution of aniline and aniline hydrochloride with hydrochloric acid and sodium nitrite.

Hazard: Suspected carcinogen.

Use: Dyes (chrysoidine, induline, solid yellow, and acid yellow), insecticide.

4-aminoazobenzene-3,4'-disulfonic acid.

(Acid Yellow 9).

$C_6H_4(SO_3H)NNC_6H_3NH_2(SO_3H)$.

Properties: Bright, violet needles.

Use: For synthesizing dyes for dyeing wool.

***p*-aminoazobenzene hydrochloride.** (aminoazobenzene salt). $C_6H_5NNC_6H_4NH_2 \cdot HCl$.

Properties: Steel-blue crystals. Soluble in alcohol; slightly soluble in water.

Derivation: By passing dry hydrogen chloride gas into a solution of aminoazobenzene.

Hazard: Suspected carcinogen.

Use: Dyes, coloring lacquers, intermediate.

aminoazobenzemonosulfonic acid.

$NH_2C_6H_4NNC_6H_4SO_3H$.

Properties: Yellowish-white, microscopic needles. Barely soluble in water; almost insoluble in alcohol, ether, and chloroform.

Derivation: By sulfonating aminoazobenzene.

Hazard: Suspected carcinogen.

Use: Dye stuff manufacture.

***o*-aminoazotoluene.** (Solvent Yellow; 3,2-amino-5-azotoluene; toluazotoluidine).

CAS: 97-56-3. $CH_3C_6H_4N_2C_6H_3NH_2CH_3$.

Properties: Reddish-brown to yellow crystals. Mp 100–117C. Soluble in alcohol, ether, oils, and fats; slightly soluble in water.

Derivation: From *o*-toluidine by treatment with nitrite and hydrochloric acid.

Hazard: Suspected carcinogen.

Use: Dyes, medicine.

6,*p*-(*p*-aminobenzamido)benzamido-1-naphthol-3-sulfonic acid.

$H_2NC_6H_4CONHC_6H_4CONHC_{10}H_5(OH)(SO_3H)$.

Gray paste containing approximately 35% solids.

Use: Intermediate.

aminobenzene. See aniline.

***p*-aminobenzenearsonic acid.** See arsanilic acid.

2-amino-*p*-benzenedisulfonic acid. (aniline-2,5-disulfonic acid). $C_6H_5NH_2(SO_3H)_2 \cdot 4H_2O$.

Properties: Crystals. Very soluble in water and alcohol.

Derivation: Boiling sodium salt of 4-chloro-3-nitrobenzene sulfonate with sodium sulfite, resulting in formation of sodium-2-nitrobenzene disulfonate, which is reduced with iron and acetic acid to aniline-2,5-disulfonic acid.

Use: Intermediate.

4-amino-*m*-benzenedisulfonic acid. (aniline-2,4-disulfonic acid). $C_6H_5NH_2(SO_3H)_2 \cdot 2H_2O$.

Properties: Needles decompose when heated above 120C. Very soluble in water and alcohol.

Derivation: By heating sulfanilic acid with fuming sulfuric acid at 170–180C.

Use: Dye intermediate.

***m*-aminobenzenesulfonic acid.** See metanilic acid.

***p*-aminobenzenesulfonic acid.** See sulfanilic acid.

***m*-aminobenzoic acid.** $C_6H_4NH_2CO_2H$.

CAS: 99-05-8.

Properties: Yellowish or reddish crystals, sublimes easily, sweet taste. Mp 173C–174C. Slightly soluble in water, alcohol, and ether.

Use: Dye intermediate.

***o*-aminobenzoic acid.** See anthranilic acid.

***p*-aminobenzoic acid.** (PABA).

CAS: 150-13-0. $\text{NH}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$. Required by many organisms as a vitamin for growth, active in neutralizing the antibiostatic effect of some sulfonamide drugs.

Properties: Light buff, odorless crystals; white when pure; discolor on exposure to light and air. Mp 186–187C. Sparingly soluble in cold water; soluble in hot water, glacial acetic acid, ethyl acetate. Unstable to ferric salts and oxidizing agents.

Derivation: Reduction of *p*-nitrobenzoic acid. Commercially available as the calcium, potassium, and sodium salts. Food source: Widely distributed, especially in yeast.

Grade: Technical, NF.

Use: Dye intermediate, pharmaceuticals, nutrition, UV absorber in suntan lotions.

2-aminobenzothiazole. $\text{C}_6\text{H}_4\text{NC}(\text{NH}_2)\text{S}$ (bicyclic).

Use: As an azo dye intermediate and in photographic chemicals.

***m*-aminobenzotrifluoride.**

CAS: 98-16-8. $\text{CF}_3\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless to oily yellow liquid.

Grade: Technical (88% min), purified (98% min).

Use: Pharmaceutical intermediate.

o*-aminobenzoylformic anhydride.** See isatin.N*-(*p*-aminobenzoyl)glycine.** See *p*-aminohippuric acid.***o*-aminobiphenyl.** (*o*-phenylaniline; *o*-biphenylamine).

CAS: 90-41-5. $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless or purplish crystals. Mp 49.3C, bp 299C. Slightly soluble in water.

Derivation: Reduction of *o*-nitrobiphenyl.

Hazard: Toxic by ingestion, inhalation, and skin absorption. A carcinogen.

Use: Research, analytical chemistry.

1-aminobutane. See *n*-butylamine.**2-aminobutane.** See *sec*-butylamine.**aminobutanoic acid.** See aminobutyric acid.**2-amino-1-butanol.** $\text{CH}_3\text{CH}_2\text{CHNH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. D 0.944 at 20/20C, mp

–2C, bp 178C (at 10 mm Hg = 79–80C), flash p 164F (73.3C), bulk wt 7.85 lb/gal (20C); pH (0.1 M aqueous solution) 11.11, refr index 1.453 (20C). Completely miscible with water at 20C; soluble in alcohols. Corrosive to copper, brass, aluminum. Combustible.

Use: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; organic synthesis.

aminobutyric acid. (aminobutanoic acid; GABA).

CAS: 56-12-2. An unusual amino acid having the following isomers: α : $\text{CH}_3\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. Isolated from a bacterium (*Corynebacterium diphtheriae*). The *dl* form is a crystalline solid, mp 305C, soluble in water, slightly soluble in alcohol, insoluble in ether. The *l*(+) form is solid, mp 270C, sweetish taste, soluble in water. β : $\text{CH}_2\text{CH}(\text{NH}_2)\text{CH}_2\text{COOH}$. The *dl* form is a tasteless solid, mp 190C, water soluble, insoluble in ether and alcohol. The *d*(–) form decomposes at 220C. γ : (GABA) $\text{H}_2\text{N}(\text{CH}_2)_3\text{COOH}$. Obtained from bacteria, yeast, and plant life. Crystalline solid, mp 202C, soluble in water, insoluble in organic solvents. Decomposes to pyrrolidone and water on quick heating. This substance is reported to be a neurotransmitter that activates or retards nervous reactions in the cells of the brain, including the sense of pain. All three isomers have been synthesized by various reaction sequences, the first reported in 1880.

 α -aminocaproic acid. See norleucine.**aminocaproic lactam.** See caprolactam.**1-(aminocarbonyl)propyl *n*-((methylamino)carbonyloxy)ethanimidothioate.**

CAS: 92065-18-4. mf: $\text{C}_8\text{H}_{13}\text{N}_3\text{O}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

aminochlorobenzene. See chloroaniline.**3-amino-5-chlorobenzoic acid.**

CAS: 21961-30-8. mf: $\text{C}_7\text{H}_6\text{ClNO}_2$.

Hazard: Low toxicity by ingestion.

4-amino-4'-chlorodiphenyl. $\text{C}_{12}\text{H}_{10}\text{ClN}$.

Properties: Crystalline solid. Mp 128C. Insoluble in water; soluble in acetone, benzene, glacial acetic acid, and alcohol.

Derivation: Chlorination of 4-nitrodiphenyl and reduction of the product with iron and hydrochloric acid in alcohol.

Use: Sulfur determination in various materials, e.g., rubber, coal, etc.

2-amino-4-chlorophenol. (*p*-chloro-*o*-aminophenol). $\text{C}_6\text{H}_3\text{OHNH}_2\text{Cl}$.

Properties: Light brown crystals. Mp 138C (decomposes).

Derivation: Reduction of *p*-chloro-*o*-nitrophenol.

Use: Intermediate.

2-amino-4-chlorotoluene. 5-chloro-2-methylaniline ($\text{NH}_2 = 1$); 4-chloro-*o*-toluidine ($\text{CH}_3 = 1$). $\text{C}_7\text{H}_7\text{ClNH}_2$.

Properties: Off-white solid or light brown oil that tends to darken on storage. Mp 20–22C.

Hazard: Toxic by ingestion and inhalation.

Use: Intermediate.

2-amino-5-chlorotoluene. $\text{C}_7\text{H}_7\text{ClNH}_2$.

Properties: Crystalline solid. Mp 26–27C. Sparingly soluble in water; soluble in dilute acids.

Use: Intermediate.

2-amino-6-chlorotoluene. 6-chloro-*o*-toluidine ($\text{CH}_3 = 1$); 3-chloro-2-methylaniline ($\text{NH}_2 = 1$). $\text{C}_7\text{H}_7\text{ClNH}_2$.

Properties: Liquid. Mp 0–2C.

Hazard: Toxic by ingestion or inhalation.

Use: Intermediate.

4-amino-2-chlorotoluene. 2-chloro-*p*-toluidine ($\text{CH}_3 = 1$); 3-chloro-4-methylaniline ($\text{NH}_2 = 1$). $\text{C}_7\text{H}_7\text{ClNH}_2$.

Properties: Liquid. Mp 21–24C.

Use: Intermediate.

4-amino-2-chlorotoluene-5-sulfonic acid.

(brilliant toning red amine; permanent red 2B amine). $\text{C}_7\text{H}_6\text{ClNH}_2\text{SO}_3\text{H}$.

Properties: White to buff powder. Essentially insoluble as free acid; soluble as sodium or ammonium salt.

Grade: 98.5% min purity.

Use: Intermediate for azo pigments.

5-amino-2-chlorotoluene-4-sulfonic acid.

(lake red carbon amine).

$\text{C}_7\text{H}_6\text{ClNH}_2\text{SO}_3\text{H}$.

Properties: White to pink powder. Essentially insoluble as free acid; soluble as sodium or ammonium salt.

Grade: 98.5% min purity.

Use: Intermediate for azo pigments.

***m*-amino-*p*-cresol methyl ether.** See 5-methyl-*o*-anisidine.

aminocyclohexane. See cyclohexylamine.

***l*-amino-dehydrogenase.** See amino oxidase.

3-amino-2,5-dichlorobenzoic acid. See amiben.

2-amino-4,6-dichlorophenol. See 2,4-dichloro-6-aminophenol.

***p*-aminodiethylaniline.** (*N,N*-diethyl-*p*-phenylenediamine; diethylaminoaniline).

$(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid. Bp 260–262C. Insoluble in water; soluble in alcohol and ether.

Derivation: Treatment of diethylaniline with nitrous acid and subsequent reduction.

Hazard: See aniline.

Use: Dye intermediate, source of diazonium compounds in diazo copying process.

***p*-aminodiethylaniline hydrochloride.**

$\text{C}_{10}\text{H}_{16}\text{N}_2\cdot\text{HCl}$.

Properties: Colorless needles. Soluble in water and alcohol; insoluble in ether.

Hazard: See aniline.

Use: Color photography.

2-amino-4,6-dihydroxypteridine. See xanthopterin.

***p*-aminodimethylaniline.** (dimethylaminoaniline; dimethyl-*p*-phenylenediamine).

$(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Colorless; asbestos-like needles; stable in air when pure. If impure, the crystals liquefy. Mp 41C, bp 257C. Soluble in water, alcohol, and benzene.

Derivation: By reduction of *p*-nitrosodimethylaniline with zinc dust and hydrochloric acid.

Method of purification: Recrystallization from mixture of benzene and ligroin.

Hazard: Toxic by ingestion or inhalation of vapor.

Use: Base for production of methylene blue, photo-developer, reagent for detection of hydrogen sulfide, reagent for cellulose, organic synthesis, reagent for certain bacteria.

3-amino-*n*-(2-(dimethylamino)ethyl)naphthalimide. See nafidimide.

aminodimethylbenzene. See xylydine.

2-amino-4,6-dimethylpyridine.

$(\text{CH}_3)_2\text{C}_5\text{H}_2\text{NNH}_2$.

Properties: Solid. Mp 65.2–68.5C, bp 235C. Water soluble.

Derivation: Prepared from 2-aminopyridine.

Use: Organic intermediate.

2-amino-4,6-dinitrophenol. See picramic acid.

***p*-aminodiphenyl.** (4-aminodiphenyl; *p*-xenyamine).

CAS: 92-67-1. $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless crystals. Mw 169.23, mp 53C, bp 302C.

Hazard: Toxic by ingestion, inhalation, skin absorption. TLV: confirmed human carcinogen.

Use: Organic research.

***p*-aminodiphenylamine.** (*N*-phenyl-*p*-phenylenediamine). $\text{NH}_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Purple powder. Mp 75C. Insoluble in water; soluble in alcohol and acetone.

Derivation: Reduction of the coupling product of diazotized sulfanilic acid and diphenylamine.

Use: Dye intermediate, pharmaceuticals, photographic chemicals.

4-aminodiphenylamine-2-sulfonic acid.

(5-amino-2-anilinobenzenesulfonic acid).

$\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{NH}_2\text{SO}_3\text{H}$.

Properties: Needle like crystals. Barely soluble in water.

Derivation: From *p*-nitrodiphenylamine-*o*-sulfonic acid by reduction with iron and hydrochloric acid.

Use: Synthesis of dyestuffs.

aminodithioformic acid. See dithiocarbamic acid.

aminoethane. See ethylamine.

2-aminoethanesulfonic acid. See taurine.

2-aminoethanethiol. (cysteamine; mercaptamine; thioethanolamine).

CAS: 60-23-1. $\text{HSCH}_2\text{CH}_2\text{NH}_2$.

Properties: Crystals with unpleasant odor. Oxidizes on contact with air. Mp 97C. Soluble in water. Combustible.

Use: Medicine (believed to offer protection against radiation).

1-aminoethanol. See aldehyde ammonia.

2-aminoethanol. See ethanolamine.

2-(2-aminoethoxy)ethanol. ("Diglycolamine"; DGA). $\text{NH}_2\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless, slightly viscous liquid; mild amine odor. Bp 221C, d 1.0572 (20/20C), flash p 260F (126.6C), fp -12.5C. Miscible with water and alcohols. Combustible.

Hazard: Strong irritant to tissue.

Use: Removal of acid components from gases, especially carbon dioxide and hydrogen sulfide from natural gas; intermediate.

4-amino-*n*-(6-ethoxy-3-pyridazinyl)benzenesulfonamide. See sulfaethoxy pyridazine.

aminoethoxyvinylglycine.

Use: Inhibitor of ethylene biosynthesis in plants.

1-[(aminoethyl)amino]-2-propanol.

$\text{C}_3\text{H}_9\text{N}_2\text{O}$.

Properties: Thick, colorless liquid. Bp 112C (11 mm Hg), d 0.984, refr index 1.743. Slight odor of ammonia.

Use: Curing epoxy resins.

4-(2-aminoethyl)diethylenetriamine. See 2,2',2''-nitrotris(ethylamine).

aminoethylethanolamine. See hydroxyethylethylenediamine.

4-aminoethylglyoxaline. See histamine.

4-(2-aminoethyl)imidazole. See histamine.

2-aminoethylisothiuronium diacetate.

CAS: 63680-10-4. mf: $\text{C}_3\text{H}_9\text{N}_3\text{S}\cdot 2\text{C}_2\text{H}_4\text{O}_2$.

Hazard: Moderately toxic.

β -aminoethylisothiourea dihydrobromide.

(2-(2-aminoethyl)-2-thiopseudourea dihydrobromide; AET). $\text{C}_3\text{H}_9\text{N}_3\text{S}\cdot 2\text{HBr}$.

Properties: Crystals, hygroscopic. Mp 194-195C.

Derivation: Thiourea is refluxed with 2-bromoethylamine hydrobromide in isopropanol.

Use: Enzyme activator, free radical detoxifier (believed to offer protection against radiation).

4-(1-aminoethyl)phenol.

CAS: 134855-87-1. mf: $\text{C}_8\text{H}_{11}\text{NO}$.

Hazard: A severe eye irritant.

***N*-aminoethylpiperazine.**

CAS: 140-31-8.

$\text{H}_2\text{NC}_2\text{H}_4\text{NCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$. An amine combining a primary, secondary, and tertiary amine in one molecule.

Properties: Liquid. D 0.9837, bp 222.0C, flash p 200F (93.3C), fp 17.6C. Soluble in water. Combustible.

Hazard: Strong irritant to tissue.

Use: Epoxy curing agent, intermediate for pharmaceuticals, anthelmintics, surface-active agents, synthetic fibers.

2-amino-2-ethyl-1,3-propanediol. (AEPD; aminoamyleneglycol).

$\text{CH}_2\text{OHC}(\text{C}_2\text{H}_5)\text{NH}_2\text{CH}_2\text{OH}$.

Properties: Solid or viscous liquid. Mp 38C. Soluble in water and alcohol.

Use: Emulsifying agent (in soap form) for oils, fats, and waxes, absorbent for acidic gases CO_2 and H_2S , organic synthesis.

s-(2-aminoethyl) phosphorothioate.

CAS: 5746-40-7. mf: $\text{C}_2\text{H}_8\text{NO}_3\text{PS}$.

Hazard: A reproductive hazard.

2-aminoethylsulfuric acid.

$\text{NH}_2\text{CH}_2\text{CH}_2\text{OSO}_3\text{H}$.

Properties: White, crystalline powder; noncorrosive. Mp 274-280C; sinters at 274C and darkens without complete melting at 280C; d 1.782; bulk d 1.007. Soluble in water; insoluble in most organic

solvents; pH (1% aqueous solution) 4.0 (20C), (5% aqueous solution) 3.3 (39C).

Use: Organic synthesis of ethyleneimine and various other compounds, amination of cotton.

3-amino- α -ethyl-2,4,6-triiodohydrocinnamic acid. See iopanoic acid.

4-aminofolic acid. See aminopterin.

aminoform. See hexamethylenetetramine.

amino-G acid. (2-naphthylamine-6,8-disulfonic acid; 7-amino-1,3-naphthalene-disulfonic acid). $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: White, crystalline solid. Soluble in water.

Derivation: (1) Form G acid by heating sodium salt with ammonia and sodium bisulfite solution in an autoclave under pressure. (2) Sulfonation by β -naphthylamine.

Use: Azo dye intermediate.

α -aminoglutaric acid. See glutamic acid.

amino-4-guanidovaleric acid. See arginine.

7-aminoheptanenitrile.

CAS: 23181-80-8. mf: $C_7H_{14}N_2$.

Hazard: Moderately toxic by ingestion.

aminohexamethyleneimine.

$NH_2NCH_2CH_2CH_2CH_2CH_2CH_2$.

Properties: Liquid. Bp 170C. Soluble in water and most organic solvents. Combustible.

Use: Intermediate for dyes, pharmaceuticals, and photographic chemicals.

2-aminohexanoic acid. See norleucine.

6-aminohexanoic acid. See norleucine.

***p*-aminohippuric acid.** [*N*-(*p*-aminobenzoyl)glycine; PAHA].

$NH_2C_6H_4CONHCH_2COOH$.

Properties: White, crystalline powder. Discolors on exposure to light. Soluble in alcohol and most organic solvents. Very soluble in dilute hydrochloric acid and alkalis. Forms a water-soluble sodium salt. Mp 197-199C.

Grade: USP.

Use: Medicine (diagnostic agent), intermediate.

aminohydroxybenzoic acids. See aminosalicylic acids.

4-amino-1-hydroxybutane-1,1-diylidiphosphonic acid.

CAS: 66376-36-1. mf: $C_4H_{13}NO_7P_2$.

Hazard: A reproductive hazard.

α -amino- β -hydroxybutyric acid. See threonine.

2-amino-2-hydroxymethyl-1,3-propanediol.

See tris(hydroxymethyl)aminomethane.

α -amino- β -hydroxypropionic acid. See serine.

6-amino-*n*-hydroxy-3-pyridinecarboxamide.

See 6-aminonicotinohydroxamic acid.

α -amino- β -imidazolepropionic acid. See histidine.

α -aminoisocaproic acid. See leucine.

α -aminoisovaleric acid. See valine.

amino-J acid. (2-naphthylamine-5,7-disulfonic acid; 6-amino-1,3-naphthalene-disulfonic acid).

$C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: Crystallizes in white lustrous leaflets from water and in long needles from hydrochloric acid solution.

Derivation: By sulfonation of either 2-naphthylamine-5-sulfonic acid or 2-naphthylamine-7-sulfonic acid.

Use: Azo dye intermediate.

2-amino-6-mercaptapurine.

Use: Pharmaceutical end product for treatment of leukemia.

aminomercuric chloride. See mercury, ammoniated.

aminomethane. See methylamine.

3-amino-4-methoxybenzanilide.

$CH_3OC_6H_3(NH_2)CONHC_6H_5$.

Properties: Gray powder.

Use: Dyes, pharmaceuticals, and other organic chemicals.

1-amino-2-methoxy-5-methylbenzene. See 5-methyl-*o*-anisidine.

***m*-(4-amino-3-methoxyphenylazo) benzenesulfonic acid.**

$H_2NC_6H_3(OCH_3)NNC_6H_4SO_3H$.

Properties: Maroon paste containing approximately 38% solids.

Use: Intermediate.

4-aminomethyl-1-benzylpyrrolidin-2-one fumarate (2:1).

CAS: 97205-35-1. mf: $C_{24}H_{32}N_4O_8 \cdot C_4H_4O_4$.

Hazard: Moderately toxic by ingestion.

3-amino-3-methyl-1-butyne. See 2-methyl-3-butyne-2-amine.

4-amino-4'-methyl-diphenylamine-2-sulfonic acid. (aminotoluidinobenzenesulfonic acid). $\text{CH}_3\text{C}_6\text{H}_4\text{NHC}_6\text{H}_3\text{NH}_2\text{SO}_3\text{H}$.**Properties:** Light to dark gray paste with characteristic odor.**Use:** Intermediate.**4-amino-10-methylfolic acid.** See methotrexate.**3-amino-5-methylisoxazole.****Use:** Analog of the nucleic acid constituent guanine.**2-amino-1-methyl-2-oxoethyl-*n*-(((methylamino)carbonyloxy)ethanimidothioate.**CAS: 92065-77-5. mf: $\text{C}_7\text{H}_{13}\text{N}_3\text{O}_3\text{S}$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2-amino-3-methylpentanoic acid.** See isoleucine.**2-amino-4-methyl-5-phosphono-3-pentenoic acid.**CAS: 137424-81-8. mf: $\text{C}_6\text{H}_{12}\text{NO}_5\text{P}$.**Hazard:** A poison.**2-amino-2-methyl-1,3-propanediol.**(AMPD; aminobutylene glycol; butanediolamine). $\text{CH}_2\text{OCH}(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$.**Properties:** Colorless crystals. Mp 110C. Soluble in water and alcohol. Corrosive to copper, brass, and aluminum.**Use:** Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; organic synthesis; cosmetics.**2-amino-2-methyl-1-propanol.** (isobutanolamine; AMP). $\text{CH}_3(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$.**Properties:** Solid or viscous liquid. Mp 30C, bp 165C, d 0.93, refr index 1.45.**Hazard:** Toxic by ingestion.**Use:** Emulsifying agent (in soap form) for oils, fats, and waxes, absorbent for acidic gases, organic synthesis, cosmetics.**2-amino-3-methylpyridine.** (2-amino-3-picoline). $\text{N}:\text{C}(\text{NH}_2)\text{C}(\text{CH}_3):\text{CHCH}:\text{CH}$.**Properties:** Liquid. Bp 221C, mp 29.5–33.3C. Soluble in water.**Derivation:** From 2-aminopyridine.**Hazard:** Toxic by ingestion.**Use:** Intermediate.**2-amino-4-methylpyridine.** (2-amino-4-picoline). $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{C}(\text{CH}_3)\text{CH}:\text{CH}$.**Properties:** Crystals. Bp 230.9C (115–117C at 11 mm), mp 96–99.0C. Sublimes on slow heating. Soluble in water and lower alcohols.**Derivation:** Prepared from 2-aminopyridine.**Use:** Intermediate, medicine.**2-amino-5-methylpyridine.** (2-amino-5-picoline). $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{CHC}(\text{CH}_3):\text{CH}$.**Properties:** Crystals. Bp 227.1C, mp 76.6C. Soluble in water.**Derivation:** Prepared from 2-aminopyridine.**Use:** Intermediate.**2-amino-6-methylpyridine.** (2-amino-6-picoline). $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{CHCH}:\text{C}(\text{CH}_3)$.**Properties:** Crystals. Bp 214.4C, mp 43.7C. Soluble in water.**Derivation:** Prepared from 2-aminopyridine.**Use:** Intermediate.**2-amino-4-(methylthio)butyric acid.** See methionine. **α -amino- β -methylvaleric acid.** See isoleucine. **α -amino- γ -methylvaleric acid.** See leucine.***dl*-2-amino-3-methylvaleric acid.** See *dl*-isoleucine.**aminonaphthalenesulfonic acid.** See naphthylaminesulfonic acid.**4-amino-1-naphthol.** (4-hydroxy- α -naphthylamine). $\text{C}_{10}\text{H}_9\text{NO}$.**Properties:** Acicular crystals. Soluble in water.**Derivation:** Rearrangement of α -naphthylhydroxylamine in acetone.**Use:** Inhibitor of polymerization, chemical intermediate. Must be kept dry during storage to avoid oxidation and discoloration.**aminonaphtholsulfonic acid.** Any of several sulfonated aromatic acids derived from naphthol or naphthylamine and used as azo dye intermediates.**6-aminonicotinic acid.** (6-aminopyridine-3-carboxylic acid). $\text{C}_6\text{H}_6\text{N}_2\text{O}_2$.**Properties:** Crystals. Mp decomposes above 300C.**6-aminonicotinohydroxamic acid.**CAS: 76706-59-7. mf: $\text{C}_6\text{H}_6\text{N}_3\text{O}_2$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.

amino oxidase. (L-amino acid oxidase; D-amino acid oxidase; L-amino dehydrogenase). An enzyme that catalyzes the deamination of α -amino acids by dehydrogenation to keto acids and ammonia. Two types are recognized, acting on the D- and L-amino acids. Recent emphasis has been on characterization of the D-amino oxidase, which is known to contain the flavin isoalloxazine as coenzyme. Both types are found in animal tissue, especially in liver and kidney, as well as in snake venom and certain bacteria.

2-amino-2-oxoethyl-2,2-dimethyl-*n*-(((methylamino)carbonyl)oxy)propanimidothioate.

CAS: 92065-91-3. mf: $C_9H_{17}N_3O_3S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-amino-2-oxoethyl *n*-(((methylamino)carbonyl)oxy)ethanimidothioate.

CAS: 92065-82-2. mf: $C_8H_{11}N_3O_3S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-amino-6-oxypurine. See guanine.

1-aminopentane. See *n*-amylamine.

2-aminophenetole. See *o*-phenetidine.

4-aminophenetole. See *p*-phenetidine.

***m*-aminophenol** (*m*-hydroxyaniline).

CAS: 591-27-5. $C_6H_4NH_2OH$.

Properties: White crystals. Mp 122C. Soluble in water, alcohol, and ether.

Derivation: Fusion of *m*-sulfanilic acid with caustic soda and subsequent extraction of the melt with ether.

Hazard: Toxic by ingestion.

Use: Dye intermediate, intermediate for *p*-aminosalicylic acid.

***o*-aminophenol.** (*o*-hydroxyaniline).

CAS: 95-55-6. $C_6H_4NH_2OH$.

Properties: White crystals; turn brown with age. Mp 172–173C, sublimes on further heating. Soluble in cold water, alcohol, benzene; freely soluble in ether.

Derivation: By reduction of *o*-nitrophenol mixed with aqueous ammonia by means of a stream of hydrogen sulfide. Also available as the hydrochloride.

Grade: Technical, 99% min.

Use: Dyeing furs and hair; dye intermediate for azo and sulfur dyes; pharmaceuticals.

***p*-aminophenol.** (*p*-hydroxyaniline).

CAS: 123-30-8. $C_6H_4NH_2OH$.

Properties: White or reddish yellow crystals turn violet on exposure to light. Mp 184C (decomposes). Soluble in water and alcohol.

Derivation: (1) By reduction of *p*-nitrophenol with iron filings and hydrochloric acid; (2) by electrolytic reduction of nitrobenzene in concentrated sulfuric acid and treatment with an alkali to free the base. Also available as the hydrochloride.

Grade: Technical, photographic.

Use: Dyeing textiles, hair, furs, feathers, photographic developer, pharmaceuticals, antioxidants, oil additives.

4-amino-1-phenol-2,6-disulfonic acid.

$C_6H_4OHNH_2(SO_3H)_2$.

Properties: Fine needles. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: Action of sulfur dioxide on *p*-nitrophenol.

Use: Dyes.

2-amino-1-phenol-4-sulfonic acid. (*o*-amino-phenol-*p*-sulfonic acid). $C_6H_4OHNH_2SO_3H$.

Properties: Brown crystals, No mp. Decomposes on heating. Fairly soluble in hot water, very soluble in alkaline solution.

Derivation: (1) Sulfonation and nitration of chlorobenzene followed by hydrolysis to phenol with caustic soda with subsequent reduction by sodium sulfide. (2) Sulfonation of *o*-aminophenol. (3) Sulfonation of phenol followed by nitration and reduction.

Use: Intermediate for dyes.

***p*-aminophenylarsonic acid.** See arsanilic acid.

***m*-aminophenylboronic acid hemisulfate.**

(3-aminobenzeneboronic acid).

$H_2NC_6H_4B(OH)_2 \cdot 1/2H_2SO_4$.

Properties: Mw 186, mp above 300C.

Use: Adsorbant additive for the chromatographic separation of 3'-terminal polynucleotides from RNA.

1-amino-2-phenylethane. See 2-phenylethylamine.

***o*-aminophenylglyoxalic lactim.** See isatin.

***p*-aminophenylmercaptoacetic acid.**

$NH_2C_6H_4SCH_2CO_2H$.

Properties: Mp 186–187C. Insoluble in water, alcohol, benzene, chloroform; soluble in aqueous acid or alkali solutions.

Use: Synthetic intermediate for dyes and pharmaceuticals.

2-(*p*-aminophenyl)-6-methylbenzothiazole.See dehydrothio-*p*-toluidine.***m*-aminophenyl methyl carbinol.** $\text{NH}_2\text{C}_6\text{H}_4\text{CH}(\text{OH})\text{CH}_3$.**Properties:** Solid. D 1.12, bp 217.3C (100 min), mp 66.4C, flash p 315F (157C). Soluble in water. Combustible.**Use:** Carrier for dyeing synthetic fibers; intermediate for perfume, chemicals, and pharmaceuticals.**1-(*m*-aminophenyl)-3-methyl-5-pyrazolone.** $\text{NH}_2\text{C}_6\text{H}_4\text{NNC}(\text{CH}_3)\text{CH}_2\text{CO}$.**Properties:** Light tan paste containing approximately 45% solids.**Use:** Intermediate.**aminophenylnorharman.**CAS: 219959-86-1. mf: $\text{C}_{17}\text{H}_{13}\text{N}_3$.**Hazard:** A poison by ingestion.**1-amino-2-phenylpropane.** See 2-phenylpropylamine. **α -amino- β -phenylpropionic acid.** See phenylalanine.**aminopherase.** See transaminase.**aminophylline.** (3,7-dihydro-1,3-dimethyl-1H-purine-2,6-dione compounded with 1,2-ethanediamine (2:1)). $\text{C}_{16}\text{H}_{24}\text{N}_{10}\text{O}_4$.**Properties:** White or slightly yellowish granular powder; slight ammonia odor; bitter taste. Mw 420.44.**Derivation:** Prepared from theophylline and aqueous ethylenediamine.**Hazard:** Cardiovascular and respiratory collapse.**Use:** Small animal muscle relaxant for heaves in horses, and diuretic in dogs with congestive heart failure.**aminopicoline.** See aminomethylpyridine.**aminoplast resin.** (amino resin). A class of thermosetting resins made by the reaction of an amine with an aldehyde. The only such aldehyde in commercial use is formaldehyde, and the most important amines are urea and melamine.**Use:** Molding, adhesives, laminating, textile finishes, permanent-press fabrics, wash-and-wear apparel fabrics, protective coatings, paper manufacture, leather treatment, binders for fabrics, foundry sands, graphite resistors, plaster-of-paris fortification, foam structures, and ion-exchange resins.

See dimethylol urea; methylol urea; melamine resin; urea-formaldehyde resin.

2-aminopropane. See isopropylamine.**2-aminopropanoic acid.** See alanine.**3-aminopropanoic acid.** See β -alanine.**1-amino-2-propanol.** See isopropanolamine.**2-amino-1-propanol.** (2-aminopropyl alcohol; β -propanolamine). $\text{CH}_3\text{CH}(\text{NH}_2)\text{CH}_2\text{OH}$.**Properties:** Colorless to pale yellow liquid. Both *l* and *dl* forms are available. *dl*-Form: fish odor. Bp 173–176C. Freely soluble in water, alcohol, ether. *l*-Form: refr index 1.4480–1.4495 (26C), distillation range approximately 114C at 100 mm Hg. Combustible.**Use:** Organic synthesis and chemical intermediate.**3-amino-1-propanol.** (propanolamine). $\text{H}_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{OH}$.**Properties:** Colorless liquid. Mp 12.4C, bp 184–186C (168C), flash p 175F (79.4C), d 0.9786 (30C). Miscible with alcohol, water, acetone, and chloroform. Combustible.**Grade:** 99% pure.**Hazard:** Irritant to tissue.**Use:** Organic intermediate.**3-aminopropionitrile.** $\text{H}_2\text{NCH}_2\text{CH}_2\text{CN}$.**Properties:** Colorless liquid. Bp 185C, refr index 1.44. May polymerize if stored in presence of air.**Derivation:** Reaction of acrylonitrile with ammonia.**Use:** Production of β -alanine and pantothenic acid.**2-aminopropyl alcohol.** See 2-amino-1-propanol.***N*-aminopropylmorpholine.** (4-(3-aminopropyl)morpholine). $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{NC}_3\text{H}_6\text{NH}_2$.**Properties:** Colorless liquid. D 0.9872 (20/20C), bp 224.5C, flash p 220F (104.4C) (OC), fp –15C. Soluble in water and alcohol. Combustible.**Hazard:** Strongly irritant to tissue.**Use:** Fiber synthesis; chemical intermediate.***n*-(3-aminopropyl)-1,3-propanediamine polymer with (chloromethyl)oxirane.**CAS: 51961-45-6. mf: $(\text{C}_6\text{H}_{17}\text{N}_3 \bullet \text{C}_3\text{H}_5\text{ClO})_x$ **Hazard:** A severe eye irritant.**(3-aminopropyl)triethylsilane.**CAS: 17887-09-1. mf: $\text{C}_9\text{H}_{23}\text{NSi}$.**Hazard:** A poison. **γ -aminopropyltrimethoxysilane.** $\text{NH}_2(\text{CH}_2)_3\text{Si}(\text{OCH}_3)_3$.**Properties:** 100% active, water-white liquid. D 1.01; refr index 1.42.**Use:** Glass fabric sizing, binder, adhesion promoter.

aminopterin. (4-aminofolic acid; aminopteroylglutamic acid). $C_{19}H_{20}N_8O_5 \cdot 2H_2O$. Differs slightly in structure from folic acid and antagonizes the utilization of folic acid by the body, an antimetabolite.

Properties: Occurs as clusters of yellow needles that are soluble in aqueous sodium hydroxide solutions.

Use: Medicine, rodenticide.

aminopteroylglutamic acid. See aminopterin.

6-aminopurine. See adenine.

2-aminopyridine. (α -pyridylamine).

CAS: 504-29-0. $C_5H_4NNH_2$.

Properties: White leaflets or large colorless crystals. Fp 58.1C; bp 210.6C. Soluble in water, alcohol, benzene, ether.

Hazard: Toxic. TLV: 0.5 ppm.

Use: Intermediate for antihistamines and other pharmaceuticals.

3-aminopyridine. (β -pyridylamine).

$C_5H_4NNH_2$.

Properties: White crystals. Mp 64C; bp 250–252C. Soluble in water, alcohol, benzene, ether.

Use: Intermediate in preparation of drugs and dye-stuffs.

4-aminopyridine.

CAS: 504-24-5. $C_5H_4NNH_2$.

Properties: Crystals. Mp 158.9C, bp 273.5C. Soluble in water.

Derivation: From 2-aminopyridine.

Grade: 95% (minimum).

Use: Intermediate.

3-amino-pyridine-2-carboxaldehyde.

CAS: 143621-35-6. mf: $C_7H_6N_2S$.

Hazard: A poison.

3-aminopyridine-2-carboxaldehyde thiosemicarbazone. See 3-amino-pyridine-2-carboxaldehyde.

4-aminosalicylic acid. (PASA; PAS; *p*-amino-salicylic acid; 4-amino-2-hydroxybenzoic acid).

CAS: 65-49-6. $NH_2C_6H_3(OH)COOH$.

Properties: White or nearly white bulky powder. Odorless or has slight acetous odor. Mp 150–151C (decomposes). Affected by light and air. Darkened solutions should not be used. Soluble in dilute sodium hydroxide and dilute nitric acid, slightly soluble in ether; practically insoluble in benzene. Water solutions decompose with evolution of carbon dioxide.

Derivation: From *m*-aminophenol and potassium bicarbonate, soluble under pressure.

Grade: USP.

Use: Medicine, industrial preservative.

5-aminosalicylic acid. (*m*-aminosalicylic acid; 5-amino-2-hydroxybenzoic acid).

CAS: 89-57-6. $NH_2C_6H_3(OH)COOH$.

Properties: White crystals, sometimes pinkish. Mp 260–280C (decomposes). Soluble in hot water or alcohol.

Derivation: From the corresponding nitrosalicylic acid by reduction.

Use: Dyes, intermediate.

α -aminosuccinamic acid. See asparagine.

***l*- α -aminosuccinamic acid.** See *l*-asparagine.

aminosuccinic acid. See aspartic acid.

***dl*-aminosuccinic acid.** See *dl*-aspartic acid.

aminotetrazole. (5-aminotetrazole; 5-amino-1h-tetrazole; 1h-tetrazol-5-amine).

CAS: 4418-61-5. CH_3N_5 .

Properties: Crystals. Mp: 206C (decomp), mw: 85.09.

Hazard: Moderately toxic. An unstable material; explodes with KOH.

5-aminotetrazole. See aminotetrazole.

amino-terminal residue. The amino acid residue in a polypeptide chain which has a free α -amino group.

5-amino-1h-tetrazole. See aminotetrazole.

2-aminothiazole. (2-thiazylamine).

$SCHCHNCNH_2$.

Properties: Light yellow crystals. Mp 90C, distills at 3 mm without decomposition. Slightly soluble in cold water, alcohol, and ether; soluble in hot water and dilute mineral acids.

Derivation: Chlorination of vinyl acetate and condensation with thiourea.

Use: Intermediate in synthesis of sulfathiazole, medicine (thyroid inhibitor).

α -amino- β -thiolpropionic acid. See cysteine.

aminothiourea. See thiosemicarbazide.

aminotoluene. See *o*-toluidine; *m*-toluidine; *p*-toluidine; benzylamine.

aminotransferases. Enzymes that catalyze the transfer of amino groups from α -amino to α -keto acids; commonly called transaminases.

6-amino-*s*-triazine-2,4-diol. See ammelide.

3-amino-1,2,4-triazole. (amitrole).

CAS: 61-82-5.

Properties: White, crystalline solid. Mp 156–159C. Soluble in water and alcohol.
Hazard: Use on food crops not permitted. TLV: 0.2 mg/m³; suspected human carcinogen.
Use: Herbicide, defoliant.

4-amino-3,5,6-trichloropicolinic acid. See picloram.

3-(3-amino-2,4,6-triiodophenyl)-2-ethylpropanoic acid. See iopanoic acid.

aminourea hydrochloride. See semicarbazide hydrochloride.

“Amino Vital Fast Charge” [Ajinomot].
 TM for pharmaceutical grade amino acids drink powders.

“Amino Vital Mix and Shake” [Ajinomot].
 TM for pharmaceutical grade amino acids drink powders.

“Amino Vital RTD Drink” [Ajinomot].
 TM for pharmaceutical grade amino acids drink powders.

“Aminox” [Uniroyal]. TM for a low-temperature reaction product of diphenylamine and acetone.
Properties: Light-tan powder. D 1.13, mp 85–95C. Soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.
Use: Antioxidant for nylon and light-colored rubber products.

aminoxylene. See xylydine.

amitrole. Generic name for 3-amino-1,2,4-triazole.

amlodipine.
 CAS: 88150-42-9. mf: C₂₀H₂₅ClN₂O₃.
Hazard: Human systemic effects.

amlure. See propyl 1,4-benzodioxan-2-carboxylate.

“Ammate” [Du Pont]. TM for ammonium sulfamate in various grades.
Hazard: See ammonium sulfamate.
Use: Nonselective herbicide.

ammeline. (6-amino-*s*-triazine-2,4-diol; cyanuramide).

Properties: Crystalline solid. Mp (decomposes). Insoluble in alcohol; slightly soluble in hot water. Similar to melamine and suggested for melamine-type (amino) resins.

ammeline. (4,6-diamino-*s*-triazine-2-ol; cyanurdiamide).

$\overline{\text{NC}(\text{OH})\text{NC}(\text{NH}_2)\text{NC}(\text{NH}_2)}$
Properties: Crystalline solid. Mp decomposes. Insoluble in water and alcohol. A compound similar to melamine.
Use: In melamine-type resins and in special high-temperature lubricants.

ammine. A coordination compound formed by the union of ammonia with a metallic substance in such a way that the nitrogen atoms are linked directly to the metal. Note the distinction from amines in which the nitrogen is attached directly to the carbon atom.
 See cobaltamine; coordination compound.

ammonia, anhydrous.

CAS: 7664-41-7. NH₃.

Properties: Colorless gas (or liquid); sharp, intensely irritating odor; lighter than air; easily liquefied by pressure. Bp –33.5C, fp –77C, vap press of liquid 8.5 atm (20C), sp vol 22.7 cu ft/lb (70C), d (liquid) 0.77 at 0C and 0.6819 at bp. Very soluble in water, alcohol, and ether. Autoign temp 1204F (650C). Combustible. *Note:* Ammonia is the first complex molecule to be identified in interstellar space. It has been observed in galactic dust clouds in the Milky Way and is believed to constitute the rings of the planet Saturn.

Derivation: From synthesis gas, a mixture of carbon monoxide, hydrogen, carbon dioxide, and nitrogen (from air) obtained by steam reforming or by partial combustion of natural gas (U.S.), or from the action of steam on hot coke (Haber-Bosch process). The latter method is used in South Africa. After removal of the carbon oxides, the gas composition is adjusted to a ratio of 3 parts H₂ to 1 part N₂ and passed to the synthesis unit over a catalyst at pressures of about 300 atm and temperature of approximately 500C. The catalyst most widely used is produced by fusion of iron oxide (Fe₃O₄) containing aluminum oxide and potassium oxide as promoters, followed by reduction of the oxide. Chemisorption of the nitrogen on the catalyst surface is the rate-controlling step. Other methods include use of refinery off-gases, coke-oven gas, electrolytic hydrogen, and calcium cyanamide. Ammonia has been made experimentally using solar energy to activate the reaction

Ammonia is formed as an end product of animal metabolism by decomposition of uric acid.

Grade: Commercial 99.5%, refrigerant 99.97%.

Hazard: Inhalation of concentrated fumes may be fatal. TLV: 25 ppm. Moderate fire risk, explosive limits in air 16 to 25%. Forms explosive compounds in contact with silver or mercury.

Use: Fertilizers, either as such or in the form of compounds, e.g., ammonium nitrate; manufacture of nitric acid, hydrazine hydrate, hydrogen cyanide, urethane, acrylonitrile, and sodium carbonate (by Solvay process); refrigerant; nitriding of steel; condensation catalyst; synthetic fibers; dyeing; neutralizing agent in petroleum industry; latex preservative; explosives; nitrocellulose; ureaformaldehyde; nitroparaffins; melamine; ethylenediamine; sulfite cooking liquors; fuel cells; rocket fuel; yeast nutrient; developing diazo films.

See ammonium hydroxide; Haber, Fritz; synthesis gas.

ammonia, aromatic spirits. A mixture of 10% of ammonia in alcohol. Strong, suffocating odor.

Hazard: Irritant to mucous membranes. Flammable, keep tightly sealed.

Use: Medicine (respiratory stimulant).

ammonia-soda process. See Solvay process.

ammoniated glycyrrhizin.

CAS: 1407-03-0.

Properties: From roots of *Glycyrrhiza glabra*.

Use: Food additive.

ammoniated mercury chloride. See mercury, ammoniated.

ammoniated ruthenium oxychloride. See ruthenium red.

ammoniated superphosphate. Fertilizer produced by mixing ammonia with superphosphate in the ratio of 5 parts to 100.

ammonio-cupric sulfate. See copper sulfate, ammoniated.

ammonio-ferric oxalate. See ferric ammonium oxalate.

ammonio-ferric sulfate. See ferric ammonium sulfate.

ammonium acetate.

CAS: 631-61-8. $\text{NH}_4(\text{C}_2\text{H}_3\text{O}_2)$.

Properties: White, deliquescent, crystalline mass. Mp 114C, d 1.073. Soluble in water and alcohol. Mp 114C, d 1.073. Combustible.

Derivation: By the interaction of glacial acetic acid and ammonia.

Use: Reagent in analytical chemistry, drugs, textile dyeing, preserving meats, foam rubbers, vinyl plastics, explosives.

ammonium acid carbonate. See ammonium bicarbonate.

ammonium acid fluoride. See ammonium bifluoride.

ammonium acid methanearsonate.

$\text{CH}_3\text{AsO}(\text{OH})\text{ONH}_4$. A postemergent herbicide, available as "Ansar" 157, a clear solution containing 9.54% As.

ammonium acid phosphate. See ammonium phosphate, monobasic.

ammonium alginate. (ammonium polymannuronate). $\text{C}_6\text{H}_7\text{O}_6 \bullet \text{NH}_4$. A hydrophilic, colloid.

Properties: Filamentous, grainy, granular or powder, colorless or slightly yellow, may have a slight characteristic smell and taste. Slowly soluble in water forming a viscous solution. Insoluble in alcohol.

Grade: Technical, FCC.

Use: Thickening agent and stabilizer in food products.

See algin.

ammonium alum. See aluminum ammonium sulfate.

ammonium aluminum chloride. See aluminum ammonium chloride.

ammonium arsenate.

CAS: 7784-44-3. $(\text{NH}_4)_2\text{HAsO}_4$.

Properties: White crystals or powder efflorescing in air with loss of ammonia. D 1.99. Soluble in water; decomposes in hot water.

ammonium aurin tricarboxylate.

$\text{C}(\text{C}_6\text{H}_4\text{OHCOONH}_4)_3(\text{C}_6\text{H}_3(\text{O})\text{COONH}_4)$.

Forms colored lakes with aluminum, chromium, iron, and beryllium.

ammonium benzenesulfonate. (ammonium sulfonate). $\text{C}_6\text{H}_5\text{SO}_3\text{NH}_4$.

Properties: Mp 271C (decomposes), d 1.34.

Grade: 35% solution in kerosene.

Hazard: Flammable.

ammonium benzoate. $\text{C}_6\text{H}_5\text{COONH}_4$.

Properties: White crystals or powder. Soluble in water, alcohol, and glycerol. Decomposes at 198C, d 1.260, sublimes at 160C.

Use: Medicine, latex preservative.

ammonium baborate. See ammonium borate.

ammonium bicarbonate. (ammonium acid carbonate; ammonium hydrogen carbonate).

CAS: 1066-33-7. NH_4HCO_3 .

Properties: White crystals. D 1.586, mp (decomposes at 36–60C). Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: By heating ammonium hydroxide with an excess of carbon dioxide and evaporation.

Impurities: Ammonium carbonate.

Grade: Technical, CP, FCC.

Hazard: Evolves irritating fumes on heating to 35C.
Use: Production of ammonium salts, dyes; leavening agent for cookies, crackers, cream-puff doughs; fire-extinguishing compounds; pharmaceuticals; degreasing textiles; blowing agent for foam rubber; boiler scale removal; compost treatment.

ammonium bichromate. See ammonium dichromate.

ammonium bifluoride. (ammonium acid fluoride; ammonium hydrogen fluoride).

CAS: 1341-49-7. NH_4HF_2 .

Properties: White crystals. Deliquescent, d 1.211. Soluble in water and alcohol.

Derivation: Action of ammonium hydroxide on hydrofluoric acid with subsequent crystallization.

Hazard: Corrosive to skin. TLV: 2.5 mg(F)/m³.

Use: Ceramics, chemical reagent, etching glass (white acid), sterilizer for brewery, dairy, and other equipment; electroplating processing beryllium, laundry sour.

ammonium binoxalate. $(\text{NH}_4)\text{HC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals. D 1.556, decomposes on heating. Soluble in water.

Derivation: Action of ammonium hydroxide on oxalic acid with subsequent crystallization.

Use: Analytical reagent, ink removal from fabrics.

ammonium biphosphate. See ammonium phosphate, monobasic.

ammonium bisulfate. (acid ammonium sulfate; ammonium hydrogen sulfate). NH_4HSO_4 .

Properties: Colorless, deliquescent powder. Mp 145C; d 1.79. Soluble in water; insoluble in acetone and alcohol.

Use: Catalyst in organic synthesis, hair wave formulation.

ammonium bisulfide. See ammonium sulfide.

ammonium bitartrate. (acid ammonium tartrate). $(\text{NH}_4)\text{HC}_4\text{H}_4\text{O}_6$.

Properties: White crystals. D 1.636. Soluble in water, acids, and alkalis; insoluble in alcohol.

Derivation: By the action of ammonium hydroxide on tartaric acid.

Use: Baking powder.

ammonium boranecarboxylate.

CAS: 74861-59-9. mf: $\text{CH}_2\text{BO}_2 \cdot \text{H}_4\text{N}$.

Hazard: Moderately toxic.

ammonium borate. (ammonium baborate).

$\text{NH}_4\text{HB}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals, efflorescent with loss

of ammonia. Soluble in water. D 2.38–2.95. Non-combustible.

Derivation: Action of ammonium hydroxide on boric acid with subsequent crystallization.

Hazard: Evolves irritating fumes, especially when heated.

Use: Fireproofing compounds, electrical condensers, herbicide.

ammonium bromide. NH_4Br .

Properties: Colorless crystals or yellowish white powder, soluble in water and alcohol, somewhat hygroscopic. D 2.43, mp sublimes. Noncombustible.

Derivation: Action of hydrobromic acid on ammonium hydroxide with subsequent crystallization.

Grade: Technical, pure, CP, NF.

Use: Precipitating silver salts for photographic plates, medicine (for its bromide ion), analytical chemistry, process engraving, textile finishing, fire retardant, anticorrosive agents.

ammonium cadmium bromide. See cadmium ammonium bromide.

ammonium cadmium chloride.

$4\text{NH}_4\text{Cl} \cdot \text{CdCl}_2$.

Properties: Colorless, rhombic crystals. Mw 397.3, d 2.01. Soluble in water.

Hazard: A poison and human carcinogen. TLV: 0.05 mg(Cd)/m³ (Proposed: 0.01 mg(Cd)/m³ (dust), suspected human carcinogen; 0.002 mg(Cd)/m³ (respirable dust), suspected human carcinogen).

ammonium caprylate. (octanoic acid ammonium salt). $\text{C}_8\text{H}_{19}\text{NO}_2$.

Properties: Hygroscopic crystals. Decomposed at room temperature, mp approximately 75C. Hydrolyzes readily. Soluble in alcohol and glacial acetic acid; partly soluble in acetone; insoluble in benzene.

Use: Pesticide, photographic emulsions, chemical intermediate.

ammonium carbamate. $\text{NH}_4\text{CO}_2\text{NH}_2$.

Properties: White, rhombic, crystalline powder; very volatile; forms urea upon heating. Soluble in water and alcohol. Sublimes at 60C, decomposes in air to evolve ammonia.

Derivation: Interaction of dry ammonia gas and carbon dioxide from ammonia liquor with ammonia and ammonium carbonate.

Grade: Technical.

Hazard: Evolves irritating fumes when heated.

Use: Fertilizer.

ammonium carbazotate. See ammonium picrate.

ammonium carbonate. (crystal ammonia; ammonium sesquicarbonate; hartshorn).

CAS: 506-87-6. $(\text{NH}_4)\text{HCO}_3 \cdot (\text{NH}_4)\text{CO}_2\text{NH}_2$. A

mixture of ammonium acid carbonate and ammonium carbamate.

Properties: Colorless, crystalline plates or white powder; unstable in air, being converted into the bicarbonate. Strong odor of ammonia, sharp ammoniacal taste. Soluble in water, decomposes in hot water, yielding ammonia and carbon dioxide. Non-combustible.

Derivation: Ammonium salts are heated with calcium carbonate.

Method of purification: Sublimation.

Grade: Technical, lumps, cubes, powder, CP, NF, FCC.

Hazard: Evolves irritating fumes when heated.

Use: Ammonium salts, medicine (expectorant), baking powders, smelling-salts, fire-extinguishing compounds, pharmaceuticals, textiles (mordant), fermentation accelerator in wine manufacture, organic chemicals, ceramics, washing wool.

ammonium ceric nitrate. See ceric ammonium nitrate.

ammonium chlorate.

CAS: 10192-29-7. NH_4ClO_3 .

Properties: Colorless or white crystals, water soluble.

Derivation: Reaction of ammonium chloride with sodium chlorate in solution.

Hazard: Spontaneous chemical reaction with reducing agents. Powerful oxidizer. When contaminated with combustible materials, it can ignite. Shock sensitive; can detonate when exposed to heat or vibration, especially when contaminated.

Use: Explosives.

ammonium chloride.

(sal ammoniac).
CAS: 12125-02-9. NH_4Cl .

Properties: White crystals; cool, saline taste; somewhat hygroscopic. Sublimes at 350C, d 1.54. Soluble in water, glycerol; slightly soluble in alcohol.

Derivation: (1) As a by-product of the ammonia-soda process, (2) reaction of ammonium sulfate and sodium chloride solutions.

Grade: Technical (lumps or granulated), CP, USP, FCC.

Hazard: TLV: 10 mg/m³ (fume).

Use: Dry batteries, mordant (dyeing and printing), soldering flux, manufacturing of various ammonia compounds, fertilizer, pickling agent in zinc coating and tinning, electroplating, washing powders, melt-retarding snow treatment, production of urea-formaldehyde resins and adhesives, bakery products.

ammonium chloroosmate. See ammonium hexachloroosmate.

ammonium chloroplatinate. See ammonium hexachloroplatinate.

ammonium chloroplatinite. (platinous ammonium chloride; platinum ammonium chloride).

CAS: 16919-58-7. $(\text{NH}_4)_2\text{PtCl}_6$.

Properties: Dark ruby-red crystals. Decomposes 140–150C. Soluble in water; insoluble in alcohol.

Use: In photography.

ammonium chromate. (chromic acid, diammonium salt).

CAS: 7788-98-9. $(\text{NH}_4)_2\text{CrO}_4$.

Properties: Yellow crystals. D 1.866, mp (decomposes). Soluble in cold water; insoluble in alcohol.

Derivation: Addition of ammonium hydroxide to a solution of ammonium bichromate, recovery by crystallization.

Impurities: Dichromates.

Grade: Technical, CP.

Hazard: Toxic by inhalation, strong irritant. TLV: TWA 0.05 mg(Cr)/m³; Confirmed Human Carcinogen.

Use: Mordant in dyeing; photography (sensitizer for gelatin coatings); analytical reagent; catalyst; corrosion inhibitor.

ammonium chrome alum. See chromium ammonium sulfate.

ammonium chromium sulfate. See chromium ammonium sulfate.

ammonium citrate, dibasic.

$(\text{NH}_4)_2\text{HC}_6\text{H}_5\text{O}_7$.

Properties: White granules, soluble in water, very slightly soluble in alcohol.

Use: Pharmaceuticals, rustproofing, cotton printing, plasticizer, analytical reagent in determination of phosphate in fertilizer.

ammonium cobaltous phosphate. See cobaltous ammonium phosphate.

ammonium decaborate. See ammonium pentaborate.

ammonium dichromate. (ammonium bichromate).

CAS: 7789-09-5 $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$.

Properties: Orange needles. D 2.152 (25C), decomposes with slight heating. Soluble in water and alcohol.

Derivation: Action of chromic acid on ammonium hydroxide with subsequent crystallization.

Hazard: Dusts and solutions are toxic, irritating to eyes and skin; dangerous fire risk. Strong oxidizing agent may explode in contact with organic materials. TLV: 0.05 mg(Cr)/m³; Confirmed Human Carcinogen.

Use: Mordant for dyeing, pigments, manufacturing of alizarin, chrome alum, oil purification, pickling, manufacture of catalysts, leather tanning, synthetic perfumes, photography, process engraving and li-

thography (sensitizer for photo-chemical insolubilization of albumin, etc.), chromic oxide, pyrotechnics.

ammonium dihydrogen phosphate. See ammonium phosphate monobasic.

ammonium dimethyldithiocarbamate.
(CH₃)₂NCS₂NH₄.

Properties: Yellow crystals. Soluble in water, decomposes in air.

Grade: 42% solution in water.

Use: Fungicide.

ammonium dinitro-*o*-cresolate.

Hazard: Dangerous in contact with combustible materials. Strong oxidizing agent. Flammable.

Use: Herbicide.

ammonium dithiocarbamate. CH₆N₂S₂.

Properties: Yellow crystals. Mp 99C (decomposes), d 1.45. Soluble in water.

Derivation: Reaction of ammonia with carbon disulfide.

Use: Organic synthesis, especially heterocyclic compounds; analytical reagent.

ammonium-ferric-cyano-ferrate(II). See ferric ammonium ferrocyanide.

ammonium fluoride.

CAS: 12125-01-8. NH₄F.

Properties: White crystals. D 1.31, decomposed by heat. Soluble in cold water.

Derivation: Interaction of ammonium hydroxide and hydrofluoric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grade: Technical, CP.

Hazard: Corrosive to tissue. TLV: 2.5 mg(F)/m³.

Use: Fluorides, analytical chemistry, antiseptic in brewing, etching glass, textile mordant, wood preservation, mothproofing.

ammonium fluoroberyllate.

CAS: 14874-86-3. mf: BeF₄•2H₄N.

Hazard: A poison by ingestion and inhalation.

ammonium fluosilicate. (ammonium silico-fluoride).

CAS: 16919-19-0. (NH₄)₂SiF₆.

Properties: White, crystalline powder. D 2.01. Soluble in alcohol and water.

Hazard: Strong irritant to eyes and skin. TLV: 2.5 mg(F)/m³.

Use: Laundry sours, mothproofing, disinfectant in brewing industry, glass etching, light metal casting, electroplating.

ammonium formate. HCOONH₄.

Properties: Deliquescent, crystalline powder. D 1.26; mp 115C. Soluble in water and alcohol.

Derivation: Reaction of formic acid with ammonia.

Use: Analytical chemistry (metal precipitant).

ammonium gluconate. NH₄C₆H₁₁O₇.

Properties: White powder. Soluble in water, insoluble in alcohol. Optical rotation +11.6 (in water).

Derivation: From gluconic acid by neutralization with ammonia.

Use: Emulsifying agent for cheese and salad dressings.

ammonium glutamate. (monoammonium glutamate).

See sodium glutamate.

ammonium hexachloroosmate. (ammonium chlorosmate; osmium ammonium chloride).

(NH₄)₂OsCl₆.

Properties: Red powder. Contains 43.5% osmium. Soluble in alcohol and water.

Hazard: See osmium.

ammonium hexachloroplatinate. (ammonium chloroplatinate; platinic-ammonium chloride; platonic sal ammoniac; platinum ammonium chloride).

(NH₄)₂PtCl₆.

Properties: Orange-red crystals or yellow powder. D 3.06, mp (decomposes). Slightly soluble in water; insoluble in alcohol.

Grade: Technical, CP.

Use: Plating, platinum sponge.

ammonium hexafluorogermanate.

(NH₄)₂GeF₆.

Properties: White crystalline solid. D 2.564, mp 380C (sublimes). Soluble in cold water; insoluble in alcohol.

ammonium hexanitratocerate. See ceric ammonium nitrate.

ammonium hydrate. See ammonium hydroxide.

ammonium hydrogen carbonate. See ammonium bicarbonate.

ammonium hydrogen fluoride. See ammonium bifluoride.

ammonium hydrogen sulfate. See ammonium bisulfate.

ammonium hydrosulfide. See ammonium sulfide.

ammonium hydroxide. (ammonia solution; aqua ammonia; ammonium hydrate). NH₄OH.

Properties: Colorless liquid, strong odor. Concentration of solutions range up to approximately 30% ammonia.

Grade: Technical, CP, 16%, 20%, 26%, NF (strong), FCC.

Hazard: Liquid and vapor extremely irritating, especially to eyes.

Use: Textiles, manufacture rayon, rubber, fertilizers, refrigeration, condensation polymerization, photography (development of latent images), pharmaceuticals, ammonia soaps, lubricants, fireproofing wood, ink manufacture, explosives, ceramics, ammonium compounds, saponifying fats and oils, organic synthesis, detergents, food additives, household cleanser.

ammonium hypophosphite. $\text{NH}_4\text{N}_2\text{PO}_2$.

Properties: Deliquescent crystals or white powder, decomposes when heated. Soluble in water and alcohol.

Hazard: Evolves flammable and toxic fumes on heating.

Use: Catalyst in nylon manufacture. See phosphine.

ammonium ichthosulfonate. See ichthammol.

ammonium iodate. NH_4IO_3 .

Properties: White, odorless, granular powder.

Hazard: Fire risk in contact with organic materials.

Use: Oxidizing agent.

ammonium iodide. NH_4I .

Properties: White, hygroscopic crystals or powder. D 2.56, mp sublimes with decomposition. Soluble in water or alcohol. Affected by light.

Use: Iodides, medicine (expectorant), photography.

ammonium laurate, anhydrous.

Properties: Tan, waxlike material; free from ammonia odor. D 0.88 (25C), pH (5% dispersion) 7.6–7.8, mp 42–56C, neutralization value 120–125. Soluble in ethanol, methanol, cottonseed oil, mineral oil, (hot) in naphtha, toluene, and vegetable oil. Combustible.

Use: Production of oil-in-water emulsions with high oil content; cosmetics.

ammonium lignin sulfonate. See lignin sulfonate.

ammonium linoleate. $\text{C}_{17}\text{H}_{31}\text{COONH}_4$.

Properties: Yellow paste with ammoniacal odor. D 1.1, pH (5% dispersion) 9.5–9.8, total solids 82%. Soluble in water, ethanol and methanol; emulsifies in naphtha, toluene, mineral oil, and vegetable oil. Combustible.

Grade: Technical, 80%.

Use: Emulsifying agent for oils, waxes, and hydrocarbon solvents; surface tension reducer; detergent; water-repellent finishes.

ammonium magnesium arsenate. See magnesium ammonium arsenate dihydrate.

ammonium metavanadate. (ammonium vanadate). NH_4VO_3 .

Properties: White crystals. D 2.326, mp decomposes at 210C. Insoluble in saturated ammonium chloride solution; slightly soluble in cold water. Nonflammable.

Derivation: Alkali solutions of vanadium pentoxide and precipitation with ammonium chloride.

Use: For catalyst as vanadium pentoxide, dyes, varnishes, indelible inks, drier for paints and inks, photography, analytical reagent.

ammonium molybdate. (molybdic acid 85%). $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24}\cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.27, mp decomposes. Soluble in water; insoluble in alcohol. Nonflammable.

Derivation: Dissolving molybdenum trioxide in aqueous ammonia.

Grade: Technical, CP, reagent (contains 85% MoO_3).

Hazard: Irritant.

Use: Analytical reagent, pigments, catalyst for dehydrogenation and desulfurization in petroleum and coal technology, production of molybdenum metal, source of molybdate ions.

ammonium-12-molybdophosphate. (ammonium phosphomolybdate).

Properties: Yellow, crystalline powder. Soluble in alkali; insoluble in alcohol and acids; very slightly soluble in water. Nonflammable.

Derivation: Interaction of ammonium molybdate with phosphoric and nitric acids.

Grade: 91% MoO_3 .

Use: Reagent, ion exchange columns, photographic additives, imparting water resistance.

ammonium-12-molybdosilicate. (ammonium silicomolybdate). $(\text{NH}_4)_4\text{SiMo}_{12}\text{O}_{40}\cdot x\text{H}_2\text{O}$.

Properties: Crystalline, yellow granules; thermally stable. Only slightly soluble in water, ethanol, and ethyl acetate. Nonflammable.

Grade: Technical, reagent.

Use: Catalysts, reagents, in atomic energy as precipitants and inorganic ion-exchangers, in photographic processes as fixing agents and oxidizing agents, in plating processes as additive, and in plastics, adhesives, and cement industries for imparting water resistance.

ammonium nickel chloride. See nickel ammonium chloride.

ammonium nickel sulfate. See nickel ammonium sulfate.

ammonium nitrate. (Norway saltpeter). NH_4NO_3 .

Properties: Colorless crystals. D 1.725, mp 169.6C,

bp (decomposes at 210C with evolution of nitrous oxide). Soluble in water, alcohol, and alkalis.

Derivation: Action of ammonia vapor on nitric acid.

Grade: Usually expressed in percent of nitrogen, as 20.5% N, 33.5% N. FGAN is a fertilizer grade, prilled and usually coated with kieselguhr. Also available as an 83% solution. A temperature-stabilized grade is also available that inhibits breakdown of prills due to crystalline changes.

Hazard: May explode under confinement and high temperatures, but not readily detonated. Ventilate well. To fight fire, use large amounts of water. The material must be kept as cool as possible and removed from confinement and flooded with water in event of fire. Explodes more readily if contaminated with combustibles. Strong oxidizing agent. May be made resistant to flame and detonation by proprietary process involving addition of 5–10% ammonium phosphate.

Use: Fertilizer, explosives especially as prills/oil mixture, pyrotechnics, herbicides and insecticides, manufacture of nitrous oxide, absorbent for nitrogen oxides, ingredient of freezing mixtures, oxidizer in solid rocket propellants, nutrient for antibiotics and yeast, catalyst.

See explosives.

ammonium nitrate-carbonate mixtures.

See calcium ammonium nitrate.

ammonium nitroso- β -phenylhydroxylamine.

See cupferron.

ammonium oleate. $C_{17}H_{33}COONH_4$. An ammonium soap.

Properties: Yellow to brownish ointmentlike mass; ammonia odor. Decomposes on heating. Soluble in water and hot alcohol. Combustible.

Use: Emulsifying agent, cosmetics.

ammonium oxalate. $(NH_4)_2C_2O_4 \cdot H_2O$.

Properties: Colorless crystals. D 1.502, decomposed by heat. Soluble in water.

Use: Analytical chemistry, safety explosives, manufacture of oxalates, rust and scale removal.

ammonium palmitate. $C_{15}H_{31}COONH_4$. An ammonium soap.

Properties: Yellowish granules. Mp 20C. Soluble in water, hot alcohols, and benzene. Combustible.

Derivation: Reaction of palmitic acid and ammonium carbonate.

Use: Thickening agent for petroleum-derived solvents, lubricants, etc.; waterproofing.

ammonium paratungstate. See ammonium tungstate.

ammonium pentaborate. (ammonium decaborate). $(NH_4)_2B_{10}O_{16} \cdot 8H_2O$.

Properties: Crystals or powder. Soluble in water.

Use: Intermediate for boron chemicals; as a power-level control in atomic submarines.

ammonium pentadecafluorooctanoate.

See ammonium perfluorooctanoate.

ammonium perchlorate. (AP; APC).

NH_4ClO_4 .

Properties: White crystals. D 1.95, mp (decomposes on heating). Soluble in water.

Derivation: Interaction of ammonium hydroxide, hydrochloric acid, and sodium chlorate. Recovery by crystallization.

Hazard: Strong oxidizing agent; ignites violently with combustibles. Shocksensitive; may explode when exposed to heat or by spontaneous chemical reaction. Sensitive, high explosive when contaminated with reducing materials. Skin irritant.

Use: Explosives, pyrotechnics, analytical chemistry, etching and engraving agent, smokeless rocket and jet propellant.

ammonium perfluorooctanoate. (ammonium pentadecafluorooctanoate).

CAS: 3825-26-1. $C_8F_{15}COONH_4$.

Properties: White powder. Mw 431, d 0.6–0.7 g/cc, bp 125C (sublimes). Highly soluble in water.

Hazard: Toxic by inhalation and skin contact. TLV: 0.01 mg/m³.

Use: For polymerization of fluorinated monomers.

ammonium permanganate. NH_4MnO_4 .

Properties: Crystal or powder form, having a metallic sheen in rich violet-brown or dark purple shades, soluble in water.

Hazard: May explode on shock or on exposure to heat. Toxic by ingestion or by inhalation of dust or fume. Powerful oxidizer.

ammonium peroxychromate. $(NH_4)_3CrO_5$.

Properties: Red-brown crystals. Mp @ 40°C (decomp), bp: explodes @ 50°C, mw 234.1.

Hazard: A poison. TLV: 0.05 mg(Cr)/m³; confirmed human carcinogen. Moderately flammable by chemical reaction with reducing agents. A powerful oxidizer. Moderately explosive when heated.

ammonium perrhenate. NH_4ReO_4

Properties: Colorless, weakly oxidizing solid. Stable to heat; decomposes at 365C. Moderately soluble in hot water; slightly soluble in cold water.

Derivation: Liquid ion-exchange.

Hazard: Moderate fire risk in contact with reducers.

ammonium persulfate.

CAS: 7727-54-0. $(NH_4)_2S_2O_8$.

Properties: White crystals. D 1.98; mp decomposes. Strong oxidizer. Water soluble.

Derivation: Electrolysis of concentrated solution of ammonium sulfate. Recovered by crystallization.

Hazard: TLV: 0.1 mg/m³. Fire risk in contact with reducers.

Use: Oxidizer, bleaching agent; photography; etchant for printed circuit boards, copper; electroplating; manufacture of other persulfates; deodorizing and bleaching oils; aniline dyes; preserving foods; depolarizer in batteries; washing infected yeast.

ammonium phosphate, dibasic. (ammonium phosphate, secondary; diammonium hydrogen phosphate; diammonium phosphate; DAP). $(\text{NH}_4)_2\text{HPO}_4$.

Properties: White crystals or powder. D 1.619, mildly alkaline in reaction. Soluble in water; insoluble in alcohol. Noncombustible.

Derivation: Interaction of ammonium hydroxide and phosphoric acid in proper proportions.

Grade: Technical, CP, fertilizer, feed, dentifrice, highly purified for phosphors, FCC.

Use: Flameproofing of wood, paper, and textiles; coating vegetation to retard forest fires; to prevent afterglow in matches and smoking of candle wicks; fertilizer (high analysis phosphate type); plant nutrient solutions; manufacture of yeast, vinegar, and bread improvers; feed additive; flux for soldering tin, copper, brass, zinc; purifying sugar; in ammoniated dentrifices; halophosphate phosphors. 84

ammonium phosphate, hemibasic.

Properties: White, crystalline material; somewhat hygroscopic. Strongly acid in reaction. Soluble in water. Noncombustible.

Use: Nutrient for truck gardens, yeast food, buffer for adjustment of pH values, metal cleaning.

ammonium phosphate, monobasic. (ammonium acid phosphate; ammonium biphosphate; ammonium dihydrogen phosphate; ammonium phosphate, primary). $\text{NH}_4\text{H}_2\text{PO}_4$.

Properties: Brilliant white crystals or powder. D 1.803. Mildly acid in reaction. Moderately soluble in water. Noncombustible.

Derivation: Interaction of phosphoric acid and ammonia in proper proportions.

Grade: Technical, CP, FCC, single crystals.

Use: Fertilizers; flameproofing agent; to prevent afterglow in matches; plant nutrient solutions; manufacturing of yeast, vinegar, yeast foods, and bread improvers; food additive; analytical chemistry.

ammonium phosphite. (neutral ammonium phosphite). $(\text{NH}_4)_2\text{HPO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless, crystalline mass. Hygroscopic. Soluble in water.

Grade: Technical.

Use: Chemical (reducing agent), lubricating grease (corrosion inhibitor).

ammonium phosphomolybdate. See ammonium-12-molybdophosphate.

ammonium phosphotungstate. (ammonium phosphowolframate). $2(\text{NH}_4)_3\text{PO}_4 \cdot 24\text{WO}_3 \cdot x\text{H}_2\text{O}$.

Properties: White powder. Soluble in alkali, insoluble in acid, sparingly soluble in water.

Derivation: Interaction of ammonium tungstate, ammonium phosphate, and nitric acid.

Use: Chemical reagent, ion-exchange.

ammonium phosphowolframate. See ammonium phosphotungstate.

ammonium picrate. (ammonium carbazate; ammonium picronitrate).

Properties: Yellow crystals. D 1.72, mp (decomposes). Slightly soluble in water and alcohol.

Hazard: A high explosive when dry, flammable when wet.

Use: Pyrotechnics, explosive compositions.

ammonium polymannuronate. See ammonium alginate.

ammonium polyphosphate. See urea-ammonium polyphosphate; "Poly-N" [Solutia].

ammonium polysulfide. $(\text{NH}_4)_2\text{S}_x$.

Properties: Known only in solution. Yellow, unstable; H_2S odor. Decomposed by acids with evolution of hydrogen sulfide.

Derivation: Passing hydrogen sulfide into 28% ammonium hydroxide and dissolving an excess of sulfur in the resulting solution.

Hazard: Evolves toxic and flammable gas on contact with acids.

Use: Analytical reagent, insecticide spray.

ammonium potassium hydrogen phosphate.

Use: Food additive.

ammonium reineckate. See Reinecke salt.

ammonium ricinoleate. $\text{C}_{17}\text{H}_{32}\text{OHCOONH}_4$.

Properties: White paste. Combustible.

Grade: Technical.

Use: Detergent, emulsifying agent.

ammonium saccharin.

Properties: White crystals or crystalline powder; intense sweet taste. Sol in water.

Hazard: A severe eye irritant.

Use: Food additive.

ammonium salts. Salts formed by neutralization of ammonium hydroxide with acids. Usually white and water soluble; usually decomposed by heat into ammonia and the corresponding acid, which may also decompose. All ammonium salts liberate ammonia (NH_3) when heated with a strong base, e.g., sodium hydroxide or calcium hydroxide.

ammonium selenate. $(\text{NH}_4)_2\text{SeO}_4$.

Properties: Colorless crystals. D 2.194. Soluble in water, insoluble in alcohol.

Use: Mothproofing agent.

ammonium selenite. $(\text{NH}_4)_2\text{SeO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless or slightly reddish crystals. Keep away from dust or light. Soluble in water.

Grade: Technical.

Use: Analysis (test for alkaloids), glass colorant.

ammonium sesquicarbonate. See ammonium carbonate.

ammonium silicofluoride. See ammonium fluosilicate.

ammonium silicomolybdate. See ammonium-12-molybdosilicate.

ammonium soap. A soap resulting from the reaction of a fatty acid with ammonium hydroxide. Has an appreciable vapor pressure of ammonia and decomposes on continued exposure, leaving the fatty acid residue. Usually not sold as detergents, but used in toilet preparations and emulsions.

ammonium stearate. (octadecanoic acid; ammonium salt).

CAS: 1002-89-7. $\text{C}_{17}\text{H}_{33}\text{COONH}_4$.

Properties: Tan, waxlike solid; free from ammonia odor. Mw 301.58, d 0.89 (22C), pH (3% dispersion) 7.6, mp 73–75C, neutralization value 70–80. Soluble in boiling water and hot toluene; partly soluble in hot butyl acetate and ethanol. Combustible.

Grade: Available as anhydrous solid or as paste.

Hazard: A nuisance dust. TLV: TWA 10 mg/m³.

Use: Vanishing creams, brushless shaving creams, other cosmetic products; waterproofing of cements, concrete, stucco, paper and textiles, etc.

ammonium sulfamate.

CAS: 7773-06-0. $\text{NH}_4\text{OSO}_2\text{NH}_2$.

Properties: White, hygroscopic solid. Mp 130C, decomposes at 160C. Soluble in water and ammonia solution. Nonflammable.

Derivation: Hydrolysis of the product obtained when urea is treated with fuming sulfuric acid.

Hazard: Hot acid solutions when enclosed may explode. TLV: 10 mg/m³.

Use: Flameproofing agent for textiles and certain grades of paper, weed and brush killer, electroplating, generation of nitrous oxide.

ammonium sulfate.

CAS: 7783-20-2. $(\text{NH}_4)_2\text{SO}_4$.

Properties: Brownish-gray to white crystals according to degree of purity. D 1.77, mp 513C with decomposition. Soluble in water, insoluble in alcohol and acetone. Nonflammable.

Derivation: (1) Ammoniacal vapors from destructive distillation of coal react with sulfuric acid, followed by crystallization and drying. (2) Synthetic

ammonia is neutralized with sulfuric acid. (3) By-product of manufacture of caprolactam. (4) From gypsum by reaction with ammonia and carbon dioxide.

Method of purification: Recrystallization or sublimation.

Grade: Commercial, technical, CP, enzyme (no heavy metals), FCC.

Use: Fertilizers, water treatment, fermentation, fireproofing compositions, viscose rayon, tanning, food additive.

ammonium sulfate nitrate.

Properties: A double salt of approximately 60% ammonium sulfate and 40% ammonium nitrate, 26% nitrogen content. White to light gray granules, soluble in water.

Hazard: Oxidizer, dangerous in contact with organic materials.

ammonium sulfide.

CAS: 12124-99-1. $(\text{NH}_4)_2\text{S}$. The true sulfide is stable only in the absence of moisture and below 0C. The ammonium sulfide of commerce is largely ammonium bisulfide or hydrosulfide, NH_4HS .

Properties: Yellow crystals. Mp (decomposes). Soluble in water, alcohol, and alkalis. Evolves hydrogen sulfide on contact with acids.

Grade: Technical, CP, liquid, 40–44%.

Hazard: Strong irritant to skin and mucous membranes.

Use: Textile industry, photography (developers), coloring brasses, bronzes, iron control in soda ash production, synthetic flavors.

ammonium sulfite.

CAS: 10192-30-0. $(\text{NH}_4)_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; acrid, sulfurous taste. D 1.41. Hygroscopic, sublimates at 150C with decomposition. Soluble in water.

Use: Chemical (intermediates, reducing agent), medicine, permanent wave solutions, photography, metal lubricants.

ammonium sulfocyanate. See ammonium thiocyanate.

ammonium sulfocyanide. See ammonium thiocyanate.

ammonium sulfonate. See ammonium benzenesulfonate.

ammonium sulfuricinoleate.

Properties: Yellow liquid. Soluble in alcohol. Combustible.

Grade: Technical.

Use: Medicine, furniture polish.

ammonium tartrate.

CAS: 3164-29-2. $(\text{NH}_4)_2\text{C}_4\text{H}_4\text{O}_6$.

Properties: White crystals. D 1.601, decomposes on heating. Soluble in water and alcohol.
Use: Textile industry, medicine.

ammonium

tetrathiocyanodiammonochromate. See Reinecke salt.

ammonium tetrathiotungstate. $(\text{NH}_4)_2\text{WS}_4$.

Properties: Orange-colored, crystalline powder; sensitive to heat; hydrogen sulfide odor. Mp (decomposes). Soluble in water, ammoniacal, and amine solutions.

Use: Source of high purity tungsten disulfide for catalysts, lubricants, semiconductors.

ammonium thiocyanate. (ammonium sulfocyanide; ammonium sulfocyanate).

CAS: 1762-95-4. NH_4SCN .

Properties: Colorless, deliquescent crystals. D 1.3057; mp 149.6C; decomposes at 170C. Soluble in water, alcohol, acetone, and ammonia.

Derivation: By boiling an aqueous solution of ammonium cyanide with sulfur or polysulfides, or by the reaction of ammonia and carbon disulfide.

Grade: Technical, CP, 50–60% solution.

Use: Analytical chemistry; chemicals (thiourea); fertilizers; photography; ingredients of freezing solutions, especially liquid rocket propellants; fabric dyeing; zinc coating; weed killer and defoliant; adhesives; curing resins; pickling iron and steel; electroplating; temporary soil sterilizer; polymerization catalyst; separator of zirconium and hafnium, and of gold and iron.

ammonium thioglycolate. $\text{HSCH}_2\text{COONH}_4$.

Properties: Colorless liquid, repulsive odor. Evolves hydrogen sulfide. Combustible.

Use: Solutions of various strengths are used for hair waving and for hair removal.

ammonium thiosulfate.

CAS: 7783-18-8. $(\text{NH}_4)_2\text{S}_2\text{O}_3$.

Properties: White crystals decomposed by heat. PH of 60% solution 6.5–7.0. Very soluble in water.

Grade: Pure crystals (97%), 60% photographic solution.

Use: Photographic fixing agent, especially for rapid development; analytical reagent; fungicide; reducing agent; brightener in silver plating baths; cleaning compounds for zinc-base die-cast metals; hair waving preparations; fog screens.

ammonium titanium oxalate. (titanium ammonium oxalate). $(\text{NH}_3)_2\text{TiO}(\text{C}_2\text{O}_4)_2$.

Properties: A water-soluble powder

Use: Mordant in dyeing cellulosic fibers, leather, etc.

ammonium tungstate. (ammonium wolframate; ammonium paratungstate).

$(\text{NH}_4)_6\text{W}_7\text{O}_{24} \cdot 6\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water; insoluble in alcohol.

Derivation: Interaction of ammonium hydroxide and tungstic acid with subsequent crystallization.

Use: Preparation of ammonium phosphotungstate and tungsten alloys.

See ammonium metatungstate.

ammonium valerate. (pentanoic acid, ammonium salt; valeric acid, ammonium salt). $\text{C}_5\text{H}_{13}\text{NO}_2$.

Properties: Very hygroscopic crystals. Mp 108C, mw 119.16. Very soluble in water, alcohol, and ether.

Grade: Food and flavor codex.

Use: Flavoring material.

ammonium vanadate. See ammonium metavanadate.

ammonium wolframate. See ammonium tungstate.

ammonium zirconifluoride. See zirconium ammonium fluoride.

ammonium zirconyl carbonate.

$(\text{NH}_4)_3\text{ZrOH}(\text{CO}_3)_3 \cdot 2\text{H}_2\text{O}$. D 1.238 (24C). Stable up to approximately 68C; decomposes in dilute acids, alkalies.

Grade: Aqueous solution

Use: Ingredient in water repellents for paper and textiles, catalyst, stabilizer in latex emulsion paints, ingredient in floor wax to aid in resistance to detergents, lubricant in fabrication of glass fibers.

ammonobasic mercuric chloride. See mercury, ammoniated.

ammonolysis. The procedure that is analogous to hydrolysis, with ammonia substituted for water.

ammonotelic. Organisms that excrete excess nitrogen in the form of ammonia.

“Ammo-Phos” [Olin]. TM for high-analysis ammonium phosphate-containing fertilizers.

amniote egg. The type of egg laid by reptiles and birds, having a nutritious yolk and a hard outer shell to protect the embryo from the dry environment. The amniote egg is named for the amnion, a sac that contains the embryo.

amobarbital. (5-ethyl-5-isoamylbarbituric acid). $\text{C}_{11}\text{N}_{18}\text{N}_2\text{O}_3$.

Properties: White, crystalline powder; odorless with bitter taste. Mp 156–161C. Solutions are acid to litmus. Very slightly soluble in water; soluble in alcohol.

Grade: USP.

Hazard: May be a habit forming drug of abuse.

Use: Medicine (also as sodium salt), hypnotic.

“Amoco Performance Products” [Amoco Performance Products]. TM for specialty engineering polymers to help reduce pollution.

amodiaquine hydrochloride.

Properties: Yellow crystalline solid; odorless; bitter. Mp 150–160C (decomposes), pH (1% solution) 4.0–4.8. Soluble in water; sparingly soluble in alcohol; very slightly soluble in benzene, chloroform, and ether.

Grade: NF.

Use: Medicine (antimalarial).

amorphous. Noncrystalline, having no molecular lattice structure which is characteristic of the solid state. All liquids are amorphous. Some materials that are apparently solid, such as glasses, or semisolid, such as some high polymers, rubber, and sulfur allotropes, also lack a definite crystal structure and a well-defined melting point. They are considered high-viscosity liquids. The cellulose molecule contains amorphous as well as crystalline areas. Carbon derived by thermal decomposition or partial combustion of coal, petroleum, and wood is amorphous (coke, carbon black, charcoal), though other forms (diamond, graphite) are crystalline. Amorphous metallic alloys for transformer coils are made by extremely rapid cooling of the molten mixture. They are composed of iron, nickel, phosphorus, and boron.

See liquid; liquid crystal; glass, metallic.

amorphous wax. See microcrystalline wax.

amosite. A type of asbestos.

See asbestos.

AMP. (1) Abbreviation for 2-amino-2-methyl-1-propanol. (2) Abbreviation for adenosine monophosphate.

See adenylic acid.

AMP resistance. See Antibiotic resistance.

A5MP. Abbreviation for adenosine-5-monophosphoric acid.

See 5'-adenylic acid.

“AMP-95” [Angus]. TM for 2-amino-methyl-1-propanol.

Grade: 95% and 99+%.

Available forms: Liquid.

Use: Multifunctional amine, used as codispersant, solubilizer, stabilizer, neutralizer, buffer, and catalyst.

“Ampco” [Ampco]. TM for a series of aluminum-iron-copper alloys containing 6–15% aluminum, 1.5–5.25% iron, balance copper. Resistant to

fatigue, corrosion, erosion, wear, and cavitation pitting.

Use: For bushings, bearings, gears, slides, etc.

“Ampcoloy” [Ampco]. TM for a series of industrial copper alloys including low-iron-aluminum bronzes, nickel-aluminum bronzes, tin bronzes, manganese bronzes, lead bronzes, beryllium-copper, and high-conductivity alloys.

“Ampco-Trode” [Ampco]. TM for a series of aluminum-bronze arc-welding electrodes and filler rod containing 9.0–15.0% aluminum, 1.0–5.0% iron, balance copper, for joining like or dissimilar metals and overlaying surfaces resistant to wear, corrosion, erosion, and cavitation-pitting.

AMPD. Abbreviation for 2-amino-2-methyl-1,3-propanediol.

amphetamine. (1-phenyl-2-aminopropane; methylphenethylamine; “Benzedrine”).

Properties: Colorless, volatile liquid; characteristic strong odor; slightly burning taste. Bp 200–203C (decomposes), flash p 80F (26.6C). Soluble in alcohol and ether; slightly soluble in water.

Grade: Dextro-, dextrolevo-. Also available as phosphate and sulfate.

Hazard: Flammable, moderate fire risk. Basis of a group of hallucinogenic (habit-forming) drugs that affect the central nervous system. Sale and use restricted to physicians. Production limited by law.

Use: Medicine.

amphibole. A type of asbestos.

See asbestos.

amphibolic pathway. A metabolic pathway used in both catabolism and anabolism.

amphiphathic. Containing both polar and nonpolar domains.

amphiphathy. The simultaneous attraction and repulsion in a single molecule or ion consisting of one or more groups having an affinity for the phase in which they are dissolved together with groups that tend to be expelled by the medium.

amphiphilic. Molecule having a water-soluble polar head (hydrophilic) and a water-insoluble organic tail (hydrophobic), e.g., octyl alcohol, sodium stearate. Such molecules are necessary for emulsion formation and for controlling the structure of liquid crystals.

See emulsion; liquid crystal.

amphiprotic. Capable of donating and accepting protons, thus able to serve as an acid or a base.

ampholyte. A substance that can ionize to form either anions or cations and thus may act as either an acid or a base. An ampholytic detergent is cationic in acid media and anionic in base media. Water is an ampholyte.

See amphoteric.

amphora catalyst. See catalyst, amphora.

“Amphosol” [Stepan]. (cocamidopropyl betaine) TM for chemical used in shampoos, liquid hand soap, bubble bath, thickeners, and foam enhancers.

amphoteric. Having the capacity of behaving either as an acid or a base. Thus, aluminum hydroxide neutralizes acids with the formation of aluminum salts, $\text{Al}(\text{OH})_3 + 3\text{HCl} \rightarrow \text{AlCl}_3 + 3\text{H}_2\text{O}$, and also dissolves in strongly basic solutions to form aluminates, $\text{Al}(\text{OH})_3 + 3\text{NaOH} \rightarrow \text{Na}_3\text{AlO}_3 + 3\text{H}_2\text{O}$. Amino acids and proteins are amphoteric, i.e., their molecules contain both an acid group (COOH) and a basic group (NH₂). Thus, wool can absorb both acidic and basic dyes.

amphotericin B. A polyene antifungal antibiotic. $\text{C}_{47}\text{H}_{73}\text{NO}_{17}$.

Properties: Pale yellow, semicrystalline powder. Mp >170C (gradual decomposition). Insoluble in water; slightly soluble in methanol; somewhat more soluble in dimethylsulfoxide.

Derivation: Fermentation with *Sterptomyces nodosus*. Commercially available as a deoxycholate complex.

Grade: USP.

Hazard: May have undesirable side effects.

Use: Medicine (meningitis treatment).

ampicillin (USAN). (6, D, α-aminophenyl-acet-amido penicillanic acid). $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S}$. A semi-synthetic antibiotic, active against some Gram-negative infections.

amplification. An increase in the number of copies of a specific DNA fragment; can be in vivo or in vitro.

See cloning; polymerase chain reaction

amprolium. (1-[(4-amino-2-propyl-5-pyrimidinyl)-methyl]-2-picolinium chloride). $\text{C}_{14}\text{H}_{19}\text{ClN}_4$. A coccidiostat used in veterinary medicine.

amprotopine phosphate. (phosphate of the *dl*-tropic acid diethylamino-2,2-dimethyl-*l*-propanol). $\text{C}_{18}\text{H}_{29}\text{NO}_3 \cdot \text{H}_3\text{PO}_4$.

Properties: Bitter crystals. Mp 142–144C. Soluble in water; slightly soluble in alcohol.

Use: Medicine (antispasmodic).

AMPS (sulfonic acid). See 2-acrylamido-2-methyl-1-propanesulfonic acid.

ampule. (ampul; ampulla). A small-sealed glass container used for sterile liquids. It protects contents from air or contamination.

amsonic acid. (4,4'-diamino-2,2'-stilbenedisulfonic acid). $\text{C}_{14}\text{H}_{14}\text{N}_2\text{O}_6\text{S}_2$.

Properties: Acicular crystals. Slightly soluble in water.

Use: Manufacture of bleaching agents and organic dyes.

amsulosin hydrochloride. See r(-)-5-(2-((2-(2-ethoxyphenoxy)ethyl)amino)propyl)-2.

amygdalic acid. See mandelic acid.

amygdalin. (mandelonitrile-β-gentiobioside; amygdaloside). $\text{C}_6\text{H}_5\text{CHCNO}_2 \cdot \text{C}_{12}\text{H}_{21}\text{O}_{10}$. A glycoside found in bitter almonds, peaches, and apricots.

Properties: White crystals; bitter taste. Mp 214–216C (anhydrous). Soluble in water and alcohol; insoluble in ether.

See almond oil (note).

amyl. The 5-carbon aliphatic group C_5H_{11} , also known as pentyl. Eight isomeric arrangements (exclusive of optical isomers) are possible. The amyl compounds occur (as in fusel oil) or are formed (as from the petroleum pentanes) as mixtures of several isomers, and, since their boiling points are close and their other properties similar, it is neither easy nor usually necessary to purify them.

See amyl alcohol.

amyl acetate. (amylacetic ester; banana oil; pear oil).

CAS: 628-63-7. $\text{CH}_3\text{COOC}_5\text{H}_{11}$. Commercial amyl acetate is a mixture of isomers, the composition and properties depending upon the grade and derivation. The main isomers are isoamyl, normal, and secondary amyl acetates.

Properties: Colorless liquid; persistent banana-like odor. Flash p 65–95F (18.3–35C) (CC) depending on grade, autoign temp approximately 714F (380C).

Derivation: Esterification of amyl alcohol (often fusel oil) with acetic acid and a small amount of sulfuric acid as catalyst.

Method of purification: Rectification.

Grade: Commercial (85–88%), high test (85–88%), technical (90–95%), pure (95–99%), special antibiotic grade. Amyl acetate is also sold by original source as from fusel oil, pentane, or Oxo process.

Hazard: Flammable, high fire risk. Explosive limits in air 1.1 to 7.5%.

Use: Solvent for lacquers and paints, extraction of penicillin, photographic film, leather polishes, nail polish, warning odor, flavoring agent, printing and finishing fabrics, solvent for phosphors in fluorescent lamps.

n-amyl acetate.

CAS: 628-63-7. $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$,

Properties: Colorless liquid. Bp 148.4C, mp -70.8C, d 0.879 (20/20C), wt/gal (20C) 7.22 lbs, flash p 77F (25C) (CC). Very slightly soluble in water; miscible with alcohol and ether. Vapor heavier than air. Autoign temperature 714F (380C).

Derivation: Esterification of *n*-amyl alcohol with acetic acid.

Hazard: Flammable, dangerous fire risk. TLV: 100 ppm.

Use: See amyl acetate.

sec-amyl acetate.

CAS: 626-38-0. $\text{CH}_3\text{CO}_2\text{C}_5\text{H}_{11}$.

Properties: Colorless liquid. May be mixture of secondary isomers. Distillation range 123–145C, mild odor, nonresidual, purity of ester content as amyl acetate 85–88%, d 0.862–0.866 (20/20C), flash p 89F (31.6C) (CC), wt/gal (20C) approximately 7.19 lbs.

Derivation: Esterification of *sec*-amyl alcohol and acetic acid.

Grade: Technical.

Hazard: Flammable, moderate fire risk. Toxic. TLV: 125 ppm.

Use: Solvent for nitrocellulose and ethyl cellulose, cements, coated paper, lacquers, leather finishes, nail enamels, plastic wood, textile sizing, and printing compounds.

amylacetic ester. See amyl acetate.

amyl acid phosphate. $(\text{C}_5\text{H}_{11})_2\text{HPO}_4$ and $\text{C}_5\text{H}_{11}\text{H}_2\text{PO}_4$. A mixture of primary and amyl isomers. Water-white liquid, d 1.070–1.090, flash p 245F (118.3C) (COC). Insoluble in water, soluble in alcohol. Combustible.

Hazard: Strong irritant to tissue.

Use: Curing catalyst and accelerator in resins and coatings, stabilizer, dispersion agent, lubricating and antistatic agent in synthetic fibers.

amyl alcohol. (amyl hydrate). Eight isomers of amyl alcohol, $\text{C}_5\text{H}_{11}\text{OH}$, are possible, exclusive of several optical isomers, and six are offered commercially. In addition, definite mixtures of the isomers are sold under a variety of names (unfortunately, some of them identical with the names of the pure isomers) as well descriptive data on the pure isomers, see: (1) *n*-amyl alcohol, primary; (2) 2-methyl-1-butanol (active amyl alcohol from fusel oil); (3) isoamyl alcohol, primary; (4) 2-pentanol; (5) 3-pentanol; (6) *tert*-amyl alcohol. The other two isomers not described in detail are (7) *sec*-isoamyl alcohol; (8) 2,2-dimethyl-1-propanol. (1), (2), (3), and (8) are primary alcohols; (4), (5), and (7) are secondary alcohols; and (6) is a tertiary alcohol. (1), (4), and (5) are normal, and (2), (3), (6), (7), and (8) are branched-chain compounds. (2), (4), and (7) are asymmetric and have optically active forms.

***n*-sec-amyl alcohol.** See 2- and 3-pentanol.

***tert*-amyl alcohol.** (dimethylethylcarbinol; 2-methyl-2-butanol; amylene hydrate; *tert*-pentanol).

CAS: 75-85-4. $(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; camphor odor; burning taste. D 0.81 (20/20C), fp -11.9C, bp 101.8C, refr index 1.4052 (20C), wt/gal 6.76 lbs, flash p 70F (21.2C) (OC), Autoign temp 819F (437C). Slightly soluble in water; miscible with alcohol and ether. Solutions neutral to litmus.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentanes.

Grade: Technical, CP, NF.

Hazard: Flammable, dangerous fire risk.

Use: Solvent, flotation agent, organic synthesis, medicine (sedative).

***sec*-amyl alcohol, active.** See 2-pentanol.

amyl alcohol, fermentation. See fusel oil.

amyl alcohol, primary. A mixture of primary amyl alcohols made from normal butenes by the Oxo process is sold under this name. It consists of 60% primary *n*-amyl alcohol, 35% 2-methyl-1-butanol, and 5% 3-methyl-1-butanol.

Hazard: Flammable, moderate fire risk.

Use: A solvent.

***n*-amyl alcohol, primary.** (1-pentanol; *n*-butyl carbinol).

CAS: 71-41-0. $\text{CH}_3(\text{CH}_2)_4\text{OH}$.

Properties: Colorless liquid; mild odor. Bp 137.8C, fp -78.9C, d 0.812–0.819 (20/20C), wt/gal (20C) 6.9 lbs, flash p 123F (50.5C) (OC). Autoign temp 572F (300C). Slightly soluble in water; miscible with alcohol, benzene, and ether. Combustible.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentane.

Grade: Technical, CP, 98%.

Hazard: Lower explosive level in air 1.2% by volume. Moderate fire risk.

Use: Raw material for pharmaceutical preparations; organic synthesis solvent.

amyl alcohol, primary active. See 2-methyl-1-butanol.

amyl aldehyde. See *n*-valeraldehyde.

***n*-amylamine.** (pentylamine; 1-aminopentane). $\text{C}_5\text{H}_{11}\text{NH}_2$.

Properties: Colorless liquid, d 0.75 (20/20C), fp -55.0C, bp 104.4C, flash p 45F (7.2C) (OC). Soluble in water, alcohol, and ether.

Derivation: Reaction of ammonia and amyl chloride which gives a mixture of mono-, di-, and triamyl amines.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Strong irritant.

Use: Chemical intermediate, dyestuffs, rubber chemicals, insecticides, synthetic detergents, flotation agents, corrosion inhibitors, solvent, gasoline additive, pharmaceuticals.

sec-amylamine. (2-aminopentane).

Properties: Colorless liquid. Bp 198F, d 0.7; flash p 20F (65.5C).

Hazard: Flammable, dangerous fire risk.

Use: See *n*-amylamine.

amylase. A class of enzymes which convert starch into sugars. Fungal and bacterial amylases from specific fungi and bacteria have been suggested for commercial fermentation processes.

Use: Textile desizing, conversion of starch to glucose sugar in syrups (especially corn syrups), baking (to improve crumb softness and shelf life), dry cleaning (to attack food spots and similar stains).

See amylpsin; diastase; ptyalin.

***n*-amylbenzene.** (1-phenylpentane).

$\text{C}_6\text{H}_5\text{CH}_2(\text{CH}_2)_3\text{CH}_3$. Water-white liquid, mild odor, fp -75C , bp 205C , d 0.8585 (20/4C), flash p 150F (65.5C) (OC). Insoluble in water, soluble in hydrocarbons and coal tar solvents. Combustible.

Hazard: Irritant to skin and eyes, narcotic in high concentrations. Moderate fire risk.

sec-amylbenzene. (2-phenylpentane).

Properties: Clear liquid. Fp -75C , bp 190.3C , d 0.861 (20/4C).

Hazard: Moderate fire hazard. Combustible. Irritant to skin and eyes, narcotic in high concentrations.

Grade: Pure, 99.0 mole %, technical, 95.0 mole %.

Use: Weed control, chemical intermediate.

amyl benzoate. See isoamyl benzoate.

amyl butyrate. See isoamyl butyrate.

amyl carbinol. See hexyl alcohol.

***n*-amyl chloride.** (1-chloropentane).

Properties: Colorless liquid. Bp 107.8C , fp -99C , d 0.883 (20/4C), refr index 1.4128 (20C), flash p 54F (12.2C) (OC). Miscible with alcohol and ether; insoluble in water. Autoign temp 500F (260C).

Derivation: (1) Distillation of amyl alcohol with salt and sulfuric acid, (2) addition of hydrochloric acid to α -amylene.

Grade: Technical.

Hazard: Flammable, dangerous fire risk; lower explosive level 1.4%, upper explosive level 8.6%. May be narcotic in high concentrations.

Use: Chemical intermediate.

amyl chlorides, mixed.

Properties: Straw- to purple-colored liquid. D 0.88 (20C), 95% distills between 85 and 109C, wt/gal 7.33 lb, refr index (20C) 1.406. Insoluble in water; water azeotrope at 77–82C approximately 90% $\text{C}_5\text{H}_{11}\text{Cl}$, miscible with alcohol and ether. Flash p 38F (3.3C) (OC). Components: 1-chloropentane, bp 107.8C; 2-chloropentane, bp 96.7C; 3-chloropentane, bp 97.3C; 1-chloro-2-methylbutane, bp 99.9C; 1-chloro-3-methylbutane, bp 98.8C; 3-chloro-2-methylbutane, bp 93.0C; 2-chloro-2-methylbutane, bp 86.0C.

Derivation: Vapor phase chlorination of mixed normal pentane and isopentane.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.4–8.6%. May be narcotic in high concentrations.

Use: Synthesis of other amyl compounds, solvent, rotogravure ink vehicles, soil fumigation.

α -amylcinnamic alcohol. (2-benzylidene-1-heptanol). $\text{C}_6\text{H}_5\text{CH}:\text{C}(\text{CH}_2\text{OH})\text{C}_5\text{H}_{11}$.

Properties: Yellow liquid; floral odor. D 0.954–0.962 (25/25C). Soluble in 3 parts 70% alcohol. Combustible.

Derivation: Synthetic.

Use: Perfumery, flavoring.

α -amylcinnamic aldehyde. (jasmine aldehyde; α -pentylcinnamaldehyde).

Properties: Clear, yellow, oily liquid; jasmine-like odor. D 0.962–0.968, refr index 1.554–1.559. Aldehyde content 97%. Soluble in 6 volumes of 80% alcohol. Combustible.

Derivation: Synthetic.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

6,*n*-amyl-*m*-cresol. $\text{C}_{12}\text{H}_{18}\text{O}$.

Properties: Liquid at room temperature. Mp 24C . Insoluble in water; soluble in acetone and ethanol.

Use: Prevention of molds, bactericide.

α ,*n*-amylene. Legal label name for 1-pentene.

β ,*n*-amylene. Legal label name for 2-pentene.

amylene dichloride. See dichloropentane.

amylene hydrate. See *tert*-amyl alcohol.

***n*-amyl ether.** (diamyl ether). $\text{C}_{10}\text{H}_{22}\text{O}$.

Properties: Colorless liquid. Bp 186C , fp -70C , d 0.783, flash p 135F (57C), autoign temp 340F (171C), refr index 1.41. Insoluble in water; soluble in alcohol and ether.

Hazard: Narcotic in high concentration.

Use: General solvent for fats, oils, waxes, resins, etc.

amyl formate. $\text{HCOOC}_5\text{H}_{11}$.

Properties: Colorless liquid composed of a mixture

of isomeric amyl formates with isoamyl formate in predominance. Plum-like odor. Less odoriferous and more active solvent than amyl acetate. It also has both a lower boiling point and a higher rate of evaporation. D 0.880–0.885, bp 123.5C, flash p 80F (26.6C). Miscible with oils, hydrocarbons, alcohols, ketones; slightly soluble in water.

Grade: Technical, FCC.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion and inhalation.

Use: Solvent for cellulose esters, resins; solvent mixtures; films and coatings; perfume for leather; flavoring.

***n*-amylfuroate.** (amyl pyromucate).

$C_4H_9OCO_2C_5H_{11}$.

Properties: Colorless oil. Decomposes on standing, d 1.0335 (20/4C), bp 233C. Insoluble in water; soluble in alcohol. Combustible.

Derivation: Esterification of furoic acid.

Use: Perfumes, lacquers.

amyl heptanoate. mf: $C_{12}H_{24}O_2$.

Properties: Colorless to pale yellow liquid; fruity taste. D: 0.859, refr index: 1.422.

Use: Food additive.

amyl hydrate. See amyl alcohol.

amyl hydride. See *n*-pentane.

amyl mercaptan. Legal label name for pentanethiol.

***tert*-amyl mercaptan.** See 2-methyl-2-butanethiol.

6-amylmercaptapurine. See 6-(pentylthio)purine.

amyl methyl alcohol.

CAS: 105-30-6. mf: $C_6H_{14}O$.

Properties: Liquid. Bp: 130°, flash p: 114°F (CC), d: 0.804, vap d: 3.52.

Hazard: Moderately toxic by ingestion and skin contact. A skin and severe eye irritant. Human systemic irritant by inhalation. A flammable liquid; can react with oxidizing materials. To fight fire, use CO_2 , dry chemical.

amyl nitrate (mixed isomers). $C_5H_{11}NO_3$.

Properties: Colorless liquid; ethereal odor. Bp 145C, flash p 118F (47.8C), d 0.99 (20C). Flammable.

Hazard: Oxidizing agent, moderate fire risk.

Use: Additive to increase cetane number of diesel fuels.

amyl nitrite. (isoamyl nitrite).

CAS: 463-04-7. $(CH_3)_2CHCH_2CH_2NO$.

Properties: Yellowish liquid; peculiar ethereal, fruity odor; pungent aromatic taste. D 0.865–0.875

(25C); bp 96–99C; autoign temp 405F (207C). Soluble in alcohol; almost insoluble in water. Decomposes on exposure to air, light, or water.

Derivation: Interaction of amyl alcohol with nitrous acid.

Grade: NF, (75% min), technical.

Hazard: Flammable, dangerous fire risk, a strong oxidizer. Vapor may explode if ignited.

Use: Perfumes, diazonium compounds.

amylglucosidase. An enzyme used commercially to convert starches to dextrose.

amylograph. A device designed to record the action of heat on a mixture of flour and water. It is used in measuring diastatic activity through viscosity change.

amyloid. A gelatinous hydrate that results from diluting a solution of concentrated sulfuric acid and cellulose with water.

amyopectin. The outer, almost insoluble portion of starch granules. It is a hexosan, a polymer of glucose, and is a branched molecule of many glucose units. It stains violet with iodine and forms a paste with water.

amylpsin. (animal diastase). The starch-digesting enzyme of pancreatic juice, the most powerful enzyme of the digestive tract. It is an amylase that converts starches through the soluble-starch stage to various dextrans and maltose. It acts in neutral, slightly acid, and slightly alkaline environments, with an optimum pH of 6.3–7.2. It requires the presence of certain negative ions for activation.

Use: Biochemical research.

amylose. The inner, relatively soluble portion of starch granules. Amylose is a hexosan, a polymer of glucose, and consists of long, straight chains of glucose units joined by a 1,4-glycosidic linkage. It stains blue with iodine. Microcrystalline amylose is available chiefly as a food ingredient and dietary energy source.

***o*-sec-amyphenol.** $C_5H_{11}C_6H_4OH$.

Properties: Clear, straw-colored liquid. D 0.955–0.971 (30/30C), initial bp over 235.0C, final bp below 250.0C, wt/gal 8.0 lbs. Very slightly soluble in water; soluble in oil and organic solvents, flash p 219F (OC). Combustible.

Use: Dispersing and mixing agent for paint pastes,

antiskinning agent for paint, varnish and oleoresinous enamels, organic synthesis.

p-tert-amylyphenol. $(\text{CH}_3)_2(\text{C}_6\text{H}_4)\text{CC}_6\text{H}_4\text{OH}$.

Properties: White crystals. Mp 93C, bp 265–267C (138C at 15 mm). Slightly soluble in water; soluble in alcohol and ether, flash p 232F (111C) (OC). Combustible.

Use: Manufacture of oil-soluble resins, chemical intermediate.

p-tert-amylyphenyl acetate.

Properties: Colorless liquid. D 0.996 (20C), boiling range 253–272C, fruity odor, flash p 240F (115.5C). Combustible.

Use: Perfumes, flavorings.

amyl propionate. $\text{CH}_3\text{CH}_2\text{COOC}_5\text{H}_{11}$. Probably the isoamyl isomer.

Properties: Colorless, high-boiling liquid; apple-like odor. D 0.869–0.873 (20/20C); wt/gal (20C) approximately 7.25 lbs; distillation range 135–175C; flash p 106F (41.1C) (OC); autoign temp 712F (377C). Miscible with most organic solvents. Flammable.

Derivation: By reacting amyl alcohol with propionic acid in the presence of sulfuric acid as a catalyst, followed by neutralization, drying, and distillation.

Hazard: Fire hazard.

Use: Perfumes, lacquers, flavors.

amyl pyromucate. See n-amyl furoate.

amyl salicylate. See isoamyl salicylate.

amyl sulfide. See diamyl sulfide.

amyltrichlorosilane. $\text{C}_5\text{H}_{11}\text{SiCl}_3$. A mixture of isomers.

Properties: Colorless to yellow liquid. Bp 168C, d 1.137 (25/25C), refr index 1.4152 (20C), flash p 145F (62.8C) (COC). Readily hydrolyzed by moisture with the liberation of hydrogen chloride. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and amyl magnesium chloride.

Hazard: Toxic and corrosive.

Use: Intermediate for silicones.

amyl valerate. See isoamyl valerate.

amyl valerianate. See isoamyl valerianate.

amyris oil, West Indian type.

Properties: Extracted from *Amryris balsamifera* L. (Fam. Rutaceae). Clear, pale yellow viscous liquid; odor of sandalwood. Sol in mineral oil, propylene glycol; insol in glycerin.

Use: Food additive.

“Amytal” [Lilly]. TM for amobarbital (USP).

anabesine. (neonicotine; 2-(3-pyridyl)piperidine). $\text{C}_{10}\text{H}_{14}\text{N}_2$. A naturally occurring alkaloid.

Properties: Colorless liquid, darkens on exposure to air. Bp 270C, fp 9C, d 1.046 (20/20C), refr index 1.5430 (20C). Miscible with water; soluble in alcohol and ether.

Derivation: (1) Extraction from *Anabasis aphylla* and *Nicotiana glauca*, (2) synthetic.

Use: Insecticide.

anabolism. The phase of intermediary metabolism concerned with the energy-requiring biosynthesis of cell components from smaller precursors.

anacardic acid. $\text{C}_{22}\text{H}_{32}\text{O}_3$. The chief component of cashew nutshell oil.

anacardium gum. See cashew gum.

anaerobe. An organism that lives without oxygen and uses another chemical species as a terminal electron acceptor. Obligate anaerobes die when exposed to oxygen; facultative anaerobes can live in both aerobic and anaerobic environments.

anaerobic. Descriptive of a chemical reaction or a microorganism that does not require the presence of air or oxygen. Examples are the fermentation of sugars by yeast and the decomposition of sewage sludge by anaerobic bacteria. It is also applied to certain polymers that solidify when kept out of contact with air.

See “Loctite”; bacteria; botulism.

anagensis. Evolutionary change along an unbranching lineage; change without speciation.

analcite. (analcime). $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A mineral, one of the zeolites.

Properties: Colorless, white, sometimes greenish-grayish, yellowish, or reddish white. Hardness 5–5.5; d 2.22–2.29.

Occurrence: Europe, U.S., Nova Scotia.

analgin-tempidone mixture. See tempalgin.

analytical chemistry. The subdivision of chemistry concerned with identification of materials (qualitative analysis) and with determination of the percentage composition of mixtures or the constituents of a pure compound (quantitative analysis). The gravimetric and volumetric (or “wet”) methods (precipitation, titration, and solvent extraction) are still used for routine work; indeed, new titration methods have been introduced, e.g., cryoscopic methods, pressure-metric methods (for reactions that produce a gaseous product), redox methods, and use of an F-sensitive electrode. However, faster and more accurate techniques (collectively called instrumental) have been developed in the last few decades. Among these are infrared, ultraviolet, and X-ray

spectroscopy, where the presence and amount of a metallic element are indicated by lines in its emission or absorption spectrum; colorimetry, by which the percentage of a substance in solution is determined by the intensity of its color, chromatography of various types, by which the components of a liquid or gaseous mixture are determined by passing it through a column of porous material or on thin layers of finely divided solids, separation of mixtures in ion-exchange columns; and radioactive tracer analysis. Optical and electron microscopy, mass spectrometry, microanalysis, nuclear magnetic resonance (NMR), and nuclear quadrupole resonance (NQR) spectroscopy all fall within the area of analytical chemistry. New and highly sophisticated techniques have been introduced in recent years, in many cases replacing traditional methods.

See spectroscopy; nuclear magnetic resonance; nuclear quadrupole resonance spectroscopy; chromatography; fiber, optical; supercritical fluid.

anandamide. A fat produced by the brain that stimulates the same receptors as THC (1-*trans*- Δ^9 -tetrahydrocannabinol), the psychoactive substance in marijuana and hashish.

See *n*-(2-hydroxyethyl)-5,8,11,14-eicosatetraenamide (all-*z*)-.

anaphoresis. The migration of dispersed particles under the influence of an electrical field toward an anode.

anaphylaxis. Abnormal reaction to a second injection of a foreign protein, e.g., penicillin. It is an extreme form of allergy which often has serious consequences (swelling of tissues) and has been known to be fatal.

anaplerotic reaction. An enzyme-catalyzed reaction that can replenish the supply of intermediates in a metabolic pathway, most commonly the citric acid cycle.

anatase. (octahedrite). A natural crystallized form of titanium dioxide, d 3.8, refr index 2.5, mp 1560C.

andalusite. Al_2OSiO_4 . A natural silicate of aluminum.

Properties: Gray, greenish, reddish, or bluish in color. D 3.1–3.2, hardness 7–7.5.

Occurrence: Massachusetts, Connecticut, California, Nevada, Europe, South Africa, Australia.

Use: Constituent of sillimanite refractories, spark-plug insulators, laboratory ware, superrefractories.

androgen. A male sex hormone. The androgenic hormones are steroids and are synthesized in the body by the testis, the cortex of the adrenal gland, and, to a slight extent, by the ovary.

androstenolone. See DHEA.

androsterone. $C_{19}H_{30}O_2$. An androgenic steroid, metabolic product of testosterone. The international unit (IU) of androgenic activity is defined as 0.1 mg androsterone.

Properties: Crystalline solid. Mp 185–185.5C, sublimes in high vacuum. Dextrorotatory in solution. Not precipitated by digitonin. Practically insoluble in water; soluble in most organic solvents.

Derivation: Isolation from male urine, synthesis from cholesterol.

Use: Medicine, biochemical research.

Andrussov oxidation. Ammonia and methane are oxidized with air in the presence of platinum catalyst to form hydrogen cyanide. Side reactions are hydration of methane to carbon dioxide and hydrogen, and oxidation of methane and ammonia to carbon monoxide and nitrogen. The reaction is strongly exothermic. The process has been elaborated wherever natural gas is abundant.

anesthetic. A chemical compound that induces loss of sensation in a specific part or all of the body. A brief classification of the more important agents is as follows:

(A) General

(1) Hydrocarbons

(a) Cyclopropane (USP). Effective in presence of substantial proportions of oxygen; flammable.

(b) Ethylene (USP). Rapid anesthesia and rapid recovery; flammable.

(2) Halogenated hydrocarbons

(a) Chloroform. Nonflammable. Its use is being abandoned because of its high toxicity.

(b) Ethyl chloride. A gas at room temperature, liquefies at relatively low pressure. Applied as a stream from container directly on tissue. Sometimes used in gaseous form as inhalation-type general anesthetic. Flammable.

(c) Trichloroethylene. Toxic and flammable. Used as general anesthetic since 1934.

(3) Ethers

(a) Ethyl ether (USP). First anesthetic used in surgery (1846), now largely replaced with less dangerous types. Highly flammable, explodes in presence of spark or open flame.

(b) Vinyl ether. A liquid having many of the physiological properties of ethylene and ethyl ether. Highly flammable.

(4) Miscellaneous

(a) Tribromoethanol. Basal anesthetic, supplemented by an inhalation type when general anesthesia is needed. Ingredient of "Avertin."

(b) Nitrous oxide. Originally prepared by Priestley in 1772 (laughing gas); first used as anesthetic by Humphry Davy in 1800. Used (with oxygen) largely for dental surgery. Nonflammable.

(c) Barbiturates.

(B) Local

(1) Alkaloids (cocaine)

(2) Synthetic products (procaine group, e.g., "Novocain"); alkyl esters of aromatic acids (topical).

(3) Quinine hydrochloride.

anethole. (anise camphor; *p*-methoxypropenylbenzene; *p*-propenylanisole).

Properties: White crystals; sweet taste; odor of oil of anise. Affected by light. D 0.983–0.987, refr index 1.557–1.561, optical rotation 0.08, mp 22–23C, distillation range 234–237C. Soluble in 8 volumes of 80% alcohol, 1 volume of 90% alcohol; almost immiscible with water.

Derivation: By crystallization from anise or fennel oils; synthetically from *p*-cresol.

Grade: USP, technical, FCC.

Use: Perfumes, particularly for dentifrices, flavors, synthesis of anisic aldehyde, licorice candies, color photography (sensitizer in color-bleaching process), microscopy.

Anfinsen, Christian B. (1916–1991). An American biochemist who won the Nobel Prize for chemistry in 1972. His work involved the molecular basis of evolution and the chemistry of enzymes. He worked with Moore and Stein. His doctorate was granted from Harvard.

ANFO. A high explosive based on ammonium nitrate.

See explosive, high.

angelic acid. (*cis*-2-methyl-2-butenic acid; α -methyl-crotonic acid). $\text{CH}_3\text{CH}:\text{C}(\text{CH}_3)\text{COOH}$. The *cis* isomer of tiglic acid.

Properties: Colorless needles or prismatic crystals; spicy odor. D 0.9539 (76/4C), mp 45C, bp 185C, refr index 1.4434 (47C). Soluble in alcohol, ether, and hot water.

Derivation: From the root of *Angelica archangelica* or from the oil of *Anthemis nobilis* by distillation.

Use: Flavoring extracts.

angelica oil.

Properties: Essential oil; strong aromatic odor; spicy taste. D 0.853–0.918, optical rotation +16 to +41.

Soluble in alcohol. Chief known constituents: phellandrene, valeric acid. Combustible.

Derivation: Distilled from the roots and seeds of *Angelica archangelica* found principally in Europe.

Grade: Technical, FCC.

Use: Preparation of liqueurs, perfumery.

angelica seed oil.

Properties: Extracted from seeds of *Angelica archangelica* L. A light yellow liquid; sweet taste. Sol in fixed oils; sltly sol in mineral oil; insol in glycerin, propylene glycol.

Use: Food additive.

"Angio-Conray" [Mallinckrodt]. TM for an 80% solution of sodium iothalamate used in diagnostic medicine.

angiotensin. (angiotonin; hypertensin). A peptide found in the blood, important in its effect on blood pressure. Both a decapeptide and an octapeptide are known. Their amino acid sequences and hence the complete structures have been established.

angiotonin. See angiotensin.

Ångstrom. (Å). A unit of length almost one one-hundred millionth (10^{-8}) centimeter. The Ångstrom is defined in terms of the wavelength of the red line of cadmium (6438.4696 Å). Used in stating distances between atoms, dimensions of molecules, wavelengths of short-wave radiation, etc. See nanometer.

anhydride. A chemical compound derived from an acid by elimination of a molecule of water. Thus, sulfur trioxide (SO_3) is the anhydride of sulfuric acid (H_2SO_4), carbon dioxide (CO_2) is the anhydride of carbonic acid (H_2CO_3), and phthalic acid [$\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$] minus water gives phthalic anhydride [$\text{C}_6\text{H}_4(\text{CO}_2)\text{O}$]. Not to be confused with anhydrous.

anhydrite. CaSO_4 . A natural calcium sulfate usually occurring as compact granular masses and resembling marble in appearance. Differs from gypsum in hardness and lack of hydration.

8,9-anhydro-4'-deoxy-3'-*n*-desmethyl-3'-*n*-ethylerythromycin b-6,9-hemiacetal.

CAS: 150785-53-8. mf: $\text{C}_{38}\text{H}_{67}\text{NO}_{10}$.

Hazard: A poison.

anhydroenneheptitol. (AEH; 4-hydroxy-2H-pyran-3,3,5,5(4H,6H)tetramethanol).

Use: Alkyd resins, rosin esters, urethane coatings and foams, surfactants, lubricating oil additives.

anhydrous. Descriptive of an inorganic compound that does not contain water either adsorbed on its surface or combined as water of crystallization. Do not confuse with anhydride.

anidex. A synthetic fiber designated by the FTC as a cross-linked polyacrylate elastomer.

anileridine. (ethyl-1-(*p*-aminophenethyl)-4-phenylisonipecotate). $C_{22}H_{28}N_2O_2$.

Properties: White crystalline powder; odorless. Oxidizes and darkens in air and on exposure to light. Exhibits polymorphism of two crystalline forms observed, one melts at approximately 80C and the other at approximately 89C. Soluble in alcohol and chloroform; very slightly soluble in water.

Grade: NF.

Hazard: Addictive.

Use: Medicine (narcotic).

aniline. (aniline oil; phenylamine; aminobenzene).

CAS: 62-53-3. $C_6H_5NH_2$. One of the most important of the organic bases, the parent substance for many dyes and drugs.

Properties: Colorless, oily liquid; characteristic odor and taste; rapidly becomes brown on exposure to air and light. Vapors will contaminate foodstuffs and damage textiles. D 1.0235, solidifies at $-6.2C$, bp 184.4C, wt/gal 8.52 lbs (20C), refr index 1.5863 (20C), flash p 158F (70C) (CC), autoign temp 1140F (615C). Soluble in alcohol, ether, and benzene; soluble in water.

Derivation: By (1) catalytic vapor-phase reduction of nitrobenzene with hydrogen; (2) reduction of nitrobenzene with iron filings using hydrochloric acid as catalyst; (3) catalytic reaction of chlorobenzene and aqueous ammonia; (4) ammonolysis of phenol (Japan).

Grade: Commercial, CP.

Hazard: An allergen. Toxic if absorbed through the skin. TLV: 2 ppm. Combustible.

Use: Rubber accelerators and antioxidants, dyes and intermediates, photographic chemicals (hydroquinone), isocyanates for urethane foams, pharmaceuticals, explosives, petroleum refining, diphenylamine, phenolics, herbicides, fungicides.

aniline acetate. $C_6H_5NH_2 \cdot CH_3COOH$.

Properties: Colorless liquid, becomes dark with age; on standing or heating is converted gradually to acetanilide. D 1.070–1.072. Miscible with water and alcohol. Combustible.

Use: Organic synthesis.

aniline, arsenate. See arsenic acid, aniline salt.

aniline black. A black dye developed on cotton and other textiles from a bath containing aniline hydrochloride, an oxidizing agent (usually chromic acid), and a catalyzer (usually a vanadium or copper salt).

Hazard: See aniline.

aniline chloride. See aniline hydrochloride.

aniline-2,4-disulfonic acid. See 4-amino-*m*-benzenedisulfonic acid.

aniline-2,5-disulfonic acid. See 2-amino-*p*-benzene-3,4'-disulfonic acid.

aniline dye. Any of a large class of synthetic dyes made from intermediates based on or made from aniline. Most are somewhat toxic and irritating to eyes, skin, and mucous membranes. They are generally much less toxic than the intermediates from which they are derived.

aniline hydrochloride. (aniline salt; aniline chloride). $C_6H_5NH_2 \cdot HCl$.

Properties: White crystals; commercial product frequently greenish in appearance; darkens in light and air. D 1.2215, mp 198C, bp 245C. Soluble in water, alcohol, and ether.

Derivation: By (1) passing a current of dry hydrogen chloride gas into an ethereal solution of aniline, (2) neutralizing aniline at 100C with concentrated hydrochloric acid and subsequent crystallization.

Hazard: See aniline.

Use: Intermediates, dyeing and printing, aniline black.

aniline ink. A fast-drying printing ink used on kraft paper, cotton fabric, cellophane, polyethylene, etc. The name is due to the fact that original inks for this purpose were solutions of coal tar dyes in organic solvents. Modern inks usually employ pigments rather than dyes and are of two types: spirit inks containing organic solvent as the vehicle, and emulsion inks in which water is the main vehicle.

aniline point. The lowest temperature at which equal volumes of aniline and the test liquid are miscible. Cloudiness occurs on phase separation. Used as a test for components of hydrocarbon fuel mixtures.

aniline salt. See aniline hydrochloride.

***p*-anilinesulfonic acid.** See sulfanilic acid.

aniline yellow. See *p*-aminoazobenzene.

1-anilino-4-hydroxyanthraquinone.

$C_6H_4(CO)_2C_6H_2(OH)NHC_6H_5$ (tricyclic). A chemical intermediate.

anilinophenol. See *p*-hydroxydiphenylamine.

anilophos.CAS: 64249-01-0. mf: $C_{13}H_9ClNO_3PS_2$.**Hazard:** Moderately toxic by ingestion and skin contact.**Use:** Agricultural chemical.**animal black.** See bone black.**animal diastase.** See amylopsin.**animal oil.** See bone oil.**animal starch.** See glycogen.**anion.** An ion having a negative charge, anions in a liquid subjected to electric potential collect at the positive pole or anode. Examples are hydroxyl, OH^- ; carbonate, CO_3^{2-} ; phosphate, PO_4^{3-} .***o*-anisaldehyde.** (*o*-methoxybenzaldehyde; *o*-anisic aldehyde).CAS: 135-02-4. $C_8H_8(OCH_3)CHO$.**Properties:** White to light tan solid; burned, slightly phenolic odor. Bp 238C, mp (two crystalline forms) 38–39C and 3C, d (liquid) 1.1274 (25/25C), (solid) 1.258 (25/25C), refr index 1.5608 (20C), flash p 244F (117C). Insoluble in water; soluble in alcohol. Combustible.**Grade:** 95% (min).**Use:** Intermediate.***p*-anisaldehyde.** (aubepine; *p*-anisic aldehyde; *p*-methoxybenzaldehyde).CAS: 123-11-5. $C_8H_8(OCH_3)CHO$.**Properties:** Colorless to pale yellow liquid; odor of hawthorn. D 1.119–1.122, refr index 1.570–1.572, mp OC, bp 248C. Insoluble in water; soluble in 5 volumes of 50% alcohol. Combustible.**Derivation:** Obtained from anethole or anisole by oxidation.**Grade:** Liquid and crystals, the latter being the disulfite compound.**Use:** Perfumery, intermediate for antihistamines, electroplating, flavoring.**(–)-anisatin.**CAS: 5230-87-5. mf: $C_{15}H_{20}O_8$.**Hazard:** Moderately toxic by ingestion.**Source:** Natural product.**anise alcohol.** See anisic alcohol.**anise camphor.** See anethole.**anise oil.** (anise seed oil; aniseed oil).

See anethole.

anisic acid. (*p*-methoxybenzoic acid). $CH_3OC_6H_4COOH$.**Properties:** White crystals or powder. D 1.385 (4C), mp 184C, bp 275–280C. Soluble in alcohol and ether; almost insoluble in water.**Derivation:** Oxidation of anethole.**Use:** Repellent and ovicide.**anisic alcohol.** (anisyl alcohol; anise alcohol; *p*-methoxybenzyl alcohol). $CH_3OC_6H_4CH_2OH$.**Properties:** Solidifies at room temperature; floral odor. D 1.111–1.114, refr index 1.541–1.545, boiling range 255–265C. Soluble in 1 volume of 50% alcohol; insoluble in water. Combustible.**Derivation:** Obtained from anisic aldehyde by reduction.**Grade:** Technical, FCC.**Use:** In perfumery for light floral odors, pharmaceutical intermediate, flavoring.**anisic aldehyde.** See anisaldehyde.***o*-anisidine.** (*o*-methoxyaniline; *o*-amino-anisole).CAS: 90-04-0. $CH_3OC_6H_4NH_2$.**Properties:** Reddish or yellowish oil; becomes brownish on exposure to air, volatile with steam. D 1.097 (20C), bp 225C, fp 5C. Soluble in dilute mineral acid, alcohol, and ether; insoluble in water.**Derivation:** (1) Reduction of *o*-nitroanisole with tin or iron and hydrochloric acid; (2) heating *o*-aminophenol with potassium methyl sulfate.**Method of purification:** Steam distillation.**Grade:** 99% (1% max moisture).**Hazard:** Strong irritant. TLV: 0.5 mg/m³. Toxic when absorbed through the skin.**Use:** Intermediate for azo dyes and for guaiacol.***p*-anisidine** (*p*-methoxyaniline; *p*-aminoanisole).CAS: 104-94-9. $CH_3OC_6H_4NH_2$.**Properties:** Fused, crystalline mass. Crystallizing point 57.2C (min), d 1.089 (55/55C), bp 242C. Soluble in alcohol and ether; slightly soluble in water.**Derivation:** (1) Reduction of *p*-nitroanisole with iron filings and hydrochloric acid; (2) methylation of *p*-aminophenol.**Grade:** Technical.**Hazard:** Strong irritant. TLV: 0.5 mg/m³. Toxic when absorbed through the skin.**Use:** Azo dyestuffs, intermediate.**anisindione.** (2,*p*-anisyl-1,3-indandione). $C_{16}H_{12}O_3$.**Properties:** Pale yellow crystals. Mp 156–157C.**Grade:** ND.**Use:** Anticoagulant (blood).**anisole.** (methylphenyl ether; methoxybenzene).CAS: 100-66-3. $C_6H_5OCH_3$.**Properties:** Colorless liquid; aromatic odor. D 0.999

(15/15C), fp -37.8C , bp 155C , refr index 1.5170 (20C), flash p 125F (51.6C) (OC). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: From sodium phenate and methyl chloride, heating phenol with methanol.

Use: Solvent, perfumery, vermicide, intermediate, flavoring.

anisomycin. $\text{C}_{14}\text{H}_{19}\text{NO}_4$.

Properties: Needles. Mp 140C . Slightly soluble in water; soluble in low-molecular weight alcohols, ketones, and chloroform; slightly soluble in organic solvents. Water solutions are stable at room temperature over broad range of pH.

Use: Fungus inhibitor, mildew preventive in vegetables.

anisotropic. Descriptive of crystals whose index of refraction varies with the direction of the incident light. This is true of most crystals, e.g., calcite (Ice-land spar); it is not true of isometric (cubic) crystals, which are isotropic.

anisotropy factor. The coefficient by which the contribution of one absorption band to the ordinary refraction has to be multiplied in order to obtain the rotatory contribution of the same band.

anisoyl chloride.

CAS: 100-07-2. $\text{CH}_3\text{OC}_6\text{H}_4\text{COCl}$.

Properties: Clear crystals or amber liquid. Mp 22C , bp $262\text{--}263\text{C}$. Soluble in acetone and benzene; decomposed by water or alcohol. Fumes in moist air.

Use: Intermediate for dyes and medicines.

Hazard: Solutions corrosive to tissue. Explosion risk when in closed containers due to pressure caused by decomposition at room temperature.

n-anisoyl-gaba.

CAS: 72432-14-5. mf: $\text{C}_{12}\text{H}_{15}\text{NO}_4$.

Hazard: A poison by ingestion.

anisyl acetate. (*p*-methoxybenzyl acetate).

$\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{COCH}_3$.

Properties: Colorless liquid; lilac odor. D 1.104–1.107, refr index 1.514–1.516. Soluble in 4 volumes of 60% alcohol. Combustible.

Derivation: Reaction of anisic alcohol with acetic anhydride.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

anisylacetone. (generic name for 4-(*p*-methoxyphenyl)-2-butanone).

$\text{CH}_3\text{OC}_6\text{H}_4\text{C}_2\text{H}_4\text{COCH}_3$.

Properties: A colorless to pale yellow liquid. Mp 8C . Combustible.

Use: In insect attractants, organic synthesis, flavoring.

anisyl alcohol. See anisic alcohol.

***p*-anisylchlorodiphenylmethane.** (*p*-methoxytriphenylmethyl chloride).

$\text{CH}_3\text{OC}_6\text{H}_4\text{C}(\text{C}_6\text{H}_5)_2\text{Cl}$.

Properties: Mp $122\text{--}124\text{C}$, mw 308.81.

Grade: Research.

Hazard: Skin and eye irritant.

Use: NH_2^- protecting reagent for amino acids in oligonucleotide synthesis.

anisyl formate. (*p*-methoxybenzyl formate).

$\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{OCOH}$.

Properties: Colorless liquid; lilac odor. D 1.139–1.141. Soluble in 5.5 volumes of 70% alcohol. Combustible.

Use: Perfumery, flavoring.

2*p*-anisyl-1,3-indandione. See anisindione.

annatto. $\text{C}_{27}\text{H}_{34}\text{O}_4$. Vegetable dye containing ethyl bixin.

Derivation: From the seeds of *Bixa orellana*.

Occurrence: South America, West Indies, India.

Use: (As extract) coloring margarine, sausage casings, etc.; food-product marking inks. For details, see regulations of Meat Inspection Division, USDA and FDA regulations.

See bixin.

anneal. Generally synonymous with “hybridize”.

annealing. Maintenance of glass or metal at a specified temperature for a specific length of time (at least three days for plate glass) and then gradual cooling at a predetermined rate. This treatment removes the internal strains resulting from previous operations and eliminates distortions and imperfections. A clearer, stronger, and more uniform material results.

See temper.

annealing point, glass. The temperature at which the internal stress in glass is substantially relieved within 15 minutes.

annellation. A chemical reaction in which one cyclic or ring structure is added to another to form a polycyclic compound.

annotation. Adding pertinent information such as the gene coded for, the amino acid sequence, or other commentary to the database entry of raw sequence of DNA bases.

See bioinformatics.

“Ano” [BASF]. TM for a series of dyestuffs used for coloring anodized aluminum.

See anodic coating.

anode. The positive electrode of an electrolytic cell, to which negatively charged ions travel when an electric current is passed through the cell. Such anodes are usually made of graphite or other form of

carbon, although titanium has been successfully introduced in the chlor-alkali industry. In a primary cell (battery or fuel cell), the anode is the negative electrode.

See cathode; electrode.

anode mud. Residue obtained from the bottom of a copper or other plating bath. In the electrolytic refining of copper, the anode mud contains the relatively inert metals platinum, silver, and gold and is usually collected and treated for the recovery of these metals and other rare elements.

anode process. See electrophoresis.

anodic coating. (anodizing). The electrolytic treatment of aluminum, magnesium, and a few other metals as a result of which heavy, stable films of oxides are formed on their surfaces. A thin oxide film will form on an aluminum surface without special treatment on exposure of the metal to air. This provides excellent resistance to corrosion. This fact led to the development of electrochemical processes to produce much thicker and more effective protective and decorative coatings. The chief electrolytes used are sulfuric, oxalic, and chromic acids. The metal acts as the anode. Such anodic coatings are hard and have good electrical insulating properties. Their ability to absorb dyes and pigments makes it possible to obtain finishes in a complete range of colors, including black. The luster of the underlying metal gives them a metallic sheen; colorants can be used to reproduce the color of any metal with which the aluminum might be used. Anodized coatings can be used as preparatory treatments to electroplating; copper, nickel, cadmium, silver, and iron have been successfully deposited over oxide coatings.

See aluminum.

anodizing. See anodic coating.

anomalous dispersion. The inversion of the usual change of refractive index with wavelength near an absorption band.

anomer. A special kind of diastereoisomer (or epimer) occurring in some sugars and other substances having asymmetric carbon atoms.

anomeric. Denoting sugar modifications that differ only in that the H and OH, or H and OMe on the reducing carbon are reversed.

anomers. Two stereoisomers (α and β) of a given sugar that differ only in the configuration about the carbonyl (anomeric) carbon atom (carbon 1 for pyranoses and carbon 2 for furanoses).

anoxomer.

CAS: 60837-57-2.

Properties: A polymer consisting of 1,4-benzenediol, 2-(1,1-dimethylethyl)-polymer with diethyl-

benzene, 4-(1,1-dimethylethyl)phenol, 4-methoxyphenol, 4,4'(1-methylethylidene)bis(phenol) and 4-methylphenol.

Use: Food additive.

ANPO. Abbreviation for α -naphthylphenyloxazole.

Anrade's theory. This states that viscosity is the result of transportation of momentum in collisions of molecules.

ANSI. See American National Standards Institute.

antabuse.

Use: Drug for treatment of alcoholism.

See tetraethylthiuram disulfide.

antacid. Any mildly alkaline substance, such as sodium bicarbonate, taken internally or in water solution to neutralize excess stomach acidity.

antagonist, structural. (antimetabolite). An organic compound that is structurally related to a biologically active substance (enzyme, nucleic acid, amino acid, etc.) and that acts as an inhibitor of its growth and development. Such biological antagonism exists between sulfa drugs and *p*-aminobenzoic acids, and also between histamine and a group of compounds collectively called antihistamines. One of the most important of these from an agricultural standpoint is imidazole, which, together with similar compounds, is used to "antagonize" the metabolism of insects, especially those attacking fabrics; it is also being used in irrigation waters to protect plants from pests. Structural antagonists have important medical applications in the complex field of allergic disease.

See antihistamine; anticoagulant; antigen-antibody.

"Antarcticine" [Centerchem]. TM for a high molecular weight glycoprotein obtained from an antarctic strain of bacteria.

Use: Provides stability to proteins and lipid membranes exposed to extreme cold and dryness.

"Antaron FC-34" [BASF]. TM for a high-foaming, water-soluble, amphoteric surfactant with soaplike qualities, a complex fatty amido compound 40% active.

Use: Fulling agent and detergent for woolen and worsted fabrics; effective under neutral, acid, and alkaline conditions; recommended for use in bubble baths, detergents, and in soaps for dedusting purposes.

antazoline. $C_{17}H_{19}N_3$.

Properties: White, odorless crystalline powder with bitter taste. Mp 120C. Sparingly soluble in alcohol and water; practically insoluble in benzene and ether.

Use: Medicine (antihistamine). Available as hydrochloride and phosphate.

anteiso- Prefix denoting an isomer (usually a fatty acid or derivative) that has a single, simple branching attached at the third carbon from the end of a straight chain, in distinction to an iso- compound, where the attachment is to the second carbon from the end. For example, isododecanoic acid would be $\text{CH}_3\text{CH}(\text{CH}_3)(\text{CH}_2)_8\text{COOH}$, while anteisododecanoic acid would be $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)(\text{CH}_2)_7\text{COOH}$.

anthelmintic. An agent used in veterinary medicine as a vermifuge.

anthelmycin. USAN name for an antibiotic substance produced by *Streptomyces longissimus*.

antheridiol. $\text{C}_{29}\text{H}_{42}\text{O}_5$.

Properties: Colorless, fine crystals. Mp 250C. Slightly soluble in water; soluble in warm methanol.

Use: A plant hormone having a specific sex function, it is secreted by certain water molds. It has been used to modify plant fertility. Said to be the first plant sex hormone to be discovered (1942).

anthocyanin. A flavonoid plant pigment that accounts for most of the red, pink, and blue colors in plants, fruits, and flowers. Water soluble. See flavonoid.

anthonaphthol as. See C.I. azoic coupling component 2.

anthophyllite. $(\text{Mg},\text{Fe})_7\text{Si}_8\text{O}_{22}(\text{OH})_2$. A natural magnesium-iron silicate. See asbestos.

anthracene.

CAS: 120-12-7. $\text{C}_6\text{H}_4(\text{CH})_2\text{C}_6\text{H}_4$.

Properties: Yellow crystals with blue fluorescence. D 1.25 (27/4C), mp 217C, bp 340C, fp 250F (121C) (CC). Soluble in alcohol and ether; insoluble in water. Combustible. It has semiconducting properties.

Derivation: (1) By salting out from crude anthracene oil and draining. The crude salts are purified by pressing and finally phenanthrene and carbazole are removed by the use of various solvents. (2) By distilling crude anthracene oil with alkali carbonate in iron retorts, the distillate contains only anthracene and phenanthrene. The latter is removed by carbon disulfide.

Impurities: Phenanthrene, carbazole, and chrysene.

Method of purification: By sublimation with superheated steam or by crystallization from benzene followed by sublimation; for very pure crystals, zone melting of solid anthracene.

Grade: Commercial (90–95%), pure crystals.

Hazard: A carcinogen.

Use: Dyes, alizarin, phenanthrene, carbazole, anthraquinone, calico printing, a component of smoke screens, scintillation counting crystals, organic semiconductor research.

anthracene oil. A coal tar fraction boiling in the range 270–360C, a source of anthracene and similar aromatics. Also used as a wood preservative and pesticide, except on food crops.

Hazard: A carcinogen.

1,8,9-anthracenetriol. See anthralin.

anthracite. See coal.

anthragallic acid. See anthragallic acid.

anthragallic acid. (1,2,3-trihydroxyanthraquinone; anthragallic acid). $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3(\text{OH})_3$. Tricyclic.

Properties: Brown powder. Soluble in alcohol, ether, and glacial acetic acid; slightly soluble in water and chloroform. Sublimes at 290C.

Derivation: Product of the reaction of benzoic, gallic, and sulfuric acids.

Use: Dyeing.

“Anthragen” [BASF]. TM for a series of lake colors. Used for printing inks, wallpaper, coated paper, paint, rubber, and organic plastics.

“Anthralan” [BASF]. TM for a series of acid dyestuffs. Used on wool.

anthralin. (1,8,9-anthracenetriol; 1,8-dihydroxyanthranol). $\text{C}_{14}\text{H}_{10}\text{O}_3$.

Properties: Odorless, tasteless, yellow powder. Mp 176–181C. Filtrate from water suspension is neutral to litmus. Soluble in chloroform, acetone, benzene, and solutions of alkali hydroxide; slightly soluble in alcohol, ether, and glacial acetic acid; insoluble in water. Combustible.

Derivation: By catalytic reduction of 1,8-dihydroxyanthraquinone with hydrogen at high pressure.

Grade: NF, 95%.

Hazard: Very irritating. Do not use on scalp or near eyes.

Use: Medicine (treatment of psoriasis).

anthranilic acid. (*o*-aminobenzoic acid).

CAS: 118-92-3. $\text{C}_6\text{H}_4(\text{NH}_2)(\text{CO}_2\text{H})$.

Properties: Yellowish crystals; sweetish taste. Mp 144–146C (sublimes). Soluble in hot water, alcohol, and ether. Combustible.

Derivation: Phthalimide plus an alkaline hypobromite solution.

Grade: Technical (95–98%), 99% or better.
Use: Dyes, drugs, perfumes, and pharmaceuticals.

anthranol. (9-hydroxyanthracene). $C_{14}H_9OH$.
Properties: Crystals. Mp 120C. Soluble in organic solvents with a blue fluorescence. Changes in solution to anthrone. Combustible.
Use: Dyes.

anthranone. See anthrone.

anthrapurpurin. (1,2,7-trihydroxyanthraquinone; isopurpurin; purpurin red). $C_6H_3OH(CO)_2C_6H_2(OH)_2$. Tricyclic.
Properties: Orange-yellow needles. Mp 369C, bp 462C. Soluble in alcohol and alkalis; slightly soluble in ether and hot water.
Derivation: By fusion of anthraquinonedisulfonic acid with caustic soda and potassium chlorate; the melt is run into hot water and the anthrapurpurin precipitated by hydrochloric acid.
Use: Dyeing, organic synthesis.

anthraquinone.
 CAS: 84-65-1. $C_6H_4(CO)_2C_6H_2$.

Properties: Yellow needles. D 1.419–1.438, mp 286C, bp 379–381C, flash p 365F (185C) (CC). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.
Derivation: (1) By heating phthalic anhydride and benzene in the presence of aluminum chloride and dehydrating the product; (2) by condensation of 1,4-naphthoquinone with butadiene.
Method of purification: Sublimation.
Grade: Sublimed, 30% paste (sold on 100% basis), electrical 99.5%.
Use: Intermediate for dyes and organics, organic inhibitor, bird repellent for seeds.
 See anthraquinone dye.

anthraquinone-1,5- and 1,8-disulfonic acids. (rho acid, chi acid, respectively). $C_{14}H_8O_6S_2$.
Properties: (in pure state) Slightly yellow to white crystals. The technical grade is grayish-white. Soluble in water and strong sulfuric acid. The 1,8-isomer is the more soluble. The 1,5-disulfonic acid melts with decomposition at 310–311C. The 1,8-isomer melts and decomposes at 293–294C.
Derivation: Anthraquinone is sulfonated with fuming sulfuric acid in the presence of mercury or mercuric oxide to a mixture of the 1,5- and 1,8-disulfon-

ic acids, which are separated by fractional crystallization.

Method of purification: Fractional crystallization from strong sulfuric acid, or in the form of their alkali salts from either acid or alkaline solutions.
Grade: Technical.
Use: Dyes.

anthraquinone dye. $C_6H_4(CO)_2C_6H_4$. A dye whose molecular structure is based on anthraquinone. The chromophore groups are $=C=O^-$ and $=C=C=$. The benzene ring structure is important in the development of color. CI numbers from 58000 to 72999. These are acid or mordant dyes when OH or HSO_3 groups, respectively, are present. The anthraquinone dyes that can be reduced to an alkaline solution leuco (vat) derivative having affinity for fibers and that can be reoxidized to the dye are known as anthraquinone vat dyes. They are largely used on cotton, rayon, and silk, and have excellent properties of color and fastness.

anthrarufin. See 1,5-dihydroxyanthraquinone.

anthrone. (anthranone; 9,10-dihydro-9-oxoanthracene). $C_{14}H_{10}O$. The keto is the more stable form of anthranol.
Properties: Colorless needles. Mp 156C. Insoluble in water; soluble in alcohol, benzene, and hot sodium hydroxide solutions.
Derivation: Reduction of anthraquinone with tin and hydrochloric acid.
Use: Rapid determination of sugar in body fluids, and of animal starch in liver tissue; general reagent for carbohydrates; organic synthesis.

anti-. (1) A prefix used in designating geometrical isomers in which there is a double bond between the carbon and nitrogen atoms. This prevents free rotation, so that two different spatial arrangements of substituent atoms or groups are possible. When a given pair of these are on opposite sides of the double bond, the arrangement is called *anti*-; when they are on the same side, it is called *syn*-, as indicated below:

These prefixes are disregarded in alphabetizing chemical names. (2) A prefix meaning “against” or “opposed to,” as in antibody, antimalarial, etc.

antianxiety agent. See psychotropic drug.

antibiotic. A chemical substance produced by microorganisms that has the capacity in dilute solutions to inhibit the growth of other microorganisms or destroy them. Only approximately 20 out of several hundred known have proved generally useful in therapy. Those that are used must conform to FDA

requirements. The most important groups of antibiotic-producing organisms are the bacteria, lower fungi, or molds, and actinomycetes. These antibiotics belong to very diverse classes of chemical compounds. Most of the antibiotics produced by bacteria are polypeptides (such as tyrothricin, bacitracin, polymyxin). The penicillins are the only important antibiotics produced by fungi. Actinomycetes produce a wide variety of compounds (actinomycin, streptomycin, chloramphenicol, tetracycline). The antimicrobial activity (antibiotic spectrum) of antibiotics varies greatly; some are active only on bacteria, others on fungi, still others on bacteria and fungi; some are active on viruses, some on protozoa, and some are also active on neoplasms. An organism sensitive to an antibiotic may, on continued contact with it, develop resistance and yet remain sensitive to other antibiotics. Certain antibiotics are used as direct food additives to inhibit growth of bacteria and fungi; among these are nisin, pimaricin, nystatin, and tylosin. *Note:* A number of antibiotics have been restricted by FDA, both for direct use by humans and as additives to animal feeds. Among those are streptomycin, chloramphenicol, tetracycline, and penicillin.

See penicillin; cephalosporin; plasmid; Waksman; Fleming.

antibiotic resistance. Plasmids generally contain genes that confer on the host bacterium the ability to survive a given antibiotic. If the plasmid pBR322 is present in a host, that host will not be killed by (moderate levels of) ampicillin or tetracycline. By using plasmids containing antibiotic resistance genes, the researcher can kill off all the bacteria that have not taken up this plasmid, thus ensuring that the plasmid will be propagated as the surviving cells divide.

“Antiblaze” [Albermarle]. TM for a trichloropropyl phosphate additive flame retardant.

Use: On either side of two-component rigid urethane systems and in rebonded flexible foam, coatings, and elastomers.

antiblock agent. A substance (e.g., a finely divided solid of mineral nature) that is added to a plastic mix to prevent adhesion of the surfaces of films made from the plastic to each other or to other surfaces. They are of particular value in polyolefin and vinyl films. The hard, infusible particles tend to roughen the surface and so maintain a small air space between adjacent layers of the film, thus preventing adhesion. Silicate minerals are widely used for this purpose. Another type of antiblock function is performed by high-melting waxes, which bloom to the surface and form a layer that is harder than the plastic.

antibody. See antigen-antibody.

anticaking agent. An additive used primarily in certain finely divided food products that tend to be hygroscopic to prevent or inhibit agglomeration and thus maintain a free-flowing condition. Such substances as starch, calcium metasilicate, magnesium carbonate, silica, and magnesium stearate are used for this purpose in table salt, flours, sugar, coffee, whiteners, and similar products.

anticancer drug. See antineoplastic.

antichlor. Any product that serves to neutralize and remove hypochlorite or free chlorine after a bleaching operation. For many years the term was considered synonymous with sodium thiosulfate, but it may equally be applied to sodium disulfite or any other product used for the purpose.

anticholinergic. A drug or pharmaceutical that inhibits the action of acetylcholine by reactivating the cholinesterase. Examples are atropine sulfate and pralidoxime iodide.

anticipation. Each generation of offspring has increased severity of a genetic disorder; e.g., a grandchild may have earlier onset and more severe symptoms than the parent, who had earlier onset than the grandparent.

See additive genetic effects; complex trait.

anticoagulant. A complex organic compound, often a carbohydrate, that has the property of retarding the clotting or coagulation of blood. The most effective of these is heparin, which acts by interfering with the conversion of prothrombin to thrombin and by inhibiting the formation of thromboplastin. In addition to their specific clinical uses, anticoagulants have been applied with limited success to rodenticides (see warfarin). They are regarded as cumulative poisons, requiring multiple ingestions to be lethal. One type (diaphenadione) has been found to reduce blood cholesterol in experimental animals.

anticodon. A specific sequence of three nucleotides in a tRNA, complementary to a codon for an amino acid in a mRNA.

antidepressant. See psychotropic drug.

antidote. Any substance that inhibits or counteracts the effects of a poison which has entered the body by any route. Mild acids or alkalis (except sodium bicarbonate) exert neutralizing action if corrosive materials have been swallowed; for noncorrosive poisons, warm salt water or milk may be given to cause vomiting. Activated charcoal in water is effective in protecting the throat and stomach linings, except for corrosive poisons. Nothing should be administered by mouth if the subject is unconscious. Artificial respiration may be necessary. In no case should alcohol be used as an antidote. Atropine sulfate and pralidoxime iodide have

been successfully used as antidotes for poisoning by cholinesterase inhibitors.

antiemetic agent. A compound usually classed as a pharmaceutical that inhibits or prevents nausea. A well-known type is dimenhydrinate ("Dramamine") which is useful to counteract motion sickness, nausea due to pregnancy, etc. A more recent antiemetic is a benzoquinolizine derivative used for nausea resulting from anesthesia ("Emeticon" [Pfizer]).

antienzyme. A substance present in the substrate that restricts or negates the catalytic activity of the enzyme on that substrate.

antifertility agent. A synthetic steroid sex hormone of the type normally produced by the body during pregnancy. Said to act by simulating the conditions of pregnancy and thus suppressing ovulation, which automatically prevents conception. The hormones used are basically of two kinds: (1) progestin (synthetic progesterone) and (2) synthetic estrogen. There are also several other derivatives, all of which are much stronger than natural progesterone and estrogen when taken orally. The chemical modifications are necessary for oral potency. Injectable contraceptives that remain effective over much longer periods than the oral type are also available. The active ingredient is medoxyprogesterone acetate. Experimental work is also being done with *N,N'*-octaethylenediamine bis(dichloroacetamide) ("Fertilysin"). An estrogen-free type is available in England (chloromadinone acetate); it is said to be less effective, but with less tendency to cause blood clotting than estrogenic types.

Hazard: FDA requires that oral contraceptives carry a label warning of the tendency of these agents to form blood clots. There is also a possibility that they have other adverse side effects. *Note:* Proteins and peptides that act as enzyme inhibitors have been identified in the semen of some mammals.

antifoam agent. See defoaming agent.

antifouling paint. An organic coating formulated especially for use on the hulls and bottoms of ships, boats, buoys, pilings, and the like to protect them from attack by barnacles, teredos, and other marine organisms. The chief specific ingredient is a metallic naphthenate, e.g., copper naphthenate; mercury compounds are also used.

antifreeze. (1) Water additive. Any compound that lowers the freezing point of water. Both sodium chloride and magnesium chloride were once used, but their extreme corrosive properties made them a liability in automotive cooling systems. Methanol requires only 27% by volume for protection to -17.7°C . Due to its tendency to evaporate rapidly at operating temperatures, its flammability, and its low boiling point (63.9°C), it has been replaced by glycol

derivatives which are relatively noncorrosive, nonflammable, have very low evaporation rates, and are effective heat-exchange agents. A concentration of 35% protects against freezing to -17.7°C . Ethylene and propylene glycol antifreezes can be carried in an automotive cooling system for several years without damage, and are satisfactory coolants at summer operating temperatures. Methoxypropanol has been introduced as an antifreeze-coolant for diesel engines. (2) Gasoline additive. A proprietary preparation, TM "Drygas," consists of methanol, isopropanol, or mixtures of these, that lowers the freezing point of water enough to inhibit ice formation in feed lines and carburetors. It is added directly to the gasoline.

Hazard: Poisonous. Flammable.
See coolant.

antigen-antibody. An antibody is a blood serum protein of the globulin fraction that is formed in response to introduction of an antigen. It has a molecular weight of approximately 160,000. An antigen is an infective organism (protein) with molecular weight of at least 10,000; it is able to induce formation of an antibody in an organism into which it is introduced (by injection). Thus an animal is able to resist infections to which it has previously been exposed. The entire science of immunology is based on antigen-antibody reactions, the most outstanding feature of which is their specificity. The antibodies produced in the bloodstream can react only with the homologous antigen or with those of a similar molecular structure. As a result, the animal can destroy a particular virus or bacterium and become immune. The specificity of antigens is due not so much to the composition of the molecule as to its configuration. Certain radicals (polar and quaternary ammonium groups) seem to "mate" with corresponding complementary structures in the antibody molecule. A precipitate or agglutinate is formed by the reaction which is analogous to colloidal (catalytic) reactions in some respects, e.g., surface configuration.

See immunochemistry; Pasteur; allergen; antagonist, structural.

antiglobulin. An agent used to coagulate globulin.

antihistamine. A synthetic substance structurally analogous to histamine whose presence in minute amounts prevents or counteracts the action of excess histamine formed in body tissues. These compounds are usually complex amines of various types and also have other physiological effects and medical uses. Examples are chlorpheniramine maleate, dimenhydrinate, diphenhydramine hydrochloride, imidazole, pheniramine maleate, pyrilamine maleate, thonzylamine hydrochloride, tripeleminamine hydrochloride.

See antagonist, structural.

antihypertensive agent. An organic compound having the property of lowering blood pressure in animals and humans. Among the better-known types are the alkaloid reserpine and its derivative syrosingopine, guanethidine sulfate, α -methyl dopa (α -methyl-3,4-dihydroxyphenylalanine), and hydralazine. They function by various nerve-blocking mechanisms involving structural antagonism. They should be taken only by prescription.

antiinflammatory agent. Any of a number of drugs that prevent or inhibit inflammation of tissue. Most common of these is aspirin.

antiknock agent. Any of a number of organic compounds that increase the octane number of a gasoline when added in low percentages by reducing knock, especially in high-compression engines. Knock is caused by spontaneous oxidation reactions in the cylinder head, resulting in loss of power and characteristic ignition noise. Branched-chain hydrocarbon gasolines ameliorate this problem, and antiknock additives virtually eliminate it. Tetraethyllead, the most effective of these, has been used for many years, but its contribution to air pollution has almost eliminated its use in automotive fuels. Lead-free gasolines are now used in conjunction with catalytic converters. The antiknock agents used in them are nonmetallic compounds such as methyl-*tert*-butyl ether (MTBE) or a mixture of methanol and *tert*-butyl alcohol.

See octane number; gasoline.

antilymphocytic serum. (ALS). An immunological suppressant for use in organ transplants. It acts to control the buildup of rejection factors in the blood that result from introduction of foreign organs into the body.

See immunochemistry.

antimatter. See antiparticle.

antimetabolite. See antagonist, structural; antihistamine; metabolite.

antimonate. Salt in which antimony has a valence of 5.

antimonial lead alloy. (hard lead). Lead alloy containing approximately 6–28% antimony. Common grades are as follows: (1) 15% antimony, resistant to sulfuric acid used in type metal; (2) national stock pile specification, 10.7–11.3% antimony; (3) battery grids, 5–11% antimony; (4) battery terminals, 4% antimony; (5) cable sheaths, 1% antimony.

antimonic. Adjective used for compounds in which antimony has a valence of 5, e.g., antimony pentachloride, pentasulfide, etc.

antimonic acid. See antimony pentoxide.

antimonic anhydride. See antimony pentoxide.

antimonite. See stibnite.

antimonous. (antimonious). Adjective used for compounds in which antimony has a valence of 3, as in antimony tribromide, antimony trichloride, antimony trioxide, antimony trisulfide.

antimonous sulfide. See antimony trisulfide.

antimony.

CAS: 7440-36-0. Sb (from Latin stibium). Metallic element of atomic number 51, group VA of the periodic table, aw 121.75, valences 3, 4, and 5. Two stable isotopes.

Properties: Silver-white solid. Mp 630.5C, bp 1635C. Low thermal conductivity, Mohs hardness 3 to 3.5. Oxidized by nitric acid; not attacked by hydrochloric acid in absence of air; reacts with sulfuric acid and aqua regia. Combustible. A semiconductor.

Available forms: Besides the stable metal, there are two allotropes: yellow crystals and amorphous black modifications.

Source: Ores: Stibnite, kermasite, tetrahedrite, livingstonite, jamisonite.

Occurrence: Algeria, Bolivia, China, Mexico, South Africa, Peru, Yugoslavia.

Derivation: Reduction of stibnite with iron scrap; direct reduction of natural oxide ores. About half the antimony used in the U.S. is recovered from lead base battery scrap metal.

Grade: Up to 99.999% pure, technical, powder, commercial grade in 55-lb cakes 10 × 10 × 2.5 inches.

Hazard: Use with adequate ventilation. Soluble salts are toxic. TLV: 0.5 mg(Sb)/m³.

Use: Hardening alloy for lead, especially storage batteries and cable sheaths; bearing metal; type metal; solder; collapsible tubes and foil; sheet and pipe; semiconductor technology (99.999% grade); pyrotechnics.

antimony-124. Radioactive antimony isotope.

Properties: Half-life 60 days, radiation β and γ . The chemical form used is often antimony trichloride and oxychloride in hydrochloric acid solution.

Use: As a tracer, especially in solid-state studies and marker of interfaces between products in pipelines. The γ ray has sufficient energy to eject neutrons from beryllium. Convenient portable neutron sources that may be reactivated in a nuclear reactor are made by irradiation of an antimony pellet encased in a beryllium shell.

Hazard: Radioactive poison.

antimony-125. Radioactive antimony isotope.

Half-life 2.4 years, emits β and γ rays.

Hazard: Radioactive poison.

antimony black. Metallic antimony in the form of a fine powder produced by electrolysis or chemical action on an antimony salt solution. See antimony trisulfide.

antimony bromide. See antimony tribromide.

antimony, caustic. See antimony trichloride.

antimony chloride. See antimony trichloride.

antimony chloride, basic. See antimony oxychloride.

antimony dichlorotrifluoride. SbCl_2F_3 . A thick liquid stored in iron drums. Used as catalyst for fluorocarbon manufacture.

antimony fluoride. See antimony trifluoride.

antimony hydride. (stibine).
CAS: 7803-52-3. SbH_3 .

Properties: Colorless gas. Mp -88C , bp -17C .

Derivation: Action of hydrogen chloride on antimony-metal compounds such as Zn_3Sb_2 ; also released by reduction of antimony compounds in hydrochloric acid solutions with zinc or other reducing metal.

Hazard: Toxic. TLV: 0.1 ppm.

antimony iodide. See antimony triiodide.

antimonyl. The radical or group SbO which occurs commonly in formulas of antimony compounds. Thus SbOCl is often named antimonyl chloride, and numerous other antimony compounds are sometimes named in a similar manner.

antimony lactate.

CAS: 58164-88-8. $\text{Sb}(\text{C}_3\text{H}_5\text{O}_2)_3$.

Properties: Tan-colored mass. Soluble in water.

Grade: Technical.

Hazard: Toxic. TLV: 0.5 mg(Sb)/ m^3 .

Use: Mordant in fabric dyeing.

antimony oxide. See antimony trioxide.

antimony oxychloride. (antimony chloride, basic; antimonyl chloride). SbOCl .

Properties: White powder. Mp 170C (decomposes). Soluble in hydrochloric acid and alkali tartrate solutions; insoluble in alcohol, ether, and water.

Derivation: Interaction of water and antimony chloride.

Hazard: Toxic. TLV: 0.5 mg(Sb)/ m^3 .

Use: Antimony salts, flameproofing textiles.

antimony pentachloride. (antimony perchloride).

CAS: 7647-18-9. SbCl_5 .

Properties: Reddish-yellow, oily liquid; offensive odor; hygroscopic. Mp 2.8C , d 2.34 , bp 92C (30

mm). Solidifies by absorption of moisture. Decomposed by excess water into hydrochloric acid and antimony pentoxide. Soluble in an aqueous solution of tartaric acid in hydrochloric acid and chloroform.

Derivation: Action of chlorine on antimony powder.

Hazard: Corrosive, fumes in moist air, reacts strongly with organics. TLV: 0.5 mg(Sb)/ m^3 .

Use: Analysis (testing for alkaloids and cesium), dyeing intermediates, as chlorine carrier in organic chlorinations.

antimony pentafluoride.

CAS: 7783-70-2. SbF_5 .

Properties: Viscous, hygroscopic liquid. D 2.99 (23C), mp 7C , bp 149.5C , hydrolyzed by water. Soluble in potassium fluorid, (KF) and liquid sulfur dioxide.

Derivation: Antimony pentachloride and anhydrous hydrogen fluoride.

Hazard: Corrosive to skin and tissue. TLV: 0.5 mg(Sb)/ m^3 .

Use: Catalyst and/or source of fluorine in fluorination reactions.

antimony pentasulfide. (antimony red; antimony persulfide; antimony sulfide golden).

CAS: 1315-04-4. Sb_2S_5 .

Properties: Orange-yellow powder; odorless. Insoluble in water; soluble in concentrated hydrochloric acid with evolution of hydrogen sulfide; soluble in alkali. Decomposes on heating.

Hazard: Flammable, dangerous fire risk near oxidizing materials. TLV: 0.5 mg(Sb)/ m^3 .

Use: Red pigment, rubber accelerator.

antimony pentoxide. (antimonic anhydride; antimonic acid; stibic anhydride).

CAS: 1314-60-9. Sb_2O_5 .

Properties: White or yellowish powder. D 3.78, mp 450C , loses oxygen above 300C . Slightly soluble in water; soluble in strong bases forming antimonates; insoluble in acids except concentrated hydrochloric acid.

Derivation: Action of concentrated nitric acid on the metal or the trioxide.

Use: Preparation of antimonates and other antimony compounds, flame retardant for textiles.

antimony persulfide. See antimony pentasulfide.

antimony potassium tartrate. (tartar emetic; potassium antimonyl tartrate; tartrated antimony). $\text{K}(\text{SbO})\text{C}_4\text{O}_6 \cdot 1/2\text{H}_2\text{O}$.

Properties: Transparent, odorless crystals efflorescing on exposure to air or white powder; sweetish metallic taste. D 2.6, at 100C loses all its water. Soluble in water, glycerol; insoluble in alcohol. Aqueous solution is slightly acid.

Derivation: By heating antimony trioxide with a solution of potassium bitartrate and subsequent crystallization.

Grade: Technical, crystals, powdered, CP, USP.

Hazard: Toxic. TLV: 0.5 mg(Sb)/m³.

Use: Textile and leather mordant, medicine, insecticide.

antimony salt. (deHaens salt). Mixture of antimony trifluoride and either sodium fluoride or ammonium sulfate.

Properties: White crystals. Soluble in water.

Hazard: Toxic. TLV: 0.5 mg(Sb)/m³.

Use: Dyeing and printing textiles.

antimony sodiate. See sodium antimonate.

antimony sulfate. (antimony trisulfate).

CAS: 7446-32-4. Sb₂(SO₄)₃.

Properties: White powder or lumps. Deliquescent, decomposes in water. D 3.62 (4C), flammable.

Hazard: A poison. TLV: 0.5 mg(Sb)/m³.

Use: Matches, pyrotechnics.

antimony tribromide. (antimony bromide).

SbBr₃.

Properties: Yellow, deliquescent, crystalline mass. Decomposed by water, d 4.148, mp 96.6C, bp 280C. Soluble in carbon disulfide, hydrobromic acid, hydrochloric acid, ammonia.

Hazard: Toxic. TLV: 0.5 mg(Sb)/m³.

Use: Analytical chemistry, mordant, manufacturing antimony salts.

antimony trichloride. (antimonous chloride; antimony chloride; caustic antimony).

CAS: 10025-91-9. SbCl₃.

Properties: Colorless, transparent, very hygroscopic, crystalline mass. Fumes slightly in air. D 3.14, bp 223.6C, mp 73.2C. Soluble in alcohol, acetone, acids. With water forms antimony oxychloride.

Derivation: Interaction of chlorine and antimony or by dissolving antimony sulfide in hydrochloric acid.

Grade: Technical, CP.

Hazard: Corrosive liquid or solid. Very irritating to eyes, skin. TLV: 0.5 mg(Sb)/m³.

Use: Antimony salts, bronzing iron, mordant, manufacturing lakes, chlorinating agent in organic synthesis, pharmaceuticals, fireproofing textiles, analytical reagent.

antimony trifluoride. (antimony fluoride).

CAS: 7783-56-4. SbF₃.

Properties: White to gray hygroscopic crystals. Mp 292C, d 4.58. Soluble in water.

Grade: 99–100%.

Hazard: Strong irritant to eyes and skin.

Use: Porcelain, pottery, dyeing, fluorinating agent.

antimony triiodide. (antimony iodide). SbI₃.

Properties: Red crystals. Volatile at high temperatures. D 4.768, mp 167C, bp 420C. Soluble in carbon disulfide, hydrochloric acid, and solution of potassium iodide; insoluble in alcohol and chloroform;

decomposes in water with precipitation of oxyiodide.

Derivation: Action of iodine on antimony.

antimony trioxide. (antimony white; antimony oxide).

CAS: 1309-64-4. Sb₂O₃. Occurs in nature as valentinite.

Properties: White, odorless, crystalline powder. D 5.67; mp 655C. Insoluble in water; soluble in concentrated hydrochloric and sulfuric acids, strong alkalis. Amphoteric.

Derivation: Burning antimony in air, adding ammonium hydroxide to antimony chloride, directly from low-grade ores.

Grade: Technical, pigment.

Hazard: TLV: 0.5 mg/m³ for handling and use; suspected human carcinogen during production.

Use: Flameproofing of textiles, paper, and plastics (chiefly polyvinyl chloride); paint pigments; ceramic opacifier; catalyst; intermediate; staining iron and copper; phosphors; mordant; glass decolorizer.

antimony trisulfate. See antimony sulfate.

antimony trisulfide. (antimony orange;

black antimony; antimony needles; antimonous sulfide; antimony sulfide).

CAS: 1345-04-6. Sb₂S₃.

Properties: (1) Black crystals; (2) orange-red crystals. D 4.562, mp 546C. Insoluble in water; soluble in concentrated hydrochloric acid and sulfide solutions.

Derivation: (1) Occurs in nature as black crystalline stibnite; (2) As precipitated from solutions of salt of antimony, the trisulfide is an orange-red precipitate, which is filtered, dried, and ground.

Grade: Technical.

Hazard: Explosion risk in contact with oxidizing materials.

Use: Vermilion or yellow pigment, antimony salts, pyrotechnics, matches, percussion caps, camouflage paints (reflects infrared radiation in same way as green vegetation), ruby glass.

antimycin A₁. (C₂₈H₄₀O₉N₂). An antibiotic substance said to have strong fungicidal properties.

Properties: Crystals. Mp 139–140C. Soluble in alcohol, ether, acetone, and chloroform; slightly soluble in benzene, carbon tetrachloride, and petroleum ether; insoluble in water.

Derivation: From *Streptomyces*.

Use: Active against a large group of fungi but, in general, not against bacteria; possible insecticide and miticide.

antineoplastic. A drug that inhibits the formation of tumors (neoplasms). Many of these are antibiotics used in treatment of cancer.

See bleomycin.

antineutron. See antiparticle.

antioxidant. An organic compound added to rubber, natural fats and oils, food products, gasoline, and lubricating oils to retard oxidation, deterioration, rancidity, and gum formation, respectively. Rubber antioxidants are commonly of an aromatic amine type, such as di- β -naphthyl-*p*-phenylenediamine and phenyl- β -naphthylamine 1% or less based on the rubber content of a mixture affords adequate protection. Many antioxidants are substituted phenolic compounds (butylated hydroxyanisole, di-*tert*-butyl-*p*-cresol, and propyl gallate). Food antioxidants are effective in very low concentration (not more than 0.01% in animal fats) and not only retard rancidity but protect the nutritional value by minimizing the breakdown of vitamins and essential fatty acids. Sequestering agents, such as citric and phosphoric acids, are frequently employed in antioxidant mixtures to nullify the harmful effect of traces of metallic impurities. *Note:* Max concentration of food antioxidants approved by FDA is 0.02%.

antiozonant. (antiozidant). A substance used to reverse or prevent the severe oxidizing action of ozone on elastomers both natural and synthetic. Among antiozonant materials used are petroleum waxes, both amorphous and microcrystalline, secondary aromatic amines (such as *N,N*-diphenyl-*p*-phenylenediamine), quinoline, and furan derivatives.

See ozone.

antiparallel. Describing two linear polymers that are opposite in polarity or orientation.

antiparticle. (antimatter). Any of several species of subatomic particles that are identical in mass to ordinary particles, but opposite in electrical charge or (in the case of the neutron) in magnetic moment. Thus, a positron is an electron with a positive charge, an antiproton is a proton with a negative charge, and an antineutron has no charge but has a magnetic moment opposite to that of a neutron. A photon is its own antiparticle. When an antiparticle collides with its opposite particle (e.g., a collision of an electron and a positron) both particles are annihilated and their masses are converted to photons of equivalent energy. The same is true of other subatomic particles (neutrinos, mesons, etc.) some of which are fantastically short-lived (of the order of billionths of a second).

antiperspirant. Any substance having a mild astringent action that tends to reduce the size of skin pores and thus restrain the passage of moisture on local body areas. The most commonly used antiperspirant agent is aluminum chlorohydrate. Use of zirconium compounds in antiperspirant sprays has been virtually discontinued because of their suspected carcinogenicity, though they are permissible in creams. Antiperspirants exert a neutralizing action

that gives them deodorant properties. The FDA classified them as drugs rather than as cosmetics.

antipport. Co-transport of two solutes across a membrane in opposite directions.

antiprecipitant. Substances that prevent precipitation in chemical processes.

antiproton. See antiparticle.

antipsychotic agent. See psychotropic drug.

antipyretic.

Use: Any of a group of drugs that reduce fever or inflammation, e.g., aconite.

antipyrine. (phenazone; 2,3-dimethyl-1-phenyl-3-pyrazolin-5-one).

CAS: 60-80-0. $(\text{CH}_3)_2(\text{C}_6\text{H}_5)\text{C}_3\text{HN}_2\text{O}$.

Properties: Colorless crystals or powder; odorless; slightly bitter taste. D 1.19, mp 110–113C, bp 319C. Soluble in water, alcohol, and chloroform; slightly soluble in ether.

Derivation: Condensation of methylphenylhydrazine and ethyl acetoacetate.

Method of purification: Crystallization.

Grade: Technical, NF.

Use: Medicine (analgesic); analytical reagent for nitrous acid, nitric acid, and iodine number.

antipyrine chloral hydrate. See chloral hydrate antipyrine.

antipyrine iodide. See iodophenazone.

antirheumatic. Any of various drugs used in the treatment of rheumatoid arthritis. Among these are certain gold salts, e.g., disodium aurothiomalate and gold sodium thiosulfate. Penicillamine is also reported to be effective. Cortisone is no longer widely used because of deleterious side effects.

antiscorbutic. Tending to prevent scurvy. See ascorbic acid.

antisense. Nucleic acid that has a sequence exactly opposite to an mRNA molecule made by the body; binds to the mRNA molecule to prevent a protein from being made. See transcription.

anti-sense strand. See discussion under "Sense strand".

antiseptic. A substance applied to humans or animals that retards or stops the growth of microorganisms without necessarily destroying them, e.g., alcohol; boric acid and borates; certain dyes, as acriflavine; menthol; hydrogen peroxide; hypochlorites; iodine; mercuric chloride; and phenol. Many of these are corrosive and poisonous, and

should be used with great caution. Among the newer antiseptics are hexachlorophene, which is also toxic, and some quaternary ammonium compounds. See disinfectant; sanitizer; fumigant.

antiskinning agent. A liquid antioxidant used in paints and varnishes to inhibit formation of an oxidized film on the exposed surface in cans, pails, or other open containers.

antistatic agent. The marked tendency of thermoplastic polymers to accumulate static charges which result in adherent particles of dust and other foreign matter has required study of possible means of eliminating or reducing this property. The following have been tried: (1) Development of more electrically conductive polymers, e.g., tetracyanoquinodimethane. (2) Incorporation of additives that migrate to the surface of the plastic or fiber and modify its electrical properties. (Examples of these are fatty quaternary ammonium compounds, fatty amines, and phosphate esters.) Other types of antistatic additives are hygroscopic compounds, such as polyethylene glycols and hydrophobic slip additives, that markedly reduce the coefficient of friction of the plastic. (3) Copolymerization of an antistatic resin with the base polymer.

“Antistine” phosphate [Novartis]. TM for antazoine phosphate.

antitussive. A medicinal preparation for suppressing coughs, often containing codeine. Chloroform is no longer permitted as an ingredient.

antizymotic. Property of preventing fermentation. A material that prevents fermentation.

Antonow’s rule. The rule states that the interfacial tension of two liquids in equilibrium is equal to the difference between the surface tensions.

“Antox” [Du Pont]. TM for rubber antioxidant, a condensation product of butyraldehyde-aniline. Amber liquid.

“Antron” [Du Pont]. TM for nylon textile fibers in the form of continuous filament yarns and staple.

ANTU. (α -naphthylthiourea).
CAS: 86-88-4.
Hazard: TLV: 0.3 mg/m³.

A-number. A number that indicates the amount of fatty acids precipitated from edible fats.

AOAC International. (AOAC) Formerly called the Association of Official Agricultural Chemists, and the Association of Official Analytical Chemists. It was founded in 1884. There are 4000 members. These scientists develop, test, and study

methods for analyzing fertilizer, foods, feeds, drugs, pesticides, cosmetics and other products related to agricultural and public health. It is located at 481 North Frederick Avenue, Suite 500, Gaithersburg, Maryland 20877-2417.

Website: <http://www.aoac.org>

AOCS. See American Oil Chemist’s Society.

AOD process. Injection of a mixture of argon and oxygen into molten steel to reduce carbon impurities.

AP. Abbreviation for ammonium perchlorate.

ap-. A prefix denoting formation from or relationship to another compound, e.g., apomorphine.

AP-1 site. The binding site on DNA at which the transcription “factor” AP-1 binds, thereby altering the rate of transcription for the adjacent gene. AP-1 is actually a complex between c-fos protein and c-jun protein, or sometimes is just c-jun dimers. The AP-1 site consensus sequence is (C/G)TGACT(C/A)A. Also known as the TPA-response element (TRE). [TPA is a phorbol ester, tetradecanoyl phorbol acetate, which is a chemical tumor promoter.

APAP. Abbreviation for acetyl-*p*-amino-phenol. See *p*-acetylaminophenol.

apatite. A natural calcium phosphate (usually containing fluorine) occurring in the earth’s crust as phosphate rock. It is also the chief component of the bony structure of teeth.

Properties: Color variable. D 3.1–3.2, hardness 5, frequently in hexagonal crystals.

Occurrence: Eastern U.S., California, the former U.S.S.R., Canada, Europe.

Use: Source of phosphorus and phosphoric acid, manufacture of fertilizers, laser crystals. See fluoridation.

APC. Abbreviation for ammonium perchlorate.

apertomer. A device for measuring the angular aperture of an objective. It was invented by Abbé.

apholate. C₁₂H₂₂N₉P₃. Generic name for 2,2,4,4,6,6-hexakis(1-aziridinyl)-2,2,4,4,6,6-hexahydro-1,3,5,2,4,6-triazatriphosphorine. Prevents reproduction in certain insects by inhibiting formation of DNA in eggs.

Use: Insect sterilant.

aphrodine. See yohimbine.

API. See active pharmaceutical ingredient.

API. See American Petroleum Institute.

apigenin 8-c-glucoside. See 8- β -d-glucopyranosyl-apigenin.

API gravity. A scale of density measurement adopted by the API. It runs from 0.0 (equivalent to d 1.076) to 100.0 (equivalent to d 0.6112). The API values as used in the petroleum industry decrease as density increases.

aplysiatoxin.

CAS: 52659-57-1. mf: $C_{32}H_{47}BrO_{10}$.

Hazard: A poison.

APO. See triethylenephosphoramidate.

apocarothenal. Food color supplied in dark purplish-black beadlets. Vitamin A activity 120,000 units/g. Dispersible in warm water. Approved for food use by FDA.
See β -apo-8'-carotenal.

β -apo-8'-carotenal.

CAS: 1107-26-2. mf: $C_{30}H_{40}O$.

Properties: Fine crystalline powder with dark metallic sheen or violet crystals. Mp: 139°. Sol in chloroform; sltly sol in acetone; insol in water.

Use: Food additive.

apoenzyme. The protein portion of an enzyme, absent any organic or inorganic cofactors or prosthetic groups that might be required for catalytic activity.

apolar adsorption. (homopolar adsorption).

Adsorption in which molecules of the adsorbed substance are concentrated at the adsorption layer without any fission.

apomine black gx.

CAS: 1937-37-7. mf: $C_{34}H_{25}N_9O_7S_2 \cdot 2Na$.

Hazard: Confirmed carcinogen. Moderately toxic by ingestion and inhalation. An eye irritant.

apopino oil. See shiu oil.

apoptosis. Programmed cell death, the body's normal method of disposing of damaged, unwanted, or unneeded cells.
See cell.

apparent density. See density.

Appert, Nicolas. (1752–1841). A French pioneer in the science of food preservation. Though not a chemist, his work on application of heat to food products led to a form of home preserving that eventually developed into the canning industry. The idea of destroying bacteria by heat treatment was later applied more exhaustively by Pasteur.

applaud. See buprofezine.

apple acid. See malic acid.

apple oil. See isoamyl valerate.

applied research. The experimental investigation of a specific practical problem for the immediate purpose of creating a new product, improving an older one, or evaluating a proposed ingredient. The experimental program is set up to answer the question "What happens?" rather than "Why does it happen?" Examples are the determination of the value of a new rubber antioxidant, the substitution of one drying oil for another in a paint formulation, and the development of a new synthetic product. While applied research has produced the multitude of new materials that have revolutionized industry, agriculture, and medicine in the last 50 years or so, its achievements have usually been practical outgrowths of prior fundamental research.

approved name. The official name for a chemical adopted by a government bureau, trade, or medical association.

apramycin.

CAS: 37321-09-8. mf: $C_{21}H_{41}N_5O_{11}$.

Properties: Crystals. Mp: 245–247°. Sol in water; sltly sol in lower alcs.

Use: Drug (veterinary); food additive.

aprotic solvent. A type of solvent that neither donates nor accepts protons. Examples: dimethylformamide, benzene, dimethyl sulfoxide.

APS. Abbreviation for appearance potential spectroscopy.

See spectroscopy.

aptation. Change in an organism resulting from natural selection; a structure which is the result of such selection.

aqua ammonia. See ammonium hydroxide.

"Aquacar" [Dow]. TM for water treatment microbiocides that are aqueous solutions of glutaraldehyde.

Use: For controlling slime-forming bacteria, sulfate-reducing bacteria, and algae in water cooling towers, air washers, pasteurizers, and other recirculation water systems.

See glutaraldehyde.

"Aquaclean Alkaline" [Stromme]. TM for a synthetic detergent hold cleaner.

Use: To remove stains and discoloring after transporting coke and coal cargoes.

"Aquaclean Clean Up" [Stromme]. TM for a cleaning agent.

Use: After transport of cargoes where the hold did not

have barrier or release agent installed prior to loading.

“Aquaclean HD” [Stromme]. TM for a cargo hold cleaning material.

Use: To clean cargo containers after transport of oily cargos.

“Aquaflow” [Hercules, Ltd.]. TM for rheology cellulose.

“Aquapel” [Hercules]. TM for an alkylketene dimer that is reactive with alkaline cellulose.

Available forms: Liquid.

Use: For sizing agents.

“Aquaprint” [BASF]. TM for a resin-bonded pigment color for printing on textiles. The vehicle, an oil-in-water emulsion, contains a water-insoluble binder that adheres to the fibers and anchors the color permanently to the cloth.

aqua regia. (nitrohydrochloric acid; chloronitrous acid; chlorazotic acid).

Properties: Fuming yellow, volatile, suffocating liquid.

Derivation: A mixture of nitric and hydrochloric acids, usually 1 part of nitric acid to 3 or 4 parts of hydrochloric acid.

Grade: Technical.

Hazard: A powerful oxidizer, toxic, corrosive liquid.

Use: Metallurgy, testing metals, dissolving metals (platinum, gold, etc.).

“Aquarex” [Du Pont]. TM for a series of wetting agents for elastomers. They act as stabilizers and mold lubricants.

“Aquasorb” [Hercules, Ltd.]. TM for a cellulose gum.

“Aquasorb AR” [Mallinckrodt]. TM for a phosphorus pentoxide (P₂O₅)-based desiccant.

Hazard: Powerful oxidizer and caustic.

“Aquatreat” [ALCOA]. TM for water-soluble dithiocarbamate salt bactericides.

Use: In cooling towers, paper and pulp mills, air washers, petroleum production, and sugar processing.

aqueous tension. Water vapor pressure at a given temperature over pure water or an aqueous solution.

Ar. Symbol for argon.

ara-A. (α - β -D-arabinofuranosyladenine; vidarabine).

CAS: 24356-66-9. A biologically active pharmaceutical product having both antitumor and antiviral properties. It was originally prepared (1959) by

chemical synthesis at Stanford Research Institute, and later isolated from a fermentation beer of *Streptomyces antibioticus*.

arabic gum. (acacia gum).

CAS: 9000-01-5. The dried, water-soluble exudate from the stems of *Acacia senegal* or related species.

Properties: Thin flakes, powder, granules, or angular fragments; color white to yellowish white; almost odorless; mucilaginous consistency. Completely soluble in hot and cold water, yielding a viscous solution of mucilage; insoluble in alcohol. The aqueous solution is acid to litmus. Combustible.

Occurrence: Sudan, West Africa, Nigeria.

Derivation: A carbohydrate polymer, complex and highly branched. The central core or nucleus is D-galactose and D-glucuronic acid (actually the calcium, magnesium, and potassium salts), to which are attached sugars such as L-arabinose and L-rhamnose.

Grade: USP, FCC (both grades of acacia).

Use: Pharmaceuticals, adhesives, inks, textile printing, cosmetics, thickening agent and colloidal stabilizer in confectionery and food products, binding agent in tablets, emulsifier.

arabinogalactan. A water-soluble polysaccharide extracted from timber of the western larch trees. It is a complex, highly branched polymer of arabinose and galactose.

Properties: Dry, light-tan powder. Readily soluble in hot and cold water; both powder and solutions fairly stable. Combustible.

Use: Dispersing and emulsifying agent, lithography.

arabinose. (pectin sugar; gum sugar).

C₅H₁₀O₅. Both the D- and L-enantiomers occur naturally. L-Arabinose is common in vegetable gums, especially arabic.

Properties: White crystals. Mp 158.5C, d 1.585 (20/4C). Soluble in water and glycerol; insoluble in alcohol and ether. Combustible.

Use: Culture medium.

Ara-C. Abbreviation for cytosine arabinoside.

arachidic acid. (eicosanoic acid).

CH₃(CH₂)₁₈COOH. A widely distributed but minor component of the fats of peanut oils and related plant species.

Properties: Shining, white, crystalline leaflets. Mp 75.4C, d 0.2840 (100/4C), bp 328C (decomposes), refr index 1.4250. Soluble in ether; slightly soluble in alcohol; insoluble in water. Combustible.

Derivation: From peanut oil.

Grade: Technical, 99%.

Use: Organic synthesis, lubricating greases, waxes and plastics, source of arachidyl alcohol, biochemical research.

arachidonic acid. (5,8,11,14-eicosatetraenoic acid).
CAS: 506-32-1.
 $\text{CH}_3(\text{CH}_2)_4(\text{CH}:\text{CHCH}_2)_4(\text{CH}_2)_2\text{COOH}$. A C_{20} unsaturated fatty acid. Combustible. An essential fatty acid.

Source: Liver, brain, glandular organs; also made synthetically.

Use: Biochemical research, source of prostaglandins and other pharmacologically active compounds. See eicosanoid.

arachidyl alcohol. (1-eicosanol).
 $\text{CH}_3(\text{CH}_2)_{18}\text{CH}_2\text{OH}$. A long-chain saturated fatty alcohol much like stearyl alcohol.

Properties: White, waxlike solid. Mp 66.5C; bp 369C (220C at 3 mm Hg); refr index 1.455. Soluble in hot benzene. Combustible.

Derivation: Ziegler synthesis (trialkylaluminum process).

Grade: Technical, 99%.

Use: Lubricants, rubber, plastics, textiles, research.

arachin. (arachine). A protein from peanuts, a globulin containing arginine, histidine, lysine, cystine; yellow-green syrup, soluble in water and alcohol, insoluble in ether. Combustible.

aragonite. A form of calcium carbonate appearing in pearls.
See nacre.

aragonite needles. Slender crystals of the mineral aragonite that constitute most carbonate muds in the modern ocean. Some of the needles form by direct precipitation from seawater, and some by the collapse of the skeletons of organisms.

aralkonium chloride. $\text{C}_{21}\text{H}_{36}\text{Cl}_3\text{N}$.
Properties: Water-soluble solid; bitter taste.
Use: As sanitizer and deodorant.

aralkyl. See arylalkyl.

aramid. Generic name for a distinctive class of highly aromatic polyamide fibers that are characterized by their flame-retardant properties. Some types are also suitable for protective clothing, dust-filter bags, tire cord, and bullet-resistant structures. They are derived from *p*-phenylenediamine and terephthaloyl chloride.
See "Nomex"; "Kevlar"; polyamide.

"Aramite" [Uniroyal].
 $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OCH}_2\text{CH}(\text{CH}_3)\text{OSOOC}_2\text{H}_4\text{Cl}$. TM

for 2-(*p*-*tert*-butylphenoxy)isopropyl-2-chloroethyl sulfite.

Properties: Clear, light-colored oil. D 1.148–1.152 (20C); bp 175C (0.1 mm Hg). Very soluble in common organic solvents; insoluble in water. Noncorrosive.

Grade: Technical (90% min), wettable powder, emulsifiable concentrate restricted to postharvest application on fruit trees.

Hazard: A carcinogen. Irritant to eyes and skin, toxic by ingestion.

Use: Antimicrobial agent, miticide.

"Aranox" [Uniroyal]. TM for *p*-(*p*-tolysulfonylamido)-diphenylamine.
 $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NHC}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Gray powder. D 1.32; mp 135C (min). Soluble in acetone, benzene, and ethylene dichloride; insoluble in gasoline and cold water; slightly soluble in hot water or hot alkaline solutions.

Use: Antioxidant for light-colored rubber products.

"Arasan" [Du Pont]. TM for seed disinfectants based on thiram.

"Arazate" [Uniroyal]. TM for zinc dibenzyl dithiocarbamate.

arbutin. (ursin). $\text{C}_{12}\text{H}_{16}\text{O}_7$. Available commercially in both natural and synthetic forms. Pure synthetic arbutin is hydroquinone- β ,D-glucopyranoside.

Properties: White powder (pure synthetic). Mp 199–200C. Soluble in water and alcohol. Stable in storage.

Derivation: A glucoside found in the leaves of the cranberry, blueberry, and manzanita shrubs, and in the roots, trunks, and leaves of most pear species. Pure arbutin can be prepared synthetically from acetobromoglucose and hydroquinone in the presence of alkali.

Use: Oxidation inhibitor, polymerization inhibitor, color stabilizer in photography, intermediate.

arc furnace. A furnace that is heated by an electric arc with carbon or graphite as one electrode, and a similar unit, or the furnace charge, as the other electrode.

archaometry. Application of chemical and physical analytical methods to archaeology. Among those used are microanalytical methods, spectroscopic analysis, X rays, and other types of nonde-

structive tests. For age determination, ^{14}C measurement (chemical dating) is one of the most valuable techniques.

arene. See aromatic.

Arens-van Dorp synthesis. The preparation of alkoxyethyl alcohol from ketones and ethoxyacetylene. In the Isler modification, β -chlorovinyl ether is reacted with lithium amide to give lithium ethoxyacetylene which is then condensed with the ketone. This avoids the tedious preparation of ethoxyacetylene.

argentite. (silver glance). Ag_2S . Lead-gray to black or blackish-gray mineral. A natural silver sulfide. Contains 87.1% silver. Differs from other soft black minerals in cutting like wax. Soluble in nitric acid, d 7.2–7.36, Mohs hardness 2–2.5.

Occurrence: Nevada, Colorado, Montana, Mexico, Chile, Canada.

Use: An important ore of silver.

argentum. The Latin name for silver, hence the symbol Ag.

arginase. An enzyme that produces ornithine and urea by splitting arginine. It is found in liver.

Use: Biochemical research.

arginine. (guanidine aminovaleric acid; amino-4-guanidinovaleric acid).

An essential amino acid for rats, occurring naturally in the L(+) form. Available as the glutamate and hydrochloride.

Properties: Prisms from water containing two molecules of H_2O , anhydrous plates from alcohol solution. Dehydrates at 105°C , decomposes at 244°C . Sparingly soluble in alcohol; insoluble in ether.

Derivation: Widely found in animal and plant proteins. It is precipitated as the flavianate from gelatin hydrolyzate in industry.

Use: Biochemical research, medicine, pharmaceuticals, dietary supplement.

5-l-argininecyanoginosin Ia.

CAS: 101043-37-2. mf: $\text{C}_{49}\text{H}_{74}\text{N}_{10}\text{O}_{12}$.

Hazard: A poison by ingestion and inhalation.

Source: Natural product.

arginine vasopressin.

CAS: 113-79-1. mf: $\text{C}_{46}\text{H}_{65}\text{N}_{15}\text{O}_{12}\text{S}_2$.

Hazard: A poison.

argon (Ar). A nonmetallic element of atomic number 18, in the noble gas group of the Periodic

System. Aw 39.948. Present in atmosphere to 0.94% by volume.

Properties: Colorless monatomic gas; odorless; tasteless. It is not known to combine chemically with any element, but forms a stable clathrate with β -hydroquinone. Fp -189.3°C , bp -185.8°C , d 1.38 (air = 1), sp vol 9.7 cu ft/lb (21.1C @ 1 atm). Slightly soluble in water. Noncombustible; an asphyxiant gas.

Derivation: (1) By fractional distillation of liquid air. (2) By the treatment of atmospheric nitrogen with metals such as magnesium and calcium to form nitrides. (3) Recovery from natural gas oxidation bottoms-steam in ammonia plant. (4) Originally formed by radioactive decay of ^{40}K .

Method of purification: (1) Highly purified argon is obtained by passing the gas through a bed of titanium at 850°C . (2) Synthetic zeolite molecular sieves separate oxygen from argon to give high purity gas.

Grade: Technical, highest purity (99.995%).

Use: Inert-gas shield in arc welding, furnace brazing, plasma jet torches (with hydrogen), electric and specialized light bulbs (neon, fluorescent, sodium vapor, etc.); titanium and zirconium refining; flushing molten metals (steel) to remove dissolved gases; in Geiger-counter tubes; lasers; inert gas or atmosphere in miscible applications; decarburization of stainless steel (AOD process).

Argyrol. TM for an organic compound of silver and a protein, used in medicine for its specific antiseptic and bacteriostatic action.

"Aridye" [BASF]. TM for a product and process for printing colors on textiles using permanent and insoluble pigments suspended in an organic vehicle into which water is emulsified to give printing consistency. The vehicle contains a water-insoluble binder that adheres to the clot and anchors the color permanently to the fibers.

aripiprazole.

CAS: 129722-12-9. mf: $\text{C}_{23}\text{H}_{27}\text{Cl}_2\text{N}_5\text{O}_2$.

Hazard: A poison.

aristolochic acid, sodium salt. See sodium aristolochate i.

arkose. A rock consisting primarily of sand-sized particles of feldspar. Most arkose accumulates close to the source area of the feldspar, because feldspar weathers quickly to clay and seldom travels far.

"Armalon" [Du Pont]. TM for TFE-fluorocarbon fiber felt and also for TFE-fluorocarbon resin-coated glass fabrics, tapes, and laminates.

Armstrong's acid. (naphthalene-1,5-disulfonic acid). $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})_2$.

Properties: White, crystalline solid. Soluble in water.

Derivation: Sulfonation of naphthalene with fuming

sulfuric acid at low temperature followed by separation from the 1,6-isomer.

Use: Dye intermediate.

Arndt-Eistert synthesis. Procedure for converting an acid to its next higher homolog.

“Arnel” [Celanese]. TM for an acetate fiber made from cellulose triacetate. It has a higher melting point, and is less soluble than cellulose acetate. See acetate fiber; cellulose triacetate.

aromatic. (arene). A major group of unsaturated cyclic hydrocarbons containing one or more rings, typified by benzene, which has a 6-carbon ring containing three double bonds. The vast number of compounds of this important group, derived chiefly from petroleum and coal tar, are rather highly reactive and chemically versatile. The name is due to the strong and not unpleasant odor characteristic of most substances of this nature. Certain 5-membered cyclic compounds such as the furan group (heterocyclic) are analogous to aromatic compounds. *Note:* The term “aromatic” is often used in the perfume and fragrance industries to describe essential oils that are not aromatic in the chemical sense.

aromaticity. A stable electron shell configuration in organic molecules, especially those related to benzene.

See resonance; orbital theory.

aromatic oils (hydrocarbons). See aromex.

aromatization. See hydroforming.

aromex.

CAS: 78308-32-4.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

“Arosurf TA100” [Crompton & Knowles].

(di-stearyldimethylammonium chloride)

CAS: 107-64-2. TM for powder cationic-quaternary fabric softener.

Use: For retail powdered detergent-softener, industrial laundry and pap-softening formulas, and cosmetic formulations.

arrack. An oriental distilled liquor which is obtained from palm or rice juice.

arrayed library. Individual primary recombinant clones (hosted in phage, cosmid, YAC, or other vector) that are placed in two-dimensional arrays in microtiter dishes. Each primary clone can be identified by the identity of the plate and the clone location (row and column) on that plate. Arrayed libraries of clones can be used for many applications, including screening for a specific gene or genomic region of interest.

See library; genomic library; gene chip technology.

arrest point. The temperature at which a system of more than one component, being heated or cooled absorbs or yields heat without changing temperature.

Arrhenius, Svante. (1859–1927). A native of Sweden, he won the Nobel Prize in chemistry in 1903. He is best known for his fundamental investigations on electrolytic dissociation of compounds in water and other solvents, and for his basic equation stating the increase in the rate of a chemical reaction with rise in temperature:

$$\frac{d \ln k}{dT} = \frac{A}{RT^2}$$

in which k is the specific reaction velocity, T is the absolute temperature, A is a constant usually referred to as the energy of activation of the reaction, and R is the gas-law constant.

arrowroot. (maranta). The starch that is obtained from the roots of the maranta plant, which has many uses, including food ingredients, cosmetics, glues, and starches.

arsacetin. (sodium acetylarsanilate; sodium *p*-acetyl aminophenylarsonate).

$\text{CH}_3\text{CONHC}_6\text{H}_4\text{AsO(OH)ONa}$.

Properties: White, crystalline powder; odorless; tasteless. Free of arsenous or arsenic acid. Solutions will admit of thorough sterilization. Soluble in cold water, but more so in warm water.

Use: Medicine (antisyphilitic).

9-arsafluorenic acid.

CAS: 5687-22-9. mf: $\text{C}_{12}\text{H}_9\text{AsO}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

arsanilic acid. (atoxylic acid; *p*-aminobenzearsonic acid; *p*-aminophenylarsonic acid).

$\text{C}_6\text{H}_4\bullet\text{C}_6\text{H}_8\text{AsNO}_3$.

Properties: White, crystalline powder; practically odorless. Mp 232C. Soluble in hot water; slightly soluble in cold water, alcohol, and acetic acid; insoluble in acetone, benzene, chloroform, and ether.

Derivation: By condensing aniline with arsenic acid, removing the excess of aniline by steam distillation in alkaline solution, and setting the acid free using hydrochloric acid.

Hazard: A poison. Yields flammable vapors on heating above melting point.

Use: Arsanilates, manufacture of arsenical medicinal compounds such as arsphenamine, veterinary medicine, grasshopper bait.

arsenic.

CAS: 7440-38-2. As. A nonmetallic element of atomic number 33, group Va of periodic table, aw 74.9216, valences of 2, 3, 5; no stable isotopes.

Properties: Silver-gray, brittle, crystalline solid that darkens in moist air. Allotropic forms: black, amor-

phous solid (β -arsenic); yellow, crystalline solid, d 5.72 (commercial product ranges from 5.6 to 5.9), mp 814C (36 atm), sublimes at 613C (1 atm), Mohs hardness 3.5, insoluble in water and in caustic and nonoxidizing acids. Attacked by hydrochloric acid in presence of oxidant. Reacts with nitric acid. Low thermal conductivity; a semiconductor.

Derivation: Flue dust of copper and lead smelters from which it is obtained as white arsenic (arsenic trioxide) in varying degrees of purity. This is reduced with charcoal. The commercial grade is not made in the U.S.

Grade: Technical, crude (90–95%), refined (99%), semiconductor grade (99.999%), single crystals.

Hazard: Carcinogen and mutagen. OSHA employee exposure limit: TWA 0.01 mg(As)/m³; Cancer Hazard. TLV: TWA 0.2 mg(As)/m³.

Use: (Metallic form) Alloying additive for metals, especially lead and copper as shot, battery grids, cable sheaths, boiler tubes. High-purity (semiconductor) grade: used to make gallium arsenide for dipoles and other electronic devices; doping agent in germanium and silicon solid state products; special solders; medicine.

See arsenic trioxide.

arsenic acid. (orthoarsenic acid).

CAS: 7778-39-4. H₃AsO₄•1/2H₂O. Arsenic pentoxide is also sometimes called arsenic acid.

Properties: White, translucent crystals. D 2–2.5, mp 35.5C, bp (loses water at 160C). Soluble in water, alcohol, alkali, glycerol.

Derivation: By digestion of arsenic with nitric acid.

Grade: Pure, technical, CP.

Use: Manufacture of arsenates, glass making, wood treating process, defoliant (regulated), desiccant for cotton, soil sterilant.

arsenic acid, aniline salt.

CAS: 63957-41-5. mf: C₁₈H₂₁N₃•AsH₃O₄.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

arsenical Babbitt. See Babbitt metal.

arsenical nickel. See niccolite.

arsenic anhydride. See arsenic pentoxide.

arsenic, black. (β -arsenic).

See arsenic.

arsenic bromide. Legal label name for arsenic tribromide.

arsenic chloride. See arsenic trichloride.

arsenic disulfide. (arsenic monosulfide; ruby arsenic; red arsenic glass; red arsenic sulfide; red arsenic).

CAS: 56320-22-0. As₂S₂ or AsS. Occurs as the mineral realgar.

Properties: Orange-red powder. D 3.4–2.6, mp 307C. Soluble in acids and alkalis; insoluble in water.

Derivation: By roasting arsenopyrite and iron pyrites and sublimation.

Grade: Technical.

Use: Leather industry, depilatory agent, paint pigment, shot manufacture, pyrotechnics, rodenticide, taxidermy.

arsenic hydride. See arsine.

arsenic pentafluoride. AsF₅. A gas, bp –52.8C, fp –79C. Readily hydrolyzed, soluble in alcohol and benzene.

Use: Doping agent in electroconductive polymers.

arsenic pentasulfide. As₂S₅.

Properties: Yellow or orange powder. Soluble in nitric acid and alkalis; insoluble in water. Decomposes to sulfur and the trisulfide when heated.

Derivation: By precipitation from arsenic acid in a hydrochloric acid solution with hydrogen sulfide. It is filtered, then dried.

Grade: Technical.

Use: Paint pigments, light filters, other arsenic compounds.

arsenic pentoxide. (arsenic oxide; arsenic anhydride; arsenic acid).

CAS: 1303-28-2. As₂O₅.

Properties: White, amorphous solid; deliquescent; forms arsenic acid in water. D 4.086, mp 315C. Soluble in water, alcohol.

Derivation: By action of oxidizing agent, such as nitric acid, on arsenious oxide.

Use: Arsenates, insecticides, dyeing and printing, weed killer, colored glass, metal adhesives.

arsenic sesquioxide. See arsenic trioxide.

arsenic sulfide. Legal label name for arsenic disulfide.

arsenic thioarsenate. As(AsS₄).

Properties: Dry, free-flowing yellow powder, stable, high-melting. Insoluble in water and organic solvents, but soluble in aqueous caustics.

Use: Scavenger for certain oxidation catalysts and thermal protectant for metal-bonded adhesives and coating resins.

arsenic tribromide. (arsenic bromide; arsenious bromide; arsenous bromide).

CAS: 7784-33-0. AsBr₃.

Properties: Yellowish-white, hygroscopic crystals. D 3.54 (25C), mp 33C, bp 221C. Decomposed by water.

Derivation: Direct union of arsenic and bromine.

Use: Analytical chemistry, medicine.

arsenic trichloride. (arsenic chloride; arsenious chloride; arsenous chloride; caustic arsenic chloride; fuming liquid arsenic).

CAS: 7784-34-1. AsCl_3 .

Properties: Colorless or pale yellow oil. Bp 130.5C, fp -18C , d 2.163 (14/4C). Soluble in concentrated hydrochloric acid and most organic solvents, decomposed by water. Fumes in moist air. Noncombustible.

Derivation: (1) By action of chlorine on arsenic; (2) by distillation of arsenic trioxide with concentrated hydrochloric acid.

Grade: Technical.

Hazard: Strong irritant to eyes and skin.

Use: Intermediate for organic arsenicals (pharmaceuticals, insecticides), ceramics.

See arsenic.

arsenic trifluoride (arsenious fluoride).

CAS: 7784-35-2. AsF_3 .

Properties: Mobile liquid that fumes in air.

Hazard: Extremely toxic.

Use: Fluorinating reagent, catalyst, ion implantation source, and dopant.

arsenic trioxide. (crude arsenic; white arsenic; arsenious acid; arsenious oxide; arsenous anhydride).

CAS: 1327-53-3. As_2O_3 .

Properties: White powder; odorless; tasteless. D 3.865. Slightly soluble in water; soluble in acids, alkalis, and glycerol. Sublimes on heating.

Derivation: Smelting of copper and lead concentrates. Flue dust to which pyrite or galena concentrations are added yields As_2O_3 vapor. Condensation gives product of varying purity called crude arsenic (90–95% pure). A higher-purity oxide called white arsenic (99+% pure) is obtained by resubliming the crude As_2O_3 .

Hazard: A human carcinogen.

Use: Pigments, ceramic enamels, aniline colors, decolorizing agent in glass, insecticide, rodenticide, herbicide, sheep and cattle dip, hide preservative, wood preservative, preparation of other arsenic compounds.

arsenic trisulfide. (arsenious sulfide; arsenic sulfide [yellow]; arsenous sulfide; arsenic trisulfide).

CAS: 1303-33-9. As_2S_3 .

Properties: Yellow crystals or powder, changes to a red form at 170C. D 3.43, mp 300C. Insoluble in water and hydrochloric acid; dissolves in alkaline sulfide solutions and nitric acid.

Derivation: Occurs in nature as the mineral orpiment. May be precipitated from arsenious acid solution by the action of hydrogen sulfide.

Grade: Technical, pigment, single crystals.

Use: Pigment, reducing agent, pyrotechnics, glass used for infrared lenses, semiconductors, hair removal from hides.

arsine. (arsenic hydride).

CAS: 7784-42-1. AsH_3 .

Properties: Colorless gas. Fp -113.5C , bp -62C , decomposes 230C. Soluble in water; slightly soluble in alcohol and alkalis.

Derivation: Reaction of aluminum arsenide with water or hydrochloric acid, electrochemical reduction of arsenic compounds in acid solutions.

Grade: Technical, 99% pure or in mixture with other gases.

Hazard: Highly poisonous by inhalation. TLV: 0.05 ppm.

Use: Organic synthesis, military poison, doping agent for solid-state electronic components.

arsphenamine. A specific for syphilis originally developed by Ehrlich, but no longer in use. It was a derivative of arsenic and benzene.

See Ehrlich.

“Artic” [Du Pont]. TM for refrigeration grade of methyl chloride.

artificial cinnabar. See mercuric sulfide, red.

artificial snow. A copolymer of butyl and isobutyl methacrylate, often dispersed from an aerosol bomb or other atomizing device, used in decorative window displays, etc. Man-made snow is crystallized water vapor made by mechanical means.

aryl. A compound whose molecules have the ring structure characteristic of benzene, naphthalene, phenanthrene, anthracene, etc., (i.e., either the 6-carbon ring of benzene or the condensed 6-carbon rings of the other aromatic derivatives). For example, an aryl group may be phenyl C_6H_5 or naphthyl C_{10}H_7 . Such groups are often represented in formulas by “R.”

See alkyl.

arylalkyl. A compound containing both aliphatic and aromatic structures, e.g., alkyl benzenesulfonate. Also called aralkyl.

As. Symbol for arsenic.

as-. Abbreviation for asymmetrical, same as *uns-*.

ASA. (1) American Standards Association. (2) Abbreviation for acrylic ester-modified styrene acrylonitrile terpolymer.

See “Luran Sulfur.”

asarone. See 2,4,5-trimethoxy-1-propenylbenzene.

asbestine. A soft, fibrous magnesium silicate.

Use: As a filler in paper, rubber, and plastics.

asbestos.

CAS: 1332-21-4. A group of impure magnesium silicate minerals that occur in fibrous form.

Properties: White, gray, green, brown. D 2.5. Non-combustible. (1) Serpentine asbestos is the mineral chrysotile, a magnesium silicate. The fibers are strong and flexible, so that spinning is possible with the longer fibers. A microcrystalline form, TM "Avibest," has been developed. (2) Amphibole asbestos includes various silicates of magnesium, iron, calcium, and sodium. The fibers are generally brittle and cannot be spun, but are more resistant to chemicals and to heat than serpentine asbestos. (3) Amosite. (4) Crocidolite.

Occurrence: Vermont, Arizona, California, North Carolina, Africa, Italy, Yukon, Quebec, Mexico.

Hazard: A carcinogen. Highly toxic by inhalation of dust particles. TLV: (amosite) 0.5 fibers/cc; (chrysotile) 2 fibers/cc; (crocidolite) 0.2 fibers/cc; (other forms) 2 fibers/cc.

Use: Fireproof fabrics, brake lining, gaskets, roofing compositions, electrical and heat insulations, paint filler, chemical filters, reinforcing agent in rubber and plastics, component of paper dryer felts, diaphragm cells, cement reinforcement. *Note:* A promising substitute for asbestos for cement reinforcement is glass fiber made from slate and limestone.

ascaridole. 1,4-peroxido-*p*-menthene-2).

Properties: A liquid, naturally occurring peroxide. Bp 84C (5 mm), d 1.011 (13/15C), refr index 1.4743 (20C).

Derivation: By vacuum distillation of chenopodium oil.

Hazard: Strong oxidizing agent, explodes on heating to 130C or in contact with organic acids.

Use: Initiator in polymerization, medicine.

"Ascarite II" [Thomas]. TM for a sodium hydroxide-nonfibrous silicate formulation.

Use: Quantitative absorption of carbon dioxide in the determination of carbon in steel and organic compounds by direct combustion and other analysis.

ascorbic acid. (*l*-ascorbic acid; vitamin C).

CAS: 50-81-7. $C_6H_8O_6$.

A dietary factor that must be present in the diet of humans to prevent scurvy. It cures scurvy and increases resistance to infection. Ascorbic acid presumably acts as an oxidation-reduction catalyst in the cell. It is readily oxidized; citrus juices should not be exposed to air for more than a few minutes before use.

Properties: White crystals (plates or needles). Mp 192C. Soluble in water; slightly soluble in alcohol;

insoluble in ether, chloroform, benzene, petroleum ether, oils and fats. Stable to air when dry. One international unit is equivalent to 0.05 milligram of *l*-ascorbic acid.

Source: Food source: acerola (West Indian cherry); citrus fruits; tomatoes; potatoes; green, leafy vegetables. Commercial sources: Synthetic product made by fermentation of sorbitol.

Grade: USP, FCC.

Use: Nutrition, color fixing, flavoring and preservative in meats and other foods, oxidant in bread doughs, abscission of citrus fruit in harvesting, reducing agent in analytical chemistry. The iron, calcium, and sodium salts are available for biochemical research.

ascorbic acid oxidase. An enzyme found in plant tissue that acts upon ascorbic acid in the presence of oxygen to produce dehydroascorbic acid.

Use: Biochemical research.

ascorbyl palmitate. $C_{22}H_{38}O_7$. A white or yellowish-white powder having a citrus-like odor. Mp 116–117C; soluble in alcohol and in animal and vegetable oils; slightly soluble in water.

Derivation: Palmitic and *l*-ascorbic acids.

Grade: FCC.

Use: Antioxidant for fats and oils, source of vitamin C, stabilizer, emulsifier.

ascorbyl stearate.

Use: Food additive.

-ase. A suffix characterizing the names of many enzymes, e.g., diastase, cellulase, cholinesterase, etc. However, the names of some enzymes end in *-in* (i.e., pepsin, rennin, papain).

asexual reproduction. A type of reproduction involving only one parent that usually produces genetically identical offspring. Asexual reproduction occurs without meiosis or syngamy, and may happen through budding, by the division of a single cell, or the breakup of an entire organism into two or more parts.

ash. (1) In analytical chemistry, the residue remaining after complete combustion of a material. It consists of mineral matter (silica, alumina, iron oxide, etc.) the amount often being a specification requirement. (2) The end product of large-scale coal combustion as in power plants; now said to be the sixth most plentiful mineral in the U.S. It consists principally of fly ash, bottom ash, and boiler ash. Some of its values are recoverable, and there are a number of industrial uses of fly ash, e.g., in cement products and road fill.

See fly ash.

"Asience" [Kao]. TM for a line of luxurious hair care products.

askarel. A generic descriptive name for synthetic electrical insulating (dielectric) material which, when decomposed by the electric arc, evolves only nonexplosive gases or gaseous mixtures, i.e., chlorinated aromatic derivatives, particularly pentachlorodiphenyl and trichlorobenzene, but also including pentachlorodiphenyl oxide, pentachlorophenylbenzoate, hexachlorodiphenylmethane, pentachlorodiphenyl ketone, and pentachloroethylbenzene. Non-flammable.

Use: Insulating medium in transformers, dielectric fluid.

See dielectric; transformer oil.

ASM International. (ASM). Formally organized in 1935, this society actually had been active under other names since 1913, when the need for standards of metal quality and performance in the automobile became generally recognized. Most recent previous name was American Society for Metals. ASM International has over 53,000 members and publishes *Metals Review* and the famous *Metals Handbook*, as well as research monographs on metals. It is active in all phases of metallurgical activity, metal research, education, and information retrieval. Its headquarters is at 9639 Kinsman Road, Materials Park, OH 44073. Website: <http://www.asminternational.org>

asparagic acid. See aspartic acid.

L-asparaginase. (L-asnase; colaspase; elspar). CAS: 9015-68-3. An enzyme used in the treatment of certain types of leukemia. Produced by biochemical activity of certain bacteria, yeasts, and fungi. Yields are in excess of 3500 units/g of source.

asparagine. (α -aminosuccinamic acid; β -asparagine; althein; aspartamic acid; aspartamide). $\text{NH}_2\text{COCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. The β amide of aspartic acid, a nonessential amino acid, existing in the D(+)- and L(-)-isomeric forms as well as the DL-racemic mixture. L(-)-asparagine is the most common form.

Properties: L(-)-Asparagine monohydrate: White crystals. Mp 234–235°C. Acid to litmus. Nearly insoluble in ethanol, methanol, ether and benzene; soluble in acids and alkalis.

Derivation: Widely distributed in plants and animals both free and combined with proteins.

Use: Biochemical research, preparation of culture media, medicine.

l-asparagine.

CAS: 70-47-3. mf: $\text{C}_4\text{H}_8\text{N}_2\text{O}_3 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder or rhombic hemihedral crystals; sltly sweet taste. Mp: 234°. Sol in water; insol in alc, ether.

Use: Food additive.

asparaginic acid. See aspartic acid.

“Aspartame.” [Nutrasweet]. (3-amino-n-(α -carboxyphenethyl)succinamic acid n-methyl ester, stereoisomer; aspartylphenylalanine methyl ester; n-l- α -aspartyl-l-phenylalanine l-methyl ester; candere; dipeptide sweetener; Equal (TM); methyl aspartylphenylalanate; l-methyl n-l- α -aspartyl-l-phenylalanine; Nutrasweet (TM); sweet dipeptide). $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$.

Properties: White crystalline powder from water or alcohol; odorless; sweet taste. Mw: 294.34; mp 190. Slightly soluble in water, alcohol. TM for a synthetic nonnutritive sweetener approved by FDA for tabletop use and as a packaged food additive. The U.S., Canada, and South Africa permit its use in carbonated beverages. A combination of aspartic acid and l-phenylalanine, it is said to be 200 times sweeter than sugar.

See sweetener, nonnutritive.

aspartamic acid. See asparagine.

aspartamide. See asparagine.

aspartic acid. (asparaginic acid; asparagic acid; aminosuccinic acid).

$\text{COOHCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A naturally occurring nonessential amino acid. The common form is L(+)-aspartic acid.

Properties: Colorless crystals. Soluble in water; insoluble in alcohol and ether. Optically active. DL-aspartic acid. Mp 278–280°C (decomposes), d 1.663 (12/12C). L(+)-aspartic acid. Mp 251°C. D(-)-aspartic acid. Mp 269–271°C (decomposes), d 1.6613.

Source: Young sugar cane, sugar beet molasses.

Derivation: Hydrolysis of asparagine, reaction of ammonia with diethyl fumarate.

Use: Biological and clinical studies, preparation of culture media, organic intermediate, ingredient of aspartame, detergents, fungicides, germicides, metal complexation. Available commercially as DL(-), L(+)-, and DL-aspartic acid.

dl-aspartic acid.

CAS: 617-45-8. mf: $\text{C}_4\text{H}_7\text{NO}_4$.

Properties: Colorless to white monoclinic crystals; acid taste. Mp: 280° (decomp). Sltly sol in water; insol in alc, ether.

Hazard: Very low toxicity.

Use: Food additive.

l-aspartic acid.

CAS: 56-84-8. mf: $\text{C}_4\text{H}_7\text{NO}_4$.

Properties: Colorless to white crystals or leaflets; acid taste. Mp: 270°. Sltly sol in water; insol in alc, ether.

Hazard: Low toxicity.

Use: Food additive; drug.

***l*-aspartic acid, *n*-acetyl-, dilithium salt.**

See dilithium *n*-acetyl-*l*-aspartate.

aspartocin. USAN for antibiotic produced by *Streptomyces griseus*.

aspergillic acid. (2-hydroxy-3-isobutyl-6-(1-methylpropyl)pyrazine-1-oxide). $C_{12}H_{20}N_2O_2$. An antibiotic from strains of *Aspergillus flavus*.

Properties: Yellow crystals. Mp 97C. Insoluble in cold water; soluble in common organic solvents and dilute acids. Hydrochloride melts at 178C and is soluble in water.

Use: Antibiotic.

Aspergillus. A genus of small molds and fungi used in industry to ferment carbohydrates for producing citric and other organic acids.

ASPET. See American Society of Pharmacology and Experimental Therapeutics.

asphalt. (petroleum asphalt; Trinidad pitch; mineral pitch).

CAS: 8052-42-4. A dark-brown to black cementitious material, solid or semisolid in consistency, in which the predominating constituents are bitumens that occur in nature as such or are obtained as residua in petroleum refining (ASTM). It is a mixture of paraffinic and aromatic hydrocarbons and heterocyclic compounds containing sulfur, nitrogen, and oxygen.

Properties: Black solid or viscous liquid. D approximately 1.0. Soluble in carbon disulfide, flash p 450F (132C), autoign temp 900F (482C), solid softens to viscous liquid at approximately 93C, penetration value (paving) 40–300, (roofing) 10–40. Good electrical resistivity. Combustible.

Occurrence: California, Trinidad, Venezuela, Cuba, Canada (Athabasca tar sands).

Hazard: Toxic by inhalation of fume. TLV: (fume): 5 mg/m³.

Use: Paving and road-coating, roofing, sealing and joint filling, special paints, adhesive in electrical laminates and hot-melt compositions, diluent in low-grade rubber products, fluid loss control in hydraulic fracturing of oil wells, medium for radioactive waste disposal, pipeline and underground cable coating, rust-preventive hot-dip coatings, base for synthetic turf, water-retaining barrier for sandy soils, supporter of rapid bacterial growth in converting petroleum components to protein.

See bacteria; protein; oil sands.

asphalt (blown). (mineral rubber; oxidized asphalt; hard hydrocarbon).

Properties: Black, friable solid obtained by blowing air at high temperature through petroleum-derived asphalt with subsequent cooling. Penetration value 10–40, softening point 85 to 121C. Combustible.

Use: Primarily roofing, as diluent in low-grade rubber products and as thickener in oil-based drilling fluids.

asphalt (cut-back). A liquid petroleum product produced by fluxing an asphaltic base with suitable distillates. (ASTM).

Properties: Flash p 50F(10C) (OC).

Grade: Solution of residue from distillation in carbon tetrachloride, 99.5%.

Hazard: Flammable, dangerous fire hazard.

Use: Road surfaces.

asphaltene. A component of the bitumen in petroleum, petroleum products, malthas, asphalt cements and solid native bitumens. Soluble in carbon disulfide but insoluble in paraffin naphthas. (ASTM). It is composed of polynuclear hydrocarbons of molecular weight up to 20,000, joined by alkyl chains.

asphalt, liquid. See residual oil; asphalt (cut-back).

asphalt (oxidized). See asphalt (blown).

asphalt paint. Asphaltic base in a volatile solvent with or without drying oils, resins, fillers, and pigments. Ground asbestos was frequently used as a component of heavy asphaltic paints for roofing and waterproofing purposes.

Hazard: Flammable, dangerous fire risk.

asphyxiant gas. A gas that has little or no positive toxic effect but that can bring about unconsciousness and death by replacing air and thus depriving an organism of oxygen. Among the so-called asphyxiant gases are carbon dioxide, nitrogen, helium, methane, and other hydrocarbon gases.

aspidospermine. $C_{22}H_{30}O_2N_2$.

Properties: White to brownish-yellow crystalline alkaloid. Mp 208C, bp 220C (1–2 mm Hg), sublimes at 180C under reduced pressure. Soluble in fats, fixed oils, absolute alcohol, and ether. Its sulfate and hydrochloride are soluble in water.

Use: Medicine (respiratory stimulant).

aspirin. (acetylsalicylic acid; *o*-acetoxybenzoic acid).

CAS: 50-78-2. $CH_3COOC_6H_4COOH$.

Properties: White crystals or white, crystalline powder; odorless; slightly bitter taste. Stable in dry air, slowly hydrolyzes in moist air to salicylic and acetic

acids. Mp 132–136C, bp 140C (decomposes). Soluble in water, alcohol, chloroform, and ether; less soluble in absolute ether. Dissolves with decomposition in solutions of alkali hydroxides and carbonates.

Derivation: Action of acetic anhydride on salicylic acid.

Method of purification: Crystallization.

Grade: Technical, USP.

Hazard: An allergen; may cause local bleeding especially of the gums; 10-g dose may be fatal. May cause excessive biosynthesis of prostaglandins. Dust dispersed in air is serious explosion risk. TLV: TWA 5 mg/m³

Use: Medicine (analgesic, antiinflammatory, antipyretic).

“Assam Milk Tea” [*Chun Chiao*]. TM a less astringent tea brewed by boiling leaves in milk.

assay. (1) The quantitative determination by chemical analysis of metallic values in an ore. Ores are assayed by heat fractionation. (2) Dry assay refers to the determination of metal values in ores by chemical methods not involving the use of solutions. (3) Assay value refers to the proportion of precious metal indicated in ounces of metal per ton of ore. (4) Wet assay is the chemical determination of metal per ton of ore. (5) Pharmaceutical products are assayed to validate the amount of drug present in a given unit. (6) Assays on organisms (bacteria) to determine their reactions to an antibiotic or insecticide. This is called bioassay. Organic materials are assayed by solvent extraction and chemical separation

assembly. Putting sequenced fragments of DNA into their correct chromosomal positions.

assimilation. The activity whereby different parts of the substrate in a fermentation are changed into cell substance.

assistant. A term loosely used in the textile industry for any chemical compound that aids in a processing step, e.g., scouring, dyeing, bleaching, finishing, etc.
See auxiliary; dyeing assistant.

association. A reversible chemical combination due to any of the weaker classes of chemical bonding forces. Thus, the combination of two or more molecules due to hydrogen bonding, as in the union of water molecules with one another or of acetic acid molecules with water molecules, is called association; also, combination of water or solvent molecules with molecules of solute or with ions, i.e., hydrate formation or solvation. Formation of complex ions or chelates, as copper ion with ammonia or copper ion with 8-hydroxyquinoline is another example. Aqueous solutions of soaps or synthetic detergents are often called association colloids.

association polymer. A polymer formed by simple addition of molecules or by rearrangement of bonds.

A-stage resin. (resole; one-step resin). An alkaline catalyzed thermosetting phenol-formaldehyde-type resin consisting primarily of partially condensed phenol alcohols. At this stage, the product is fully soluble in one or more common solvents (alcohols, ketones) and is fusible at less than 150C. On further heating and without use of a catalyst or additive, the resin is eventually converted to the insoluble, infusible, cross-linked form (C-stage). The A-stage resin is a constituent of most commercial laminating varnishes and is also used in special molding powders.

See B-stage resin; C-stage resin; novolak; phenol-formaldehyde resin.

astatine. At. Nonmetallic element of atomic number 85. Group VIIA of periodic table, aw 211. Heaviest member of the halogen family, has 20 isotopes, all radioactive; derived by α -bombardment of bismuth. The two most stable isotopes have half-lives of approximately 8 hours. Astatine occurs in nature to the extent of approximately one ounce in the entire earth's crust. Like iodine, it concentrates in the thyroid gland. Its use in medicine is still experimental.

aster lake. Red lake pigment having high oil absorption properties.

ASTM. See American Society for Testing and Materials.

Aston, Francis William. (1877–1945). This noted English chemist and physicist carried out much of his work with J. J. Thomson at Cambridge. He was the pioneer investigator of isotopes, and his method of separating the lighter from the heavier atomic nuclei provided the technique that later developed into the mass spectroscope, which utilizes a magnetic field for this purpose. Aston received the Nobel Prize for this discovery in 1922, just three years after Rutherford performed the first transmutation of elements. Aston also correctly estimated the energy content of a hydrogen atom and predicted the controlled release of this energy.

“Astracel” [*BASF*]. TM for a group of fast dyes for union shades on polyester-carbon blended fabrics.

“Astragal” [*Lanxess*]. TM for dyeing auxiliaries.

Use: In dye processes to ensure level uptake of dyes and give color fastness.

astrazon golden yellow gl. See C.I. basic yellow 28.

astrochemistry. Application of radioastronomy (microwave spectroscopy) to determination of the existence of chemical entities in the gas clouds of interstellar space and of elements and compounds in celestial bodies, including their atmospheres. Such data are obtained from spectrographic study of the light from the sun and stars, from analysis of meteorites, and from actual samples from the moon. Hydrogen is by far the most abundant element in interstellar space, with helium a distant second. Over 25% of the elements, including carbon, have been identified, as well as molecules of water, carbon monoxide, carbon dioxide, ammonia, ethane, methane, acetylene, formaldehyde, formic acid, methyl alcohol, hydrogen cyanide, and acetonitrile. When applied to the planets only, the science is called chemical planetology.
See nucleogenesis.

“Astrol” [BASF]. TM for a group of fast alizarin direct blues.

“Astro Starch” [Penford]. TM for cationic potato starches.
Use: As an alkaline-size emulsion stabilizer.

asulam potassium salt. See potassium asulam.

asymmetric carbon atom. One having its four valences held by four different groups or atoms. Compounds possessing asymmetric carbon atoms have optically active isomers.

asymmetric induction. The action of a force, arising in an optically active molecule, that influences adjacent symmetrical molecules in such a way that they become asymmetric.

asymmetric syntheses. Processes that produce optically active compounds from symmetrically constituted molecules by the intermediate use of optically active reagents, but without the use of any of the methods of resolution.

asymmetry. A molecular structure in which an atom having four tetrahedral valences is attached to four different atoms or groups. The commonest cases involve the carbon atom, though they may exist also with other elements such as nitrogen and sulfur, i.e., lactic acid which contains one asymmetric carbon (indicated by *). In such cases, two optical isomers (L and D enantiomers) result that are nonsuperposable mirror images of each other.

At. Symbol for astatine.

atactic. A type of polymer molecule in which substituent groups or atoms are arranged randomly above and below the backbone chain of atoms when the latter are all in the same plane, as shown below. See polymer, stereospecific.

“ATBC” [Reilly]. (acetyltri-*n*-butyl citrate)
CAS: 77-90-7. TM for aqueous-based pharmaceutical coatings.

ATE. Abbreviation for aluminum triethyl.
See triethyl aluminum.

-ate. A suffix having two different meanings. (1) In inorganic compounds, it indicates a salt whose metal or radical is in the highest oxidation state, as in calcium sulfate, ammonium nitrate, etc. (2) In engineering terminology, it means “result of,” as in precipitate, condensate, alkylate, distillate, etc.

“ATEC” [Reilly]. (acetyltriethyl citrate)
CAS: 77-89-4. TM for aqueous-based pharmaceutical coatings.

atenolol. (1-*p*-carbamoylmethylphenoxy-3-isopropylamino-2-propanol). C₁₄H₂₂N₂O₃.

Properties: Colorless crystals. Mp 147C.

Use: An adrenergic blocker used in treatment of hypertension. FDA approved.

ATG or AUG. The codon for methionine; the translation initiation codon. Usually, protein translation can only start at a methionine codon (although this codon may be found elsewhere within the protein sequence as well). In eukaryotic DNA, the sequence is ATG; in RNA it is AUG. Usually, the first AUG in the mRNA is the point at which translation starts, and an open reading frame follows, i.e., the nucleotides taken three at a time will code for the amino acids of the protein, and a stop codon will be found only when the protein coding region is complete.

atlantic black gac. See apomine black gx.

ATM. Abbreviation for aluminum trimethyl.
See trimethyl aluminum.

atmolysis. The separation of admixed gases by means of a porous partition. Use is made of the different speeds at which the gases diffuse.

atmosphere. (1) The gaseous envelope that surrounds the earth. It comprises of four major divisions: the troposphere (from sea level to approximately 10 km), the stratosphere (ozone region) which extends from approximately 10 to 50 km, the mesosphere which extends from from approximately 50 to 100 km, and the thermosphere which ranges from approximately 100 to 1000 km or more. There is no sharp boundary between the layers. The pressure drops rapidly as altitude increases (from 1 atm at sea level to 10^{-13} atm at 1000 km). The chemical entities and reactions that occur in these spheres are the subject of extensive research. (2) The pressure exerted by the air at sea level (14.696 psi), which will support a column of mercury 760 mm high (approximately 30 in.). This is standard barometric pressure, though it varies slightly with local meteorological conditions. It is often used to indicate working pressures of steam. The accepted abbreviation is *atm*. (3) Any environmental gas or mixture of gases, e.g., an atmosphere of nitrogen or an inert atmosphere.

atmosphere (controlled). As used in the technology of food preservation and storage, a gaseous environment in which the concentrations of oxygen, carbon dioxide, and nitrogen are held constant at a specific level, the temperature also being controlled. Controlled atmosphere storage techniques are used on a commercial scale in the U.S.

atmospheric pollution. See air pollution.

“Atnul” [ACH]. (glycerol monostearate).
CAS: 31566-31-1. TM for intermediate chemical.
Use: For food processing and baking, snack goods, pharmaceuticals, plastics, paints, coatings, and cosmetics.

atom. The smallest possible unit of an element, consisting of a nucleus containing one or more protons and (except hydrogen) one or more neutrons, and one or more electrons which revolve around it. The protons are positively charged, the neutrons have no charge, the electrons are negatively charged. As each atom contains the same number of protons as electrons, the atom is electrically neutral. Atoms in general are characterized by stability. One might wonder why the negatively charged electrons are not attracted into the positively charged nucleus in response to the law of opposite charges, causing the atom to collapse on itself. That this does not occur is due to the nature of the electron, which is not only a particle but also a standing quantum wave. As explained by Dr. W. V. Houston, “The normal state of an atom is balance between the attraction of the nucleus for the electron wave and what might be called the elastic resistance to compression of the

wave itself.” Atoms of the various elements differ in mass (weight), that is, in the number of neutrons and protons and also in the number of electrons. Atoms of a given element are identical, except that an element may have atoms of different masses, called isotopes. Individual atoms of uranium and thorium have been resolved at 5 Å in the scanning electron microscope. Motion pictures of uranium atoms at magnification of 7.5 million times have been made at the Enrico Fermi Institute at the University of Chicago. Atoms of the same or different elements combine to form molecules. When the atoms are of two or more different elements, these molecules are called compounds. Atoms remain essentially unchanged in chemical reactions except that some of the outermost electrons may be removed, shared, or transferred as occurs in oxidation, ionization, and chemical bonding. A few atomic species disintegrate as a result of nuclear changes and thus are radioactive. Heavy unstable atoms such as uranium-235 and plutonium can be split by bombardment with high-energy particles yielding tremendous energy.

See electron; proton; bonds, chemical; orbital theory; ionization; radioactivity; fission.

atom-cavity microscope.

A technique that traps single atoms in a magneto-optical trap and are dropped through a high-finesse optical cavity. A laser probe measures atomic motions.

Use: Study of atomic-scale motions of single atoms. See: scanning tunneling microscope; chemical force microscopy.

atom form factor. (atomic scattering factor; atomic structure factor; *f*-value). Quantity in the expression for the intensity of an X-ray beam reflected by a crystal, whose value is dependent on the varying configuration of the electrons in the crystal atoms relative to the nuclei, as well as on the incident angle and the wave length of the X rays.

atomic absorption coefficient. Ratio of absorption coefficient of an element to the number of atoms per unit volume.

atomic absorption spectroscopy. An analytical technique in which the substance to be analyzed is converted into an atomic vapor by spraying a solution into an acetylene-air flame. Some types of compounds require a reducing flame, such as acetylene-nitrous oxide. The absorbance at a selected wavelength is measured and compared with that of a reference substance. The absorbance measured is proportional to the concentration.

atomic energy. See nuclear energy.

atomic force microscopy.

A technique similar to scanning tunneling microscopy employing an instrument that uses a sharply

tipped electrode in close proximity to a surface. As the electrode is moved, the change in electrode signal relates to the shape of the surface being scanned.
Use: Study of atomic-scale structure of surfaces, transport of atoms and molecules.
See: scanning tunneling microscope; chemical force microscopy.

atomic hydrogen welding. A method of welding in which hydrogen gas is passed through an arc between two tungsten electrodes. The arc breaks down the molecules to form atomic hydrogen. The recombination of the atoms to form molecules and the combustion of the molecular hydrogen in atmospheric oxygen produce a flame temperature of 4000–5000C.

atomic number. The number of protons (positively charged mass units) in the nucleus of an atom, upon which its structure and properties depend. This number represents the location of an element in the periodic table. It is normally the same as the number of negatively charged electrons in the shells. Thus, an atom is electrically neutral except in an ionized state, when one or more electrons have been gained or lost. Atomic numbers range from 1, for hydrogen, to 109 for meitnerium.
See periodic table; atomic weight; mass number.

atomic radius. One-half the distance between two adjacent atoms in crystals of elements. It varies according to interatomic forces.

atomic scattering factor. *See* atom form factor.

atomic structure factor. *See* atom form factor.

atomic susceptibility. Product of the specific or mass susceptibility of an element and its atomic weight.

atomic theory. *See* Dalton, John.

atomic volume. The atomic weight of an element divided by its density.

atomic weight. (aw). The average weight or mass of all the isotopes of an element as determined from the proportions in which they are present in a given element, compared with the mass of the 12 isotope of carbon (taken as precisely 12.000), which is the official international standard. The true atomic weight of carbon when the masses of its isotopes are averaged is 12.01115; that of oxygen is 15.9994. The total mass of any atom is the sum of the masses of all its constituents (protons, neutrons, and electrons). Official atomic weight determinations are released periodically by the IUPAC.
See atomic number; mass number.

ATP. Abbreviation for adenosine triphosphate.

ATPase. An enzyme that hydrolyzes ATP to yield ADP and phosphate; usually coupled to some process requiring energy such as the sodium potassium ATPase.

ATP synthase. An enzyme complex that forms ATP from ADP and phosphate during oxidative phosphorylation in the inner mitochondrial membrane or the bacterial plasma membrane, and during photophosphorylation in chloroplasts. Uses a proton gradient to chemiosmotically drive the synthesis.

atranorin.

CAS: 479-20-9. mf: $C_{10}H_{18}O_8$.

Hazard: A poison by skin contact. A skin irritant.

atrazine. (2-chloro-4-ethylamino-6-isopropylamino-*s*-triazine).

CAS: 1912-24-9.

Hazard: TLV: 5 mg/m³.

Use: Herbicide, plant growth regulator, and weed-control agent for corn, etc., and for noncrop and industrial sites. Reported to inhibit photosynthesis of algae in streams.

atropine. (daturine).

CAS: 51-55-8. $C_{17}H_{23}NO_3$. An alkaloid obtained from species of *Atropa*, *Datura*, or *Hyoscyamus*.

Properties: White crystals or powder. Optically inactive (but usually contains levorotatory hyoscyamine). Mp 114–116C. Soluble in alcohol, ether, chloroform, and glycerol; slightly soluble in water.

Derivation: By extraction from *Datura stramonium* or by synthesis.

Grade: Technical, NF.

Use: Medicine (antidote for cholinesterase-inhibiting compounds, organophosphorus insecticides, nerve gases); artificial respiration may also be necessary.

“Attack All” [Kao]. TM for a laundry detergent containing bleach, disinfectant, deodorizer, and softener in one.

attapulgit. $(MgAl)_5Si_8O_{23}(OH)_4 \cdot 4H_2O$. A hydrated aluminum-magnesium silicate, the chief ingredient of fuller’s earth.

Use: Drilling fluids, decolorizing oils, filter medium. *See* clay.

attar. (otto). An essential oil (fragrance) made by steam distillation of flowers, especially roses. *See* essential oil; perfume.

attenuator. An RNA sequence involved in regulating the expression of some prokaryotic genes.

atto- (a). Prefix meaning 10⁻¹⁸ unit (abbreviated a), e.g., 1 ag = 1 attogram (10⁻¹⁸ g).

attrition mill. (burr mill). A grinding machine consisting of two metal plates or discs with small projections (burrs). One plate may be stationary while the other rotates, or both may rotate in opposite directions. Feed enters through a hopper above the plates, and ground product emerges at the bottom. There are numerous variations in design.

Au. Symbol for gold, from Latin *aurum*.

AUG. See initiation codon.

auger. See screw.

Auger electron. Low-energy conversion electron produced by absorption of X-ray quanta by an electron of an outer shell.
See AES; spectroscopy.

auramine. [4,4'-(imidocarbonyl)bis(*N,N*-dimethylaniline)].

CAS: 492-80-8.

$(\text{CH}_3)_2\text{NC}_6\text{H}_4(\text{C}:\text{NH})\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: Yellow flakes or powder. Soluble in water, alcohol, and ether.

Use: Yellow dye for paper, textiles, leather; antiseptic; fungicide.

aureolin. See Indian yellow.

“Aureomycin” [Cytotec]. TM for chlortetracycline hydrochloride. An antibiotic. Must conform to FDA requirements.

“Auric” [Du Pont]. TM for a ferric oxide brown pigment.

auric compounds. See gold compounds.

aurin (*p*-rosolic acid). $(\text{C}_6\text{H}_4\text{OH})_2\text{CC}_6\text{H}_4\text{O}$. A triphenylmethane derivative.

Properties: Reddish-brown pieces with greenish metallic luster; easily powdered. Insoluble in water, benzene, and ether; soluble in alcohol.

Use: Indicator, dye intermediate.

aurous compounds. See gold compounds.

austenite. A component of steel, a nonmagnetic solid solution of carbon or ferric carbide in γ -iron. Very unstable below its critical temperature, but may be obtained in high-carbon steels by rapid quenching from high temperatures. Addition of manganese and nickel lowers critical transition temperature, and stable austenite may be obtained at room temperature. Characterized by a face-centered cubic lattice.

austenitic alloys. (austenitic steels). Alloys of iron, chromium, and nickel noted for their resistance to corrosion.

Australian bark. See wattle bark.

autocatalysis. A catalytic reaction induced by a product of the same reaction. This occurs in some types of thermal decomposition, in autoxidation, and in many biochemical systems, as when an enzyme activates its own precursor.

See autoxidation.

autoclave. A chamber, usually of cylindrical shape, provided with a door or gate at one end which can be securely closed during operation. It is built heavily enough to accommodate steam pressures of considerable magnitude. It is used to effect chemical reactions requiring high temperature and pressure, such as open-steam vulcanization of rubber. Sizes vary from laboratory units to production size, which may be over 50 ft long and three or more feet in diameter. The latter are provided with baffles to ensure equal distribution of the entering steam. Autoclaves are also used in certain sterilization processes.

“Autofloc” [Nalco]. TM for computerized apparatus in mining.

Use: For monitoring and control of clarification/thickening operations.

autohesion. The formation of a bond between two contiguous surfaces of the same material, when they are pressed together.

autoignition point. (autoignition temperature; autoign temp). The minimum temperature required to initiate or cause self-sustained combustion in any substance in the absence of a spark or flame. This varies with the test method. Some approximate autoignition temperatures follow:

phenol	715C (1319F)
acetone	537C (1000F)
aniline	537C (1000F)
toluene	537C (1000F)
magnesium powder	472C (883F)
butane	430C (806F)
amyl acetate	398C (750F)
pine shavings	265C (507F)
cotton batting	230C (446F)
ethyl ether	180C (356F)
nitrocellulose film	137C (279F)
carbon disulfide	100C (212F)

See flash point.

autoionization. Spontaneous dissociation of a molecule.

autolysis. Hydrolysis by tissue proteases; self digestion.

autolyte. A substance that conducts an electric current by itself without requiring a dissolved salt to carry the current.

autolyzed yeast extract. See baker's yeast extract.

automatic control. Maintenance of desired process conditions (temperature, pressure, etc.) by means of sensing devices that function either electromechanically (thermostat) or electronically (feedback). Applicable to many operations and processes in the chemical industries, such as petroleum refining, evaporation, distillation, heat transfer, electroplating, calendaring, extrusion, and many others. Automatic control is not identical with automation.

See instrumentation.

automation. Substitution of specially designed machines for manual labor in such mechanical operations as wrapping, packaging of small units, filling and capping bottles, sealing cans and containers, and materials feeding and proportioning. Automated procedures are much more efficient than manual and effect notable cost savings provided that the machinery is reliable. Do not confuse automation with automatic control.

automotive exhaust emission. See air pollution.

autoradiography. A technique that uses X-ray film to visualize radioactively labeled molecules or fragments of molecules.

Use: In analyzing length and number of DNA fragments after they are separated by gel electrophoresis.

autosomal dominant. A gene on one of the non-sex chromosomes that is always expressed, even if only one copy is present. The chance of passing the gene to offspring is 50% for each pregnancy.

See autosome; dominant; gene.

autosome. A chromosome not involved in sex determination. The diploid human genome consists of a total of 46 chromosomes: 22 pairs of autosomes, and 1 pair of sex chromosomes (the X and Y chromosomes).

See sex chromosome.

autotroph. An organism that can synthesize its own complex molecules from simple carbon and nitrogen sources, such as CO₂ and NH₃.

autoxidation. (autooxidation). A spontaneous, self-catalyzed oxidation occurring in the presence of air. It usually involves a free-radical mechanism. It is initiated by heat, light, metallic catalysts, or free-radical generators. Industrial processes, such as manufacture of phenol and acetone from cumene, are based on autoxidation. Other instances are the drying of vegetable oils, the spoilage of fats, gum formation in lubricating oils, and the degradation of

high polymers exposed to sunlight for long periods. See autocatalysis.

Auwers-Skita rule. In its original form, the rule stated that in *cis-trans* isomeric hydroaromatic compounds, the *cis* had the higher density and refractive index and the lower molecular refractivity. A more modern statement of the von Auwers-Skita rule (which has undergone several modifications since it was first enunciated) is that, among alicyclic epimers not differing in dipole moment, the isomer of highest heat content has the higher density, index of refraction, and boiling point.

Auwers synthesis. Expansion of coumarones to flavonols by treatment of 2-bromo-2-(α -bromobenzyl)coumarones with alcoholic alkali.

auxiliary. Any of a number of chemical compounds used in some phase of textile processing. They may be classified as follows: (1) fats, oils, and waxes; (2) starches, gums, and glues (sizing); (3) soaps and detergents; (4) inorganic chemicals (bleaching, mercerizing); (5) organic solvents; (6) special-purpose products (flameproofing, mildewproofing, repellent and decorative coatings, and permanent-press resins). They are sometimes also called assistants.

auxin. A natural or synthetic plant growth hormone that regulates longitudinal cell structure so as to permit bending of the stalk or stem in phototropic response. The natural materials are formed in small amounts in the green tips of growing plants, in root tips, and on the shaded side of growing shoots. 3-Indoleacetic acid is the most important natural auxin.

See plant growth regulator.

auxochrome. A radical or group of atoms whose presence is essential in enabling a colored organic substance to be retained on fibers. The best examples are the groups -COOH, -SO₃H, -OH, and -NH₂.

auxotroph. See auxotrophic mutant.

auxotrophic mutant. (auxotroph). A mutant organism defective in the synthesis of a given biomolecule, which must therefore be supplied for the organism's growth.

"Avadex" [Solutia]. TM for a series of liquid or granular herbicides containing 2,3-dichloroallyl diisopropylthiocarbamate. Widely used to control growth of wild oats in agricultural crops.

Hazard: By ingestion and inhalation.

"Availaphos" [Occidental]. TM for a mineral supplement supplying phosphorus and calcium in readily available form for animal and poultry feeds.

“**Avantia**” [*Isp Europe*]. TM for a pharmaceutical tablet-coating systems.

“**Avelox Tabs**” [*Lapgap*]. TM for film coated tablets.

Use: Treatment of bacterial bronchitis, pneumonia and sinusitis.

avermectin b₁

CAS: 71751-41-2.

Hazard: A poison by ingestion. Moderately toxic by inhalation and skin contact.

Use: Agricultural chemical.

avermectin b_{1a}

CAS: 65195-55-3. mf: C₄₈H₇₂O₁₄.

Hazard: A poison by ingestion. Moderately toxic by skin contact.

Use: Food additive; insecticide; miticide; agricultural chemical.

aviation gasoline. See gasoline

“**Avibest**” [*FMC*]. TM for a microcrystalline form of asbestos.

“**Avicel**” [*FMC*]. TM for microcrystalline cellulose, a highly purified particulate form of cellulose.

Properties: Particle size ranges from less than 1 to 150 microns (average varies with grade), density 1.55 (bulk density 0.3–0.5). Insoluble in dilute acids, organic solvents, oils; swells in dilute alkali. Dispersible in water to form stable gels or pourable suspensions. Adsorbs oily and syrupy materials.

Use: Aid to stabilization and emulsification, ingredient in foods, suspending agent, binder and hardening agent in tableting, separatory medium in column and thin-layer chromatography, pure cellulose raw material.

avidin. A protein occurring in egg white, where it constitutes approximately 0.2% of the total protein. It has the property of combining firmly with biotin and rendering it unavailable to organisms, since proteolytic enzymes do not destroy the avidin-biotin complex. Avidin loses its ability to combine with biotin when subjected to heat; hence cooked egg white does not lead to biotin deficiency.

“**Avitene**” [*FMC*]. TM for a microcrystalline form of collagen.

“**Avitex**” [*Du Pont*]. TM for a group of textile softeners, lubricants, and antistatic agents. Both anionic and cationic types are available.

“**Avitone**” [*Du Pont*]. TM for a group of chemical compounds based on hydrocarbon sodium sulfonates that are used principally as softening lubricating and finishing agents for textiles, leather, and paper.

avocado oil. An edible oil high in unsaturated fatty acids.

Properties: Greenish oil; faint odor, bland taste. D 0.91, acid value 1–7, saponification value 177–198, iodine value 71–95, fp 7–9C, refr index 1.461–1.465 (40C).

Use: Cosmetic creams, hair conditioners, suntan preparations, salad oils.

Avogadro’s law. A principle stated in 1811 by the Italian chemist Amadeo Avogadro (1776–1856) that equal volumes of gases at the same temperature and pressure contain the same number of molecules regardless of their chemical nature and physical properties. This number (Avogadro’s number) is 6.023×10^{23} . It is the number of molecules of any gas present in a volume of 22.41 L and is the same for the lightest gas (hydrogen) as for a heavy gas such as carbon dioxide or bromine. Avogadro’s number is one of the fundamental constants of chemistry. It permits calculation of the amount of pure substance in a mole, the basis of stoichiometric relationships. It also makes possible determination of how much heavier a simple molecule of one gas is than that of another; as a result the relative molecular weights of gases can be ascertained by comparing the weights of equal volumes. Avogadro’s number (conventionally represented by “N” in chemical calculations) is now defined to be the number of atoms present in 12 grams of the carbon-12 isotope (one mole of carbon-12) and can be applied to any type of chemical entity.

See mole.

avuncular relationship. The genetic relationship between nieces and nephews and their aunts and uncles.

“**Axell**” [*Accurate*]. TM for polyclonal antibodies.

“**AxellPrep**” [*Accurate*]. TM for products for the isolation of human mononuclear cells.

axis of symmetry. An imaginary line in a crystal. The crystal, when rotated around this line through 360°, shows the same crystal face, at least twice.

“**Axyll**” [*Accurate*]. TM for monoclonal antibodies.

aza-. Prefix indicating the presence of nitrogen in a heterocyclic ring.

3-azabicyclo(3,2,2)nonane. C₈H₁₅N.

Properties: White-tan solid. Mp 180C (sublimes). Partly soluble in water; solubility decreases with an increase in temperature. Readily soluble in alcohol, bulk d 4.67 lb/gal (20C).

Use: Intermediate for the preparation of pharmaceuticals and rubber chemicals.

1-azabicyclo(2.2.2)octane. See quinuclidine.

azabicyclooctanol methyl bromide diphenylacetate.

CAS: 69766-47-8. mf: $C_{22}H_{26}NO_2 \cdot Br$.

Hazard: A poison.

8-azaguanine. (5-amino-1,4-dihydro-7H-1,2,3-triazolo[4,5-d]pyrimidin-7-1).

CAS: 134-58-7. $C_4H_4N_6O$.

Properties: Crystals from dilute aqueous sodium hydroxide. Insoluble in water, alcohol, and ether.

Grade: Refined.

Use: Inhibitor of purine synthesis.

azaspiracid.

CAS: 214899-21-5. mf: $C_{47}H_{71}NO_{12}$.

Hazard: A poison by ingestion.

2-azaspiro(5.5)undec-7-ene.

CAS: 6671-96-1. mf: $C_{10}H_{17}N$.

Hazard: A poison by ingestion and skin contact. A severe skin and eye irritant.

azathioprine. (Imuran). An immunosuppressive drug administered for the purpose of inhibiting the natural tendency of the body to reject foreign tissues by one or more types of immunizing reactions, i.e., formation of leucocytes or antibodies. It has been used with some success in cases of kidney and liver transplants.

6-azauridine. (6-azauracil riboside; *as*-triazine-3,5(2*H*,4*H*)dione riboside).

CAS: 54-25-1. $C_8H_{11}N_3O_6$.

Derivation: Microbiological fermentation.

Use: Research on cell formation and cancer.

azelaic acid. (nonanedioic acid; 1,7-heptanedicarboxylic acid). $HOOC(CH_2)_7COOH$.

Properties: Yellowish to white, crystalline powder. Mp 106C, bp 365C (decomposes). Soluble in hot water, alcohol, and organic solvents.

Derivation: Oxidation of oleic acid by ozone.

Grade: Technical.

Use: Organic synthesis, lacquers, product of hydro-tropic salts, alkyd resins, polyamides, polyester adhesives, low-temperature plasticizers, urethane elastomers.

azelaoyl chloride. $ClOC(CH_2)_7COCl$.

Properties: Bp 125–130C (3 mm). Slowly decomposes in cold water; soluble in hydrocarbons and ethers.

Use: Organic synthesis.

azeotrope. See azeotropic mixture.

azeotropic distillation. A type of distillation in which a substance is added to the mixture to be separated in order to form an azeotropic mixture with one or more of the components of the original

mixture. The azeotrope or azeotropes thus formed will have boiling points different from the boiling points of the original mixture and will permit greater ease of separation.

azeotropic mixture. (azeotrope). A liquid mixture of two or more substances which behaves like a single substance in that the vapor produced by partial evaporation of liquid has the same composition as the liquid. The constant boiling mixture exhibits either a maximum or minimum boiling point as compared with other mixtures of the same substances.

azide. Any of a group of compounds having the characteristic formula $R(N_3)_x$. R may be almost any metal atom, a hydrogen atom, a halogen atom, the ammonium radical, a complex ($[CO(NH_3)_6]$, $[Hg(CN)_4M]$ with M = Cu, Zn, Co, Ni) an organic radical like methyl, phenyl, nitrophenol, dinitrophenol, *p*-nitrobenzyl, ethyl nitrate, etc., and a variety of other groups or radicals. The azide group has a chain structure rather than a ring structure. All the heavy metal azides, such as hydrogen azide, and most if not all of the light metal azides (under appropriate conditions) are explosive. They should be handled with utmost care and protected from light, shock, and heat. Many of the organic azides are also explosive. See lead azide; hydrazoic azide.

aziminobenzene. See 1,2,3-benzotriazole.

azimino compounds. Stable heterocyclic compounds having three adjacent nitrogen atoms in one ring.

azimsulfuron.

CAS: 120162-55-2. mf: $C_{13}H_{16}N_4O_5S$.

Hazard: Low toxicity by ingestion, inhalation, and contact. A mild eye irritant.

azine dye. A class of dyes derived from phenazine. $(C_6H_4)_2N_2(C_6H_4)$ (tricyclic). The chromophore group may be $=C=N-$, but the color is more probably due to the characteristic unsaturation of the benzene rings. The members of the group are quite varied in application. The nigrosines (CI 50415–50440) and safranines (CI 50200–50375) are examples of this group.

See dye, synthetic.

azinphos methyl. (*O,O*-dimethyl-*S*-4-oxo-1,2,3-benzotriazin-3(4*H*)-yl methyl phosphorodithioate; "Guthion").

CAS: 86-50-0. $C_{10}H_{12}N_3O_3PS_2$.

Properties: Brown, waxy solid. Mp 73C. Slightly soluble in water; soluble in most organic solvents.

Hazard: A poison, cholinesterase inhibitor. Absorbed by skin. TLV: 0.2 mg/m³.

Use: Insecticide for fruit. Use may be restricted.

aziridine. A compound based on the ring structure.

See ethyleneimine; ethylethyleneimine; propyleneimine; polypropyleneimine; 1-aziridineethanol.

1-aziridineethanol. (*N*-(2-hydroxyethylethyleneimine)).

CAS: 1072-52-2. $\text{C}_2\text{H}_4\text{NCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Bp 167.9C, flash p 185F (OC). Combustible. Handling: Inhibited with 1–3% dissolved sodium hydroxide.

Hazard: Irritant to skin and eyes.

Use: Chemical intermediate.

1-aziridinepropionic acid, cinnamyl ester.

CAS: 99900-94-4. mf: $\text{C}_{14}\text{H}_{17}\text{NO}_2$.

Hazard: A poison.

“A-Z Lite” [Nalco]. TM for corrosion inhibitor.

Use: In cooling tower systems.

azlon. Generic name for a manufactured fiber in which the fiber-forming substance is composed of any regenerated naturally occurring protein (FTC). Proteins from corn, peanuts, and milk have been used. Azlon fiber has a soft hand, blends well with other fibers, and is used like wood. Combustible.

azobenzene. (diphenyldiimide; benzeneazobenzene).

CAS: 103-33-3. $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_5$.

Properties: Yellow or orange crystals. Mp 68C, bp 297C, d 1.203 (20/4C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Reduction of nitrobenzene with sodium stannite.

Hazard: Toxic; may cause liver injury.

Use: Manufacture of dyes and rubber accelerators, fumigant, acaricide.

azobenzene-*p*-sulfonic acid. $\text{C}_{12}\text{H}_{10}\text{O}_3\text{N}_2\text{S}$.

Properties: Orange crystals. Mp 129C.

Use: Intermediate and reagent chemicals.

4,4'-azobis(4-cyanovaleric acid).

CAS: 2638-94-0.

$[\text{=NC}(\text{CH}_3)(\text{CN})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}]_2$.

Properties: Light sensitive. Mp 90C (decomposes), mw 280.28.

Grade: 80% solution in water.

Hazard: Toxic.

azobisdimethylvaleronitrile.

Properties: White, crystalline solid.

Use: Initiator for suspension polymerization of vinyl chloride; solution polymerization of various monomers such as acrylonitrile, MMA, vinyl acetate.

1,1'-azobisformamide. (azodicarbonamide).

$\text{H}_2\text{NCONNCONH}_2$.

Properties: Yellow powder. D 1.65 (20/20C), mp above 180C (decomposes). Insoluble in common solvents; soluble in dimethyl sulfoxide. Hydrolyzes at high temperatures to nitrogen, carbon dioxide, and ammonia.

Derivation: From hydrazine.

Grade: Technical, FCC.

Use: Blowing agent for plastics and rubbers, maturing agent for flours.

2,2'-azobisisovaleronitrile.

CAS: 13472-08-7. mf: $\text{C}_{10}\text{H}_{16}\text{N}_4$.

Hazard: Moderately toxic by ingestion.

azobisisobutyronitrile.

$(\text{CH}_3)_2\text{C}(\text{CN})\text{NNC}(\text{CN})(\text{CH}_3)_2$.

Properties: White powder. Mp 105C (decomposes). Insoluble in water; soluble in many organic solvents and in vinyl monomers.

Hazard: Toxic by ingestion.

Use: Catalyst for vinyl polymerizations and for curing unsaturated polyester resins, blowing agent for plastics.

azocyclotin. See (1*h*-1,2,4-triazolyl-1-yl)tricyclohexylstannane.

azodicarbonamide. See 1,1'-azobisformamide.

azodine. (benzeneazonaphthylethylenediamine).

CAS: 136-40-3. $\text{C}_{18}\text{H}_{18}\text{N}_4$.

Properties: Red crystals. Mp 107–108C.

Use: Reagent for rapid determination of penicillin in blood, urine, and other media.

“Azodrin” [Shell]. [3-(dimethoxyphosphinyloxy)*n*-methyl-*cis*-crotonamide]; monocrotophos]. CAS: 6923-22-4. TM for dimethylphosphate of 3-hydroxy-*N*-methyl-*cis*-crotonamide.

$(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3)\text{:CHC}(\text{O})\text{NHCH}_3$.

Properties: Reddish brown solid with a mild ester odor. Bp 125C. Soluble in water and alcohol; almost insoluble in kerosene and diesel fuel. Commercially available as a water-miscible solution.

Hazard: Flammable, dangerous fire risk. Use may be restricted. Toxic via ingestion, inhalation, and skin absorption. TLV: TWA 0.25 mg/m³; Not Classifiable as a Human Carcinogen.

Use: Controls certain insects which attack cotton plants.

azo dye. Any of a broad series of synthetic dyes that have —N=—N— as a chromophore group. They are produced from amino compounds by diazotization and coupling. Over half of the commercial dyes are in this general category. By varying the chemical composition it is possible to produce acid, basic, direct, or mordant dyes. This general group is subdivided as monoazo, diazo, trisazo, and tetrazo

according to the number of $-N=N-$ groups in the molecule. Examples are Chrysoidine Y, Bismarck Brown 2R, and Direct Green B.
See dye, synthetic; azoic dye.

azo dye intermediate. Any of various sulfonated aromatic acids derived from α - and β -naphthol, naphthalene, and α - and β -naphthylamine. Besides their systematic names, some are named after their discoverers, while others have letter designations. All have a fused ring structure with amino, hydroxyl, or sulfonic groups at various locations. For details, see the following entries:

1,2,4-acid	γ acid
amino-G acid	J acid
amino-J acid	Kochs acid
Armstrong's acid	L acid
B acid	Laurent's acid
Broenner' acid	M acid
Casella's acid	Neville-Winter acid
Chicago acid (SS acid)	peri acid
chromotropic acid	R acid
Cleve's acid	R R acid (2R acid)
crocein (Bayer's acid)	Schaeffer's acid
epsilon acid	Schoelkopf's acid
G acid	sultam acid
	Tobias acid

azoic dye. There is no fundamental chromophoric difference between azo and azoic dyes. The differentiation is made to characterize a group of azo pigments which are precipitated within the cellulose fiber by carrying out the dye coupling on the fiber. With the advent of the equally brilliant but more easily applied fiber-reactive dyes, the azoics have lost some of their importance.

azophenylene. See phenazine.

“Azosol” [BASF]. TM for a series of dyestuffs; soluble in organic solvents.
Use: Coloring spirit lacquers and spirit inks.

azosulfamide. (disodium 2-(4'-sulfamylphenylazo)-7-acetamido-1-hydroxynaphthalene-3,6-disulfonate). $C_{18}H_{14}N_4Na_2O_{10}S_3$.
Properties: Dark red powder; odorless; tasteless.

Soluble in water with an intense red color; practically insoluble in organic solvents.

Use: Medicine (antibacterial).

azote. The French word for nitrogen ($a =$ not, plus $zoo =$ alive as in *zoon* = animal). Nitrogen-bearing compounds can be recognized by this root word in such terms as azo, azide, azobenzene, carbazole, thiazole, etc. The derivation is due to the chemical inertness of nitrogen.

azotic acid. See nitric acid.

azoxybenzene. (diphenyldiazene oxide).

CAS: 495-48-7. $C_6H_5NO=NC_6H_5$.

Properties: Yellow crystals. D 1.16, mp 36C. Soluble in alcohol; insoluble in water.

Use: Intermediate in organic synthesis.

azoxystrobin.

CAS: 131860-33-8. mf: $C_{22}H_{17}N_3O_5$.

Hazard: Moderately toxic by inhalation.

azoxytoluidine. See diaminoazoxytoluene.

azulene.

CAS: 275-51-4. $C_{10}H_7$. Aromatic hydrocarbon with a 7-carbon ring fused to a 5-carbon ring.

Properties: Blue to greenish-black leaflets. Mw 128.19, mp 99-100C, bp 242C, decomposes at 270C, bp 115-135C at 10 mm Hg. Soluble in alcohol, ether, acetone.

azure blue. See cobalt blue.

azuresin.

Properties: Moist, irregular, dark blue or purple granules; slightly pungent odor.

Derivation: Carbacrylic cation-exchange resin, in reversible combination with 3-amino-7-dimethylaminophenazathionium chloride (azure A dye).

Grade: NF.

Use: Medicine (diagnostic test).

B

β. See beta.

B. Symbol for boron.

Ba. Symbol for barium.

¹³⁷**Ba.** See barium-137.

babassu oil. A nondrying, edible oil expressed from the kernels of the babassu palm, which grows in profusion in Brazil. Composition: 44% lauric acid, 15% myristic acid, 16% oleic acid, balance mixed acids. Usable in foods and soapmaking, but supply is limited by cost of exploitation of the large quantities potentially available. Combustible.

Babbitt metal. One of a group of soft alloys used widely for bearings. They have good bonding characteristics with the substrate metal, maintain oil films on their surfaces, and are nonseizing and anti-friction. Used as cast, machined, or preformed bimetallic bearings in the form of a thin coating on a steel base; the main types are lead base, lead-silver base, tin base, cadmium base, and arsenical. The latter contains up to 3% arsenic.

Hazard: Dust is toxic by inhalation.

Babcock test. A rapid test for butterfat in milk introduced by Stephen M. Babcock in 1890 and now in worldwide use in the dairy industry.

Babinet principle. Identical diffraction patterns of a substance are produced by two diffraction screens one of which is the exact negative of the other.

Babo's law. The lowering of vapor pressure is proportional to the mole fraction of nonvolatile solute in a solution.

BAC. See: (1) Biologically activated C; (2) blood alcohol concentration; (3) bromacetyl cellulose; (4) bacterial artificial chromosome.

B acid. (1-amino-8-naphthol-3,5-disulfonic acid). $C_{10}H_4NH_2OH(SO_3H)_2$.

Derivation: Sulfonation of 1-amino-8-naphthol-3-sulfonic acid.

Use: Azo dye intermediate.

bacillomycin. See bacillus subtilis BPN.

bacillus. A type of bacteria characterized by a rodlike shape.

bacillus subtilis BPN. (bacillomycin; fungocin; subtilisins).

CAS: 1395-21-7.

Hazard: A severe eye irritant. TLV: CL 0.00006 mg/m³.

Use: Laundry detergents.

bacitracin methylene disalicylate.

Properties: White to gray-brown powder. Slight unpleasant odor, less bitter than bacitracin. Soluble in water, pyridine, ethanol; less soluble in acetone, ether, chloroform, benzene; pH of saturated aqueous soluble 3.5–5.0. Available also as the sodium salt.

Use: Antibiotic, feed additive.

bacitracin zinc.

Use: Drug (veterinary); feed additive.

backcross. A cross between an animal that is heterozygous for alleles obtained from two parental strains and a second animal from one of those parental strains. Also used to describe the breeding protocol of an outcross followed by a backcross.

See model organisms.

back filling. Process of applying starch, with or without other filling or weighting materials, to the back of a cloth.

Back-Goudsmit effect. Effect of a weak magnetic field on the spectral lines of an element having a nuclear magnetic moment.

back-mutation. A mutation that causes a mutant gene to revert back to its wild-type genotype.

bacteria. Microorganisms often composed of a single cell in the form of straight or curved rods (bacilli), spheres (cocci), or spiral structures. Their chemical composition is primarily protein and nucleic acid. Chlorophyll molecules are also present, enabling bacteria to carry out photosynthesis. Some types, called anaerobic, are able to live and reproduce in the absence of oxygen; aerobic types require oxygen. Bacteria that can live either with or without oxygen are called facultative. Filamentous bacteria are related to blue-green algae. Molds that yield antibiotics (*Actinomycetes*) are of this type. Pathogenic bacteria are infectious organisms that cause such diseases as pneumonia, tuberculosis, syphilis, and typhus. The staining of bacteria for microscopic identification was originated by Koch, a German physician and bacteriologist (1843–1910). Bacteria are often classified as Gram-positive or Gram-negative. Food spoilage is often induced by bacterial contamination. There are many beneficial types of

bacteria in the body, e.g., intestinal flora that aid in metabolism. Bacteria rich in proteins can be produced by fermentation of animal wastes for feed supplements. The outstanding development in this field is the laboratory modification of bacteria by gene-splicing techniques. This noteworthy achievement has an enormous future potential in the chemical, agricultural, food, and pharmaceutical industries. The Supreme Court has ruled it to be a patentable invention.

See recombinant DNA; biotechnology.

Use: (1) Fermentation processes used in baking and the manufacture of alcohol, wine, vinegar, beer (yeast), and antibiotics (molds). (2) Fixation of atmospheric nitrogen in the soil. (3) Reaction with hydrocarbons (methane and other paraffins) to yield proteins (yeasts). (4) Purification of sewage sludge activated by bacteria (see sewage sludge). (5) Reaction with cellulose to form biopolymers and high-protein foodstuffs. (6) Reaction with waste materials (coal and cement dusts, gasworks effluent) to release plant nutrients for inexpensive fertilizers (the former U.S.S.R.). (7) Precipitation and concentration of uranium and some other metals by compounds obtained from bacteria grown on carbonaceous materials such as lignin and cellulose. (8) Formation of azo compounds in soil treated with the herbicide propanil. (9) Synthesis of hormones by recombinant DNA methods (*E. coli*).

See insulin. (10) Miscellaneous reactions, e.g., oxidation of pentaerythritol to tris(hydroxymethyl)acetic acid; conversion of the sulfur in gypsum to elemental sulfur via hydrogen sulfide; clean-up of oil spills. See fermentation; virus; enzyme; biotechnology.

bacterial artificial chromosome. (BAC).

A vector used to clone DNA fragments (100- to 300-kb insert size; average, 150 kb) in *Escherichia coli* cells. Based on naturally occurring F-factor plasmid found in the bacterium *E. coli*.

See cloning vector.

bactericide. (germicide). Any agent that will kill bacteria, especially those causing disease. Bactericides vary greatly in their potency and specificity. They may be other organisms (bacteriophages), chemical compounds, or shortwave radiation.

See virus; antibiotic; biocide.

bacteriophage. A type of virus that attacks and destroys bacteria by surrounding and absorbing them.

bacteriophage lambda. A virus which infects *E. coli*, and which is often used in molecular genetics experiments as a vector, or cloning vehicle. Recombinant phages can be made in which certain non-essential DNA is removed and replaced with the DNA of interest. The phage can accommodate a DNA "insert" of about 15-20 kb. Replication of that virus will thus replicate the investigator's DNA.

bacteriostat. A substance that prevents or retards the growth of bacteria. Examples are quaternary ammonium salts and hexachlorophene. See antiseptic.

baddeleyite. (zirconia). ZrO_2 . A natural zirconium oxide.

Properties: Black, brown, yellow to colorless; streak white, luster submetallic to vitreous to greasy. D5.5-6.0, mp 2500-2950C. Highly resistant to chemicals.

Grade: Crude (53%, 73-75%), purified (98%).

Occurrence: Brazil, Ceylon.

Use: Corrosion- and heat-resistant applications, source zirconium.

Badische acid. (2-naphthylamine-8-sulfonic acid). $C_{10}H_9NO_3S$.

Properties: Colorless needles, partially soluble in water and alkalies, slightly soluble in alcohol.

Derivation: Sulfonation of 2-naphthylamine.

Use: Azo dye intermediate.

Bakeland (Bakelite) process. Condensation of phenol and formaldehyde to *o*-hydroxymethylphenol (Lederer-Manasse), which undergoes further arylation yielding a polymeric structure.

Bakeland, L. H. (1863-1944). Born in Ghent, Belgium. He did early research in photographic chemistry and invented Velox paper (1893). After working for several years in electrolytic research, he undertook fundamental study of the reaction products of phenol and formaldehyde, which culminated in his discovery in 1907 of phenol-formaldehyde polymers originally called "Bakelite." The reaction itself had been investigated by Bayer in 1872, but Bakeland was the first to learn how to control it to yield dependable results on a commercial scale. The Bakelite Co. was founded in 1910 and now is Bakelite AG.

See phenol-formaldehyde resins.

Baeyer-Drewson indigo synthesis. Formation of indigos by an aldol addition of *o*-nitrobenzaldehydes to acetone, pyruvic acid, or acetaldehyde. Of interest mainly as a method of protecting *o*-nitrobenzaldehydes.

Baeyer-Villiger reactions. The oxidation of aromatic, open-chain, and cyclic ketones to esters and lactones by peracids.

baffle. A flow-regulating device consisting of a perforated metal plate placed horizontally in liquid-mixing tanks, distillation columns, and the like to restrict or divert the passage of liquid, thus providing a uniformly dispersed flow. Baffles are also used in open-steam autoclaves to ensure even distribution of the entering steam.

bagasse. A form of cellulose (biomass) derived as a by-product of the crushing of sugar cane or guayule plants. Contains a high proportion of hemicellulose. After pulping with either soda or kraft cooking liquor, it can be made into a low grade of paper. It is also used in compressed form as an insulating board in construction, as a medium for growth of nutritive bacteria, in animal feeds, in manufacturing of furfural; and as on-site fuel for cane-sugar mills. In Hawaii, it is being used as a fuel for electric power generation.

Hazard: Dust is flammable.
See biomass.

baghouse. (bag filter). A large-scale dust-collecting device composed of a series of large cotton or nylon bags assembled in a heavy metal frame or housing. The bags may be as much as 10 ft high, each "bag" being made up of three units sewn together as one element approximately 18 inches in diameter. Discharge hoppers are located beneath the bags. A suction or blower system forces dust-laden air through an inlet port on one side of the frame just above the hopper space. It enters the bags, where it deposits its suspended solids, while the cleaned air is drawn through and leaves by an outlet port. A motor-driven shaker mechanism agitates the bags periodically, dislodging the accumulated layer of dust, which falls into the hoppers. Installations of this type are often of impressive size, some containing over 300 bags.

See "Nomex." [Du Pont]

bait. An insecticide or rodenticide placed in such a way as to attract the pest. Arsenic compounds and Bordeaux mixture are typical insect baits. All types are highly toxic.
See pesticide.

"Bakelite" [Bakelite AG]. TM for polyethylene, polypropylene, epoxy, phenolic, polystyrene, phenoxy, perylene, polysulfone, ethylene copolymers, ABS, acrylics, and vinyl resins and compounds.

Baker-Nathan effect. Effect originally observed in the reaction of *p*-substituted benzyl bromides with pyridine and other processes in which the observed rates are opposite to those predicted by the electron-releasing inductive effect of alkyl groups, i.e., $\text{CH}_3 > \text{CH}_2\text{CH}_2 > (\text{CH}_2)_2\text{CH} > \text{C}(\text{CH}_3)_3$. To explain it, a type of electron delocalization involving Σ electrons was proposed, termed hyperconjugation, which manifests itself in systems in which a saturated carbon atom attached to an unsaturated carbon or one with an empty orbital bears at least one hydrogen atom.

baker's yeast extract.

Properties: From ruptured cells of *Saccharomyces cerevisiae*. Liquid, paste or powder. Water sol.
Use: Food additive.

Baker-Venkataraman rearrangement.

Base-catalyzed rearrangement of *o*-acyloxyketones to β -diketones, important intermediates in the synthesis of chromones and flavones.

"Bake Smart" [Advanced Ingredients].

TM for a carb based powder comprised of glucose syrup, dextrose and fiber.

Use: Delivers moisture control, binds moisture in a broad range of foods.

baking finish. A paint or varnish that requires baking at temperatures greater than 66C for the development of desired properties (ASTM). Such finishes are based on oil-modified alkyd, melamine, epoxy, nitrocellulose, or urea resins, or combinations of these. Baking is often done by infrared radiation, producing high-molecular weight coatings that are dense and tough.

baking powder. A synthetic leavening agent widely used in the baking industry. There are several types, all of which are composed of a carbonate, a weak acid or acidic compound, and a filler. A typical composition is sodium bicarbonate, tartaric acid or monobasic calcium phosphate, and cornstarch. Ingredients sometimes used are ammonium carbonate and potassium bitartrate. Upon contact with moisture and heat the active ingredients react to evolve carbon dioxide, which "raises" the dough in the early minutes of heat exposure, thus producing a stable solid foam. Wheat-flour gluten is sufficiently elastic to retain the bubbles of carbon dioxide.

baking soda. See sodium bicarbonate.

BAL. Abbreviation for British Anti-Lewisite.
See 2,3-dimercaptopropanol.

balagrín.

CAS: 71330-43-3.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

balance. (1) Exact equality of the number of atoms of various elements entering into a chemical reaction and the number of atoms of those elements in the reaction products. For example, in the reaction $\text{NaOH} + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O}$, the atoms in the input side are H[2], Na[1], O[1], and Cl[1]. Each of these is also present in the products, though in different combination. The atoms of catalysts (when present) do not enter into reactions and therefore are not involved. The balance of chemical reactions follows the law of conservation of mass. The term *material balance* is used by chemical engineers in designing processing equipment. It denotes a precise list of all the substances to be introduced into a reaction and all those that will leave it in a given time, the two sums being equal.

(2) A precision instrument designed for weighing extremely small amounts of material with high accu-

racy. An analytical balance or microbalance for weights from about 1 g to 0.1 mg is standard equipment in chemical laboratories. Its essential feature is a one-piece metal beam (lever) pivoted on a knife-edge or flexure at its exact center (fulcrum) so that it is free to oscillate. From it are suspended two scale pans approximately 2 inches in diameter, each of which is also positioned on a knife-edge on the lower arms of the beam. Exact balance is indicated by a pointer attached to the beam. Either an aluminum rider or a chain and vernier is provided for maximum accuracy. Highly sophisticated balances operating electronically with built-in microprocessors have become available in recent years.

balata. See rubber, natural (note).

Baldwin rules for ring closure. Set of empirical rules, stereochemical in nature, predicting the relative facility of ring closure reactions.

Baldwin's phosphorus. Fused nitrate of lime, which emits light for several hours after exposure to sunlight.

ball-and-ring method. The melting point of a material is determined by filling the aperture of a metal ring with the material, placing a metal ball on it, and heating to the temperature at which the material softens and is then pushed out of the ring by the weight of the ball. It is used for substances that have no definite melting point, but soften before melting.

ball clay. A clay that has good plasticity, strong bonding power, high refractoriness, and fires to a white or cream-colored product. Used as bonding and plasticizing agent or chief ingredient of white-ware, porcelains, stoneware, terra-cotta, glass refractories, and floor and wall tile. See clay.

Balling hydrometer. A device for determining the approximate percentage of sugar in solution at 60°F.

ball mill. A jacketed steel cylinder rotating on a horizontal axis and containing steel balls of varying diameter; the interior walls are usually equipped with baffle bars to impart a rolling and cascading action to the balls. The total weight of the balls may be 2000 lb or more. The grinding efficiency depends on the number of contacts between any two balls; thus the greater the number of balls, the more effective the grinding action. The material is introduced through an opening in the axis of the cylinder, which is then hermetically closed. Discharge is by the same opening after replacement of the cover plate with a grill to retain the balls. Ball mills can be adapted to continuous operation in which the feed enters at one end and is discharged at the other. Products ground are dry chemicals, paint pigments, etc. See pebble mill; jar mill.

Bally-Scholl synthesis. Formation of meso-benzanthrones by the action of glycerol or a derivative, and sulfuric acid on anthraquinones or anthranols.

balsam. A resinous mixture of varying composition obtained from several species of evergreen trees or shrubs. Contains oleoresins, terpenes, and usually cinnamic and benzoic acids. All types are soluble in organic liquids and insoluble in water. Some have a penetrating, pleasant odor. They are combustible and in general nontoxic. The best-known types are as follows:

(1) Peru balsam, from Central America, is a thick, viscous liquid (d 1.15) containing vanillin. Used in flavoring, chocolate manufacturing, as an ingredient in expectorants and cough syrups, and as a fragrance in shampoos and hair conditioners. A mild allergen. Shipped in drums.

(2) Tolu balsam, a plastic solid, is derived from a related tree in Colombia. Its uses are similar to Peru balsam. Source of tolu oil. Odorless.

(3) Copaiba balsam from Brazil and Venezuela (d 0.94–0.99) is a viscous liquid used in varnishes and lacquers as an odor fixative and in manufacture of photographic paper. It is the source of copaiba oil.

(4) Balm of Gilead is from a Middle Eastern shrub and is used in perfumery and medicine.

(5) Canada balsam, from the North American balsam fir, is a liquid, d 0.98, used in microscopy, in fine lacquers, as a flavoring, and as a fragrance.

(6) Benzoin resin (Benjamin gum). See benzoin resin.

balsam fir oil. See fir needle oil, Canadian type.

Bamberger's formula. A structural formula for naphthalene that shows the valences of the benzene rings pointing to the centers.

bamboo. A grass native to southeast Asia having a rather high cellulose content, which makes possible its use for specialty papers. Its fibers are longer than those of most other plants of this type and are comparable to those of coniferous woods. Has a composition of total cellulose 58%, α -cellulose 35%, pentosans 28%, lignin 23%. Also used for making light furniture, fishing rods, etc. Combustible.

bambuterol.

CAS: 81732-65-2. mf: $C_{18}H_{29}N_3O_5$.

Hazard: A poison.

Bamford-Stevens reaction. Formation of olefins by base-catalyzed decomposition of *p*-toluenesulfonylhydrazones of aldehydes and ketones.

banana oil. (1) (Banana liquid.) A solution of nitrocellulose in amyl acetate or similar solvent; so

termed because of its penetrating banana-like odor.
(2) Synonym for amyl acetate.

Banbury mixer. A batch-type internal-mixing machine, named after its inventor, that has been widely used in the rubber industry since 1920 for high-volume production. It will also accept plastic molding powders. Its chief feature is an enclosed, barrel-shaped chamber in which two rotors with oppositely curved contours rotate rapidly on a horizontal axis, first masticating the rubber and then efficiently incorporating the dry ingredients. Both steam and water jacketing are provided. Batches may be up to 1000 lb. A plunger at the entrance port rides on top of the batch to furnish enough pressure for proper mixing. A hydraulically operated discharge gate is located below the mixing chamber.

band, absorption. See absorption band.

“Bandane” [Velsicol]. TM for polychlorodicyclopentadiene isomers.
Use: As an herbicide.

banded iron formation. An iron formation that consists of alternating iron-rich and iron-poor layers. Most rocks of this type are older than about two billion years.

bandwidth. Difference between limiting frequencies of a frequency band.

banod shift assay. See gel shift assay.

“Banox” [Nalco]. TM for a series of dry, powdered, phosphate-type corrosion inhibitors. No. 1 is artificially colored. Nos. 1-P and WT are colorless.
Use: Refrigerator cars, refrigeration brine, cooling towers, and small water systems.

Banting, Sir Frederick. (1891–1941). A native of Ontario, Canada, Banting did his most important work in endocrinology. His brilliant research culminated in the preparation of the antidiabetic hormone that he called insulin, derived from the isles of Langerhans in the pancreas. He received the Nobel Prize in medicine for this work together with MacLeod of the University of Toronto. In 1930, the Banting Institute was founded in Toronto. He was killed in an airplane crash.

“Banvel” D [Velsicol]. TM for an herbicide containing 2-methoxy-3,6-dichlorobenzoic acid (dimethylamine salt).

BAP. Abbreviation for benzyl-*p*-aminophenol.

“Barafene” [BASF]. TM for coatings used to prevent permeation of volatile ingredients, oils, and oxygen through polyolefin containers.

“Barak” [Du Pont]. TM for dibutylammonium oleate (C₄H₉)₂NH₂COOC₁₇H₃₃.

Properties: Translucent, light brown liquid. Combustible.

Use: To activate accelerators and improve processing of rubber and synthetic rubbers.

barban. Generic name for 4-chloro-2-butyryl-*m*-chlorocarbanilate.

C₈H₇(Cl)NHCOOCH₂C:CCH₂Cl. Herbicide and plant growth regulator.

***o*-barene.** See 1,2-dicarbododecaborane(12).

barberite. A nonferrous alloy containing 88.5% copper, 5% nickel, 5% tin, 1.5% silicon.

Properties: D 8.80, mp 1070C. It offers good resistance to sulfuric acid in all dilutions up to 60%, seawater, moist sulfurous atmospheres, and mine waters.

Barbier-Wieland degradation. Stepwise carboxylic acid degradation of aliphatic acids (particularly in sterol side chains) to the next lower homolog. The ester is converted to a tertiary alcohol that is dehydrated with acetic anhydride, and the olefin oxidized with chromic acid to a lower homologous carboxylic acid.

barbital. (diethylmalonylurea; diethylbarbituric acid; “Veronal”).

CAS: 57-44-3. C₈H₁₂N₂O₃.

Properties: White crystals or powder; bitter taste; odorless. Stable in air. Mp 187–192C. Soluble in hot water, alcohol, ether, acetone, and ethyl acetate.

Derivation: By the interaction of diethyl ester or diethylmalonic acid and urea.

Grade: Technical, CP.

Hazard: See barbiturates.

Use: Medicine (sedative), stabilizer for hydrogen peroxide.

See barbiturates.

barbiturate. A derivative of barbituric acid that produces depression of the central nervous system and consequent sedation. Used by prescription only for sedative and anesthetic purposes.

Hazard: Habit-forming. Several types, including amo-, seco-, and pentobarbital, are under government restriction.

barbituric acid. (malonylurea; pyrimidine-trione; 2,4,6-tri-oxohexahydro pyrimidine).

Properties: White crystals; efflorescent; odorless. Mp 245C with some decomposition. Slightly soluble in water and alcohol; soluble in ether. Forms salts with metals.

Derivation: By condensing malonic acid ester with urea.

Grade: Technical.

Use: Preparation of barbiturates, polymerization catalyst, dyes.

Bardhan-Sengupta phenanthrene synthesis.

Formation of octahydrophenanthrene derivatives by cyclodehydration of derivatives of 2-(β -phenethyl)-1-cyclohexanol and consequent dehydration to phenanthrenes with selenium.

bar disintegrator. See cage mill.

Barff process. The deposition of a rust-resistant coating on iron-base metals by oxidation with superheated steam.

Barfoed's reagent. Aqueous solution of copper acetate.

Use: To distinguish monosaccharides from disaccharides (red cuprous oxide forms in presence of glucose).

barite. (BaSO_4). Natural barium sulfate, barytes, heavy spar.

barium.

CAS: 7440-39-3. Ba. Alkaline-earth element of atomic number 56, group IIA of periodic table; aw 137.34; valence 2; 7 stable isotopes.

Properties: Silver-white, somewhat malleable metal. D 3.6. Values for melting and boiling points are reported ranging from 704–850C for mp and from 1140–1637C for bp (The most acceptable values, based on reliable original work, appear to be mp 710C and bp 1500C). Extremely reactive, reacts readily with water, ammonia, halogens, oxygen, and most acids. Gives green color in flame. Extrudable and machinable.

Occurrence: Ores of barite and witherite are found in Georgia, Missouri, Arkansas, Kentucky, California, Nevada, Canada, Mexico.

Derivation: Reduction of barium oxide with aluminum or silicon in a vacuum at high temperature.

Available forms: Rods, wire, plate, powder.

Grade: Technical, pure.

Hazard: Flammable (pyrophoric) at room temperature in powder form; store under inert gas, petroleum, or other oxygen-free liquid. When heated to approximately 200C in hydrogen, barium reacts violently, forming BaH_2 . TLV: for all soluble barium compounds, 0.5 mg/m³ (as barium).

Use: Getter alloys in vacuum tubes, deoxidizer for copper, Frary's metal, lubricant for anode rotors in X-ray tubes, spark-plug alloys.

barium-137. Radioactive isotope of barium. See cesium-137.

barium acetate.

CAS: 543-80-6. $\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)\cdot\text{H}_2\text{O}$.

Properties: White crystals. D 2.02, mp (decomposes). Soluble in water, insoluble in alcohol.

Derivation: Acetic acid is added to a solution of barium sulfide. The product is recovered by evaporation and subsequent crystallization.

Grade: Technical, CP.

Use: Chemical reagent, acetates, textile mordant, catalyst manufacturing, paint and varnish driers. See barium.

barium aluminate. $3\text{BaO}\cdot\text{Al}_2\text{O}_3$.

Properties: Gray, pulverized mass. Soluble in water, acids.

See barium.

barium azide.

CAS: 18810-58-7. $\text{Ba}(\text{N}_3)_2$. Crystalline solid, d 2.936, loses nitrogen at 120C, soluble in water, slightly soluble in alcohol.

Hazard: Explodes when shocked or heated.

Use: High explosives.

See barium.

barium binoxide. See barium peroxide.

barium borotungstate. (barium borowolframate). $2\text{BaO}\cdot\text{B}_2\text{O}_3\cdot 9\text{WO}_3\cdot 18\text{H}_2\text{O}$.

Properties: Large, white crystals. Effloresces in air. Keep well stoppered!! Soluble in water.

Hazard: A poison. TLV: See barium.

Use: Making borotungstates.

barium borowolframate. See barium borotungstate.

barium bromate.

CAS: 13967-90-3. $\text{Ba}(\text{BrO}_3)_2\cdot\text{H}_2\text{O}$.

Properties: White crystals or crystalline powder. D 3.820, decomposes at 260C. Slightly soluble in water, insoluble in alcohol.

Derivation: By passing bromine into a solution of barium hydroxide; barium bromide and barium bromate are formed, which are separated by crystallization.

Grade: Pure, reagent.

Hazard: A poison. Moderate fire risk in contact with organic materials. TLV: see barium.

Use: Analytical reagent, oxidizing agent, corrosion inhibitor.

barium bromide. $\text{BaBr}\cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. D 3.852, mp (anhydrous) 847C. Soluble in water and in alcohol.

Derivation: Interaction of barium sulfide and hydrobromic acid with subsequent crystallization.

Grade: Technical, CP.

Hazard: A poison. TLV: see barium.

Use: Manufacturing bromides, photographic compounds, phosphors.

barium carbonate.

CAS: 513-77-9. BaCO_3 .

Properties: White powder; found in nature as the mineral witherite. D 4.275, mp 174C at 90 atmospheres, 811C at one atmosphere. Insoluble in water; soluble in acids (except sulfuric).

Derivation: Precipitated barium carbonate is made by reaction of sodium carbonate or carbon dioxide with barium sulfide.

Grade: Technical, CP, reagent 99.5%.

Hazard: A poison. TLV: see barium.

Use: Treatment of brines in chlorine-alkali cells to remove sulfates, rodenticide, production of barium salts, ceramic flux, optical glass, case-hardening baths, ferrites, in radiation-resistant glass for color television tubes.

barium chlorate.

CAS: 13477-00-4. $\text{Ba}(\text{ClO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless prisms or white powder. D 3.179, mp 414C. Soluble in water. Combustible.

Derivation: Electrolysis of barium chloride.

Grade: Technical, CP, reagent.

Hazard: A poison. TLV: see barium. Strong oxidizer, fire risk in contact with organic materials.

Use: Pyrotechnics, explosives, textile mordant, manufacture of other chlorates.

barium chloride.

CAS: 10361-37-2. $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, flat crystals. D 3.097, mp 960C (anhydrous). Soluble in water; insoluble in alcohol. Combustible.

Derivation: (1) By the action of hydrochloric acid on barium carbonate or barium sulfide; (2) by heating a mixture of barium sulfate, carbon, and calcium chloride.

Grade: Technical (crystals or powdered), 99%, crystals, powdered, CP.

Hazard: Ingestion of 0.8 g may be fatal. TLV: see barium.

Use: Chemicals (artificial barium sulfate, other barium salts), reagents, lubrication oil additives, boiler compounds, textile dyeing, pigments, manufacture of white leather.

barium chromate. (lemon chrome; ultramarine yellow; baryta yellow; Steinbuhl yellow).

CAS: 10294-40-3. BaCrO_4 .

Properties: Heavy, yellow, crystalline powder. D 4.498. Soluble in acids; insoluble in water. Combustible.

Derivation: Interaction of barium chloride and sodium chromate. The precipitate is washed, filtered, and dried.

Grade: Technical, CP.

Hazard: TLV: 0.05 mg(Cr)/m³; Confirmed Human Carcinogen.

Use: Safety matches, corrosion inhibitor in metal-

joining compounds, pigment in paints, ceramics, fuses, pyrotechnics, metal primers, ignition control devices.

See chrome pigment.

barium citrate. $\text{Ba}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot \text{H}_2\text{O}$.

Properties: Grayish-white crystalline powder. Soluble in water, hydrochloric, and nitric acids.

Hazard: See barium.

Use: Manufacture of barium compounds, stabilizer for latex paints.

barium cyanide.

CAS: 542-62-1. $\text{Ba}(\text{CN})_2$.

Properties: White, crystalline powder. Soluble in water and alcohol.

Derivation: By the action of hydrocyanic acid on barium hydroxide with subsequent crystallization.

Hazard: TLV: 0.5 mg(Ba)/m³; Not Classifiable as a Human Carcinogen.

Use: Metallurgy, electroplating.

barium cyanoplatinite. (platinum barium cyanide; barium platinum cyanide).

$\text{BaPt}(\text{CN})_4 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow or green crystals. Mp 100C (loses 2H₂O), d 2.08. Soluble in water; insoluble in alcohol.

Grade: CP.

Hazard: See barium and cyanides.

Use: X-ray screens.

barium cyclohexanesulfamate.

CAS: 64011-64-9.

Hazard: A poison.

Use: Agricultural chemical.

barium dichromate. (barium bichromate).

$\text{BaCr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Brownish-red needles or crystalline masses. Soluble in acids; decomposed by water.

Hazard: See barium.

barium dioxide. See barium peroxide.

barium diphenylamine sulfonate.

$(\text{C}_6\text{H}_5)_2\text{NHC}_6\text{H}_4\text{SO}_3)_2\text{Ba}$.

Properties: White crystals. Soluble in water.

Hazard: See barium.

Use: Indicator in oxidation-reduction titrations.

barium di-*o*-phosphate. See barium phosphate, secondary.

barium dithionate. (barium hyposulfate).

$\text{BaS}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. D 4.536. Soluble in hot water; slightly soluble in alcohol.

Derivation: Action of manganese dithionate on barium hydroxide.

Hazard: See barium.

barium ethylsulfate. $\text{Ba}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water and alcohol. Combustible.

Derivation: Interaction of barium hydroxide and ethylsulfuric acid.

Hazard: See barium.

Use: Organic preparations.

barium ferrite.

Grade: Powder.

Use: Permanent-magnet material.

barium fluoride.

CAS: 7787-32-8. BaF_2 .

Properties: White powder. D 4.828, mp 1354C. Sparingly soluble in water.

Derivation: Interaction of barium sulfide and hydrofluoric acid, followed by crystallization.

Grade: Technical, CP, single pure crystals, and 99.98%.

Hazard: See barium.

Use: Ceramic flux, carbon brushes for electrical equipment, glass making, manufacture of other fluorides, crystals for spectroscopy, electronics, dry-film lubricants.

barium fluosilicate. (barium silicofluoride).

BaSiF_6H .

Properties: White, crystalline powder. Insoluble in water.

Grade: Technical.

Hazard: See barium.

Use: Ceramics, insecticidal compositions.

barium fructose diphosphate. See fructose-1,6-diphosphate, calcium, barium salts.

barium hexafluorogermanate. BaGeF_6 .

White crystalline solid, mp approximately 665C, dissociates to barium fluoride and germanium fluoride, d 4.56.

barium hydrate. See barium hydroxide.

barium hydrosulfide. $\text{Ba}(\text{SH})_2$.

Properties: Yellow crystals. Hygroscopic. Soluble in water.

Hazard: See barium.

barium hydroxide (anhydrous). $\text{Ba}(\text{OH})_2$.

Available commercially.

See barium hydroxide hydrates.

barium hydroxide, monohydrate. (barium monohydrate). $\text{Ba}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: White powder. Soluble in dilute acids; slightly soluble in water.

Hazard: See barium.

Use: Manufacturing of oil and grease additives, barium soaps, and chemicals. Refining of beet sugar, alkalizing agent in water softening, sulfate removal agent in treatment of water and brine, boiler scale

removal, dehairing agent, catalyst in manufacture of phenol-formaldehyde resins, insecticide and fungicide, sulfate-controlling agent in ceramics, purifying agent for caustic soda, steel carbonizing agent, glass, refining edible oils, elastomer vulcanization.

barium hydroxide, octahydrate. (barium hydrate; barium octahydrate; caustic baryta).

$\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder or crystals. D 2.18, mp 78C (losing its water of crystallization), mp (anhydrous $\text{Ba}(\text{OH})_2$) 408C. Absorbs carbon dioxide from air. Keep well stoppered!! Soluble in water, alcohol, and ether.

Derivation: (1) By dissolving barium oxide in water with subsequent crystallization, (2) By precipitation from an aqueous solution of the sulfide by caustic soda, (3) By heating barium sulfide in earthenware retorts into which a current of moist carbonic acid is passed, after which superheated steam is passed over the resulting heated carbonate.

Impurities: Iron and calcium in commercial grades.

Grade: Technical (crystals or anhydrous powder), CP, ACS reagent.

Hazard: See barium.

Use: Organic preparations, barium salts, analytical chemistry.

See barium hydroxide monohydrate.

barium hydroxide pentahydrate. (barium pentahydrate). $\text{Ba}(\text{OH})_2 \cdot 5\text{H}_2\text{O}$.

Properties: Translucent, free-flowing, white flakes. Approximately 65 lb/cu ft.

Hazard: See barium.

Use: Same as the octahydrate.

barium hypophosphite. $\text{BaH}_4(\text{PO}_2)_2$.

Properties: White, crystalline powder; odorless. Soluble in water; insoluble in alcohol.

Hazard: See barium.

Use: Nickel plating.

barium hyposulfate. See barium dithionate.

barium hyposulfite. See barium thiosulfate.

barium iodate. $\text{Ba}(\text{IO}_3)_2$.

Properties: White, crystalline powder. D 5.23, mp decomposes at 476C. Slightly soluble in water, hydrochloric, and nitric acids; insoluble in alcohol.

Hazard: See barium.

barium iodide. $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals, decomposes and reddens on exposure to air. D 5.150, mp loses $2\text{H}_2\text{O}$ and melts at 740C. Soluble in water; slightly soluble in alcohol.

Derivation: Action of hydriodic acid on barium hydroxide or of barium carbonate on ferrous iodide solution.

Hazard: See barium.

Use: Preparation of other iodides.

barium manganate. (manganese green; Cas-
sel green). BaMnO_4 .

Properties: Emerald-green powder. D 4.85. Insoluble in water; decomposed by acids.

Hazard: See barium.

Use: Paint pigment.

barium mercury bromide. See mercuric
barium bromide.

barium mercury iodide. See mercuric bari-
um iodide.

barium metaphosphate. $\text{Ba}(\text{PO}_3)_2$.

Properties: White powder. Slowly soluble in acids;
insoluble in water.

Hazard: See barium.

Use: Glasses, porcelains, and enamels.

barium metasilicate. See barium silicate.

barium molybdate. BaMoO_4 .

Properties: White powder. Absolute d 4.7, approxi-
mate mp 1600C. Slightly soluble in acids and water.

Grade: Crystal, 99.84% pure.

Hazard: See barium.

Use: Electronic and optical equipment, pigment in
paints and other protective coatings.

barium monohydrate. See barium hydrox-
ide monohydrate.

barium monosulfide. See barium sulfide.

barium monoxide. See barium oxide.

barium nitrate.

CAS: 10022-31-8. $\text{Ba}(\text{NO}_3)_2$.

Properties: Lustrous, white crystals. D 3.244, mp
575C. Soluble in water; insoluble in alcohol.

Derivation: By the action of nitric acid on barium
carbonate or sulfide.

Grade: Technical, crystals, fused mass or powder,
CP.

Hazard: Strong oxidizing agent. See barium.

Use: Pyrotechnics (gives green light), incendiaries,
chemicals (barium peroxide), ceramic glazes, ro-
denticide, electronics.

barium nitrite. $\text{Ba}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White to yellowish, crystalline powder.
D 3.173, decomposes at 217C. Soluble in alcohol,
water.

Hazard: See barium.

Use: Diazotization, corrosive inhibitor, explosives.

barium octahydrate. See barium hydroxide
octahydrate.

barium oxalate. $\text{BaC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.66.

Slightly soluble in water; soluble in dilute nitric or
hydrochloric acid.

Hazard: See barium.

Use: Analytical reagent, pyrotechnics.

barium oxide. (barium monoxide; barium
protoxide; calcined baryta).

CAS: 1304-28-5. BaO .

Properties: White to yellowish-white powder. D
5.72, mp 1923C. Absorbs carbon dioxide readily
from air. Soluble in acids and water. Reacts violent-
ly with water to form the hydroxide.

Derivation: Decomposition of carbonate at high
temperature in presence of carbon, oxidation of bari-
um nitrate.

Grade: Technical (regular grind) 208 lb/cu ft, techni-
cal fine grind (175 lb/cu ft), porous, carbide-free,
and 97%.

Hazard: Toxic by ingestion. See barium.

Use: Dehydrating agent for solvents, detergent for
lubricating oils.

barium pentahydrate. See barium hydrox-
ide pentahydrate.

barium perchlorate. $\text{Ba}(\text{ClO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals. D 2.74, mp 505C.
Soluble in methanol and water.

Hazard: Oxidizer, fire and explosion risk in contact
with organic materials. Toxic by ingestion. See
barium.

Use: Manufacture of explosives, experimentally in
rocket fuels.

barium permanganate. $\text{Ba}(\text{MnO}_4)_2$.

Properties: Brownish-violet crystals. Soluble in
water.

Hazard: Oxidizing material. Fire and explosion risk
in contact with organic materials. Toxic by inges-
tion.

See barium.

Use: Strong disinfectant, manufacture of permanga-
nates, depolarizing dry cells.

barium peroxide. (barium binoxide; barium
dioxide; barium superoxide).

CAS: 1304-29-6. BaO_2 and $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$.

Properties: Grayish-white powder. D 4.96, mp
450C, decomposes 800C. Slightly soluble in water.

Derivation: By heating barium oxide in oxygen or air
at approximately 1000F.

Grade: Technical, reagent.

Hazard: Oxidizing material. Fire and explosion risk
in contact with organic materials. Keep cool and dry.
Toxic by ingestion, skin irritant.

Use: Bleaching, decolorizing glass, thermal welding
of aluminum, manufacture of hydrogen peroxide,
oxidizing agent, dyeing textiles.

barium phosphate, secondary. (barium
di-*o*-phosphate). BaHPO_4 .

Properties: White powder. D 4.16. Soluble in dilute

nitric acid or dilute hydrochloric acid; slightly soluble in water.

Hazard: See barium.

Use: Flame retardant, phosphors.

barium phosphosilicate.

Use: Anticorrosive pigment for solvent-based epoxies and as auxiliary pigment for 1-package zinc-rich coatings. Also used in water-based coatings.

barium platinum cyanide. See barium cyanoplatinite.

barium potassium chromate. (Pigment E). $\text{BaK}(\text{CrO}_4)_2$.

Properties: Pale-yellow pigment. D 3.65. Compared with other chromate pigments, it has a low chloride and sulfate content and forms stronger, more elastic paint films.

Derivation: By a kiln reaction at 500C between potassium dichromate and barium carbonate.

Hazard: See barium.

Use: Component of anticorrosive paints for use on iron, steel, and light metal alloys.

barium protoxide. See barium oxide.

barium pyrophosphate. $\text{Ba}_3\text{P}_2\text{O}_7$.

Properties: White powder. Soluble in acids and ammonium salts; very slightly soluble in water.

Hazard: See barium.

barium reineckate.

CAS: 22708-05-0. mf: $\text{C}_4\text{H}_6\text{CrN}_6\text{S}_4 \cdot \frac{1}{2}\text{Ba}$

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

barium selenide. BaSe .

Properties: Crystalline powder. D 5.0. Decomposes in water.

Hazard: See barium.

Use: Semiconductors, photocells.

barium silicate. (barium metasilicate).

BaSiO_3 .

Properties: Colorless powder. D 4.4, bp 1604C. Insoluble in water; soluble in acids.

Use: In ceramics.

Hazard: See barium.

barium silicide. BaSi_2 .

Properties: Light-gray solid. Evolves hydrogen on exposure to moisture.

Hazard: See barium.

Use: Metallurgy to deoxidize steel, etc.

barium silicofluoride. See barium fluosilicate.

barium-sodium niobate. A synthetic electro-optical crystal used to produce coherent green light in lasers, also to make such devices as electro-opti-

cal modulators and optical parametric oscillators. The crystal undergoes no optical damage from laser irradiation at high power levels.

barium stannate. $\text{BaSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Sparingly soluble in water; readily soluble in hydrochloric acid.

Hazard: See barium.

Use: Production of special ceramic insulations requiring dielectric properties.

barium stearate. $\text{Ba}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White crystalline solid. Mp 160C, d 1.145. Insoluble in water or alcohol. Combustible.

Use: Waterproofing agent; lubricant in metalworking, plastics, and rubber; wax compounding; preparation of greases; heat and light stabilizer in plastics.

barium sulfate. (barytes [natural]; blanc fixe [artificial, precipitated]; basofor).

CAS: 7727-43-7. BaSO_4 .

Properties: White or yellowish powder; odorless; tasteless. D 4.25–4.5, particle size 2–25 microns, mp 1580C. Soluble in concentrated sulfuric acid. Non-combustible.

Derivation: (1) By treating a solution of a barium salt with sodium sulfate (salt cake), (2) by-product in manufacture of hydrogen peroxide, (3) occurs in nature as the mineral barite (Arkansas, Missouri, Georgia, Nevada, Canada, Mexico).

Grade: Technical, dry, pulp, bleached, ground, float-ed, natural, CP, USP, X-ray.

Hazard: TLV: 10 mg/m³.

Use: Weighting mud in oil-drilling, paper coatings, paints, filler and delustrant for textiles, rubber, plastics and lithograph inks, base for lake colors, X-ray photography, opaque medium for gastrointestinal radiography, in battery plate expanders.

barium sulfide. (barium monosulfide; black ash). BaS .

Properties: Yellowish-green or gray powder or lumps. D 4.25. Soluble in water, decomposes to the hydrosulfide.

Derivation: Barium sulfate (crude barite) and coal are roasted in a furnace. The melt is lixiviated with hot water, filtered, and evaporated.

Impurities: Iron, arsenic.

Hazard: See barium.

Use: Dehairing hides, flame retardant, luminous paints, barium salts, generating pure hydrogen sulfide.

barium sulfite. BaSO_3 .

Properties: White powder, decomposed by heat. Soluble in dilute hydrochloric acid; insoluble in water.

Grade: Technical, CP.

Hazard: See barium.

Use: Analysis, paper manufacturing.

barium sulfocyanide. See barium thiocyanate.

barium superoxide. See barium peroxide.

barium tartrate. $\text{BaC}_4\text{H}_4\text{O}_6$.

Properties: White crystals. D 2.98. Soluble in water; insoluble in alcohol.

Hazard: See barium.

Use: Pyrotechnics.

barium thiocyanate. (barium sulfocyanide). $\text{Ba}(\text{SCN})_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water and in alcohol. Deliquescent.

Derivation: By heating barium hydroxide with ammonium thiocyanate and subsequent crystallization.

Hazard: See barium.

Use: Making aluminum or potassium thiocyanates, dyeing, photography.

barium thiosulfate. (barium hyposulfite). $\text{BaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. D 3.5, decomposed by heat. Slightly soluble in water; insoluble in alcohol.

Hazard: See barium.

Use: Explosives, luminous paints, matches, varnishes, photography.

barium titanate. BaTiO_3 .

Properties: Light gray-buff powder. Mp 3010F, d 5.95. Insoluble in water and alkalis; slightly soluble in dilute acids; soluble in concentrated sulfuric and hydrofluoric acids.

Use: Ferroelectric ceramics (single crystals either pure or doped with iron) are used in storage devices, dielectric amplifiers, and digital calculators.

barium tungstate. (barium wolframate; barium white; tungstate white; wolfram white). BaWO_4 .

Properties: White powder. D 5.04. Insoluble in water.

Use: Pigment and in X-ray photography for manufacturing of intensifying and phosphorescent screens.

“Barium XA” [Barium]. TM for a product used by manufacturers of high quality tool steels. Eliminates chain-type occlusions and degasifies the steel.

barium zirconate. BaZrO_3 .

Properties: Light gray-buff powder. D 5.52, bulk d 140 lb/cu ft, mp 4550F. Insoluble in water and alkalis; slightly soluble in acid.

Use: Manufacture of a white, easily colored silicone rubber compound having good heat stability at temperatures up to 500F; electronics.

barium zirconium silicate. A complex of BaO , ZrO_2 , SiO_2 .

Properties: White powder. Bulk d 118 lb/cu ft, mp 2800F. Insoluble in water and alkalis; slightly soluble in acids; soluble in hydrofluoric acid.

Use: Production of electrical resistor ceramics, glaze opacifiers, and stabilizer for colored ground coat enamels.

bark. The cellulosic outer layer or cortex of trees and other woody plants. The bark of certain species such as oak, hemlock, etc., is a source of tannic acid; medicinal products, e.g., quercitrin and quillaja, are also derived from barks, especially cinchona, from which quinine is obtained. Phenolic-rich bark extracts mixed with epichlorohydrin are reported useful as adhesive compounds. An unusual form of bark is cork from the oak species *Quercus suber*. In the pulp industry, bark is removed from logs with high-pressure jets of water.

See hydraulic barking; cork; quinine.

barking, hydraulic. See hydraulic barking.

bark tannage. To tan leather by using vegetable tannins found in bark, wood, or plant matter instead of tanning via minerals.

bar. A unit of measurement equal to 10^{-24} cm², for the cross-section (target area) of the nucleus of an atom.

Barnett acetylation method. Acetylation of hydroxy compounds such as cellulose with acid anhydrides in the presence of chlorine and sulfur dioxide. With cellulose, the process yields the diacetate below 65C and the triacetate above this temperature.

barometric pressure. The pressure of the air at a particular point on or above the surface of the earth. At sea level, this pressure is sufficient to support a column of mercury approximately 29.9 inches in height (760 mm), equivalent to 14.7 lb/inch² absolute (psia) or 1 atm.

“Barospense” [Mallinckrodt]. TM for a special barium sulfate formulation used in radiographic examinations of the gastrointestinal tract.

barostat. An instrument for regulation or maintenance of pressure at a constant value.

barrel finishing. Cleaning, smoothing, and polishing of metal or plastic items by mechanical friction obtained by placing them in drums or barrels that rotate on their horizontal axis. An abrasive medium and water are usually added. The barrels are six- or eight-sided, and often contain vertical dividers to make two or more compartments that can be individually loaded and unloaded. Such treatment is widely used for large-scale cleaning and burnishing of metal parts, which it finishes to exact dimensional

tolerances much more economically than is possible by manual methods.

barrier layer. The electrical double layer formed at interface between a metal and a semiconductor or between two metals.

barrier, moisture. Any substance that is impervious to water or water vapor. Most effective are high-polymer materials such as vulcanized rubber, phenolformaldehyde resins, polyvinyl chloride, and polyethylene, which are widely used as packaging films. The chief factors involved are polarity, crystallinity, and degree of cross-linking. Water-soluble surfactants and protective colloids increase the susceptibility of a film to water penetration. Any pigments and fillers must be completely wetted by the polymer. Properly formulated paints are effective moisture barriers.

barrier substance. A substance applied to skin for protection against exposure to irritants.

Bartell cell. Displacement cell for determining adhesion tension between liquids and solids.

barthrin. Generic name for a synthetic analog of allethrin described as the 6-chloropiperonyl ester of chrysanthemum monocarboxylic acid.

Use: As insecticide with applications similar to allethrin and other analogs as furethrin, ethythrins, and cyclothrin. Relatively nontoxic to humans.

Barton, Derek H. R. (1918–1998). An English organic chemist who won the Nobel Prize for chemistry in 1969 with Hassel. The field of conformational analysis in organic chemistry was initiated through his research in the terpene and steroid fields. He did extensive research in the area of carbanion autoxidations. He was instrumental in research concerning the relationship of molecular rotation to structure in complex organic molecules. His education took place in London, France, and Ireland.

Barton reaction. Conversion of a nitrite ester to a γ -oximino alcohol by photolysis involving the homolytic cleavage of an N–O bond followed by hydrogen abstraction.

Bart reaction. (Scheller modification; Starkey modification). Formation of aromatic arsonic acids by treating aromatic diazonium compounds with alkali arsenites in the presence of cupric salts or powdered silver or copper; in the Scheller modification, primary aromatic amines are diazotized in the presence of arsenious chloride and a trace of cuprous chloride.

baryta, calcined. See barium oxide.

baryta, caustic. See barium hydroxide.

baryta water. A solution of barium hydroxide.

baryta yellow. See barium chromate.

barytes. See barium sulfate.

“Basacryl” [BASF]. TM for a series of cationic dyestuffs for the dyeing and printing of polyacrylonitrile fiber.

basal group. The earliest diverging group within a clade; for instance, to hypothesize that sponges are basal animals is to suggest that the lineage(s) leading to sponges diverged from the lineage that gave rise to all other animals.

basal metabolic rate. The rate of oxygen consumption by an animal's body at complete rest under fasting conditions.

basal metabolism. See metabolism.

“Basazol” [BASF]. TM for dyes used in printing and dyeing paper composed of cellulosic fibers.

base. Any of a large class of compounds with one or more of the following properties: bitter taste, slippery feeling in solution, ability to turn litmus blue and to cause other indicators to take on characteristic colors, ability to react with (neutralize) acids to form salts. Included are both hydroxides and oxides of metals. Water-soluble hydroxides such as sodium, potassium, and ammonium hydroxide undergo ionization to produce hydroxyl ion (OH^-) in considerable concentration, and it is this ion that causes the previously mentioned properties common to bases. Such a base is strong or weak according to the fraction of the molecules that breaks down (ionizes) into positive ion and hydroxyl ion in the solution. Base strength in solution is expressed by pH. Common strong bases (alkalies) are sodium and potassium hydroxides, ammonium hydroxide, etc. These are caustic and corrosive to skin, eyes, and mucous membranes. The pH range of basic solutions is from 7.1 to 14. Modern chemical terminology defines bases in a broader manner. A Lowry-Brønsted base is any molecular or ionic substance that can combine with a proton (hydrogen ion) to form a new compound. A Lewis base is any substance that provides a pair of electrons for a covalent bond with a Lewis acid. Examples of such bases are hydroxyl ion and most anions, metal oxides, and compounds of oxygen, nitrogen, and sulfur with nonbonded electron pairs (such as water, ammonia, hydrogen sulfide).

See Lewis electron theory for hard and soft bases.

base pair. (bp). Two nitrogenous bases (adenine and thymine or guanine and cytosine) held together by weak bonds. Two strands of DNA are held together in the shape of a double helix by the bonds between base pairs.

base saponification number. The number of milligrams of KOH equivalent to the amount of acid required to neutralize the alkaline constituents present after saponifying 1 g of sample.

base sequence. The order of nucleotide bases in a DNA molecule; determines structure of proteins encoded by that DNA.

base sequence analysis. A method, sometimes automated, for determining the base sequence.

BASF process. A process for producing acetylene by burning a mixture of low-molecular weight hydrocarbons (as natural gas) with oxygen to produce a temperature of 1485C. The combustion products and cracked gases are quickly chilled by scrubbing with water, and the acetylene is separated by distillation and solvent extraction from ethylene, carbon monoxide, hydrogen, and other reaction products. The Sachsse process is similar.

basic. Descriptive of a compound that is more alkaline than other compounds of the same name, e.g., lead carbonate, basic; basic salt.

basic bismuth salicylate. See salicylic acid, bismuth basic salt.

basic brown 4. See C.I. basic brown 4.

basic chemicals. See heavy chemicals.

basic dichromate. See bismuth chromate.

basic fuchsin. (CI 42500).

CAS: 569-61-9. A mixture of three parts pararosaniline acetate and one part pararosaniline hydrochloride.

Grade: Certifiable.

Use: For staining *Tubercle bacillus* and in distinguishing between the *coli* and *aerogenes* types of bacteria in the Endo medium. Also used in the periodic acid-Schiff (PAS) method, in the Feulgen stain, and in the Gomoris aldehyde-function method for staining elastic tissue.

basic lining. A furnace lining containing basic compounds that decompose under furnace conditions to give basic oxides. The usual basic linings contain calcium and magnesium oxides or carbonates.

basic oxide. An oxide that is a base or that forms a hydroxide when combined with water and/or that will neutralize acidic substances. Basic oxides are all metallic oxides, but there is a great variation in the degree of basicity. Some basic oxides, such as those of sodium, calcium, and magnesium, combine with water vigorously or with relative ease and also neutralize all acidic substances rapidly and completely. The oxides of the heavy metals are only

weakly basic, do not dissolve or react with water to any extent, and neutralize only the more strongly acidic substances. There is a gradual transition from basic to acidic oxides, and certain oxides, such as aluminum oxide, show both acidic and basic properties.

See base.

basic research. See fundamental research.

basic salt. A compound belonging in the category of both salt and base because it contains OH (hydroxide) or O (oxide) as well as the usual positive and negative radicals of normal salts. Among the best examples are bismuth subnitrate, often written BiONO₃, and basic copper carbonate, Cu₂(OH)₂CO₃. Most basic salts are insoluble in water, and many are of variable composition.

basic slag. A slag produced in the manufacturing of steel. It contains a variable amount of tricalcium phosphate, calcium silicate, lime, and oxides of iron, magnesium, and manganese. Used as a fertilizer for its phosphorus and lime.

See slag.

basic yellow 11. See C.I. basic yellow 11.

basil oil, comoros type.

Properties: From steam distillation of *Ocimum basilicum* L. Light yellow liquid; spicy odor. Sol in fixed oils, mineral oil; sltly sol in propylene glycol; insol in glycerin.

Use: Food additive.

basis metal. In electroplating, the metal that is being coated constitutes the cathode. It may be any of a large number of metals.

“Basogal phosphorus” [BASF]. TM for leveling agent for vat dyeing.

bastnasite. An ore from which all nine of the lanthanide minerals (rare earths) are obtained. The only large deposit in the U.S. is in southwest California.

See monazite.

batch distillation. Distillation in which the entire sample of the material to be distilled (the charge) is placed in the still before the process is begun, and product is withdrawn only from the condenser of the apparatus.

bating. In leather processing, the treatment of delimed skins with pancreatin or other tryptic enzyme to give a softer and smoother-grained product. The extent of bating varies from none for sole leather to 10 hours or more for soft kid skins. The chemical mechanism is not clearly defined.

batrachotoxinin A. $C_{24}H_{35}NO_5$. An isomeric component of batrachotoxin; the strongest neurotoxin among venoms. It is a steroidal alkaloid. The A form is only 1/500 as strong as the complete venom, but is still as toxic as strychnine. It is found in the so-called poison dart frog of Colombia. Its structure has been elucidated; when synthesized it may prove useful in medicine.
See snake venom.

battery. An electrochemical device that generates electric current by converting chemical energy to electrical energy. Its essential components are positive and negative electrodes made of more or less electrically conductive materials, a separating medium, and an electrolyte. There are four major types: (1) primary batteries (dry cells), which are not reversible and in which the anode (zinc) is the negative plate and the cathode (graphite) is the positive plate with ammonium chloride as electrolyte; (2) secondary or storage batteries, which are reversible and can be recharged and in which lead sponge is the negative plate (anode) and lead oxide the positive plate (cathode), with sulfuric acid as electrolyte; (3) nuclear and solar cells, or energy converters; and (4) fuel cells. So-called superbatteries of high charge density have been developed using solid electrolytes of lithium-titanium dioxide and trilithium nitride in which lithium atoms are intercalated in the crystal structure.

See dry cell; storage battery; voltaic cell; fuel cell; solar cell; intercalation compound.

battery acid. (electrolyte acid). Sulfuric acid of strength suitable for use in storage batteries.

Properties: Water-white; odorless. Practically free from iron.

Derivation: By diluting high-grade commercial sulfuric acid with distilled water to standard strengths.

Hazard: Corrosive to skin and tissue.

See sulfuric acid.

Use: Storage batteries.

battery limits. That portion of a chemical plant in which the actual processes are carried out, as distinguished from storage buildings, offices, and other subordinate structures called offsites.

batu. A variety of East India copal resin.
See East India.

Baudisch reaction. Synthesis of *o*-nitrosophenols from benzene or substituted benzenes, hydroxylamine, and hydrogen peroxide in the presence of copper salts.

Baumé. (Bé). An arbitrary scale of specific gravities devised by the French chemist Antoine Baumé and used in the graduation of hydrometers. The relations of specific gravity (at 60/60F) are as follows: $Bé = 145 - 145/d$ for liquids heavier than water, $Bé = 140/d - 130$ for liquids lighter than water.

bauxite. A natural aggregate of aluminum-bearing minerals, more or less impure, in which the aluminum occurs largely as hydrated oxides. It is usually formed by prolonged weathering of aluminous rocks. Contains 30–75% Al_2O_3 , 9–31% H_2O , 3–25% Fe_2O_3 , 2–9% SiO_2 , 1–3% TiO_2 .

Properties: White cream, yellow, brown, gray, or red. D 2–2.55, Mohs hardness 1–3. Insoluble in water; decomposed by hydrochloric acid. Noncombustible.

Occurrence: Australia, Jamaica, France, Guiana, Guinea, U.S. (Arkansas), Brazil.

Use: Most important ore of aluminum, aluminum chemicals, abrasives, aluminous cement, refractories, decolorizing and deodorizing agent, catalysts, filler in rubber, plastics, paints, cosmetics, hydraulic fracturing.

See Bayer process; Hall process.

Note: Due to increasing cost of bauxite the use of other aluminum-containing minerals is under active investigation.

“Baybond” [Bayer Material]. TM for aqueous polyurethane dispersions.

Bayer process. Process for making alumina from bauxite. The main use of alumina is in the production of metallic aluminum. Bauxite is mixed with hot concentrated sodium hydroxide, which dissolves the alumina and silica. The silica is precipitated, and the dissolved alumina is separated from the solids, diluted, cooled, and then crystallized as aluminum hydroxide. The aluminum hydroxide is calcined to anhydrous alumina, which is then shipped to reduction plants.

See Hall process.

Bayer’s acid. See crocein acid.

“Baygon” [Bayer]. TM for *o*-isopropoxyphenyl methylcarbamate.

bay oil. See myrcia oil.

baypival. See 1-(*p*-chlorophenoxy)-3,3-dimethyl-1-(1-imidazolyl)-2-butanone.

“Baytex” [Bayer]. TM for *o,o*-diN(methylthio)-*m*-tolyl)phosphorothioate.
See fenthion.

BBO. See 2,5-dibiphenyloxazole.

BBP. Abbreviation for butyl benzyl phthalate.

BCG. See bromocresol green.

BCWL. Abbreviation for basic carbonate white lead.
See lead carbonate, basic.

“BDA” [Dow]. TM for inhibited hydrochloric acid solution containing surfactants.

Use: In limestone and dolomite formations, in oil-well fracturing and acidizing.

4-BDAF. See 4,4'-((2,2,2-trifluoro-1-(trifluoromethyl)ethylidene)bis(4,1-phenyleneoxy))bisbenzamine.

Be. Symbol for beryllium.

Bé. Abbreviation for Baumé.

bead. (1) In a rubber-fabric composite (tires, transmission belts), the point at which the cut edges of the fabric meet after being folded over. A length of pure gum rubber, called a bead strip, is used to seal the joint. The bead must be removed from tires before reclaiming—an operation called debanding. (2) See microsphere.

beamhouse. The part of a tannery where raw animal skins are washed, soaked, dehaired, and prepared for tanning.

“Bearite.” TM for a series of lead-base bearing metals containing about 17% antimony and fractional percentages of copper and bismuth; babbitt.

“Bearium.” TM for high-lead bronze with 18–26% lead that is used for bearings and similar items.

beat. Maximum or minimum of intensity caused by interference of two wave series of slightly different frequencies. The number of beats per second is equal to the difference in frequency between the two tones.

beater. An open, oval tank into which digested paper pulp is fed together with water and other processing ingredients such as clay, rosin, pigments, etc. The resulting slurry (approximately 5% solids content) is strongly agitated by a rotating drum equipped with closely spaced, horizontal, finlike projections which effectively disintegrate and macerate the wood fibers while the slurry is continuously circulated. The time of beating varies with the type and quality of the paper being made. Conical refiners (called Jordans) are often used to complete the beating operation for high-grade papers. The beating operation is critical in converting wood pulp to paper.

beat frequency. The difference in frequencies of two interfering waves.

Bechamp reaction. Formation of *p*-amino or *p*-hydroxyphenylarsonic acids by heating aromatic amines or phenols with arsenic acid. The arsylation requires an active hydrogen atom, and is practically limited to the benzene series. Apart from para

substitution, a small amount of ortho arsylation is observed, particularly when the para position is blocked.

“Beckacite” [Reichhold]. TM for fumaric, maleic, and modified phenolic resins.

“Beckamine” [Reichhold]. TM for urea-formaldehyde resins.

Beckmann rearrangement. The conversion of a ketone oxime to a substituted amide by an intermolecular rearrangement brought about by a catalyst. For example, the oxime of cyclohexanone is converted into caprolactam with sulfuric acid as catalyst.

Beckmann thermometer. A specific form of mercury thermometer that because of its large bulb has greater sensitivity but smaller range. It is used to measure small changes very accurately.

“Beckosol” [Reichhold]. TM for alkyd resins used at coating vehicles.

Becquerel effect. The electromotive force resulting from unequal illumination of two similar electrodes immersed in an electrolyte.

Becquerel, Henri. (1851–1908). A French physicist who shared the Nobel Prize in physics with the Curies for the discovery of the radioactivity of uranium salts. He also discovered the deflection of electrons by a magnetic field, as well as the existence and properties of γ -radiation.

beer. See brewing.

Beer’s law States that the degree of absorption of light is dependent on the thickness of the layer crossed and on the molecular concentration of colored substances in that layer.

beerstone. A deposit occurring on containers during brewing operations and consisting of calcium oxalate and organic material.

beeswax. Wax from the honeycomb of the bee. Beeswax consists largely of myricyl palmitate, cerotic acid and esters, and some high-carbon paraffins.

Properties: Brown or white (bleached) solid; faint odor. D 0.95, melting range 62–65C. Insoluble in water, slightly; soluble in alcohol; soluble in chloroform, ether, and oils. Combustible.

Grade: Technical, crude, refined, NF, FCC, USP (white).

Use: Furniture and floor waxes, shoe polishes, leather

dressings, anatomical specimens, artificial fruit, textile sizes and finishes, church candles, cosmetic creams, lipsticks, adhesive compositions.

beeswing. A light, gummy sediment deposited in bottled wines.

beet sugar. See sucrose

behavioral genetics. The study of genes that may influence behavior.

behenic acid. (docosanoic acid).

$\text{CH}_3(\text{CH}_2)_{20}\text{COOH}$. A saturated fatty acid, a minor component of the oils of the type of peanut and rapeseed.

Properties: Solid. Mp 80.0C, bp 306C (60 mm Hg), 265C (15 mm Hg), d 0.8221 (100/4C), refr index 1.4270 (100C). Combustible.

Derivation: Occurs in bean oil, hydrogenated mustard oil, and rapeseed oil.

Grade: Technical, 99%.

Use: Cosmetics, waxes, plasticizers, chemicals, stabilizers.

See "Hystrene" [*Crompton & Knowles*].

behenone. $\text{C}_{22}\text{H}_{44}\text{O}$. An aliphatic ketone. Insoluble in water, inert, compatible with high-melting waxes, fatty acids. Incompatible with resins, polymers, and organic solvents at room temperature but compatible with them at high temperature.

Use: As an antiblocking agent.

behenyl alcohol. (1-docosanol).

$\text{CH}_3(\text{CH}_2)_{20}\text{CH}_2\text{OH}$. A long-chain, saturated fatty alcohol.

Properties: Colorless waxy solid. Mp 71C, bp 180C (0.22 mm Hg). Insoluble in water; soluble in ethanol and chloroform. Combustible.

Derivation: Reduction of behenic acid with lithium aluminum hydride as catalyst.

Grade: Technical; 99%.

Use: Synthetic fibers, lubricants, evaporation retardant on water surfaces.

Beilstein, F. P. (1838–1906). A German chemist noted for his compilation "Handbuch der Organischen Chemie," the first edition of which appeared in 1880. A multivolume compendium of the properties and reactions of organic compounds, it has been revised several times and remains a unique and fundamental contribution to chemical literature.

Beilstein's test. A test to detect halogens in organic compounds. Copper gauze is heated in a flame until the flame shows no green color; if the addition of an organic compound produces a green flame, a halogen is present.

BEK. See butyl ethyl ketone.

bel. (1) An interval corresponding to a factor of 10 on a logarithmic scale showing the relationship of two quantities of power. (2) A unit of difference in sound sensation degrees.

belladonna. (deadly nightshade; banewort). A herbaceous perennial bush (*Atropa belladonna*) of which the leaves and roots are used for their content of hyoscyamine and atropine.

Occurrence: Southern and central Europe, Asia Minor, Algeria; cultivated in North America, England, France.

Grade: Belladonna leaf, USP; belladonna root.

Hazard: Very toxic when high in atropine.

Use: Medicine (gastrointestinal relaxant).

Bellier index. (Bellier number). The temperature at which solid fatty acids begin to crystallize from 70% alcohol solution, acidulated with acetic acid, when the solution is slowly and progressively cooled with constant agitation.

Bellier number. See Bellier index.

bell jar. A bell-shaped glass jar that is used for the protection of instruments, etc.

bell metal. A copper-based hard alloy that contains 15–40% tin and optional additions of zinc, iron, and lead. Frequently used in bells and musical chimes.

bemberg. A cuprammonium rayon fiber. Flammable, not self-extinguishing.

"Bemul" [Drierite]. TM for a practically odorless emulsifying agent; a pure white, edible glycerol monostearate in bead form; mp 58–59C; completely dispersible in hot water; completely soluble in alcohols and hot hydrocarbons.

Use: Pharmaceuticals; cosmetics; foodstuffs; protective coating for edible hygroscopic powders, tablets, and crystals; pour-point depressant for lubricating oils; textile sizes.

"Benadryl." [Pfizer]. Proprietary name of diphenhydramine hydrochloride.

Benary reaction. Action of Grignard reagents on enamino ketones or aldehydes yields β -substituted α,β -unsaturated ketones or aldehydes.

benazolin ethyl ester. See ethyl 4-chloro-2-oxo-3(2h)-benzothiazoleacetate.

bench gas. See coal gas.

bench test. A simulated test in which the conditions are approximated, but the equipment is not necessarily identical, with that in which the item will be used.

bendiocarb. $C_{11}H_{13}NO_4$.

Properties: White powder. Mp 130C. Slightly soluble in water.

Hazard: Poison by ingestion, skin absorption.

Use: Contact insecticide.

“Benecel” [Aqualon].

CAS: 9004-67-5. TM for methylcellulose.

Use: In food, pharmaceutical, and personalcare items.

Benedict solution. A water solution of sodium carbonate, copper sulfate, and sodium citrate. The blue color changes to a red, orange, or yellow precipitate or suspension in the presence of a reducing sugar such as glucose, and is therefore used in testing for such materials, especially for urinalysis in the treatment of diabetes.

See Fehling's solution.

beneficiation. A process used in extractive metallurgy whereby an ore, either metallic or nonmetallic, is concentrated in preparation for further processing (smelting). Calcination is often an important step in beneficiation; others steps include physical separation of high-grade ore from impurities (gangue) by screening, washing, milling, or magnetic means. A process for removing sulfur from coal by chemical comminution has been developed.

benefin. (*N*-butyl-*N*-ethyl- α,α,α -tri-fluoro-2,6-dinitro-*p*-toluidine). $C_8H_2(NO_2)_2CF_3NC_5H_{14}$.

Properties: Yellow-orange solid. Mp 65–66.5C, bp 121–122C (0.5 mm Hg). Slightly soluble in water; readily soluble in acetone and xylene.

Hazard: Highly toxic.

Use: Herbicide.

“Ben-ex” [Kelco]. TM for specialty drilling-fluid additives.

Bengal fire. Material used in pyrotechnics composed of realgar, potassium nitrate, and sulfur.

Benjamin gum. See benzoin resin.

benomyl. (“Benlate” [Du Pont]; methyl-1-(butylcarbamoyl)-2-benzimidazole-carbamate).

CAS: 17804-35-2. Generic name for a postharvest fungicide for peaches, apples, etc. Also used as oxidizer in sewage treatment.

Hazard: High toxicity by ingestion. TLV: 10 mg/m³.

bensulide. (*N*-(2-mercaptoethyl)benzenesulfonamide).

CAS: 741-58-2.

Use: Herbicide.

benthos. The bottom-dwelling life of an ocean or freshwater environment.

bentonite. A colloidal clay (aluminum silicate) composed chiefly of montmorillonite. There are two varieties: (1) sodium bentonite (Wyoming or western), which has high swelling capacity in water; and (2) calcium bentonite (southern), with negligible swelling capacity.

Properties: (Wyoming) Light to cream-colored impalpable powder; forms colloidal suspension in water, with strongly thixotropic properties.

Occurrence: Wyoming, Mississippi, Texas, Canada, Italy, the former U.S.S.R..

Use: Oil-well drilling fluids; cement slurries for oil-well casings; bonding agent in foundry sands and pelletizing of iron ores; sealant for canal walls; thickener in lubricating greases and fireproofing compositions; cosmetics; decolorizing agent; filler in ceramics, refractories, paper coatings; asphalt modifier; polishes and abrasives; food additive; catalyst support.

See clay, “Flo-Fre” [Oil-Dri].

benz(e)acephenanthrylene. (3,4-benz(e)acephenanthrylene; 2,3-benzfluoranthene; benzo(b)fluoranthene; b(b)f).

CAS: 205-99-2. $C_{20}H_{12}$.

Properties: Needles from C_6H_6 or EtOH. Mw: 252.32, mp 168C.

Hazard: Confirmed carcinogen.

benzalacetone. See benzylidene acetone.

benzalazine. (benzylidene azine).

$C_6H_5CH:NN:CHC_6H_5$.

Properties: Yellow crystals. Mp 91–93C. Insoluble in cold water; soluble in benzene, and hot alcohol.

Use: Stabilizer; polymerization catalyst; UV absorbent; reagent and intermediate.

benzal chloride. See benzyl dichloride.

benzaldehyde. (benzoic aldehyde; synthetic oil of bitter almond).

CAS: 100-52-7. C_6H_5CHO .

Properties: Colorless or yellowish, strongly refractive, volatile oil; odor resembling oil of bitter almond; burning aromatic taste. Oxidizes readily. D 1.0415 (25/4C), refr index 1.5440–1.5464 at 20C, fp –56C; bp 178C, flash p 145F (62.7C) (CC). Miscible with alcohol, ether, fixed and volatile oils; slightly soluble in water. Oxidizes in air to benzoic acid. Combustible. Autoign temp 377F (191.6C).

Derivation: (1) Air oxidation of toluene with uranium or molybdenum oxides as catalysts; (2) reaction of benzyl dichloride with lime; (3) extraction from oil of bitter almond.

Impurities: Usually chlorides.

Method of purification: Rectification.

Grade: Technical, NF. *Note:* The specifications, especially regarding impurities, vary considerably for the grades used for dye manufacture from those used in perfumery.

Hazard: Highly toxic.

Use: Chemical intermediate for dyes, flavoring materials, perfumes, and aromatic alcohols; solvent for oils, resins, some cellulose ethers, cellulose acetate and nitrate; flavoring compounds; synthetic perfumes; manufacturing of cinnamic acid, benzoic acid; pharmaceuticals; photographic chemicals.

benzaldehyde cyanohydrin. See mandelonitrile.

benzaldehyde green. See Malachite green.

benzalkonium chloride. A mixture of alkyl dimethylbenzylammonium chlorides of general formula $C_6H_5CH_2N(CH_3)_2RCl$ in which R is a mixture of the alkyls from C_8H_{17} to $C_{18}H_{37}$. It is a typical quaternary ammonium salt.

Properties: White or yellowish-white, amorphous powder or gelatinous pieces; aromatic odor; very bitter taste. Soluble in water, alcohol, or acetone; almost insoluble in ether; slightly soluble in benzene. Water solutions foam strongly when shaken and are alkaline to litmus.

Grade: USP.

Hazard: Highly toxic.

Use: Cationic detergent; surface antiseptic; fungicide.

benzamide. (benzoylamide). $C_6H_5CONH_2$.

Properties: Colorless crystals. Mp 130C, bp 288C, d 1.341. Soluble in hot water, hot benzene, alcohol, and ether. Combustible.

Derivation: From benzoyl chloride and ammonia or ammonium carbonate.

Grade: Technical.

Use: Organic synthesis.

benzaminoacetic acid. See hippuric acid.

benzanilide. (benzoylaniline; phenylbenzamide). $C_6H_5NH(COC_6H_5)$.

Properties: White to reddish crystals and powder. Related to acetanilide, containing benzoyl in place of acetyl radical. D 1.306, mp 160–162C. Soluble in alcohol; insoluble in water; slightly soluble in ether.

Derivation: From benzoic anhydride and aniline with sodium hydroxide.

Use: Intermediate in the synthesis of dyes, drugs, and perfumes.

benz(a)anthracene. (benzanthracene; 1,2-benzanthracene; benzo(b)phenanthrene; tetraphene).

CAS: 56-55-3. $C_{18}H_{12}$.

Properties: Colorless leaflets or plates from EtOH/AcOH. Mw 228.30, mp 160C, bp 400C.

Hazard: Confirmed carcinogen. Found in oils, waxes, smoke, food, drugs.

benzanthrone. $C_{17}H_{10}O$. A four-ring system.

Properties: Pale-yellow needles. Mp 170C. Soluble in alcohol and other organic solvents.

Derivation: (1) From anthranol and glycerol via condensation via sulfuric acid (anthranol is made from anthraquinone), (2) from anthracene in sulfuric acid solution by addition of glycerol and heating to 100–110C until the anthracene disappears. The reaction mass is then diluted with water, salted out, and purified.

Method of purification: Crystallization from toluene.

Use: Dyes.

benzathine penicillin G. (*N,N'*-dibenzylethylenediamine dipenicillin G).

$2C_{16}H_{18}N_2O_4S \bullet C_{16}H_{20}N_2 \bullet 4H_2O$.

Properties: White crystalline powder; odorless. The pH of a saturated solution is 4.5–7.5. Slightly soluble in alcohol; almost insoluble in water.

Grade: USP.

Use: Medicine (antibiotic).

benzazimide. See 4-ketobenzotriazine.

“Benzedrine” [Glaxo-SmithKline]. TM for amphetamine sulfate.

benzene.

CAS: 71-43-2. C_6H_6 .

Structure: I. Complete ring showing all elements.

II. Standard ring showing double bonds only.

III. Simple ring without double bonds, with numerals indicating position of carbon atoms to which substituent atoms or groups may be attached (2 = ortho, 3 = meta, 4 = para).

IV. Generalized structure with enclosed circle suggesting the resonance of this compound. This structure is now in general use.

These structures are also referred to as the benzene nucleus.

Properties: Colorless to light-yellow; mobile; non-polar liquid of highly refractive nature; aromatic odor. Bp 80.1C, fp 5.5C, d 0.8790 (20/4C), wt/gal 7.32 lb, refr index 1.50110 at 20C, flash p 12F (-11C) (CC), surface tension 29 dynes/cm; autoign temp 1044F (562C). Miscible with alcohol, ether, acetone, carbon tetrachloride, carbon disulfide, acetic acid; slightly soluble in water. Vapors burn with smoky flame.

Derivation: (1) Hydrodealkylation of toluene or pyrolysis of gasoline; (2) transalkylation of toluene by disproportionation reaction; (3) catalytic reforming of petroleum; (4) fractional distillation of coal tar.

Grade: Crude, straw color, motor, industrial pure (2C), nitration (1C), thiophene-free, 99 mole %, 99.94 mole %, nanograde.

Hazard: A carcinogen. Highly toxic. Flammable, dangerous fire risk. Explosive limits in air 1.5 to 8% by volume. TLV: 10 ppm.

Use: Manufacturing of ethylbenzene (for styrene monomer), dodecylbenzene (for detergents), cyclohexane (for nylon), phenol, nitrobenzene (for aniline), maleic anhydride, chlorobenzene, diphenyl, benzene hexachloride, benzene-sulfonic acid, and as a solvent.

See aromatic.

benzene azimide. See 1,2,3-benzotriazole.

benzeneazoanilide. See diazoaminobenzene.

benzeneazobenzene. See azobenzene.

benzeneazo-*p*-benzeneazo- β -naphthol. ("Sudan" III; tetraazobenzene- β -naphthol). $C_{22}H_{16}ON_4$. A red dye; CI 26100.444.

Properties: Brown powder. Mp 195C. Insoluble in water; soluble in alcohol, oils, chloroform, glacial arctic acid.

Use: Coloring oils red; biological stain.

benzeneazonaphthylethylenediamine. See azodine.

benzenecarboxylic acid. See benzoic acid.

benzenediazonium chloride. $C_6H_5N(N)Cl$.
Properties: Ionic salt. Very soluble in water; insoluble in most organic solvents.
Hazard: Highly toxic. Can explode on heating.
Use: Dye intermediate.

benzene dibromide. See dibromobenzene.

1,3-benzenedicarbonitrile. See *m*-phthalodinitrile.

benzene-*o*-dicarboxylic acid. See phthalic acid.

benzene-*p*-dicarboxylic acid. See terephthalic acid.

1,2-benzenedicarboxylic acid, 4,4'-carbonylbis-, ar,ar'-diethyl estercompd. with 1,3-benzenediamine.

CAS: 65701-07-7. mf: $C_{21}H_{18}O_3 \bullet C_6H_8N_2$.

Hazard: Moderately toxic by ingestion. A severe skin and eye irritant.

1,2-benzenedicarboxylic acid, di-*c*7-*c*9-branched alkyl esters.

CAS: 68515-41-3.

Hazard: A reproductive hazard.

1,2-benzenedicarboxylic acid dipentyl ester, branched and linear.

CAS: 84777-06-0.

Hazard: A reproductive hazard.

benzene hexachloride. (BHC). A commercial mixture of isomers of 1,2,3,4,5,6-hexachlorocyclohexane.

Hazard: The γ -isomer is highly toxic. Use may be restricted.

Use: An insecticide.

See lindane.

benzene, 1-isocyanato-2-methyl-. See 1-isocyanato-2-methylbenzene.

benzenemonosulfonic acid. See benzenesulfonic acid.

benzenephosphinic acid. (phenylphosphinic acid). $C_6H_5H_2PO_2$.

Properties: Colorless crystals. Mp 82-84C, d 1.376 (29C). Decomposes at 200C. Stable in air. Soluble in water, alcohol, acetone; slightly soluble in ether; insoluble in benzene, hexane, CCl_4 . Combustible.

Use: Antioxidant, intermediate for metallic-salt formation, accelerator for organic peroxide catalysts.

benzenephosphonic acid. (phenylphosphonic acid). $C_6H_5H_2PO_3$.

Properties: Colorless crystals. Mp 158C, d 1.475 (4C), decomposes at 275C. Soluble in water, alcohol, CCl_4 . Combustible.

Hazard: Highly toxic.

Use: Intermediate in antifouling paint agents; catalyst in organic reactions.

benzenephosphorus dichloride. $C_6H_5PCl_2$.

Properties: Highly reactive, colorless liquid. Mp -51C, bp 224.6C, d 1.315 (25C), refr index 1.5958 (25C). Soluble in common inert organic solvents. Fumes in air; hydrolyzes in water.

Hazard: Highly corrosive to skin, tissue. Flammable.

Use: Organic synthesis, for derivation of plasticizers, polymers, antioxidants; oil additives.

benzenephosphorus oxydichloride.

Properties: Reactive colorless liquid. Mp 3.0C, bp 258C, d 1.197 (25C), refr index 1.5585 at 25C. Soluble in common inert organic solvents; hydrolyzes in water. Combustible.

Hazard: Strong irritant to skin, mucous membranes.

Use: Organic synthesis, for derivation of plasticizers, polymers, antioxidants, oil additives.

benzenesulfinic acid, zinc salt. See zinc benzenesulfinate.

benzenesulfonic acid. (benzenemonosulfonic acid; phenylsulfonic acid).

CAS: 42615-29-2. $\text{C}_6\text{H}_5\text{SO}_3\text{H}$.

Properties: Fine, deliquescent needles or large plates. Mp 65–66C when anhydrous; with 1.5 molecules water, mp 43–44C. Soluble in water, alcohol; slightly soluble in benzene; insoluble in ether and carbon disulfide.

Derivation: By reacting benzene with fuming sulfuric acid.

Hazard: Irritant to skin, eyes, mucous membranes.

Use: Manufacturing of phenol, resorcinol, and other organic syntheses, and as a catalyst.

benzenesulfonic acid, dodecyl-, compd. with isopropylamine.

CAS: 26264-05-1. mf: $\text{C}_{18}\text{H}_{30}\text{O}_3\text{S}\cdot\text{C}_3\text{H}_7\text{N}$.

Hazard: A severe eye irritant.

benzene-1,3,5-tricarboxylic acid chloride.

See trimesoyl trichloride.

benzenoid. Any organic compound containing or derived from the benzene ring structure, e.g., phenol, nitrobenzene, anthracene, styrene. This large array of unsaturated compounds, derived chiefly from petroleum and coal tar, provides a broad base for the synthesis of polymers, dyes, and intermediates.

See aromatic.

benzenyl trichloride. See benzotrichloride.

benzethonium chloride. $\text{C}_{27}\text{H}_{42}\text{ClNO}_2$. A synthetic quaternary ammonium compound,

Properties: Colorless plates; odorless; very bitter taste. Mp 164–166C. Soluble in water, alcohol, acetone. Aqueous solution yields flocculent white precipitate with soap solutions.

Grade: NF.

Hazard: An oral poison.

Use: Antiseptic; cationic detergent.

2,3-benzfluoranthene. See benz(e)acephenanthrylene.

benzhydrol. (benzohydrol; diphenylmethanol; diphenylcarbinol).

CAS: 91-01-0. $(\text{C}_6\text{H}_5)_2\text{CH}_2\text{O}$.

Properties: Needlelike, colorless crystals. Mp 69C, bp 298C, 176C (13 mm Hg). Slightly soluble in water; easily soluble in alcohol, ether, chloroform, and carbon disulfide. Combustible.

Derivation: Reduction of benzophenone with magnesium or zinc dust.

Use: Preparation of certain antihistamines; insecticide.

benzhydryl bromide. See diphenylmethyl bromide.

benzhydryl chloride. $(\text{C}_6\text{H}_5)_2\text{CHCl}$.

Properties: Water-white to light straw-colored liquid. Refr index 1.596, mp 16C, bp 140C (3 mm Hg). Combustible.

Use: Organic synthesis.

benzidine. (benzidine base; *p*-diaminodiphenyl).

CAS: 92-87-5. $\text{NH}_2(\text{C}_6\text{H}_4)_2\text{NH}_2$.

Properties: Grayish-yellow, white, or reddish-gray crystalline powder. Mp 127C, bp 400C. Soluble in hot water, alcohol, ether; slightly soluble in cold water. Combustible. Also available as the hydrochloride.

Derivation: (1) By reducing nitrobenzene with zinc dust in alkaline solution followed by distillation; (2) by electrolysis of nitrobenzene, followed by distillation; (3) by nitration of diphenyl followed by reduction of the product with zinc dust in alkaline solution, with subsequent distillation.

Grade: Technical (paste; powder 80–85%).

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: confirmed human carcinogen.

Use: Organic synthesis; manufacture of dyes, especially of Congo red; detection of blood stains; stain in microscopy; reagent; stiffening agent in rubber compounding.

benzidinedicarboxylic acid. See diaminodiphenic acid.

benzidine dye. Any of a group of azo dyes derived from 3,3'-dichlorobenzidine; they include yellow and orange colors claimed to be lightfast and alkali-resistant. Congo red is derived from benzidine and naphthionic acid.

Hazard: These compounds are highly toxic and carcinogenic. Physical contact with them should be avoided.

benzidine rearrangement; semidine

rearrangement. The acid-catalyzed rearrangement of hydrazobenzenes to 4,4'-diaminobiphenyls. If the hydrazobenzene contains a *para* substituent, the product is a *p*-aminodiphenylamine (semidine rearrangement).

benzidine sulfate.

CAS: 531-86-2. $C_{12}H_{12}N_2 \cdot H_2SO_4$.

Properties: White, crystalline powder. Soluble in ether; sparingly soluble in water, alcohol, dilute acids.

Derivation: Action of sulfuric acid or sodium sulfate on benzidine with subsequent recovery by precipitation.

Hazard: Poison by ingestion, skin absorption. A carcinogen.

Use: Organic synthesis.

benzil. (dibenzoyl). $C_6H_5CO \cdot COC_6H_5$.

Properties: Yellow needles. Mp 95C, bp 346–348C, d 1.521. Soluble in alcohol, ether; insoluble in water.

Derivation: From benzoin by oxidation with HNO_3 .

Use: Organic synthesis; insecticide.

benzilic acid. (diphenylglycolic acid).

$(C_6H_5)_2C(OH)COOH$.

Properties: White to tan powder with a characteristic odor. Mp 148–151C. Soluble in hot water and alcohol. Combustible.

Use: Chemical intermediate.

benzilic acid rearrangement. Rearrangement of benzyl to benzilic acid on treatment with base.

α -benzil monoxime.

CAS: 14090-77-8. mf: $C_{14}H_{11}NO_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

benzimidazole. (1,3-benzodiazole; azindole; benzoglyoxaline).

CAS: 51-17-2. $C_7H_6N_2$.

Properties: Tabular crystals. Mp 172–174C, mw 118.13, bp >360C. Weak base sparingly soluble in cold water and ether. Freely soluble in alcohol; practically insoluble in benzene and petroleum ether.

benzine. The name *benzine* is archaic and misleading and should not be used. (ASTM Petroleum Definitions D-288.) Do not confuse with benzene. See ligroin.

1,2-benzisothiazolin-3-one 1,1-dioxide calcium salt. See calcium saccharin.

benzocaine. See ethyl-*p*-aminobenzoate hydrochloride.

benzocetamine.

CAS: 17243-39-9. mf: $C_{18}H_{19}N$.

Hazard: Moderately toxic by ingestion.

benzodihydropyrene. (dihydrocoumarin). $C_6H_8O_2$ (bicyclic).

Properties: White to light yellow, oily liquid with a sweet odor. Congeals at 23C. Insoluble in water; soluble in alcohol, chloroform, ether. Combustible.

Use: Perfumery.

1,3-benzodioxole-4-carboxaldehyde.

CAS: 7797-83-3. mf: $C_8H_6O_3$.

Hazard: A poison by ingestion.

1,3-benzodioxol-4-ol, 2,2-dimethyl-, acetylmethylcarbamate.

CAS: 22791-33-9. mf: $C_{13}H_{15}NO_5$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,3-benzodioxol-4-yl methylcarbamate.

CAS: 22791-23-7. mf: $C_9H_9NO_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

“BenzoFlex” [Seidler]. TM for a battery cleaner.

“Benzoflex” [Velsicol]. TM for a series of plasticizers that are dibenzoate esters of dipropylene glycol or any of several polyethylene glycols.

Use: Primary plasticizer for vinyl resins; adhesive formulations; some grades in food-packaging adhesives.

8,9-benzofluoranthene. See benzo(k)fluoranthene.

benzo(k)fluoranthene.

CAS: 207-08-9. mf: $C_{20}H_{12}$.

Properties: Yellow prisms from C_6H_6 or AcOH. Mp: 217°, bp: 480°.

Hazard: Confirmed carcinogen.

benzofuran. See coumarone.

benzoglycolic acid. See mandelic acid.

benzoguanamine. (2,4-diamino-6-phenyl-*s*-triazine). $C_6H_5C_3N_3(NH_2)_2$.

Properties: Crystals. D 1.40, mp 227–228C. Soluble in methyl“Cellosolve.” alcohol, dilute hydrochloric acid; partially soluble in dimethylformamide, acetone; practically insoluble in chloroform, ethyl acetate; insoluble in water, benzene, ether. Combustible.

Derivation: Benzonitrile and dicyandiamide in the presence of sodium and liquid ammonia.

Use: Thermosetting resins, resin modifiers; chemical intermediate for pesticides, pharmaceuticals, and dyestuffs.

benzohydrol. See benzhydrol.

benzoic acid. (carboxybenzene; benzenecarboxylic acid; phenylformic acid).

CAS: 65-85-0. C_6H_5COOH . It occurs naturally in benzoin resin.

Properties: White scales or needle crystals; odor of benzoin or benzaldehyde. D 1.2659, mp 121.25C, partially sublimes at 100C, p 249.2C, flash p 250F (121.1C) (CC). Freely volatile in steam. Soluble in alcohol, ether, chloroform, benzene, carbon disulfide, carbon tetrachloride, turpentine; slightly soluble in water. Combustible.

Derivation: (1) Decarboxylation of phthalic anhydride in the presence of catalysts; (2) chlorination of toluene to yield benzotrichloride, which is hydrolyzed to benzoic acid; (3) oxidation of toluene; (4) from benzoin resin.

Method of purification: Sublimation.

Grade: Technical, CP, USP, FCC.

Hazard: Moderately toxic by ingestion. Use restricted to 0.1% in foods.

Use: Sodium and butyl benzoates, plasticizers, benzoyl chloride, alkyd resins, food preservative, seasoning tobacco, flavors, perfumes, dentifrices, standard in analytical chemistry, antifungal agent.

benzoic aldehyde. See benzaldehyde.

benzoic anhydride. $(C_6H_5CO)_2O$.

Properties: Colorless prisms. D 1.198, mp 42C, bp 360C, refr index 1.576. Soluble in most organic solvents; insoluble in water.

Use: Dyes, intermediates, pharmaceuticals (benzoylating agent), organic synthesis.

benzoic trichloride. See benzotrichloride.

benzoin. (bitter almond-oil camphor; benzoyl-phenylcarbinol; 2-hydroxy-2-phenylacetophenone; phenylbenzoylcarbinol).

CAS: 119-53-9. $C_6H_5CH_2OHC_6H_5$.

Properties: White or yellowish crystals; slight camphor odor. Mp 137C. Slightly soluble in water and ether; soluble in acetone and hot alcohol. Optically active. Combustible.

Derivation: Condensation of benzaldehyde in an alkaline cyanide solution.

Hazard: Highly toxic.

Use: Organic synthesis, intermediate, photopolymerization catalyst.

Note: Do not confuse with benzoin resin.

benzoin condensation. Cyanide ion-catalyzed condensation of aromatic aldehydes to give benzoin (acyloins).

α -benzoin oxime. (benzoin antioxime).

$C_6H_5CH_2OC(NOHC_6H_5)$.

Properties: Solid. Mp 150–152C.

Use: Organic intermediates and photographic chemicals, analytical reagent for determination of metals.

benzoin resin. (gum benzoin; Benjamin gum).

Properties: Reddish-brown globules; balsamic, vanilla-like odor. Brittle at room temperature but softened by heat. Soluble in warm alcohol and carbon disulfide; insoluble in water.

Source: Obtained from the styrax tree in Southeast Asia and Sumatra. The Sumatran grade is higher melting and only 75% soluble in alcohol.

Grade: Technical, tincture USP.

Chief constituents: Benzoic acid, cinnamic acid, vanillin.

Use: Source of benzoic acid; perfumery; cosmetics; medicine (antiseptic and expectorant).

Note: Do not confuse with benzoin.

benzol. Obsolete name for benzene, no longer in approved use.

benzonitrile. (phenyl cyanide).

CAS: 100-47-0. C_6H_5CN .

Properties: Colorless oil; almond-like odor; sharp taste. D 1.0051; bp 190.7C; fp –13.1C, viscosity 1.054 centistokes (100F), refr index 1.5289. Soluble in boiling water, alcohol, ether; slightly soluble in cold water.

Derivation: From benzoic acid by heating with lead thiocyanate.

Hazard: High toxicity; absorbed by skin.

Use: Manufacture of benzoguanamine; intermediate for rubber chemicals; solvent for nitrile rubber, specialty lacquers, and many resins and polymers, and for many anhydrous metallic salts.

benzo(b)phenanthrene. See benz(a)anthracene.

benzophenol. See phenol.

benzophenone. (diphenylketone).

CAS: 119-61-9. $(C_6H_5)_2CO$.

Properties: White prisms with sweet, roselike odor. Mp 47.5C; bp 305C. Partially soluble in alcohol, ether; soluble in chloroform; insoluble in water. Combustible.

Method of purification: Crystallization from alcohol.

Grade: Free from chlorine (FFC), also FCC.

Use: Organic synthesis; odor fixative; derivatives are used as ultraviolet absorbers; flavoring; soap fragrance; pharmaceuticals; polymerization inhibitor for styrene.

benzophenone oxide. See xanthone.

3,3',4,4'-benzophenonetetracarboxylic dianhydride. (BTDA). $C_{17}H_6O_7$.

Properties: Free-flowing powder. Mp 228C.

Use: Epoxy curing agent, heat-resistant polymers, specialty alkyd resins, polyesters, and plasticizers.

12h-benzo(b)phenoselenazine.

CAS: 64050-25-5. mf: $C_{16}H_{11}NSe$.

Hazard: Moderately toxic. TWA 0.2 mg(Se)/m³

Use: Agricultural chemical.

benzopyrene. (3,4-benzopyrene).

CAS: [a] form 50-32-8. $C_{20}H_{12}$. A polynuclear (five-ring) aromatic hydrocarbon. Found in coal tar and cigarette smoke, and in the atmosphere as a product of incomplete combustion.

Derivation: Occurs as benzo[a]pyrene and benzo[e]pyrene.

Properties: (Benzo[a]pyrene) Yellowish crystals. Mp 179C, bp 310–312C (10 mm Hg). Insoluble in water; slightly soluble in alcohol; soluble in benzene, toluene, xylene.

Hazard: Highly toxic, carcinogen by inhalation.

benzopyrone. See coumarin.

benzoquinone. See quinone.

benzoesulfimide. See saccharin.

s-(2-(2-benzothiazolylamino)-2-oxoethyl) ethanethioate. See 2-(acetylthioglycolic amide)benzothiazole.

benzothiazole. C_6H_3SCHN (bicyclic).

Properties: Yellow liquid; unpleasant odor. D 1.246, refr index 1.637, bp 227C. Slightly soluble in water; soluble in alcohol. Combustible.

Hazard: Highly toxic by ingestion.

Use: Derivatives used as rubber accelerators.

benzothiazolyl disulfide. See 2,2'-dithiois(benzothiazole).

benzothiazyl-2-cyclohexylsulfenamide. See *N*-cyclohexyl-2-benzothiazole-sulfenamide.

2-benzothiazyl-*N,N*-diethylthiocarbonyl sulfide. (diethyldithiocarbamic acid-2-benzothiazoyl ester). $(C_6H_3SCN)SSCN(C_2H_5)_2$.

Properties: Free-flowing, light-yellow to tan powder. D 1.27, mp 69C (min).

Use: Rubber accelerator.

benzothiazyl disulfide. See 2,2'-dithiois(benzothiazole).

1-benzothiophene-4-ol. See 4-hydroxybenzothiophene.

1,2,3-benzotriazole. (aziminobenzene; benzene azimide). $C_6H_4NHN_2$.

Properties: White to light tan crystalline powder; odorless. Boiling range 201–204C (15 mm Hg). Very stable toward acids and alkalis and toward oxidation and reduction. Its basic characteristics are very weak, but it forms stable metallic salts. Can exist in two tautomeric forms. Soluble in alcohol and benzene; slightly soluble in water. Derivatives are ultraviolet absorbers.

Hazard: Highly toxic by ingestion. May explode under vacuum distillation.

Use: Photographic restrainer, chemical intermediate.

benzotrichloride. (toluene trichloride; benzenyl trichloride; benzoic trichloride; phenylchloroform). $C_6H_5CCl_3$.

Properties: Colorless to yellowish liquid; fumes in air; hydrolyzes in water; penetrating odor. D 1.38; bp 220C, fp –5C, refr index 1.5584. Soluble in alcohol and ether; insoluble in water.

Derivation: Chlorination of boiling toluene.

Method of purification: Rectification.

Hazard: Highly toxic by inhalation, fumes highly irritant.

Use: Synthetic dyes, organic synthesis.

benzotrifluoride. (toluene trifluoride; trifluoromethylbenzene). $C_6H_5F_3$.

Properties: Water-white liquid; aromatic odor. Bp 102.1C; fp –29.1C, d 1.1812 (25/4C), refr index 1.4146, flash p 54F (12.2C) (CC). Miscible with alcohol, acetone, benzene, carbon tetrachloride, ether, *n*-heptane; insoluble in water.

Hazard: Highly toxic by inhalation. Flammable, dangerous fire risk. TLV: 2.5 mg(F)/m³.

Use: Intermediate for dyes and pharmaceuticals, solvent and dielectric fluid, vulcanizing agent, insecticides.

trans-β-benzoylacrylic acid.

$C_6H_5COCH:CHCOOH$.

Properties: Straw-yellow needles or plates. Mp 99C. Soluble in most solvents; only slightly soluble in cold water and ligroin. Combustible.

Use: Reagent for characterizing phenols; intermediate in the manufacturing of bactericides, insecticides, surface-active agents, and the upgrading of drying oils.

***N*-benzoyl-L(+)-alanine.** See alanine.

benzoylamide. See benzamide.

benzoylaminoacetic acid. See hippuric acid.

benzoylaniline. See benzanilide.

***p*-benzoylbenzoic acid.**

CAS: 611-95-0. mf: C₁₄H₁₀O₃.

Hazard: A poison.

benzoyl chloride.

CAS: 98-88-4. C₆H₅COCl.

Properties: Transparent, colorless liquid; pungent odor; vapor causes tears. D 1.2188, fp -0.5C, bp 197.2C, refr index 1.5536 (20C), flash p 162F (72.2C). Soluble in ether and carbon disulfide; decomposes in water. Combustible.

Derivation: (1) Interaction of benzoic acid and sulfuric chloride, (2) benzotrichloride and water in the presence of zinc chloride, (3) phosphorus tri- or pentachloride and benzoic acid.

Grade: Technical, CP.

Hazard: Highly toxic. Strong irritant to skin, eyes, and mucous membranes, and via ingestion, inhalation.

Use: Introduction of benzoyl group, dye intermediates, benzoyl peroxide manufacturing, analytical reagent.

benzoyl-2,5-diethoxyaniline.

C₆H₅CONHC₆H₅(OC₂H₅)₂.

Properties: Gray pellets. Mp 83–84C.

Hazard: Possibly toxic.

Use: Intermediate for pharmaceuticals, dyestuffs, and other organic chemicals.

benzoylferrocene. (phenyl ferrocenyl ketone).

C₅H₅FeC₃H₄COC₆H₅.

Properties: Dark red, crystalline solid. Mp 107–108C.

Hazard: Possibly toxic.

Use: Intermediate.

benzoyl fluoride. C₆H₅COF.

Hazard: High toxicity; TLV: 2.5 mg(F)/m³.

Use: Manufacturing of acyl and other fluorides.

benzoylglycin. See hippuric acid.

benzoylglycocol. See hippuric acid.

6-benzoylheteratisine. See heteratisine 6-benzoate.

2-benzoyl-2-hydroxypropane. See α-hydroxy-α-methylpropiofenone.

1-benzoylnapelline.

CAS: 198126-85-1. mf: C₂₉H₃₇NO₄.

Hazard: A poison.

Source: Natural product.

3-(3-(6-benzoyloxy-3-cyano-2-pyridyloxy-carbonyl)benzoyl)-1-ethoxymethyl-5-fluorouracil.

CAS: 110690-43-2. mf: C₂₈H₁₉FN₄O₈.

Hazard: A poison by ingestion. A reproductive hazard.

benzoyloxytriphenylstannane. See triphenylstannyl benzoate.

benzoyl peroxide. (dibenzoyl peroxide).

CAS: 94-36-0. (C₆H₅CO)₂O₂.

Properties: White, granular, crystalline solid; tasteless; faint odor of benzaldehyde. Active oxygen, approximately 6.5%. Mp 103–105C, decomposes explosively above 105C, autoign temp 176F (80C), d 1.3340 (25C). Soluble in nearly all organic solvents; slightly soluble in alcohols, vegetable oils; slightly soluble in water.

Grade: Technical, wet or dry; FCC.

Hazard: Highly toxic via inhalation. May explode spontaneously when dry (<1% of water). Never mix unless at least 33% water is present. TLV: 5 mg/m³.

Use: Bleaching agent for flour, fats, oils, and waxes; polymerization catalyst; drying agent for unsaturated oils; pharmaceutical and cosmetic purposes; rubber vulcanization without sulfur; burnout agent for acetate yarns; production of cheese; embossing vinyl flooring (proprietary).

See peroxides.

benzoylphenyl carbinol. See benzoin.

2-benzoylpyridine. C₆H₅COC₅H₄N.

Properties: Colorless liquid. Fp 42.7C. Insoluble in water.

Grade: 98% (minimum).

Use: Organic synthesis.

4-benzoylpyridine. C₆H₅COC₅H₄N.

Properties: Colorless liquid. Fp 71.4C. Insoluble in water.

Grade: 98% (minimum).

Use: Organic synthesis.

benzoylsulfonic imide. See saccharin.

benzoyloxytributylstannane.

CAS: 4342-36-3. mf: C₁₉H₃₂O₂Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical.

benzozone. See acetyl benzoyl peroxide.

1,2-benzphenanthrene. See chrysene.

benzpyrene. See benzopyrene.

benzyl abietate. $C_{19}H_{29}COOCH_2C_6H_5$.

Properties: Nonvolatile, viscous liquid that resembles Canada balsam. Soluble in most anhydrous solvents.

See balsam.

benzyl acetate. (acetic acid benzyl ester; acetic acid phenylmethyl ester; α -acetoxytoluene; benzyl ethanoate; phenylmethyl acetate). CAS: 140-11-4. $C_6H_5CH_2OOCCH_3$.

Properties: Water-white liquid; floral odor. Mw 150.19, d 1.059–1.062 (15C); mp $-51.5C$, bp $212C$; refr index 1.5015–1.5035, flash p 216F (102.2C) (CC), autoign temp 862F (460C), vap press 1 mm (45C), vap d 5.1, refr index 1.501. Soluble in alcohol, most fixed oils, propylene glycol; insoluble in glycerin and water at 214° .

Derivation: (a) By treating benzyl chloride with sodium acetate in various solvents; (b) by esterification of benzyl alcohol with acetic anhydride or acetic acid.

Method of purification: Distillation.

Grade: Free-from-chlorine grade, which should have an ester content of 97% but for which lower-grade material is sometimes substituted; technical grade, which is not free from chlorine and for which ester content varies considerably; FCC.

Hazard: A poison by inhalation. Moderately toxic by ingestion. Combustible.

Use: Artificial jasmine and other perfumes, soap perfume, flavoring, solvent and high boiler for cellulose acetate and nitrate, natural and synthetic resins, oils, lacquers, polishes, printing inks, varnish removers.

benzyl alcohol. (α -hydroxytoluene; phenylmethanol; phenylcarbinol). CAS: 100-51-6. $C_6H_5CH_2OH$.

Properties: Water-white liquid; slight odor; sharp, burning taste. Bp $206C$, flash p 220F (105C) (OC), d 1.040–1.050 (25/25C), refr index 1.5385–1.5405 (20C). Somewhat soluble in water; miscible with alcohol, ether, chloroform. Autoign temperature 817F (436C). Combustible.

Derivation: (a) By hydrolysis of benzyl chloride; (b) from benzaldehyde by catalytic reduction or Cannizzaro reaction.

Method of purification: Distillation and chemical treatment.

Grade: Free from chlorine (FFC), technical, NF, textile, photographic, reagent, FCC.

Hazard: Highly toxic.

Use: Perfumes and flavors; photographic developer for color movie films; dyeing nylon filament, textiles, and sheet plastics; solvent for dyestuffs, cellulose esters, casein, waxes, etc.; heat-sealing polyethylene films; intermediate for benzyl esters and ethers; bacteriostat; cosmetics, ointments, emulsions; ball point pen inks; stencil inks.

benzylamine. (aminotoluene). $C_6H_5CH_2NH_2$.

Properties: Light amber liquid; strongly alkaline reaction. D 0.9813; bp $184.5C$; refr index 1.540 at $20C$. Soluble in alcohol, ether, water. Combustible.

Derivation: From benzyl chloride and ammonia.

Hazard: Highly toxic, strong irritant to skin and mucous membranes.

Use: Chemical intermediate for dyes, pharmaceuticals, and polymers.

N-benzyl-p-aminophenol. (BAP).

$C_6H_5CH_2NHC_6H_4OH$.

Properties: Light brown powder. Mp $84-90C$, 96–99% pure. Solubility of 50% in anhydrous methanol, 50% in 95% ethanol, 0.06% in water; 0.1–0.5% in gasoline, varying with chemical nature of gasoline.

Use: In cracked gasoline, in concentration of 0.001–0.004% by weight to prevent gum formation.

2-benzylamino-1-propanol.

$C_6H_5NHCH(CH_2OH)CH_3$.

Properties: White to yellow solid. Both *l* and *dl*-forms are available. Mp (*dl*-form) $70-73C$. Specific rotation (*l*-form) $+38^\circ$ to $+44^\circ$ (1.0% solution in alcohol) at $25C$. Combustible.

benzylaniline. $C_6H_5NHCH_2C_6H_5$.

Properties: Colorless prisms. Mp $33C$, bp $310C$. Soluble in alcohol and ether; insoluble in water.

Use: Organic synthesis.

benzylbenzene. See diphenylmethane.

benzyl benzoate.

CAS: 120-51-4. $C_6H_5CH_2OOC C_6H_5$.

Properties: Water-white liquid; sharp, burning taste; faint aromatic odor. D 1.116–1.120 (25/25C), bp $325C$, mp $18.8C$, refr index 1.568–1.569 (20C), flash p 298F (147.7C). Supercools easily. Insoluble in water, glycerol; soluble in alcohol, chloroform, ether. Combustible.

Derivation: (a) By a Cannizzaro reaction from benzaldehyde, (b) by esterifying benzyl alcohol with benzoic acid, (c) by treating sodium benzoate with benzyl chloride.

Method of purification: Distillation and crystallization.

Grade: Technical, USP, FCC.

Hazard: Irritant to eyes, skin.

Use: Fixative and solvent for musk in perfumes and flavors; medicine (external); plasticizer for nitrocellulose and cellulose acetate; miticide.

benzyl bromide. (α -bromotoluene).

$C_6H_5CH_2Br$.

Properties: Clear, refractive liquid; pleasant odor. Not easily hydrolyzed. D 1.438 at 16C, bp 198–199C, fp $-3.9C$, vap d 5.8. Soluble in alcohol, benzene, ether; insoluble water.

Derivation: (1) Bromination of toluene, (2) interaction of benzyl alcohol and hydrobromic acid.

Hazard: Highly toxic. Corrosive to skin and tissue. A lachrymator.

Use: Making foaming and frothing agents, organic synthesis.

benzyl butyrate. $C_3H_7COOCH_2C_6H_5$.

Properties: Liquid; fruity odor. Bp 240C, d 1.016 (17.5C). Soluble in alcohol. Combustible.

Grade: Technical, FCC.

Use: Plasticizer, odorants, flavoring.

benzyl carbinol. See phenethyl alcohol.

benzyl "Cellosolve." See ethylene glycol monobenzyl ether.

benzyl chloride. (α -chlorotoluene).

CAS: 100-44-7. $C_6H_5CH_2Cl$.

Properties: Colorless liquid; pungent odor. D 1.090–1.111 (25/25C), fp $-43C$, bp 179C, refr index 1.5365 (25C), flash p 153F (67.2C) (OC), autoign temp 1085F (525C). Soluble in alcohol, ether; insoluble in water. Combustible.

Derivation: By passing chlorine over boiling toluene until it has increased 38% in weight. The product is washed with water and separated by fractional distillation.

Grade: Technical; CP; 95%; redistilled.

Available forms: Anhydrous; stabilized (with aqueous sodium carbonate solution).

Hazard: A carcinogen in animals. Highly toxic, intense eye and skin irritant. TLV: 1 ppm. A lachrymator.

Use: Dyes; intermediates; benzyl compounds; synthetic tannins; perfumery; pharmaceuticals; manufacture of photographic developer; gasoline gum inhibitors; penicillin precursors; quaternary ammonium compounds.

benzyl chlorocarbonate. (benzyl chloroformate). C_6H_5OCOCI .

Properties: Oily liquid with lachrymatory properties; odor of phosgene. Decomposes above 100C, reacts with water to form hydrochloric acid.

Hazard: Highly toxic, emits very toxic phosgene fumes at 100C. Irritant to eyes.

Use: Peptide synthesis.

benzyl chloroformate. See benzyl chlorocarbonate.

***o*-benzyl-*p*-chlorophenol.** (chlorophene, USAN; "Santophen"; septiphene; 4-chloro- α -phenyl-*o*-cresol). $C_6H_5CH_2C_6H_3OHCl$.

Properties: White to light tan or pink flakes; slight phenolic odor. Crystallizing point 45C min, D 1.202–1.206 (55/55C). Insoluble in water; highly soluble in alcohol, other organic solvents; dispersible in aqueous media with the aid of soaps or synthetic dispersing agents; noncorrosive to most metals. Combustible.

Hazard: Highly toxic, an irritant.

Use: Active principle or enhancing agent for disinfectants.

benzyl cinnamate. (cinnamein). $C_9H_7O_2C_7H_7$.

Properties: White crystals; aromatic odor. Mp 39C, congeal point (min) 34C, bp 244C (25 mm Hg). Insoluble in water; soluble in alcohol.

Hazard: Moderately toxic.

Grade: Technical, FCC.

Use: Perfumery and flavors.

benzyl cyanide. (phenylacetonitrile; α -tolunitrile). $C_6H_5CH_2CN$.

Properties: Colorless, oily liquid; aromatic odor. D 1.0157, fp $-24C$, bp 230C, refr index 1.5211 (25C). Soluble in alcohol and ether; insoluble in water.

Derivation: Interaction of benzyl chloride and potassium cyanide.

Grade: Technical.

Hazard: Highly toxic, absorbed by skin. TLV: 5 mg(CN)/m³.

Use: Organic synthesis, especially penicillin precursors.

benzyl dichloride. (benzylidene chloride; benzal chloride; chlorobenzal; α , α -dichlorotoluene). $C_6H_5CHCl_2$.

Properties: Colorless, oily liquid; faint aromatic odor. D 1.295 (16C), fp $-16.1C$, bp 207C, refr index 1.5502 (20C). Soluble in alcohol, ether, dilute alkali; insoluble in water. Combustible.

Derivation: Chlorination of toluene, until two formula weights of chlorine are absorbed, in absence of catalysts but presence of light.

Hazard: Strong irritant and lachrymator.

Use: Dyes; manufacture of benzaldehyde and cinnamic acid.

benzyl dimethyloctadecyl ammonium 3-nitrobenzenesulfonate.

CAS: 124088-59-1. mf: $C_{27}H_{50}N^+C_6H_4NO_3S^-$.

Hazard: Moderately toxic by ingestion and skin contact. A severe eye and mild skin irritant.

4-(benzyl-(2-((2,5-diphenyloxazole-4-carbonyl)amino)ethyl)carbamoyle)-2-

decanoylaminobutyric acid.CAS: 219905-91-6. mf: $C_{40}H_{48}N_4O_6$.**Hazard:** A poison.**benzyl disulfide.** See dibenzyl disulfide.**benzyl ethanoate).** See benzyl acetate.**N-benzylethanolamine.** $C_6H_5CH_2NH(C_2H_4OH)$.**Properties:** Colorless to light yellow liquid. D 1.044 (27C); refr index 1.5400–1.5430; distillation range 240–255C. Combustible.**Use:** Corrosion inhibitor; intermediate.**benzyl ether.** (dibenzyl ether).CAS: 103-50-4. $(C_6H_5CH_2)_2O$.**Properties:** Colorless, unstable liquid. Bp 295C, d 1.001, flash p 275F (135C), refr index 1.54. Insoluble in water; soluble in alcohol, ether, acetone.**Derivation:** Benzaldehyde is reduced with cobalt complex, $[Co(CO)_4]_2$.**Hazard:** Moderately toxic by ingestion. A skin irritant.**Use:** Solvent, plasticizer for nitrocellulose.**6-benzyl-1-(ethoxymethyl)-5-isopropyluracil.**

See emivirine.

benzyl ethyl ether. $C_6H_5CH_2OC_2H_5$.**Properties:** Colorless, oily liquid; aromatic odor. Bp 185C, d 0.949, refr index 1.4955 (20C). Volatile in steam; insoluble in water; miscible with alcohol, ether. Combustible.**Derivation:** By boiling benzyl chloride with either sodium or potassium ethylate.**Hazard:** Narcotic in high concentration. May be skin irritant.**Use:** Organic synthesis, flavoring.**benzyl ethylsalicylate.** $C_6H_5CH_2OOC C_6H_4OC_2H_5$.**Use:** As fixative and solvent in perfumes.**benzyl fluoride.** $C_6H_5CH_2F$.**Properties:** Colorless liquid. Forms acicular crystals on prolonged cooling. D 1.022 at 25C, bp 139.8C (753 mm), fp –35C.**Derivation:** By decomposing benzyltrimethylammonium fluoride.**Hazard:** Very irritant. TLV: 2.5 mg(F)/m³.**Use:** Organic synthesis.**benzyl formate.** $C_6H_5CH_2OOCH$.**Properties:** Colorless liquid; fruity-spicy odor. Resembles benzyl acetate in many respects but differs in its greater volatility. D 1.083–1.087, refr index 1.511–1.513, bp 203C. Miscible with alcohols, ketones, oils, aromatic, aliphatic and halogenated hydrocarbons; insoluble in water.**Hazard:** May be narcotic in high concentration.**Use:** Perfumes, flavoring, solvent for cellulose esters.**benzyl fumarate.** $C_6H_5CH_2OOCCH=CHCOOCH_2C_6H_5$.**Properties:** White powder. Mp 59C, bp 210C (5 mm Hg). Insoluble in water; soluble in alcohol and ether.**Derivation:** Reaction of fumaric acid and benzyl alcohol.**Use:** Spray deodorant.**5'-benzyl-3'-furylmethyl α -ethylphenylacetate.**CAS: 51628-36-5. mf: $C_{22}H_{22}O_3$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**5'-benzyl-3'-furylmethyl α -isopropyl-4-methoxyphenyl acetate.**CAS: 51628-56-9. mf: $C_{24}H_{26}O_4$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**benzylhexadecyldimethylammonium chloride.**

See cetalkonium chloride (USAN).

benzylhydroquinone. See *p*-benzyloxyphenol.**benzylidene acetone.** (benzalacetone; methyl styryl ketone; 4-phenyl-3-buten-2-one). $C_6H_5CH=CHCOCH_3$.**Properties:** Colorless crystals; odor of coumarin. Mp 72C, congeal point 39C (min), bp 260–262C, refr index 1.5836 (46C), d 1.0377 (15/15C). Soluble in alcohol, ether, benzene, chloroform; insoluble in water. Combustible.**Derivation:** Condensation of benzaldehyde and acetone.**Use:** Organic synthesis, perfumery, fixative, flavoring.**benzylidene azine.** See benzalazine.**benzylidene chloride.** See benzyl dichloride.**2-benzylidene-1-heptanol.** See α -amylcinamic alcohol.**N-benzylidiethanolamine.** $(C_6H_5CH_2N(C_2H_4OH))_2$.**Properties:** Colorless to light yellow liquid. D 1.073, refr index 1.5345–1.5375, distilling range 240–255C. Miscible with water. Combustible.**Use:** Corrosive inhibitor; intermediate.**N-benzylidimethylamine.** $C_6H_5CH_2N(CH_3)_2$.**Properties:** Colorless to light-yellow liquid. D 0.894 (27C); refr index 1.4985–1.5005 (25C); bp 180–182C; distilling range 65–68C (18 mm Hg). Combustible.**Use:** Intermediate, especially for quaternary ammonium compounds; dehydrohalogenating catalyst; corrosion inhibitor; acid neutralizer; potting compounds; adhesives; cellulose modifier.

benzyl iodide. $C_6H_5CH_2I$.

Properties: Colorless crystals or liquid. D 1.7335, mp 34.1C, bp (decomposes). Soluble in alcohol, carbon disulfide, ether; insoluble in water.

Derivation: Interaction of benzyl chloride and hydriodic acid.

Hazard: Powerful irritant.

benzyl isoamyl ether. See isoamyl benzyl ether.

benzyl isobutyl ketone. See 4-methyl-1-phenyl-2-pentanone.

benzyl isoeugenol. (1, α -phenyl-4-propenyl-veratrole). $CH_3CHCH_2C_6H_4(OCH_3)OCH_2C_6H_5$.

Properties: White, crystalline solid; floral odor of the carnation type. Soluble in alcohol, ether. Combustible.

Use: Perfumery, fixative.

N-benzylisopropylamine.

$C_6H_5CH_2NH(CH_2CHCH_3)$.

Properties: Colorless to yellow liquid. D 0.895 (25C), refr index 1.4995–1.5015 (25C). Combustible.

Use: Rust inhibitor; intermediate.

benzyl isothiocyanate. $C_6H_5CH_2NCS$.

Properties: Colorless to slightly yellow liquid; a lachrymator.

Hazard: Very irritant to tissues.

Use: Chemical intermediate.

benzyl mercaptan. See benzyl thiol.

benzylmethylamine. $C_6H_5CH_2NHCH_3$.

Properties: Colorless to light yellow liquid. D 0.936 (25C), refr index 1.5185–1.5220 (25C), distillation range 183–188C. Combustible.

Use: Organic synthesis.

N-benzyl-N,N-methylethanolamine.

$C_6H_5CH_2NCH_2(C_2H_4OH)$.

Properties: Colorless to light-yellow liquid. D 1.006 (27C), refr index 1.5250–1.5270 (25C), distillation range 95–105C (2 mm Hg). Combustible.

Use: Corrosive inhibitor, intermediate.

3-benzyl-4-methyl umbelliferone.

$C_6H_5CH_2CH_2C_6H_4O_3$.

Properties: Tan, crystalline powder. Mp 255C min. Slightly soluble in ethanol; insoluble in water.

Use: Optical whitening agent; intermediate.

5-benzoyloxy-8-chloro-n,n-dimethyl-1,2,3,4-tetrahydro-1-naphthylamine hydrochloride.

CAS: 63978-98-3. mf: $C_{19}H_{22}ClNO \cdot ClH$.

Hazard: A poison.

p-benzoyloxyphenol. (benzylhydroquinone; "Agerite Alba"). $C_6H_5CH_2OC_6H_4OH$.

Properties: Light-tan powder; faint odor. D 1.26, mp 121–122C. Slightly soluble in water; practically insoluble in petroleum hydrocarbons; very soluble in benzene and alkalis. Combustible.

Use: Rubber antioxidant; stabilizer; polymerization inhibitor; chemical intermediate.

p-(benzyloxy)phenyl bis(1-aziridinyl) phosphinate.

CAS: 41920-59-6. mf: $C_{17}H_{19}N_2O_3P$.

Hazard: Moderately toxic.

n,n'-(3-benzoyloxy-1,2-propanedioxy-sulfinyl) bis(3-methylphenylmethylcarbamate).

CAS: 81862-10-4. mf: $C_{28}H_{32}N_2O_9S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

n,n'-(3-benzoyloxy-1,2-propanedioxy-sulfinyl)bis(1-naphthylmethylcarbamate).

CAS: 81877-67-0. mf: $C_{34}H_{32}N_2O_9S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

benzyl pelargonate. $C_6H_5CH_2OOCCH_2H_{17}$.

Properties: Liquid; mild odor. D 0.962 (15.5/15.5C), bp 315C.

Use: In flavors and perfumes, bactericides and fungicides, organic synthesis.

p-benzylphenol. (4-hydroxydiphenylmethane).

$C_6H_5CH_2C_6H_4OH$.

Properties: White crystals from ethanol. Mp 84C, bp 320–322C. Soluble in ethanol, ether, chloroform, benzene, acetic acid, caustic alkalis; moderate solubility in hot water. Combustible.

Hazard: Toxic by ingestion.

Use: Antiseptic and germicide; organic synthesis.

benzyl phenylacetate.

$C_6H_5CH_2COOCH_2C_6H_5$.

Properties: Colorless liquid; honeylike odor. D 1.097–1.099, refr index 1.554–1.556. Soluble in alcohol. Combustible.

Use: Perfumery and flavors.

benzyl phenyl ketone. See deoxybenzoin.

benzylphosphonic acid dibutyl ester.

CAS: 3762-27-4. mf: $C_{15}H_{25}O_3P$.

Hazard: A poison by ingestion.

benzyl propionate. $C_2H_5COOCH_2C_6H_5$.

Properties: Similar to benzyl acetate but has sweeter odor. Liquid. Bp 220C, d 1.036 (17.5C). Insoluble in water. Combustible.

Grade: Technical; FCC.

Use: Perfumes; flavoring.

benzylpyridine. $C_6H_5CH_2C_5H_4N$.

Properties: Liquid. Bp 276.8C, mp 13.6C, d 1.061 (20C), refr index 1.5797. Insoluble in water. Combustible.

Hazard: Toxic by ingestion.

benzyl salicylate. $C_6H_5(H_2OH)COOCH_2C_6H_5$.

Properties: Colorless liquid; faint sweet odor. D 1.176–1.179, refr index 1.580–1.581, mp 24C min, bp 208C (26 mm). Soluble in 9 vols of 90% alcohol. Combustible.

Derivation: Reaction of sodium salicylate and benzyl chloride.

Grade: Technical, FCC.

Use: Perfume fixative, solvent for synthetic musk, sunscreensing lotions, soap odorant.

benzyl succinate. (dibenzyl succinate).

$C_6H_5CH_2OOCCH_2CH_2COOCH_2C_6H_5$.

Properties: White crystalline powder; almost tasteless. Mp 45C. Soluble in alcohol, ether, chloroform, also in fixed and volatile oils; insoluble in water. Combustible.

Use: Medicine (antispasmodic).

benzyl sulfide. $(CH_2C_6H_5)_2S$.

Properties: Colorless plates. D 1.0712, mp 49C. Soluble in alcohol and ether; insoluble in water.

Derivation: Action of potassium sulfide on benzyl chloride and subsequent distillation.

Use: Organic synthesis.

7-benzyl-3-thia-7-azabicyclo(3.3.1)nonane perchlorate.

CAS: 89398-07-2. mf: $C_{14}H_{19}NS \cdot ClHO_4$.

Hazard: A poison by ingestion.

benzyl thiocyanate. $C_6H_5CH_2CNS$.

Properties: Colorless crystals. Mp 41C, bp 230C. Insoluble in water; soluble in alcohol and ether.

Hazard: Strong irritant to skin, tissue. Moderate fire hazard.

Use: Insecticide.

benzylthiol. (benzyl mercaptan; α -toluenethiol). $C_6H_5CH_2SH$.

Properties: Colorless liquid; strong odor. Bp 195C, flash p 158F (70C) (CC), d 1.05. Insoluble in water; soluble in alcohol, carbon disulfide. Combustible.

Hazard: Toxic by inhalation and ingestion; irritant to tissue.

Use: Odorant, flavors.

2-benzyl-6-thiouracil. $C_6H_5CH_2C_3N_2OS$. A drug intermediate.

benzyltrimethylammonium chloride.

$C_6H_5CH_2N(CH_3)_3Cl$.

Properties: A quaternary ammonium salt. Colorless crystals; stable up to 135C, above which benzyl chloride and trimethylamine are formed. Properties of 60% solution: d 1.07 (20/20C), wt/gal 8.90 lb, fp

below –50C. Readily soluble in water, ethanol, and butanol; slightly soluble in butyl phthalate and tributyl phosphate.

Grade: 60–62% aqueous solution.

Use: Solvent for cellulose, gelling inhibitor in polyester resins, intermediate.

benzyltrimethylammonium hexafluorophosphate. $C_6H_5CH_2N(CH_3)_3PF_6$.

Properties: Crystals. Mp 160C.

Hazard: Toxic by ingestion, irritant to skin.

4-benzyltrimethylammonium methoxide.

$C_6H_5CH_2(CH_3)_3NOCH_3$.

Properties: A quaternary ammonium salt. Yellow liquid; decomposes on distillation.

Hazard: Toxic by ingestion, irritant to skin.

Use: Catalyst, organic-soluble strong base.

“Benzyl Tuex” [Uniroyal]. TM for tetrabenzoylthiuram disulfide.

benzynes. C_6H_4 .

Properties: An unsaturated, cyclic hydrocarbon with a structure similar to benzene, in which one of the double bonds is replaced by a triple bond. It may be prepared from benzenediazonium-2-carboxylate or from isatoic anhydride.

bepridil hydrochloride monohydrate. See 3-isobutoxy-2-pyrrolidino-*n*-phenyl-*n*-benzylpropylamine.

berberine. $C_{20}H_{19}NO_5$.

Properties: White to yellow crystals. Mp 145C (anhydrous). Insoluble in water; soluble in ether, alcohol. Salts of berberine are: berberine bisulfate, berberine sulfate, and berberine hydrochloride. All three are yellow crystals, slightly soluble in water.

Derivation: From the root of *Berberis vulgaris* or *Hydrastis canadensis*.

Hazard: Toxic via ingestion, inhalation, skin absorption.

Use: Medicine (antipyretic).

“Berbond 8200” [Bercen]. TM for a strippable wallpaper saturant.

Use: In many paper manufacturing areas.

“Bercohem 4842” [Bercen]. TM for a low molecular weight polyacrylate-based dispersant.

Use: For pigmented paper coating formulations.

bergamot oil.

Properties: An essential oil. Brownish-yellow to green liquid; agreeable odor; bitter taste.

Use: Perfumery.

Bergius, Frederick. (1884–1949). A German chemist who won a Nobel Prize in 1931 with Bosch for chemical high-pressure methods. He invented a method of converting coal dust into oil via pressur-

ized hydrogen. He also invented a method for production of cattle feed and sugar from wood by hydrolysis. He was educated in Poland and Germany.

Bergius process. Formation of petroleum-like hydrocarbons by hydrogenation of coal at high temperatures and pressures (e.g., 450C and 300 atm) with or without catalysts; production of toluene by subjecting aromatic naphthas to cracking temperatures at 100 atm with a low partial pressure of hydrogen in the presence of a catalyst.

Bergius-Willstatter saccharification process. Process for industrial production of fermentable sugar from wood by hydrolysis of tannin and xylan-free cellulose with 40–45% hydrochloric acid. The use of concentrated acid requires acid-resistant equipment and recovery of acid. The sugar produced must be rehydrolyzed prior to fermentation.

Bergmann azlactone peptide synthesis.

Conversion of an acetylated amino acid and an aldehyde into an azlactone with an alkylene side chain; reaction with a second amino acid with ring opening and formation of an acylated unsaturated dipeptide, followed by catalytic hydrogenation and hydrolysis to the dipeptide.

Bergmann degradation. Stepwise degradation of polypeptides involving benzylation, conversion to azides, and treatment of the azides with benzyl alcohol; this treatment yields, via rearrangement to isocyanates, carbobenzoxy compounds which undergo catalytic hydrogenation and hydrolysis to the amide of the degraded peptide.

Bergmann-Zervas carbobenzoxy method.

Formation of the *N*-carbobenzoxy derivative of an amino acid for use in peptide synthesis and liberation of the amino group at an appropriate stage of synthesis by hydrogenolysis of the activated CO bond.

Berg, Paul. (1926–). An American molecular biologist who won the Nobel Prize for chemistry in 1980 with Sanger and Gilbert. Berg's research concerned the biochemistry of nucleic acid, particularly regarding recombinant DNA, that is combining a molecule DNA's from different species. His Doctorate was attained at Western Reserve, and later he performed research at Stanford University.

berkelium. Bk. Synthetic radioactive element with atomic number 97, first produced (1949) as the 243 isotope by bombarding americium with helium ions in a cyclotron. The chemical properties of berkelium have been studied by tracer techniques and are similar to those of the other transuranium elements. Its oxidation behavior is similar to that of the rare earth cerium. It has a mp of 986C. There are 8 isotopes ranging from 243 to 250; the 249 isotope

has been made by neutron bombardment of curium 244. Atomic weight is generally accepted as 249. The following compounds have been identified by X-ray diffraction: berkelium dioxide (BkO₂), berkelium sesquioxide (Bk₂O₃), berkelium trifluoride (BkF₃), berkelium trichloride (BkCl₃), and berkelium oxychloride (BkOCl).

Berlin blue. Any of a number of the varieties of iron blue pigments.
See iron blue.

Berlin red. A red pigment consisting, essentially, of red-iron oxide.

“Bersize 6125” [Bercen]. TM for a surface size for paper and paperboard.

Use: To give a good printing surface to fine papers.

Berthelot, M. P. (1827–1917). A French chemist who did fundamental work on the organic synthesis of hydrocarbons, fats, and carbohydrates. Opposed the then current idea that a “vital force” is responsible for synthesis. Did important work on explosives for French government. He was one of the first to prove that all chemical phenomena depend on physical forces that can be measured.

bertholite. A name given to chlorine when used as a poison gas.

Berthollet, Claude Louis. (1748–1822). A French chemist. Followed Lavoisier, but did not accept the latter's contention that oxygen is the characteristic constituent of acids. He was the first to propose chlorine as a bleaching agent. His essay on chemical physics (1803) was the first attempt to explain this subject. His speculations on stoichiometry, especially as regards relative masses of reacting atoms, profoundly affected later theories of chemical affinity.

beryl. Be₃Al₂(SiO₃)₆. Sometimes with replacement of beryllium by sodium, lithium, cesium. A natural silicate of beryllium and aluminum.

Hazard: A known carcinogen (OSHA).
See beryllium.

beryllia. See beryllium oxide.

beryllides. Intermetallic compounds made by chemically combining beryllium with such metals as zirconium and tantalum.

beryllium.

CAS: 7440-41-7. Be. Metallic element of atomic number 4, group IIA of the periodic table; aw 9.0121; valence 2; no stable isotopes.

Properties: A hard, brittle, gray-white metal. D 1.85, mp 1280C. Soluble in acids (except nitric) and alkalis. Resistant to oxidation at ordinary temperatures. High heat capacity and thermal conductivity. It is

the lightest structural metal known; can be fabricated by rolling, forging, and machining. Joining is chiefly by shrink-fitting; brazing and welding are difficult. Highly permeable to X rays.

Occurrence: Beryl, the ore of beryllium, is found chiefly in South Africa, Zimbabwe, Brazil, Argentina, and India. Principal sources in U.S. are Colorado, Maine, New Hampshire, and South Dakota. There are undeveloped deposits in Canada.

Derivation: The ore is converted to the oxide or hydroxide, then to the chloride or fluoride. The halide may be (1) reduced in a furnace by magnesium metal, or (2) reduced by electrolysis. Liquid-liquid extraction with an organophosphate chelating agent can be used as a method of purification, or as an alternative process on the ore itself.

Grade: Technical, over 99.5% pure.

Available forms: Hot-pressed or cold-pressed and sintered blocks; sheet (0.04 inch); tube; rods; wire; powder.

Hazard: A carcinogen (OSHA). Very high toxicity, especially by inhalation of dust. TLV: 0.002 mg/m³.

Use: Structural material in space technology; moderator and reflector of neutrons in nuclear reactors; source of neutrons when bombarded with α -particles; special windows for X ray tubes; in gyroscopes, computer parts, inertial guidance systems; additive in solid-propellant rocket fuels; beryllium-copper alloys.

beryllium acetate.

CAS: 543-81-7. Be₄O(C₂H₃O₂)₆.

Properties: White crystals. Mp 285–286C, bp 330–331C. Insoluble in water; hydrolyzed by hot water, dilute acids. Soluble in chloroform and other organic solvents. Can be crystallized from hot acetic acid in very pure form.

Hazard: Toxic by inhalation and ingestion.

Use: Source of pure beryllium salts.

See beryllium.

beryllium acetylacetonate. Be(C₅H₇O₂)₂.

Properties: Crystalline powder. Mp 108C, bp 270C. Freely soluble in alcohol and ether; slightly soluble in water. Resistant to hydrolysis. A chelating non-ionizing compound.

Hazard: Toxic.

See beryllium.

beryllium carbide. Be₂C.

Properties: Fine, hexagonal, hard, refractory crystals; attacked vigorously by strong, hot alkali solutions forming methane gas and alkali beryllate. D 1.91; decomposes above 2100C.

Derivation: By direct interaction of elemental beryllium and carbon; by reduction of beryllium oxide with carbon above 1500C.

Use: Nuclear-reactor cores.

beryllium chloride.

CAS: 7787-47-5. BeCl₂.

Properties: White or slightly yellow deliquescent

crystals; sweetish taste. Mp 440C, bp 520C, d 1.90. Very soluble in water; soluble in alcohol, benzene, ether, carbon disulfide. Readily hydrolyzed.

Derivation: By passing chlorine over a mixture of beryllium oxide and carbon.

Hazard: Very toxic.

Use: In dry form, as catalyst for organic reactions. See beryllium.

beryllium-copper. A precipitation-hardenable alloy; often also contains nickel or cobalt and has relatively high electrical conductivity, high strength, and high hardness.

Properties: D 8.22. Tensile strength of heat-treated sheet 175,000 psi, elongation 5% in 2 inches; Brinell hardness 350; good electrical conductivity. Typical analysis: copper 97.4; beryllium 2.25; nickel 0.35.

Hazard: Avoid inhalation.

See beryllium.

Use: Electrical switch parts, watch springs, optical alloys, electronic equipment, valves and parts, spot-welding electrodes, nonsparking tools, springs and diaphragms, shims, cams, and bushings.

Note: A comparatively recent development is an 85 copper, 9 nickel, 6 tin alloy reported to be 15% stronger than Be-Cu.

beryllium fluoride. BeF₂.

Properties: Hygroscopic solid. Mp 800C, d 1.986. Readily soluble in water; sparingly soluble in alcohol.

Derivation: By the thermal decomposition (900–950C) of ammonium beryllium fluoride.

Hazard: A known carcinogen. Toxic by inhalation and ingestion. TLV: 2.5 mg(F)/m³.

Use: Production of beryllium metal by reduction with magnesium metal; nuclear reactors; glass manufacturing.

beryllium hydrate. See beryllium hydroxide.

beryllium hydride. BeH₂.

Properties: White solid. Reacts with water, dilute acids, and methanol, liberating hydrogen. When heated to 220C it liberates hydrogen rapidly.

Hazard: For toxicity see beryllium. Fire risk when exposed to water, organic materials, and heat.

Use: Experimentally in rocket fuels.

beryllium hydroxide. (beryllium hydrate).

CAS: 13327-32-7. Be(OH)₂.

Properties: White powder. Decomposes to the oxide at 138C. Soluble in acids and alkalies; insoluble in water.

Derivation: By precipitation with alkali from pure beryllium acetate.

Grade: Technical.

Hazard: Very toxic.

See beryllium.

beryllium metaphosphate. Be(PO₃)₂.

Properties: White porous powder or granular material. High melting point. Insoluble in water.

Hazard: Very toxic.

Use: Raw material for special ceramic compositions; catalyst carrier.

See beryllium.

beryllium nitrate.

CAS: 13597-99-4. $\text{Be}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White to faintly yellowish, deliquescent mass. Mp 60C, decomposes 100–200C. Soluble in water, alcohol.

Derivation: Action of nitric acid on beryllium oxide, with subsequent evaporation and crystallization; reaction of beryllium sulfate with barium nitrate.

Grade: Technical, CP.

Use: Chemical reagent, gas-mantle hardener.

Hazard: Very toxic. Oxidizing material, dangerous fire risk.

See beryllium.

beryllium nitride. Be_3N_2 .

Properties: Hard, refractory, white crystals. Mp 2200C, reacts with mineral acids to form the corresponding salts of beryllium and ammonia. Readily attacked by strong alkali solutions, liberating ammonia.

Derivation: By heating beryllium metal powder in a dry, oxygen-free nitrogen atmosphere at 700–1400C.

Use: Atomic energy, production of the radioactive carbon isotope ^{14}C for tracer uses.

See beryllium.

beryllium oxide. (beryllia).

CAS: 1304-56-9. BeO .

Properties: White powder. A unique ceramic material. D 3.016, mp 2570C. Hardness (Mohs) 9. Soluble in acids and alkalis; insoluble in water. High electrical resistivity and thermal conductivity; transparent to microwave radiation; undamaged by nuclear radiation. High heat-stress resistance. Can be fabricated into finished shapes.

Derivation: By heating beryllium nitrate or hydroxide.

Grade: Technical, CP, pure, single crystals.

Hazard: Highly toxic by inhalation. Keep container tightly closed and flush out after use.

Use: Electron tubes; resistor cores; windows in klystron tubes; transistor mountings; high-temperature reactor systems; additive to glass, ceramics, and plastics; preparation of beryllium compounds; catalyst for organic reactions.

See beryllium.

beryllium potassium fluoride. (potassium beryllium fluoride). $\text{BeF}_2 \cdot 2\text{KF}$.

Properties: White, crystalline masses. Soluble in water; insoluble in alcohol.

Hazard: Toxic by inhalation and ingestion. TLV: 2.5 mg(F)/m³.

beryllium potassium sulfate. $\text{BeSO}_4 \cdot \text{K}_2\text{SO}_4$.

Properties: Shiny crystals, insoluble in alcohol, soluble in water and concentrated potassium sulfate solution.

Use: Metal plating especially chromium and silver.

Hazard: See beryllium.

See beryllium.

beryllium sodium fluoride. (sodium beryllium fluoride). $\text{BeF}_2 \cdot 2\text{NaF}$.

Properties: White, crystalline mass. Mp approximately 350C. Soluble in water.

Hazard: Toxic by inhalation and ingestion. TLV: 2.5 mg(F)/m³.

Use: Making pure beryllium metal.

beryllium sulfate.

CAS: 13510-49-1. $\text{BeSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals. D 1.713, decomposes at 540C. Soluble in water; insoluble in alcohol.

Hazard: A carcinogen (OSHA). TLV: 0.002 (Be)mg/m³; Confirmed Human Carcinogen

See beryllium.

Berzelius, J. J. (1779–1848). A native of Sweden, Berzelius was one of the foremost chemists of the 19th century. He made many contributions to both fundamental and applied chemistry; coined the words *isomer* and *catalyst*; classified minerals by chemical compound; recognized organic radicals which maintain their identity in a series of reactions; discovered selenium and thorium, and isolated silicon, titanium, and zirconium; did pioneer work with solutions of proteinaceous materials which he recognized as being different from “true” solutions.

“**Be Square**” [*Baker Petrolite*]. TM for a hard or plastic grade of petroleum microcrystalline wax.

Bessel function. Solution of the Bessel’s equation.

Bessel’s equation. Linear differential equation $x^2y'' + xy' + (x^2 - n^2)y = 0$, whose solutions are expressible as power series in x .

Bessonoff’s reagent. (phospho-tungstic-phosphomolybdic acid). It gives a deep blue reaction with ascorbic acid.

Use: For the detection of ascorbic acid.

Best, Charles H. (1899–1978). Born in Maine, Best was educated at the University of Toronto, where he distinguished himself as a student of biochemistry. He collaborated with the late Dr. Frederick Banting in the isolation of the hormone insulin. He later became head of the insulin division of the Connaught Laboratories of the University as well as of the Banting and Best Research Institute. He also developed histaminase (an antiallergic enzyme) and

the anticoagulant heparin.
See Banting, Sir Frederick.

beta. (β). A prefix having meanings analogous to those of α .

(1) It indicates (a) the position of a substituent atom or radical in a compound; (b) the second position in a naphthalene ring; or (c) the attachment of a chemical unit to the side chain of an aromatic compound.

(2) It refers to a secondary allotropic modification of a metal or compound.

(3) It designates a type of radioactive decay. See beta particle.

beta battery. Alternative name for the sodium-sulfur battery under development.
See storage battery; electrolyte.

betaine hydrochloride. (lysine hydrochloride).

CAS: 107-43-7. $C_5H_{11}O_2N \cdot HCl$.

Properties: Colorless crystals. Mp 227–228C (decomposes). Soluble in water and alcohol; insoluble in chloroform and ether. Aqueous solutions are strongly acid. Liberates hydrogen chloride at the mp.

Grade: Technical.

Use: Source of hydrogen chloride in solders and fluxes, organic synthesis.

betaine phosphate. $C_5H_{11}O_2N \cdot H_3PO_4$.

Properties: White, odorless granules; acid taste. Mp 198–200C. Very soluble in water.

Grade: Technical.

Use: Source of phosphoric acid.

“Betanox” Special [Uniroyal]. TM for low-temperature reaction product of phenyl- β -naphthylamine and acetone.

Properties: Tan powder. D 1.16, mp above 120C. Soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Use: Antioxidant for wire insulation, tire treads, tire carcass, inner tubes, dark-colored footwear, proofing, and mechanical goods.

beta particle. (β particle). A charged particle emitted from a radioactive atomic nucleus either natural or manufactured. The energies of β particles range from 0 to 4 MeV. They carry a single charge; if this is negative, the particle is identical with an electron; if positive, it is a positron. β -rays (streams of these particles) may cause skin burns and are harmful within the body. Protection to the skin can be afforded by a thin sheet of metal.

See electron; decay; radioactive.

“Betaprene” [Reichhold]. TM for olefinic hydrocarbon resins used as coating vehicles.

betatron. An electromagnetic device for accelerating electrons (β particles). Its action is similar in

principle to that of an electric transformer in which the secondary windings are replaced with focusing magnets. The electrons travel around the core in a vacuum tube placed between the magnets. At each revolution around the core the electrons pick up the same energy as the voltage that would have been induced in one turn of wire at that point. The betatron can generate electron beams up to 320 MeV. Invented by D. W. Kerst in 1940, it is used chiefly for basic physical research.

Bethanizing. The process of electrodepositing very pure zinc on iron or steel.

Bettendorf’s reagent. A reagent used for the detection of arsenic in presence of bismuth and antimony compounds. It consists of a concentrated solution of stannous chloride in fuming hydrochloric acid.

Hazard: Powerful tissue irritant.

“Better Locks Lite Almond Conditioner” [Afrocare]. TM for a hair treatment.

Use: Adds sheen, softens, and absorbs oils.

Betterton-Kroll process. A process for obtaining bismuth and purifying desilverized lead that contains bismuth. Metallic calcium or magnesium is added to the molten lead to cause formation of high-melting intermetallic compounds with bismuth. These separate as a surface scum and are skimmed off. The excess calcium and magnesium are removed from the lead by use of chlorine gas as mixed molten chlorides of lead or zinc. Bismuth of 99.995% purity is produced in this way.

Betti reaction. The reaction of aromatic aldehydes, primary aromatic or heterocyclic amines, and phenols leading to α -aminobenzylphenols.

Betts process. An electrolytic process for removing impurities from lead in which pure lead is deposited on a thin cathode of pure lead from an anode containing as much as 10% of silver, gold, bismuth, copper, antimony, arsenic, selenium, and other impurities. The electrolyte is lead fluosilicate and fluosilicic acid. The scrap anodes and the residues of impurities associated with them are either recast into anodes or treated to recover antimony lead, silver, gold, bismuth, etc.

betula oil. See methyl salicylate.

“Beutene” [Uniroyal]. TM for a butyraldehyde-aniline reaction product.

Properties: Reddish-brown, free-flowing liquid. D 0.95. Soluble in acetone, benzene, and ethylene dichloride; slightly soluble in gasoline; insoluble in water.

Use: Rubber accelerator.

bevantolol hydrochloride.CAS: 42864-78-8. mf: $C_{20}H_{27}NO_4 \cdot ClH$.**Hazard:** Moderately toxic by ingestion.**BFE.** Abbreviation for bromotrifluoroethylene.**BF₃-ether complex.** See boron trifluoride etherate.**BFI powder.** Proprietary preparation of bis-muth formic iodide.**Use:** Skin antiseptic.**BF₃-MEA.** See boron trifluoride monoethylamine.**BF₃MeOH.** See boron trifluoride-methanol.**BFPO.** Abbreviation for bis(dimethylamino) fluorophosphine oxide.
See dimefox.**Bh.** Symbol for bohrium.**BHA.** Abbreviation for butylated hydroxyanisole.**BHC.** Abbreviation for benzene hexachloride.**BHMT amine.** $NH_2(CH_2)_6NH(CH_2)_6NH_2$. A liquid polyalkylene polyamine.
Use: In asphalt additives and corrosive inhibitors.**BHN.** Brinell hardness number.**BHT.** Abbreviation for butylated hydroxytoluene.
See 2,6-di-*tert*-butyl-*p*-cresol.**Bi.** Symbol for bismuth.**bi-.** Prefix meaning two; di- is preferred in chemical nomenclature. Exceptions are bicarbonate, bisulfate, bitartrate, in which it indicates the presence of hydrogen in the molecule, e.g., $NaHCO_3$ (sodium bicarbonate).
See bis-.**bibenzyl.** See *sym*-diphenylethane.**bicalcium phosphate.** See calcium phosphate, dibasic.**bicarburetted hydrogen.** See ethylene.**2,2'-bichavicol.**CAS: 528-43-8. mf: $C_{18}H_{18}O_2$.**Hazard:** Moderately toxic by ingestion.**Source:** Natural product.**bicyclic.** An organic compound in which only two ring structures occur. They may or may not be the

same type of ring.

See naphthalene.

bicyclobutylidene.CAS: 6708-14-1. mf: C_8H_{12} .**Hazard:** Moderately toxic by ingestion and inhalation.**bicyclohexyl.** (dicyclohexyl). $C_{12}H_{22}$.**Properties:** Colorless, mobile liquid with pleasant odor. Bp 238.5C, fp 1-3C, d 0.883 (25/16C), wt/gal 7.37 lb, refr index 1.480 (20C), flash p 165F (73.9C), autoign temp 471F (244C). Combustible.**Derivation:** Hydrogenation of diphenyl.**Use:** High-boiling solvent and penetrant.**"Bidrin" [Shell].** (TM for dimethyl phosphate of 3-hydroxy-*N,N*-dimethyl-*cis*-crotonamide; dicrotophos).

CAS: 141-66-2.

 $(CH_3O)_2P(O)OC(CH_3)_2CHC(O)N(CH_3)_2$.**Properties:** Brown liquid with a mild ester odor. Bp 400C. Miscible with water and xylene; slightly soluble in kerosene and diesel fuel. Commercially available water-miscible solution.**Hazard:** Cholinesterase inhibitor. TLV: 0.25 mg/m³. Toxic by skin absorption.**Use:** Insecticide.**biformin.** $C_9H_8O_2$. An antibiotic produced by the fungus *Polyporus biformis*, reported to be active against various bacteria and fungi.**biformylchlorazin.** See triforine.**Biginelli reaction.** Synthesis of tetrahydropyrimidinones by the acid-catalyzed condensation of an aldehyde, a β -keto ester, and urea.**"B-I-K" [Uniroyl].** TM for a surface-coated urea.**Properties:** White powder. D 1.32, melting range 129-134C. Soluble in water. Surface coating not soluble in water but soluble in rubber. Slightly soluble in acetone; insoluble in benzene, gasoline, and ethylene dichloride.**Use:** Promoter for azodicarbonamide, a nitrogen blowing agent; activator for thiazoles, sulfenamides, and thiurams; odor reducer when used with nitrosoamine-type blowing agents.**bilayer.** A double layer of amphipathic lipid molecules that orient themselves so the hydrocarbon tails face inward to form a continuous nonpolar phase, and the polar head groups face outward. In this way, they form the basic structure of membranes.**bile acid.** An acid found in bile (secretion of the liver). Bile acids are steroids having a hydroxyl group and a five-carbon-atom side chain terminating in a carboxyl group. Cholic acid is the most

abundant bile acid in human bile. Others are deoxycholic and lithocholic acids. The bile acids do not occur free in bile but are linked to the amino acids glycine and taurine. These conjugated acids are water soluble. Their salts are powerful detergents and as such aid in the absorption of fats from the intestine.

bile salts. Sodium salts of glycocholic and taurocholic acids important for physiological fat absorption.

bilirubin. (bilifulvin). $C_{33}H_{36}O_6N_4$. Red coloring matter of bile. Also occurs in blood serum as decomposition product of hemoglobin.

Properties: Orange-red powder. Mp 192C. Soluble in acids, alkalis, chloroform, and benzene; insoluble in water; very slightly soluble in alcohol and ether.

Derivation: From bile pigment.

Use: Analytical chemistry, biochemical research.

bimetal. A type of thermometer in which the sensing element consists of two thin strips of metals having different expansion coefficients bonded together in a helical or spiral structure. The extent of deflection or bending induced by temperature change is indicated by a pointer on a dial. Reasonably accurate readings are obtained in this way, the range being from -185 to 425 C. Bimetals are used in both laboratory and industry.

See thermometer.

binapacryl. Generic name for 2-*sec*-butyl-4,6-dinitrophenyl-3-methyl-2-butenolate. $C_{15}H_8O_6N_2$.

Hazard: Toxic by ingestion and inhalation.

Use: Acaricide and fungicide.

binary. Descriptive of a system containing two and only two components. Such a system may be a chemical compound composed of two elements, an element and a group (hydroxyl, methyl, etc.), or two groups, (e.g., oxalic acid). It may also be a two-component solution or alloy.

binary acid. An acid containing no oxygen, e.g., hydrofluoric acid.

binary alloy. Alloy containing two major elements, exclusive of impurities.

binary diagram. Constitution diagram for a binary metal alloy system.

bind. To exert a strong physiochemical attraction, as often occurs between various proteins and water in hydrophilic gels, between organic dyes and fabrics, or between acids or bases and various chemical complexes.

binder. (1) The film-forming ingredient in paint, usually either a drying oil or a polymeric substance.

(2) In the food industry, a material used in sausage manufacture that absorbs moisture at high temperatures, e.g., various flours, dried milk, and soy protein. (3) Any cementitious material that is soft at high temperatures and hard at room temperature, used to hold dry powders or aggregate together, e.g., asphalt and sulfur in paving compositions, and resins used in sand casting.

See paint.

binding energy. The energy that holds the protons together in an atomic nucleus. Since protons are positively charged, they exert strong mutually repulsive forces and tremendous energy is required to keep them from flying apart. This energy is so great that it results in a slightly lower value for the mass of a nucleus taken as a whole than for the sum of its constituents taken individually. This phenomenon is of vast significance, for it means that a small fraction of mass has been converted into energy within the nucleus, as shown by Einstein's equivalence equation $E = mc^2$. Thus, when a ^{235}U nucleus (92 protons) is split, as in the fission process, a portion of its binding energy (equivalent to the mass difference) is released. It amounts to approximately 200 million electron volts per nucleus. Binding energy may also be defined as the minimum energy required to dissociate a nucleus into its component neutrons and protons. The neutron or proton binding energy is that required to remove a neutron or a proton from a nucleus; the electron binding energy is that required to remove an electron from an atom or molecule. See mass defect; fission.

binding site. A place on cellular DNA to which a protein (such as a transcription factor) can bind. Binding sites may be found in the vicinity of genes and are involved in activating transcription of that gene (promoter elements), in enhancing the transcription of that gene (enhancer elements), or in reducing the transcription of that gene (silencers). *Note:* Whether the protein in fact performs these functions may depend on some condition, such as the presence of a hormone, or the tissue in which the gene is being examined. Binding sites could also be involved in the regulation of chromosome structure or of DNA replication.

Bingham body. Fluid that does not exhibit Newtonian flow, but moves in plugs.

Bingham plastic. Substance that will not flow until its yield value is reached, then will flow normally.

"Bioactive" [Scott]. TM for wine additive. **Use:** Enhances yeast survival.

"Bioban" [Angus]. TM for monocyclic oxazolines.

Grade: Industrial.

Available forms: Liquid.

Use: Antimicrobial, preservative for coating formulations, latexes, emulsions, oil recovery, and metal-working fluids.

“Bio-Care” [Dow]. TM for hyaluronic acid.

Use: Conditioner for hair and skin.

“Biocheck” [Nalco]. TM for a family of biocides, fungicides, and slimicides.

Use: Controlling and eliminating microbiological growth in pulp- and paper-mill water systems as well as for antibacterial papers.

biochemical oxygen demand. (BOD). A standardized means of estimating the degree of contamination of water supplies, especially those that receive contamination from sewage and industrial wastes. It is expressed as the quantity of dissolved oxygen (in mg/L) required during stabilization of the decomposable organic matter by aerobic biochemical action. Determination of this quantity is accomplished by diluting suitable portions of the sample with water saturated with oxygen and measuring the dissolved oxygen in the mixture both immediately and after a period of incubation, usually five days.

See sewage sludge; biodegradability; dissolved oxygen (DO); oxygen consumed.

biochemistry. Originally a subdivision of chemistry but now an independent science, biochemistry includes all aspects of chemistry that apply to living organisms. Thus, photochemistry is directly involved with photosynthesis, and physical chemistry with osmosis—two phenomena that underlie all plant and animal life. Other important chemical mechanisms that apply directly to living organisms are catalysis, which takes place in biochemical systems by the agency of enzymes; nucleic acid and protein constitution and behavior, which are known to control the mechanism of genetics; colloid chemistry, which deals in part with the nature of cell walls, muscles, collagen, etc.; acid-base relations, involved in the pH of body fluids; and such nutritional components as amino acids, fats, carbohydrates, minerals, lipids, and vitamins, all of which are essential to life. The chemical organization and reproductive behavior of microorganisms (bacteria and viruses) and a large part of agricultural chemistry are also included in biochemistry. Particularly active areas of biochemistry are nucleic acids, cell surfaces (membranes), enzymology, peptide hormones, molecular biology, and recombinant DNA. See biotechnology.

biochrome. The colored matter that can be extracted from plants or animals.

biocide. General name for any substance that kills or inhibits the growth of microorganisms such as bacteria, molds, slimes, fungi, etc. Many of them are also toxic to humans. Biocidal chemicals include

chlorinated hydrocarbons, organometallics, halogen-releasing compounds, metallic salts, organic sulfur compounds, quaternary ammonium compounds, and phenolics.

See antiseptic; disinfectant; fungicide; bactericide.

biocolloid. An aqueous colloidal suspension or dispersion produced by or within a living organism. Blood, milk, and egg yolk are examples.

biocomputer. A computer in which the silicon in the microchips is replaced by a synthetic protein or polypeptide coated with a silver compound, the combination behaving as a metallic semiconductor. Such chips have been made experimentally; they have the potential of improving the storage capacity and operating efficiency of silicon chips substantially. The materials used in the experimental chips were polylysine on a glass substrate coated with an acrylate polymer and treated with silver nitrate.

bioconversion. Utilization of animal manures, garbage, and similar organic wastes for production of fuel gases by digestion, gasification, or liquefaction.

See biogas; biomass.

biocytin. (ϵ -*N*-biotinyl-*l*-lysine). $C_{16}H_{28}N_4O_4S$.

Properties: A naturally occurring complex of biotin isolated from yeast. Mp 228.5°C. Water-soluble crystals. The molecule arising from covalent attachment of biotin to a Lys residue via an amide linkage.

biodegradability. The susceptibility of a substance to decomposition by microorganisms, specifically the rate at which detergents and pesticides and other compounds may be chemically broken down by bacteria and/or natural environmental factors. Branched-chain alkylbenzene sulfonates (ABS) are much more resistant to such decomposition than are linear alkylbenzene sulfonates (LAS), in which the long, straight alkyl chain is readily attacked by bacteria. If the branching is at the end of a long alkyl chain (isoalkyls), the molecules are about as biodegradable as the normal alkyls. The alcohol sulfate anionic detergents and most of the nonionic detergents are biodegradable. Among pesticides, the organophosphorus types, while highly toxic, are more biodegradable than DDT and its derivatives. Tests on a number of compounds gave results as follows. Easily biodegraded: *n*-propanol, ethanol, benzoic acid, benzaldehyde, ethyl acetate. Less easily biodegraded: ethylene glycol, isopropanol, *o*-cresol, diethylene glycol, pyridine, triethanolamine. Resistant to biodegradation: aniline, methanol, monoethanolamine, methyl ethyl ketone, acetone. Additives that accelerate biodegradation of polyethylene, polystyrene, and other plastics are available.

bioelectrochemistry. Application of the principles and techniques of electrochemistry to biological and medical problems. It includes such surface

and interfacial phenomena as the electrical properties of membrane systems and processes, ion adsorption, enzymatic clotting, transmembrane pH and electrical gradients, protein phosphorylation, cells, and tissues.

bioengineering. Application of the principles and methods of chemical engineering to biotechnology.

bioethics. An interdisciplinary science for which research facilities were established in 1971, encompassing the ethical and social issues resulting from advances in medicine and the biosciences. Its scope includes a number of areas of importance to chemistry, e.g., reproductive and genetic phenomena, organ transplants, gerontology and antiaging techniques, biological warfare, contraception, etc. The Kennedy Institute at Georgetown University, Washington, D.C., is the chief center for information about this developing aspect of biomedical science.

bioflavonoid. A group of naturally occurring substances thought to maintain normal conditions in the walls of the small blood vessels. The bioflavonoids are widely distributed among plants, especially citrus fruits, black currants, and rose hips (hesperidin, rutin, quercetin). They have little or no medicinal value.

biogas. Methane generated from animal manure by bacterial anaerobic digestion. Small-scale units have been in use for some years, and the possibilities of utilizing the tremendous quantities of manure available in the U.S. as an energy source have stimulated investigation of large-scale production. One installation utilizing a thermophilic fermentation technique at 55–60C has been operating in Florida since 1979, and another in Colorado since 1981. This energy source is also being exploited in China and India.
See biomass.

biogenesis. See life, origin.

biogenic sediment. Sediment consisting of mineral grains that were once parts of organisms.

biogeochemistry. A branch of geochemistry dealing with the interactions between living organisms and their mineral environment. It includes, among other studies, the effect of plants on weathering of rocks, of the chemical transformations that produced petroleum and coal, of the concentration of specific elements in vegetation at some time in the geochemical cycle (iodine in sea plants, uranium in some forms of decaying organic matter), and of the organic constituents of fossils.

bioinformatics. The science of managing and analyzing biological data using advanced computing techniques. Especially important in analyzing

genomic research data.
See informatics.

bioinorganic chemistry. Study of the mechanisms involved in the behavior of metal-containing molecules in living organisms, e.g., biological transport of iron, the effect of copper on nucleic acid and nucleoproteins, molybdenum, and manganese complexes, etc.

biological availability. Blood level or similar tests that establish a significant concentration of a drug in the bloodstream or other body systems where its presence is understood to be effective.

biologicals. Medical products produced from living organisms or their products. These include antigens, antitoxins, serums, and vaccines.

biological stain. A dye for determining microscopic structure of cells and tissues. The usefulness depends on selective adsorption of stain by bacteria or tissue.

bioluminescence. (cold light).
See chemiluminescence.

biomarker. Specific biochemical compounds that are detected within the body, and which have a particular molecular feature that makes it useful for measuring a specific process such as flux through a pathway, the progress of a disease, or the effects of treatment of a disease.

biomass. Any organic source of energy or chemicals that is renewable. Its major components are (1) trees (wood) and all other vegetation; (2) agricultural products and wastes (corn, fruit, garbage ensilage, etc.); (3) algae and other marine plants; (4) metabolic wastes (manure, sewage); and (5) cellulosic urban waste. Conversion of these is performed in several ways: (1) by combustion (heat); (2) by fermentation (alcohol); (3) by gasification (synthesis gas); and (4) by anaerobic digestion (methane). In terms of energy, wood is by far the most important component of biomass. It has become a significant source of industrial heat, e.g., in paper mills and power plants, and intensive cultivation of trees for this purpose is under way. Wood is also a potential source of alcohols; ethyl alcohol is produced from wood on large scale in Brazil as a gasoline substitute. Agricultural wastes are fermented or gasified to synthesis gas; manures and municipal waste yield methane (biogas) on digestion. In 1981, biomass supplied 3.5% of U.S. energy requirements, and this is expected to increase substantially.

biomaterial. Any material suitable for use as a surgical implant within the body to replace or support joints or tissues. Included are such metals as aluminum, stainless steels, titanium, various forms of carbon, and especially plastics (polycarbonate,

polyurethane, nylon, silicones). They have been used successfully in many areas of the body, from hip and knee replacements to mastectomies. They must be compatible with the interior environment, noncorrosive, and nondegradable, and must duplicate as closely as possible the properties of the tissues they replace. A notable breakthrough was made in this field in 1982 when a complete artificial heart was implanted successfully in a living human. Its chief component was polyurethane, the base was aluminum, and the valves were pyrolytic graphite together with polycarbonate and titanium. Other materials under consideration are styrene-butadiene copolymers for the diaphragms. The polyurethane used in the first implanted heart is "Biomer" produced by a division of Johnson & Johnson.

"Biomer" [Johnson & Johnson]. TM for a unique type of polyurethane used in heart implants.

"bioMeT 12" [ATOTECH]. TM for a rodent-repellent coating for cables in which the active ingredient is a mixture of tributyl tin salts. It has proved 95% effective in preventing destruction of telephone cables by rats and other rodents. Flexible, transparent, and effective for six months or more, it is applied mechanically over the plastic cable sheathing. Can also be used to protect other types of wiring, shipping containers, and similar products.

biomimetic chemistry. An interdisciplinary approach to biochemistry including both organic and inorganic aspects of this field. The term means imitation or mimicry of natural organic processes in living systems, and encompasses such subjects as enzyme systems, vitamin B₁₂ and flavins, oxygen binding and activation, bioorganic mechanisms, and nitrogen and small-molecule fixation. The technique was utilized in the synthesis of the bleomycin molecule. A notable example of biomimetic chemistry is the development of model synthetic catalysts that imitate the action of natural enzymes. The behavior of chymotrypsin has been duplicated by a manufactured catalyst that can accelerate certain reaction rates by the incredible factor of 100 billion.

biomineral. A mineral made by biological organisms, characterized by intricate composite microarchitectures.

biophyl. A highly refined form of verxite, consisting of more than 99% pure hydrobiotite (magnesium, iron, aluminum silicate).

Use: In foods and pharmaceuticals.

biopolymer. A water-soluble polymer resulting from the action of bacteria (genus *Xanthomonas*) on carbohydrates. The viscosity is almost as low as that of water. Chromium ion can be added to increase viscosity if desired. Such polymers are being used as viscosity builders in oil-well drilling muds and as thickeners and gel-strength additives in aqueous

media.

See fermentation.

biopterin. An enzymatic cofactor derived from pterin and involved in certain oxidation-reduction reactions.

"Biore" [Kao]. TM for a marshmallow whip facial foam.

bioremediation. The use of biological organisms such as plants or microbes to aid in removing hazardous substances from an area.

bioresmethrin. C₂₂H₂₆O₃ A synthetic insecticide of the pyrethrin type. Biodegradable and has low toxicity, it is nonpersistent and can act as a synergist.

biorex.

CAS: 205943-18-6.

mf: C₂₂H₁₉Cl₂NO₃•C₁₉H₃₀O₅•C₈H₁₀•C₅H₉NO•C₄H₆O₃.

Hazard: A poison by ingestion.

biostat. Any product that regulates growth of microorganisms.

biosynthesis. (1) Natural synthesis of organic compounds by plants and animals. For plants, this includes not only photosynthetic formation of carbohydrates and protein synthesis by means of nitrogen-fixing bacteria, but also a wide range of specialized organic compounds that are specific to individual species; many of these are poisonous. Animals and humans synthesize certain amino acids, hormones, cholesterol, etc. Some types (snakes, fish, toads, etc.) synthesize unique and powerful toxic principles.

(2) This term is also applied to such research achievements as synthesis of edible single-cell proteins by fermentation and gene-splicing techniques.

See protein, single-cell; genetic engineering; biotechnology.

biota. A collective term for all the animals and plants of an ecosystem.

biotechnology. A definition prepared by a committee of British scientists in a report issued by the Organization for Economic Cooperation and Development (Paris) may be considered official and definitive. It states that biotechnology is "application of scientific and engineering principles to the processing of any organic or inorganic substance by biological agents to provide goods and services; the biological agents include a wide range of biological catalysts, particularly microorganisms, enzymes, and animal and plant cells." This involves commercial production of chemical compounds from either (1) renewable resources (biomass) or (2) nucleic acids (DNA). Examples of (1) are production of antibiotics, alcohols, and single-cell proteins by fer-

mentation, and of (2) production of insulin, interferon, and synthetic bacteria by gene splicing. Biotechnology constitutes a major worldwide technological revolution, and may prove to be the most important development in the chemical industries since the plastics explosion of the 1930s.

biotin. (vitamin H; 2'-keto-3,4-imidazolido-2-tetrahydrothiophene-*n*-valeric acid). $C_{10}H_{16}N_2O_3S$. Biotin, frequently referred to as a member of the vitamin B complex, is necessary for the maintenance of health in animals and for growth of many microorganisms.

It influences fat metabolism, decarboxylation and carbon dioxide fixation, and deamination of some amino acids. It is closely related metabolically to pantothenic acid and folic acid. A biotin deficiency may be induced by ingestion of avidin, a raw-egg protein, because of the formation of a nonabsorbable biotin-avidin complex. Biotin is synthesized in the intestinal tract of humans; therefore, normally it is not essential in the diet.

Properties: White crystals. Mp 230–232C. Soluble in water and alcohol; insoluble in naphtha and chloroform. Stable to heat, stable in neutral or acid solution, destroyed by strong alkali or oxidizing agents. Amounts are expressed in milligrams or micrograms of biotin.

Source: Egg yolk, kidney, liver, yeast, milk, molasses.

Grade: Practical, FCC.

Use: Medicine, nutrition.

***N*-biotinyl-*l*-lysine.** See biocytin.

biotite. A component of igneous rocks and of soil, similar to mica. It is a silicate of magnesium, iron, potassium, and aluminum.

“Biozan” [Kelco]. TM for welan gum.

biphenol AF. See hexafluoroacetone bisphenol a.

biphenyl. See diphenyl.

***o*-biphenylamine.** See *o*-aminobiphenyl.

***o*-biphenyl biguanide.**

Properties: White to faintly pink powder. Mp greater than 150C on dried material, ash less than 0.5%.

Soluble in alcohol, “Carbitol,” and “Cellosolve”; very slightly soluble in water.

Use: Soap, antioxidant.

2,4'-biphenyldiamine. See 2,4'-diphenyldiamine.

2,4-biphenyldiol.

CAS: 134-52-1. mf: $C_{12}H_{10}O_2$.

Hazard: A poison by skin contact.

2-(4-biphenyl)-5,6-dihydro-*s*-traizolo(5,1-a)isoquinoline.

CAS: 75318-64-8. mf: $C_{22}H_{17}N_3$.

Hazard: Moderately toxic. A reproductive hazard.

(4,4'-biphenylenebis(2-oxoethylene))bis(3-iodopyridinium) dibromide.

CAS: 63906-07-0. mf: $C_{26}H_{20}I_2N_2O_2 \bullet 2Br$.

Hazard: A poison.

4-(2-(1,1'-biphenyl)-4-ylethoxy)quinazoline.

CAS: 124428-11-1. mf: $C_{22}H_{18}N_2O$.

Hazard: Moderately toxic by ingestion. A reproductive hazard.

(2-biphenyloxy)tributyltin.

CAS: 3644-37-9. mf: $C_{24}H_{37}OSn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

α -(4-biphenyloxy)propionic acid.

CAS: 5555-13-5. mf: $C_{15}H_{14}O_3$.

Hazard: A poison.

((2-biphenyloxy)tributyl)stannane. See (2-biphenyloxy)tributyltin.

2-(4-biphenyl)-5h-*s*-triazolo(5,1-a)isoindole.

CAS: 75318-65-9. mf: $C_{21}H_{15}N_3$.

Hazard: Moderately toxic. A reproductive hazard.

Birch reduction. Reduction of aromatic rings by means of alkali metals in liquid ammonia to give mainly unconjugated dihydro derivatives.

birefringent. Descriptive of a type of crystal that separates an impinging light ray into two components that are polarized at right angles to each other; as a result, two images appear, each of which is caused by a light ray vibrating in only one direction (plane-polarized light). Such anisotropic crystals (e.g., Iceland spar) are used in nicol prisms. See nicol; anisotropic.

birth defect. Any harmful trait, physical or biochemical, present at birth, whether a result of a genetic mutation or of some other nongenetic factor. See congenital; gene; mutation; syndrome.

bis-. Prefix meaning "twice" or "again." Used in chemical nomenclature to indicate that a chemical grouping or radical occurs twice in a molecule, e.g., bisphenol A, where two phenolic groups appear: $(\text{CH}_3)_2\text{C}(\text{C}_6\text{H}_5\text{OH})_2$.

***N,N*-bisacetoxethylaniline.**

Grade: Brown liquid.

Hazard: Combustible.

Use: Coupling agent for disperse dyes for synthetic fibers.

bis(acetoxydibutylstannane) oxide.

CAS: 5967-09-9. mf: $\text{C}_{20}\text{H}_{42}\text{O}_5\text{Sn}_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

2,2-bis(acetoxymethyl)propyl acetate.

$\text{CH}_3\text{C}(\text{CH}_2\text{OOCCH}_3)_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid. Refr index 1.4359 (20C).

Use: As a plasticizer.

2,3-bis(acetoxymethyl)quinoxaline di-*n*-oxide. See quinoxidine.

1,5-bis(4-aldoximinopyridinium)diethylether bibromide. See 1,1'-(oxydiethylene)bis(4-formylpyridinium bromide), dioxime.

bisamides. General formula RCONHR'NHCOR.

Properties: When R and R' have high molecular weight, they are hard, light-colored waxes.

bis(2-aminoethyl)sulfide. $(\text{H}_2\text{NCH}_2\text{CH}_2)_2\text{S}$.

An ethyleneimine derivative.

Properties: Colorless liquid. Fp 2.6C, bp 238C, d 8.7 lb/gal, refr index 1.5277, flash p 246F (118.9C). Very soluble in water, benzene, and ethanol. Combustible.

Use: See ethyleneimine.

bis(4-amino-3-methylcyclohexyl)methane.

CAS: 6864-37-5. mf: $\text{C}_{15}\text{H}_{30}\text{N}_2$.

Hazard: Moderately toxic by inhalation.

1,4-bis(3-aminopropoxy)butane.

CAS: 7300-34-7. mf: $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_2$.

Hazard: A poison by skin contact. Moderately toxic by ingestion and inhalation.

***N,N*-bis(3-aminopropyl)methylamine.**

$\text{CH}_3\text{N}(\text{C}_3\text{H}_6\text{NH}_2)_2$.

Properties: Liquid. D 0.9307 (20/20C), bp 240C, fp -29.6C, flash p 220F (104.4C). Miscible with water. Combustible.

Hazard: Irritant.

Use: Chemical intermediate.

bis(3-aminopropyl)methylamine-epichlorohydrin copolymer. See epichloro-

rohydrin-bis(3-aminopropyl)methylamine copolymer.

1,3-bis(2-benzothiazolylmercaptomethyl)urea.

$(\text{C}_6\text{H}_4\text{NCS}\cdot\text{SCH}_2\text{NH})_2\text{CO}$.

Properties: Buff to light tan powder. Mp 220C, d 1.38 (25C).

Use: Rubber accelerator.

***p*-bis[2-(5-*p*-biphenyloxadiazoyl)]benzene.**

(BOPOB). $\text{C}_{36}\text{H}_{25}\text{O}_2\text{N}_2$.

Properties: Shiny, yellow flakes. Mp 327-328C, fluorescence peak 4400 Å. Sparingly soluble in toluene.

Grade: Purified.

Use: Scintillation counter, wavelength shifter in liquid scintillators.

2,2-bis(*p*-bromophenyl)-1,1,1-trichloroethane. $\text{C}_{14}\text{H}_9\text{Br}_2\text{Cl}_3$. The bromine analog of DDT.

Hazard: Toxic by ingestion.

Use: Insecticide.

bis(butoxymaleoyloxy)dibutylstannane.

CAS: 15546-16-4. mf: $\text{C}_{24}\text{H}_{40}\text{O}_8\text{Sn}$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(butoxymaleoyloxy)dioctylstannane.

CAS: 29575-02-8. mf: $\text{C}_{32}\text{H}_{56}\text{O}_8\text{Sn}$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bisaniline-*p*.

CAS: 2616-10-1. mf: $\text{C}_{24}\text{H}_{28}\text{N}_2$.

Hazard: Low toxicity by ingestion and skin contact.

***cis*-bisascorbato(racemic-1,2-diaminocyclohexane)platinum(II) hydrate.**

CAS: 92784-30-0. mf: $\text{C}_{18}\text{H}_{28}\text{N}_2\text{O}_{12}\text{Pt}$.

Properties: IDLH 4 mg/m³ (as Pt).

Hazard: A poison.

bis(*tert*-butylperoxy)-2,5-dimethylhexane.

$\text{C}_{16}\text{H}_{34}\text{O}_4$ A cross-linking agent for polymers.

bis(butylthio)dimethyl stannane. See bis(butylthio)dimethyltin.

bis(butylthio)dimethyltin.

CAS: 1000-40-4. mf: $\text{C}_{16}\text{H}_{34}\text{S}_2\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

2,3-bis(carbomethoxymercapto)quinoxaline.

CAS: 58705-49-0. mf: $\text{C}_{12}\text{H}_{10}\text{N}_2\text{O}_4\text{S}_2$.

Hazard: A poison.

Bischler-Mohlau indole synthesis. Formation of 2-substituted indoles by heating *o*-halogeno-

or *o*-hydroxy-ketones with excess aniline via cyclization of the intermediate 2-arylamino ketone.

Bischler-Napieralski reaction. Cyclodehydration of β -phenethylamides to 3,4-dihydroisoquinoline derivatives by means of condensing agents such as phosphorus pentoxide or zinc chloride.

bis(2-chloroethoxy)methane. See dichloroethyl formal.

4-(((p-(bis(2-chloroethyl)amino)phenyl)imino)methyl)-5-hydroxy-6-methyl-3-pyridinemethanol.

CAS: 79967-32-1. mf: $C_{18}H_{21}Cl_2N_3O_2$.

Hazard: A poison.

5-[bis(2-chloroethyl)amino]uracil. (uracil mustard).

$\text{CONHCONHCHCN}(C_2H_4Cl)_2$.

Properties: A cream-white, odorless, crystalline compound. Moderately soluble in methanol and acetone.

Use: In medicine.

bis(2-chloroethyl) (2-chloroethyl) phosphonate.

CAS: 6294-34-4. mf: $C_6H_{12}Cl_3O_3P$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. Experimental reproductive effects. A mild skin and eye irritant.

Hazard: A reproductive hazard.

9-(2,2-bis(2-chloroethyl)hydrazino)acridine monohydrochloride.

CAS: 29023-83-4. mf: $C_{17}H_{17}Cl_2N_3 \cdot ClH$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

bis(2-chloroethyl) phthalate.

CAS: 6279-87-4. mf: $C_{12}H_{12}Cl_2O_4$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin irritant.

bis(2-chloroethylsulfonylethyl)ether. See 1,1'-(oxybis(methylenesulfonyl))bis(2-chloroethane).

1,1'-bis(chloromercuriferrocene. [1,1-di(chloromercuri)ferrocene]. $(ClHgC_3H_4)_2Fe$.

Use: Inorganic polymers.

bis-1,2-(chloromethoxy)ethane.

CAS: 13483-18-6. mf: $C_4H_8Cl_2O_2$.

Properties: Viscous liquid. Bp: 99–100° @ 22 mm, d: 1.2879 @ 14/15°.

Hazard: Questionable carcinogen.

bis(chloromethyl)ether. (dichloromethyl ether).

CAS: 542-88-1. $(CH_2Cl)O(CH_2Cl)$.

Properties: Reported to form spontaneously from formaldehyde and chloride ions in moist air.

Hazard: A carcinogen. Toxic by ingestion. TLV: 0.001 ppm.

Use: Intermediate for ion-exchange resins; laboratory reagent.

3,3-bis(chloromethyl)oxetane. See "Penton."

bis(p-chlorophenoxy)methane.

$(ClC_6H_4O)_2CH_2$.

Properties: Solid. Mp 65C. Insoluble in water and oils; soluble in ether and acetone.

Use: Acaricide.

2,7-bis(4-chlorophenyl)benzo(lmn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.

CAS: 64005-91-0. mf: $C_{26}H_{12}Cl_2N_2O_4$.

Hazard: A poison.

2,2-bis(p-chlorophenyl)-1,1-dichloroethane.

See TDE.

1,1-bis(p-chlorophenyl)ethanol. See di(p-chlorophenyl)ethanol.

bis(p-chlorophenylthio)dimethyl stannane.

See bis(p-chlorophenylthio)dimethyltin.

bis(p-chlorophenylthio)dimethyltin.

CAS: 55216-04-1. mf: $C_{14}H_{14}Cl_2S_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

1,1'-bis(p-chlorophenyl)-2,2,2-trichloroethanol. (4,4'-dichloro- α -trichloromethylbenzhydrol; Kelthane). $CCl_3C(C_6H_4Cl)_2OH$. An alcohol analog of DDT.

Hazard: Toxic by inhalation and ingestion.

Use: Miticide.

bis(cumene)chromium. See dicumene chromium.

n,n-bis(2-cyanoethyl)-n-4-hydroxy-1-anthraquinonylsulfonilamide.

CAS: 66903-22-8. mf: $C_{26}H_{20}N_4O_5S$.

Hazard: A poison.

n,n'-bis-(1-(2-cyanoethyl)thioacetaldehyde o-(n-methylcarbamoyl)oxime)disulfide.

CAS: 68789-93-5. mf: $C_{14}H_{20}N_6O_4S_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

n,n'-bis(2-cyano-2-methylpropionaldehyde o-(n-methylcarbamoyl)oxime)sulfide.

CAS: 63942-43-8. mf: $C_{14}H_{20}N_6O_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

bis(cyclohexyl)carbodiimide. See *n,n'*-methanetetrayl bis(cyclohexylamine).

bis-cyclopentadienyliron. See dicyclopentadienyliron.

bis(*l*-cysteinato)mercury.

CAS: 12550-82-2. mf: $C_6H_{12}HgN_2O_4S_2$.

Properties: IDLH 10 mg/m³ (as Hg).

Hazard: Moderately toxic by ingestion. TWA 0.01. STEL 0.03 mg/m³ (skin)

bis(decanoxyloxy)di-*n*-butylstannane.

CAS: 3465-75-6. mf: $C_{28}H_{56}O_4Sn$.

Hazard: A poison by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(decanoxyloxy)di-*n*-butyltin. See bis(decanoxyloxy)di-*n*-butylstannane.

bis(dibutylacetoxytin)oxide. See bis(acetoxydibutylstannane) oxide.

bis(dibutylthiocarbamate)copper. See copper bis(dibutylthiocarbamate).

bis(dibutylthiocarbamate)dibenzylstannane.

CAS: 64653-03-8. mf: $C_{32}H_{50}N_2S_4Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis((dibutylthiocarbamoyl)oxy)dibenzylstannane. See

bis(dibutylthiocarbamate)dibenzylstannane.

bis(dibutylthiocarbamate)dimethylstannane.

CAS: 66009-08-3. mf: $C_{20}H_{42}N_2S_4Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis((dibutylthiocarbamoyl)oxy)dimethylstannane. See

bis(dibutylthiocarbamate)dimethylstannane.

2,7-bis(3,4-dichlorophenyl)

benzo(lmn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.

CAS: 222420-34-0. mf: $C_{26}H_{10}Cl_4N_2O_4$.

Hazard: A poison.

bis(2,2-dichlorovinyl) sulfoxide. See 1,1'-sulfinylbis(1,2-dichloroethane).

bis(diethylthiocarbamate)copper. See copper(II) diethylthiocarbamate.

bis(1,3-dithiocyanato-1,1,3,3-tetrabutyl)distannoxane).

CAS: 38998-91-3. mf: $C_{36}H_{72}N_4O_2S_4Sn_4$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

bis(dodecanoloxo)diocetylstannane. See dioctyl-di(lauroyloxy)stannane.

bis((2-(ethyl)hexyloxy)maleoyloxy) di(*n*-butyl)stannane.

CAS: 15546-12-0. mf: $C_{32}H_{56}O_8Sn$.

Hazard: A poison by ingestion. A skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(2,6-diethylphenyl)carbodiimide.

$(CH_2H_3)_2C_6H_3NCNC_6H_3(C_2H_5)_2$.

Properties: Light-yellow to red-brown liquid; faintly acrid odor. D 1.007 (20/20C), bp 192–194C (0.4 mm Hg), refr index 1.591 (23C). Soluble in organic solvents. Combustible.

Hazard: Toxic by inhalation. Damaging to eyes. **Use:** Stabilizers in polyester and urethane systems, intermediate for textile chemicals and pharmaceuticals.

bis(2,6-diisopropylphenyl)carbodiimide.

CAS: 2162-74-5. mf: $C_{25}H_{34}N_2$.

Hazard: A poison by ingestion.

2,6-bis(dimethylaminomethyl)cyclohexanone. $[(CH_3)_2NCH_2]_2C_6H_8O$.

Properties: D 0.95 (20C).

Use: Preservative for aqueous paint systems, casein, pigment dispersions, and adhesives.

2,6-bis(dimethylaminomethyl)cyclohexanone dihydrochloride. $C_{12}H_{24}N_2O \cdot 2HCl$.

Properties: Free-flowing, white to off-white crystalline salt.

Use: Preservative for aqueous systems, latex paints, adhesives coatings, wax emulsions, casein, and starch solution.

bis(4-dimethylamino)triphenylcarbinol.

$C_6H_5C(OH)[C_6H_4N(CH_3)_2]_2$.

Properties: Solid. Mp 121–123C. Very soluble in ether and hot benzene; soluble in acids.

Use: Dyestuffs.

See malachite green.

bis(1,3-dimethylbutyl)amine.

$[(CH_3)_2CH_2CH_2CH(CH_3)]_2NH$.

Properties: Liquid. D 0.772–0.778 (20/20C), distillation range 179.0–205C, bulk d 6.5 lb/gal, flash p 160F (71.1C). Combustible.

((3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl)methyl)phosphonic acid, monoethyl ester, nickel(2+) salt (2:1).

CAS: 30947-30-9. mf: $C_{34}H_{56}O_8P_2 \cdot Ni$.

Hazard: Confirmed human carcinogen. Moderately toxic by ingestion.

2,4-bis(1,1-dimethylethyl)-6-(1-(4-methoxyphenyl)ethyl)phenol.

CAS: 71712-04-4. mf: $C_{23}H_{32}O_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

bis((4-(1,1-dimethylethyl)phenyl)methyl) 3-pyridinylcarbonimidodithioate.

CAS: 51308-76-0. mf: $C_{28}H_{34}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

bis((5,5-dimethyl-2-isopropylimino-4-(*o*-*n*-methylcarbamoyl)oximino)-1,3-dithiolane)sulfide.

CAS: 71108-02-6. mf: $C_{20}H_{32}N_6O_4S_5$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,1'-bis(dimethyloctoxysilyl)ferrocene.

CAS: 32613-12-0. mf: $C_{30}H_{54}FeO_2Si_2$.

Hazard: A poison by inhalation. Low toxicity by ingestion.

***N,N'*-bis(1,4-dimethylpentyl)-*p*-phenylenediamine.** (diheptyl-*p*-phenylenediamine).

$C_6H_4(CNH_7H_{15})_2$.

Properties: Amber to red liquid. D 0.90, fp 7.2C. Combustible.

Use: Gasoline antioxidant and sweetener.

bis(dimethyl(vinyl)silyl)amine. See 1,1,3,3-tetramethyl-1,3-divinylsilazane.

***n,n'*-bis-(1,4-dithiane-2-*o*-(*n*-methylcarbamoyl)oximino)sulfide.**

CAS: 63956-71-8. mf: $C_{12}H_{18}N_4O_4S_5$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

bis(ethane-1,2-diamine)copper(2+)diperchlorate.

CAS: 36407-48-4. mf: $C_4H_{16}CuN_4 \cdot 2ClO_4$.

Hazard: Moderately toxic by ingestion and inhalation.

bis(ethenyldimethylsilyl) ether. See *sym*-tetramethyldivinylsiloxane.

bis(2-ethylhexyloxycarbonylmethylthio)dibutylstannane. See

bis(isooctyloxycarbonylmethylthio)dibutyl stannane.

bis(2-ethylhexyloxycarbonylmethylthio)dimethylstannane. See

bis(isooctyloxycarbonylmethylthio)dimethylstannane.

bis(2-ethylhexyl)phthalate. $C_{24}H_{38}O_4$.

Properties: A liquid.

Use: In vacuum pumps.

bis(2-ethylhexyl)thiodipropionate.

CAS: 10526-15-5. mf: $C_{22}H_{42}O_4S$.

Hazard: Moderately toxic by ingestion. A mild skin and eye irritant.

bis(2-ethylhexylthioglycolate)dibutyltin.

See dibutyl-di(2-ethylhexyloxycarbonylmethylthio)stannane.

bis(2-ethylhexylthioglycolate)dioctyltin.

See di-*n*-octyltin bis(2-ethylhexyl) mercaptacetate.

***N,N*-bis(1-ethyl-3-methylpentyl)-*p*-phenylenediamine.** $C_6H_4(NHC_8H_{17})_2$.

Properties: Dark, reddish-brown liquid. D approximately 0.90; bulk d 7.5 lb/gal. Combustible.

Use: Antioxidant for polyunsaturated elastomers.

2,2-bis(*p*-ethylphenyl)-1,1-dichloroethane.

See 1,1-dichloro-2,2-bis(*p*-ethylphenyl)ethane.

bis(ethylthio)methylene malononitrile.

CAS: 18771-38-5. mf: $C_8H_{10}N_2S_2$.

Hazard: A poison by ingestion and skin contact. A severe eye irritant.

bisethylxanthogen. $(C_2H_5OCSS)_2$.

Properties: Yellow needles; onionlike odor. Mp 28–32C. Insoluble in water; freely soluble in benzene, ether, petroleum fractions.

Grade: 58% soluble in oil.

Use: Weed control, rubber accelerator, fungicide.

bis(2-fluoro-2,2-dinitroethoxy)methane.

See formaldehyde bis(2-fluoro-2,2-dinitroethyl) acetal.

1-(2-(bis(4-fluorophenyl)methoxy)ethyl)-4-(3-phenylpropyl)piperazine dihydrochloride.

CAS: 67469-78-7. mf: $C_{28}H_{32}F_2N_2O \cdot 2ClH$.

Hazard: A poison.

1,3-bis(3-glycidoxypropyl)tetramethylidisiloxane.

$[OCH_2CHCH_2O(CH_2)_3Si(CH_2)_2]_2O$.

Properties: Liquid. D 0.99 (25C), refr index 1.4500 (25C), bp approximately 185C (2 mm Hg). Soluble in acetone and benzene; insoluble in water. Flash p 300F (149C). Combustible.

Use: Chemical intermediate.

bis(guanidinium) chromate.

CAS: 5188-42-1. mf: $C_2H_{10}N_6 \cdot CrH_2O_4$.

Properties: IDLH Ca [15 mg/m³ ças Cr(VI)].

Hazard: Poison. TWA 0.05 mg(Cr)/m³; Confirmed Human Carcinogen

bis(hexanoyloxy)di-*n*-butylstannane.CAS: 19704-60-0. mf: C₂₀H₄₀O₂Sn.**Hazard:** A poison by ingestion. A skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**bis(hexanoyloxy)di-*n*-butyl-tin.** Seebis(hexanoyloxy)di-*n*-butylstannane.**bis(hydrogen maleato)dibutyl-tin bis(2-ethylhexyl) ester.** See bis((2-(ethyl)hexyloxy)maleoyloxy) di(*n*-butyl)stannane.**bis(hydrogen maleato)dioctyltin bis(2-ethylhexyl) ester.** See di-*n*-octyltin bis(2-ethylhexyl) maleate).**bishydroxycoumarin.** [3,3'-methylenebis(4-hydroxycoumarin)dicoumarol]. C₁₉H₂O₆.**Properties:** White or creamy-white crystalline powder; faint pleasant odor; slightly bitter taste. Mp 287–293C. Readily soluble in solutions of fixed alkali hydroxides; slightly soluble in chloroform; almost insoluble in water, alcohol, and ether.**Derivation:** (1) Originally extracted from spoiled sweet clover; (2) synthetically from methyl acetyl-salicylate sodium and formaldehyde.**Grade:** USP.**Hazard:** May cause hemorrhage.**Use:** Anticoagulant for blood.**bis(1-hydroxycyclohexyl)peroxide.**C₆H₁₀(OH)₂O₂.**Properties:** Fine, white powder. Mp 66–68C. Active oxygen 6.6% min.**Hazard:** Dangerous fire risk in contact with organic materials. Strong oxidizing agent.**Use:** Catalyst for polymerization of polyester resins.***N,N*-bis(2-hydroxyethyl)alkylamine.** Clear liquid used as an antistatic for blow molding applications for polyolefins. Approved for use in food packaging films.**bis(hydroxyethyl)butynediol ether.**HO(CH₂)₂OCH₂C•CCH₂C•CCH₂O(CH₂)₂OH.**Properties:** Dark brown liquid. D 1.136 (25/15C), solidifies below –15C, distillation range 116–235C (10 mm Hg).**Hazard:** May explode under alkaline conditions at high temperature.**Use:** Intermediate for polyesters, plasticizers, and plastics, nickel brightener in electroplating, corrosive inhibitor, pickling inhibitor prior to copper plating.***n,n*-bis(2-hydroxyethyl)cocoamide.** See coconut oil acid diethanolamine.**bis(hydroxyethyl) cocoamine oxide.** A derivative coconut oil claimed to be useful as a gasoline additive to inhibit rust formation and icing of

carburetors. Also used as foaming agent in shampoos, detergents, tooth pastes, and the like.

***N,N*-bis(hydroxyethyl)oleamide.**CH₃(CH₂)₇HC:CH(CH₂)₇CON(CH₂CH₂OH)₂. A technical grade containing 25% excess amine. Light amber liquid with faint odor.**Use:** As a surface-active agent.**bis[hydroxyethylpoly(ethyleneoxy)ethylpropylene glycol].** See poloxalene; poloxalene free-choice liquid type c feed.**β-bishydroxyethyl sulfide.** See thiodiglycol.**1,7-bis(hydroxymethyl)carborane.** See *m*-carboranedimethanol.**bis(hydroxymethyl)-*m*-carborane.** See *m*-carboranedimethanol.**bis(hydroxymethyl)-*o*-carborane.** See *o*-carboranedimethanol.**1,3-bishydroxymethylurea.** See dimethylolurea.**bis(4-hydroxyphenyl)methanone (2,4-dinitrophenyl)hydrazone.**CAS: 2675-35-6. mf: C₁₉H₁₄N₄O.**Hazard:** Moderately toxic by ingestion.**4,4-bis(4-hydroxyphenyl)pentanoic acid.** (diphenolic acid; DPA).CH₃C(C₆H₄OH)₂CH₂CH₂COOH.**Properties:** Light-tan granules. Mp 170–173C, d 1.30–1.32. Soluble in acetic acid, acetone, and ethanol; insoluble in benzene, carbon tetrachloride, and xylene. Slightly soluble in water.**Use:** Paint formulations, coatings, and finishes.**bishydroxyphenyl sulfone.** See dihydroxydiphenyl sulfone.**1,4-bis(2-hydroxypropyl)-2-methylpiperazine.** C₁₁H₂₂O₂N₂.**Properties:** Liquid; odorfree. Bp 145C (3 mm Hg), d 1.0013 (25/25C), refr index 1.4803 (20C), flash p 300F (149C). Miscible with water. Combustible.**Use:** Catalyst, chemical intermediate.**bis-intercalator.** A unique type of natural antibiotics that have antitumor and antimicrobial properties. They function by interposing two symmetrical groups between the nucleotide bases of the DNA molecule. Some are quite toxic and may be mutagenic. See carzinophillin A.**bis(isooctyloxycarbonylmethylthio)dibutylstannane.**CAS: 25168-24-5. mf: C₂₈H₅₆O₄S₂Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(isooctyloxycarbonylmethylthio)dimethylstannane.

CAS: 26636-01-1. mf: C₂₂H₄₄O₄S₂Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(isooctyloxymaleoyloxy)diethylstannane.

CAS: 33568-99-9. mf: C₄₀H₇₂O₈Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(isopropylbenzene)chromium. See dicumene chromium.

2,4-bis(isopropylamino)-6-methoxy-s-triazine. (Gesafam; ontrach; promitol; prometon).

CAS: 1610-18-0. C₁₀H₁₉N₅O.

Properties: White, extruded pellets.

Hazard: Toxic by ingestion.

Use: Industrial herbicide.

bis-keto-triazine. ("Permafresh" 110). Water-white liquid, 40% active. Can be cured with magnesium chloride to provide chlorine resistance; compatible with optical brighteners. Used as a wash-and-wear finish for cellulose and blends of cellulose.

bis(lauroyloxycarbonylmethylthio)diethylstannane. See di-*n*-octyltin bis(laurylthioglycolate).

bismanol. (MnBi). An alloy or compound of bismuth and manganese which has an exceptionally high coercive force (3400 oersteds) and a high energy product. Produced by U.S. Naval Ordnance Laboratory by powder metallurgy methods and used as a permanent magnet.

Bismarck brown. See C.I. basic brown 4.

Bismarck Brown R. (toluene-2,4-diazobis-*m*-toluylenediamine hydrochloride; CI 21010). CH₃C₆H₃[NNC₆H₄(CH₃)(NH₂)₂]₂•2HCl.

Properties: Dark brown powder. Soluble in water and alcohol.

Derivation: Action of nitrous acid on toluylene diamine.

Use: Dye for wool and leather, biological stain.

Bismarck Brown Y. (4,4'-[*m*-phenylenebis(azo)]bis(*m*-phenylenediamine)dihydrochloride; CI 21000). C₆H₄-1,3-[NNC₆H₃-2,4-(NH₂)₂•HCl]₂.

Properties: Black to brown powder. Soluble in water; insoluble in benzene and carbon tetrachloride.

Use: Dyeing textiles, biological stain.

bis(2-methoxyethoxy)ethyl ether. See dimethoxytetraglycol.

2,12-bis(1-(methoxyimino)ethyl)-5,9-dioxo-*n,n,n',n',6,8*-hexamethyl-4,10-dioxo-7-thia-3,6,8,11-tetraazatrideca-2,11-dienediamide.

CAS: 90293-56-4. mf: C₁₈H₃₀N₈O₈S.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

bis(methoxymaleoyloxy)dibutylstannane.

CAS: 15546-11-9. mf: C₁₈H₂₈O₈Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(methoxymaleoyloxy)diethylstannane.

CAS: 60494-19-1. mf: C₂₆H₄₄O₈Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

2,7-bis(4-methoxyphenyl)benzo(1*mn*)(3,8)phenanthroline-1,3,6,8(2*h*,7*h*)-tetrone.

CAS: 64005-84-1. mf: C₂₈H₁₈N₂O₆.

Hazard: A poison.

bis(1-methylamyl)sodium sulfosuccinate.

(dihexyl sodium sulfosuccinate). C₁₆H₂₉NaO₇S.

Properties: White, waxy particles. Readily soluble in hot water; slowly in cold water; soluble in benzene, carbon tetrachloride, acetone, and glycerol. Hydrolyzes in alkaline media.

Use: Surfactant, wetting agent.

***N,N'*-bis(1-methylheptyl)-*p*-phenylenediamine.** C₂H₄[NHCH(CH₂)₆C₆H₁₃]₂.

Properties: Dark reddish-brown liquid. D approximately 0.90 at (26.6C), wt/gal 7.5 lb. Combustible.

Use: Antiozonant in polyunsaturated elastomers.

bis(2-methylallyl) diglycolate.

CAS: 63917-25-9.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***n,n'*-bis-(2-(*o*-(*n*-methylcarbamoyl)oximino)-1,4-dithiane)disulfide.**

CAS: 68789-89-9. mf: C₁₂H₁₈N₄O₄S₆.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2,3:4,5-bis-*o*-(1-methylethylidene)-β-d-fructopyranose, methyl((2-(1-methylethoxy)phenoxy)carbonyl)amidossulfite.

CAS: 81897-50-9. mf: C₂₃H₃₃NO₁₀S.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1,2:4,5-bis-*o*-(1-methylethylidene)-β-d-fructopyranose, methyl((3-

methylphenoxy)carbonyl amidosulfite.CAS: 81862-13-7. mf: $C_{21}H_{29}NO_5S$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**2,3:4,5-bis-*o*-(1-methylethylidene)- β -D-fructopyranose, methyl((3-methylphenoxy)carbonyl amidosulfite.**CAS: 81862-12-6. mf: $C_{21}H_{29}NO_5S$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**1,2:4,5-bis-*o*-(1-methylethylidene)- β -D-fructopyranose, methyl((1-naphthalenyloxy) carbonyl)amidosulfite.**CAS: 81862-22-8. mf: $C_{24}H_{29}NO_5S$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**1,2:5,6-bis-*o*-(1-methylethylidene)- α -D-glucofuranose, (((2-(dimethylamino)-2-oxo-1-(methylthio)ethylidene)amino)oxy) carbonyl)methylamidosulfite.**CAS: 81877-66-9. mf: $C_{19}H_{31}N_3O_{10}S_2$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**bis((4-(1-methylethyl)phenyl)methyl) 3-pyridinylcarbonimidodithioate.**CAS: 51308-75-9. mf: $C_{26}H_{30}N_2S_2$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**2,7-bis(4-methylphenyl)benzo(Imn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.**CAS: 989-74-2. mf: $C_{28}H_{18}N_2O_4$.**Hazard:** A poison.**1,4-bis[2-(4-methyl-5-phenyloxazolyl)]benzene. Metallic element of atomic number 83, group VA of the periodic table. Aw 208.9804. Valences 3, 5; no stable isotopes; four naturally radioactive isotopes.**Properties:** Brittle metal with reddish tinge. Soluble in nitric and hydrochloric acids. Highly diamagnetic (mass susceptibility -1.35×10^6). Expands 3.3% on solidification. Electrical resistivity higher in solid than in liquid state. Extrudable at 437F, not fabricable at room temperature, d 9.8 (20C), mp 271C, bp 1560C, Brinell hardness 7. Thermal conductivity (0.018 cal/sec cm (250C)) is lowest of all metals except mercury. On heating it burns to form the oxide.**Source:** (1) Metallurgical by-products (often lead bullion) obtained chiefly from smelting ores of lead, silver, copper, and gold; (2) ores used chiefly for their bismuth and one or two other metals as tin and tungsten.**Derivation:** Debismuthizing of lead bullion by (1) fractional crystallization; (2) electrolytic (Betts) refining; or (3) addition of calcium or magnesium (Betterson-Kroll process), which removes bismuth.**Method of purification:** By addition of molten caustic, zinc, and finally chlorine (to make removable chlorides of the impurities).**Impurities:** Lead, iron, copper, arsenic, antimony, selenium.**Available forms:** Rods, wire, lump, powder.**Grade:** 99.5+% pure, high purity (less than 10 ppm impurities), single crystals.**Hazard:** Flammable in powder form.**Use:** Pharmaceuticals and medicine, cosmetics (eye shadow, lipstick), component of low-melting (fusible) alloys, catalyst in making acrylonitrile, additive to improve machinability of steels and other metals, coating selenium, thermoelectric materials, permanent magnets, semiconductors.

See bismuthinite.

bismuth ammonium citrate.**Properties:** Pearly, shining, transparent scales or white powder; slightly acid, metallic taste. Composition varies. Soluble in water; slightly soluble in alcohol.**Derivation:** Interaction of bismuth subnitrate, citric acid, and ammonium hydroxide.**Use:** Medicine.**bismuth antimonide.** BiSb. Single crystals used as semiconductors.

bismuth bromide. (bismuth tribromide).

Properties: Yellow, crystalline powder. D 5.7, bp 453C, mp 218C. Hygroscopic. Decomposed by water with formation of bismuth oxybromide. Soluble in either hydrochloric acid (dilute) or solutions of potassium iodide, bromide, and chloride. Insoluble in alcohol.

bismuth bromide oxide. See bismuth oxybromide.

bismuth carbonate, basic. See bismuth subcarbonate.

bismuth chloride. (bismuth trichloride).

Properties: White, very deliquescent crystals; volatilized by heat. D 4.56, mp 227C, bp decomposes at 300C. Soluble in acids; insoluble in alcohol, decomposes in water to the oxychloride.

Derivation: Action of hydrochloric acid on bismuth.

Use: Bismuth salts, catalyst.

bismuth chloride, basic. See bismuth oxychloride.

bismuth chromate. (basic dichromate).

Properties: Orange-red, amorphous powder. Soluble in alkalis and acids; insoluble in water.

Derivation: Interaction of bismuth nitrate and potassium chromate.

bismuth citrate. $\text{BiC}_6\text{H}_5\text{O}_7$.

Properties: White powder. D 3.458, mp (decomposes). Soluble in ammonia or alkali citrates; insoluble in water; slightly soluble in alcohol.

Derivation: Boiling bismuth subnitrate with citric acid.

Use: Medicine.

bismuth dimethyldithiocarbamate.

Properties: Lemon-yellow powder. D 2.04, mp greater than 230C (decomposes). Soluble in chloroform; slightly soluble in benzene and carbon disulfide; insoluble in water.

Use: Accelerator for natural rubber and SBR, especially in cable covers and mechanical items.

bismuth ditannate. See bismuth tannate.

bismuth ethyl chloride. $\text{BiHC}_2\text{H}_5\text{Cl}$. White powder.

Hazard: Ignites spontaneously in air, dangerous fire risk.

See bismuth.

bismuth gallate, basic. See bismuth subgallate.

bismuth glance. See bismuthinite.

bismuth hydrate. See bismuth hydroxide.

bismuth hydroxide. (bismuth hydrate; bismuth oxyhydrate; bismuth trihydroxide; bismuth trihydrate; hydrated bismuth oxide). $\text{Bi}(\text{OH})_3$.

Properties: White, amorphous powder. D 4.36. Soluble in acids, insoluble in water.

Derivation: Action of sodium hydroxide on a solution of bismuth nitrate.

Use: Plutonium separation, hydrolysis of ribonucleic acid, absorbent.

bismuthinite. (bismuth glance). Bi_2S_3 . May contain copper or iron.

Properties: Lead-gray mineral, often with yellow tarnish; metallic luster. Contains 81.2% bismuth, 18.8% sulfur, soluble in nitric acid, d 6.4–6.5, Mohs hardness 2.

Occurrence: Utah, Bolivia, Mexico.

Use: Ore of bismuth.

bismuth iodide. (bismuth triiodide). BiI_3 .

Properties: Grayish-black, metallic, glistening crystals. D 5.778 (15C); sublimes at 438C. Soluble in alcohol, hydriodic acid, and potassium iodide solutions; insoluble in water. Decomposes in hot water.

Derivation: By the interaction of bismuth and iodine.

Hazard: Toxic by ingestion.

See bismuth.

Use: Analytical chemistry, manufacturing bismuth oxyiodide.

bismuth- β -naphthol. $\text{Bi}_2\text{O}_2(\text{OH}) \cdot \text{C}_{10}\text{H}_7\text{O}$.

Properties: Brown to gray powder. Almost insoluble in water or other solvents.

Derivation: By treating a solution of sodium β -naphtholate with acetic acid solution of bismuth nitrate and adding caustic soda solution to neutralize excess acid.

Use: Medicine.

bismuth nitrate. (bismuth ternitrate; bismuth trinitrate). $\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Lustrous, clear, colorless, hygroscopic crystals; acid taste. D 2.83; bp 75–80C (decomposes). Soluble in dilute nitric acid, alcohol, and acetone; slowly decomposed by water to the subnitrate.

Derivation: Action of nitric acid on bismuth with subsequent recovery by evaporation and crystallization.

Hazard: Oxidizing material; fire risk near organic materials.

Use: Preparation of other bismuth salts, bismuth luster on tin, luminous paints and enamels, precipitation of alkaloids.

bismuth nitrate, basic. See bismuth subnitrate.

bis(octanoyloxy)di-*n*-butyl stannane.CAS: 4731-77-5. mf: C₂₂H₄₈O₈Sn.**Hazard:** Low toxicity. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**bis(octanoyloxy)di-*n*-butyltin.** Seebis(octanoyloxy)di-*n*-butyl stannane.**bismuth oleate.****Properties:** Yellowish-brown, soft, granular mass. Soluble in ether; insoluble in water.**Derivation:** A mixture of bismuth trioxide and oleic acid.**Use:** Catalyst in oxo process.**bismuth oxide.** See bismuth trioxide.**bismuth oxide, hydrated.** See bismuth hydroxide.**bismuth oxybromide.** (bismuth bromide, basic; bismuth bromide oxide). BiBrO.**Properties:** Dry powder. Insoluble in water and alcohol; soluble in hydrochloric and hydrobromic acids.**Use:** Cathodes for dry cells.**bismuth oxycarbonate.** See bismuth subcarbonate.**bismuth oxychloride.** (bismuth chloride, basic; bismuth subchloride). BiOCl.**Properties:** White lustrous crystalline powder. D 7.717. Soluble in acid; insoluble in water.**Derivation:** By action of water on bismuth chloride, interaction of dilute nitric acid solution of bismuth nitrate with sodium chloride.**Use:** Cosmetics, pigment, dry-cell cathodes.**bismuth oxyhydrate.** See bismuth hydroxide.**bismuth oxynitrate.** See bismuth subnitrate.**bismuth pentafluoride.** BiF₅.**Properties:** Crystals. Sublimes at 550C.**Hazard:** Reacts violently with water and petrolatum above 50C. Strong irritant to eyes and skin.**Use:** Fluorinating agent.**bismuth pentoxide.** Bi₂O₅. An acid anhydride, its salts have not been prepared in pure state. Made by oxidation of bismuth trioxide, giving a scarlet precipitate.**bis(*p*-phenoxyphenyl)diphenyltin.**CAS: 17601-12-6. mf: C₃₆H₂₈O₈Sn.**Hazard:** A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**bis(*p*-phenoxyphenyl)diphenylstannane.**See bis(*p*-phenoxyphenyl)diphenyltin.**bismuth phosphate.** BiPO₄.**Properties:** Odorless crystals that do not melt when heated. D 6.32 (15C). Soluble in nitric and hydrochloric acids; insoluble in acetic acid and alcohol; slightly soluble in water and weak acids.**Use:** Plutonium recovery, optical glass.**bismuth potassium iodide.** BiI₃•4KI.**Properties:** Red crystals, decomposed by water. Soluble in potassium iodide solution.**Use:** Precipitation of vitamins and antibiotics from solution.**bismuth salicylate, basic.** See bismuth subsalicylate.**bismuth selenide.** (bismuth triselenide).Bi₂Se₄.**Properties:** Black crystals. Mp 710C. Insoluble in water; decomposes on heating.**Use:** Semiconductor technology.**bismuth stannate.** Bi₂(SnO₃)₃•5H₂O.**Properties:** Light-colored crystals. Insoluble in water. Temperature of dehydration is approximately 140C.**Hazard:** Toxic material; TLV: 2 mg(Sn)/m³.

See bismuth.

Use: Component of ceramic capacitors, useful with barium titanate.**bismuth subcarbonate.** (bismuth oxycarbonate; bismuth carbonate, basic). (BiO)₂CO₃ or Bi₂O₃•CO₂•1/2H₂O.**Properties:** White, odorless powder; tasteless. D 6.86. Stable in air but slowly affected by light. Insoluble in water and alcohol; soluble in nitric or hydrochloric acid with effervescence.**Derivation:** By adding ammonium carbonate to a solution of a bismuth salt.**Grade:** Technical, CP, USP (90% Bi₂O₃ min).**Use:** Bismuth compounds, cosmetics, opacifier in X-ray diagnosis, enamel fluxes, and ceramic glazes.**bismuth subchloride.** See bismuth oxychloride.**bismuth subcitrate.**CAS: 57644-54-9. mf: C₁₂H₈O₇•Bi•3K.**Hazard:** A poison by ingestion.**bismuth subgallate.** (basic bismuth gallate).C₆H₂(OH)₃COOBi(OH)₂.**Properties:** Saffron-yellow powder; odorless; tasteless. Soluble in dilute alkalis; insoluble in water, alcohol, and ether. Stable in air but affected by light.**Derivation:** Interaction of bismuth nitrate, glacial acetic acid, and gallic acid in aqueous solution.**Use:** Medicine (treatment of alimentary canal).**bismuth subnitrate.** (basic bismuth nitrate; bismuth oxynitrate). 4BiNO₃(OH)₂•BiO(OH).

Properties: White, heavy, slightly hygroscopic powder that shows acid to moistened litmus paper. D 4.928, mp 260C (decomposes). Soluble in acids; insoluble in water and alcohol.

Derivation: Hydrolysis of bismuth nitrate, filtering and drying.

Grade: Technical, CP, NF.

Use: Cosmetics, ceramic glazes, enamel fluxes.

bismuth subsalicylate. (basic bismuth salicylate). $\text{Bi}(\text{C}_7\text{H}_5\text{O}_3)_3\text{Bi}_2\text{O}_3$.

Properties: White, bulky, crystalline powder; tasteless; odorless. Soluble in acids and alkalis; insoluble in water, alcohol, and ether. Stable in air but affected by light.

Derivation: By treating freshly prepared bismuth hydroxide with salicylic acid.

Use: Surface-coating plastics and copying paper. See salicylic acid, bismuth basic salt.

bismuth sulfate. $\text{Bi}_2(\text{SO}_4)_3$.

Properties: White needles or powder. Contains approximately 68.5% bismuth. D 5.08, decomposes at 405C. Soluble in dilute hydrochloric or nitric acid; insoluble in alcohol, water.

Use: Analysis of metallic sulfates.

See bismuth trisulfate.

bismuth sulfide. (bismuth trisulfide). Bi_2S_3 .

Properties: Blackish-brown powder. D 7.6–7.8, mp (decomposes). Soluble in nitric acid; insoluble in water.

Derivation: (1) By melting bismuth and sulfur together. (2) By passing hydrogen sulfide into a solution of a bismuth salt. (3) Occurs as the mineral bismuthinite.

Use: Manufacturing bismuth compounds.

bismuth tannate. (bismuth ditannate).

Properties: Light brownish-yellow powder containing approximately 36% bismuth. Insoluble in water and alcohol, soluble in mineral acids.

Derivation: From freshly prepared bismuth hydroxide and tannin.

Use: Medicine (astringent).

bismuth telluride. (bismuth tritelluride).

CAS: 1304-82-1. Bi_2Te_3 .

Properties: Gray, hexagonal platelets. Mp 573C, d 7.642.

Derivation: Stoichiometric combination of the elements.

Grade: Ingot, single crystals.

Hazard: Toxic. TLV: 10 mg/m³ (if selenium-doped, 5 mg/m³).

Use: Semiconductors for thermoelectric cooling and power generation.

bismuth tetraoxide. Bi_2O_4 .

Properties: Heavy, yellowish-brown powder. D 5.6, mp 305C. Soluble in acids; insoluble in water.

Derivation: By further oxidation of bismuth trioxide.

Use: Lubricant for metal-extrusion dies.

bismuth tribromide. See bismuth bromide.

bismuth trichloride. See bismuth chloride.

bismuth trihydrate. See bismuth hydroxide.

bismuth trihydroxide. See bismuth hydroxide.

bismuth triiodide. See bismuth iodide.

bismuth trinitrate. See bismuth nitrate.

bismuth trioxide. (bismuth oxide; bismuth yellow; bismite). Bi_2O_3 .

Properties: Heavy, yellow powder. D 8.8, mp 820C. Soluble in acids; insoluble in water.

Derivation: Heating bismuth nitrate in air, ignition of bismuth hydroxide.

Use: Enameling cast iron, ceramic and porcelain colors.

bismuth trisulfate.

CAS: 7787-68-0. mf: $\text{Bi}^{\bullet 3}/_2\text{H}_2\text{O}_4\text{S}$.

Hazard: Moderately toxic by ingestion.

bismuth trisulfide. See bismuth sulfide.

bismuth tritelluride. See bismuth telluride.

bismuth yellow. See bismuth trioxide.

***p*-bis[2,5(5- α -naphthylloxazolyl)]benzene.**

(NOPON). $\text{C}_{32}\text{H}_{20}\text{O}_3\text{N}_2$.

Properties: Crystals. Mp 215–217C.

Grade: Purified.

Use: Scintillation counting.

bis(3-nitrophenyl) disulfide. See nitrophenide.

bis(nonyloxymaleoyloxy)dioctylstannane.

See di-*n*-butyltin di(monononyl)maleate.

Bisphenol A. (4,4'-isopropylidenediphenol;

2,2-bis(4-hydroxyphenyl)propane).

$(\text{CH}_3)_2\text{C}(\text{C}_6\text{H}_4\text{OH})_2$.

Properties: White flakes with a mild phenolic odor. Bp 220C (4 mm), mp 153C, d 1.195 (25/25C), flash p 175F (79.4C), insoluble in water; soluble in alcohol and dilute alkalis; slightly soluble in carbon tetrachloride. Combustible.

Derivation: Condensation reaction of phenol and acetone catalyzed by hydrochloric acid at 65C.

Use: Intermediate in manufacture of epoxy, polycarbonate, phenoxy, polysulfone, and certain polyester resins; flame retardants, rubber chemicals, fungicide.

bisphenol A disodium salt.

CAS: 2444-90-8. mf: $C_{15}H_{16}O_2 \cdot 2Na$.

Hazard: Moderately toxic by ingestion and skin contact. A moderate skin and severe eye irritant.

2,7-bis(2-phenylethyl)benzo(lmn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.

CAS: 222420-31-7. mf: $C_{30}H_{18}N_2O_4$.

Hazard: A poison.

2,7-bis(phenylmethyl)benzo(lmn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.

CAS: 106897-63-6. mf: $C_{28}H_{18}N_2O_4$.

Hazard: A poison.

1,4-bis-2(5-phenyloxazolyl)benzene. (PO-POP).

($C_6H_3HNO_2$) $_2C_6H_4$.

Properties: Light yellow, cottony needles. Mp 245–246C, fluorescence max 4200 Å. Solubilities (g/100 g at 25C): water 0.00, 95% ethanol 0.00, toluene 0.12, hexane 0.02. Combustible.

Grade: Purified.

Use: Band shifter in scintillation counting.

2,5-bis(phenylthio)benzoquinone.

CAS: 17058-53-6. mf: $C_{18}H_{12}O_2S_2$.

Hazard: A poison.

bis(phenylthio)dimethyltin.

CAS: 4848-63-9. mf: $C_{14}H_{16}S_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(2-pyridinethiol 1-oxide)copper.

CAS: 14915-37-8. mf: $C_{10}H_8CuN_2O_2S_2$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

bis(tetrachloroethyl) disulfide. $C_4H_2Cl_8S_2$.

Properties: Liquid. D 1.785 (23.3C), bp 185C (3 mm Hg). Soluble in benzene, hexane, ethanol. Combustible.

Hazard: Toxic.

Use: Agricultural chemicals, additives.

bis(tetradecanoyloxy)dibutylstannane.

CAS: 28660-67-5. mf: $C_{36}H_{72}O_4Sn$.

Hazard: A poison by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

7-(3,5-bis((tetrahydro-2h-pyran-2-yl)oxy)-(4-phenoxy-3-((tetrahydro-2h-pyran-2-yl)oxy)-1-butenyl)cyclopentyl)-2-(phenylseleno)-5-heptenoic acid, methyl ester.

CAS: 62524-93-0. mf: $C_{44}H_{60}O_9Se$.

Hazard: A reproductive hazard. TWA 0.2 mg(Se)/m³

1,2-bis(thiocyanato)ethane. See ethylenedithiocyanate.

bis(tribenzylstannyl)sulfide.

CAS: 10347-38-3. mf: $C_{42}H_{42}SSn_2$.

Hazard: A poison by ingestion. A skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(tribenzyltin) sulfide. See

bis(tribenzylstannyl)sulfide.

bis(tribromophenoxy)ethane.

Properties: White, crystalline powder.

Use: Flame retardant for many thermoplastic and thermoset systems.

bis(tributyl(sebacoyldioxy))tin.

CAS: 30099-72-0. mf: $C_{34}H_{70}O_4Sn_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(tributyltin) itaconate.

CAS: 25711-26-6. mf: $C_{29}H_{58}O_4Sn_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bis(tri-*n*-butyltin) oxide. (hexabutyl-distanoxane; TBTO; tributyltin oxide).

CAS: 56-35-9. (C_4H_9) $_3SnOSn(C_4H_9)_3$.

Properties: Slightly yellow liquid. Bp 180C (2 mm Hg), solidifies below -45C, d 1.17 (25C), flash p >212F (100C) (TCC), viscosity 4.8 centistokes at 25C. Almost insoluble in water; miscible with organic solvents. Forms compounds with cellulose and lignin-containing materials not easily decomposed or dissolved in water. Combustible.

Derivation: Hydrolysis of tributyl tin chloride.

Hazard: Toxic via ingestion and inhalation. TLV: 0.1 mg(Sn)/m³.

Use: Fungicide and bactericide in underwater and antifouling paints, pesticide.

bis(tributyltin)sulfide. See 1,1,1,3,3,3-hexabutyl-distanthiane.

1,3-bis(2,4,5-trichlorophenoxy)-1,1,3,3-tetrabutyl-distanoxane. See oxybis(dibutyl(2,4,5-trichlorophenoxy)tin).

bis(trichlorosilyl)ethane. (1,1,1,4,4,4-hexachloro-1,4-disilabutane). $Cl_3SiCH_2CH_2SiCl_3$.

Properties: Colorless liquid. Bp 202.9C, flash p 190F (COC). Readily hydrolyzed with liberation of hydrogen chloride. Combustible.

Derivation: Reaction of acetylene and trichlorosilane in presence of a peroxide catalyst.

Grade: Technical.

Hazard: Corrosive when exposed to moisture.

Use: Intermediate for silicones.

bistridecyl phthalate. $C_{64}H_{104}(COOC_{13}H_{27})_2$.

Properties: Liquid. D 0.9497 (25C), boiling range 280–290C (4 mm Hg), fp –35C, flash p 485F (251C), refr index 1.483 (25C). Combustible.

Use: Primary plasticizer for most PVC resins.

bis(triethyltin) sulfate.

CAS: 57-52-3. mf: $C_{18}H_{30}O_4SSn_2$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

bis(trifluoroacetoxy)dibutyltin.

CAS: 52112-09-1. mf: $C_{12}H_{18}F_6O_4Sn$.

Hazard: A poison by ingestion. Moderately toxic by skin contact. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

1,3-bis(trifluoromethyl)-5-isocyanobenzene.

CAS: 141206-73-7. mf: $C_9H_3F_6N$.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

bistrifluoromethylmethane. See 1,1,1,3,3,3-hexafluoropropane.

bis(trifluoromethylthio)mercury.

CAS: 21259-75-6. mf: $C_2F_6HgS_2$.

Hazard: A poison. TWA 0.01. STEL 0.03 mg/ m^3 (skin)

bis(triisobutylstannane). See hexaisobutyl-ditin.

bis(trimethylhexyl)tin dichloride.

CAS: 64011-39-8. mf: $C_{18}H_{38}Cl_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

bis(trimethylsilyl)trifluoroacetamide.

(BSTFA). $CF_3C[=NSi(CH_3)_3]OSi(CH_3)_3$.

Properties: Bp 45–50C (14 mm Hg), refr index 1.3839 (20C), mw 257.4.

Use: Preparation of volatile derivatives of a wide range of biologically active compounds for gas-liquid chromatographical analysis.

bis(triphenylsilyl)chromate.

CAS: 1624-02-8. mf: $C_{36}H_{30}CrO_4Si_2$.

Properties: IDLH Ca [15 mg/ m^3 as Cr(VI)].

Hazard: Moderately toxic by ingestion and skin contact. TWA 0.05 mg(CrO_3)/ m^3

bis(triphenyltin)acetylenedicarboxylate.

CAS: 73940-87-1. mf: $C_{40}H_{30}O_4Sn_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg/ m^3 (skin)

bis(triphenyltin)sulfate.

CAS: 3021-41-8. mf: $C_{36}H_{30}Sn_2 \cdot O_4S$.

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

bis(triphenyltin)sulfide.

CAS: 77-80-5. mf: $C_{36}H_{30}SSn_2$.

Properties: Colorless crystals. Mp: 144°. Sol in org solvs.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg(Sn)/ m^3 (skin).

bis(tripropyltin)oxide.

CAS: 1067-29-4. mf: $C_{18}H_{42}OSn_2$.

Properties: Air-sensitive liquid. Bp: 154.5° @ 3.5 mm.

Hazard: A poison. TWA 0.1 mg(Sn)/ m^3 ; STEL 0.2 mg/ m^3 (skin)

bithionol. (bis[2-hydroxy-3,5-dichlorophenyl]sulfide; 2,2'-thiobis[4,6-dichlorophenol]).

CAS: 97-18-7. $HOCl_2C_6H_2SC_6H_2Cl_2OH$.

Properties: White or grayish-white, crystalline powder; odorless or with slight aromatic or phenolic odor. Mp 187C. Insoluble in water; freely soluble in acetone, alcohol, and ether; soluble in chloroform and dilute solution of fixed alkali hydroxides.

Grade: NF.

Hazard: Skin irritant, may not be used in cosmetics (FDA).

Use: Deodorant, germicide, fungistat, pharmaceuticals.

“Bitrex” [Macfarlan]. (benzyl-diethyl-[(2,6-xylyl-carbamoyl)methyl]ammonium benzoate; denatonium benzoate [USAN]).

CAS: 3734-33-6. TM for a substance for use as a denaturant for alcohol.

Properties: Bitter taste. Mp 165C; soluble in water and alcohol; insoluble in ether.

See denatonium benzoate.

bitter almond oil. See almond oil.

bittern. The solution of bromides and magnesium and calcium salts that remains after sodium chloride has been crystallized by concentration of seawater or brines.

bitter orange oil. See orange oil, bitter, coldpressed.

bitumen. A mixture of hydrocarbons occurring both in the native state and as residue from California petroleum distillation. Soluble in carbon disulfide. Solid to viscous, semisolid liquid. Used in hot-melt adhesives, coatings, paints, sealants, roofing, and road coating. Bitumens are found in asphalt, mineral waxes, and lower grades of coal. Combustible.

See asphalt; gilsonite; glance; shale oil; oil sands.

bituminous coal. See coal.

biuret. (allophanamide; carbamylurea).

Properties: White needles; odorless. Mp 190C (decomposes). Soluble in water and alcohol; very slightly soluble in ether. Loses water of crystallization at approximately 110C.

Derivation: From urea by heat.

Method of purification: Crystallization.

Use: Analytical reagent, especially for proteins.

biuret reaction. A reaction that produces characteristic rose color when certain substances in alkaline solution are treated with copper sulfate solution.

bixin. $\text{C}_{25}\text{H}_{30}\text{O}_4$. A carotenoid obtained from seeds of *Bixa orellana*.

Properties: Orange crystals. Decomposes at 217C.

Derivation: Methyl ester (methyl bixin) $\text{C}_{26}\text{H}_{32}\text{O}_4$; blue crystals, mp 203C. Ethyl ester (ethyl bixin), $\text{C}_{27}\text{H}_{34}\text{O}_4$; Red crystals, mp 138C.

Use: The ethyl ester is used as a food coloring. See annatto.

Bk. Symbol for berkelium.

black. Any of several forms of finely divided carbon, either pure or admixed with oils, fats, or waxes.

See acetylene black; bone black; carbon black; ivory black.

black, aniline. See aniline black.

black antimony. See antimony trisulfide.

black ash. (1) (Papermaking) The product obtained by heating black liquor in furnaces. The organic material is reduced to carbon. The alkaline components are leached out and used again in papermaking. The carbon may be treated to obtain activated carbon. (2) See barium sulfide.

blackbody. In radiation physics, an ideal blackbody is a theoretical object that absorbs all the radiant energy falling upon it and emits it in the form of thermal radiation. The power radiated by a unit area of a blackbody is given by Planck's radiation law, and the total power radiated is expressed by the Stefan-Boltzmann law.

black, bone. See bone black.

black cyanide. A mixture containing 45% calcium cyanide made from calcium cyanamid by heating it with sodium chloride and carbon.

black lead. See graphite.

"Black Leaf 40." TM for a pesticide consisting of a 40% solution of nicotine sulfate.

black liquor. (1) The liquor resulting from cooking pulpwood in an alkaline solution in the soda or sulfate (kraft) papermaking process. It is a source of lignin and tall oil and is said to be effective in removal of mercury from industrial effluents (USDA).

(2) Iron acetate liquor (black mordant).

black oil. See residual oil.

black phosphorus. See phosphorus.

black plate. Thin sheet steel obtained by rolling and usually used for containers. It is not coated with any metal, but a special lacquer or baked enamel finish is usually applied by the manufacturer.

black, platinum. See platinum black.

black powder. (blasting powder). A low explosive composed of potassium nitrate, charcoal, and sulfur. In some cases sodium nitrate is substituted for potassium nitrate. Typical proportions are 75%, 15%, and 10%. Gunpowder is probably the oldest variety.

Hazard: Sensitive to heat, deflagrates rapidly. Does not detonate but is a dangerous fire and explosion hazard.

Use: Time fuses for blasting and shell, in igniter and primer assemblies for propellants, pyrotechnics, mining, and blasting.

black rouge. See iron oxide, black.

black sand. A deposit of dark minerals with a high density found in stream beds and on beaches. Magnetite and ilmenite are usually present and also monazite and other minerals.

blackstrap. See molasses.

"Bladen." (hexaethyl tetraphosphate). TM for an insecticide.

Use: Insecticide.

Blaise reaction. Formation of β -oxoesters by treatment of α -bromocarboxylic esters with zinc in the presence of nitriles. The intermediate organozinc compound reacts with the nitrile, and the complex is hydrolyzed with 30% potassium hydroxide.

Blanc (chloromethylation) reaction. Introduction of the CH_2Cl group into aromatic rings on treatment with formaldehyde and hydrochloric acid in the presence of zinc chloride.

blanc fixe. Precipitated barium sulfate.

blanch. To immerse vegetables or fruits in either hot water (80–100C) or steam in preparation for cooking, freezing, or canning. The times and temperatures vary among processors; the higher the

temperature, the shorter the time required. The operation loosens the skin or peel when present, tends to remove the color, and decreases the volume. It also causes some loss of nutrient value, especially vitamins.

“**Blancophor**” [*BASF*]. TM for optical whitening agents. “FFG”: A comarin derivative used as whitening agent for wool, nylon, acetate rayon, and mixed fibers. “HS Brands”: Stilbene derivatives used on cellulosic fibers, cotton and rayon fabrics, paper, and in household and industrial detergents.

Blanc reaction-Blanc rule. Cyclization of dicarboxylic acids on heating with acetic anhydride to give either cyclic anhydrides or ketones, depending on the positions of the carboxyl groups: 1,4- and 1,5-diacids give anhydrides, while diacids in which the carboxy groups are in 1,6- or further-removed positions give ketones.

“**Blandol**” [*Crompton & Knowles*]. TM for white mineral oil (NF).

Use: Pharmaceutical and cosmetic formulations, plasticizers, paper penetrants, foam depressants.

blank. (1) A piece of material of any desired shape cut by a stamping die-prepared for further processing. (2) See control (1).

BLAST. A computer program that identifies homologous (similar) genes in different organisms, such as human, fruit fly, or nematode.

blast furnace. A vertical coke-fired furnace used for smelting metallic ores, e.g., iron ore.

blast-furnace gas. By-product gas from smelting iron ore obtained by the passage of hot air over the coke in blast furnaces. A typical gas will analyze 12.9% carbon dioxide, 26.3% carbon monoxide, 3.7% hydrogen, 57.1% nitrogen.

Hazard: Toxic by inhalation. See carbon monoxide.

Use: Heating blast-furnace stoves, boilers, or as a gas-engine fuel.

blasting agent. See black powder; ammonium nitrate; explosive, high; explosive, permissible; explosive, low.

blasting gelatin. (SNG). A type of gelatinized dynamite containing approximately 7% of nitrocellulose.

Hazard: High explosive.

blasting powder. See black powder.

“**B-L-E**” [*Uniroyal*]. TM for high-temperature reaction product of diphenylamine and acetone.

Properties: Darkbrown, viscous liquid. D 1.087. Soluble in acetone, benzene, and ethylene dichloride; insoluble in gasoline and water. Combustible.

Use: General-purpose rubber antioxidant.

bleach. To whiten a textile or paper by chemical action. Also the agent itself. Bleaching agents include hydrogen peroxide (the most common), sodium hypochlorite, sodium peroxide, sodium chlorite, calcium hypochlorite, hypochlorous acid, and many organic chlorine derivatives. Chlorinated lime is a bleaching powder used on an industrial scale. Household bleaching powders are sodium perborate and dichlorodimethylhydantoin.

Hazard: See calcium hypochlorite; lime, chlorinated. Some bleaching agents are toxic and strong oxidizing agents.

bleached lard. See lard (unhydrogenated).

bleaching assistant. A material added to bleaching baths to secure more rapid and complete penetration of the bleach or improved regulation of the bleaching action, e.g., compounds of sulfonated oils and solvents, soluble pine oils, fatty alcohol salts, sodium silicate, sodium phosphate, magnesium sulfate, and borax.

bleaching, fluorescent. The use of colorless fluorescent organic compounds to produce a whitening effect on textiles.

bleaching powder. See bleach; calcium hypochlorite.

bleach liquor. A solution of either sodium or calcium hypochlorite and water.

bleed. (1) When a dye runs. (2) To release pressure gradually, as via a valve.

blend. A uniform combination of two or more materials either of which could be used alone for the same purpose as the blend. For example, a fabric may be a blend of wool and nylon, either of which is itself usable as fabric. Instances of materials that are often blended are:

plastics (polyblends)	grains
whiskeys	coffees
fabrics	paints
colors	tobaccos
metal powders	solvents
fertilizers	

See mixture; mixing; kneading.

bleomycin. A glycopeptide antibiotic produced by *Streptomyces verticillus*; it functions as an antineoplastic and diagnostic agent. The molecule is exceedingly complex, but synthesis was achieved in 1982. It is a colorless to yellowish powder, soluble in water and methanol but insoluble in acetone and ether. It induces rupture of DNA strands.

blinding. (blister copper).

Properties: Copper (96–99% purity) produced by the reduction and smelting of copper ores. It has a blistered appearance, probably caused by gas pockets. It is usually further refined electrolytically.

blister gas. See dibromodiethyl sulfide.

blister packaging. A type of packaging used widely in the food and pharmaceutical industries, consisting of a hollow cavity of various shapes and capacities in which the material is enclosed. Polyester and polyethylene resins are often used.

block. (1) Undesirable cohesion of films or layers of plastic.

See antiblock agent. (2) A type of polymer.

See block polymer.

block copolymer. Polymer containing long stretches of two or more monomeric units linked together by chemical valences in one single chain. See block polymer.

block polymer. A high polymer whose molecule is made up of alternating sections of one chemical composition separated by sections of a different chemical nature or by a coupling group of low molecular weight. An example is blocks of polyvinyl chloride interspersed with blocks of polyvinyl acetate. Such polymer combinations are made synthetically. They depend on the presence of an active site on the polymer chain that initiates the necessary reactions.

See graft polymer; stereoblock polymer.

blood. A complex, liquid tissue of d 1.056 and pH 7.35–7.45. It is comprised of erythrocytes (red cells), leucocytes (white cells), platelets, plasma, proteins, and serum. The plasma fraction (55–70%) is whole blood from which the red and white cells and the platelets have been removed by centrifuging. Hemoglobin is a protein found in the erythrocytes. It contains the essential iron atom and functions as the transport agent for oxygen from the lungs (arterial blood) and of carbon dioxide to the lungs from the heart (venous blood). Experimental work has been reported on the effectiveness of fluorocarbon compounds in carrying out the essential transport functions of blood, especially of the red cells.

Use: Plasma is used to restore liquid volume and thus osmotic pressure in the body where blood loss has been extensive. Animal blood is used as a component of adhesive mixtures. In dried or powder form it

is a component of fertilizers, poultry feeds, and deer repellents.

See hemoglobin; plasma; platelet; rhesus factor.

bloom. (1) A thin coating of an ingredient of a rubber or plastic mixture that migrates to the surface, usually within a few hours after curing or setting. Sulfur bloom in vulcanized rubber products is most common; it is harmless but impairs the eye appeal of the product. Paraffin wax is often included purposely; when it migrates to the surface it provides an efficient barrier to sunchecking and oxidation. (2) A piece of steel made from an ingot. (3) An arbitrary scale for rating the strength of gelatin gels. When so used the word is capitalized. (4) Efflorescence of phytoplankton in seawater causing discoloration of the surface water. See red tide.

blotting. A technique for detecting one RNA within a mixture of RNAs (a Northern blot) or one type of DNA within a mixture of DNAs (a Southern blot). A blot can prove whether that one species of RNA or DNA is present, how much is there, and its approximate size. Basically, blotting involves gel electrophoresis, transfer to a blotting membrane (typically nitrocellulose or activated nylon), and incubating with a radioactive probe. Exposing the membrane to X-ray film produces darkening at a spot correlating with the position of the DNA or RNA of interest. The darker the spot, the more nucleic acid was present there.

The DNA is first transferred from the gel to a membrane by capillary action. Fluid wicks from the gel through the blotting membrane to several layers of absorbent paper, but the nucleic acids stick to the membrane. Baking the filter fixes the DNA or RNA to the filter.

Specific bands are detected by hybridization. The filter membrane is incubated with radioactive probe, which hybridizes to some bands. After the filter is washed (to remove unused probe), an X-ray film exposed to the filter will show which bands have hybridized.

blow-down. The cyclic or constant removal of water from a boiler to deter the collection of solids.

blowing agent. A substance incorporated into a mixture for the purpose of producing a foam. One type decomposes when heated to processing temperature to evolve a gas, usually carbon dioxide, which is suspended in small globules in the mixture. Typical blowing agents of this kind are baking powder (bread and cake), sodium bicarbonate or ammonium carbonate (cellular or sponge rubber), halocarbons and methylene chloride in urethane, pentane in expanded polystyrene, and hydrazine and related compounds in various types of foamed plastics. Another type is air used at room temperature as a blowing agent for rubber latex; it is introduced mechanically by whipping, after which the latex is

coagulated with acid. Air is also used for this purpose in ice cream, whipped cream, and other food products, as well as in blown asphalt and blown vegetable oils.

See foam.

blow molding. A technique for production of hollow thermoplastic products. It involves placing an extruded tube (parison) of the thermoplastic in a mold and applying sufficient air pressure to the inside of the tube to cause it to take on the conformation of the mold. Polyethylene is usually used, but a number of other materials are adaptable to this method, e.g., cellulose, nylons, polypropylene, and polycarbonates. It is an economically efficient process and especially suitable for production of toys, bottles, and other containers, as well as air-conditioning ducts and various industrial items. The method is not limited to hollow products; housings can be made by blowing a unit and sawing it along the parting line to make two housings.

blown asphalt. See asphalt (blown).

blown oil. (oxidized oil; base oil; thickened oil; polymerized oil). Vegetable and animal oils that have been heated and agitated by a current of air or oxygen. They are partially oxidized, deodorized, and polymerized by the treatment and are increased in density, viscosity, and drying power. Common blown oils are castor, linseed, rape, whale, and fish oils.

Use: Paints, varnishes, lubricants, and plasticizers.

blue copperas. See copper sulfate.

blue cross gas. See diphenylchloroarsine.

blue gas. See water gas.

blueing. (1) Producing a blue oxide film on steel by low-temperature heating; (2) heat treatment of steel springs to relieve cold-working strains.

blueing, laundry. The material used in washing to give the fabric a bluish tint, thereby neutralizing the yellow coloring to produce a whiter shade.

blueing, steel. The process for shading the surface of steel by heating to blueing temperature in the presence of air and steam.

blue lead. See lead sulfate, blue basic.

blueprint. See Turnbull's Blue.

blueprint paper. A paper that has been dipped in ammonium ferric citrate and potassium ferricyanide solution. When it is exposed to light and a wash, all black marks show as white, and the white background is colored blue.

blue verdigris. See copper acetate, basic.

blue vitriol. See copper sulfate.

blush. Precipitation of water vapor in the form of colloidal droplets on the surface of a varnish or lacquer film, caused by lowering of the temperature immediately above the coated surface due to solvent evaporation. This results in unsightly graying of the dried film and can be avoided by use of a less-volatile solvent.

4-BOC-styrene. See *p-tert*-butoxycarbonyloxystyrene monomer.

BOD. See biochemical oxygen demand.

Bodroux-Chichibabin aldehyde synthesis.

Formation of aldehydes by treatment of orthoformates with Grignard reagents.

Bodroux reaction. Formation of substituted amides by reaction of a simple aliphatic or aromatic ester with an amino magnesium halide obtained by treatment of a primary or secondary amine with a Grignard reagent at room temperature.

body. (1) A nonspecific term approximately synonymous with consistency or viscosity, usually descriptive of liquids, e.g. a heat-bodied oil (linseed oil that has been polymerized by heating).

See consistency.

(2) In biochemistry, an agglutinous substance present in the blood or tissues, e.g. antibody. See agglutination.

(3) An object having a unique physical property, e.g., blackbody.

body-centered structure. (cubic centered).

The internal crystal structure of substances in which the equivalent lattice points, as determined by X ray, are at the corners of the cell and at the center of the cube.

bodying. Gaining body, or thickening after standing, or by mixing with another ingredient.

Boeseken's method. Determination of the relative configurations of the hydroxyl groups on the reducing and vicinal carbon atoms in a cyclic sugar. Boric acid forms complexes with *cis* hydroxyl groups on vicinal carbon atoms, and the electrical conductivity of the solution is enhanced. Since there is no complex formation with *trans* hydroxyl groups, no increase in conductivity is observed.

Bogert-Cook synthesis. Condensation of β -phenylethylmagnesium bromide with cyclohexanones, followed by cyclodehydration of the tertiary alcohol with concentrated sulfuric acid, with formation of octahydrophenanthrene derivatives and a small amount of spiran.

boghead coal. A variety of bituminous or subbituminous coal resembling cannel coal in appearance and behavior during combustion, characterized by a high percentage of algal remains and volatile matter. Upon distillation it gives exceptionally high yields of tar and oil (ASTM).

Bohn-Schmidt reaction. Hydroxylation of anthraquinones containing at least one hydroxyl group by fuming sulfuric acid or sulfuric acid and boric acid in the presence of a catalyst such as mercury.

bohrium. Bh. A transfermium element. Atomic number 107. Very short half-life.

boiled oil. See linseed oil, boiled.

boiler compound. Material added to boiler feed water to reduce corrosion, foaming, or deposit formation.

boiler scale. A rocklike deposit occurring on boiler walls and tubes in which hard water has been heated or evaporated. Consists largely of calcium carbonate, calcium sulfate, or similar materials, depending on the mineral content of the water. Boiler scale decreases the rate of heat transfer through the boiler and tube walls, resulting in increased heating costs and shortening of boiler life. Most boiler feed water is softened (treated to remove calcium and magnesium ions) before use. Scale may be removed by treatment with ammonium bicarbonate solution. See water, hard; zeolite.

boiling point. The temperature of a liquid at which its vapor pressure is equal to or very slightly greater than the atmospheric pressure of the environment. For water at sea level it is 212F (100C).

boiling-point elevation, molecular. The rise in boiling point produced by 1 gram-molecule of dissolved material in 1 kg solvent. Equal to 0.52C with water as the solvent.

boiling point, initial. The temperature at which the first drop of distillate falls from a condenser.

bois de rose oil.

Properties: From steam distillation of chipped wood of *Aniba rosaeodora* var. *amazonica* Ducke, (Fam. Lauraceae). Colorless to pale yellow liquid; slt pleasant floral odor. Sol in fixed oils, propylene glycol, mineral oil; sltly sol in glycerin.

Use: Food additive.

Bolstar [Bayer Corp]. TM for sulprofos.

Bolton's reagent. A composite formed by 78% picric acid, 2% nitric acid, 20% water.

Boltzmann constant. The ratio of the molar ideal-gas constant to Avogadro's number.

Boltzmann engine. Ideal thermodynamic device working in cycles.

Boltzmann entropy hypothesis. The entropy of a system of material particles is proportional to the logarithm of the statistical probability of the distribution.

Boltzmann factor. A correction for thermal excitation in calculation of spectral-line intensities.

Boltzmann, Ludwig. (1844–1906). Born in Vienna, Boltzmann was interested primarily in physical chemistry and thermodynamics. His work has importance for chemistry because of his development of the kinetic theory of gases and the rules governing their viscosity and diffusion. The mathematical expression of his most important generalizations is known as Boltzmann's law, still regarded as one of the cornerstones of physical science.

bomb. A small metal container that can contain gases or liquids under varying degrees of pressure. An aerosol bomb contains liquids that are emitted as an atomized spray on release of pressure, the gases used being carbon dioxide, nitrous oxide, butane, etc. at relatively low pressure. An oxygen bomb is used for accelerated aging tests for rubber and plastic products; oxygen under high pressure is used. This device must be handled by a trained technician.

bombardment. Impingement upon an atomic nucleus of accelerated particles such as neutrons or deuterons for the purpose of inducing fission or of creating unstable nuclei. This operation was first accomplished with positively charged particles in the cyclotron in the early 1940s and subsequently in nuclear reactors. Neutrons are commonly used in reactors because their lack of electrical charge permits easier penetration of the target nucleus. See radioisotope; fission; fast-atom bombardment.

bomb calorimeter. An instrument to obtain the caloric or thermal value of fuel or foods.

bomb tube. See Carius tube.

BON. Abbreviation for β -oxynaphthoic acid. See 3-hydroxy-2-naphthoic acid; BON red.

bonaid. See buquinolate.

"Bonaril" [Dow]. TM for a hydrolyzed polyacrylamide for use in foundry sands.

bond, chemical. An attractive force between atoms strong enough to permit the combined aggregate to function as a unit. A more exact definition is not possible because attractive forces ranging up-

ward from 0 to those involving more than 250 kcal/mole of bonds are known. A practical lower limit may be taken as 2–3 kcal/mole of bonds, the work necessary to break approximately 1.5×10^{24} bonds by separating their component atoms to infinite distance. All bonds appear to originate with the electrostatic charges on electrons and atomic nuclei. Bonds result when the net coulombic interactions are sufficiently attractive. Different principal types of bonds recognized include metallic, covalent, ionic, and bridge. Metallic bonding is the attraction of all the atomic nuclei in a crystal for the outer shell electrons which are shared in a delocalized manner among all available orbitals. Metal atoms characteristically provide more orbital vacancies than electrons for sharing with other atoms. Covalent bonding results most commonly when electrons are shared by two atomic nuclei. Here the bonding electrons are relatively localized in the region of the two nuclei, although frequently a degree of delocalization occurs when the shared electrons have a choice of orbitals. The conventional *single* covalent bond involves the sharing of two electrons. There may also be *double* bonds with four shared electrons, *triple* bonds with six shared electrons, and bonds of intermediate multiplicity. Covalent bonds may range from *nonpolar*, involving electrons evenly shared by the two atoms, to extremely *polar*, where the bonding electrons are very unevenly shared. The limit of uneven sharing occurs when the bonding electron spends full time with one of the atoms, making the atom into a negative ion and leaving the other atom in the form of a positive ion. Ionic bonding is the electrostatic attraction between oppositely charged ions. Bridge bonds involve compounds of hydrogen in which the hydrogen bears either a + or – charge. When hydrogen is attached by a polar covalent bond to one molecule, it may attract another molecule, bridging the two molecules together. If the hydrogen is +, it may attract an electron pair of the other molecule. This is called a *protonic bridge*. If the hydrogen is –, it may attract through a vacant orbital the nucleus of an atom of a second molecule. This is called a *hydridic bridge*. Such bridges are at the lower range of bond strength but may have a significant effect on the physical properties of condensed states of those substances in which they are possible.

See hydrogen bond.

bond energy. The energy required to disrupt the bonds in one gram-mole of a chemical compound.

“Bonderite” [Occidental]. TM for chemical compositions for producing a corrosion-inhibiting finish on metals, preparing metal surfaces for the subsequent application of finish coats, and conditioning metal surfaces to facilitate metal-deformation operations.

“Bonderlube” [Occidental]. TM for soaplike chemical composition for treating metal surfaces that have been pretreated with phosphatizing coat-

ing chemicals in order to form a lubricant layer adapted to cold forming and in order to retard the formation of rust.

“Bonding Agent M-3P” [Uniroyal]. TM for 1-aza-5-methylol-3,7-doxabicyclo-(3,3,0)-octane, a 4% partitioning agent.

Use: A methylene donor for improving rubber-to-fabric adhesion.

“Bonding Agent R-6” [Uniroyal]. TM for resorcinol-acetaldehyde condensate.

Use: A resorcinol donor for improving rubber-to-fabric adhesion.

“Bonding Agent TZ” [Uniroyal]. TM for 2-chloro-4,6-bis(*N*-phenyl-*p*-phenylene diamino)-1,3,5-triazine.

Use: A rubber-to-metal bonding agent that replaces the traditional cobalt salt.

bone ash. An ash composed principally of tribasic calcium phosphate but containing minor amounts of magnesium phosphate, calcium carbonate, and calcium fluoride. Noncombustible.

Derivation: By calcining bones. A synthetic product is also available.

Use: Cleaning and polishing, ceramics, animal feeds. The better grades are used in coating molds for copper wire, bars, slabs, and other metals.

bone black. (bone char; bone charcoal).

Black pigment made by carbonizing bones. Carbon content is usually approximately 10%. Nonflammable in bulk.

Hazard: Flammable as suspended dust.

Use: Manufacturing activated carbon; decolorizing agent and filtering medium, cementation reagent, adsorptive medium in gas masks, paint and varnish pigment; clarifying shellac, water purification.

bone china. Ceramic tableware of high quality in which a small percentage of bone ash is incorporated. Made chiefly in England.

bone meal. A product made by grinding animal bones. Raw meal is made from bones that have not been previously steamed. If pressure steaming has been used, the meal is called *steamed*. The fertilizer grade contains 43–55% tricalcium phosphate, 20–25% phosphoric acid, and 4–5% ammonia. The feed grade, according to Bureau of Animal Industry specifications, must contain 65–75% tricalcium phosphate and only approximately 2% ammonia. Much of the latter grade is imported.

Use: Fertilizer (raw); animal feeds (steamed).

bone oil. (animal oil; Dippel’s oil; hartshorn oil).

CAS: 8001-85-2.

Properties: Dark-brown, fixed oil; repulsive odor. D 0.900–0.980. Soluble in water. Combustible.

Chief constituents: Hydrocarbons, pyridine bases, and amines.

Derivation: Destructive distillation of bones or other animal substances. Note distinction from bone tallow.

Grade: Technical.

Hazard: Evolves very toxic ammonium cyanide when heated to 180C.

Use: Organic preparations, source of pyrrole, denaturant for alcohol.

bone phosphate. (BPL). Phosphoric acid occurring in bones in the form of tribasic calcium phosphate.

bone seeker. An element or radioisotope that tends to lodge in the bones when absorbed into the body. Examples are fluorine, calcium, and strontium.

bone tallow. (bone fat). Fat obtained from animal bones by boiling in water, treating with steam under pressure, or solvent extraction. It is a glyceryl ester.

BON maroon. A calcium or manganese precipitated compound of 3-hydroxy-2-naphthoic acid and 2-naphthylamine-1-sulfonic acid.

See BON red.

BON red. Class name for a group of organic azo pigments made by coupling 3-hydroxy-2-naphthoic acid to various amines and forming the barium, calcium, strontium, or manganese salts. They have bright shades ranging from yellow-red to deep maroon, good light and heat resistance, nonbleeding in vehicles and solvents, and good opacity. They are widely used in printing inks, paints, enamels, lacquers, rubber, plastics, wallpaper, textiles, floor coverings, and crayons.

Boord olefin synthesis. Regiospecific synthesis of olefins from aldehydes and Grignard reagents.

boort. (bort).
See diamond, industrial.

BOPOB. See *p*-bis[2-(5-*p*-biphenyloxyazo)]benzene.

boracic acid. See boric acid.

boral. A composite material consisting of boron carbide crystals in aluminum with a cladding of commercially pure aluminum. Concentration of up to 50% boron carbide can be obtained.

Use: Reactor shields, neutron curtains, shutters for thermal curtains, safety rods, containers for fissionable material.

See composite.

"Boran" [LaMotte]. TM for diaminochryszazin used in the colorimetric determination of boron.

borane. One of a series of boron hydrides (compounds of boron and hydrogen). The simplest of these, BH_3 , is unstable at atmospheric pressure and becomes diborane (B_2H_6) as gas at normal pressures. This is converted to higher boranes, i.e., penta-, deca-, etc., by condensation. This series progresses through a number of well-characterized crystalline compounds. Hydrides up to $B_{20}H_{26}$ exist. Most are not very stable and readily react with water to yield hydrogen. Many react violently with air. As a rule, they are highly toxic. Their properties have suggested investigation for rocket propulsion, but they have not proved satisfactory for this purpose. There are also a number of organoboranes used as reducing agents in electroless nickel-plating of metals and plastics. Some of the compounds used are di- and triethylamine borane and pyridine borane.

See carborane; diborane; pentaborane; organoborane.

boranecarboxylic acid, ammonium salt.

See ammonium boranecarboxylate.

borates, tetra, sodium salt, pentahydrate.

See sodium tetraborate pentahydrate.

borax. (sodium borate; tincal; borax decahydrate). $Na_2B_4O_7 \cdot 10H_2O$. A natural hydrated sodium borate found in salt lakes and alkali soils. Also the commercial name for sodium borate.

Hazard: Toxic. TLV: 5 mg/m³.

borax, anhydrous. (borax, dehydrated; sodium borate, anhydrous).

CAS: 1303-43-4. $Na_2B_4O_7$.

Properties: White, free-flowing crystals; hygroscopic; forms partial hydrate in damp air. Mp 741C, d 2.367. Slightly soluble in cold water. Noncombustible.

Grade: Technical, 99% $Na_2B_4O_7$, standard, fine granular form, glass or fused.

Hazard: Toxic. TLV: 1 mg/m³.

Use: Manufacturing of glass, enamels, and other ceramic products; herbicide.

borax glass. Fused anhydrous borax used as a metal flux.

borax pentahydrate. $Na_2B_4O_7 \cdot 5H_2O$.

Properties: Free-flowing powder. Begins to lose water of hydration at 122C, d 1.815. Noncombustible.

Grade: Crude, technical (99.5% $Na_2B_4O_7 \cdot 5H_2O$).

Hazard: Toxic. TLV: 1 mg/m³.

Use: Weed killer and soil sterilant, fungus control on citrus fruits (FDA tolerance 8 ppm of boron residue).

borazole. (borazine). $B_3N_3H_6$. Inorganic analog of benzene.

Properties: Colorless liquid. Fp -58°C , bp 53°C , d 0.824 (0C), hydrolyzes to evolve boron hydrides.
Hazard: Dangerous fire risk. Toxic via ingestion and inhalation, strong irritant to tissue.

Borcher's metal. A group of alloys of chromium with nickel and cobalt or of chromium and iron with a small proportion of molybdenum and/or silver or gold. Heat and corrosion resistant.

Use: Chemical apparatus, crucibles, pyrometer tubes, heat treating, and annealing pots.

Borcher's process. An electrolytic method for refining silver by using silver sheet cathodes and dilute nitric acid electrolyte.

bordeaux direct. See C.I. direct red 13, disodium salt.

Bordeaux mixture. A fungicide and insecticide mixture made by adding slaked lime to a copper sulfate solution. It is either made by the user or bought as a powder ready for dissolving. Stabilizing agents are sometimes added to delay settling. Used especially for potato bugs and similar garden pests.

Hazard: Irritant and corrosive by ingestion.

boric acid. (boracic acid; orthoboric acid).

CAS: 10043-35-3. H_3BO_3 .

Properties: Colorless, odorless scales or white powder; stable in air. D: 1.4347 (15C), mp indeterminate since it loses water in stages through metaboric acid, HBO_2 , to pyroboric acid, $\text{H}_2\text{B}_4\text{O}_7$, and to the oxide, B_2O_3 . Soluble in boiling water, alcohol, and glycerol. Noncombustible.

Derivation: (1) By adding hydrochloric or sulfuric acid to a solution of borax and crystallizing. (2) From weak borax brines by extraction with a kerosene solution of a chelating agent such as 2-ethyl-1,3-hexanediol or other polyols. Borates are stripped from the chelate by sulfuric acid.

Method of purification: Recrystallization.

Grade: Technical, 99.9%, CP, USP.

Hazard: Toxic via ingestion. Use only weak solutions. Irritant to skin in dry form.

Use: Heat-resistant (borosilicate) glass, glass fibers, porcelain enamels, boron chemicals, metallurgy (welding flux, brazing copper), flame-retardant in cellulosic insulation, mattress batting and cotton textile products, fungus control on citrus fruits (FDA tolerance 8 ppm boron residue), ointment and eye wash (water solution only), nickel electroplating baths.

boric acid esters. (borate ester; trimethyl borate; tri-*n*-butyl borate; tricyclohexyl borate; tridodecylborate; tri-*p*-cresyl borates). Trihexylene glycol diborate compounds that are readily hydrolyzed to boric acid and the respective alcohols.

Properties: Colorless to yellow liquids. Bp 230–350C. Combustible.

Use: Dehydrating agents, catalysts, sources of boric

oxide, special solvents, stabilizers, plasticizers or adhesion additives to latex paints, ingredients of soldering and brazing fluxes.

orthoboric acid. See boric acid.

boric anhydride. See boric oxide.

boric oxide. (boric anhydride; boron oxide).

CAS: 1303-86-2. B_2O_3 .

Properties: Colorless powder or vitreous crystals; slightly bitter taste. D 2.46, mp approximately 450C, bp 1500C. Soluble in alcohol and hot water; slightly soluble in cold water. Noncombustible.

Derivation: By heating boric acid.

Grade: Glass or fused form, powder, technical, or highpurity 99.99+%.

Hazard: TLV: 10 mg/m³.

Use: Production of boron, heat-resistant glassware, fire-resistant additive for paints, electronics, liquid encapsulation techniques, herbicide.

boride. An interstitial compound of boron and another metal (transition, alkaline-earth, or rare-earth). Such compounds are not stoichiometric, the boron atoms being linked together in zigzag chains, two-dimensional nets, or three-dimensional structures throughout the crystal.

Properties: Color varies from gray (transition-metal) to black (alkaline-earth) to blue (rare-earth). Highly refractory, with mp from 2000 to 3000C; Mohs hardness from 8 to 10; thermally and electrically conductive. High chemical stability. Does not react with hydrochloric or hydrofluoric acids but is attacked by hot alkali hydroxides.

Derivation: (1) Sintering mixtures of metal powder and boron at 2000C; (2) reduction of mixture of the metal oxide and boric oxide with aluminum, silicon, or carbon; (3) fused-salt electrolysis; (4) vapor-phase deposition.

Use: High-temperature service such as rocket nozzles, turbines, etc.

borneol. (bornyl alcohol; 2-camphanol; 2-hydroxycamphane).

CAS: 507-70-0. $\text{C}_{10}\text{H}_{17}\text{OH}$.

Properties: White, translucent lumps; sharp, camphorlike odor; burning taste. Optically active in natural form, racemic form made synthetically. D 1.011, mp 208C, bp 212C. Soluble in alcohol and ether; insoluble in water. Flammable.

Derivation: Natural form from a species of tree in Borneo and Sumatra. Synthesized from camphor by hydrogen reduction or from α -pinene.

Grade: Technical.

Hazard: Fire risk in presence of open flame.

Use: Perfumery, esters.

Born equation. An equation representing the free energy of solvation of an ion.

bornyl acetate. $\text{C}_{10}\text{H}_{17}\text{OOCCH}_3$.

Properties: Colorless liquid; piney-camphoraceous odor. D 0.980–0.984, refr index 1.463–1.465, mp 29C. Solidifies to crystals at approximately 50F. Soluble in 3 volumes of 70% alcohol; miscible with 95% alcohol and ether. Combustible.

Derivation: Interaction of borneol and acetic anhydride in the presence of formic acid.

Grade: Technical, FCC.

Use: Perfumery, flavoring, nitrocellulose solvent.

bornyl alcohol. See borneol.

2-bornyl chloride.

CAS: 464-41-5. mf: $C_{10}H_{17}Cl$.

Hazard: A poison by inhalation. Moderately toxic by ingestion.

bornyl formate. $C_{10}H_{17}OOCH$.

Properties: Colorless liquid having a piney odor. D 1.007–1.009. Combustible.

Grade: Technical.

Use: Perfuming of soaps, disinfectants, and sanitary products; flavoring.

bornyl isovalerate. $C_{10}H_{17}OOC_3H_7$. A constituent of valerian oil.

Properties: Limpid fluid; aromatic, valerian-like odor. D 0.951 (20C), bp 255–260C. Soluble in alcohol and ether; insoluble in water. Combustible.

Use: Medicine, essential-oil intermediate, flavoring.

boroethane. See diborane.

boron. B. Nonmetallic element of atomic number 5; group IIIA of the periodic table. Aw 10.81. Valence 3. Two stable isotopes: 11 (approximately 81%) and 10 (approximately 19%).

Properties: Black, hard solid; brown, amorphous powder; crystals. D 2.45, mp 2300C, Mohs hardness 9.3. Highly reactive. Soluble in concentrated nitric and sulfuric acids; insoluble in water, alcohol, and ether. High neutron absorption capacity. Amphoteric. A plant micronutrient.

Source: Borax, kernite, colemanite, ulexite.

Derivation: (1) By heating boric oxide with powdered magnesium or aluminum; (2) by vapor-phase reduction of boron trichloride with hydrogen over hot filaments (80–2000C); (3) by electrolysis of fused salts.

Available forms: Filament, powder, whiskers, single crystals.

Grade: Technical (90–92%), 99% pure, high-purity crystals.

Hazard: Dust ignites spontaneously in air; severe fire and explosion hazard. Reacts exothermally with metals above 900C; explodes with hydrogen iodide.

Use: Special-purpose alloys, cementation of iron, neutron absorber in reactor controls, oxygen scavenger for copper and other metals, fibers and filaments in composites with metals or ceramics, semiconductors, boron-coated tungsten wires, rocket propellant

mixtures, high-temperature brazing alloys. See boron alloy; boron fiber; boron-10.

boron-10. Nonradioactive isotope of boron of mass number 10.

Properties: Has marked capacity for absorbing slow neutrons, emitting a high-energy α -particle in the process.

Derivation: Constitutes approximately 19% of natural boron.

Available forms: Crystalline powder, dry amorphous powder, colloidal suspension of dry amorphous powder in oil; in boron trifluoride–calcium fluoride, in potassium borofluoride, in boron trifluoride ethyl etherate, in boric acid.

Use: Neutron counter, radiation shielding (in the form of boral), medicine.

boron alloy. A uniformly dispersed mixture of boron with another metal or metals. Ferroboration usually contains 15–25% boron, manganese boron usually contains 60–65% manganese.

Use: Degassing and deoxidizing agents, to harden steel (in trace quantities), to increase conductivity of copper, turbojet engines.

boron bromide. See boron tribromide.

boron carbide. B_4C .

Properties: Hard, black crystals. D 2.6, Mohs hardness 9.3, mp 2350C, bp 3500C. Soluble in fused alkali; insoluble in water and acids. High capture cross-section for thermal neutrons.

Derivation: Heating boron oxide with carbon in an electric furnace.

Available forms: Powder, crystals, rods, fibers, whiskers.

Hazard: Avoid inhalation of dust or particles.

Use: Abrasive powder, abrasion resister and refractory, control rods in nuclear reactors, reinforcing agent in composites for military aircraft, and other special applications.

See boral.

boron chloride. See boron trichloride.

boron fiber. A vapor-deposited filament made by deposition of boron on a heated tungsten wire. The filament is 0.004 inch in diameter, while the wire is only 0.0005 inch. Tensile strength 350,000–450,000 psi, elastic modulus 55 million psi, upper temperature limit in oxidizing atmosphere 250C. Used in composites with epoxy resins for aircraft and space applications. The fibers can be woven into fabrics.

boron fluoride. See boron trifluoride.

boron fuel. See rocket fuel.

boron hydride. See borane; diborane; decaborane; pentaborane.

boron nitride. BN.

Properties: White powder; particle diameter approximately 1 micron. Mp 3000C (sublimes). Graphite-like, hexagonal plate structure. High electrical resistance. Compressed at 10⁶ psi, it becomes hard as diamond. Excellent heat-shock resistance, low mechanical strength, hygroscopic. Noncombustible.

Derivation: Heating a mixture of boric acid and tricalcium phosphate in ammonia atmosphere in an electric furnace.

Available forms: Powder, compressed solid, fibers, whiskers.

Use: Refractory, furnace insulation, crucibles, rectifying tubes, dielectric, chemical equipment, self-lubricating bushings, molten-metal pump parts, transistor and rectifier mounting wafers, heat-shield for plasma, nose-cone windows, heat-resistant fibers stable to 870C in oxidizing atmosphere for military composites, metalworking abrasive, high-temperature insulator, high-strength fibers.

boron oxide. See boric oxide.**boron phosphate.** (Sometimes called borophosphoric acid). BPO₃.

Properties: White, nonhygroscopic crystals. D 1.873. Soluble in water; pH (1% solution) 2.0.

Use: Special glasses, ceramics, acid cleaner, dehydration catalyst.

boron phosphide. BP. A refractory, maroon powder; noncorrosive; Mohs hardness 9.5.

Derivation: Direct union of boron and phosphorus at approximately 1000C in a reducing atmosphere.

Hazard: Evolves toxic fumes in contact with water and acids. Ignites spontaneously at 390F (199C).

boron steel. See ferroboration.**boron tribromide.** (boron bromide).

CAS: 10294-33-4. BBr₃.

Properties: Colorless, fuming liquid. Decomposed by alcohol and water. D 1.69 (15C), bp 90C, fp -46C.

Derivation: (High purity.) Direct bromination of boron followed by rectification in quartz columns.

Grade: Technical, high purity.

Hazard: Corrosive to tissue. TLV: ceiling 1 ppm. May explode when heated.

Use: Catalyst in organic synthesis manufacture of diborane.

boron trichloride. (boron chloride).

CAS: 10294-34-5. BCl₃.

Properties: Colorless, fuming liquid. D 1.35 (25C), bp 12.5C, fp -107C. Decomposed by alcohol and water. Reacts with hydrogen at 1200C.

Derivation: (1) Heating boric oxide and carbon with chlorine; (2) combining boric oxide with phosphorus pentachloride.

Grade: Technical (99%), CP (99.5%).

Hazard: Strong irritant to tissue. Fumes are corrosive and toxic.

Use: Catalyst in organic syntheses; source of many boron compounds; refining of alloys; soldering flux; making electrical resistors; extinguishing magnesium fires in heat-treating furnaces; manufacturing of diborane.

boron trifluoride. (boron fluoride).

CAS: 7637-07-2. BF₃.

Properties: Colorless gas. D 3.076 g/L, fp -126.8C, bp -101C. Does not support combustion. Soluble in cold water; hydrolyzes in hot water; soluble in concentrated sulfuric acid and most organic solvents. Easily forms double compounds such as that with ether, known as boron trifluoride etherate or BF₃-ether complex.

Derivation: From borax and hydrofluoric acid or from boric acid and ammonium bifluoride. The complex formed is then treated with cold-fuming sulfuric acid.

Grade: Pure (99% min).

Hazard: Toxic by inhalation, corrosive to skin and tissue. TLV: ceiling 1 ppm.

Use: Catalyst in organic synthesis, production of diborane, instruments for measuring neutron intensity, soldering fluxes, gas brazing.

boron trifluoride etherate. (BF₃-ether complex). CH₃CH₂O(BF₃)CH₂CH₃. A relatively stable coordination complex formed by the combination of diethyl ether with boron trifluoride, in which the boron atom is bonded to the oxygen of the ether.

Properties: Fuming liquid. Bp 259C (126C), flash p 147F (63.8C) (OC). Combustible.

Hazard: Toxic by inhalation, corrosive to skin and tissue.

Use: Catalyst in organic synthesis.

boron trifluoride-methanol. (BF₃-MeOH).

A solution of boron trifluoride in methanol.

Properties: Concentrated 14 g/100 cc, d 0.90 (20C).

Hazard: Moderate fire risk. Combustible.

Use: Esterification reagent for fats and oils.

boron trifluoride monoethylamine. (boron fluoride monoethylamine; BF₃-MEA).

BF₃-C₂H₅NH₂.

Properties: White to pale-tan flakes. D 1.38, mp 88-90C. Soluble in furfuryl alcohol, polyglycol, acetone. Releases boron trifluoride above 110C.

Hazard: Moderate fire risk. Combustible.

Use: Elevated-temperature cure of epoxy resins.

borophosphoric acid. See boron phosphate.**borosilicate glass.** See glass, heat-resistant.

“Boro-Silicone” [Reactor]. TM for fire- and heat-resistant field-castable elastomer with high hydrogen content. A solid material with resiliency to

minimize impact due to secondary missile formation.

borotungstic acid. (borowolframic acid).

Various formulas and properties given.

Grade: Technical.

Use: Mineralogic assay.

Borsche-Drechsel cyclization. Acid-catalyzed rearrangement of cyclohexanone phenylhydrazone to tetrahydrocarbazole. Subsequent oxidation yields carbazole.

Bosch, Karl. (1874–1940) A German chemist who was the 1931 recipient of the Nobel Prize with Friederick Bergius. In World War I, his catalyst study led to the production of synthetic gasoline. He also worked in the area of chemical high-pressure methods. His research in ammonia synthesis aided in the manufacture of fertilizers and explosives. His doctorate was awarded in Leipzig, Germany.

Bosch-Meiser urea process. Industrial process for formation of urea by reaction of carbon dioxide with ammonia at elevated temperatures and pressures.

Bosch process. A method of recovering hydrogen from water gas wherein carbon monoxide is reacted with steam at 500C in the presence of catalysts to form carbon dioxide and hydrogen.

Bose-Einstein statistics. The statistical analysis of interspin particles such as radiation quanta.

bosentan.

CAS: 147536-97-8. mf: $C_{27}H_{29}N_3O_6S$.

Hazard: A reproductive hazard.

“Botran” [Pfizer]. TM for an agricultural fungicide, 2,6-dichloro-4-nitroaniline.

botulism. An intense and often fatal poisoning caused by ingestion of the anaerobic bacterium *Clostridium botulinum*, a Gram-positive bacillus that proliferates in many kinds of inadequately sterilized canned food products those preserved at home. Death from respiratory paralysis occurs in from 30 to 65% of the cases. Heating to 80C or higher for 25 to 30 minutes before serving is effective protection against this powerful toxin. Extensive tests have indicated that meats such as bacon can be made resistant to botulism by treatment with a combination of potassium sorbate and sodium nitrite.

Bouchardat's solution. Iodine dissolved in aqueous potassium iodide.

Bouin's fluid. A tissue preservative composed of picric acid, formalin, and acetic acid.

bound water. Water molecules that are tightly held by various chemical groups in a larger molecule. Carboxyl, hydroxyl, and amino groups are usually involved; hydrogenbonding is often a factor. Proteins tend to bind water in this way, and in meats it will remain unfrozen as low as $-40C$.

Bourdon gauge. A pressure gauge using a flattened tube (Bourdon tube), that straightens out under pressure.

Bouveault aldehyde synthesis. Action of Grignard reagents on *N,N*-disubstituted formamides yields aldehydes.

Bouveault-Blanc reduction. Formation of alcohols by reduction of esters with sodium and an alcohol.

Boyer, Paul D. (1918–). A chemist who won the Nobel Prize in 1997 for his work on elucidating the enzymatic mechanism by which ATP synthase (ATPase) catalyzes the synthesis of adenosine triphosphate (ATP), the energy source of living cells. He is a professor of biochemistry at the University of California, Los Angeles. He received a Ph.D. in Biochemistry in 1943 from the University of Wisconsin, Madison, U.S.A.

See Walker, John E., Skou, Jens C.

Boyle, Robert. (1627–1691). A native of Ireland, Boyle devoted his life to experiments in what was then called “natural philosophy,” i.e., physical science. He was influenced early by Galileo. His interest aroused by a pump that had just been invented, Boyle studied the properties of air, on which he wrote a treatise (1660). Soon thereafter, he stated the famous law that bears his name (see following entry). Boyle's group of scientific enthusiasts was known as the “invisible college”, and in 1663 it became the Royal Society of London. Boyle was one of the first to apply the principle that Francis Bacon had described as “the new method”—namely, inductive experimentation as opposed to the deductive method of Aristotle—and this became and has remained the cornerstone of scientific research. Boyle also investigated hydrostatics, desalination of seawater, crystals, electricity, etc. He approached but never quite stated the atomic theory of matter; however, he did distinguish between compounds and mixtures and conceived the idea of “particles” becoming associated to form molecules.

Boyle's law. The volume of a sample of gas varies inversely with the pressure if the temperature remains constant. The relation is strictly true only for a perfect or ideal gas, but the law is satisfactory for practical calculations except when pressures are high or temperatures are approaching the liquefaction point. The van der Waals equation is a refinement that is adequate over a wider range. See ideal gas.

BP. (bp). Abbreviation for base pair(s). Double stranded DNA is usually measured in bp rather than nucleotides (nt).

“BPIC” [PPG]. TM for technical grade of *t*-butylperoxyisopropyl carbonate, a polymerization initiator for acrylic, ethylene, styrene, and other monomers, and a cross-linking agent for silicone and ethylene propylene elastomers.

BPL. (1) Abbreviation for bone phosphate of lime.

See bone phosphate. (2) Abbreviation for β -propiolactone.

“BPR” [FMC]. TM for insecticidal mixture containing varying proportions of pyrethrin, piperonyl butoxide, and rotenone in liquid or dust base.

Br. Symbol for bromine.

BRA. Abbreviation for β -resorcylic acid.

brackish water. Water that is lower in salinity than normal seawater and higher in salinity than freshwater, ranging from 30 to 0.5 parts salt per 1000 parts water.

Bradsher reaction. Acid-catalyzed cyclodehydration of *o*-acyldiarylalkanes to polycyclic hydrocarbons and their heterocyclic analogs.

Bragg angle. Characteristic angle of the diffraction of X rays from planes of a crystal.

Bragg law. The equation describing how a system of parallel atomic layers in a crystal reflects a beam of X rays with great intensity.

Bragg X ray method. The X ray examination of crystals using a single large crystal rotated through a small angle around an axis in a crystal face.

brake fluid. See hydraulic fluid.

branched chain. See chain.

branch migration. See Holliday intermediate.

bran oil. See furfural.

brasilin. (brazilin; brazilwood extract).

$C_{16}H_{14}O_5$. The crystalline, colorizing principle of brazilwood.

Properties: White or pale-yellow, rhombic needles from alcohol; turns orange in air or light. Soluble in water, alcohol, and ether; in alkalis giving a carmine-red color. Decomposes above 130C.

Use: Dyeing wood, ink, textiles, etc. red and purple

shades. Acid-base indicator, turning yellow in acid and carmine red in alkali. Biological stain.

brass. Copper-zinc alloys of varying composition. Low-zinc brasses (below 20%) are resistant to stress-corrosion cracking and are easily formed. Red brass (15% zinc) is highly corrosion-resistant. Yellow brasses contain 34–37% zinc, have good ductility and high strength, and can withstand severe cold-working. Cartridge brass contains 30–33% zinc. Muntz metal (40% zinc) is primarily a hot-working alloy used where cold-forming operations are unnecessary. Some brasses also contain low percentages of other elements, e.g., manganese, aluminum, silicon, lead, and tin (admiralty metal, naval brass). **Hazard:** Flammable in powder or finely divided form.

Use: Condenser tube plates, piping, hose nozzles and couplings, oil gauges, flow indicators, air cocks, drain cocks, marine equipment, jewelry, fine arts, stamping dies.

See admiralty metal; aluminum brass; red brass; yellow brass; Muntz metal.

brassicidic acid. (*trans*-13-docosenoic acid). $CH_3(CH_2)_7HC=CH(CH_2)_{11}COOH$. An isomer of erucic acid.

Properties: White crystals. Mp 61–62C, bp 282C (30 mm), *d* 0.859, refr index 1.448 (57C). Insoluble in water; slightly soluble in alcohol; soluble in ether. Combustible.

Derivation: By treating erucic acid with nitrous acid (catalyst).

von Braun reaction. Reaction of tertiary amines with cyanogen bromide to form disubstituted cyanamides and an alkyl halide.

Brazil wax. See carnauba wax.

brazing. A welding method in which a nonferrous filler alloy is inserted between the ends or edges of the metals to be joined.

See welding.

Bredt's rule. A restriction applying to bridged systems, that states that in some bridged systems the branching points (the bridgeheads) cannot be involved in a double bond. As a corollary, reactions that should lead to such compounds will be hindered or will take a different course.

breeder. A particularly efficient type of nuclear reactor that is able to utilize the tremendous energy latent in ^{238}U . This cannot be exploited in conventional (thermal) nuclear reactors, which are fueled with enriched uranium or plutonium, for these eventually become depleted and must be replaced. The fuel used for the breeder reactor is a mixture of nonfissionable ^{238}U and ^{239}Pu sealed in long, thin hexagonal metal tubes, which are in turn contained in cans called subassemblies. These constitute the

reactor core. Around it are placed several layers of U^{238} , also in subassemblies. When criticality is reached, the unmoderated neutron flux from the core permeates the entire system and thus "breeds" fissionable ^{239}Pu in the surrounding ^{238}U . The amount of fissionable material thus made available is about 100 times as great as that obtainable with a conventional reactor, since all the energy potential of the ^{238}U can be released. Twenty pounds of uranium has the potential of delivering approximately 52×10^6 kWh of electricity; only a small fraction of this would be extractable without breeding. The breeder utilizes fast neutrons that are much more efficient than the slow (thermal) neutrons used in conventional reactors. Liquid sodium is the coolant in breeder reactors, as it has no retarding effect on the neutrons: 2.9 neutrons per fission are produced in the breeder compared with only 2.4 in water-moderated reactors. This excess of neutrons makes it possible for the fast breeder to produce more fuel than it consumes. Breeders have been operating on a commercial scale in several European countries for some years. The NRC authorized construction of the Clinch River breeder, but funding was canceled as a result of opposition by environmentalist and antinuclear groups. The only operating breeder reactor in the U.S. is Argonne's EBR-11 in Idaho.

breeze. Coke particles less than one-half inch in diameter. This occurs to the extent of approximately 100 lb/ton of coal processed.

bretonite. (iodoacetone). $\text{CH}_3\text{COCH}_2\text{I}$.

Properties: Bp 102C.

brevetoxin.

CAS: 98225-48-0.

Hazard: A poison by ingestion.

Source: Natural product.

brewing. The production of beer, ale, and malt liquors by a process involving a complex series of enzymatic reactions. The most important of these is the conversion of starch to a malt extract (wort), which in turn is fermented with yeast. Mashing is the preparation of wort from malt and cereals by enzymatic hydrolysis, after which the product is boiled with hops, which impart the characteristic taste and aroma of beer. The malt extract must contain the nutrients required for yeast growth. Mashing involves a complex interplay of chemical and enzymatic reactions that are not fully understood. Few changes have been made in the basic brewing processes for more than a century, but increased automatic operation and quality-control techniques ensure a consistently good product.

See fermentation; yeast; wort.

Brewster angle. The angle of incidence at which a wave, polarized in the plane of the angle of incidence, undergoes a phase shift of one quadrant on reflection at the surface.

Brewster process. A method for the extraction of acetic acid from the acid distillate of the destructive distillation of wood. Isopropyl ether is used as the solvent for the acetic acid.

brick, refractory. A highly heat-resistant and nonconductive material used for furnace linings, as in the glass and steel industries and other applications where temperatures above 1600C are involved. Some types are made of quartzite or high-silica clay, others of metallic ores such as chromite, magnesite, and zirconia.

See refractory.

bridge. See bond, chemical; hydrogen bond.

brightener. A compound that when added to a nickel-plating formulation of the Watts type (nickel sulfate and nickel chloride in a six-to-one ratio plus boric acid) will yield a bright, reflective finish. There are two types: (1) naphthalenedisulfonic acids, diphenyl sulfonates, aryl sulfonamides, etc., which give bright deposits on polished surfaces; and (2) metal ions having high hydrogen overvoltage in acid solution (zinc, cadmium, selenium, etc.) and unsaturated organic compounds such as thiourea, acetylene derivatives, azo dyes, etc., which give mirror brightness as a result of their "leveling" action. Usually both types are used for maximum effectiveness.

See leveling (2); optical brightener.

brightening agent. (optical bleach). A colorless substance that absorbs UV radiation and produces a bluish hue complementary to the yellow tint of an off-white substrate.

bright stock. Lubricating oil of high viscosity obtained from residues of petroleum distillation by dewaxing and treatment with fuller's earth or similar material. Sometimes also applied to viscous petroleum distillates.

Use: For blending with neutral oils in preparing automotive engine lubricating oils.

"Brij" [ICI]. TM for a series of emulsifiers and wetting agents developed for use in emulsions of high alkalinity or acidity. They are polyoxyethylene ethers of higher aliphatic alcohols. Soluble in water and lower alcohols. Insoluble in coal tar hydrocarbons.

brilliant crocein. (CI 17190; Crocein Scarlet MOO). $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_{10}\text{H}_4\text{OH}(\text{S}_3\text{Na})_2$.

Properties: Light-brown powder, cherry-red solution in water.

Use: To dye wool and silk red from acid solution and cotton and paper with aid of a mordant. Also used for red lakes, biological stain.

brilliant green. (CI 42040; Malachite Green G). $\text{C}_{27}\text{H}_{34}\text{N}_2\text{O}_4\text{S}$.

Properties: Yellow crystals. Soluble in water and alcohol.

Derivation: Condensation of benzaldehyde with diethylaniline in presence of sulfuric acid, followed by oxidation of the triphenylmethane product formed and conversion to sulfate.

Use: Dyeing textiles, inks, etc.; indicator; staining bacteria; antiseptic.
See Malachite Green.

brilliant toning red amine. See 4-amino-2-chlorotoluene-5-sulfonic acid.

brimonidine.

CAS: 59803-98-4. mf: $C_{11}H_{10}BrN_5$.

Hazard: A poison by ingestion.

brimstone. Lumps or blocks of sulfur obtained in refining of sulfur. It collects on the floor of the condensing chamber, where it is cast into sticks. See sulfur.

brine. Any solution of sodium chloride and water, usually containing other salts also. The most industrially important brines are (1) in subterranean wells as in Michigan; (2) in desert lakes such as the Great Salt Lake, Searles Lake, Salton Sea, and Dead Sea; and (3) in the ocean. These are the sources of many inorganic chemicals such as soda ash, sodium sulfate, potassium chloride, bromine, chlorine, borax, etc. Brines are also used for the preservation and pickling of certain vegetables, meat curing, and freezing mixtures. Concentrations range from 3% (ocean) to 20% or more. Large areas of sand and shale containing brines under high pressure exist along the Gulf Coast. These are reported to be an important undeveloped source of natural gas and other hydrocarbons suitable for fuel or petrochemical feedstocks.

See desalination; demineralization.

Brinell hardness test. The standard method of measuring the hardness of metals. The smooth surface of the metal is dented by a steel ball under force. The standard load and time are 500 kg for 60 seconds for soft metals and 3000 kg for 30 seconds for steel and other hard metals. The size (diameter) of the resulting dent is measured, and the hardness determined from a chart or formula.

brisance. The shattering power of an explosive measured by the ratio of the weight of graded sand shattered when a charge of the test explosive is detonated in a standard manner to the weight of sand shattered by TNT detonated in the same manner.

britannia metal. See pewter; white metal.

“Britesorb” [PQ]. (silica gel).

CAS: 7631-86-9. TM for adsorbent for proteins and other materials.

Use: Beer, wine, and cooking oil.

British anti-Lewisite. See 2,3-dimercaptopropanol.

British thermal unit. See Btu.

brittle point. The temperature at which a sample shatters on application of pressure. This is slightly above the transition point.

Brix degree. A measure of the density or concentration of a sugar solution. The number of degrees Brix equals the percentage by weight of sucrose in the solution and is related empirically to the density.

Broenner acid. (2-naphthylamine-6-sulfonic acid). $C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless needles. Soluble in boiling water.

Derivation: Heating sodium-2-naphthol-6-sulfonate with concentrated ammonia at 180C in an autoclave.

Grade: Technical. Available as the sodium salt, an odorless gray-to-pink powder.

Use: Azo dye intermediate.

“Brom 55” [Great Lakes].

CAS: 77-48-5. TM for 1,3-dibromo-5,5-dimethylhydantoin.

Use: Organic synthesis and as a disinfectant or sanitizer.

bromacil. (5-bromo-3-*sec*-butyl-6-methyluracil).

CAS: 314-40-9. Substitute approved by EPA for some uses of 2,4,5-T.

Hazard: An animal carcinogen. TLV: 10 mg/m³.

Use: Herbicide.

bromal. See tribromoacetaldehyde.

bromocresol green. (tetrabromo-*m*-cresolsulfonphthalein). An acid-base indicator showing color change from yellow to blue over the pH range 3.8–5.4.

Properties: Yellow crystals. Mp 218C. Slightly soluble in water; soluble in alcohol.

See indicator.

bromocresol purple. (dibromo-*o*-cresolsulfonphthalein). An acid-base indicator that changes from yellow to purple between pH 5.2 and 6.8.

Properties: Yellow crystals. Mp 241C. Insoluble in water; soluble in alcohol.

See indicator.

bromelin. (bromelain). A milk-clotting proteolytic enzyme. It is precipitated from pineapple juice with acetone or ammonium sulfide.

Use: Biochemical research, meat-tenderizing formulations, texturizer in baking, medicine.

bromeosin. See eosin.

bromic acid. HBrO_3 .

Properties: Colorless or slightly yellow liquid; turns yellow on exposure; unstable except in very dilute solution. D 3.28, bp decomposes at 100C. Exists only in water solution.

Derivation: Sulfuric acid is added to a solution of barium bromate, and the product is recovered by subsequent distillation and absorption in water.

Hazard: By ingestion and inhalation. Strong irritant to tissue.

Use: Dyes, intermediates, pharmaceuticals, oxidizing agent.

brominated camphor. See camphor bromate.**bromine.**

CAS: 7726-95-6. Br. Nonmetallic halogen element of atomic number 35, group VIIA of the periodic table. Aw 79.904. Valences 1, 3, 5 (valence of 7 also reported). There are two stable isotopes.

Properties: Dark, reddish-brown liquid; irritating fumes. Bp 58.8C, fp -7.3C , d 3.11 (20/4C), vap d vs. air (at 15C) 5.51, wt/gal 25.7 lb, specific heat 0.107 cal/g, refr index 1.647, dielectric constant 3.2. Soluble in common organic solvents; very slightly soluble in water. Attacks most metals, including platinum and palladium; aluminum reacts vigorously and potassium explosively. Dry bromine does not attack lead, nickel, magnesium, tantalum, iron, zinc, or (below 300C) sodium.

Derivation: From seawater and natural brines by oxidation of bromine salts with chlorine; solar evaporation (Great Salt Lake); from salt beds at Stassfurt and the Dead Sea.

Method of purification: Distillation.

Grade: Technical, CP, 99.8%, 99.95%.

Hazard: Toxic by ingestion and inhalation, severe skin irritant. TLV: 0.1 ppm. Strong oxidizing agent, may ignite combustible materials on contact.

Use: Manufacture of ethylene dibromide (antiknock gasoline), organic synthesis, bleaching, water purification, solvent, intermediate for fumigants (methyl bromide), analytical reagent, fireretardant for plastics, dyes, pharmaceuticals, photography, shrink-proofing wool.

bromine azide. (bromoazide).

CAS: 13973-87-0. BrN_3 .

Properties: Crystals or red liquid. Mp approximately 45C, bp explodes. A strong oxidizing agent.

Hazard: Explosive when heated or shocked. Will ignite combustible materials on contact.

Use: Detonators and other explosive devices.

bromine chloride. BrCl .

Properties: Reddish-yellow, mobile liquid. Fp -66C , decomposes with evolution of chlorine at 10C. Soluble in water, carbon disulfide, ether. Readily hydrolyzes. Reacts with ammonia to form bromamines.

Hazard: Irritant. Oxidizing agent.

Use: Industrial disinfectant, especially for wastewaters.

bromine cyanide. See cyanogen bromide.**bromine iodide.** See iodine monobromide.**bromine pentafluoride.**

CAS: 7789-30-2. BrF_5 .

Properties: Colorless, fuming liquid. D 2.466 (25C), fp -61C , bp 40.5C, vap press (21.1C) 7 psi. Reacts with every known element except inert gases, nitrogen, and oxygen.

Derivation: By reacting bromine, diluted with nitrogen and fluorine, in a copper vessel at 200C.

Grade: 98% min.

Hazard: Corrosive to skin and tissue. TLV: 0.1 ppm. Explodes on contact with water.

Use: Synthesis, oxidizer in liquid rocket propellants.

bromine trifluoride.

CAS: 7787-71-5. BrF_3 .

Properties: Colorless liquid. D 2.80, mp 9C, bp 125C, vap press (21.1C) 0.15 psi. Decomposed violently by water.

Derivation: See bromine pentafluoride.

Grade: 98% min.

Hazard: Corrosive to skin. Very reactive and dangerous.

Use: Fluorinating agent, electrolytic solvent.

bromine water. A mixture of 3.2 g bromine in 100 g water.

Use: A laboratory reagent.

bromkal 80.

CAS: 61288-13-9.

Hazard: Confirmed carcinogen.

bromlost. (blister gas).

See dibromodimethyl sulfide.

N-bromoacetamide. (NBA). CH_3CONHBr .

Properties: White powder with bromine odor. Mp 105–108C. Contains approximately 57% active bromine, decomposes appreciably above 26.6C.

Hazard: Emits very toxic fumes of bromine on heating.

Use: Brominating and oxidizing agent in organic synthesis.

2-bromoacetamide.

CAS: 683-57-8. mf: $\text{C}_2\text{H}_4\text{BrNO}$.

Hazard: A poison by ingestion. Moderately toxic by skin contact. A severe skin and eye irritant.

bromoacetic acid.

CAS: 79-08-3. CH_2BrCOOH .

Properties: Colorless, deliquescent crystals. Keep from air and moisture. Mp 51C, bp 208C, d 1.93. Soluble in water, alcohol, and ether.

Derivation: By heating acetic acid and bromine.

Hazard: Strong irritant to skin and tissue.

Use: Organic synthesis, abscission of citrus fruit in harvesting.

bromoacetone.

CAS: 598-31-2. $\text{CH}_2\text{BrCOCH}_3$.

Properties: Colorless liquid when pure, rapidly becomes violet even in absence of air. D 1.631, bp 136C (partial decomposition), fp -54C , vap d 4.75, vap press 9 mm Hg (20C). Soluble in acetone, alcohol, benzene, and ether; slightly soluble in water.

Derivation: By treating aqueous acetone with bromine and sodium chlorate at 30–40C.

Grade: Technical.

Hazard: Toxic by inhalation and skin contact. A lachrymator gas, strong irritant.

Use: Organic synthesis, tear gas.

bromoacetone cyanohydrin.

$\text{CH}_2\text{BrC}(\text{OH})(\text{CN})\text{CH}_3$.

Properties: Colorless liquid. D 1.584 (13C); bp 94.5C (5 mm Hg). Soluble in alcohol, ether, and water.

Derivation: Interaction of bromoacetone and hydrogen cyanide at approximately 0C.

Use: Organic synthesis.

bromoallylene. See allyl bromide.

4-bromoaniline. (*p*-bromoaniline; 4-bromobenzeneamine).

CAS: 106-40-1. $\text{C}_6\text{H}_6\text{BrN}$.

Properties: Colorless, rhombic crystals. Mp 66C. Soluble in alcohol and ether; insoluble in cold water.

Derivation: Steam distillation of *p*-bromoacetanilide and sodium hydroxide or bromination of aniline.

Use: Azo dye manufacturing, preparation of dihydroquinazolines (with formaldehyde).

5-bromoanthranilic acid. (2-amino-5-bromobenzoic acid). $\text{C}_7\text{H}_6\text{BrNO}_2$.

Properties: Colorless crystals. Mp 217C. Soluble in acetone; partially soluble in alcohol, benzene, and acetic acid.

Use: Analytical reagent for metal determination (cobalt, copper, nickel, zinc).

bromoauric acid. (gold tribromide acid). $\text{HAuBr}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Dark, red-brown, needle crystals or granular masses; odorless; metallic and acidic taste. Mp 27C. Stable in air if pure, but deliquescent if chloride is present. Soluble in water and alcohol.

Derivation: By dissolving auric bromide in hydrobromic acid, concentration, and crystallization.

p-bromobenzaldehyde. $\text{BrC}_6\text{H}_4\text{CHO}$.

Properties: Solid. Mp 58C.

Use: Chemical intermediate.

bromobenzene. (phenyl bromide).

CAS: 108-86-1. $\text{C}_6\text{H}_5\text{Br}$.

Properties: Heavy, mobile, colorless liquid. Pungent odor. D 1.499, wt/gal 12.51 lb, bp 156.6C, fp -30.5C , flash p 124F (51.1C), refr index 1.5625. Miscible with most organic solvents; insoluble in water. Autoign temp 1051F (566C). Combustible.

Derivation: Bromination of benzene in presence of iron.

Grade: Technical, pure.

Hazard: Skin irritant. Moderate fire risk.

Use: Solvent, top-cylinder compounds, crystallizing solvent, organic synthesis, lubricating-oil additive.

p-bromobenzenesulfonic acid.

$\text{BrC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: Crystallizes in needles. Mp 102–103C, bp 155C (25 mm Hg). Soluble in hot water and hot alcohol.

p-bromobenzoic acid. $\text{C}_6\text{H}_4\text{BrCOOH}$.

Properties: Colorless or reddish crystals. Mp 254C. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: From *p*-bromotoluene by oxidation.

Use: Organic synthesis, detection of strontium.

o-bromobenzyl cyanide. (*o*-bromophenylacetonitrile; 2-bromo- α -cyanotoluene).

$\text{BrC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless solid or liquid. Mp 29C, d 1.519, bp 242C (decomposes). Soluble in organic solvents. Nonflammable.

Hazard: Strong lachrymator, irritant to tissue.

1-bromobutane. See *n*-butyl bromide.

2-bromobutane. See *sec*-butyl bromide.

5-bromo-3-*sec*-butyl-6-methyluracil. See bromacil.

α -bromobutyric acid. $\text{CH}_3\text{CH}_2\text{CHBrCOOH}$.

Properties: Colorless, oily liquid. D 1.54, bp 181C (760 mm Hg), 214–217C (760 mm Hg) with decomposition, fp -4C . Soluble in alcohol and ether; sparingly soluble in water. Combustible.

Derivation: By heating bromine and butyric acid.

Hazard: Toxic by ingestion.

Use: Organic synthesis.

bromocarnallite. An artificial carnallite in which chlorine is replaced by bromine.

bromochlorodifluoromethane. See "Halon 1211" [*Great Lakes*].

1-bromo-3-chloro-5,5-dimethylhydantoin.

CAS: 16079-88-2. mf: $\text{C}_5\text{H}_6\text{BrClN}_2\text{O}_2$.

Hazard: Moderately toxic by ingestion and skin contact.

Use: Agricultural chemical.

3-bromo-1-chloro-5,5-dimethylhydantoin.BrCl(CH₃)₂C₂N₂O₂.

Properties: Free-flowing, white powder; faint halogen odor. Mp 163–164C. Soluble in benzene, methylene dichloride, chloroform. Active bromine 33% min, active chlorine 14% min.

Hazard: See bromine, chlorine.

Use: Germicide and fungicide in treatment of water, disinfectant, halogenating agent, catalyst of ionic type, selective oxidant.

sym-bromochloroethane. (ethylene chlorobromide). CH₂BrCH₂Cl.

Properties: Colorless, volatile liquid; chloroform-like odor. D 1.70, bp 107–108C, wt/gal 14.9 lb (0C), fp –16.6C. Soluble in alcohol and ether; insoluble in water. Nonflammable.

Derivation: By action of bromine and chlorine on ethylene gas.

Hazard: By ingestion and inhalation, skin irritant.

Use: Solvent, especially for cellulose esters and ethers; organic synthesis; fumigant for fruits and vegetables.

7-bromo-6-chlorofebrifugine hydrobromide.

See halofuginone hydrobromide.

bromochloromethane. (methylene chlorobromide; chlorobromomethane; Halon 1011).CAS: 74-97-5. BrCH₂Cl.

Properties: Clear, colorless, volatile liquid; chloroform-like odor. D 1.93 (25C), bp 67.8C, fp –88C, refr index 1.48 (25C), vap d 4.46. Soluble in organic solvents; insoluble in water. Nonflammable.

Hazard: By inhalation. TLV: 200 ppm.

Use: Fire extinguishers, organic synthesis.

2-(3-bromo-4-chlorophenyl)-4-chloro-5-((6-chloro-3-pyridinyl)methoxy)-3(2h)-pyridazinone.CAS: 122322-22-9. mf: C₁₆H₉BrCl₃N₃O₂.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-bromo-2-(4-chlorophenyl)-1-ethoxymethyl-5-trifluoromethylpyrrole-3-carbonitrile.CAS: 122453-73-0. mf: C₁₅H₁₁BrClF₃N₂O.

Hazard: A poison by ingestion. Moderately toxic by inhalation.

Use: Agricultural chemical.

1-bromo-3-chloropropane. (trimethylene chlorobromide). BrCH₂CH₂CH₂Cl.

Properties: Colorless liquid. Fp <–50C, bp 143–145C, d 1.594 (25/25C), wt/gal 13.27 lb (25C), refr index 1.484 (25C). Insoluble in water; soluble in methanol and ether. Nonflammable.

Hazard: Toxic. Avoid inhalation of fumes.

Use: Organic synthesis, pharmaceuticals.

3-bromo-1-chloropropene.CAS: 3737-00-6. mf: C₃H₃BrCl.

Hazard: A poison by ingestion. Low toxicity by inhalation. Human systemic effects.

2-bromo-2-chloro-1,1,1-trifluoroethane.

See halothane.

bromocresol green.CAS: 76-60-8. mf: C₂₁H₁₄Br₄O₅S.

Hazard: Moderately toxic.

See tetrabromo-*m*-cresolphthalein sulfone.

2-bromo- α -cyanotoluene. See *o*-bromobenzyl cyanide.**bromocyclopentane.** See cyclopentyl bromide.**bromodan.** See

bromomethylhexachlorobicycloheptene.

4-bromo-2-(3,4-dichlorophenyl)-5-((6-iodo-3-pyridinyl)methoxy)-3(2h)-pyridazinone.CAS: 122322-26-3. mf: C₁₆H₉BrCl₂I₂N₃O₂.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

(*z*)-1-(2-bromo-1,2-diphenylethenyl)-4-ethylbenzene. See *cis*-broparestrol.**1-bromododecane.** See lauryl bromide.**bromoethane.** See ethyl bromide.**2-bromoethyl alcohol.** See ethylene bromohydrin.**2-bromoethylamine hydrobromide.**BrCH₂CH₂NH₂•HBr.

Use: Intermediate, suggested as a soldering flux.

bromoethyl chlorosulfonate.BrCH₂CH₂OSO₂Cl.

Properties: Liquid. Bp 100–105C (18 mm Hg).

Derivation: Interaction of sulfuryl chloride and glycol bromohydrin.

Hazard: Irritant to skin and tissue.

***p*-bromofluorobenzene.** C₆H₄BrF.

Properties: Colorless liquid. Bp: 151–152C, fp –17.4C, d 1.593 (15C), refr index 1.5245 (25C). Insoluble in water.

Use: Intermediate, production of *p*-fluorophenol.

bromoform. (tribromomethane; methyl tribromide).CAS: 75-25-2. CHBr₃.

Properties: Colorless, heavy liquid; odor and taste similar to those of chloroform. D 2.887, bp 151.2C, wt/gal 24 lb, boiling range 150.3–151.2C, fp 9C, surface tension 41.53 dynes/cm (20C), dielectric

constant 4.5 (20C), refr index 1.6005. Soluble in alcohol, ether, chloroform, benzene, solvent naphtha, fixed and volatile oils; slightly soluble in water. Nonflammable.

Derivation: By heating acetone or ethanol with bromine and alkali hydroxide and recovery by distillation (similar to acetone process of chloroform).

Grade: Technical, pharmaceutical, spectrophotometric.

Hazard: An animal carcinogen. By ingestion, inhalation, and skin absorption. TLV: 0.5 ppm.

Use: Intermediate in organic synthesis, geological assaying, solvent for waxes, greases, and oils, medicine (sedative).

1-bromohexane. See n-hexyl bromide.

(4-bromo-3-hydroxy-2-naphthoato)(8-quinolinolato)copper.

CAS: 14039-99-7. mf: $C_{20}H_{12}BrCuNO_4$.

Hazard: A poison.

5-bromo-6-(2-imidazolin-2-ylamino)quinoxaline. See brimonidine.

bromol. (2,4,6-tribromophenol).

CAS: 118-79-6. $C_6H_2Br_3OH$.

Properties: Soft, white needles; sweet taste; penetrating bromine odor. Sublimation point 96C, d 2.55 (20/20C), bp 244C. Soluble in alcohol, chloroform, ether, and caustic alkaline solution; almost insoluble in water.

Derivation: Action of bromine on phenol.

Hazard: By ingestion, inhalation, skin absorption. Strong skin irritant.

bromomethane. See methyl bromide.

bromomethylethyl ketone. $BrCH_2COC_2H_5$.

Properties: Colorless to pale-yellowish liquid. Affected by light. D 1.43, bp 145–146C (decomposes). Soluble in alcohol, benzene, ether, insoluble in water.

Derivation: Reaction of sodium bromide and methyl ethyl ketone in the presence of sodium chlorate.

Hazard: Strong irritant to skin and eyes.

Use: Organic synthesis.

bromomethylhexachlorobicycloheptene.

CAS: 1715-40-8. mf: $C_8H_2BrCl_6$.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

α -bromonaphthalene. $C_{10}H_7Br$.

Properties: Colorless, thick liquid; pungent odor. D 1.4870, solidifies at 6.2C, bp 279C, refr index 1.6601. Soluble in alcohol, ether, and benzene; slightly soluble in water.

Derivation: Bromination of naphthalene.

Use: Organic synthesis, microscopy, refractometry of fats.

1-bromo-2-naphthol. $BrC_{10}H_6OH$. Solid, mp 121–125C. Used as a dye intermediate.

2-bromopentane. $CH_3CH_2CHBrCH_2CH_3$.

Properties: Colorless to yellow liquid; strong odor. D 1.1850 (25/25C).

bromopheniramine maleate. (2-[*p*-bromo- α (2-dimethylaminoethyl)benzyl]pyridine bima-
leate). $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$.

Properties: Crystals. Mp 130–135C. Soluble in water, less soluble in alcohol.

Grade: NF.

Use: Medicine (antihistamine).

***p*-bromophenol.**

CAS: 106-41-2. $HO(C_6H_4)Br$.

Properties: Crystals. D 1.840 (15C), 1.5875 (80C), mp 64C, bp 238C. Slightly soluble in water; soluble in alcohol, chloroform, ether, and glacial acetic acid.

Use: Disinfectant.

bromophenol blue.

(tetrabromophenolsulfonaphthalein).

Properties: An acid-base indicator, showing color change from yellow to purple over the range pH 3.0–4.6.

***o*-bromophenylacetonitrile.** See *o*-bromobenzyl cyanide.

4-((3-((4-bromophenyl)amino)-4,5-dihydro-2h-benz(g)indazole-2-yl)acetyl)morpholine.

CAS: 301644-27-9. mf: $C_{23}H_{23}BrN_4O_2$.

Hazard: A poison by ingestion.

3-((4-bromophenyl)amino)-*n*-(2-ethoxyethyl)-4,5-dihydro-2h-benz(g)indazole-2-acetamide.

CAS: 301644-26-8. mf: $C_{23}H_{23}BrN_4O_2$.

Hazard: A poison by ingestion.

2-(2-bromophenyl)-1h-benzimidazole.

CAS: 13275-42-8. mf: $C_{13}H_9BrN_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2-(4-bromophenyl)-4-chloro-5-((4-chlorophenyl)methoxy)-3(2h)-pyridazinone.

CAS: 107359-69-3. mf: $C_{17}H_{11}BrCl_2N_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

3-(3-(4-(2-(4-bromophenyl)ethyl)phenyl)-1,2,3,4-tetrahydro-1-naphthalenyl)-4-hydroxy-2h-1-benzopyran-2-one.

CAS: 90035-11-3. mf: $C_{33}H_{27}BrO_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-(*p*-bromophenyl)imidazo(2,1-*a*)isoquinoline.CAS: 61001-06-7. mf: C₁₇H₁₁BrN₂.**Hazard:** A reproductive hazard.**5-((4-bromophenyl)methoxy)-4-chloro-2-(4-chloro-2-fluorophenyl)-3(2h)-pyridazinone.**CAS: 107359-76-2. mf: C₁₇H₁₀BrCl₂FN₂O₂.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**5-((4-bromophenyl)methoxy)-4-chloro-2-(4-chlorophenyl)-3(2h)-pyridazinone.**CAS: 107359-42-2. mf: C₁₇H₁₁BrCl₂N₂O₂.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**3-(3-(4-((4-bromophenyl)methoxy)phenyl)-1,2,3,4-tetrahydro-1-naphthalenyl)-4-hydroxy-2h-1-benzopyran-2-one.**CAS: 90035-06-6. mf: C₃₂H₂₅BrO₄.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**(4-bromophenyl)methyl butyl 3-pyridinylcarbonimidodithioate.**CAS: 51308-80-6. mf: C₁₇H₁₉BrN₂OS.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**s-((4-bromophenyl)methyl) *o*-butyl 3-pyridinylcarbonimidodithioate.**CAS: 51308-79-3. mf: C₁₇H₁₉BrN₂OS.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**(4-bromophenyl)methyl 1-methylethyl 3-pyridinylcarbonimidodithioate.**CAS: 34763-45-6. mf: C₁₆H₁₇BrN₂S₂.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**2-bromo-4-phenylphenol.** C₆H₅C₆H₃BrOH.**Properties:** Light-colored solid; faint characteristic odor. D 1.536 (25/4C), mp 93.6–95.6C, flash p 405F (207C), bp (decomposes at 18 mm Hg), 195–200C. Soluble in alkalis, most organic solvents; insoluble in water. Combustible.**Hazard:** Toxic by ingestion and inhalation.**Use:** Germicide.**3-(4-bromophenyl)-*n*-(4-propylcyclohexyl)-2-propenamide.**CAS: 315706-76-4. mf: C₁₈H₂₄BrNO.**Hazard:** A poison by ingestion.**4-bromophenyl trifluoroacetate.**CAS: 5672-84-4. mf: C₈H₇BrF₃O₂.**Hazard:** Moderately toxic by ingestion.**bromophosgene.** (carbonyl bromide; carbon oxybromide). COBr₂.**Properties:** Heavy, colorless liquid; strong odor. D 2.5 (approximately 15C), bp 64–65C. Hydrolyzed by water. Decomposed by light and heat.**Derivation:** Action of sulfuric acid on carbon tetrabromide.**Hazard:** Toxic by ingestion and inhalation.**Use:** Military poison (toxic suffocant); making crystal-violet-type coloring agents.**bromopicrin.** (nitrobromoform; tribromonitromethane). CBr₃NO₂.**Properties:** Prismatic crystals. Decomposes with explosive violence if heated rapidly. D 2.79 (18C), bp 127C (118 mm Hg), mp 103C. Soluble in alcohol, benzene, and ether; slightly soluble in water.**Derivation:** Action of picric acid on an aqueous solution of bromine and calcium oxide followed by distillation under reduced pressure.**Hazard:** Powerful irritant. Severe explosion hazard when heated.**Use:** Organic synthesis, military poison.**3-bromopropene.** See allyl bromide.**α-bromopropionic acid.** (2-bromopropionic acid). CH₃CHBrCOOH.**Properties:** Colorless liquid. D 1.69, mp 24.5C, bp 203C (decomposes). Soluble in water, alcohol, and ether.**Derivation:** By heating propionic acid with bromine.**Method of purification:** Distillation.**4-bromo-*n*-(4-propylcyclohexyl)benzamide.**CAS: 315706-68-4. mf: C₁₆H₂₂BrNO.**Hazard:** A poison by ingestion.**3-bromo-1-propyne.** See propargyl bromide.**2-bromopyridine.** C₅H₄NBr.**Properties:** Liquid. Bp 195C, d 1.627 (20C), refr index 1.5714 (20C). Solubility in 100 g water 2.08 (20C).**Use:** Synthesis of pyridine compounds.**3-bromopyridine.** C₅H₄NBr.**Properties:** Needles. Bp 174.4C, d 1.628 (20/20C), refr index 1.5710 (20C). Slightly soluble in water; readily soluble in common organic solvents.**5-((6-bromo-3-pyridinyl)methoxy)-4-chloro-2-(4-chlorophenyl)-3(2h)-pyridazinone.**CAS: 122322-20-7. mf: C₁₆H₁₀BrCl₂N₃O₂.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**5-((6-bromo-3-pyridinyl)methoxy)-4-chloro-2-(3,4-dichlorophenyl)-3(2h)-pyridazinone.**CAS: 122322-21-8. mf: C₁₆H₈BrCl₃N₃O₂.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.

5-bromosalicylhydroxamic acid.BrC₆H₃(OH)CONH(OH).

Properties: Crystals. Decomposes at 232C. Very slightly soluble in water, forming a water-soluble sodium salt.

Use: Medicine.

β-bromostyrene. (bromostyrol).CAS: 103-64-0. C₆H₅CHCHBr.

Properties: Yellowish liquid; strong floral odor. D 1.395–1.424, refr index 1.602–1.608, mp min –2C. Soluble in 4 volumes of 90% alcohol.

Use: Perfumery.

bromosuccinic acid. HOOCCH₂CHBrCOOH.

Properties: Colorless crystals. D 2.073, mp 159–161C. Soluble in water and alcohol; insoluble in ether.

Derivation: By heating bromine and succinic acid.

Use: Organic synthesis. *Note:* The above are properties of the *dl* form. Optically active forms are also known.

N-bromosuccinimide. (NBS) (CH₂CO)₂NBr.

Properties: Fine crystals; white to cream in color. Melting range 172–178C (decomposes). Soluble in carbon tetrachloride. 44.5% min active bromine.

Hazard: Use a respirator when handling dry material, which evolves toxic fumes of bromine. Strong irritant to eyes and skin.

Use: Controlled, low-energy bromination.

5-bromosulfamethazine. See sulfabromomethazine sodium.**6-bromo-2-thio-2h-1,3-benzoxazine-2,4(3h)-dione.**CAS: 23611-66-7. mf: C₈H₄BrNO₂S.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-bromothiophenol. BrC₆H₄SH.

Properties: White solid. Fp 73C, bp 239C. Almost insoluble in water; soluble in methanol and in alkaline solution (with which it reacts).

Hazard: Toxic by ingestion.

Use: Intermediate.

α-bromotoluene. See benzyl bromide.**p-bromotoluene.** (*p*-tolyl bromide).BrC₆H₄CH₃.

Properties: Crystals. Mp 28.5C, bp 184–185C, d 1.3898 (20C), refr index 1.5490, flash p 185F (85C). Combustible. Insoluble in water; soluble in alcohol, ether, and benzene.

Hazard: Toxic by ingestion.

Use: Intermediate.

bromotributylstannane. See tri-*n*-butyltin bromide.**bromotrichloromethane.** (trichlorobromomethane). CCl₃Br.

Properties: Colorless, heavy liquid; chloroform-like odor. D 2.0; bp 104C; refr index 1.5051 (20C). Miscible with many organic liquids.

Hazard: Toxic by ingestion and inhalation of fumes.

Use: Organic synthesis.

bromotriethylstannane.CAS: 2767-54-6. mf: C₆H₁₅BrSn.

Properties: Colorless liquid. D: 1.630, mp: –13.5°, bp: 221.° Sol in org solvs.

Hazard: Moderately toxic by inhalation. A reproductive hazard. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bromotrifluoroethylene. (BFE). BrFC:CF₂.

Gas (monomer) or liquid (polymer). The latter are usually clear oils at room temperature and solids at –55C. Viscosities and densities vary widely. Monomer: High-purity gas (97%). Shipped in cylinders.

Hazard: Flammable (gas or liquid). Dangerous fire risk.

Use: (BFE polymers). Flotation fluids for gyros or accelerometers used in inertial guidance systems. BFE polymers can also be used like CFE polymers.

bromotrifluoromethane. CBrF₃.

Properties: Colorless gas. Noncorrosive. Fp –168C, bp –58C, d at bp 8.71 g/L. Nonflammable.

Derivation: Bromination of fluoroform or perfluoropropane in nonmetallic reactor.

Hazard: Toxic by inhalation.

Use: Chemical intermediate, refrigerant, metal hardening, fire extinguishing.

bromotripentylstannane.CAS: 3091-18-7. mf: C₁₅H₃₃BrSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bromotripropylstannane.CAS: 2767-61-5. mf: C₉H₂₁BrSn.

Properties: Liquid. D: 1.426 @ 25/4°, mp: –49°, bp: 133°.

Hazard: Moderately toxic by inhalation. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

bromoxynil octanoate. See 2,6-dibromo-4-cyanophenyl octanoate.**bromophenol blue.** C₁₉H₁₀Br₂O₅S.

Properties: Prisms or crystals. Decomposes at 280C. Soluble in sodium hydroxide solution; partially soluble in alcohol and benzene; almost insoluble in water.

Use: Indicator (yellow = pH 3.0, purple = pH 4.6).

bromthymol blue. C₂₇H₂₈Br₂O₅S.

Properties: Yellow-white crystals. Soluble in alcohol and alkaline solution; slightly soluble in water.

Use: Indicator (yellow = pH 6.0, blue = pH 7.6).

brontin. See elargin.

bronze. An alloy of copper and tin usually containing from 1 to 10% tin. Special types contain from 5 to 10% aluminum (Al bronze), fractional percentages of phosphorus (phosphor bronze) as deoxidizer, or low percentages of silicon (Si bronze).

Hazard: Powder is flammable.

Use: Spark-resistant tools, springs, fourdrinier wire, paint, cosmetics (as powder), electrical hardware, vacuum dryers, blenders, water gauges, flow indicators, valves, drain cocks, fine arts.

See brass; phosphor bronze.

bronze blue. Any of a number of varieties of iron-blue pigments.

bronze orange. See red lake C.

bronzing liquid. (1) A solution of pyroxylin in amyl acetate together with a bronze powder, usually aluminum bronze. (2) Gloss oils and aluminum bronze. (3) Spirit varnishes and aluminum bronze.

cis-broparestrol.

CAS: 22393-63-1. mf: C₂₂H₁₉Br.

Hazard: A reproductive hazard.

brosylate ester. An ester of *p*-bromobenzene-sulfonic acid.

broth. A liquid nutrient medium, usually containing agar, used to promote the growth of bacteria in the fermentation industry and to prepare cultures for microbiological research.

brown algae. See algae, brown.

Brown-Boveri test. A way of determining the oxidation resistance of oils.

Brown, Herbert C. (1912–2004). An English-born chemist who was the recipient of the Nobel Prize for chemistry with Wittig in 1979. Via his work in organic synthesis, Brown discovered new routes to add substituents to olefins selectively. His early education was irregular and disjointed as a result of family circumstances and the economic depression of the 1930s. He eventually received his Ph.D. from the University of Chicago. The reduction of carbonyl compounds with diborane was the topic of his thesis. The bulk of his career has been spent at Purdue University.

Brownian movement. The continuous zigzag motion of the particles in a colloidal suspension, e.g., rubber latex particles. The motion is caused by impact of the molecules of the liquid upon the colloidal particles. Named after the British botanist Robert Brown, who first noted this phenomenon.

browning reaction. (Maillard reaction). A complicated and not completely evaluated sequence of chemical changes occurring without the involvement of enzymes during heat exposure of foods containing carbohydrates (usually sugars) and proteins, as well as during storage. It is responsible for the surface color change of bakery products and meats. It begins with an aldol condensation reaction involving the carbonyl groups of the proteins, and ends with formation of furfural, which produces the dark-brown coloration. Besides color change, the reaction is accompanied by alterations in flavor and texture, as well as in nutritive value. It was first noted by the French chemist Maillard.

brucine. (dimethoxystrychnine).

CAS: 357-57-3. C₂₃H₂₆O₄N₂•2H₂O or 4H₂O.

Properties: White, crystalline alkaloid; very bitter taste. Loses water at 100C, mp 178C. Soluble in alcohol, chloroform, and benzene; slightly soluble in water, ether, glycerol, and ethyl acetate. Forms brucine sulfate, hydrochloride, and nitrate (mp 230C). Also available as the sulfate.

Derivation: By extraction and subsequent crystallization from nux vomica or ignatia seeds.

Hazard: Poison by ingestion and inhalation.

Use: Denaturing alcohol, lubricant additive, separation of racemic mixtures.

brucite. (nematite).

CAS: 1317-43-7. Mg(OH)₂. Natural magnesium hydroxide.

Properties: Colorless, white, gray, greenish; luster pearly or waxy. D 2.39; Mohs hardness 2.5.

Occurrence: Nevada, Washington, Canada.

Use: Refractories.

Brugma process. A distillation procedure, which is used in petroleum refining, wherein the number of columns equals the power to which 2 must be raised to give the desired number of fractions.

B-stage resin. (resitol). A thermosetting phenolformaldehyde-type resin that has been thermally reactive beyond the A stage so that the product has only partial solubility in common solvents (alcohols, ketones) and is not fully fusible even at 150–180C. The B stage resin has limited commercial use.

BT. (*Bacillus thuringiensis*). A species of bacteria used as a pesticide for agricultural crops. It is of the stomach-poison type and has been approved for commercial use.

"BT-31 ASHAI DENKA" [Ashai Denka].

TM for a line of organic and inorganic industrial chemicals, synthetic resins, synthetic rubber, high-compound fertilizers, coating materials, latexes, pharmaceutical and food additives, explosives, photopolymers and platemaking systems, separation

and ion-exchange membranes, systems, and equipment.

BTDA. See 3,3',4,4'-benzophenonetetracarboxylic dianhydride.

Btu. (British thermal unit). The quantity of heat required to raise the temperature of 1 pound of water 1 degree F (usually from 39 to 40F). This is the accepted unit for the comparison of heating values of fuels. For example, fuel gases range from 100 (low producer gas) to 3200 (pure butane) Btu/cu ft. The usual standard for a city gas is approximately 500 Btu/cu ft.

BTX. Commercial abbreviation for benzene, toluene, xylene, the three major aromatic compounds.

Bu. Informal abbreviation for butyl.

bubble cap column. See tower, distillation.

bubbler cap plate. A part of distillation equipment for obtaining efficient contact between gases and liquids. The liquid flows over the surface of a perforated plate whereas the gas flows through the perforations.

“Bubreak” [Buckman]. TM for a defoamer.
Use: For leather processing.

Bucherer-Bergs reaction. Preparation of hydantoin from carbonyl compound by reaction with potassium cyanide and ammonium carbonate, or from the corresponding cyanohydrin and ammonium carbonate.

Bucherer carbazole synthesis. Formation of carbazoles from naphthols or naphthylamines, arylhydrazines, and sodium bisulfite.

Bucherer reaction. A procedure for preparation of β -naphthylamine by heating β -naphthol with a water solution of ammonium sulfite. “A sulfite solution is prepared by saturating concentrated ammonia solution with sulfur dioxide and adding an equal volume of concentrated ammonia solution, β -naphthol is added and the charge is heated in an autoclave provided with a stirrer or a shaking mechanism.” (L. F. Fieser). This reaction is also involved in the preparation of several azo dye intermediates, e.g., Tobias acid.

Buchner-Curtius-Slotterbeck reaction.

Formation of keto compounds from aldehydes and aliphatic diazo compounds; ethylene oxides may also be formed.

Buchner, Eduard. (1860–1917). A German chemist who was awarded the Nobel Prize for chemistry in 1907. His works included the synthesis of diiodoacetamid through alcoholic fermentation

caused by enzymes, as well as the discovery of zymase, the first enzyme to be isolated. He received his Ph.D. at the University of Munich, where he became a lecturer. Later, he taught and performed research at Tübingen, Berlin, and Würzburg.

Buchner method of ring enlargement.

Diazoacetic acid ester reacts with benzene and homologs to give the corresponding esters of non-aradienic acid, transformed at high temperatures to derivatives of cycloheptatriene, phenylacetic acid, and β -phenylpropionic acid (when one or more methyl groups are present in the initial hydrocarbon).

bucket elevator. See conveyor (5).

buckminsterfullerene. (buckyballs). C_{60} .

Spherical aromatic molecule with a hollow truncated-icosahedron structure, similar to a soccer ball. First reported in the mid 1980s. Capable of enclosing ions or atoms in a host-guest relationship.

buckyballs. See buckminsterfullerene.

bucizine hydrochloride. $C_{28}H_{33}ClN_2 \cdot 2HCl$.
1-*p*-chlorobenzhydryl-4-(*p*-(*tert*)-butylbenzyl)piperazinedihydrochloride.
Use: Medicine (antihistamine).

Budde effect. The increase in volume of halogen vapors on exposure to light.

“Budium” [Du Pont]. TM for a polybutadiene finish for application to tin plate.

buffer. A solution containing both a weak acid and its conjugate weak base, whose pH changes only slightly on addition of acid or alkali. The weak acid becomes a buffer when alkali is added, and the weak base becomes a buffer when acid is added. This action is explained by the reaction
 $A + H_2O \rightarrow B + H_3O^+$
in which the base B is formed by the loss of a proton from the corresponding acid A. The acid may be a cation such as NH_4^+ , a neutral molecule such as CH_3COOH , or an anion such as $H_2PO_4^-$. When alkali is added, hydrogen ions are removed to form water,

but as long as the added alkali is not in excess of the buffer acid, many of the hydrogen ions are replaced by further ionization of A to maintain the equilibrium. When acid is added, this reaction is reversed as hydrogen ions combine with B to form A. The pH of a buffer solution may be calculated by the mass-law equation, $\text{pH} = \text{pK}' + \log C_i/C_o$ in which pK' is the negativelogarithm of the apparent ionization constant of the buffer acid and the concentrations are those of the buffer base and its conjugate acid.

“Bufin” [Buckman]. TM for a leather finishing product.

bufotenine. [3-(2-dimethylaminoethyl)-5-indolol]. $\text{C}_{17}\text{H}_{16}\text{N}_2\text{O}$.

Properties: Colorless prisms. Insoluble in water; soluble in alcohol, dilute acids and alkalies; slightly soluble in ether.

Derivation: From toads and toadstools; also made synthetically.

Hazard: A hallucinogenic agent.

Use: Medicine (experimental).

See hallucinogen.

builder detergent. A substance that increases the effectiveness of a soap or synthetic detergent by acting as a softener and a sequestering and buffering agent. Phosphate-silicate formulations, once widely used, have been restricted for environmental reasons. They have largely been replaced by EDTA or zeolites, sometimes combined with nitrolotriactic acid. Certain starch derivatives can be used as builders.

See zeolite.

bulan. (2-nitro-1,1-bis(*p*-chlorophenyl)butane).

CAS: 76-20-0. $\text{C}_{16}\text{H}_{15}\text{Cl}_2\text{NO}_2$.

Hazard: A toxic chlorinated nitrogenous compound used as an insecticide. When mixed with Prolan, the product is called Dilan.

See Prolan; Dilan.

bulk density. See density.

bulking agent. Chemically inert material used for increasing volume.

bullion. Bulk precious metals as produced at refineries, or gold-silver alloy produced in refining.

butamiodyl. [3(3-butyrylamino-2,4,6-tri-iodophenyl)-2-ethyl sodium acrylate].

$\text{C}_3\text{H}_7\text{CONHC}_6\text{HI}_3\text{CH}_2\text{C}(\text{C}_2\text{H}_5)\text{COONa}$.

Use: Medicine (radiopaque contrast medium, diagnostic aid).

buna rubbers. German vulcanizable synthetic rubbers from butadiene with sodium as a catalyst. See rubber.

bunker fuel oil. A heavy residual oil used as fuel by ships, by industry, and for large-scale heating installations.

Bunsen burner. Common laboratory burner that allows regulation of the air to be mixed with the gas before burning.

Bunsen, Robert Wilhelm. (1811–1899).

Born in Germany, Bunsen is remembered chiefly for his invention of the laboratory burner named after him. He engaged in a wide range of industrial and chemical research, including blast-furnace firing, electrolytic cells, separation of metals by electric current, spectroscopic techniques (with Kirchhoff), and production of light metals by electrical decomposition of their molten chlorides. He also discovered two elements, rubidium and cesium.

buoyancy balance. Balance, made of silica, capable of extreme accuracy.

Use: To determine the density of gases.

buprofezine.

CAS: 69327-76-0. mf: $\text{C}_{16}\text{H}_{23}\text{N}_3\text{OS}$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact.

Use: Agricultural chemical.

buquinolate.

CAS: 5486-03-3. mf: $\text{C}_{20}\text{H}_{27}\text{NO}_5$.

Properties: Crystals. Mp: 288–291°.

Use: Drug (veterinary); food additive.

burette. A liquid-measuring device used extensively in chemical laboratories. It is a vertical glass tube, open at the top, supported on a bracket, and equipped with scale graduation marks and a hand-operated stopcock at or near the bottom. The liquid to be dispensed is flowed in at the open end and can then be withdrawn in measured amounts by operating the stopcock.

Burgundy pitch. A resin obtained from Norway spruce or European silver fir. Other types, e.g., that from various species of pines, are also offered under this name. Characterized by extreme tackiness, soluble in acetone and alcohol. Used to some extent in surgeons' tape and various special adhesive compositions.

burlap. A coarse, loose-woven fabric made from jute or similar fiber, used in low-cost laminated composites; as liner or backing in upholstery, carpets, etc.; and as a bagging material. It is often impregnated with hot-melt adhesive.

burnable poison. A neutron absorber (poison) such as boron that when incorporated in the fuel or fuel cladding of a nuclear reactor, gradually “burns up” (is changed into nonabsorbing material) under neutron irradiation. This process compensates for

the loss of reactivity that occurs as fuel is consumed and fission-product poisons accumulate and keeps the overall characteristics of the reactor nearly constant during use.

burned lime. See calcium oxide.

burned sienna. See iron oxide red.

burned umber. See umber.

burr mill. See attrition mill.

“Burton Water Salts” [Home Brewery].

TM for an additive containing papain.

Use: In brewing to prevent chill haze.

“Busan” [Buckman]. TM for a liquid bactericide, fungicide, and preservative.

Use: For leather processing.

bushy stunt virus. A viral protein present in tomato-plant infections.

Properties: Mw 7,600,000, pH 4.1.

See virus.

“Butacite” [Du Pont]. TM for polyvinyl butyral resin, available as soft, pliable sheeting in 750-ft rolls, 10–84 inches wide.

See polyvinyl acetal; resins.

1,3-butadiene. (vinylethylene; erythrene; divinyl; divinyl).

CAS: 106-99-0. $\text{H}_2\text{C}=\text{CHHC}=\text{CH}_2$,

Properties: Colorless gas; mild aromatic odor. Easily liquefied. Bp -4.41°C , d 0.6211 (liquid at 20°C), fp -108.9°C , flash p -105°F (-76°C), specific volume 6.9 cu ft/lb (700F), autoign temp 780°F (414°C), vap press 17.65 psi (0C). Soluble in alcohol and ether; insoluble in water. The material polymerizes readily, particularly if oxygen is present, and the commercial material contains an inhibitor to prevent spontaneous polymerization during shipment or storage.

Derivation: (1) Catalytic dehydrogenation of butenes or butane; (2) oxidative dehydrogenation of butenes.

Method of purification: Extractive distillation in the presence of furfural, absorption in aqueous cuprous ammonium acetate, or use of acetonitrile.

Grade: Technical (98.0%), CP (99.0%), instrument (99.4%), research (99.8%).

Hazard: A confirmed human carcinogen. Irritant in high concentration. TLV: 10 ppm. Highly flammable gas or liquid, explosive limits in air 2–11%. May form explosive peroxides on exposure to air. Must be kept inhibited during storage and shipment. In-

hibitors often used are di-*n*-butylamine or phenyl- β -naphthylamine. Storage is usually under pressure or in insulated tanks $<35^\circ\text{F}$ ($<1.67^\circ\text{C}$).

Use: Synthetic elastomers (styrene-butadiene, polybutadiene, neoprene, nitriles), ABS resins, chemical intermediate.

butadiene-acrylonitrile copolymer. See nitrile rubber.

butadiyne. See diacetylene.

butaldehyde. See butyraldehyde.

butanal. See butyraldehyde.

butane. (*n*-butane).

CAS: 106-97-8. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$,

Properties: Colorless gas; natural-gas odor. Bp -0.5°C , fp -138.3°C , condensing pressure approximately 30 lb at 32.5°C , d (liquid at 0C) 0.599, d (vapor at 0C (air = 1)) 2.07, critical temp 153.2°C , critical press (absolute) 525 psi, heating value (25°C) 3266 Btu/cu ft, sp vol (21.1C), 6.4 cu ft/lb, flash p -76°F (-60°C), autoign temp 761°F (405°C). Very soluble in water; soluble in alcohol and chloroform. Extremely stable, has no corrosive action on metals, does not react with moisture. An asphyxiant gas.

Derivation: A by-product in petroleum refining or gasoline manufacture.

Grade: Research 99.99 mole %, pure 99 mole %, technical 95 mole %, also available in various mixtures with isobutane, propane, pentanes, etc.

Hazard: Highly flammable, dangerous fire and explosion risk. Explosive limits in air 1.9–8.5%. TLV: 800 ppm. Narcotic in high concentration.

Use: Organic synthesis, raw material for synthetic rubber and high-octane liquid fuels, fuel for household and many industrial purposes, manufacture of ethylene, solvent, refrigerant, standby and enricher gas, propellant in aerosols, pure grades used in calibrating instruments, food additive.

Note: Butane in liquid form may be stored both above and below ground. Besides storage in liquefied form under its vapor pressure at normal atmospheric temperatures, refrigerated liquid storage at atmospheric pressure may be used. Such systems are closed and insulated, and the liquid petroleum gas vapor is circulated through pumps and compressors to serve as the refrigerant for the system. Butane may be stored in pits in the earth capped by metal domes and in underground chambers (Compressed Gas Association). The foregoing also applies to propane.

butanedial. See succinaldehyde.

1,4-butanedicarboxylic acid. See adipic acid.

butanedioic anhydride. See succinic anhydride.

1,3-butanediol. See 1,3-butylene glycol.

1,4-butanediol. See 1,4-butylene glycol.

2,3-butanediol. See 2,3-butylene glycol.

butanediolamine. See 2-amino-2-methyl-1,3-propanediol.

butanedione. See diacetyl.

2,3-butanedione oxime thiosemicarbazone.
 $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{CH}_3)\text{N}_2\text{HCSNH}_2$. A test reagent for manganese in very dilute solution made from dimethylglyoxime and thiosemicarbazide.

butane dioxime. See dimethylglyoxime.

butanediperoxoic acid di-*tert*-butyl ester.

CAS: 16580-04-4. mf: $\text{C}_{12}\text{H}_{22}\text{O}_6$.

Hazard: Low toxicity by ingestion.

butanenitrile. See butyronitrile.

1-butanethiol. (*n*-butyl mercaptan).

CAS: 109-79-5. $\text{C}_4\text{H}_9\text{SH}$.

Properties: Colorless liquid; strong, obnoxious odor. D 0.8412 (20/4C), refr index 1.4427 (20C), flash p 35F (1.67C), bp 97.2–101.7C. Slightly soluble in water; very soluble in alcohol and ether.

Grade: 95%.

Hazard: Toxic by inhalation. Flammable, dangerous fire risk. TLV: 0.5 ppm.

Use: Intermediate, solvent.

2-butanethiol. (*sec*-butyl mercaptan).

$\text{C}_2\text{H}_5\text{CH}(\text{SH})\text{CH}_3$.

Properties: Colorless liquid; obnoxious odor. Boiling range 73–89C, d 0.8288 (20/4C), refr index 1.4363 (20C), flash p –10F (–23.3C).

Grade: 95%.

Hazard: Toxic by inhalation. Flammable, dangerous fire risk.

1,2,4-butanetriol. $\text{HOCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Almost colorless; odorless liquid. Hygroscopic, bp 312C (extrapolated), d 1.184, refr index 1.473, flash p 332F (166C). Miscible with water and ethanol. Combustible.

Derivation: Reaction of 2-butyne-1,4-diol with water, followed by reduction.

Grade: Technical, nitration.

Use: Intermediate for alkyl resins and explosives, cellulose plasticizer, emulsifier for cosmetics, inks, finishes, paper, cork, textiles.

butanoic acid. See butyric acid.

butan-3-one-2-yl butyrate. mf: $\text{C}_8\text{H}_{14}\text{O}_3$.

Properties: White to slightly yellow liquid; red berry odor. D: 0.972–0.992, refr index: 1.408–1.429. Sol in alc, propylene glycol, most oils; insol in water.

Use: Food additive.

1-butanol. See *n*-butyl alcohol.

2-butanol acetate. See *sec*-butyl acetate.

2-butanone. See methyl ethyl ketone.

butanoyl chloride. See butyryl chloride.

“Butazate” [Uniroyal]. TM for zinc dibutylthiocarbamate.

“Butazolidin” [Novartis]. TM for phenylbutazone.

butea frondosa, flower petals, alcoholic

extract. See butea mono-spra (lam.) kuntze, flower extract.

butea mono-spra (lam.) kuntze, flower

extract.

CAS: 93333-82-5.

Hazard: Moderately toxic. A reproductive hazard.

Use: Reproductive effector.

2-butenal. See crotonaldehyde.

Butenandt, Adolf. (1903–1995). A German biochemist who won a Nobel Prize with Ruzicka in 1939. His work involved insecticides for plants and hormones. He received his doctorate at the University of Marburg, Germany. He received a multitude of honorary degrees and awards.

butene-1. (ethylethylene; α -butylene).

CAS: 25167-67-3. $\text{CH}_2\text{:CHCH}_2\text{CH}_3$.

Properties: A colorless liquefied petroleum gas. Bp –6.3C, d 0.5951 (20/4C), fp approximately –185C, specific volume 6.7 cu ft/lb (70F), flash p –110F (–79C), autoign temp approx 700F (371C). Soluble in most organic solvents; insoluble in water.

Derivation: (1) Gases containing appreciable content of butene-1, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas. (2) Can be produced directly from ethylene.

Grade: Technical 95%, CP 99.0%, research 99.4%.

Hazard: Asphyxiant gas. Highly flammable, flammable limits in air 1.6–9.3% by volume. Dangerous fire and explosion risk.

Use: Polymer and alkylate gasoline; polybutenes; butadiene; intermediate for C_4 and C_5 aldehydes, alcohols, and other derivatives; production of maleic anhydride by catalytic oxidation.

cis-butene-2. (dimethylethylene; β -butylene; also called the “high-boiling” butene-2).

$\text{CH}_3\text{HC:CHCH}_3$.

Properties: A colorless liquefied petroleum gas. Bp 3.7C, d 0.6213 (10/4C), fp -139C, specific volume 6.7 cu ft/lb (21.1C), flash p -100F (-72C), autoign temp 615F (323C). Soluble in most organic solvents; insoluble in water.

Derivation: Gases containing appreciable content of *cis*-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grade: Technical 95%, CP 99%, research 99.8%.

Hazard: Asphyxiant gas. Highly flammable. Flammable limits in air 1.8-9.7% by volume. Dangerous fire and explosion risk.

Use: Solvent, cross-linking agent, polymerization of gasoline, butadiene synthesis, synthesis of C₄ and C₅ derivatives.

trans-butene-2. (dimethylethylene; β-butylene; also called the "low-boiling" butene-2).
CH₃HC:CHCH₃,

Properties: A colorless liquified petroleum gas. Bp 0.88C, fp -105.8C, d 0.6042 (20/4C), specific volume 6.7 cu ft/lb (21.1C), flash p -100F (-72C), autoign temp 615F (324C). Soluble in organic solvents; insoluble in water.

Derivation: Gases containing appreciable content of *trans*-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grade: Technical 95%, CP 99.0%, research 99.9%.

Hazard: Asphyxiant gas. Highly flammable. Flammable limits in air 1.8-9% by volume. Dangerous fire and explosion risk.

Use: See *cis*-butene-2.

trans-butenedioic acid. See fumaric acid.

2-butene-1,3-diol. HOCH₂CH:CHCH₂OH.

Properties: Almost colorless; odorless liquid. Fp range 4.0-7.0C, bp range 232-235C, d 1.067-1.074, refr index 1.476-1.478 (25C), flash p 263F (128C). Miscible with water, ethanol, and acetone; sparingly soluble in benzene. Technical butenediol is predominantly the *cis* isomer. Combustible.

Derivation: Reduction of 2-butyne-1,4-diol, by high-pressure synthesis from acetylene and formaldehyde.

Hazard: Primary skin irritant.

Use: Intermediate for alkyd resins, plasticizers, nylon, pharmaceuticals; cross-linking agent for synthetic resins; fungicides.

butenoic acid. See crotonic acid.

3-buten-2-one. See vinyl methyl ketone.

butesin. See *n*-butyl-*p*-aminobenzoate.

butethal. (5-butyl-5-ethylbarbituric acid).
C₁₀H₁₆N₂O₃.

Properties: White crystals or powder; odorless; bitter taste. Mp 124-127C. Fairly soluble in alcohol or ether; practically insoluble in water.

Hazard: May cause addiction.

Use: Medicine (hypnotic).

See barbiturate.

butethamine hydrochloride. [2-(isobutylamino)ethyl-*p*-aminobenzoate hydrochloride].
NH₂C₆H₄COOCH₂CH₂NHCH₂CH(CH₃)₂•HCl.

Properties: White crystals or crystalline powder; odorless; bitter taste and local anesthetizing effects on tongue. Mp 192-196C, pH (1% solution) approximately 4.7, stable in air. Soluble in water; slightly soluble in alcohol and chloroform; very slightly soluble in benzene; practically insoluble in ether.

Grade: NF.

Use: Medicine (local anesthetic).

buthalitone sodium. See sodium buthalital.

***l*-buthionine sulfoximine.**

CAS: 83730-53-4. mf: C₈H₁₈N₂O₃S.

Hazard: A reproductive hazard.

butonate. (CH₃O)₂P(O)CH(CCl₃)OCC₃H₇,
(generic name for *o,o*-dimethyl-2,2,2-trichloro-1-*n*-butyryloxyethyl phosphonate).

Properties: Colorless, somewhat oily liquid; slight ester odor. D 1.3742, refr index 1.4707, bp 129C, wt/gal 11.4 Miscible with most organic solvents; stable in neutral or acid aqueous solution; unstable in aqueous alkali. lb.

Hazard: Restrict use, toxic, cholinesterase inhibitor.

Use: Insecticide.

butopyronoxyl. (butylmesityl oxide oxalate; *n*-butyl-3,4-dihydro-2,2-dimethyl-4-oxo-1,2H-pyran-6-carboxylate).

CAS: 532-34-3. C₁₂H₁₈O₄

Properties: Yellow to pale reddish-brown liquid; aromatic odor. Reasonably stable in air. Slowly affected by light. D 1.052-1.060 (25/25C); refr index 1.4745-1.4755 (25C); distilling range 256-270C. Insoluble in water; miscible with alcohol, chloroform, ether, glacial acetic acid.

Derivation: Condensation of mesityl oxide and dibutyl oxalate in the presence of sodium ethoxide.

Grade: Technical.

Hazard: Toxic by ingestion. May cause liver damage.

Use: Insect repellent.

***p*-tert-butoxycarbonyloxystyrene monomer.**

CAS: 87188-51-0. mf: C₁₃H₁₆O₃.

Hazard: Moderately toxic by skin contact. A mild skin irritant.

2-butoxyethanol. See ethylene glycol monobutyl ether.

2-(2-butoxyethoxy)ethyl thiocyanate. See β -butoxy- β' -thiocyanodiethyl ether.

1-butoxyethoxy-2-propanol.

Properties: Colorless liquid, d 0.9310 (20/20C), bp 230.3C, fp -90C , soluble in water, wt/gal 7.8 lb, flash p 250F (121C). Combustible.

Use: Solvent, hydraulic-fluid components, antistall additive for automotive fuels, plasticizer, intermediate.

butoxyethyl laurate. See ethylene glycol monobutyl ether laurate.

butoxyethyl oleate. See ethylene glycol monobutyl ether oleate.

butoxyethyl stearate. See ethylene glycol monobutyl ether stearate.

“Butoxyne 497” [International Specialty].

TM for hydroxyethyl esters of butynediol mixtures.

Grade: 100% active.

Available forms: Liquid.

Use: Nickel brightener in electroplating, copper pickling inhibitor, corrosion inhibitor in aerosol cans.

butoxypentachlorobenzene.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin irritant.

p-butoxyphenol. $\text{HOC}_6\text{H}_4\text{OC}_4\text{H}_9$.

Properties: White to faint-yellow, crystalline powder. Mp 61–65C. Soluble in alcohol, acetone, ether, benzene, aqueous alkali; insoluble in water. Combustible.

Grade: 93% pure.

Use: Synthesis.

butoxy polypropylene glycol. (generic

name for polypropylene glycol monobutyl ether). $\text{CH}_3\text{CH}_2\text{O}(\text{CH}_2\text{OCHCH}_3)_n\text{CH}_2\text{OC}_4\text{H}_9$. Colorless liquid.

Use: An insect repellent.

n-butoxypropanol.

Properties: Colorless liquid, d 0.8801 (20/20C), bp 170.2C, fp -80C (sets to glass), flash p 154F (67.7C). Soluble in water. Combustible.

Use: Solvent for water-based enamels.

β -butoxy- β' -thiocyanodiethyl ether. [2-(2-butoxyethoxy)ethyl thiocyanate].
 $\text{CH}_3(\text{CH}_2)_3\text{OCH}_2\text{OCH}_2\text{CH}_2\text{SCN}$.

Hazard: Toxic by ingestion and skin absorption. Skin irritant.

Use: Insecticide.

butoxytriglycol. (triethylene glycol monobutyl ether).

Properties: Liquid. D 1.0021 (20/20C), bp (decomposes), fp -47.6C , flash p 290F (143C). Miscible with water. Combustible.

Use: Plasticizer, intermediate.

butter. (1) A colloidal system (emulsion) in which the continuous phase is composed of liquid fat from fat globules disintegrated by mechanical agitation and the dispersed phase is composed of finely divided water droplets and undamaged fat globules. (2) Outmoded term for hygroscopic metallic chlorides of viscous consistency, e.g., butter of zinc, etc.

buttercup yellow. See zinc yellow.

butterfat. The oily portion of the milk of mammals.

Properties: Composition is largely glycerides of oleic, stearic, and palmitic acids, with smaller amounts of the glycerides of butyric, caproic, caprylic, and capric acids. D range 0.910–0.914. Cow’s milk contains approximately 4% butterfat.

See milk.

butter starter distillate. See starter distillate.

butter yellow. See dimethylaminoazobenzene.

“Butvar” [Solutia]. TM for polyvinyl butyral resins, with various hydroxy content, whose solutions provide a range of viscosities.

Use: For film clarity, flexibility, abrasion, and water resistance; for use in primers, structural hot-metal adhesives, inks, and waterproof coatings.

butyl. (1) The group C_4H_9 ; (2) butyl rubber.

n-butyl acetate.

Properties: Colorless liquid; fruity odor. Vapor is heavier than air, d 0.8826 at 20/20C, bp 126.3C, vap press 8.7 mm Hg (20C), fp -75C , refr index 1.2951 (20C), wt/gal 7.35 lb (20C), flash p 98F (36.6C) (TOC), autoign temp 790F (421C). Soluble in alcohol, ether, and hydrocarbons; slightly soluble in water.

Derivation: Esterification and then distillation after contact of butyl alcohol with acetic acid in the presence of a catalyst such as sulfuric acid.

Hazard: Skin irritant, toxic. Flammable, moderate fire risk. TLV: 150 ppm.

sec-butyl acetate.

CAS: 105-46-4. $\text{CH}_3\text{COOCH}(\text{CH}_2)(\text{C}_2\text{H}_5)$.

Properties: Colorless liquid. Bp 112.2C, d 0.8905 at 0/4C, 0.870 at 20/4C, refr index 1.389 (20C), wt/gal 7.21 lb, flash p 88F (31C) (OC). Miscible with alcohol and ether; insoluble in water.

Derivation: Esterification of sec-butyl alcohol.

Hazard: Flammable, dangerous fire risk. TLV: 200 ppm.

Use: Solvent for nitrocellulose lacquers, thinners, nail enamels, leather finishes.

tert-butyl acetate.

CAS: 540-88-5. $\text{CH}_3\text{COOC}(\text{CH}_3)_2$.

Properties: Colorless liquid. Bp 96C, d 0.896 (20C). Insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, moderate fire risk. TLV: 200 ppm.

Use: Solvent, gasoline additive.

butyl acetate dilution ratio. Measure of approximate tolerance of nitrocellulose solutions for petroleum diluents. The higher the ratio, the better the solvent.

butyl acetoacetate.

CAS: 591-60-6. $\text{CH}_3\text{COCH}_2\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. D 0.9694 (20/20C), bp 213.9C, vap press 0.19 mm Hg (20C), flash p 185F (85C), wt/gal 8.11 lb (20C). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Technical.

Use: Intermediate in synthesis of metal derivatives, dyestuffs, pharmaceuticals, flavoring.

butyl acetoxysearate.

$\text{CH}_3(\text{CH}_2)_9\text{CH}(\text{CH}_3\text{COO})(\text{CH}_2)_{10}\text{COOC}_4\text{H}_9$.

Properties: See butyl acetyl ricinoleate.

Derivation: From castor oil, butylalcohol, and acetic anhydride with hydrogenation.

Use: Plasticizer, textile oils, adhesives.

butyl acetylene. See 1-hexyne.

butyl acetyl ricinoleate. $\text{C}_{24}\text{H}_{44}\text{O}_4$

Properties: Yellow, oily liquid; mild odor. D 0.940 (20/20C), sapon number 125, fp indefinite, becomes cloudy at -32C, solidifies at -65C, flash p 230F (110C) (OC), refr index 1.4614 (20C), Saybolt viscosity 123 sec at 100F, wt/gal 7.8 lb (20C), autoign temp 725F (385C). Miscible with most organic solvents. Almost insoluble in water. Combustible.

Derivation: From castor oil, butanol, and acetic anhydride.

Grade: Technical.

Use: Plasticizer, emulsifier, lubricant, detergent, protective coatings, special cleansing compounds, quick-breaking emulsions.

n-butyl acid phosphate. (*n*-butylphosphoric acid; acid butyl phosphate).

CAS: 12788-93-1.

Properties: Water-white liquid. D 1.120-1.125 (25/4C), refr index 1.429 (25C), flash p 230F (110C) (COC). Soluble in alcohol, acetone, and toluene; insoluble in water and petroleum naphtha. Combustible.

Hazard: Strong irritant to skin and tissue.

Use: Esterification catalyst and polymerizing agent, curing catalyst and accelerator in resins and coatings, special detergents.

N-tert-butylacrylamide.

$\text{H}_2\text{C}=\text{CHCONHC}(\text{CH}_3)_3$.

Properties: White, crystalline solid. Mp 128-130C, d 1.015 (30C). Soluble in methanol, ethanol, chloroform, and acetone. Combustible.

Hazard: Toxic by ingestion and inhalation. Irritant to skin.

Use: Monomer, organic intermediate.

n-butyl acrylate.

CAS: 141-32-2. $\text{CH}_2=\text{CHCOOC}_4\text{H}_9$.

Properties: Colorless liquid. Fp -64C, boiling range 145.7-148.0C, polymerizes readily on heating, vap press (20C) 3.2 mm Hg, d 0.9015 (20/20C), wt/gal 7.5 lb (20C), flash p 120F (49C) (OC). Nearly insoluble in water. Flammable.

Derivation: Reaction of acrylic acid or methyl acrylate with butanol.

Grade: Technical (inhibited).

Hazard: Moderate fire risk. TLV: 10 ppm.

Use: Intermediate in organic synthesis, polymers and copolymers for solvent coatings, adhesives, paints, binders, emulsifiers.

See acrylic resin.

tert-butyl acrylate. $\text{CH}_2=\text{CHCOOC}(\text{CH}_3)_3$

Properties: Liquid. Bp 120C, d 0.879 (25C), refr index 1.4080 (25C), flash p 66F (18.8C) (TOC). Commercial grade contains 100 ppm hydroquinone monomethyl ether as stabilizer.

Hazard: Toxic by ingestion and inhalation. Flammable, dangerous fire risk.

Use: Monomer for acrylic resins.

butyl acrylate-vinylidene chloride

copolymer. See vinylidene chloride-butyl acrylate copolymer.

n-butyl alcohol. (1-butanol; butyric alcohol).

CAS: 71-36-3. $\text{CH}_3(\text{CH}_2)_3\text{CH}_2\text{OH}$.

Properties: Colorless liquid; vinous odor. Bp 117.7C, fp -89.0C, d (20/20C) 0.8109, wt/gal (20C) 6.76 lb, refr index 1.3993 (20C), flash p 95F (35C), autoign temp 689F (365C). Soluble in water 7.7 wt % (20C). Solution of water in *n*-butanol 20.1%. Miscible with alcohol and ether.

Derivation: (1) Hydrogenation of butyraldehyde, obtained in the Oxo process; (2) condensation of

acetaldehyde to form crotonaldehyde, which is then hydrogenated (aldol condensation).

Hazard: Toxic on prolonged inhalation, irritant to eyes. Toxic when absorbed by skin. Flammable, moderate fire risk. TLV: ceiling 50 ppm.

Use: Preparation of esters, especially butyl acetate; solvent for resins and coatings; plasticizers; dyeing assistant; hydraulic fluids; detergent formulations; dehydrating agent (by azeotropic distillation); intermediate; "butylated" melamine resins; glycol ethers; butyl acrylate.

sec-butyl alcohol. (SBA; 2-butanol; methylthylcarbinol).

CAS: 78-92-2. $\text{CH}_3\text{CH}_2\text{CH}_2\text{OCH}_3$.

Properties: Colorless liquid; strong odor. Bp 99.5C, fp -114C, d 0.808 (20/4C), wt/gal 66.74 lb (20C), refr index 1.3949 (25C), flash p 75F (23.8C) (CC), autoign temp 763F (406C). Moderately soluble in water; miscible with alcohol and ether.

Derivation: Absorption of butene from cracking petroleum or natural gas in sulfuric acid with subsequent hydrolysis by steam.

Grade: Technical.

Hazard: Toxic on prolonged inhalation, irritating to eyes and skin. Flammable, dangerous fire risk. TLV: 100 ppm.

Use: Preparation of methyl ethyl ketone, solvent, organic synthesis, paint removers, industrial cleaners.

tert-butyl alcohol. (2-methyl-2-propanol; trimethyl carbinol).

CAS: 75-65-0. $(\text{CH}_3)_3\text{COH}$.

Properties: Colorless liquid or crystals; camphor odor. Fp 25.5C, bp 82.9C, d 0.779 (liquid 26C), refr index 1.3878 (20C), flash p 52F (11.1C) (CC), autoign temp 892F (477C). Miscible with water, alcohol, and ether.

Derivation: Absorption of isobutene from cracking petroleum or natural gas in sulfuric acid with subsequent hydrolysis by steam.

Grade: Technical.

Hazard: Irritant to eyes and skin. Flammable, dangerous fire risk. TLV: 100 ppm.

Use: Alcohol denaturant, solvent for pharmaceuticals, dehydration agent, perfumery, chemical intermediate, paint removers, manufacture of methyl methacrylate, octane booster in unleaded gasoline (EPA approved).

n-butyl aldehyde. See butyraldehyde.

n-butylamine. (1-aminobutane).

CAS: 109-73-9. $\text{C}_4\text{H}_9\text{NH}_2$.

Properties: Colorless, volatile liquid; amine odor. Bp 77.1C, fp -49.1C, d 0.7385 (20/20C), wt/gal 6.2 lb (20C), refr index 1.401 (20C), flash p 30F (1.1C) (OC). Miscible with water, alcohol, ether.

Derivation: Reaction of butanol or butyl chloride with ammonia.

Grade: Technical.

Hazard: Skin irritant. Flammable, dangerous fire risk. TLV: ceiling 5 ppm.

Use: Intermediate for emulsifying agents, pharmaceuticals, insecticides, rubber chemicals, dyes, tanning agents.

sec-butylamine. (2-aminobutane).

CAS: 13952-84-6. $\text{CH}_3\text{CHNH}_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid; amine odor. D 0.725 (20C), boiling range 63-68C, refr index 1.395 (20C), solidification point -104C, flash p 15F (-9.4C), wt/gal 6.0 lb (20C).

Hazard: Flammable, dangerous fire risk.

Use: Fungicide.

tert-butylamine.

CAS: 75-64-9. $(\text{CH}_3)_3\text{CNH}_2$.

Properties: Colorless liquid. Bp 44-46C, fp -72C, d 0.700 (15C), refr index 1.3794 (18C), flash p approx 50F (10C). Miscible with water; soluble in common organic solvents.

Grade: Technical.

Hazard: Skin irritant. Flammable, dangerous fire risk.

Use: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

butyl-o-aminobenzoate. See butyl anthranilate.

n-butyl-p-aminobenzoate.

$\text{H}_2\text{NC}_6\text{H}_4\text{COOC}_4\text{H}_9$.

Properties: White powder; odorless; tasteless. Mp 57-59C, bp 174C (8 mm Hg). Soluble in dilute acids, alcohol, chloroform, ether, and fatty oils; almost insoluble in water.

Grade: NF.

Hazard: Toxic by ingestion.

Use: Medicine (local anesthetic), treatment of burns, ointments, UV absorber in suntan preparations.

N-n-butylaminoethanol. $\text{C}_4\text{H}_9\text{NHC}_2\text{H}_4\text{OH}$.

Properties: Liquid. D 0.88-0.99 (20/20C), distillation range 192-210C, wt/gal 7.4 lb, flash p 170F (76.6C). Combustible.

tert-butylaminoethyl methacrylate.

$\text{CH}_2=\text{C}(\text{CH}_3)\text{COOCH}_2\text{CH}_2\text{NHC}(\text{CH}_3)_3$.

Properties: Liquid. Bp 100-105C (12 mm Hg), d 0.914 (25C), wt/gal 7.61 lb, refr index 1.4440 (25C), flash p 205F (96.1C) (COC). Combustible.

Use: Coatings, textile chemicals, dispersing agent for nonaqueous systems, antistatic agent, stabilizer for chlorinated polymers, ion-exchange resins, emulsifying agent, cationic precipitating agent.

N'-n-butyl-3-amino-4-methoxybenzenesulfonamide.

$\text{CH}_3\text{OC}_6\text{H}_3(\text{NH}_2)\text{SO}_2\text{NHC}_4\text{H}_9$.

Properties: Pink powder. Mp 96-100C. Insoluble in water; partially soluble in alcohol and acetone.

Use: An intermediate.

N-*n*-butylaniline. C₆H₅NHC₄H₉.

Properties: Amber liquid; aniline odor. D 0.932 (20C), boiling range 236–242C, refr index 1.534 (20C), flash p 225F (107C). Very soluble in alcohol and ether; insoluble in water. Combustible.

Use: Organic synthesis, dyes.

butyl anthranilate. (butyl-*o*-aminobenzoate).C₄H₉OOCC₆H₄NH₂.

Use: Flavoring.

butylated hydroxymethylphenol. mf:C₁₅H₂₄O₂.

Properties: White crystalline powder. Mp: 140–141°. Sol in alc; insol in water, propylene glycol.

Use: Food additive.

2-*tert*-butylanthraquinone. C₁₈H₁₆O₂.

Properties: Yellow powder. Mp 102–104C. Soluble in alcohol and acetone. Combustible.

Grade: Technical (98%).

Use: Organic synthesis.

butylated hydroxyanisole. (BHA).CAS: 25013-16-5. (CH₃)₃CC₆H₃OH(OCH₃). A mixture of 2- and 3-*tert*-4-methoxyphenol.

Properties: White or slightly yellow, waxy solid having a faint characteristic odor. Melting range 48–63C. Not naturally water soluble but can be made so by special treatment. Freely soluble in alcohol and propylene glycol. Combustible.

Grade: FCC, water soluble.

Hazard: Toxic by ingestion. Use in foods restricted; consult FDA regulations.

Use: Antioxidant for fats and oils; food packaging.

butylated hydroxytoluene. See 2,6-di-*tert*-butyl-*p*-cresol.**(*e*)-1-*t*-butylazo-1-hydroxycyclopentane.**CAS: 50265-78-6. mf: C₉H₁₈N₂O.

Hazard: Low toxicity by inhalation.

***n*-butylbenzene.** (1-phenylbutane).CAS: 104-51-8. C₈H₈C₄H₉.

Properties: Colorless liquid. Bp 183.2C, fp –87.9C, d 0.860 (20C), refr index 1.489 (20C), flash p 160F (71.1C) (OC), autoign temp 774F (412C). Combustible

Grade: Technical, pure, research.

Hazard: Toxic by ingestion.

Use: Organic synthesis, especially of insecticides.

***sec*-butylbenzene.** (2-phenylbutane).CAS: 135-98-8. C₈H₈C(CH₃)C₂H₅.

Properties: Colorless liquid. Bp 170.65C, vap press 15 mm Hg (60C), fp –75.68C, d 0.8618 (204C), wt/gal 7.2 lb (20C), refr index 1.4901 (20C), flash p 145F (62.7C) (OC), autoign temp 784F (417C). Combustible.

Grade: Technical 95%, pure, research.

Hazard: Toxic by ingestion.

Use: Solvent for coating compositions, organic synthesis, plasticizer, surface-active agents.

***tert*-butylbenzene.** (2-methyl-2-phenylpropane).CAS: 98-06-6. C₆H₅C(CH₃)₃.

Properties: Colorless liquid. Bp 169.1C, fp –57.8C, d 0.866 (20C), refr index 1.492 (20C), flash p 140F (60C) (OC). Combustible. Autoign temp 842F (450C). Insoluble in water; soluble in alcohol.

Grade: Technical, pure, research.

Hazard: Toxic by ingestion.

Use: Organic synthesis, polymerization solvent, polymer linking agent.

butylbenzenesulfonamide. (*n,n*-butylbenzenesulfonamide). C₈H₉SO₂NHC₄H₉.

Properties: Liquid; pleasant odor; amber to straw color. D 1.148 (25/25C), refr index 1.5235 (25C), bp 189–190C (4.5 mm Hg).

Hazard: Toxic by ingestion.

Use: Synthesis of dyes, pharmaceuticals, other organic chemicals, in resin manufacturing, as plasticizer for some synthetic polymers.

butyl benzoate. (*n*-butyl benzoate).C₈H₈COOC₄H₉.

Properties: Colorless, oily liquid. D 1.00 (20C), bp 247.3C, fp –22C, flash p 225F (107C) (OC). Insoluble in water; miscible with alcohol or ether. Combustible.

Grade: Technical.

Use: Solvent for cellulose ether, plasticizer, perfume ingredient, dyeing of textiles.

***N-tert*-butyl-2-benzothiazolesulfenamide.**C₆H₄NCS(SNH)C₄H₉.

Properties: Light-buff powder or flakes (sometimes colored blue). Mp 104C, mp d 1.29 (25C). Soluble in most organic solvents. Combustible.

Use: Rubber accelerator.

***di-n*-butyl benzylphosphonate.** See benzylphosphonic acid dibutyl ester.**butylbenzyl phthalate.** (BBP).C₄H₉OOCC₆H₄COOC₂H₅.

Properties: Clear, oily liquid; slight odor. D 1.113–1.121 (25/25C), flash p 390F (198C). Combustible.

Grade: Technical.

Use: Plasticizer for polyvinyl and cellulosic resins, organic intermediate.

butylbenzyl sebacate.C₈H₉OOCC(CH₂)₈COOC₂H₅.

Properties: Light-straw-colored liquid. Bp 245–285C (10 mm Hg), d 1.023 (25C), wt/gal 8.6 lb, flash p 395F (201C). Combustible.

Use: Plasticizer for resins.

butyl borate. See tributyl borate.

***n*-butyl bromide.** (1-bromobutane).

CAS: 109-65-9. C₄H₉Br.

Properties: Colorless liquid. D 1.279 (20/20C), bp 101.6C, fp -112.4C, flash p 75F (23.9C) (OC), autoign temp 509F (265C). Insoluble in water; soluble in alcohol and ether.

Grade: 99%.

Hazard: Flammable, dangerous fire risk.

Use: Alkylating agent.

***sec*-butyl bromide.** (2-bromobutane).

CAS: 78-76-2. CH₃CHBrCH₂CH₃.

Properties: Clear, colorless liquid; pleasant odor. Bp 91.2C, fp -112C, d 1.2425 (25/25C), refr index 1.4320-1.4344 (25C), flash p 70F (21.1C) (OC). Soluble in alcohol and ether; insoluble in water.

Hazard: Narcotic in high concentration. Flammable, dangerous fire risk.

Use: Synthesis, alkylating agent.

butyl butanoate. See *n*-butyl butyrate.

***n*-butyl butyrate.** (butyl butanoate).

CAS: 109-21-7. CH₃(CH₂)₃COOC₄H₉.

Properties: Colorless liquid. D 0.8721 (20/20C), refr index 1.4059 (20C), fp -91.5C, bp 165.7C (736 mm Hg), flash p 128F (53.5C) (OC). Insoluble in water; soluble in alcohol and ether. Flammable.

Grade: FCC.

Hazard: Irritant and narcotic. Moderate fire risk.

Use: Flavoring.

***n*-butyl carbinol.** See *n*-amyl alcohol, primary.

***sec*-butyl carbinol.** See 2-methyl-1-butanol.

butyl "Carbitol" [Dow]. TM for diethylene glycol monobutyl ether.

butyl "Carbitol" acetate [Dow]. TM for diethylene glycol monobutyl ether acetate.

***p-tert*-butylcatechol.** (4-*tert*-butyl-1,2-dihydroxybenzene). (CH₃)₃CC₆H₃(OH)₂.

Properties: Colorless crystals. Mp 56-57C, d 1.049 (60/25C), bp 285C, flash p 265F (129C). Combustible. Soluble in ether, alcohol, acetone; slightly soluble in water at 80C.

Hazard: Toxic by ingestion and skin absorption.

Use: Polymerization inhibitor for styrene-butadiene and other olefins.

butyl "Cellosolve" [Dow]. TM for ethylene glycol monobutyl ether.

butyl "Cellosolve" acetate [Dow]. TM for ethylene glycol monobutyl ether acetate.

butyl chloral hydrate. (trichlorobutyraldehyde hydrate). CH₃CHClCCl₂CH(OH)₂.

Properties: Colorless leaflets. D 1.693 (20/4C), mp 78C. Slightly soluble in water, soluble in alcohol and ether.

Derivation: Action of chlorine on paraldehyde.

Use: Medicine (hypnotic, anticonvulsant).

***n*-butyl chloride.** (1-chlorobutane).

CAS: 109-69-3. CH₃CH₂CH₂CH₂Cl or C₄H₉Cl.

Properties: Colorless liquid. D 0.8875 (20/20C), bp 78.6C, wt/gal 7.35 lb (20C), refr index 2.4015 (20C), vap press 80.1 mm Hg (20C), fp -122.8C, viscosity 0.0045 cP (20C), flash p 15F (-9.4C) (OC), autoign temp 860F (460C). Insoluble in water; miscible with alcohol and ether.

Grade: NF, technical.

Hazard: Toxic on prolonged inhalation. Flammable, dangerous fire risk.

Use: Organic synthesis (alkylating agent), solvent, anthelmintic.

***sec*-butyl chloride.**

CAS: 78-86-4. CH₃CHClCH₂CH₃.

Properties: Colorless liquid. Bp 68C, d 0.875 (20/4C), flash p 32F (OC), refr index 1.39. Miscible with alcohol and ether; sparingly soluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

***tert*-butyl chloroacetate.**

CAS: 107-59-5. mf: C₆H₁₁ClO₂.

Hazard: A poison by ingestion. Moderately toxic by inhalation skin contact. Severe skin and moderate eye irritant.

***tert*-butylchlorodimethylsilane.**

CAS: 18162-48-6. mf: C₆H₁₅ClSi.

Hazard: Moderately toxic.

butyl(4-chlorophenyl)methyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-20-7. mf: C₁₇H₁₉ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***tert*-butyl chromate.** (chromic acid di-*t*-butyl ester).

CAS: 1189-85-1. [(CH₃)₃CO]₂CrO₃.

Properties: Liquid. Mp -5 to 0C.

Hazard: TLV: ceiling 0.1 mg(CrO₃)/m³. Toxic by skin absorption. A very powerful oxidizer and dangerous fire hazard.

butyl citrate. See tributyl citrate.

6-*tert*-butyl-*m*-cresol. (MBMC; 6-*tert*-butyl-3-methylphenol). (CH₃)₃CC₆H₃(OH)CH₃.

Properties: Clear liquid. Solidifies slightly below room temperature, fp 23.1C, bp 244C, d 0.922 (80C), flash p 116F (47C). Soluble in organic sol-

vents and aqueous potassium hydroxide. Flammable.

Hazard: Irritant to skin. Moderate fire risk.

Use: Germicide, disinfectant, synthesis of antioxidants and rubber-processing chemicals, additives to lubricating oils, synthetic resins, perfumes (fixative).

butyl crotonate. $\text{CH}_3\text{CH}:\text{CHCOOC}_4\text{H}_9$.

Properties: Water-white liquid; persistent odor. D 0.9037 (20/20C), bp 180.5C, wt/gal 7.52 lb (20C). Soluble in alcohol and ether; insoluble in water. Combustible.

butylcyclohexyl phthalate.

Properties: Clear liquid; very mild odor. D 1.078, saponification number 369, acidity (as phthalic acid) 0.01 max. Miscible with most organic solvents. Combustible.

Use: Plasticizer for polymers and elastomers, nitrocellulose lacquers.

butyldecyl phthalate.

Properties: Clear, oily liquid. D 0.977–0.987 (25/25C). Combustible.

Use: Primary plasticizer for polyvinyl chloride and copolymer resins.

***n*-butyldiamylamine.** $\text{C}_4\text{H}_9\text{N}(\text{C}_5\text{H}_{11})_2$.

Properties: Straw-colored liquid; amine odor. D 0.788 (20C), boiling range 229–241C, flash p 200F (93.3C). Combustible.

***n*-butyldichlorarsine.** $\text{C}_4\text{H}_9\text{AsCl}_2$.

Properties: Oily liquid; somewhat agreeable odor. Bp 192–194C. Decomposed by water.

Hazard: Toxic by inhalation and ingestion.

Use: Military poison.

***tert*-butyldichloroamine.**

CAS: 2156-72-1. mf: $\text{C}_4\text{H}_9\text{Cl}_2\text{N}$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation. A severe eye irritant.

butyldichlorophenoxyacetate. See 2,4-D.

butyl(3,4-dichlorophenyl)methyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-43-4. mf: $\text{C}_{17}\text{H}_{18}\text{Cl}_2\text{N}_2\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-*n*-butyl-3-(3,4-dichlorophenyl)-1-methylurea. (neburon).

Properties: White, crystalline solid. Mp 102C. Very low solubility in water and hydrocarbon solvents. Stable toward oxidation and moisture.

Use: Weed killer.

5-*tert*-butyl-3-(2,4-dichloro-5-propargyloxyphenyl)-1,3,4-oxadiazol-2(3h)-one.

CAS: 39807-15-3. mf: $\text{C}_{15}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_3$.

Hazard: A reproductive hazard.

***n*-butyl diethanolamine.**

Properties: Liquid; very light-straw color; faint amine odor. D 0.97 (20C), bp 272C, wt/gal 18.08 lb (20C), flash p 245F (118C). Combustible.

Use: Organic synthesis.

***tert*-butyl diethanolamine.**

Properties: Liquid, similar to normal compound. **Use:** Organic synthesis, epoxy curing agent, catalyst for polyester resins, inhibitor for printing inks.

***n*-butyl diethyl malonate.**

Properties: Colorless liquid with a fruity odor. D 0.972–0.974 (25/25C), refr index 1.420–1.422 (25C). Soluble in alcohols, ketones, esters. Combustible.

Use: Intermediate.

***n*-butyldiethyltin iodide.**

CAS: 17563-48-3. mf: $\text{C}_8\text{H}_{18}\text{I}\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

butyl diglycol carbonate. (diethylene glycol bis(*n*-butylcarbonate)). $(\text{C}_4\text{H}_9\text{OCO}_2\text{CH}_2)_2\text{O}$.

Properties: Colorless liquid of low volatility. D 1.07 (20/4C), boiling range 164–166C (2 mm Hg), flash p 372F (188C), Saybolt viscosity 21 cP (20C), refr index 1.435 (20C), evaporation rate 0.59 mg/sq cm/hour (100C). Insoluble in water (very stable to hydrolysis); widely soluble in organic solvents; compatible with many resins and plastics. Combustible.

Use: Plasticizer; high-boiling-point solvent and softening agent; manufacture of pharmaceuticals and lubricant compositions.

butyl diglyme. See diethylene glycol dibutyl ether.

4-*tert*-butyl-1,2-dihydroxybenzene. See *p*-*tert*-butylcatechol.

butyldimethylamine.

CAS: 927-62-8. mf: $\text{C}_6\text{H}_{15}\text{N}$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation and skin contact. A moderate eye irritant.

***o*-butyl s-((4-(1,1-dimethylethyl)phenyl)methyl)-3-pyridinylcarbonimidodithioate.**

CAS: 51308-64-6. mf: $\text{C}_{21}\text{H}_{28}\text{N}_2\text{OS}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***n*-butyl-2,6-dimethyl-1-piperidine-carboxamide.**

CAS: 67626-66-8. mf: $C_{12}H_{24}N_2O$.

Hazard: Moderately toxic by ingestion. A moderate skin and eye irritant.

butyl "Dioxitol" [Shell]. TM for diethylene glycol monobutyl ether.

4-butyl-1,2-diphenyl-3,5-pyrazolidinedione.

See phenylbutazone.

butyl dodecanoate. See butyl laurate.

butylene. (butene). One of the liquefied petroleum gases butene-1, *cis*-butene-2, *trans*-butene-2, and isobutene.

butylene dimethacrylate. $C_{12}H_{18}O_4$

Properties: Liquid. Bp 110C (3 mm Hg), d 1.011, (25/15.6C), refr index 1.4502 (25C), flash p >150F (65C). Combustible.

Use: Monomer for resins.

1,3-butylene glycol. (1,3-butanediol).

$HOCH_2CH_2CH(OH)CH_3$. Can exist in optical isomeric forms.

Properties: Practically colorless; viscous liquid. Hygroscopic. D 1.0059 (20/20C), wt/agl 8.4 lb (20C), bp 207.5C, vap press 0.06 mm Hg (20C), refr index 1.4401 (20C), flash p 250F (121C) (COC), autoign temp 741F (393C). Completely soluble in water and alcohol; slightly soluble in ether. Combustible.

Derivation: Reduction of aldol.

Use: Polyesters, polyurethanes, surface-active agents, plasticizers, humectant, coupling agent, solvent, food additive, flavoring.

1,4-butylene glycol. (1,4-butanediol; tetramethylene glycol).

CAS: 110-63-4. $HOCH_2CH_2CH_2CH_2OH$.

Properties: Colorless, oily liquid. Bp 230C, mp 16C, d 1.020 (20/4C). Flash p >250F (>121C). Miscible with water; soluble in alcohol; slightly soluble in ether. Combustible.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Grade: Technical.

Hazard: Toxic by ingestion.

Use: Solvents, humectant, intermediate for plasticizers, pharmaceuticals, cross-linking agent in polyurethane elastomers, manufacture of tetrahydrofuran, terephthalate plastics.

2,3-butylene glycol. (2,3-dihydroxybutane;

2,3-butanediol; pseudobutylene glycol; *sym*-dimethylethylene glycol). $CH_3CH_2OCH_2OCH_3$. Can exist in optical isomeric forms.

Properties: Nearly colorless, crystalline solid or liquid. Hygroscopic. D 1.045 (20/20C), mp 23–27C,

bp 179–182C, refr index 1.438 (20C), flash p 185F (85C) (OC). Soluble in alcohol and ether; miscible with water. Combustible.

Derivation: From corn sugar by acid hydrolysis, also from fermentation of sugar by acid hydrolysis, also from fermentation of sugar-beet molasses.

Grade: 99%.

Use: Resins, solvent for dyes, intermediate, blending agent.

1,2-butylene oxide. \square (1,2-epoxybutane).

CAS: 106-88-7. $H_2COCH_2CH_2CH_3$.

Properties: Colorless liquid. D 0.8312 (20/20C), bp 63C, sets to a glass below –150C, flash p approx 0F (–17C) (CC). Soluble in water; miscible with most organic solvents.

Grade: Approximately 97.5% purity.

Hazard: Toxic concentration of vapors occurs at room temperature. Highly flammable, dangerous fire risk.

Use: Intermediate for various polymers, stabilizer for chlorinated solvents.

2,3-butylene oxide. \square (2,3-epoxybutane).

$CH_3HCOCHCH_3$. Two forms, *cis* and *trans*, are known.

Properties: *cis*: fp –80C, bp 59.7C (742 mm Hg), d 0.8266 (25/4C). *trans*: fp –85C, bp 53.5C (742 mm Hg), d 0.8010 (25/4C). Flash p approx 0F (–17C). Very soluble in ether, benzene, organic solvents; decomposes in water.

Hazard: Toxic concentration of vapors occurs at room temperature. Highly flammable, dangerous fire risk.

Use: Intermediate.

butyl epoxystearate. \square (butyl-9,10-epoxyoc-

tadecanoate). $CH_3(CH_2)_7CHOCH(CH_2)_7COOC_4H_9$.

Properties: Colorless liquid; mild, slightly fatty, slightly fruity odor. D 0.910 (20C), wt/gal 7.59 lb. Combustible.

Use: Plasticizer for low-temperature flexibility improvement of vinyl resins.

***n*-butylethanolamine.** $C_4H_9NHCH_2CH_2OH$.

Properties: Colorless liquid; very faint amine odor. D 0.892 (20C), boiling range 194–204C, flash p 170F (76.6C). Combustible.

***t*-butylethanolamine.**

CAS: 4620-70-6. mf: $C_6H_{15}NO$.

Hazard: Moderately toxic by ingestion and skin contact. A severe eye irritant.

butyl ether. (*n*-dibutyl ether).

CAS: 142-96-1. $C_4H_9OC_4H_9$.

Properties: Colorless liquid; stable; mild ethereal odor. D 0.7694 (20/20C), bp 142.2C, vap press 4.8 mm Hg (20C), flash p 77F (25C), fp –95.2C, latent

heat of vaporization 67.8 cal/g at 140.9C, refr index 1.3992 (20C), wt/gal 6.4 lb (20C), viscosity 0.0069 cP (20C), autoign temp 382F (194C). Miscible with most common organic solvents; immiscible with water.

Grade: Technical, spectrophotometric.

Hazard: Toxic on prolonged inhalation. Flammable, moderate fire risk. May form explosive peroxides, especially in anhydrous form.

Use: Solvent for hydrocarbons, fatty materials; extracting agent used especially for separating metals, solvent purification, organic synthesis (reaction medium).

butylethylacetaldehyde. See 2-ethylhexaldehyde.

5-butyl-5-ethylbarbituric acid. See butethal.

***n*-butyl ethyl ether.** See ethyl-*n*-butyl ether.

butyl ethyl ketone. (3-heptanone).

CAS: 106-35-4. (C₄H₉)(C₂H₅)CCO.

Properties: Clear liquid, d 0.8198 (20/20C), bp 148C, fp -36.7C, refr index 1.4224 (20C), flash p 115F, vap d 3.93.

Grade: Available as 20% solution in hexane.

Hazard: Fumes are irritating. Flammable, dangerous fire risk. Store solution under nitrogen.

Use: Reactive chemical intermediate.

2-butyl-2-ethylpropanediol-1,3. See 2-ethyl-2-butylpropanediol-1,3.

***tert*-butylformamide.** (CH₃)₃CNHCOH.

Properties: Colorless, high-boiling liquid. Soluble in water and common hydrocarbon solvents.

Use: Solvent and in petroleum additives.

butyl formate.

CAS: 592-84-7. HCOOC₄H₉.

Properties: Colorless liquid. D 0.885-0.9108, bp 107C, fp -90C, flash p 64F (17.7C) (CC), autoign temp 612F (322.5C). Miscible with alcohols, ethers, oils, hydrocarbons; slightly soluble in water.

Grade: Technical.

Hazard: Narcotic and irritating in high concentration. Flammable, dangerous fire risk.

Use: Solvent for nitrocellulose, some types of cellulose acetate, many cellulose ethers, many natural and synthetic resins, lacquers, perfumes, organic synthesis (intermediate), flavoring.

***n*-butyl furfuryl ether.** C₄H₉OCH₂C₄H₃O.

Properties: Colorless liquid, turning dark on exposure to air. Extremely hygroscopic, unstable with moisture. D 0.955 (10/0C), bp 189-190C (765 mm Hg), refr index 1.4522 (20C).

***n*-butyl furoate.** C₄H₃OCO₂C₄H₉.

Properties: Colorless oil. Decomposes on standing.

D 1.055 (20/5C), bp 83-84C (1 mm Hg), 118-120C (25 mm Hg). Insoluble in water, soluble in alcohol and ether.

***n*-butyl glycidyl ether.** (glycidylbutylether; BGE).

CAS: 2426-08-6. C₄H₉OH₂CHOCH₂.

Properties: Clear, colorless liquid; irritating odor. Bp 164C, vapor press 3.2 mm Hg (25C), vap d 3.78, d 0.908 (25/4C). Soluble in water.

Hazard: TLV: 25 ppm. A mild skin and eye irritant.

***n*-butyl glycol phthalate.** See dibutoxyethyl phthalate.

***tert*-butyl hydroperoxide.**

CAS: 75-91-2. (CH₃)₃COOH. A highly reactive peroxy compound.

Properties: Water-white liquid. Fp -8C, decomposes at 75C, d 0.896 (20/4C), refr index 1.396 (25C) (90% pure), flash p (90%) 130F (54.4C). Moderately soluble in water; very soluble in organic solvents and alkali-metal hydroxide solutions. Combustible.

Grade: 70%, 90% pure.

Hazard: Moderate fire risk. Oxidizer.

Use: Polymerization, oxidation, sulfonation catalyst, bleaching, deodorizing.

***tert*-butylhydroquinone.** C₆H₃(OH)₂C(CH₃)₃.

Properties: Intermediate. Mp 125C. Insoluble in water; soluble in alcohol, acetone, and ethyl acetate.

butylhydroxyoxostannane. See butyl stannic acid.

***tert*-butyl hypochlorite.** (CH₃)₃COCl.

Properties: Yellowish liquid.

Hazard: Toxic by ingestion and inhalation. May explode at room temperature.

Use: Organic chlorinations, oxidation of alcohols to ketones and sulfides to sulfoxides.

4,4'-butylidenebis(6-*tert*-butyl-*m*-cresol).

[(CH₃)₃CC₆H₂(OH)(CH₃)₂CHC₃H₇].

Properties: White powder. Mp 209C (min), d 1.03 (25C).

Use: Antioxidant for rubber, dry or latex.

***n*-butylisocyanate.**

CAS: 111-36-4. C₄H₉NCO.

Properties: Colorless liquid. Bp 115C, d 0.88 (20/4C).

Use: Intermediate for pesticides, herbicides, pharmaceuticals.

Hazard: Strong irritant to eyes and skin.

butyl isodecyl phthalate.

Properties: Clear liquid; mild odor; color (Hazen) 50 max. D 0.9 (20/20C), saponification number 310, acidity (as phthalic acid) 0.01 max.

Use: Plasticizer for polyvinyls.

tert-butylisopropylbenzene hydroperoxide.**Properties:** White crystals.**Hazard:** Dangerous fire risk. Reacts strongly with reducing materials. Oxidizing agent.**n-butyl lactate.**CAS: 138-22-7. $\text{CH}_3\text{CH}_2\text{COOC}_4\text{H}_9$.**Properties:** Water-white, stable liquid; mild odor. D 0.974–0.984 (20/20C), flash p 168F (75.5C) (TOC), mp –43C, wt/gal 8.15 lb, bp 188C, refr index 1.4216 (20C), vap press 0.4 mm Hg (20C), latent heat of vaporization 77.4 cal/g (20C), autoign temp 720F (382C). Miscible with many lacquer solvents, diluents, oils, slightly soluble in water, hydrolyzed in acids and alkalis. Combustible.**Grade:** Technical, 95% min.**Hazard:** Toxic. TLV: 5 ppm.**Use:** Solvent for nitrocellulose, ethyl cellulose, oils, dyes, natural gums, many synthetic polymers, lacquers, varnishes, inks, stencil pastes, antiskinning agent, chemical (intermediate), perfumes, dry-cleaning fluids, adhesives.**N-n-butyl lauramide.** $\text{C}_{11}\text{H}_{23}\text{CONHC}_4\text{H}_9$.**Properties:** White solid; lauric acid odor. Boiling range 200–225C (2 mm Hg), flash p 375F (190C). Combustible.**butyl laurate.** (butyl dodecanoate). $\text{C}_{11}\text{H}_{23}\text{COOC}_4\text{H}_9$.**Properties:** Liquid. D 0.855 (25C), bp 130–180C (5 mm Hg), fp –10C. Insoluble in water. Combustible.**Derivation:** Alcoholysis of coconut oil with butyl alcohol followed by fractional distillation.**Use:** Plasticizer, flavoring.**butyllithium.** (*n*-butyllithium; *sec*-butyllithium; *tert*-butyllithium). $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{Li}$; $\text{CH}_3\text{CHLiCH}_2\text{CH}_3$; $(\text{CH}_3)_3\text{CLi}$.**Properties:** Available usually in solution in one of the C_5 to C_7 hydrocarbons, in which it is quite stable. *sec*-Butyllithium solution must be kept at or below 15.5C. Sold by percent butyllithium in the solution.**Hazard:** Irritant. Solid and solution highly flammable, ignites in moist air.**Use:** Polymerization of isoprene and butadiene; intermediate in preparation of lithium hydride; rocket fuel component; metalating agent.**n-butylmagnesium chloride.** $\text{C}_4\text{H}_9\text{MgCl}$.**Properties:** Liquid. D 0.88.**Derivation:** From magnesium and butyl chloride.**Grade:** Available in solution in ethyl ether or in tetrahydrofuran.**Hazard:** Flammable, dangerous fire risk.**Use:** Grignard reagent, as an alkylating agent.**n-butylmelamine.**CAS: 5606-24-6. mf: $\text{C}_7\text{H}_{14}\text{N}_6$.**Hazard:** A poison.**n- and sec-butyl mercaptan.** See 1-butane-thiol; 2-butanethiol.**tert-butylmercaptan.** Legal label name for 2-methyl-2-butanethiol.**butyl mesityl oxide.** See butopyronoxyl.**n-butyl methacrylate.** (methacrylic acid, butyl ester).CAS: 97-88-1. $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{COOC}_4\text{H}_9$.**Properties:** Colorless liquid. Bp 163.5–170.5C, fp <–75C, d 0.895 (25/25C), flash p 130F (54.4C) (OC), refr index 1.4220. Readily polymerized. Insoluble in water. Combustible.**Derivation:** Reaction of methacrylic acid or methyl methacrylate with butanol.**Grade:** Technical (inhibited).**Hazard:** Toxic by ingestion. Moderate fire risk.**Use:** Monomer for resins, solvent coatings, adhesives, oil additives; emulsions for textiles, leather, and paper finishing.

See acrylic resin.

tert-butyl methacrylate. $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{COOC}(\text{CH}_3)_3$.**Properties:** Colorless liquid. Bp 66C (57 mm Hg), d 0.877 (25C), refr index 1.4124 (24C), flash p 92F (33.3C) (TOC).**Grade:** Technical containing 100 ppm hydroquinone monomethyl ether as inhibitor.**Hazard:** Toxic by ingestion. Flammable, dangerous fire risk.**Use:** Monomer for resins.

See acrylic resin.

butyl methacrylate resins. See "Elvacite" [Du Pont].**tert-butyl-4-methoxyphenol.** See butylated hydroxyanisole.**sec-butyl-6-methyl-3-cyclohexene-1-carboxylate.** See siglure.**p-tert-butyl- α -methylhydrocinnamaldehyde.** $(\alpha\text{-methyl-}\beta\text{-}(p\text{-tert-butylphenyl)propionaldehyde})$. $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{CH}_2\text{CH}(\text{CH}_3)\text{CHO}$.**Properties:** Light-yellow liquid; strong floral odor. D 0.942–0.949 (25/25C), refr index 1.503–1.510 (20C), flash p 204F (95.5C) (TCC). Soluble in 1-part 90% alcohol. Stable, nondiscoloring. Combustible.**Grade:** 93%, 85% purity.**Use:** Perfume.**6-tert-butyl-3-methylphenol.** See 6-*tert*-butyl-*m*-cresol.**n-butyl myristate.** $\text{CH}_3(\text{CH}_2)_{12}\text{COOC}_4\text{H}_9$. The butyl ester of myristic acid.

Properties: Water-white oily liquid. Saponification number 193–203, fp 1–7C, boiling range 167–197C (5 mm Hg), d 0.850–0.858 (25C). Insoluble in water; soluble in acetone, castor oil, chloroform, methanol, mineral oil, toluene. Combustible.

Derivation: Alcoholysis of coconut oil with butyl alcohol followed by fractional distillation.

Use: Plasticizer, lubricant for textiles, paper stencils, cosmetic preparations.

n-butyl nitrate. $C_4H_9NO_3$.

Properties: Water-white liquid; ethereal odor. D 1.103 (20C), bp 123C, flash p 97F (36C). Insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, moderate fire risk in contact with reducing materials. Oxidizing agent, may explode from shock or heating.

tert-butyl nitrite. (nitrous acid *tert*-butyl ester). $(CH_3)_3CONO$.

Properties: Yellowish liquid; pleasant odor. D 0.867, bp 63C, refr index 1.36. Soluble in alcohol, carbon disulfide, chloroform; slightly soluble in water.

Derivation: Reaction of *tert*-butyl alcohol, sodium nitrite, and sulfuric acid.

Use: Jet fuel.

butyl nonanoate. See butyl pelargonate.

butyl octadecanoate. See *n*-butyl stearate.

butyloctyl phthalate.

Properties: Water-white liquid; mild characteristic odor. D 0.991–0.997 (20/20C), saponification number 298–308. Miscible with most organic solvents. Combustible.

Use: Plasticizer for vinyl resins.

butyl oleate.

CAS: 142-77-8.
 $CH_3(CH_2)_7CH_2CH(CH_2)_7COOC_8H_{17}$

Properties: Light-colored, oleaginous liquid; mild odor. D 0.873 (20/20C), iodine value 76.8, fp opaque at 12C, solid at –26.4C, wt/gal 7.26 lb (20C), boiling range 173–227C (2 mm Hg), flash p 356F (180C). Insoluble in water; miscible with alcohol, ether, vegetable and mineral oils. Combustible.

Derivation: Alcoholysis of olein or esterification of oleic acid with butanol.

Use: Plasticizer (particularly for PVC), solvent, lubricant, water-resisting agent, coating compositions, polishes, waterproofing compounds.

butyl "Oxitol"[Shell]. TM for ethylene glycol monobutyl ether.

Hazard: Slight irritant to skin and eyes.

Use: Solvent in various types of surface-coating formulations to improve gloss and leveling, component of hydraulic fluids, coupling agent in various types of cleaning and cutting oils.

butylparaben. (*n*-butyl hydroxybenzoate).

Properties: Finely divided solid. Mp 68C. Soluble in acetone, alcohol, and propylene glycol.

Available forms: Calcium and magnesium salts are available.

Use: Pharmaceutical preservative, fungistat.

See "Parabens."

n-butyl pelargonate. (*n*-butyl nonanoate).

Properties: Liquid with fruity odor. Combustible. D 0.865 (15.5/15.5C), bp 270C.

Use: Flavors and perfumes, chemical intermediate.

sec-butyl pelargonate.

Properties: Liquid. D 0.8608 (20/4C), bp 123C (15 mm Hg), refr index 1.4220. Combustible. Shows optical activity.

Use: Chemical intermediate.

tert-butyl peracetate. See *tert*-butyl peroxyacetate.

tert-butyl perbenzoate. See *tert*-butyl peroxybenzoate.

tert-butyl perisobutyrate. See *tert*-butyl peroxyisobutyrate.

tert-butyl permaleic acid. See *tert*-butyl peroxypermaleic acid.

tert-butyl peroxide. See di-*tert*-butyl peroxide.

tert-butyl peroxyacetate. (*tert*-butyl peracetate).

Properties: Flash p <80F (<26.6C) (COC), d 0.923.

Grade: Available as a 72–76% solution in benzene.

Hazard: Flammable, dangerous fire risk. Oxidizer.

Use: Polymerization initiator for vinyl monomers, manufacture of polyethylene and polystyrene.

tert-butyl peroxybenzoate. (*tert*-butyl perbenzoate).

Properties: Colorless liquid; mild aromatic odor. D 1.04 (25/25C), fp 8.5C, vap press 0.33 mm Hg (50C), flash p 200F (93.3C). Soluble in alcohols, esters, ethers, ketones; insoluble in water.

Grade: 98% min.

Hazard: Oxidizing material; do not store near combustible materials.

Use: Polymerization initiator for polyethylene, polystyrene, polyacrylates, and polyesters; chemical intermediate.

tert-butyl peroxy-2-ethylhexanoate. (*tert*-butyl peroctoate). $(CH_3)_3COOOCCH(C_2H_5)C_6H_{13}$

Properties: Colorless liquid; faint odor. D 0.895 (25/25C), fp $<-30^{\circ}\text{C}$, refr index 1.426 (25C), decomposes at 89°C , flash p 190F (87.7C). Insoluble in water; miscible with most organic solvents.

Hazard: Oxidizing material. Do not store near combustibles.

***tert*-butyl peroxyisobutyrate.** (*tert*-butyl peroxyisobutyrate).

CAS: 109-13-7. $(\text{CH}_3)_3\text{COOOCCH}(\text{CH}_3)\text{CH}_3$.

Properties: Flash p $<80^{\circ}\text{F}$ ($<26.6^{\circ}\text{C}$).

Grade: Available as a 72–75% solution in benzene.

Hazard: Flammable, dangerous fire risk. Oxidizing agent.

Use: Polymerization catalyst.

***tert*-butylperoxyisopropyl carbonate.**

(BPIC). $(\text{CH}_3)_3\text{COOOCOCH}(\text{CH}_3)_2$.

Properties: Liquid. Fp -3°C , d 0.945, refr index 1.4050 (20C), flash p 112–118F (44–47C) (TOC). Almost insoluble in water; miscible with hydrocarbons, esters, and ethers. Relatively stable under ordinary conditions. Flammable.

Grade: Technical (8.6% active oxygen).

Hazard: Moderate fire risk. Oxidizing agent.

Use: Polymerization initiator, cross-linking agent.

***tert*-butylperoxymaleic acid.** (*tert*-butylpermaleic acid). $(\text{CH}_3)_3\text{COOOCCH}:\text{CHCOOH}$. An unsaturated peroxide.

Properties: White crystals. Mp 114–116C (decomposes). Slightly soluble in water, cool 5% alkaline solution, and alcohols; moderately soluble in oxygenated organic solvents and polyester monomers; slightly soluble in naphtha, carbon tetrachloride, and chloroform; insoluble in benzene.

Grade: 95% pure.

Hazard: Oxidizing agent. Do not store near combustible materials.

Use: Polymerization catalyst, bleaching, pharmaceuticals.

***tert*-butylperoxyphthalic acid.** (*tert*-butylperphthalic acid). $(\text{CH}_3)_3\text{COOOC}_6\text{H}_4\text{COOH}$.

Properties: White crystals. Mp 96–99C. Insoluble in water; soluble in cool 5% alkaline solutions and in alcohols; moderately soluble in oxygenated organic solvents, chlorinated hydrocarbons and polyester monomers; slightly soluble in petroleum hydrocarbons.

Grade: 95% pure.

Hazard: Oxidizing agent. Do not store near combustible materials.

Use: Polymerization catalyst and oxidizing agent.

***tert*-butylperoxyphthalate.**

CAS: 927-07-1. $(\text{CH}_3)_3\text{COOOC}(\text{CH}_3)_2$.

Properties: Colorless liquid. D 0.854 (25/25C). Solidifies below -19°C , refr index 1.410 (25C), decomposes at 70°C , flash p 155–160F (68–71C). Insoluble in water and ethylene glycol; soluble in most organic solvents.

Grade: Available as 75% soluble in mineral spirits.

Hazard: (Solution) Flammable, dangerous fire risk. Oxidizing agent. May explode on heating.

Use: Polymerization initiator.

***tert*-butyl perphthalic acid.** See *tert*-butyl peroxyphthalic acid.

***o*-sec-butylphenol.**

CAS: 89-72-5. $\text{C}_7\text{H}_9(\text{CH}_3)\text{CHC}_6\text{H}_4\text{OH}$.

Properties: A slightly volatile liquid. Mw 150.22, bp 226–228C, flash p 225F, d 0.891. Insoluble in water; slightly soluble in alcohol, ether, and alkalis. Combustible.

Hazard: TLV: 5 ppm. Skin and eye irritant.

Use: Chemical intermediate in preparation of resins, plasticizers, surface-active agents.

***o*-tert-butylphenol.** $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OH}$.

Properties: Light-yellow liquid. Fp -7°C , d 0.982 (20C), bp 224C, flash p 230F (110C) (OC). Soluble in isopentane, toluene, and ethanol; insoluble in water. Combustible.

Hazard: Toxic by ingestion, moderate irritant to eyes and skin.

Use: Chemical intermediate for synthetic resins, plasticizers, surface-active agents, perfumes, and other products. A permissible antioxidant for aviation gasoline (ASTM D910-64T).

***p*-tert-butylphenol.**

CAS: 98-54-4. $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OH}$.

Properties: White crystals; distinctive odor. D (crystals) 1.03, d (molten) 0.908 (114/4C), bp 239C, mp 100C. Insoluble in water, soluble in alcohol and ether. Combustible.

Derivation: Catalytic alkylation of phenol with olefins.

Hazard: Irritant to eyes and skin.

Use: Plasticizer for cellulose acetate; intermediate for antioxidants, special starches, oil-soluble phenolic resins; pour-point depressors and emulsion breakers for petroleum oils and some plastics; synthetic lubricants; insecticides; industrial odorants; motor-oil additives.

***n*-butylphenyl acetate.** $\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid; rose-honey odor. D 0.991–0.994 (25/25C), bp 135–141C (18 mm Hg), refr index 1.488–1.490 (20C). Soluble in 2 volumes 80% alcohol. Combustible. Made synthetically.

Grade: 98% min.

Use: Perfumes, flavoring.

***n*-butylphenyl ether.** $\text{C}_4\text{H}_9\text{OC}_6\text{H}_5$.

Properties: Water-white liquid; aromatic odor. D 0.929 (20C), boiling range 202–212C, flash p 180F (82C). Combustible.

Hazard: Toxic by ingestion.

1-(3-(4-*tert*-butylphenyl)-2-methylpropyl) piperidine. See fenpropidine.

4-*tert*-butylphenyl salicylate.

Properties: Off-white, odorless crystals. Mp 62–64C. Soluble in alcohol, ethyl acetate, toluene; insoluble in water.

Use: Light absorber, best at 2900–3300 Å.

***p*-*tert*-butylphenyl salicylate.**

Hazard: Moderately toxic by ingestion.

Use: Food additive.

***n*-butylphosphoric acid.** See *n*-butyl acid phosphate.

***n*-butyl phthalate.** See dibutyl phthalate.

butylphthalylbutyl glycolate.

Properties: Colorless liquid; odorless liquid. D 1.093–1.103 (25/25C), bp 219C (5 mm Hg), solidifies below –35C, darkens on heating above 290C, flash p 390F (199C) (OC). Insoluble in water. Extremely light stable. Combustible.

Use: Plasticizer for polyvinyl chloride. FDA approved for use in vinyl food wrappings.

***n*-butyl phthalyl-*n*-butyl glycolate.** See “Morflex 190” [Reilly].

***n*-butyl propionate.**

Properties: Water-white liquid; applelike odor. D 0.875 (20C), 0.874 (15.5C), wt/gal 7.3 lb, bp 146C (commercial grades boil over a range of 130–150C due to presence of butyl alcohol and esters), fp –89C, flash p 90F (32.2C), autoign temp 800F (426C). Soluble in alcohol and ether; miscible with all coal tar and petroleum distillates; very slightly soluble in water.

Derivation: Esterification of propionic acid with butyl alcohol and sulfuric acid catalyst.

Grade: Technical (85–90% to 95% ester content).

Hazard: Skin and eye irritant. Flammable, moderate fire risk.

Use: Solvent for nitrocellulose, retarder in lacquer thinner, ingredient of perfumes, flavors.

2-*t*-butylpyrimidine. See 2-(1,1-dimethyl-ethyl)pyrimidine.

butyl ricinoleate. $\text{C}_{17}\text{H}_{32}(\text{OH})\text{COOC}_4\text{H}_9$.

Properties: Yellow to colorless oleaginous liquid. D 0.916 (20/20C), bp approx 275C (13 mm Hg), flash p 220F (104.4C), Saybolt viscosity 112 (100F), fp indefinite, slightly opaque at –30C, very viscous at –50C, wt/gal 7.62 lb (20C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Castor oil and butyl alcohol.

Use: Plasticizer, lubricant.

butyl rubber. A copolymer of isobutylene (97%) and isoprene (3%). Polymerized below –95C with aluminum chloride catalyst.

Properties: D 0.92. Vulcanizates have tensile strength up to 2000 psi (unreinforced) and 3000 psi (reinforced). Service temperatures range from –55 to +204C. Good abrasion resistance, excellent impermeability to gases, high dielectric constant, excellent resistance to aging and sunlight, superior shock-absorbing and vibration-damping qualities. Resistance to oils and greases only fair. Will support combustion.

Grade: Stabilized, latex, chlorine-containing elastomer, low molecular weight (liquid).

Use: Tire carcasses and linings, especially for tractors and other outsize vehicles; electric wire insulation; encapsulating compounds; steam hose and other mechanical rubber goods; pond and reservoir sealant. Latex is used for paper coating, textile and leather finishing, adhesive formulations, air bags, tire vulcanization, self-curing cements, pressure-sensitive adhesives, tire-cord dips, sealants. See isobutylene-isoprene copolymer.

butyl sebacate. See dibutyl sebacate.

butyl sorbate. $\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_4$. An insect attractant for the European chafer.

***n*-butylstannic acid.** $[(\text{C}_4\text{H}_9)\text{Sn}(\text{OH})_3]$.

Properties: White, infusible, and insoluble free-flowing powder. Exists as a polymer of undetermined chemical structure. Further dehydration results in polymers with molecular weights of 1000–5000 that are soluble in organic solvents.

Hazard: Toxic by ingestion and skin absorption. TLV: 0.1 mg(Sn)/m³.

Use: Polymerization catalyst, antioxidant, and heat stabilizer for PVC (not approved by FDA for food containers), electrically conducting tin oxide coatings, alkaline-earth-metal phosphates in fluorescent light bulbs, intermediate for silicones.

butyl stannic acid.

Properties: White infusible solid. Sol in Me_2CO .

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

butyl stearamide. $\text{C}_{17}\text{H}_{35}\text{CONHC}_4\text{H}_9$.

Properties: Light-straw-colored liquid. D 0.869 (20/20C), boiling range 195–200C (2 mm Hg), flash p 430F (221C), amide odor. Combustible.

Use: Plasticizer and intermediate for the synthesis of insecticides, surface-active agents, pharmaceuticals, and textile assistants.

butyl stearate. (butyl octadecanoate).

Properties: Colorless, stable, oleaginous liquid; practically odorless, sometimes with faint fatty odor. D 0.855–0.860 (25/25C), mp 19.5–20C, flash

p 320F (160C) (CC). Wt/gal 7.14 lb (20C), refr index 1.4430 (20C), bp 350C. Miscible with mineral and vegetable oils; soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Alcoholysis of stearin or esterification of stearic acid with butanol.

Grade: Technical, cosmetic, chemically pure.

Use: Ingredient of polishes, special lubricants, and coatings; lubricants for metals and in textile and molding industries; in wax polishes as dye solvent; plasticizer for laminated fiber products; rubber hydrochloride; chlorinated rubber and cable lacquers; carbon paper and inks; emollient in cosmetic and pharmaceutical products; lipsticks; damp proof for concrete; flavoring.

butyl sulfide. See di-*tert*-butyl sulfide.

4-*tert*-butyl-*o*-thiocresol. (2-methyl-4-*tert*-butylthiophenol). $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{CH}_3)\text{SH}$.

Properties: Colorless liquid; mild (nonmercaptan) odor. D 0.983 (25C), fp -4C, bp 250C, refr index 1.546 (25C). Insoluble in water; soluble in hydrocarbons. Combustible.

Grade: Available as 98% pure, supplied under nitrogen atmosphere, and as 55% solution in hydrocarbon.

Use: Peptizer for rubbers, polymer modifier, lubricating-oil additive.

4-*tert*-butylthiophenol. $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{SH}$.

Properties: Colorless liquid; mild (nonmercaptan) odor. D 0.986 (25C), fp -11C, bp 238C, refr index 1.546 (25C). Insoluble in water; soluble in hydrocarbons.

Grade: 98%, supplied under nitrogen atmosphere.

Use: Lubricating-oil additives, polymer modifiers, antioxidants, dyes.

(butylthio)trioctylstannane.

CAS: 70303-47-8. mf: $\text{C}_{28}\text{H}_{60}\text{SSn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

(butylthio)tripropylstannane. See tripropyl(butylthio)stannane.

***n*-butyltin trichloride.** $\text{C}_4\text{H}_9\text{SnCl}_3$.

Properties: Colorless liquid. Fumes in contact with air. D 1.71 (25/4C), bp 102C (12 mm Hg), refr index 1.5190 (25C). Soluble in organic solvents; sparingly soluble in water with partial hydrolysis.

Hazard: Toxic by ingestion, strong irritant to skin. Avoid exposure to liquids or vapors. TLV: 0.1 mg(Sn)/m³.

Use: Intermediate, catalyst, stabilizer.

***n*-butyltin tris(dibutyldithiocarbamate).**

CAS: 73927-88-5. mf: $\text{C}_{31}\text{H}_{63}\text{N}_3\text{S}_6\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

butyl titanate. See tetrabutyl titanate.

***p*-*tert*-butyltoluene.** (1-methyl-4-*tert*-butylbenzene).

CAS: 98-51-1. $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{CH}_3$.

Properties: Colorless liquid. D 0.857-0.863 (20/20C), bp 192.8C. Insoluble in water. Combustible.

Grade: Technical.

Hazard: Toxic by inhalation, ingestion, and skin absorption. TLV: 10 ppm.

Use: Solvent, intermediate.

***n*-butyltrichlorosilane.** $\text{C}_4\text{H}_9\text{SiCl}_3$.

Properties: Colorless liquid. Bp 142C, d 1.1608 (25/25C), refr index 1.4363 (25C), flash p 126F (52C) (COC). Readily hydrolyzed with liberation of hydrogen chloride. Soluble in benzene, ether, heptane.

Derivation: Grignard reaction of silicon tetrachloride.

Grade: Technical, 95%.

Hazard: Corrosive to skin and tissue. Moderate fire risk.

Use: Intermediate for silicones.

butyl trichloro stannane.

CAS: 1118-46-3. mf: $\text{C}_4\text{H}_9\text{Cl}_3\text{Sn}$.

Properties: Liquid. D: 0.85 @ 20°/4°, bp: 93° @ 10 mm.

Hazard: Moderately toxic by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

***N*-*n*-butylurea.**

CAS: 592-31-4. $\text{C}_4\text{H}_9\text{HNCONH}_2$.

Properties: White solid; odorless. Decomposes on heating, mp 96C. Soluble in water, alcohol, and ether.

***n*-butyl vinyl ether.** See vinyl-*n*-butyl ether.

1-butyne. See ethylacetylene.

2-butyne. See crotonylene.

butynediol.

CAS: 110-65-6. $\text{HOCH}_2\text{C}\equiv\text{CCH}_2\text{OH}$.

Properties: White, orthorhombic crystals. Mp 58C, bp 238C, refr index 1.450 (25C). Soluble in water, aqueous acids, alcohol, and acetone; insoluble in ether and benzene. Combustible.

Derivation: High-pressure synthesis from acetylene and formaldehyde.

Grade: Crystalline solid, 97%, aqueous soluble 35%.

Hazard: Toxic by ingestion. May explode on contamination with mercury salts, strong acids, and alkaline earth hydroxides and halides at high temperatures.

Use: Intermediate, corrosion inhibitor, electroplating brightener, defoliant, polymerization accelerator, stabilizer for chlorinated hydrocarbons, cosolvent for paint and varnish removal.

3-butyn-1-ol. (β -ethynyl ethanol).HC:CCH₂CH₂OH.**Properties:** Water-white liquid; characteristic odor. D 0.9257 (20/4C), refr index 1.4409 (20C), bp 128.9C, fp -63.6C. Combustible.**Use:** Preparation of perfume bases, acetylenic esters, plastics, plasticizers, pharmaceuticals, wetting agents, medicinals, and organic synthesis.**1,1'-(2-butynylene)dipyrrolidine dihydrochloride.** See tremorine dichlorohydrate.**butyraldehyde.** (butaldehyde; *n*-butanal; *n*-butylaldehyde; butyric aldehyde).CAS: 123-72-8. CH₃(CH₂)₂CHO.**Properties:** Water-white liquid; characteristic pungent aldehyde odor. D 0.8048 (20/20C), bp 75.7C, vap press 91.5 mm Hg (20C), flash p 20F (-6.6C), wt/gal 6.7 lb (20C), coefficient of expansion 0.00114 (20C), fp -99C, viscosity 0.043 cP (20C), autoign temp 446F (230C). Slightly soluble in water; soluble in alcohol and ether.**Derivation:** (1) Oxo process; (2) dehydrogenating butanol vapors over a catalyst, the butyraldehyde being separated by distillation; (3) partial reduction of crotonaldehyde.**Grade:** Technical (93% min).**Hazard:** Flammable, dangerous fire risk.**Use:** Plasticizers, rubber accelerators, solvents, high polymers.**butyric acid.** (*n*-butyric acid; butanoic acid; ethylacetic acid; propylformic acid).CAS: 107-92-6. CH₃CH₂CH₂COOH.**Properties:** Colorless liquid; penetrating and obnoxious odor. Refr index 1.3981 (20C), d 0.9583 (20/4C), fp -5.0 to -8C, bp 163.5C (757 mm Hg) and 75C (25 mm Hg), vap press 0.84 mm Hg (20C), autoign temp 846F (452C). Miscible with water, alcohol, and ether. Combustible.**Derivation:** Occurs as glyceride in animal milk fats. Produced as a by-product in hydrocarbon synthesis, by oxidation of butyraldehyde, and by butyric fermentation of molasses or starch.**Grade:** 90%, 95%, 99%, edible, synthetic, reagent, technical, FCC.**Hazard:** Strong irritant to skin and tissue.**Use:** Synthesis of butyrate ester perfume and flavor ingredients, pharmaceuticals, delimiting agent, disinfectants, emulsifying agents, sweetening gasolines.**butyric alcohol.** See *n*-butyl alcohol.**butyric aldehyde.** See butyraldehyde.**butyric anhydride.**CAS: 106-31-0. (CH₃CH₂CH₂CO)₂O.**Properties:** Water-white liquid. Hydrolyzes to butyric acid. D 0.9681 (20/20C), fp -75C, bp 199.5C, vap press 0.3 mm Hg (20C), flash p 190F (87.7C), wt/gal 8.1 lb (20C). Combustible.**Grade:** Technical, 98%.**Use:** Manufacture of butyrates, drugs, and tanning agents.**butyryn.** See glyceryl tributryrate.**butyrolactam.** See 2-pyrrolidone.**butyrolactone.** (γ -butyrolactone).CAS: 96-48-0. OCH₂CH₂CH₂CO.**Properties:** Colorless liquid; pleasant odor. Bp 204C, fp -44C, d 1.144, flash p 209F (98.3C) (OC). Miscible with water, alcohol, and ether. Combustible.**Derivation:** High-pressure synthesis from acetylene and formaldehyde.**Grade:** Technical.**Hazard:** Toxic by ingestion.**Use:** Intermediate for synthesis of butyric acid compounds, polyvinylpyrrolidone, methionine, solvent for acrylate and styrene polymers, ingredient of paint removers and textile assistants.**butyrone.** See dipropyl ketone.**butyronitrile.** (propyl cyanide; butanenitrile).CAS: 109-74-0. CH₃(CH₂)₂CN.**Properties:** Colorless liquid. D 0.796 (15C), fp -112.6C, bp 116-117C, flash p 79F (26.1C) (OC). Slightly soluble in water; soluble in alcohol and ether.**Hazard:** Flammable, dangerous fire risk.**Use:** Basic material in industrial, chemical, and pharmaceutical intermediates and products; poultry medicines.**butyryl chloride.** (butyryl chloride; butanoyl chloride). C₃H₇COCl.**Properties:** Colorless liquid; pungent acid chloride odor. Reacts with alcohol and water; miscible with ether. Fp -89C, distillation range 100-110C, d 1.028 (15C), refr index 1.4121 (20C).**Hazard:** Toxic by ingestion and inhalation, strong irritant to tissue.**Use:** Organic synthesis.**butyryl chloride.** See butyryl chloride.**10-butyryldithranol.**CAS: 75464-11-8. mf: C₁₈H₁₆O₃.**Hazard:** A poison by ingestion. A mild skin irritant.***n*-butyryltri-*n*-hexyl citrate.** See "Citroflex B-6" [Reilly].**BVE.** Abbreviation for butyl vinyl ether. See vinyl-*n*-butyl ether.

“B-X-A” [Uniroyal]. TM for a diarylamine-ketone-aldehyde reaction product.

Properties: Brown powder. D 1.10, melting range 85–95C. Store in a cool place. Soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Use: Antioxidant for rubber and nylon.

Use: Food packaging, sporting goods, wire and cable, building construction and automotive. More recent uses are extrusion laminations, in extrusion coatings, and as adhesive films and webs for thermal laminating and other new uses not related to packaging.

“Bynel” [DuPont]. TM for resins developed as coextrudable adhesives for multilayer packaging structures.

BZ. A nonlethal gas that causes temporary disability. It is a derivative of lysergic acid.

C

C. Symbol for carbon.

¹⁴C. (carbon-14). The naturally occurring radioactive isotope of carbon used in chemical dating, tracer studies, etc.

C12-C14-*tert*-alkyl amines.

CAS: 68955-53-3.

Hazard: A poison by ingestion. Moderately toxic by skin contact. Low toxicity by inhalation. A severe skin irritant.

“C-22” [Haynes]. TM for a high-strength, nickel-based alloy with corrosion resistance to oxidizing or reducing medias, excellent resistance to localized corrosion while maintaining ease of welding and fabrication.

Available forms: Sheet, plate, bars, rods, welding electrodes, and wire.

Use: Fabrication into all types of process equipment.

CA. Abbreviation for cellulose acetate and cortisone acetate; also for controlled atmosphere.

C_{3A}. Abbreviation for tricalcium aluminate as used in cement.
See cement, Portland.

Ca. Symbol for calcium.

CAB. Abbreviation for cellulose acetate butyrate.

“Cab-O-Sil” [Cabot]. TM for colloidal silica particles sintered together in chainlike formations. Surface area ranges from 50 to 400 m²/g, depending on grade.

Grade: Standard M-5, L-5, SD-20.

Use: Thickening and emulsifying agent for oil–water systems, drilling muds, cattle-feed supplements, tile cleaners, dispersion of oil slicks on seawater, plastics, solar-heated ceiling tiles.

“Cab-O-Sperse” [Cabot]. TM for aqueous dispersions of pyrogenic silica for use in the paper and textile industries.

cacao butter. (cocoa butter).
See theobroma oil.

C acid. (2-naphthylamine-4,8-disulfonic acid).
C₁₀H₅(NH)₂(SO₃H)₂.

Properties: White, crystalline solid. Slightly soluble in water.

Derivation: Reduction of 2-nitronaphthalene-4,8-disulfonic acid. The sodium salt is recrystallized from water.

Use: Azo dye intermediate.

cacodylic acid. (dimethylarsinic acid).
(CH₃)₂AsOOH.

Properties: Colorless, deliquescent crystals; odorless. Mp 200C. Soluble in water, alcohol, and acetic acid; insoluble in ether.

Derivation: By distilling a mixture of arsenic trioxide and potassium acetate, and oxidizing the resulting product with mercuric oxide.

Hazard: Toxic by ingestion.

Use: Herbicide, especially for control of Johnson grass on cotton; soil sterilant; chemical warfare; timber thinning.

cactinomycin. USAN for an antibiotic produced from *Streptomyces* which is 10% dactinomycin and 90% of two forms of actinomycin C.

“Cadalyte” [Du Pont]. TM for a series of compounds for cadmium electroplating.

cadaverine. (1,5-diaminopentane; pentamethylenediamine). NH₂(CH₂)₅NH₂. A ptomaine formed in the decay of animal proteins after death, also made synthetically.

Properties: Syrupy, colorless liquid; fuming; odorous. Mp 9C, bp 178–179C. Soluble in water and alcohol; slightly soluble in ether.

Hazard: Toxic by ingestion, absorbed by skin, a skin and eye irritant.

Use: Preparation of high polymers, intermediate, biological research.

Cade oil. See juniper tar oil.

cadiene. See sesquiterpene.

“Cadminate” [Mallinckrodt]. TM for a turf fungicide containing 60% cadmium succinate and 40% inert matter.

Hazard: See cadmium.

See cadmium.

cadmium.

CAS: 7440-43-9. Cd. Metallic element of atomic number 48, group IIB of the periodic table. Aw 112.40. Valence 2. There are eight stable isotopes.

Properties: Soft, blue-white, malleable metal or grayish-white powder. D 8.642, mp 320.9C, bp 767C, refr index 1.13, Mohs hardness 2.0. Soluble in acids, especially nitric, and in ammonium nitrate solution. Lowers melting point of certain alloys when used in low percentages. Tarnishes in moist air. Corrosion resistance poor in industrial atmo-

spheres. Becomes brittle at 80C. Resistant to alkalis. High neutron absorber. Combustible.

Occurrence: A greenockite (cadmium sulfide) ore containing zinc sulfide; also in lead and copper ores containing zinc. Canada, central and western U.S., Peru, Australia, Mexico, Zaire.

Derivation: (1) Dust or fume from roasting zinc ores is collected, mixed with coal or coke and sodium or zinc chloride, and sintered. The cadmium fume is collected in an electrostatic precipitator, leached, fractionally precipitated, and distilled. (2) By direct distillation from cadmium-bearing zinc. (3) By recovery from electrolytic zinc process (approximately 40%).

Grade: Technical, powder, pure sticks, ingots, slabs, high-purity crystals (<10 ppm impurities).

Hazard: Flammable in powder form. Toxic by inhalation of dust or fume. A carcinogen. Cadmium plating of food and beverage containers has resulted in a number of outbreaks of gastroenteritis (food poisoning). Soluble compounds of cadmium are highly toxic; however, ingestion usually induces a strong emetic action that minimizes the risk of fatal poisoning. Use as fungicide may be restricted. TLV: (dust and soluble compounds) 0.05 mg/m³; (oxide fume as Cd) ceiling 0.05 mg/m³.

Use: Electrodeposited and dipped coatings on metals, bearing and low-melting alloys, brazing alloys, fire-protection systems, nickel-cadmium storage batteries, power transmission wire, TV phosphors, basis of pigments used in ceramic glazes, machinery enamels, baking enamels, Weston-standard-cell control of atomic fission in nuclear reactors, fungicide, photography and lithography, selenium rectifiers, electrodes for cadmium-vapor lamps and photoelectric cells.

cadmium acetate.

CAS: (2) 543-90-8. (1) Cd(OOCCH₃)₂•3H₂O; (2) Cd(OOCCH₃)₂.

Properties: Colorless crystals. (1) d 2.01, loses water at 130C; (2) d 2.341, mp 256C. Soluble in water and alcohols.

Derivation: Interaction of acetic acid and cadmium oxide.

Hazard: See cadmium. (2) TLV: 0.05 mg(Cd)/m³ (Proposed: TWA 0.01 mg(Cd)/m³ (dust), Suspected Human Carcinogen; 0.002 mg(Cd)/m³ (respirable dust), Suspected Human Carcinogen)

Use: Ceramics (iridescent glazes), manufacture of acetates, assistant in dyeing and printing textiles, electroplating baths, laboratory reagent. See cadmium.

cadmium ammonium bromide. (ammonium-cadmium bromide). CdBr₂•4NH₄Br.

Properties: Colorless crystals. Soluble in alcohol and water.

Hazard: See cadmium.

See cadmium.

cadmium antimonide. A semiconductor used in thermoelectric devices.

Hazard: See cadmium and antimony.

cadmium-base Babbitt. See Babbitt metal.

cadmium borotungstate.

Cd₃(BW₁₂O₄₀)•18H₂O.

Properties: Yellow, heavy crystals. Mp 75C. Soluble in water. The solution is yellow to light brown.

Grade: Technical.

Hazard: See cadmium.

Use: Separating minerals. See cadmium.

cadmium bromate. Cd(BrO₃)₂•H₂O.

Properties: White crystals or crystalline powder. D 3.758, mp (decomposes). Soluble in water; insoluble in alcohol.

Derivation: By adding cadmium sulfate to a solution of barium bromate.

Hazard: Strong oxidizer, dangerous in contact with organics. Highly toxic, irritant, oxidizer.

Use: Analytical reagent.

cadmium bromide.

CAS: 7789-42-6. CdBr₂ or CdBr₂•4H₂O.

Properties: White to yellowish efflorescent crystalline. Mp (anhydrous) 568C, bp 863C. Soluble in water, acetone, alcohol, and acids.

Derivation: By heating cadmium in bromine vapor.

Grade: Technical, reagent.

Hazard: See cadmium.

Use: Photography, process engraving, lithography. See cadmium.

cadmium carbonate.

CAS: 513-78-0. CdCO₃.

Properties: White, amorphous powder. D 4.258, decomposes at <500C. Soluble in dilute acids and in concentrated solution of ammonium salts; insoluble in water.

Grade: Reagent.

Hazard: See cadmium.

See cadmium.

cadmium chlorate. Cd(ClO₃)₂•2H₂O.

Properties: Colorless, prismatic crystals. Hygroscopic, d 2.28 (18C), mp 80C. Soluble in alcohol, water, and acetone.

Grade: Technical.

Hazard: Dangerous in contact with organic materials.

cadmium chloride.

CAS: 10108-64-2. (1) CdCl₂; (2) CdCl₂•2.5H₂O.

Properties: Small, white, odorless crystals. D (1) 4.05, (2) 3.327, mp (1) 568C, bp (1) 960C. Soluble in water and acetone.

Derivation: Action of hydrochloric acid on cadmium with subsequent crystallization.

Grade: Technical, reagent.

Use: Preparation of cadmium sulfide, analytical chemistry, photography, dyeing and calico printing, ingredient of electroplating baths, addition to tinning solution, manufacture of special mirrors, manufacture of cadmium yellow.

cadmium cyanide. $\text{Cd}(\text{CN})_2$. Obtained as a white precipitate when potassium or sodium cyanide is added to a concentrated solution of a cadmium salt. A complex ion is formed when it is dissolved in an excess of the precipitating agent, and a solution of this complex is used as an electrolyte for electrodeposition of cadmium.

Hazard: See cadmium and cyanide.

Use: Electroplating copper.

cadmium diethyldithiocarbamate.

Properties: White to cream-colored rods. D 1.39, melting range 68–76C. Mostly soluble in benzene, carbon disulfide, chloroform; insoluble in water and gasoline.

Hazard: See cadmium.

Use: Accelerator for butyl rubber.

See cadmium.

cadmium fluoride.

CAS: 7790-79-6. CdF_2 . Available as pure crystals, 99.89%, d 6.6, mp approximately 1110C, soluble in water and acids, insoluble in alkalis.

Hazard: See cadmium.

Use: Electronic and optical applications, high-temperature dry-film lubricants, starting material for crystals for lasers, phosphors.

See cadmium.

cadmium hydroxide. (cadmium hydrate).

Properties: White, amorphous powder. D 4.79, mp loses H_2O at 300C. Soluble in ammonium hydroxide and in dilute acids; insoluble in water and alkalis; absorbs carbon dioxide from air.

Derivation: By the action of sodium hydroxide on a cadmium-salt solution.

Grade: Technical, CP.

Hazard: See cadmium.

Use: Cadmium salts, cadmium plating, storage-battery electrodes.

See cadmium.

cadmium iodate. $\text{Cd}(\text{IO}_3)_2$.

Properties: Fine, white powder. D 6.48; mp (decomposes). Slightly soluble in water; soluble in nitric acid or ammonium hydroxide.

Grade: Technical.

Hazard: Fire risk in contact with organic materials.

Use: Oxidizing agent.

cadmium iodide. CdI_2 .

Properties: White flakes or crystals; odorless. Becomes yellow on exposure to air and light. Occurs in two allotropic forms. D (α) 5.67, (β) 5.30; mp (α)

388C, (β) 404C; bp (α) 796C. Soluble in water, alcohol, ether, acetone, ammonia, and acids.

Derivation: By the action of hydriodic acid on cadmium oxide.

Hazard: See cadmium.

Use: Photography, process engraving and lithography, analytical chemistry, electroplating, lubricants, phosphors, nematocide.

See cadmium.

cadmium molybdate. CdMoO_4 .

Properties: Yellow crystals. D 5.347, mp approximately 1250C. Slightly soluble in water; soluble in acids.

Grade: Technical, crystals, 99.98% pure.

Hazard: See cadmium.

Use: Electronic and optical applications.

See cadmium.

cadmium nitrate.

CAS: 10325-94-7. (1) $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$; (2) $\text{Cd}(\text{NO}_3)_2$.

Properties: White, amorphous pieces or hygroscopic needles. (1) d 2.455, mp 59.5C, bp 132C; (2) mp 350C. Soluble in water, ammonia, and alcohol.

Derivation: Action of nitric acid on cadmium or cadmium oxide and crystallization.

Grade: Technical, reagent.

Hazard: Dangerous fire and explosion hazard.

Use: Cadmium salts, photographic emulsions, coloring glass and porcelain, laboratory reagent, cadmium salts.

cadmium oxalate. $\text{Cd}(\text{COO})_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous powder. D 3.32 (dehydrated), mp (decomposes at 340C). Soluble in dilute acids, ammonium hydroxide; insoluble in alcohol and water.

cadmium oxide.

CAS: 1306-19-0. CdO (forms 1 and 2).

Properties: (1) Colorless, amorphous powder; d 6.95. (2) Brown or red crystals; d 8.15. Both decompose on heating at 900C. The crystals are soluble in acids and alkalis; insoluble in water.

Derivation: Cadmium metal is distilled in a retort, the vapor reacted with air, and the oxide collected in a baghouse.

Hazard: Inhalation of vapor or fume may be fatal. A carcinogen (OSHA). TLV: (fume as cadmium) ceiling 0.05 mg/m^3 .

Use: Cadmium plating baths, electrodes for storage batteries, cadmium salts, catalyst, ceramic glazes, phosphors, nematocide.

cadmium pigment. A family of pigments based on cadmium sulfide or cadmium selenide, used chiefly where high color retention is required. They are lightfast and have good alkali resistance. Red shades are obtained with cadmium selenide, yellow with cadmium sulfide. Used in paints and high-gloss baking enamels, they are often extended

with barium sulfate and are then called cadmium lithopone.

cadmium potassium iodide.

$\text{CdI}_2 \cdot 2\text{KI} \cdot 2\text{H}_2\text{O}$.

Properties: White powder, becomes yellowish with age. Deliquescent. D 3.359; mp 76C (decomposes). Soluble in water, alcohol, ether, and acid.

Derivation: By combining cadmium iodide and potassium iodide in solution in proportion of their combining weights, and subsequent crystallization.

Hazard: See cadmium.

Use: Analytical chemistry, medicine.
See cadmium.

cadmium propionate. $\text{Cd}(\text{OOCCH}_2\text{H}_5)_2$. A solid used in scintillation counters.

cadmium ricinoleate.

$\text{Cd}[\text{CH}_3(\text{CH}_2)_5\text{CH}_2\text{OCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CO}_2]_2$.

Properties: Odorless, fine, white powder derived from castor oil. Mp 104C, d 1.11.

Hazard: See cadmium.

Use: Solution used to stabilize polyvinyl chloride and copolymers against light and heat.

See cadmium.

cadmium selenide. CdSe.

Properties: Red powder. D 5.81 (15/4C), mp >1350C. Insoluble in water; stable at high temperature.

Use: Red pigment, semiconductors, phosphors, photoelectric cells.

cadmium selenide lithopone. See cadmium pigment.

cadmium stearate.

Hazard: See cadmium.

Use: As a lubricant and stabilizer in plastics.

See cadmium.

cadmium succinate. $\text{Cd}(\text{OOCCH}_2)_2$.

Properties: A white powder. Slightly soluble in water; insoluble in alcohol.

Hazard: See cadmium.

Use: Fungicide.

See cadmium.

cadmium sulfate.

CAS: 10124-36-4. (1) CdSO_4 ; (2) $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O}$; (3) $\text{CdSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless, odorless crystals. D (1) 4.69, (2) 3.09, (3) 3.05; mp (1) 1000C. Soluble in water; insoluble in alcohol.

Derivation: By the action of dilute sulfuric acid on cadmium or cadmium oxide.

Grade: Technical, CP.

Hazard: A carcinogen (OSHA).

Use: Pigments, fluorescent screens, electrolyte in Weston standard cell, electroplating.

See cadmium.

cadmium sulfide. (orange cadmium).

CAS: 1306-23-6. CdS.

Properties: Yellow or brown powder. D 4.82, mp 1750C (100 atm), sublimes (in nitrogen) 980C. Insoluble in cold water; forms a colloid in hot water; soluble in acids and ammonia. Can be polished like a metal. It is an n-type semiconductor.

Derivation: (1) By passing hydrogen sulfide gas into a solution of a cadmium salt acidified with hydrochloric acid. The precipitate is filtered and dried. (2) Occurs naturally as greenockite.

Grade: Technical, NF, highpurity (single crystals).

Hazard: A carcinogen (OSHA), highly toxic. See cadmium.

Use: Pigments and inks, ceramic glazes, pyrotechnics, phosphors, fluorescent screens, scintillation counters, rectifiers, photoconductor in xerography, transistors, photovoltaic cells, solar cells, catalyst in photodecomposition of hydrogen sulfide.

See cadmium pigment.

cadmium telluride.

CAS: 1306-25-8. CdTe.

Properties: Brownish-black, cubic crystals. Mp 1090C, d 6.2 (25/4C). Oxidizes on prolonged exposure to moist air. Insoluble in water and mineral acids except nitric, in which it is soluble with decomposition.

Derivation: Fusion of the elements, reaction of hydrogen telluride and cadmium chloride.

Grade: High purity crystals, 99.99+%.

Hazard: Toxic by inhalation.

Use: Semiconductors, phosphors.

cadmium tungstate. CdWO_4 .

Properties: White or yellow crystals or powder. Soluble in ammonium hydroxide, alkali cyanides; almost insoluble in water.

Derivation: By the interaction of cadmium nitrate and ammonium tungstate.

Available forms: Single crystal rods, broken crystals (crackle).

Hazard: Toxic by inhalation.

Use: Fluorescent paint, X-ray screens, scintillation counters, catalyst, phosphors.

“Cadox PS” [Akzo]. CAS: 94-17-7. TM for a mixture of 50% bis(*p*-chlorobenzoyl)peroxide in silicone fluid.

Available forms: Paste.

Use: Curing agent for silicone rubbers.

See *p*-chlorobenzoyl peroxide.

“Cadura” E Ester [Shell]. TM for glycidyl ester of “Versatic” 911 Acid.

Hazard: Irritant to skin.

Use: Modifier for alkyd resins and thermosetting acrylic systems, reactive diluent for epoxy resins.

caerulein.

CAS: 17650-98-5. mf: $\text{C}_{58}\text{H}_{73}\text{N}_{13}\text{O}_{21}\text{S}_2$.

Hazard: A poison.

caesium. See cesium.

C_{4AF}. Abbreviation for tetracalcium aluminoferrate as used in cement.
See cement, Portland.

caffeine. (theine; methyltheobromine; 1,3,7-trimethylxanthine).
CAS: 58-08-2. C₈H₁₀N₄O₂•H₂O.

Properties: White, fleecy masses or long, flexible, silky crystals; odorless; bitter taste. An alkaloid. Loses water at 80C. Efflorescent in air. Mp 236.8C. Soluble in chloroform; slightly soluble in water and alcohol; very slightly soluble in ether. Solution neutral to litmus.

Derivation: By extraction of coffee beans, tea leaves, or kola nuts; also synthetically. Much of the caffeine of commerce is a by-product of decaffeinated-coffee manufacture.

Method of purification: Recrystallization.

Grade: Technical, USP, FCC.

Hazard: One grain or more is toxic, 200 micrograms per mL has been found to inhibit activity of the enzyme DNA polymerase. Use in soft drinks not to exceed 0.02%.

Use: Beverages, medicine.

cage compound. See inclusion complex; clathrate compound.

cage mill. (bar disintegrator, squirrel-cage disintegrator). A comminuting device that may consist of two rotating structures similar to water wheels, one fitting inside the other. They are provided with horizontal crossbars or breaker plates. The assembly is covered with a close-fitting housing. The two wheels or cages rotate at high speed in opposite directions on a horizontal axis. The material to be reduced is fed into the smaller cage from a hopper. It is ejected at speeds up to 12,000 ft/min and is fragmented by contact with the bars. As the pieces are thrown back and forth within the cages, they are disintegrated further by mutual impact. Some types of cage mills have only a single cage, but others have more than two. They are used for size reduction of niter cake, fertilizers, coal, and other friable materials. Particle size can be varied by adjusting the space between the crossbars.

cage zeolite. (sodalite). A structure of sodium aluminosilicates often arranged in combined tetrahedra at the intersections of which are sodium atoms, with oxygen atoms at the midpoints. Such sodalite units often combine to form supercages.

They are common and extremely effective catalysts. Many zeolites occur naturally, but synthetic types are tailor-made for special purposes and have particular catalytic functions.

See zeolite.

“Cairox” [Carus]. TM for potassium permanganate.

cajeputene. (dipentene; *dl-p*-mentha-1,8-diene, inactive; limonene).

CAS: 138-86-3. C₁₀H₁₆.

Properties: Bp 178C, flash p 109F (42C), refr index 1.4739 (20C), d 0.840.

Cake alum. See aluminum sulfate.

calabarine. See physostigmine.

Caladryl. Proprietary name for diphenhydramine, camphor, and calamine.

Use: Dermatological.

calamine. (1) A hydrated zinc silicate containing 67.5% zinc oxide; d 3.5, Mohs hardness 4.5 to 5. Pyroelectric. Occurs in U.S. and Europe. Source of metallic zinc. (2) Zinc oxide with low percentage of ferric oxide; zinc oxide must be 98%. Soluble in mineral acids, insoluble in water. Pharmaceutical preparation (USP).

calamus oil.

Properties: Yellow to brownish-yellow essential oil. D 0.959–0.970 (15C), refr index 1.503–1.510, saponification value 6–20. Slightly soluble in water.

Derivation: By steam distillation of calamus, the stem or root of the sweet flag. Chief known constituents are asarone (see 2,4,5-trimethoxy-1-propenylbenzene) and eugenol.

Use: Perfumery, flavoring agent.

calandria. The heating unit of a vacuum-evaporating system.

“Calan” SR [Searle]. TM for verapamil hydrochloride in sustained-release oral caplet form.

Use: Drug.

“Calan” Tablets [Searle]. TM for verapamil hydrochloride in tablet form.

Use: Drug.

calaverite. AuTe₂. One of the gold telluride group of minerals. Corresponds to the same general formula as sylvanite and krennerite. Pale bronze-yellow color or tin-white, tarnishing to bronze-yellow on exposure. Metallic luster. Contains 40–43% gold, 1–3% silver; d 9.0; Mohs hardness 2.5.

Occurrence: U.S. (California, Colorado), Australia, Canada.

Use: Important source of gold.

“Calcene” [PPG]. TM for a specially prepared precipitated calcium carbonate for use in compounding rubber, paints, and plastics. The particles of grade TM are coated with stearic acid to aid in dispersion. Grade NC is not coated.

calciferol. See ergocalciferol.

calcimine. (kalsomine). Essentially chalk and glue in powdered form ready to mix with water. Used as temporary decoration for interior plaster walls. Will not withstand washing.

calcination. Heating of a solid to a temperature below its melting point to bring about a state of thermal decomposition or a phase transition other than melting. Included are the following types of reactions: (1) thermal dissociation, including destructive distillation of organic compounds, e.g., concentration of aluminum by heating of bauxite; (2) polymorphic phase transitions, e.g., conversion of anatase to rutile form of TiO₂; (3) thermal recrystallization, e.g., devitrification of glass. Calcination is often used in the beneficiation of ores.

See destructive distillation; pyrolysis.

calcine. Radioactive waste prepared for disposal in the form of granular powder made by drying liquid wastes at high temperature (approximately 800C).

calcined. Processed by burning or incinerating. Examples are chalk converted to lime and zinc sulfide converted to zinc oxide.

calcite. CaCO₃. The most common form of natural calcium carbonate. Dogtooth spar, Iceland spar, nailhead spar, and satin spar are varieties of calcite. Essential ingredient of limestone, marble, and chalk.

Properties: Colorless, white, and various-colored crystals; vitreous to earthy luster; good cleavage in three directions. D 2.72, Mohs hardness 2. May contain small amounts of magnesium, iron, manganese, and zinc. Reacts with acids to evolve carbon dioxide.

Use: Phosphor. Iceland spar is used in optical instruments.

calcitonin. A thyroid hormone controlling the proportion of calcium in circulating blood. May be used in calcium balance control and possibly also in the treatment of bone fractures, hypervitaminosis, and other calcium-related diseases. It is obtained in purified form from pig thyroid; has been made synthetically.

calcium.

CAS: 7440-70-2. Ca. Alkaline-earth element of atomic number 20, group IIA of the periodic table. Aw 40.08. Valence 2. Six stable isotopes.

Properties: Moderately soft, silver-white, crystalline metal. D 1.57, mp 845C, sublimes above mp in vacuum, bp 1480C, Brinell hardness 17. Oxidizes in air to form adherent protective film. Can be machined, extruded, or drawn. Soluble in acid. Decomposes water to liberate hydrogen.

Derivation: Electrolysis of fused calcium chloride, by thermal process under high vacuum from lime reduced with aluminum. Does not occur free in nature.

Available forms: Crowns, nodules, ingots, crystals up to 99.9% pure.

Hazard: Evolves hydrogen with moisture. Flammable in finely divided state. Fire and explosion hazard when heated or on contact with strong oxidizing agents.

Use: Alloying agent for aluminum, copper, and lead; reducing agent for beryllium; deoxidizer for alloys. Dehydrating oils. Decarburization and desulfurization of iron and its alloys, getter in vacuum tubes. Separation of nitrogen from argon. Reducing agent in preparation of chromium metal powder, thorium, zirconium, and uranium. Fertilizer ingredient.

Note: Calcium is an essential component of bones, teeth, shells, and plant structures. It occurs in milk in trace amounts and is necessary in animal and human nutrition. Vitamin D aids in the deposition of calcium in bones.

calcium 45. Radioactive calcium of mass number 45.

Properties: Half-life 164 days; emits β-radiation.

Derivation: By reactor irradiation of calcium carbonate, by neutron bombardment of scandium, or as a by-product of the irradiation of calcium nitrate for the preparation of ¹⁴C.

Available forms: Calcium chloride in hydrochloric acid solution and solid calcium carbonate.

Hazard: Dangerous radiation hazard, MPC in air 3 × 10⁻⁸ μCi/mL. This isotope is a bone seeker and may cause damage to the blood-forming organs.

Use: Research aid for studying water purification, calcium exchange in clays, detergency, surface wetting and other surface phenomena, calcium uptake and deposition in bone, soil characteristics as related to soil utilization of fertilizer and crop yield, diffusion of calcium in glass, etc.

calcium abietate. $(C_{20}H_{29}O_2)_2Ca$. Product of the action of lime on rosin or resin acids.
See calcium resinate.

calcium acetate. (vinegar salts; gray acetate; lime acetate; calcium diacetate).
 $Ca(CH_3COO)_2 \cdot H_2O$.

Properties: Brown, gray, or white (when pure) powder, amorphous or crystalline; slightly bitter taste, slight odor of acetic acid; decomposes on heating. Soluble in water; slightly soluble in alcohol. Combustible.

Derivation: Action of pyroligneous acid on calcium hydroxide; the solution, on being filtered and evaporated to dryness, yields gray acetate of lime.

Grade: Technical (80% basis), reagent, CP, pure, brown, gray, FCC.

Use: Manufacture of acetone, acetic acid, acetates, mordant in dyeing and printing of textiles, stabilizer in resins, additive to calcium soap lubricants, food additive (as antimold agent in bakery goods, sausage casings), corrosion inhibitor.

calcium acetylsalicylate. (aspirin, soluble).
 $(CH_3COOC_6H_4COO)_2 \cdot 2H_2O$.

Properties: White powder. Aqueous solutions are unstable. Soluble in water.

Derivation: (1) Action of acetylsalicylic acid upon calcium carbonate in the presence of a small amount of water; (2) by passing carbon dioxide into an aqueous solution of calcium carbonate and acetylsalicylic acid.

Use: Medicine (antipyretic).

calcium acid sulfite. See calcium hydrogen sulfite.

calcium acrylate. $(H_2C:CHCOO)_2Ca$.

Properties: Free-flowing, white powder. Soluble in water; deliquescent. Solution polymerizes to form hydrophilic resin.

Use: Ion-exchange clay-soil stabilizer, binder, and sealer (laboratory scale only).

calcium alginate.

Properties: White or cream-colored powder or filaments, grains, or granules; slight odor and taste. Insoluble in water and acids; soluble in alkaline solution.

Grade: FCC.

Hazard: Flammable but self-extinguishing.

Use: Pharmaceutical products; food additive; thickening agent and stabilizer in ice cream, cheese products, canned fruits, and sausage casings; synthetic fibers.

See algin; alginic acid.

calcium aluminate. (tricalcium aluminate).
 $3CaO \cdot Al_2O_3$.

Properties: Crystals or powder. D 3.038 (25C), mp (decomposes at 1535C). Soluble in acids. A refractory and an important ingredient of cements, espe-

cially of aluminous cement. Fused calcium aluminate (a glass) can be used for infrared transmission and detection. Noncombustible.

calcium aluminum hydride. See aluminum calcium hydride.

calcium aluminum silicate. See aluminum calcium silicate.

calcium ammonium nitrate. A uniform mixture of approximately 60% ammonium nitrate and 40% limestone and/or dolomite. A fertilizer containing approximately 20% N.

Hazard: Oxidizer, fire risk in contact with organic materials.

calcium arsenate. (tricalcium orthoarsenate).
 $Ca_3(AsO_4)_2$.

Properties: White powder. Slightly soluble in water; soluble in dilute acids. Decomposes on heating.

Derivation: Interaction of calcium chloride and sodium arsenate.

Grade: Technical, CP.

Hazard: Toxic by ingestion and inhalation. TLV: 0.2 mg/m³ (arsenic).

Use: Insecticide, germicide.

calcium arsenite. $CaAsO_3 \cdot H_2O$.

Properties: White, granular powder. Insoluble in water; soluble in acids.

Grade: Technical.

Hazard: Toxic by inhalation and ingestion.

Use: Germicide, insecticide.

calcium arsonate (1:1).

CAS: 52740-16-6. mf: $AsH_2O_3 \cdot Ca$.

Hazard: A confirmed human carcinogen

calcium ascorbate. $Ca(C_6H_7O_6)_2 \cdot 2H_2O$.

Properties: A white to slightly yellow crystalline powder; odorless. Soluble in water; slightly soluble in alcohol; insoluble in ether. The pH of a 10% solution is between 6.8 and 7.4.

Grade: FCC.

Use: Food preservative.

calcium biphosphate. See calcium phosphate, monobasic.

calcium bisulfide. See calcium hydrosulfide.

calcium bisulfite. See calcium hydrogen sulfite.

calcium borate. CaB_4O_7 .

Properties: White powder. Soluble in dilute acids; partially soluble in water.

Use: Fire-retardant compositions, antifreeze compounds, metallurgical flux, porcelain.

calcium bromate. $Ca(BrO_3)_2 \cdot H_2O$.

Properties: White, crystalline powder. D 3.329, loses its water at 180C. Very soluble in water.

Grade: FCC.

Hazard: Oxidizing agent, fire risk in contact with organic materials.

Use: Maturing agent, dough conditioner.

calcium bromide.

CAS: 7789-41-5. (1) $\text{CaBr}_2 \cdot 6\text{H}_2\text{O}$; (2) CaBr_2 .

Properties: White powder or crystals; odorless; sharp saline taste. (1) D 2.295 (25C), mp 38C, bp 149C (decomposes); (2) d 3.353 (25C), mp 730C (slight decomposition), bp 806–812C, very deliquescent. Very soluble in water; soluble in alcohol and acetone.

Derivation: By the action of hydrobromic acid on calcium oxide, carbonate, or hydroxide and subsequent crystallization.

Grade: Technical, CP.

Use: Photography, medicine, dehydrating agent, food preservative, road treatment, freezing mixtures, sizing compounds, wood preservative, fire retardant.

calcium carbide.

CAS: 75-20-7. CaC_2 .

Properties: Grayish-black, irregular, hard solid; garlic-like odor. Must be kept dry. D 2.22, mp approximately 2300C. Decomposes in water with formation of acetylene and calcium hydroxide and evolution of heat.

Derivation: Interaction of pulverized limestone or quicklime with crushed coke or anthracite in an electric furnace.

Grade: Technical, lumps, powder.

Hazard: Forms flammable and explosive gas and corrosive solid with moisture.

Use: Generation of acetylene gas for welding, chloroethylenes, vinyl acetate monomer, acetylene chemicals, reducing agent.

calcium carbonate.

CAS: 1317-65-3. CaCO_3 .

Properties: White powder or colorless crystals; odorless; tasteless. D 2.7–2.95, decomposes at 825C. Very slightly soluble in water (a few ppm); soluble in acids with evolution of carbon dioxide. Noncombustible.

Occurrence: Calcium carbonate is one of the most stable, common, and widely dispersed materials. It occurs in nature as aragonite, oyster shells, calcite, chalk, limestone, marble, marl, and travertine, especially in Indiana (structural limestone), Vermont (marble), Italy (travertine), and England (chalk).

Derivation: (1) Mined from natural surface deposits. (2) Precipitated (synthetic) by reaction of calcium chloride and sodium carbonate in water solution or by passing carbon dioxide through a suspension of hydrated lime ($\text{Ca}(\text{OH})_2$) in water.

Hazard: A nuisance particulate dust. TLV: 10 mg/m³.

Use: Source of lime; neutralizing agent, filler, and

extender in rubber, plastics, paints; opacifying agent in paper; fortification of bread; putty; tooth powders; antacid; whitewash; Portland cement; sulfur dioxide removal from stack gases; metallurgical flux; analytical chemistry; carbon dioxide generation (laboratory).

See chalk, calcite, marble, limestone, whiting. *Note:* Calcium carbonate is a major cause of boiler scale when hard water is used in heating systems.

calcium caseinate.

Properties: White or slightly yellow powder; nearly odorless. Insoluble in cold water; forms a milky solution when suspended in water, stirred, and heated.

Use: Medicine, special foods.

See casein.

calcium chlorate.

CAS: 10137-74-3. $\text{Ca}(\text{ClO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White to yellowish crystals. Keep well stoppered. Melts when rapidly heated at 100C, mp (anhydrous) 340C, hygroscopic, d 2.711. Soluble in water and alcohol.

Derivation: By the action of chlorine on hot calcium hydroxide slurry.

Hazard: Oxidizer, dangerous fire risk, forms explosive mixtures with combustible materials.

Use: Photography, pyrotechnics, dusting powder to kill poison ivy, herbicide.

calcium chloride.

CAS: 10043-52-4. (1) CaCl_2 ; (2) $\text{CaCl}_2 \cdot \text{H}_2\text{O}$; (3) $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$; (4) $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, deliquescent crystals, granules, lumps, or flakes. (1) D 2.15 (25C), mp 772C, bp alone 1600C; (2) mp 260C; (3) USP grade, d 0.835 (25C); (4) d 1.71 (25C), bp loses 4H₂O at 30C and 6H₂O at 200C. All forms soluble in water and alcohol. Water solution is neutral or slightly alkaline.

Derivation: (1) Action of hydrochloric acid on calcium carbonate and subsequent crystallization. (2) Commercially obtained as a by-product in the Solvay soda and other processes. (3) Recovery from brines.

Grade: Technical, CP, FCC, USP (dihydrate), various forms and purities, solution.

Use: De-icing and dust control of roads; drilling muds; dust proofing; freeze proofing and thawing coal, coke, stone, sand, ore; concrete conditioning; paper and pulp industry; fungicides; refrigeration brines; drying and desiccating agent; sequestrant in foods; firming agent in tomato canning; tire weighting; pharmaceuticals; electrolytic cells. The hexahydrate (4) has been evaluated for solar-heat storage.

calcium chlorite.

CAS: 14674-72-7. $\text{Ca}(\text{ClO}_2)_2$.

Properties: White crystals. D 2.71. Decomposes in water.

Hazard: Strong oxidizer, fire risk in contact with organic materials.

calcium chromate.CAS: 13765-19-0. CaCrO_4 ; $\text{CaCrO}_4 \cdot 2\text{H}_2\text{O}$.**Properties:** Bright-yellow powder. Hydrate loses water at 200C. Anhydrous: d 2.89. Soluble in dilute acids; slightly soluble in water.**Hazard:** TLV: 0.001 mg(Cr)/m³; suspected human carcinogen.**Use:** Pigment, corrosion inhibitor, oxidizing agent, depolarizer for batteries, coating for light metal alloys.**calcium citrate.** (lime citrate; tricalcium citrate). $\text{Ca}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 4\text{H}_2\text{O}$.**Properties:** White powder; odorless. Loses most of its water at 100C and all of it at 120C. Almost insoluble in water; insoluble in alcohol.**Grade:** Reagent, technical, FCC.**Use:** Dietary supplement, sequestrant, buffer, and firming agent in foods.**calcium cyanamide.** (lime nitrogen; calcium carbimide).CAS: 156-62-7. CaCN_2 .**Properties:** Colorless crystals or powder. D 1.083, mp 1300C, sublimes above 1150C. Decomposes in water, liberating ammonia and acetylene.**Derivation:** Calcium carbide powder is heated in an electric oven into which nitrogen is passed (24–26 hours). Any uncombined calcium carbide is leached out after removal.**Grade:** Fertilizer, 21% N, industrial.**Hazard:** Fire risk with moisture or combined with calcium carbide. A skin irritant. TLV: 0.5 mg/m³.**Use:** Fertilizer, nitrogen products, pesticide, hardening iron and steel.**calcium cyanide.**CAS: 592-01-8. $\text{Ca}(\text{CN})_2$.**Properties:** Colorless crystals or white powder, gray-black (technical). Decomposes in moist air liberating hydrogen cyanide. Decomposes above 350C. Soluble in water and very weak acid with evolution of hydrogen cyanide.**Hazard:** Toxic by ingestion and skin absorption. TLV: 5 mg(CN)/m³.**Use:** Rodenticide; fumigant for greenhouses, flour mills, grain, seed, citrus trees under tents for control of scale insects; leaching of gold and silver ores; manufacture of other cyanides.**calcium cyclamate.** (calcium cyclohexylsulfamate; calcium cyclohexanesulfamate).CAS: 139-06-0. $(\text{C}_6\text{H}_{11}\text{NHSO}_3)_2\text{Ca} \cdot 2\text{H}_2\text{O}$.**Properties:** White crystals or powder; nearly odorless; very sweet taste. Freely soluble in water (solutions are neutral to litmus); almost insoluble in alcohol, benzene, chloroform, and ether; pH (10% solution) 5.5–7.5. Sweetening power approximately 30 times that of sucrose.**Grade:** NF, FCC.**Hazard:** Not permitted for use in foods and soft drinks, because of suspected carcinogenicity.**Use:** Nonnutritive sweetener.

See cyclamate.

calcium cyclamate dihydrate.CAS: 5897-16-5. mf: $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_6\text{S}_2 \cdot \text{Ca} \cdot 2\text{H}_2\text{O}$.**Hazard:** Low toxicity by ingestion.**calcium dehydroacetate.** $(\text{C}_8\text{H}_7\text{O}_4)_2$.**Properties:** White to cream powder. Almost insoluble in water and organic solvents.**Grade:** 96% min.**Use:** Fungicide.

See dehydroacetic acid.

calcium diacetate. See calcium acetate.**calcium dichromate.** $\text{CaCr}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$ (or $\cdot 4\text{H}_2\text{O}$).**Properties:** Brownish-red crystals. Deliquescent, d (4.5H₂O variety) 2.136. Soluble in water.**Grade:** Technical, CP.**Use:** Corrosion inhibitor, catalyst, manufacture of chromium compounds.**calcium dihydrogen sulfite.** See calcium hydrogen sulfite.**calcium dioxide.** See calcium peroxide.**calcium disodium edetate.** (USAN) (calcium disodium EDTA; edathamil calcium disodium; calcium disodium ethylenediaminetetraacetate). $\text{CaNa}_2\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}_8 \cdot x\text{H}_2\text{O}$. For other variations of the name, see ethylenediaminetetraacetic acid. The calcium disodium salt is a mixture of the dihydrate and trihydrate.**Properties:** White, odorless powder or flakes; slightly hygroscopic; faint saline taste. Stable in air. Soluble in water; insoluble in organic solvents. It acts as a chelating agent for heavy metals.**Grade:** USP, FCC.**Use:** Medicine (antidote in heavy-metal poisoning), in foods to "complex" trace heavy metals, as a preservative, and to retain color and flavor; antigushing agent in fermented malt beverages. (For restrictions on food uses, see FDA regulations.)**calcium distearate.** See calcium stearate.**calcium ethylhexoate.** See soap (2).**calcium ferrocyanide.** $\text{Ca}_2\text{Fe}(\text{CN})_6 \cdot 12\text{H}_2\text{O}$.**Properties:** Yellow crystals. D 1.68, decomposes on heating. Soluble in water; insoluble in alcohol.**Use:** Removal of metallic impurities in the manufacture of citric, tartaric, and other acids.**calcium fluoride.**CAS: 7789-75-5. CaF_2 .**Properties:** White powder occurring in nature as fluorite (pure form) or flourspar (mineral). Mp 1402C, bp approximately 2500C, d 3.18, Mohs

hardness 4. Reacts with hot, concentrated sulfuric acid to liberate hydrogen fluoride. Insoluble in water; soluble in ammonium salts.

Derivation: (1) By powdering pure fluorite or fluorspar; (2) by the interaction of soluble calcium salt and sodium fluoride.

Grade: See fluorspar.

Hazard: An irritant. TLV: (F) 2.5 mg/m³.

Use: See fluorspar. Single pure (99.93%) crystals of calcium fluoride are also produced for use in spectroscopy, electronics, lasers, and high-temperature dry-film lubricants.

calcium fluorophosphate. (fluoroapatite; FAP). CaPO₃F. A laser crystal, said to have the lowest energy threshold of any room-temperature crystal.

calcium fluosilicate. See calcium silico-fluoride.

calcium formate. Ca(OOCH)₂.
Properties: White powder. Mp >300C, d 2.015. Soluble in water; insoluble in alcohol.
Use: Briquet binder, drilling fluids, lubricants, chrome tanning.

calcium 4-(β-D-galactosido)-D-gluconate.
See calcium lactobionate.

calcium gluconate.
CAS: 299-28-5. Ca(C₆H₁₁O₇)₂•H₂O.

Properties: White fluffy powder or granules; odorless; practically tasteless. Stable in air. Loses water at 120C. Soluble in hot water; less soluble in cold water; insoluble in alcohol, acetic acid, and other organic solvents; specific rotation (20/D) approximately +6 degrees. Solution neutral to litmus.

Derivation: Neutralization of gluconic acid with lime or calcium carbonate.

Grade: Technical, USP, FCC, special for ampules.
Use: Food additive, buffer and sequestering agent, vitamin tablets.

calcium glutamate. Similar to sodium glutamate.

calcium glycerophosphate. (calcium glycerinophosphate). CaC₃H₇O₂PO₄.

Properties: White, crystalline powder; odorless; almost tasteless. Slightly hygroscopic; decomposes above 170C. Slightly soluble in water; insoluble in alcohol.

Derivation: By esterification of phosphoric acid with glycerol and conversion of glycerophosphoric acid to the calcium salt.

Grade: Technical, pure, FCC.

Use: Stabilizer for plastics, nutrient and dietary supplement.

calcium glycolate. (CH₃OHCOO)₂Ca.
Properties: White solid.

Grade: Technical.

Use: Source of glycolic acid and of the glycolic acid radical in chemical synthesis.

calcium hexametaphosphate.

Hazard: A nuisance dust.

Use: Food additive.

calcium hexasilicofluorate. See calcium silicofluoride.

calcium hydrate. See calcium hydroxide.

calcium hydride.

CAS: 7789-78-8. CaH₂.

Properties: Grayish-white lumps or crystals. Forms calcium hydroxide in moist air and evolves hydrogen. D 1.7, decomposes at 675C. Decomposed by water, organic acids, and lower alcohols.

Grade: Technical, 94% pure.

Hazard: Evolves highly flammable hydrogen when wet; solid product is slaked lime. Irritating to skin.

Use: Reducing agent, drying agent, analytical reagent in organic chemistry, easily portable source of hydrogen, cleaner for blocked-up oil wells.

calcium hydrogen phosphate.

CAS: 7789-77-7. mf: CaHPO₄•2H₂O.

Properties: White crystals. Mp: 36°. Slowly sol in water.

Use: Food additive.

calcium hydrogen sulfite. (calcium bisulfite; calcium dihydrogen sulfite; calcium acid sulfite). Ca(HSO₃)₂. A solution of calcium sulfite in aqueous sulfur dioxide.

Properties: Yellowish liquid; strong sulfur dioxide odor. D 1.06. Corrosive to metals.

Derivation: Action of sulfur dioxide on calcium hydroxide (solution).

Hazard: Irritating and corrosive to skin and tissue.

Use: Antichlor in bleaching textiles, paper pulp (dissolving lignin) preservative, bleaching sponges, hydroxylamine salts, germicide, disinfectant.

calcium hydrosulfide. (calcium bisulfide; calcium sulfhydrate). Ca(HS)₂•6H₂O.

Properties: Colorless, transparent crystals. Soluble in alcohol and water. Decomposes in air (15–18C).

Use: Leather industry.

calcium hydroxide. (calcium hydrate; hydrated lime; caustic lime; slaked lime).

CAS: 1305-62-0. Ca(OH)₂.

Properties: Soft, white, crystalline powder; alkaline, slightly bitter taste. D 2.34, loses its water at 580C, pH of water solution (25C) 12.4. Slightly soluble in water; soluble in glycerol, syrup, and acids; insoluble in alcohol. Absorbs carbon dioxide from air.

Derivation: Action of water on calcium oxide.

Impurities: Calcium carbonate, magnesium salts, iron.

Grade: Technical, chemical lime (insoluble matter less than 2%, magnesium less than 3%), building lime, USP, CP, FCC.

Hazard: Skin irritant, avoid inhalation. TLV: 5 mg/m³.

Use: Mortar, plasters, cements, calcium salts, causticizing soda, depilatory, unhairing of hides, white-wash, soil conditioner, ammonia recovery in gas manufacture, disinfectant, water softening, purification of sugar juices, accelerator for low-grade rubber compounds, petrochemicals, food additive as buffer and neutralizing agent, shell-forming agent (poultry).

calcium hypochlorite. (calcium oxychloride).

CAS: 7778-54-3. Ca(OCl)₂.

Properties: White, crystalline solid. D 2.35, decomposes at 100C. Decomposes in water and alcohol; not hygroscopic. Practically clear in water solution. Stable chlorine carrier. An oxidizer.

Derivation: Chlorination of a slurry of lime and caustic soda with subsequent precipitation of calcium hypochlorite dihydrate, dried under vacuum.

Grade: Commercial (70%), high purity (99.2% available chlorine as calcium hypochlorite).

Hazard: Dangerous fire risk in contact with organic materials.

Use: Algicide, bactericide, deodorant, potable-water purification, disinfectant for swimming pools, fungicide, bleaching agent (paper, textiles). See lime, chlorinated.

calcium hypophosphite. Ca(H₂PO₂)₂.

Properties: White powder. Evolves phosphine at 300C. Soluble in water; insoluble in alcohol.

Use: Medicine, corrosion inhibitor.

calcium iodate. Ca(IO₃)₂.

Properties: White crystals or powder; odorless. D 4.5 (15C), decomposes at 540C. Soluble in water and nitric acid; insoluble in alcohol. Oxidizer.

Grade: Technical, CP, FCC.

Hazard: Fire risk in contact with organic materials.

Use: Deodorant, mouth washes, food additive, dough conditioner (up to 0.0075 part per 100 of flour used).

calcium iodide. CaI₂•6H₂O.

Properties: Yellowish-white crystals, deliquescent, decomposes in air by absorption of carbon dioxide. D 2.55 (anhydrous 4.0 at 25C), loses 6H₂O at 42C, mp 783C, bp approximately 1100C. Soluble in water, ethanol, and pentanol.

Derivation: Action of hydriodic acid on calcium carbonate.

Use: Photography, medicine.

calcium iodobenenate. Ca(OOCC₂₁H₄₂I)₂.

Properties: White, odorless powder. Insoluble in alcohol; slightly soluble in cold water.

Use: Medicine and pharmaceuticals.

calcium lactate.

CAS: 814-80-2. mf: C₆H₁₀CaO₆•xH₂O.

Properties: White crystalline powder with up to 5 H₂O. Sol in water; insol in alc.

Hazard: A poison.

Use: Food additive.

calcium lactobionate.

CAS: 5001-51-4. mf: C₂₄H₄₂CaO₂₄.

Properties: White powder. Mp: 120° (decomp). Sol in water; insol in alc, ether.

Use: Food additive.

calcium lignosulfonate.

CAS: 8061-52-7.

Properties: Brown, amorphous polymer obtained from the spent sulfite pulping liquor of wood. Sol in water.

Use: Dispersing agent for pesticides; food additive.

calcium metasilicate. (calcium silicate).

CAS: 1344-95-2. CaSiO₃.

Properties: White powder. D 2.9. Insoluble in water.

Hazard: Irritating dust. TLV: 10 mg/m³. Use in foods restricted to 5% in baking powder, 2% in table salt.

Use: Absorbent, antacid, filler for paper and paper coatings, cosmetics, food additive (anticaking agent), manufacture of glass and Portland cement. See dicalcium silicate.

calcium molybdate.

CAS: 7789-82-4. CaMoO₄.

Properties: White, crystalline powder. Mp approximately 1250C, d 4.35. Soluble in mineral acids; insoluble in alcohol, ether, or water. Noncombustible.

Derivation: Fusion of calcium oxide and a molybdenum ore.

Grade: Technical, single crystals, 99.97%.

Use: Molybdc acid, alloying agent in production of iron and steel, crystals in optical and electronic applications, phosphors.

calcium naphthenate.

Properties: Sticky, tenacious mass. Insoluble in water; soluble in ethyl acetate, carbon tetrachloride, gasoline, benzene, and ether. Combustible.

Derivation: Precipitation from aqueous solutions of calcium salts and sodium naphthenate.

Use: Waterproofing compositions, adhesives, driers, wood fillers, grafting waxes, cements, varnishes, color lakes.

See soap (2).

calcium nitrate. (lime nitrate; nitrocalcite;

lime saltpeper; Norwegian saltpeper).

CAS: 10124-37-5. (1) Ca(NO₃)₂•4H₂O; (2) Ca(NO₃)₂.

Properties: White, deliquescent mass. D (1) 1.82, (2) 2.36; mp (1) 42C, (2) 561C. Soluble in water, alcohol, and acetone.

Grade: Technical, pure, CP, reagent.

Hazard: Strong oxidizer, dangerous fire risk in contact with organic materials, may explode if shocked or heated.

Use: Pyrotechnics, explosives, matches, fertilizers, other nitrates, source of ^{14}C by nuclear irradiation.

calcium nitride. Ca_3N_2 .

Properties: Brown crystals. D 2.63 (17C), mp 1195C. Soluble in water with evolution of ammonia (irritating gas), soluble in dilute acids, insoluble in absolute alcohol.

calcium nitrite. $\text{Ca}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless or yellowish crystals, hygroscopic. D 2.23 (34C) (anhydrous), mp loses its water at 100C. Soluble in water; slightly soluble in alcohol.

Grade: Technical.

Use: Corrosion inhibitor in lubricants and steel-reinforced concrete.

calcium novobiocin. See novobiocin.

calcium octoate. See soap (2).

calcium oleate. (oleic acid calcium salt).

$\text{Ca}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Yellowish crystals. Soluble in benzene and chloroform; almost insoluble in water, alcohol, and acetone; decomposes at approximately 140C.

Use: Grease-thickening agent, emulsifying agent, waterproofing concrete.

calcium orthophosphate. See calcium phosphate, tribasic.

calcium orthotungstate. See calcium tungstate.

calcium oxalate. $\text{Ca}_2\text{C}_2\text{O}_4$.

Properties: White, crystalline powder. D 2.2. Soluble in dilute hydrochloric and nitric acids; insoluble in acetic acid and water.

Grade: Technical, CP.

Hazard: An irritant.

Use: Making oxalic acid and organic oxalates, glazes, rare-earth-metal separations.

calcium oxide. (lime; quicklime; burnt lime; calx; unslaked lime; fluxing lime).

CAS: 1305-78-8. CaO .

Properties: White or grayish-white hard lumps; sometimes with a yellowish or brownish tint due to iron; odorless. Crumbles on exposure to moist air, d 3.40, mp 2570C, bp 2850C. Soluble in acid; reacts with water to form calcium hydroxide with evolution of heat.

Derivation: Calcium carbonate (limestone) is roasted in kilns until all the carbon dioxide is driven off.

Impurities: Calcium carbonate; magnesium, iron, and aluminum oxides.

Grade: Technical, refractory, agricultural, FCC.

Hazard: Evolves heat on exposure to water. Dangerous near organic materials. Strong irritant. TLV: 2 mg/m³.

Use: Refractory, flux in steel manufacture, pulp and paper, manufacture of calcium carbide, sulfur dioxide removal from stack gases, sewage treatment (phosphate removal, pH control), poultry feeds, neutralization of acid waste effluents, insecticides and fungicides, dehairing of hides, sugar refining, food additive, glass manufacture, sodium carbonate by Solvay process, carbon dioxide absorbent. *Note:* Like other high-melting solids (tungsten, zirconia, carbon), lime (CaO) becomes incandescent when heated to near its mp (2500C). Of both historical and etymological interest is the use of lime as an illuminant in stage lighting for some years before the advent of electricity (1850–1880). Invented in 1816, this technique involved an oxyhydrogen flame impinging on a cylinder of lime, causing it to emit a brilliant white light that was concentrated to a beam by a lens. The light was powerful enough to spotlight actors or simulate sunshine. It became known in theatrical circles as limelight and was the origin of the familiar phrase “in the limelight.” See lime.

calcium oxychloride. See calcium hypochlorite.

calcium palmitate. $\text{Ca}(\text{C}_{15}\text{H}_{31}\text{CO}_2)_2$.

Properties: White or pale yellow powder produced by reacting a soluble palmitate with a soluble calcium salt. Insoluble in water; slightly soluble in alcohol or ether. Combustible.

Use: Waterproofing agent, thickener for lubricating oils, manufacture of solidified oils. Available only as technical grade.

See soap (2).

calcium pantothenate. $(\text{C}_5\text{H}_{16}\text{NO}_5)_2\text{Ca}$. The calcium salt of pantothenic acid, available in both the dextro and racemic form. Only the dextro form has vitamin activity.

Properties: (Both forms identical) white, slightly hygroscopic powder; odorless; sweetish taste. Mp 170–172C; decomposes at 195–196C; specific rotation (5% aqueous solution) +28.2 (25C). Stable in air. Solutions have a pH of 7–9. Soluble in water and glycerol; insoluble in alcohol, chloroform, and ether.

Source: Same as pantothenic acid.

Grade: USP (both forms), FCC.

Use: Medicine, animal feeds, dietary supplement. See pantothenic acid.

calcium pectate. A material developed in plants, such as beans, peas, potatoes, which enables them to seal off fungus-infected areas.

See pectic acid; pectin.

calcium perborate. $\text{Ca}(\text{BO}_3)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Gray-white lumps or powder. Soluble in acids, and in water with evolution of oxygen.

Use: Medicine, bleach, tooth powders.

calcium perchlorate. $\text{Ca}(\text{ClO}_4)_2$.

Properties: White crystals. D 2.651, decomposes at 270C. Soluble in water and alcohol.

Hazard: Strong oxidizer, dangerous fire risk in contact with organic materials.

calcium permanganate.

CAS: 10118-76-0. $\text{Ca}(\text{MnO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Violet, deliquescent crystals. D 2.4. Soluble in water and ammonia; decomposed by alcohol.

Grade: Technical, pure.

Hazard: TLV: 5 mg(Mn)/m³. Strong oxidizer, dangerous fire risk in contact with organic materials.

Use: Textile industry, sterilizing water, dentistry, disinfectant, deodorizer, an additive (with hydrogen peroxide) in liquid rocket propellants, in binders for welding electrode coatings.

calcium peroxide. (calcium superoxide; calcium dioxide).

CAS: 1305-79-9. CaO_2 .

Properties: White or yellowish powder; odorless; almost tasteless. Decomposes at approximately 200C. Almost insoluble in water; soluble in acids with formation of hydrogen peroxide. Available oxygen 22.2% (min 13.3% in technical grade).

Derivation: Interaction of solution of a calcium salt and sodium peroxide with subsequent crystallization.

Grade: 60–75%, FCC.

Hazard: Strong oxidizing agent. Dangerous fire risk in contact with organic materials. Irritating in concentrated form.

Use: Seed disinfectant, dentrifices, dough conditioners, antiseptic, bleaching of oils, modification of starches, high-temperature oxidation.

calcium phenylate. (calcium phenoxide; calcium phenate). $\text{Ca}(\text{OC}_6\text{H}_5)_2$.

Properties: Finely divided red crystals. Slightly soluble in water and alcohol.

Use: Lubricating-oil detergent, emulsifier.

calcium phosphate. See calcium phosphate, dibasic; calcium phosphate monobasic; calcium phosphate tribasic.

calcium phosphate, dibasic. (dicalcium orthophosphate; bicalcium phosphate; secondary calcium phosphate). $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ and CaHPO_4 .

Properties: White, crystalline powder; tasteless; odorless. (Hydrate) d 2.306, loses its water at 109C. Soluble in dilute hydrochloric, nitric, and acetic acids; insoluble in alcohol; slightly soluble in water. Nonflammable.

Derivation: Interaction of fluorine-free phosphoric acid with milk of lime.

Grade: USP, FCC, dentrifice grade, feed grade, 18.5 or 21% P.

Use: Animal-feed supplement, food supplement, dentrifice, medicine, glass, fertilizer, stabilizer for plastics, dough conditioner, yeast food.

calcium phosphate, monobasic. (calcium biphosphate; acid calcium phosphate; calcium phosphate primary; monocalcium phosphate). $\text{CaH}_2(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, pearly scales or powder; deliquescent in air. Loses water at 100C, decomposes at 200C, d 2.20. Soluble in water and acids. Aqueous solutions are acid. Nonflammable.

Derivation: By dissolving either dicalcium or tricalcium phosphate in phosphoric acid and allowing the solution to evaporate spontaneously.

Grade: FCC, ceramic, anhydrous, hydrated.

Use: Baking powders, fertilizers, mineral supplement, stabilizer for plastics, to control pH in malt, glass manufacture, buffer in foods, firming agent. See superphosphate.

calcium phosphate, precipitated. See calcium phosphate, tribasic.

calcium phosphate, primary. See calcium phosphate, monobasic.

calcium phosphate, secondary. See calcium phosphate, dibasic.

calcium phosphate, tertiary. See calcium phosphate, tribasic.

calcium phosphate, tribasic. (calcium orthophosphate; tricalcium phosphate; precipitated calcium phosphate; tricalcium orthophosphate; tertiary calcium phosphate). $\text{Ca}_3(\text{PO}_4)_2$. True $\text{Ca}_3(\text{PO}_4)_2$ can be prepared thermally but is rare. Precipitated "tricalcium phosphate" is a hydroxyapatite with the approximate formula $\text{Ca}_5\text{OH}(\text{PO}_4)_3$.

Properties: White, crystalline powder; odorless; tasteless. D 3.18, mp 1670C, refr index 1.63. Soluble in acids; insoluble in water, alcohol, and acetic acid. Nonflammable.

Derivation: (1) Phosphate rock, apatite, and phosphorite; (2) by the interaction of soluble of calcium chloride and sodium triphosphate with excess of ammonia; (3) by interaction of hydrated lime and phosphoric acid.

Grade: Granular, technical, CP, NF, pure precipitated, FCC.

Use: Ceramics, calcium acid phosphate, phosphorus and phosphoric acid, polishing powder, cattle foods, clarifying sugar syrups, medicine, mordant (dyeing textiles with Turkey red), fertilizers, dentrifices, stabilizer for plastics, in meat tenderizers, in foods as anticaking agent, buffer, nutrient supplement, removal of ⁹⁰Sr from milk.

See bone ash.

calcium phosphide. (photophor).

CAS: 1305-99-3. Ca_3P_2 (or Ca_2P_2).

Properties: Red-brown crystals or gray granular masses. D 2.51 (15C), mp approximately 160C, insoluble in alcohol and ether.

Derivation: By heating calcium phosphate with aluminum or carbon, by passing phosphorus vapors over metallic calcium.

Grade: Technical.

Hazard: Dangerous fire risk; decomposed by water to phosphine, which is highly toxic and flammable. See phosphine.

Use: Signal fires, torpedoes, pyrotechnics, rodenticide.

calcium phosphite. (dicalcium orthophosphite). $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White powder, loses its water at 200–300C (decomposes), forming phosphine. Slightly soluble in water; insoluble in alcohol.

Use: Catalyst for polymerization reactions.

calcium phytate. (hexacalcium phytate).

$\text{C}_6\text{H}_6(\text{CaPO}_4)_6$.

Properties: Free-flowing, white powder. Slightly soluble in water. The pH of saturated solution is neutral.

Derivation: Corn steep liquor.

Use: Sequestering agent to remove excess metals from wine and vinegar, source of calcium in pharmaceuticals and nutrition, source of phytic acid and its salts.

calcium plumbate. Ca_2PbO_4 .

Properties: Orange to brown crystalline powder. Decomposed by hot water or carbon dioxide, d 5.71. Soluble in acids (decomposes); insoluble in cold water.

Hazard: Fire risk in contact with organic materials. Toxic by ingestion.

Use: Oxidizing agent, pyrotechnics and safety matches, glass, storage batteries.

calcium polysilicate. $\text{CaO} \cdot 12\text{SiO}_2$. A powder used as an anticaking agent.

calcium propionate. $\text{Ca}(\text{OOCCH}_2\text{CH}_3)_2$. Occurs also with one water. White powder, soluble in water, slightly soluble in alcohol.

Grade: FCC.

Use: Mold-inhibiting additive in bread, other foods, tobacco, pharmaceuticals, medicine (antifungal agent).

calcium propyl arsenate. $\text{C}_3\text{H}_7\text{AsO}_3\text{Ca}$.

Properties: Crystals. Soluble in water.

Hazard: Toxic by ingestion.

Use: Preemergence control of crabgrass.

calcium pyrophosphate. $\text{Ca}_2\text{P}_2\text{O}_7$.

Properties: White powder. D 3.09, mp 1230C. Solu-

ble in dilute hydrochloric and nitric acids; insoluble in water.

Grade: FCC.

Use: Polishing agent in dentrifices, mild abrasive for metal polishing, nutrient and dietary supplement.

calcium resinat.

CAS: 9007-13-0.

Properties: Yellowish-white, amorphous powder or lumps; rosin odor. Insoluble in water; soluble in acid, amyl acetate, butyl acetate, ether, amyl alcohol.

Derivation: By boiling calcium hydroxide with rosin and filtering; fusion of hydrated lime and melted rosin.

Grade: Technical, fused.

Hazard: Flammable, dangerous fire risk, spontaneous heating.

Use: Waterproofing; manufacturing paint driers, porcelains, perfumes, cosmetics, enamels; coating for fabrics, wood, paper; tanning leather.

See soap (2).

calcium ricinoleate.

$\text{Ca}[\text{CH}_2(\text{CH}_2)_7\text{CH}_2\text{OCH}_2\text{CHCH}(\text{CH}_2)_7\text{CO}_2]_2$.

Properties: White powder; slight odor of fatty acids. Mp 84C, d 1.04. Combustible.

Derivation: Derived from castor oil.

calcium *d*-saccharate. $\text{CaC}_6\text{H}_8\text{O}_8 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline powder; odorless; tasteless. Insoluble in water and alcohol; soluble in calcium gluconate solution.

Derivation: Oxidation of *d*-gluconic acid and neutralization with lime.

Use: Plasticizer for cement, mortar, etc.

calcium saccharin.

mf: $\text{C}_{14}\text{H}_8\text{CaN}_2\text{O}_6\text{S}_2 \cdot 3.5\text{H}_2\text{O}$.

Properties: White crystalline powder; faint aromatic odor. Sol in water.

Use: Food additive.

calcium selenate. CaSeO_4 .

Properties: A powder. D 2.7 (dihydrate). Water soluble.

Use: General pesticide.

calcium silicate. See calcium metasilicate; wollastonite; Portland cement.

calcium silicide. CaSi_2 .

Properties: Solid. D 2.5. Insoluble in cold water; decomposes in hot water; soluble in acids and alkalis.

Hazard: Flammable, may ignite spontaneously in air.

calcium silicofluoride. (calcium hexafluorosilicate). CaSiF_6 .

Properties: (Dihydrate) Finely divided solid. D 2.25.

Insoluble in cold water and acetone; decomposed by hot water.

Hazard: Toxic to experimental animals.

Use: Flotation agent, insecticide, rubber compounding, ceramic glazes.

calcium-silicon alloy. Contains 30% calcium.

Hazard: Flammable, may ignite spontaneously in air.

calcium sorbate. $\text{Ca}(\text{OOCCH}_2\text{CH}_2)_2$.

Use: Chemical preservative in foods.

calcium stannate. $\text{CaSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Insoluble in water; dehydrates at approximately 350C.

Hazard: Toxic by ingestion and inhalation. TLV: 2 mg/m³.

Use: Additive to ceramic capacitors, production of ceramic colors.

calcium stearate. (calcium distearate; octadecanoic acid, calcium salt).

CAS: 1592-23-0. $\text{Ca}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$. Variable proportions of calcium stearate and calcium palmitate.

Properties: White powder; slight characteristic odor. Mp 179C. Insoluble in water; slightly soluble in hot alcohol. Decomposed by many acids and alkalis.

Derivation: Interaction of sodium stearate and calcium chloride, then filtration.

Grade: Technical, FCC.

Hazard: A nuisance dust. TWA 10 mg/m³, total dust.

Use: Water repellent, flattening agent in paints, lubricant in making tablets, emulsions, cements, wax crayons, stabilizer for vinyl resins, food additive, mold-release agent, cosmetics.

calcium stearoyl lactate.

Properties: Cream-colored powder; caramel odor. Slightly sol in hot water.

Use: Food additive.

calcium stearyl lactylate. $\text{C}_{48}\text{H}_{86}\text{CaO}_{12}$.

Properties: Finely divided, nonhygroscopic solid. Almost insoluble in water.

Use: Food additive (flour mixing, egg whites, etc.).

calcium strontium sulfide. CaSrS_2 or $\text{CaS} \cdot \text{SrS}$.

Use: Phosphorescent pigment; a phosphor.

calcium sulfamate. $\text{Ca}(\text{SO}_3\text{NH}_2)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water. Aqueous solution is stable on boiling. Nonflammable.

Grade: Technical.

Use: Flame-proofing agent for textiles and certain grades of paper.

calcium sulfate.

CAS: 10101-41-4. CaSO_4 or $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ or $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$. Occurs in nature as anhydrite and in

hydrated form as gypsum (plaster of Paris, the hemihydrate $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$).

Properties: (Pure anhydrous) White, odorless powder or crystals. D 2.964, mp 1450C. Slightly soluble in water. (Dihydrate, pure precipitated) D 2.32, loses 1.5 waters at 128C, becomes anhydrous at 163C. Noncombustible. Neither the anhydrous nor the dihydrate form can set with water.

Derivation: From natural sources and as a by-product in many chemical operations.

Grade: Technical, pure precipitated (as the dihydrate), FCC.

Hazard: TLV: (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%).

Use: Portland-cement retarder; tile and plaster; source of sulfur and sulfuric acid; polishing powders; paints (white pigment, filler, drier); paper (size filler, surface coating); dyeing and calico printing; metallurgy (reduction of zinc minerals); drying industrial gases, solids, and many organic liquids; in granulated form as soil conditioner; quick-setting cements, molds, and surgical casts; wallboard; food additive; desiccant.

calcium sulfhydrate. See calcium hydrosulfide.

calcium sulfide. CaS .

Properties: Yellow to light-gray powder; odor of hydrogen sulfide in moist air; unpleasant alkaline taste. D 2.6. Gradually decomposes in moist air or in weak acids; decomposed by acids. Slightly soluble in water with partial decomposition; insoluble in alcohol.

Derivation: Strong heating of pulverized calcium sulfate and charcoal.

Hazard: Irritating to skin and mucous membranes.

Use: Luminous paint, depilatory, preparation of arsenic-free hydrogen sulfide, lubricant additive, ore dressing and flotation agent, phosphors.

calcium sulfite. $\text{CaSO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White powder. Loses its water at 100C. Soluble in sulfurous acid; slightly soluble in water.

Derivation: Action of sulfurous acid on calcium carbonate.

Use: Textiles (antichlor), disinfectant in sugar industry, brewing, biological cleansing, food preservative and discoloration retarder, paper manufacture.

calcium sulfocyanate. See calcium thiocyanate.

calcium superoxide. See calcium peroxide.

calcium tannate.

Properties: Yellowish-gray powder. Soluble in dilute acids; slightly soluble in water.

Use: Pharmaceuticals, adhesives.

calcium tartrate. $\text{CaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.

Properties: White crystals. Soluble in dilute acids; slightly soluble in water or alcohol.

Derivation: Interaction of calcium salt and crude cream of tartar.

Grade: Technical, CP.

Use: Tartaric acid, food preservative, antacid.

calcium thiocyanate. (calcium sulfocyanate). $\text{Ca}(\text{SCN})_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, hygroscopic crystals. Soluble in water and alcohol.

Use: Solvent for cellulose and polyacrylate, acrylonitrile polymers; stiffening and swelling of textiles.

calcium thioglycollate. $\text{CaCH}_2\text{COOC} \cdot 3\text{H}_2\text{O}$.

Properties: White powder. Loses water at 100C. Decomposes at 250C. Slightly soluble in water; insoluble in alcohol.

Use: Depilatories and hair-waving preparations.

calcium titanate. CaTiO_3 .

Properties: Powder. D 3.98, mp 1800C.

Use: Electronics.

calcium trisodium pentetate (USAN). [trisodium[(carboxymethyl)imino]bis(ethylenenitro)tetraacetate]. $\text{CaNa}_3\text{C}_{14}\text{H}_{18}\text{N}_3\text{O}_{10}$. A chelating agent, antidote for lead poisoning.

calcium tungstate. (calcium orthotungstate; calcium wolframate normal). CaWO_4 .

Properties: White crystals. D 6.062. Soluble in ammonium chloride; insoluble in water; decomposed by hot acids.

Derivation: (1) Interaction of calcium chloride and sodium tungstate. (2) Occurs in nature as scheelite, in Nevada, California, Arizona, Utah, Colorado, New Zealand, Europe.

Method of purification: A slurry of powdered scheelite is treated with soda ash to form the soluble sodium tungstate. Insoluble impurities are filtered off, and calcium tungstate is precipitated with lime.

Use: Luminous paints, fluorescent lamps, photography, medicine (radiopaque agent).

Note: Synthetic crystals are available for use as scintillation counters and possible application in lasers.

calcium undecylenate. $[\text{CH}_2\text{CH}(\text{CH}_2)_8\text{COO}]_2\text{Ca}$.

Properties: A fine, white powde. Mp 155C. Of limited solubility.

Use: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

calcium zirconate. CaZrO_3 .

Properties: Solid. Mp 2550C, d 4.78. Soluble in nitric and other acids. Noncombustible.

calcium zirconium silicate. CaZrSiO_5 or $\text{CaOZrO}_2\text{SiO}_2$.

Properties: White solid. Mp 1593C. Insoluble in

water, alkalies; slightly soluble in acids; soluble in hydrofluoric acid. Noncombustible.

Use: Electrical resistor ceramics, glaze opacifier.

"Calcocid" [Cytec]. TM for a series of acid dyestuffs used in the dyeing of wool and worsted goods, natural silk and jute; and in coloring diversified materials.

"Calcofast" [Cytec]. TM for a series of metalized dyes containing chemically combined chromium used for dyeing wool. They can also be applied to leather, nylon, etc.

"Calcofluor" [Cytec]. TM for a series of direct-dyeing dyes that possess fluorescent properties. Used for dyeing cotton, linen, viscose, acetate, nylon, wool, and certain synthetics. Used also in soaps as a brightener for textiles.

caldopentamine. See tetrapropylene-pentamine.

caldron process. Procedure for the recovery of silver in which a slurry of ore in a copper vessel is agitated with salt.

calender. A machine in which material is passed between heated steel rolls for any of several purposes: (1) to convert it into a sheet of uniform thickness; (2) to cause it to impregnate a textile fabric; or (3) to increase its surface gloss and hardness. Calenders (i.e., cylinders) are composed of from three to as many as 10 or 12 hollow cast-iron rolls up to 84 in. in width, set vertically in a frame. The standard rubber or plastics calender has three steam-heated rolls that turn in opposing directions, either at the same speed or different speeds. When moving at the same speed they deliver the mixture fed between the top and center rolls in a smooth sheet that can be as thin as 0.005 inches, from between the center and bottom rolls. If fabric impregnation is desired, the center roll runs faster than the other two, thus pressing the soft and tacky mixture, called friction, into the textile material (tire carcasses, electrical tape, etc.). In paper manufacturing a high-speed calender "stack" imparts a smooth finish to the sheet as it leaves the drying unit. Smaller calenders are used to apply coating compositions. Laboratory sizes of all types are available. See supercalender.

"Calgon" [Nalco]. TM for a sodium phosphate glass cleaner (commonly called sodium hexametaphosphate). It has a molecular ratio of 1:1 $\text{Na}_3\text{O}:\text{P}_2\text{O}_5$, with a guaranteed min of 67% P_2O_5 . Several specialized compositions are available.

Derivation: From food-grade phosphoric acid and commercial soda ash by a thermal process.

Available forms: Powder, agglomerated particles, and broken glassy plates, either pure or adjusted with mild alkalies.

Properties: Miscible with water but insoluble in organic solvents. It possesses sequestering, dispersing, and deflocculating properties and precipitates proteins. In very low concentration, it inhibits corrosion of steel and prevents the precipitation of slightly soluble, scale-forming compounds such as calcium carbonate and calcium sulfate.

Use: Softening water without precipitate formation, as in dyeing, laundering, textile processing, and washing operations; corrosion inhibitor in deicing salt preparations; frozen desserts; pretanning hides in the manufacture of leather; dispersing clays and pigments; threshold treatment for scale; and corrosion prevention.

“**Calgosil**” [*Nalco*]. TM for a metaphosphate silicate compound, used to provide corrosion reduction in low-hardness waters.

caliche. See sodium nitrate.

“**Califlux**” [*Crompton & Knowles*]. TM for a series of oils composed principally of nitrogen bases and acidaffins. Used in plasticizers, in extenders, and as reclaiming agents for dark-colored compounds.

californium. Cf. A synthetic radioactive element of the actinide group with atomic number 98 and aw 252. It has several isotopes, two of which (^{252}Cf and ^{249}Cf) are available in milligram amounts. The pure metal has not yet been obtained. Several compounds are known: trioxide, trifluoride, trichloride, and sesquioxide. The 252 isotope has potential uses in neutron-activation analysis for continuous materials testing, mineral prospecting, oil-well logging, etc. Biologically, it is a bone-seeking element and has specialized applications in medicine.

“**Calo-Clor**” [*Mallinckrodt*]. TM for a mercurial turf fungicide containing 73% mercury in chemical combination (principally mercuric and mercurous chlorides).

Hazard: Toxic by ingestion or inhalation.

“**Calocure**” [*Mallinckrodt*]. TM for a mercurial turf fungicide having a mercury content of 36%, mainly mercuric and mercurous chlorides.

Hazard: A poison. See mercury. See mercury.

“**Calogran**” [*Mallinckrodt*]. TM for turf fungicide composed of extremely finely divided form of mercurous chloride. Contains 85% mercury (insoluble in water).

Hazard: A poison. See mercury. See mercury.

calomel. See mercurous chloride.

calorie. (1) The amount of heat needed to raise 1 g of water 1C at 1 atm. (2) A kilogram calorie is the

amount of heat required to raise 1 kg of water 1C (equal to 4184×10^7 ergs). In the latter case, the word Calorie should be capitalized when used alone, or the abbreviation kcal may be used. Kilogram calories are used in connection with foods and beverages.

calorific value. The number of heat units obtained by the complete combustion of unit mass of a fuel or other material.

calorimeter. Device for determining heat evolution or absorption in a chemical reaction.

calorizing. The process by which steel is coated with aluminum by heating it in aluminum powder. The aluminum forms an alloy with the steel surface and produces a thin, tightly adherent coating. See cementation.

calotropagenin. CAS: 24211-64-1. mf: $\text{C}_{23}\text{H}_{32}\text{O}_6$.

Hazard: A poison.

Source: Natural product.

cal sintering. A method for recovering alumina from fly ash developed in 1978 by Oak Ridge National Laboratories. The essential steps are pelletizing and sintering a mixture of fly ash and lime (from either limestone or gypsum) at 1000–1200C for 20 min. The product is ground to 40 mesh and leached with dilute sulfuric acid. The leached solution is then solvent extracted, crystallized, and calcined to alumina, which then can be converted to aluminum by standard methods. The high recovery of alumina suggests that fly ash is a viable alternative raw material for aluminum.

calspar. See calcite.

calutron. A type of electromagnetic separator used for radioisotope purification. See electromagnetic separation.

Calvin cycle. The cyclic pathway used by plants to fix carbon dioxide and produce triose phosphates. Named after Melvin Calvin, an early worker in the field.

Calvin, Melvin. (1911–1997). An American chemist who won the Nobel Prize for chemistry in 1961. Much of his work involved the study of photosynthesis, biophysics, and application of physics and chemistry of molecules to some of the basic problems of biology. His doctorate was from the University of Minnesota. He did postgraduate work in England and at Northwestern University and the University of Notre Dame.

“**Cambrele**” [*ICI*]. TM for a nonwoven, mended fabric used for carpet backing, road reinforcement, upholstery, interlinings, tablecloths, and other

household applications. It is said to be composed of two different polymers, one lying within the other. Upon heating to the melting point of the external polymer, the fibers soften and unite to form a fabric. The term *melled* refers to this type of fusion. See nonwoven fabric.

cAMP. Biochemical designation for cyclic adenosine-3',5'-monophosphate, an activator of hormones and initiator of prostaglandin synthesis.

Campbell synthesis. Ketoxime plus aryl Grignard reagent yields arylated ethylenimine.

2-camphanol. See borneol.

2-camphanone. See camphor.

camphene.

CAS: 79-92-5. $C_{10}H_{16}$. A terpene.

Properties: Colorless crystals. Mp 48–52C, bp 159–162C. Soluble in ether; slightly soluble in alcohol; insoluble in water.

Derivation: (1) By heating pinene hydrochloride with alkalis, aniline, or alkali salts such as sodium acetate. (2) A constituent of certain essential oils.

Grade: Technical (mp 46C).

Hazard: Toxic by ingestion.

Use: Manufacture of synthetic camphor, camphor substitute.

camphor. (gum camphor; 2-camphanone).

CAS: 76-22-2. $C_{10}H_{16}O$. A ketone occurring naturally in the wood of the camphor tree (*Cinnamomum camphora*).

Properties: Colorless or white crystals, granules, or easily broken masses; penetrating aromatic odor. D 0.99, mp 174–179C, sublimes slowly at room temperature, flash p 150F (65.5C) (CC), autoign temp 871F (466C). Slightly soluble in water; soluble in alcohol, ether, chloroform, carbon disulfide, solvent naphtha, and fixed and volatile oils. Combustible.

Derivation: Steam distillation of camphor-tree wood and crystallization. This product is called natural camphor and is dextrorotatory. Synthetic camphor, most of which is optically inactive, may be made from pinene, which is converted into camphene; by treatment with acetic acid and nitrobenzene it becomes camphor, turpentine oil is also used.

Grade: Technical (synthetic, mp 163–168C), USP (mp 174–179C).

Hazard: Evolves flammable and explosive vapors when heated. TLV: (synthetic) 2 ppm.

Use: Medicine (internal and external), plasticizer for cellulose nitrate, other explosives and lacquers, insecticides, moth and mildew proofings, tooth powders, flavoring, embalming, pyrotechnics, intermediate. *Note:* A liquid form (camphor oil) is produced almost exclusively in Taiwan and was formerly used in the manufacture of sassafras oil; the available supply is used chiefly as a fragrance or flavoring material and to some extent as a pharmaceutical product.

camphor bromate. (α -bromo-1-camphor; brominated camphor). $C_{10}H_{15}BrO$.

Properties: Colorless crystals; slight camphor odor and taste. Also available as powder. Discolors in light and should be stored in cool, dark place. Mp 76C, bp 274C, d 1.449. Soluble in alcohol, ether, chloroform, and oils; insoluble in water.

Derivation: By heating camphor with bromine.

Use: Medicine, manufacture of camphor derivatives.

camphoric acid. $C_{8}H_{14}(COOH)_2$.

Properties: Colorless, odorless needles or scales. D 1.0–1.86 (20/4C), mp 186–188C. Soluble in alcohol, ether, fatty oils, chloroform. Partially soluble in water.

Derivation: By oxidizing camphor with nitric acid.

Use: Pharmaceuticals, medicine.

camphor, Malayan. See borneol.

dl-camphoroquinone. (2,3-bornanedione).

Properties: Mw 166.22, mp 198–200.

Use: Synthetic intermediate.

camphor peppermint. See menthol.

Campillit. See cyanogen bromide.

Camp's quinoline synthesis. Formation of hydroxyquinolines from *o*-acylaminoacetophenones in alcoholic sodium hydroxide. The relative proportions of the isomeric products are mainly determined by the acyl residue on the amino nitrogen.

Canada balsam. See balsam.

Canadian Society for Mass Spectrometry.

(CSMS). The Canadian Society for Mass Spectrometry is a society dedicated to the promotion of mass spectrometry. There are over 120 CSMS members involved in mass spectrometric research and development in university, industrial and governmental laboratories. The CSMS publishes a newsletter every six months and hosts the Tandem Mass Spectrometry Workshop in Lake Louise, Alberta. It can be reached at L/C 2201C Banting Building, Tunny's Pasture, Ottawa, Ontario, Canada, K1A 0L2. Website: <http://www.csms.inter.ab.ca>

cananga oil. An essential oil similar in odor to ylangylang oil, strongly levorotatory. Used for floral odors in perfumery and as flavoring agent.

canavanine.

$\text{NH}_2\text{CNHNHOCH}_2\text{CH}_2\text{CHNH}_2\text{COOH}$. A non-protein amino acid obtained from jackbean meal. It is found naturally in the *l*(+) form.

Properties: Crystals from dilute alcohol. Sulfate: crystals from dilute alcohol, mp 172C (decomposes). Soluble in water; nearly insoluble in alcohol.
Use: Biochemical research.

candelilla wax.

Properties: Yellowish-brown, opaque to translucent solid. D 0.983, mp 67–68C, saponification value 65, iodine number 37, refr index 1.4555. Soluble in chloroform, turpentine, carbon tetrachloride, trichloroethylene, toluene, hot petroleum ether, and alkalies; insoluble in water. Combustible.

Occurrence: Mexico, Texas.

Grade: Crude, refined, powdered.

Use: Leather dressing, polishes, cements, varnishes, candles, electric insulating composition, sealing wax, waterproofing and insect-proofing containers, paint removers, dentistry, paper sizes, stiffener for soft waxes.

candicidin (USAN). An antifungal antibiotic produced by *Streptomyces griseus*.

candida lipolytica.

Properties: Derived from *Candida lipolytica* Fam. Cryptococcaceae.

Use: Food additive.

candidate gene. A gene located in a chromosome region suspected of being involved in a disease.

See positional cloning; protein.

candidia guilliermondii.

Properties: Derived from *Candida guilliermondii* Fam. Cryptococcaceae.

Use: Food additive.

candidin. An antifungal antibiotic produced by *Streptomyces viridoflavus*.

canescogenin. See nigrescigenin.

cane sugar. See sucrose.

cannabis. (marijuana).

CAS: 8063-14-7. Its principle, tetrahydrocannabinol, can be made synthetically.

Derivation: Dried flowering tops of pistillate plants of *Cannabis sativa*.

Source: Iran, India; cultivated in Mexico and Europe.

Hazard: A mild hallucinogen. Sale is illegal in U.S.

Use: Medicine, ophthalmology (treatment of glaucoma).

cannel coal. A variety of bituminous or subbituminous coal of uniform and compact fine-grained texture. Dark gray to black; has a greasy luster. It is noncaking, yields a high percentage of volatile matter, and burns with a luminous, smoky flame. (ASTM definition, ASTM D493-39.) Combustible.

Hazard: Explosion risk in form of dust.

Cannizzaro reaction. Base catalyzed dismutation of aromatic aldehydes or aliphatic aldehydes with no α -hydrogen into the corresponding acids and alcohols. When the aldehydes are not identical, the reaction is called the "crossed Cannizzaro reaction."

Cannizzaro, Stanislao. (1826–1910). Born in Italy, he extended the research of Avogadro on the molecular concentration of gases and thus was able to prove the distinction between atoms and molecules. His investigations of atomic weights helped to make possible the discovery of the periodic law by Mendeleyev. His research in organic chemistry led to the establishment of the Cannizzaro reaction involving the oxidation reduction of an aldehyde in the presence of concentrated alkali.

canola. (rapeseed; colza oil).

Properties: Yellow-brown liquid. D 0.913–0.917, mp 17–22. The oil obtained from rapeseed.

canonical form. The basic or general form.

canthaxanthin. $\text{C}_{40}\text{H}_{52}\text{O}_2$. A carotenoid colorant occurring in many natural products, it has been isolated from a variety of edible mushrooms. It has also been synthesized. The *trans* form is a violet, crystalline solid that is soluble in chloroform and various oils. It is a permissible colorant for foods, drugs, etc. It is used to produce artificial tanning of the skin but is not approved for this use.

Hazard: Oral intake may cause loss of night vision.

"CAO-1 and CAO-3" [Aqualon]. TM for technical and food-grade BHT (butylated hydroxytoluene), also known as 2,6-di-tertiary butyl para cresol.

"CAO-5" [Aqualon]. TM for the hindered phenolic antioxidant 2,2'-methylene-bis(4-methyl-6-tertiary-6-butyl phenol).

Caoutchouc. See rubber.

CAP. Abbreviation for catabolite gene activator protein.

CAP. Abbreviation for chloramphenicol.

cap. All eukaryotes have at the 5' end of their messages a structure called a "cap", consisting of a 7-methylguanosine in 5'-5' triphosphate linkage with the first nucleotide of the mRNA. It is added

post-transcriptionally, and is not encoded in the DNA.

capillarity. The attraction between molecules, similar to surface tension, which results in the rise of a liquid in small tubes or fibers or in the wetting of a solid by a liquid. It also accounts for the rise of sap in plant fibers and of blood in capillary (hair-like) vessels.

capillary array. Gel-filled silica capillaries used to separate fragments for DNA sequencing. The small diameter of the capillaries permit the application of higher electric fields, providing high speed, high throughput separations that are significantly faster than traditional slab gels.

capillator. An instrument for colorimetrically comparing pH values in capillary tubes.

***l*-capnoidine.**

CAS: 485-50-7. mf: C₂₀H₁₇NO₆.

Hazard: A poison.

Source: Natural product.

“Capoten” [Bristol-Myers]. TM for captopril.

“Capow” [Kenrich]. TM for a series of powdered forms of coupling agents based on titanium, zirconium, or aluminum.

“Capracyl” [Du Pont]. TM for a group of neutral-dyeing, premetalized acid colors that produce the highest possible degree of lightfastness on nylon. Also suitable for dyeing wool, particularly in blends with cellulosic fibers.

capraldehyde. See *n*-decanal.

“Capran” [General Electric]. TM for transparent nylon 6 thermoplastic film used for food packaging.

capreomycin (USAN). Antibiotic produced by *Streptomyces capreolus*. Used in medicine.

capric acid. (decanoic acid; decoic acid; decylic acid).

CAS: 334-48-5. CH₃(CH₂)₈COOH. Occurs as a glyceride in natural oils.

Properties: White crystals, unpleasant odor. D 0.8858 (40C), bp 270C, 172.6C (30 mm Hg), mp 31.5C, refr index 1.4288 (40C), acid number 308–315. Soluble in most organic solvents and dilute nitric acid; insoluble in water. Combustible.

Derivation: Fractional distillation of coconut-oil fatty acids.

Grade: Technical, 90%, FCC.

Use: Esters for perfumes and fruit flavors, base for wetting agents, intermediates, plasticizer, resins, intermediate for food-grade additives.

caproic acid. (hexanoic acid; hexylic acid; hexoic acid).

CAS: 142-62-1. CH₃(CH₂)₄COOH. Present in milk fats to extent of approximately 2%.

Properties: Oily, colorless or slightly yellow liquid; odor of Limburger cheese. D 0.9276 (20/4C), fp –4.0C, bp 205C, refr index 1.4168 (20C), wt/gal 7.7lb, viscosity 0.031 cP (20C), flash p 215F (101C OC). Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: From crude fermentation of butyric acid, fractional distillation of natural fatty acids.

Grade: Technical, reagent to 99.8%, FCC.

Hazard: Strong irritant to tissue.

Use: Analytical chemistry, flavors, manufacture of rubber chemicals, varnish driers, resins, and pharmaceuticals.

caproic aldehyde. See *n*-hexaldehyde.

caprolactam. (aminocaproic lactam; 2-oxo-hexamethyleneimine).

CAS: 105-60-2.

Properties: White flakes or fused. Mp 68–69C; bp 180C (50 mm Hg); d (70% solution) 1.05; refr index 1.4935 (40C); 1.4965 (31C), heat of fusion 29 cal/g, heat of vaporization 116 cal/g; viscosity 9 cP 78C; vap press 3 mm Hg 100C, 50 mm Hg 180C. Soluble in water, chlorinated solvents, petroleum distillate, and cyclohexane.

Derivation: (1) Catalytic oxidation of cyclohexane to cyclohexanol, reacting with peracetic acid to form caprolactone, and further reaction with ammonia; (2) catalytic hydrogenation of phenol to cyclohexanone, reaction with ammonia to cyclohexanone oxime with Beckmann rearrangement with sulfuric acid catalyst; (3) catalytic oxidation of cyclohexane to cyclohexanone, reaction with hydroxylamine sulfate and ammonia to cyclohexanone oxime followed by sulfuric acid—catalyzed Beckmann rearrangement; (4) UV-catalyzed reaction of cyclohexane with nitrosyl chloride to cyclohexanone oxime hydrochloride, followed by Beckmann rearrangement. Method (1) was never used commercially. Method (3) has been modified to minimize formation of by-product ammonium sulfate.

Available forms: Flake, molten.

Hazard: Toxic by inhalation. TLV: (vapor) 5 ppm, (dust) 1 mg/m³.

Use: Manufacture of synthetic fibers (especially nylon 6), plastics, bristles, film, coatings; synthetic leather, plasticizers and paint vehicles, cross-linking agent for polyurethanes, synthesis of amino acid lysine.

caprolactone.

Derivation: Reaction product of peracetic acid and cyclohexanone, an intermediate product in the manufacture of caprolactam.

Use: Intermediate in adhesives, urethane coatings, and elastomers; solvent; diluent for epoxy resins; synthetic fibers; organic synthesis.

“Caprolan” [General Electric]. TM for a polyamide fiber made from polymerized caprolactam. Has excellent dyeability and a wide variety of end uses, maintains a superior level of dimensional stability after heat setting, and has outstanding mechanical qualities.

See caprolactam; nylon.

“Capron” [General Electric]. TM for type of nylon 6 resin.

Use: Injection or blow molding, compounding extrusion, and film production.

capryl compounds. The term *approximately capryl* is generally but erroneously used in the trade to refer to octyl compounds. Thus, the definition of capryl and caprylic compounds will be found under the corresponding octyl entry, e.g., for capryl alcohol. See *sec-n*-octyl alcohol; for caprylic halides, see corresponding octyl halide; for caprylic acid see octanoic acid.

caprylyl peroxide. Legal label name for octyl peroxide.

capsanthin.

CAS: 465-42-9. mf: $C_{40}H_{56}O_3$.

Hazard: A poison by skin contact.

capsid. The protein coat of a virus particle.

cap site. (a) In eukaryotes, the cap site is the position in the gene at which transcription starts, and really should be called the “transcription initiation site”. The first nucleotide is transcribed from this site to start the nascent RNA chain. That nucleotide becomes the 5' end of the chain, and thus the nucleotide to which the cap structure is attached.

(b) In bacteria, the CAP site (note the capital letters) is a site on the DNA to which a protein factor (the Catabolite Activated Protein) binds.

captafol. See *cis-n*-[1,1,2,2-(tetrachloroethyl)thio]-4-cyclohexene-1,2-dicarboximide.

captan. (*N*-trichloromethylmercapto-tetrahydrophthalimide).

CAS: 133-06-2. $C_9H_8Cl_3NO_2S$.

Properties: White to cream powder. Mp 158–164C, d 1.5. Practically insoluble in water; partially soluble in acetone, benzene, and toluene, slightly soluble in ethylene dichloride and chloroform.

Derivation: Reaction product of tetrahydrophthalimide and trichloromethylmercaptan.

Hazard: An animal carcinogen. An irritant. Avoid

inhalation of dust or spray mist. TLV: 5 mg/m³. Avoid contamination of feed and foodstuffs.

Use: Seed treatment; fungicide in paints, plastics, leather, fabrics; fruit preservation; bacteriostat.

captopril. (*2,d*-methyl-3-mercapto-propanoyl-*l*-proline). An orally active hypertensive drug. Its use is limited by FDA. Said to be free from usual side effects of commonly used hypertensive drugs.

capture. The process in which an atomic or nuclear system acquires an additional particle, e.g., the capture of electrons by positive ions or capture of electrons or neutrons by nuclei.

See cross-section (1); neutron; fission.

caramel. (1) A sugar-based food colorant made from liquid corn syrup by heating in the presence of catalysts to approximately 250F (121C) for several hours, cooling to 200F (93C), and filtering. The brown color results from either Maillard reactions, true caramelization, or oxidative reactions. Caramels are colloidal in nature, the particles being held in solution by either positive or negative electric charges.

See caramelization; browning reaction.

(2) A low-enriched uranium reactor fuel containing 6.8% ²³⁵U (approximately 10 times as much as natural uranium). It has sufficient neutron density to yield plutonium.

caramelization. A type of nonenzymic browning reaction occurring during exposure of food products to heat when the products contain no nitrogen compounds, e.g., sugars.

See browning reaction.

caraway oil.

Properties: Yellowish liquid. D 0.900–0.910. Insoluble in water; soluble in alcohol. The oil obtained from the caraway seed. The chief components are carvone and *d*-limonene.

Use: Medicinals and food flavoring.

carbamate. A compound based on carbamic acid (NH₂COOH), which is used only in the form of its numerous derivatives and salts.

carbamic acid, ester with salicylaldehyde dimethyl acetal. See salicylaldehyde dimethyl acetal carbamate.

carbamide. See urea.

carbamide peroxide. See urea peroxide.

carbamide phosphoric acid. (urea phosphoric acid). CO(NH₂)₂•H₃PO₄.

Properties: White, rhombic crystals. Very soluble in water and alcohol.

Hazard: Evolves toxic fumes when heated.

Use: Catalyst for acid-setting resins, flame-proofing compositions, cleaning compounds, acidulant.

carbamidine. See guanidine.

carbamate. See *sym*-diethyldiphenylurea.

carbamyguanidine sulfate. See guanilyurea sulfate.

carbamyldiazine hydrochloride. See semicarbazide hydrochloride.

carbamyurea. See biuret.

carbanil. See phenyl isocyanate.

carbanilide. See diphenylurea.

carbanion. A negatively charged organic ion, such as H_3C^- or RC^- , having one more electron than the corresponding free radical. Carbanions are short-lived but important intermediates in base-catalyzed polymerization and alkylation reactions. See carbonium ion; carbene; free radical.

carbaryl. ("Sevin"; generic name for 1-naphthyl-*N*-methylcarbamate).

CAS: 63-25-2. $C_{10}H_7OOCNHCH_3$.

Properties: Solid. Mp 142C, d 1.23. Insoluble in water.

Derivation: Synthesized directly from 1-naphthol and methyl isocyanate or from naphthyl chloroformate (1-naphthol and phosgene) plus methylamine.

Hazard: Toxic by ingestion, inhalation, and skin absorption; irritant. A reversible cholinesterase inhibitor. Use may be restricted. TLV: 5 mg/m³.

Use: Insecticide.

carbazide. See carbodihydrazide.

carbazole. (dibenzopyrrole; diphenylenimine).

CAS: 86-74-8. $(C_6H_4)_2NH$ (tricyclic).

Properties: White crystals with characteristic odor. Mp 244–246C, bp 352–354C. Partially soluble in alcohol and ether; insoluble in water.

Derivation: (1) From crude anthracene cake by selective solution of the phenanthrene with crude solvent naphtha, removal of the anthracene by conversion into a sulfonic derivative, and extraction by means of water. (2) Synthetically from *o*-aminobiphenyl.

Grade: Technical, 97%.

Use: Manufacture of dyes, reagents, explosives, insecticides, lubricants, rubber antioxidants; odor inhibitor in detergents, UV sensitizer for photographic plates.

carbazoic acid. See picric acid.

carbene. (methylene). An organic radical containing divalent carbon. Some divalent-carbon de-

rivatives where the carbon is multiple bonded to oxygen or nitrogen are stable compounds (carbon monoxide); most are highly reactive units known only as reaction intermediates. Carbenes, carbonium ions, carbanions, and free radicals are the four most important classes of organic reaction intermediates containing carbon in an unstable valence state. A typical synthesis involving a carbene is that of cyclopropanes by the addition of carbenes to olefins.

carbenoid. Class of materials precipitated when certain crude oils or bitumens are dissolved in naphtha.

2-carbethoxycyclohexanone.

$OC_6H_9COOC_2H_5$.

Properties: Colorless liquid with a characteristic ester odor. Bp 106–107C (11 mm Hg), d 1.074 (25C), refr index 1.4750 (17.5C). Soluble in dilute alkali; insoluble in water. Combustible.

Use: Intermediate.

2-carbethoxycyclopentanone. (ethyl cyclopentanone-2-carboxylate; ethyl-2-oxocyclopentanecarboxylate). $OC_5H_7COOC_2H_5$.

Properties: Colorless liquid with characteristic ester odor. Bp 122–124C (25 mm Hg), flash p 191F (88.3C), refr index 1.451 (25C), d 1.0976 (0C). Soluble in equimolar amounts of dilute alcohol; insoluble in water. Combustible.

Hazard: Vapors are toxic, as is skin contact.

Use: Pharmaceutical intermediate.

β -carbethoxyethyltriethoxysilane.

$C_2H_5OOC(CH_2)_2Si(OC_2H_5)_3$.

Properties: Colorless liquid. Bp 246C. Combustible.

Hazard: An irritant.

Use: Intermediate.

***N*-carbethoxypiperazine.** $C_7H_{14}N_2O_2$.

Properties: Colorless, somewhat viscous liquid; slight odor. Bp 116–117C (12 mm Hg), 237C, refr index 1.4756 (25C). Miscible with water and common organic solvents.

Use: Intermediate.

β -carbethoxypropylmethyldiethoxysilane.

$C_2H_5OOC(C_3H_7)CH_2Si(OC_2H_5)_2$.

Properties: Colorless liquid. Bp 228C. Combustible.

Hazard: An irritant.

Use: Intermediate.

carbide. A binary solid compound of carbon and another element. The most familiar carbides are those of calcium, tungsten, silicon, boron, and iron (cementite). Two factors have an important bearing on the properties of carbides: (1) the difference in electronegativity between carbon and the second element, and (2) whether the second element is a transition metal. Saltlike carbides of alkali metals are obtained by reaction with acetylene. Those ob-

tained from silver, copper, and mercury salts are explosive.

See acetylide; carbide, refractory; carbide, cemented.

carbide, cemented. A powdered form of refractory carbide united by compression with a bonding material (usually iron, nickel, or cobalt), followed by sintering. Tungsten carbide is bonded with cobalt at 1400C; from 3 to 25% of cobalt is used, depending on the properties desired. Used chiefly in metal-cutting tools that are hard enough to permit cutting speeds in rock or metal up to 100 times that obtained with alloy steel tools.

carbide, refractory. A carbide characterized by great hardness, thermal stability, high melting point, and chemical resistance. Decomposed by fusion with alkali and attacked by mixtures of nitric and hydrofluoric acids. The best-known refractory carbides are those of silicon, boron, tungsten, and tantalum. Used as abrasives, furnace linings, and in other high-temperature applications. Some types are bonded.

carbinol. (1) Synonym for methanol, CH_3OH ; (2) any compound of similar structure retaining the COH radical and in which hydrocarbon radicals may be substituted for the hydrogen originally attached to the carbon. Thus, isopropanol, $(\text{CH}_3)_2\text{CH}_2\text{O}$, and benzyl alcohol, $\text{C}_6\text{H}_5\text{CH}_2\text{OH}$, may be named dimethylcarbinol and phenylcarbinol, respectively.

carbinoxamine maleate. (2-[*p*-chloro- α -(2-dimethylaminoethoxy)-benzyl]pyridinemaleate). $\text{C}_{16}\text{H}_{14}\text{ClCH}(\text{C}_5\text{H}_4\text{N})\text{OCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2 \cdot \text{C}_4\text{H}_4\text{O}_4$.

Properties: White crystalline powder; odorless; bitter. Mp 116–121C, pH (1% solution) 4.6–5.1. Very soluble in water; freely soluble in alcohol and chloroform; very slightly soluble in ether.

Grade: NF.

Use: Medicine.

“Carbitol” [Dow]. TM for a group of mono- and dialkyl ethers of diethylene glycol and their derivatives, specialized solvents with a wide variety of properties and uses. Specific types are as follows: butyl “Carbitol”.

See diethylene glycol monobutyl ether.

butyl “Carbitol” acetate. See diethylene glycol monobutyl ether acetate.

“Carbitol” acetate. See diethylene glycol monoethyl ether acetate.

N-hexyl “Carbitol”. See diethylene glycol monohexyl ether.

methyl “Carbitol”. See diethylene glycol monomethyl ether.

carbitol acrylate. See ethylcarbitol acrylate.

carbobenzyloxy-*l*-alanine.

Properties: Mw 223.23, mp 82–84C, optical rotation –14.2 degrees (23C).

Grade: 98+% pure.

Carbocaine. Proprietary name for mepivacaine hydrochloride.

Use: Local anesthetic in dentistry..

carbocalcitonin.

CAS: 60731-46-6. mf: $\text{C}_{148}\text{H}_{244}\text{N}_{42}\text{O}_{47}$.

Hazard: A poison by ingestion.

carbocation. A positively charged ion whose charge resides at least partially on a carbon atom or group of carbon atoms.

See carbonium ion.

carbocoal. A fuel, obtained by distilling a mix of coal pitch and residue, which produces dark-gray briquettes.

carbocyclic. Any organic compound whose skeleton is in the form of a closed ring of carbon atoms. This includes both alicyclic and aromatic structures.

carbodihydrazide. (carbazide). $\text{CO}(\text{NHNH}_2)_2$.

Properties: Colorless crystals. Mp 154C, d 1.1616 (–5C). Very soluble in water and alcohol.

Use: Organic intermediate and photographic chemical.

carbodiimide. See cyanamide (1).

-carbodithioic. Suffix for an organic acid in which sulfur replaces both oxygen atoms of the carboxyl.

carbofuran. See “Furadan.”

carbohydase. An enzyme whose catalytic activity is directed toward the breaking down of complex carbohydrates to simpler units. Illustrations are amylase, invertase, maltase.

carbohydase, aspergillus.

Properties: From fermentation of *Aspergillus oryzae* var. Tan amorphous powder or liquid. Sol in water.

Use: Food additive.

carbohydase and cellulase.

Properties: Derived from *Aspergillus niger*.

Use: Food additive.

carbohydase and protease, mixed.

Properties: From controlled fermentation of *Bacillus licheniformis* var. Brown amorphous powders or liquid. Sol in water; insol in alc, chloroform, ether.

Use: Food additive.

carbohydase, rhizopus.

Properties: Derived from *Rhizopus oryzae*.

Use: Food additive.

carbohydrate. A compound of carbon, hydrogen, and oxygen that contains the saccharose unit or its first reaction product and in which the ratio

of hydrogen to oxygen is the same as in water. Carbohydrates are the most abundant class of organic compounds, constituting three-fourths of the dry weight of all vegetation. They are also widely distributed in animals and lower forms of life. They comprise: (1) monosaccharides, simple sugars such as fructose (levulose) and its isomer glucose (dextrose), both having the formula $\text{C}_6\text{H}_{12}\text{O}_6$; (2) disaccharides, sucrose ($\text{C}_{12}\text{H}_{22}\text{O}_{11}$), maltose, cellobiose, and lactose; and (3) polysaccharides (high polymeric substances). The last group includes all starch and cellulose families, as well as pectin, the seaweed products agar and carrageenan, and natural gums. The simple sugars are crystalline and water soluble, with a sweet taste; starches are water soluble, tasteless, and amorphous; cellulose is insoluble in water and organic solvents and is only partially crystalline. Galactose, sorbose, xylose, arabinose, and mannose are constituents of more complex sugars. The natural gums are water soluble plant products composed of monosaccharide units joined by glycosidic bonds (arabic, tragacanth). Carbohydrates are an important natural source of ethanol now in extensive use in gasohol and other energy applications. See energy sources; gasohol; fermentation.

Carbohydrogen. See oil gas.

carboid. An asphaltic material insoluble in trichlorethylene.

“Carbolac” [Cabot]. TM for high-color channel blacks, used for paint, varnish, and lacquer.

carbulated camphor. See phenol, camphorated.

carbolfuchsin. (Ziehl's stain). A staining solution of fuchsin in alcohol and aqueous phenol used in the study of microorganisms.

carbolic acid. Legal label name for phenol.

carbolic oil. (middle oil). The fraction, having a boiling range of about 190–250C, obtained from distillation of coal tar and containing naphthalene, phenol, and cresols.

carbomer. A polymer composed of acrylic acid cross-linked with allyl sucrose.

carbometer. Device for measuring the quality of carbon in steel by determining the magnetic characteristics of a standard-size sample as cast at the furnace.

carbomethoxy malathion.

CAS: 3700-89-8. mf: $\text{C}_8\text{H}_{15}\text{O}_6\text{PS}_2$.

Hazard: Moderately toxic by ingestion. Human systemic effects. A severe skin and eye irritant.

3-carbomethoxy-1-methyl-4-piperidone hydrochloride. $\text{C}_8\text{H}_{13}\text{NO}_3 \cdot \text{HCl}$.

Properties: White, crystalline solid. Mp 165C. Soluble in water, alcohols; insoluble in ether, hydrocarbons.

Use: Pharmaceutical intermediate.

2-carbomethoxy-1-methylvinyl dimethyl phosphate. The β -isomer is also a pesticide. See mevinphos for the α -isomer.

carbomycin.

CAS: 4564-87-8. $\text{C}_{42}\text{H}_{67}\text{NO}_{16}$. An antibiotic isolated from products of *Streptomyces halstedii* when grown in suitable media by the deep-culture method. It inhibits growth of certain Gram-positive bacteria such as staphylococci, pneumococci, and hemolytic streptococci. Mp 214C.

carbon.

CAS: 7440-44-0. C. A nonmetallic element, atomic number 6, aw 12.011, group IVA of the periodic table, normal valence 4, but divalent forms are known (carbenes). Carbon has two stable and four radioactive isotopes. The ^{12}C isotope, which comprises 99% of the element, is the standard to which atomic weights of all other elements are referred (i.e., $^{12}\text{C} = 12.00$ exactly). One mole of carbon atoms (6.02×10^{23}) is contained in 12 g of ^{12}C . Carbon has two crystalline allotropes (diamond and graphite) and several amorphous allotropes (coal, coke, carbon black, charcoal). Carbon is present in all organic and in a few inorganic compounds (carbon oxides, carbon disulfide, and metallic carbonates such as calcium carbonate). It is the active element in photosynthesis and thus occurs in all plant and animal life. The radioisotope ^{14}C is used in tracer research and chemical dating. Carbon is a strong reducing agent and is used as such in purifying metals. It is one of the few elements capable of forming four covalent bonds. Its strong electrical conductivity is used to advantage in electrodes and other electrical devices. Its presence in small proportions in steel has a pronounced effect on the properties of the metal. Carbon forms binary compounds called carbides with many metals and some nonmetals. A few compounds are known that contain divalent carbon (carbenes or methylenes).

Since its major properties and uses vary widely with its form, the following entries should be consulted: diamond, graphite, activated carbon, carbon black,

industrial carbon, charcoal, wood, coke, steel, carbon cycle.

carbon-11. (^{11}C). A short-lived radioactive isotope of carbon that emits positrons, which in turn become a source of γ -rays when they collide with an electron within the body. It is used experimentally in nuclear medicine for labeling pharmaceuticals.

carbon-13. (^{13}C). A stable, nonradioactive carbon isotope used for special analytical research. Commercially available in gram quantities.

carbon-14. (^{14}C ; radiocarbon). Naturally occurring, radioactive carbon isotope of mass number 14, a special case of radioactivity induced by cosmic rays in the upper atmosphere. Neutrons produced by cosmic radiation impact nitrogen atoms to yield ^{14}C and a proton. Half-life 5580 years; β -radiation. Can be made by reactor irradiation of calcium nitrate. **Use:** Radiation source in thickness gauges and other instruments, elucidation of mechanisms in organic chemistry, metallurgy, and biochemical reactions, radiocarbon dating in geology and archaeometry. See chemical dating; archaeometry.

Carbona. An obsolete proprietary mixture of petroleum ether (bp 70–72°C) and carbon tetrachloride. **Use:** Cleaning fluid.

carbon, activated. (active carbon; activated charcoal). An amorphous form of carbon characterized by high adsorptivity for many gases, vapors, and colloidal solids. The carbon is obtained by the destructive distillation of wood, nutshells, animal bones, or other carbonaceous material. It is "activated" by heating to 800–900°C with steam or carbon dioxide, which results in a porous internal structure (honeycomb-like). The internal surface area of activated carbon averages approximately 10,000 square feet per gram. The density is from 0.08 to 0.5. It is not effective in removing ethylene.

Grade: Technical, USP, as activated charcoal.

Hazard: Flammable. Toxic by inhalation of dust.

Use: Decolorizing of sugar, water and air purification, solvent recovery, waste treatment, removal of sulfur dioxide from stack gases and "clean" rooms, deodorant, removal of jet fumes from airports, catalyst for natural-gas purification, brewing, chromium electroplating, air-conditioning.

carbonado. See diamond, industrial.

-carbonyl. A suffix that indicates the presence of the $-\text{CHO}$ group.

carbon, amorphous. See carbon, activated; carbon black.

carbonate. A compound resulting from the reaction of either a metal or an organic compound with carbonic acid. The reaction with a metal yields a salt

(calcium carbonate) and that with an aliphatic or aromatic compound forms an ester, e.g., diethyl carbonate, diphenyl carbonate. The latter are liquids used as solvents and in synthesizing polycarbonate resins.

See carbonic acid.

carbonate hardness of water. Hardness as a result of the introduction of carbonate, bicarbonate of calcium, and magnesium.

carbonate mineral. A mineral in which the basic building block is a carbon atom linked to three oxygen atoms. Calcite, aragonite, and dolomite are the most abundant examples found in sediments and sedimentary rocks.

carbonate rock. A sedimentary rock that consists primarily of carbonate minerals. The dominant mineral is nearly always either calcite, in which case the rock is limestone, or dolomite, in which case the rock is dolomite.

carbonate sediment. Unconsolidated sediment that consists primarily of carbonate minerals, usually aragonite or calcite.

carbonation. (1) Saturation of a liquid with carbon dioxide. (2) Production of a carbonate by means of carbon dioxide. (3) Removal of excess lime in sugar refining by carbon dioxide.

carbon atom. (1) Primary: a carbon atom having not more than one other carbon directly attached to it. (2) Secondary: a carbon atom having two other carbon atoms directly attached to it. (3) Tertiary: a carbon atom that is joined to three other carbon atoms. (4) Quaternary: a carbon atom having four other carbon atoms directly attached to it.

carbon bisulfide. See carbon disulfide.

carbon black.

CAS: 1333-86-4. A finely divided form of carbon, practically all of which is made by burning vaporized heavy-oil fractions in a furnace with 50% of the air required for complete combustion (partial oxidation). This type is also called furnace black. Carbon black can also be made from methane or natural gas by cracking (thermal black) or direct combustion (channel black), but these methods are virtually obsolete. All types are characterized by extremely fine particle size, which accounts for their reinforcing and pigmenting effectiveness.

Grade: (Furnace black) conducting (CF), fine (FF), high modulus (HMF), high elongation (HEF), reinforcing (RF), semireinforcing (SRF), high abrasion (HAF), super abrasion (SAF), fast extruding (FEF), general purpose (GPF), intermediate super abrasion (ISAF), channel replacement (CRF), easy-processing furnace black (EPF).

Hazard: TLV: 3.5 mg/m³.

Use: Tire treads, belt covers, and other abrasion-resistant rubber products; plastics as reinforcing agent, opacifier, electrical conductor, UV-light absorber; colorant for printing inks; carbon paper; typewriter ribbons; paint pigment; nucleating agent in weather modification; expanders in battery plates; solar-energy absorber (see note).

Note: A suspension of finely divided carbon particles in compressed air has been researched as a solar-energy absorber. The heat is absorbed until the particles vaporize, yielding energy that can be used directly or for power production. The suspension is placed in a transparent container located in a solar concentrator.

carbon-black oil. A heavy refinery fraction similar to fuel oil, used as a feedstock for furnace black.

carbon, combined. A metallurgical term for carbon that has combined chemically with iron to form cementite, as distinct from graphitic carbon in iron or steel.

See ferrite.

carbon cycle. (1) The progress of carbon from air (carbon dioxide) to plants by photosynthesis (sugar and starches), then through the metabolism of animals to decomposition products that ultimately return it to the atmosphere in the form of carbon dioxide. (2) One of the processes by which the sun and other self-luminous astronomical bodies are thought to derive their energy. The net process is the combination (fusion) of four hydrogen atoms to form helium. The carbon cycle involves successive additions of hydrogen atoms, followed by β decay, to an initial carbon-12 atom until a final step is reached in which the new nucleus breaks down to a helium atom and regenerated carbon-12. The carbon thus functions as a catalyst for the process. At the temperatures prevailing in the sun, all atoms are stripped of their electrons and the reaction is between the nuclei of the atoms (thermonuclear reaction). Symbolically the set of reactions is written ${}^{12}\text{C} + {}^1\text{H} \rightarrow {}^{13}\text{N}$, ${}^{13}\text{N} \rightarrow {}^{13}\text{C} + e$; ${}^{13}\text{C} + {}^1\text{H} \rightarrow {}^{14}\text{N}$, ${}^{14}\text{N} + {}^1\text{H} \rightarrow {}^{15}\text{O}$, ${}^{15}\text{O} \rightarrow {}^{15}\text{N} + e$, ${}^{15}\text{N} \rightarrow {}^{12}\text{C} + {}^4\text{He}$.

See fusion.

carbon dating. Radiocarbon dating is a method of determining quite accurately the age of a carbon-bearing material derived from living plants or animals within the last 70,000 years. It is based on determining the ratio of carbon-14 in the material to that in a modern reference sample by measuring the radioactivity of the carbon-14 in the material. Since the half-life of carbon-14 is 5730 \pm 30 years and the living precursor utilized carbon dioxide from the atmosphere or some other part of the earth's dynamic carbon reservoir, a process that ceased when the original plant or animal died, the amount of carbon-14 now present gives directly the age of the material. The carbon-14 in the reservoir is constantly being

replaced by the sequence ${}^{14}\text{N} \rightarrow {}^{14}\text{C} + \text{O} \rightarrow {}^{14}\text{CO}_2$. This has maintained the constant ratio of carbon isomers during the ages, however, burning of fossil fuels since the Industrial Revolution has lowered somewhat the fraction of carbon-14 in the atmosphere during the last few centuries, which does not affect measurements on older objects. The sample to be tested must be carefully prepared to prevent contamination by younger carbon. The radiocarbon technique was discovered by Willard F. Libby (1908–1980), who won a Nobel Prize (1960), and has been applied with great success in the fields of archaeology, geology, geochemistry, and geophysics. Its accuracy has been checked and verified by use of tree-ring counts (dendrochronology) and with the known ages of objects from ancient cultures, such as Egyptian and Chinese. The former shows that for the 2400–6000-year age of bristlecone-pine tree rings, 5200 ${}^{14}\text{C}$ years equal 6000 calendar years.

carbon dichloride. See perchloroethylene.

carbon dioxide.

CAS: 124-38-9. CO_2 .

Properties: (1) Gas: colorless; odorless. D 1.97 g/L (0C, 1 atm), d 1.53 (air = 1.00). (2) Liquid: volatile, colorless; odorless. D 1.101 (–37C), sp volume 8.76 cu ft/lb (70F). (3) Solid (dry ice): white, snowlike flakes or cubes. D 1.56 (–79C), mp –78.5C (sublimes). All forms are noncombustible. Miscible with water (1.7 volumes per volume at 0C and 0.76 volume per volume at 25C and 760 mm Hg partial pressure of CO_2). Also miscible with hydrocarbons and most organic liquids. An asphyxiant gas in concentrations of 10% or more; low concentrations (1–3%) increase lung ventilation and are used admixed with oxygen in resuscitation equipment.

Derivation: (1) Gas: for industrial use, carbon dioxide is recovered from synthesis gas in ammonia production, substitute-natural gas production, cracking of hydrocarbons, and natural springs or wells. For laboratory purposes it is obtained by the action of an acid on a carbonate. It is also a by-product of the fermentation of carbohydrates and an end product of combustion and respiration. Air contains 0.033% of carbon dioxide (see greenhouse effect). (2) Liquid: by compressing and cooling the gas to approximately –37C. (3) Solid (dry ice): by expanding the liquid to vapor and snow in presses that compact the product into blocks. The vapor is recycled.

Grade: Technical, USP, commercial and welding, 99.5%, bone dry (99.95%).

Hazard: Solid damaging to skin and tissue; keep away from mouth and eyes. TLV: 5000 ppm (gas).

Use: Refrigeration, carbonated beverages, aerosol propellant, chemical intermediate (carbonates, synthetic fibers, *p*-xylene, etc.), low-temperature testing, fire extinguishing, inert atmospheres, municipal water treatment, medicine, enrichment of air in greenhouses, fracturing and acidizing of oil wells, mining (Cardox method), miscible pressure source,

hardening of foundry molds and cores, shielding gas for welding, cloud seeding, moderator in some types of nuclear reactors, immobilization for humane animal killing, special lasers, blowing agent, as demulsifier in tertiary oil recovery, possible source of methane, (liquid) carrier for powdered-coal slurry.

Note: Carbon dioxide is the source of the carbon utilized by plants to form organic compounds in the photosynthetic reaction catalyzed by chlorophyll. See photosynthesis; carbon cycle (1).

carbon disulfide. (carbon bisulfide).

CAS: 75-15-0. CS₂.

Properties: Clear, colorless, or faintly yellow liquid; almost odorless when pure; usually strong, disagreeable odor. D 1.260 at 25/25C, bp 46.3C, fp -111C, wt/gal 10.48 lb (25C), refr index 1.6232 (25C), flash p -22F (-30C), autoign temp 212F (100C). Soluble in alcohol, benzene, and ether; slightly soluble in water. Classed as an inorganic compound.

Derivation: (1) Reaction of natural gas or petroleum fractions with sulfur. (2) From natural gas and hydrogen sulfide at very high temperature (plasma process). (3) By heating sulfur and charcoal and condensing the carbon disulfide vapors.

Method of purification: Distillation.

Impurities: Sulfur compounds.

Grade: 99.9%, spectrophotometric.

Hazard: A poison. Toxic by skin absorption. TLV: 10 ppm. Highly flammable, dangerous fire and explosion risk, can be ignited by friction. Explosive limits in air 1-50%.

Use: Viscose rayon, cellophane, manufacture of carbon tetrachloride and flotation agents, solvent.

carbon, divalent. See carbene.

Carbone primary cell. This device uses a porous, cup-shaped carbon element as the positive electrode and a zinc ring as the negative. The electrolyte is a caustic-soda solution with a special mineral oil floating on its surface. The oil prevents evaporation of the electrolyte.

carbon fiber. See graphite fiber.

carbon fixation reactions. (dark reactions).

The light-independent enzymatic reactions involved in the synthesis of glucose from CO₂, ATP, and NADPH.

carbon fluoride. (CF)_n, C_nF_n. A solid, nonconductive material formed on carbon anodes during electrolysis of molten potassium fluoride-hydrogen fluoride mixtures to yield elemental fluoride. C_nF_n is unstable above 60C, (CF)_n forms only at high temperatures.

carbon, graphitic. A metallurgical term referring to practically pure carbon that forms in pig iron during cooling because the absorbing power of iron for carbon decreases as its temperature falls. It exists

in the form of tiny flakes distributed throughout the mass. The tendency of graphitic carbon is to weaken the metal, whereas combined carbon, up to the limit of approximately 0.90%, strengthens it.

See pearlite; cementite; ferrite.

carbon hexachloride. See hexachloroethane.

carbonic acid. H₂CO₃.

A weak acid formed by reaction of carbon dioxide with water. Both organic and inorganic carbonates are formed from it by reaction with organic compounds or metals, respectively. Thus inorganic carbonates (CaCO₃, K₂CO₃, Na₂CO₃, etc.) are salts of carbonic acid, and organic carbonates are esters of carbonic acid.

carbonic anhydrase. An enzyme in red blood cells that catalyzes the production of carbon dioxide and water from carbonic acid.

Use: Biochemical research.

carbon, industrial. Any form of pure carbon used for industrial purposes, exclusive of fuel. Coke is one of the most important. Besides its use (combined with coal tar pitch) for refractories, furnace linings, electrodes, fibers, etc., it has tremendous volume consumption for reduction of iron in blast furnaces (see coke). Graphite in its many applications is another form; activated carbon for decolorizing and solvent recovery, carbon black for rubber and printing inks, industrial diamonds as abrasives and drilling bits, compressed carbon for electrodes and other electrical uses, and carbon fibers and whiskers are all included in this term.

carbonium ion. A positively charged organic ion, such as H₃C⁺, H₂RC⁺, R₃C⁺, etc., having one less electron than the corresponding free radical and acting in subsequent chemical reactions as though the positive charge were localized on the carbon atom. Such ions can exist only when corresponding negative ions are also present. An electron-deficient carbon atom is extremely reactive and has only a transitory existence in most cases, but many organic rearrangement and replacement reactions are effectively explained in terms of a carbonium-ion intermediate, including acid-catalyzed polymerization of propylene and other olefins. In this case, propylene and hydrogen ion form a carbonium ion as follows:

The latter then combines with another molecule of HC₃-HC=CH₂ to start chain growth. The difference between a carbonium ion, a free radical, and a carbanion may be illustrated as follows:

carbonium salt. Alkyl halide in which three hydrogen atoms in the methyl group have been replaced by aryl radicals. It acts as an electrolyte when dissolved.

carbonization. See destructive distillation.

carbon monoxide.

CAS: 630-08-0. CO. Discovered by Priestly in America in 1799.

Properties: Colorless gas or liquid; practically odorless. Burns with a violet flame. D 0.96716 (air = 1.0), bp -190°C , fp -207°C , sp vol 13.8 cu ft/lb (21.1C), autoign temp (liquid) 1128F (609C). Slightly soluble in water; soluble in alcohol and benzene. Classed as an inorganic compound.

Derivation: (1) Made almost pure by placing a mixture of oxygen and carbon dioxide in contact with incandescent graphite, coke, or anthracite. (2) Action of steam on hot coke or coal (water gas) or on natural gas (synthesis gas). In the latter case, carbon dioxide is removed by absorption in amine solution, and the hydrogen and carbon monoxide separated in a low-temperature unit. (3) By-product in chemical reactions. (4) Combustion of organic compound with limited amount of oxygen, as in automobile cylinders. (5) Dehydration of formic acid.

Grade: Commercial (98%), CP (99.5%).

Hazard: Highly flammable, dangerous fire and explosion risk. Flammable limits in air 12–75% by volume. Toxic by inhalation. TLV: 25 ppm. *Note:* Carbon monoxide has an affinity for blood hemoglobin over 200 times that of oxygen. A major air pollutant.

Use: Organic synthesis (methanol, ethylene, isocyanates, aldehydes, acrylates, phosgene), fuels (gaseous), metallurgy (special steels, reducing oxides, nickel refining), zinc white pigments.

carbon nanotubes. Carbon atoms formed into extended hollow tubes instead of closed, hollow spheres as in fullerenes. They also form as a series of nested, concentric tubes. Can be used as nanometer-scale syringe needles for injecting molecules into cells and as nanoscale probes for making fine-scale measurements.

Use: Drug delivery, chemical reactors, electronic devices.

See nanophase carbon materials.

carbon nitride. (C_2N_2).

Properties: Mw 22.02, d 0.87, mp -34.4°C , bp -20.5°C .

carbon oxybromide. See bromophosgene.

carbon oxychloride. See phosgene.

carbon oxycyanide. See carbonyl cyanide.

carbon oxyfluoride. See carbonyl fluoride.

carbon oxysulfide. See carbonyl sulfide.

carbon ratio. (1) Fixed carbon percentage coal. (2) Ratio of isotopes ^{12}C to ^{13}C .

carbon steel. See steel.

carbon suboxide. C_3O_2 . Molecular structure: $\text{O}=\text{C}=\text{C}=\text{C}=\text{O}$.

Properties: Colorless gas or liquid; strong, pungent odor. Bp 7°C , fp -110°C , refr index 1.45, d 1.12. Forms malonic acid with water. Polymerizes on storage, even under pressure of 7 atm.

Derivation: From malonic acid by destructive distillation.

Hazard: Explosive limits in air 6–30%. Strong irritant to eyes and mucous membranes, cause lachrymation and impaired breathing.

Use: Dyeing auxiliary, chemical intermediate.

carbon tetrabromide. (tetrabromomethane).

CAS: 558-13-4. CBr_4 . A brominated hydrocarbon.

Properties: Colorless crystals. D 3.42, mp 90.1°C , bp 189.5°C . Insoluble in water; soluble in alcohol, ether, and chloroform. Noncombustible.

Hazard: A poison; narcotic in high concentration. TLV: 0.1 ppm.

Use: Organic synthesis.

carbon tetrachloride. (tetrachloromethane; perchloromethane).

CAS: 56-23-5. CCl_4 . A chlorinated hydrocarbon.

Properties: Colorless liquid; sweetish, distinctive odor. Vapor 5.3 times heavier than air, d 1.585 (25/4C), bp 76.74°C , fp -23.0°C , refr index 1.4607 (20C), vap press 91.3 mm Hg (20C), wt/gal 13.22 lb (25C), flash p none. Miscible with alcohol, ether, chloroform, benzene, solvent naphtha, and most of the fixed and volatile oils; insoluble in water. Noncombustible.

Derivation: (1) Interaction of carbon disulfide and chlorine in the presence of iron; (2) chlorination of methane or higher hydrocarbons at 250–400C.

Method of purification: Treatment with caustic alkali solution to remove sulfur chloride, followed by rectification.

Grade: Technical, CP, electronic.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Do not use to extinguish fire. Narcotic. A carcinogen (OSHA). TLV: 5 ppm. Decomposes to phosgene at high temperatures.

Use: Refrigerants. Metal degreasing, agricultural fumigant, chlorinating organic compounds, production of semiconductors, solvent (fats, oils, rubber, etc.).

Note: Not permitted in products intended for home use.

carbon tetrafluoride. See tetrafluoromethane.

carbon trichloride. See hexachloroethane.

carbonyl. A compound of carbon monoxide with a metal, as in $\text{Co}(\text{CO})_3$.

***N,N'*-carbonylbis(4-methoxymetanic acid)disodium salt.** (sodium methoxymetanalate urea). $[\text{C}_6\text{H}_3(\text{OCH}_3)_3(\text{SO}_3\text{Na})\text{NH}]_2\text{CO}$.

Properties: Gray paste, solids approximately 70%.

Grade: Technical.

Use: Intermediate.

carbonyl bromide. See bromophosgene.

carbonyl chloride. See phosgene.

carbonyl cyanide. (carbon oxycyanide). $\text{CO}(\text{CN})_2$.

Properties: Colorless liquid. Unstable in the presence of water. Bp -83°C , d 1.139 (-114°C), mp 114°C .

Hazard: Toxic. TLV: 5 mg(CN)/m³.

Use: Organic synthesis.

1,1'-carbonyldiimidazole. (*N,N*-carbonyldiimidazole; 1,1'-carbonylbis-1H-imidazole). $\text{C}_8\text{H}_{10}\text{N}_4\text{O}$. Should be handled in absence of atmospheric moisture to avoid release of carbon dioxide.

Properties: Off-white powder or crystals. Mw 162.15, mp $118-120^\circ\text{C}$.

Use: Enzyme cross-linking agent, condensing agent for nucleoside triphosphate synthesis.

carbonyl fluoride. (fluoroformyl fluoride; carbon oxyfluoride).

CAS: 353-50-4. COF_2 .

Properties: Colorless, hygroscopic gas. Unstable in the presence of water. Bp -83°C , d 1.139 (-114°C), fp -114°C . Min purity 97 mole %. Nonflammable.

Derivation: Action of silver fluoride on carbon monoxide.

Grade: Technical.

Hazard: Toxic by inhalation, strong irritant to skin. TLV: 2 ppm.

Use: Organic synthesis.

carbonyl group. The divalent group $\text{C}=\text{O}$, which occurs in a wide range of chemical compounds. It is present in aldehydes, ketones, organic acids, and sugars and in the carboxyl group, i.e.,

In combination with transition metals, it forms coordination compounds that are highly toxic, because

they decompose to release carbon monoxide when absorbed by the body, e.g., nickel carbonyl. Several metal carbonyls have antiknock properties. The carbonyl group is also found in combination with nonmetals, as in phosgene (carbonyl chloride); these compounds are also poisonous.

carbonyl sulfide. (carbon oxysulfide).

CAS: 463-58-1. COS.

Properties: Colorless gas with typical sulfide odor except when pure. D gas 2.1 (air = 1), fp -138.8°C , bp -50.2°C (1 atm). Soluble in water and alcohol.

Derivation: Hydrolysis of ammonium or potassium thiocyanate.

Hazard: Narcotic in high concentrations. Flammable, explosive limits in air 12–28.5%.

carbophenothion. (generic name for S-[ϵ -(*p*-chlorophenyl)thiomethyl]-*O,O*-diethyl phosphorodithioate; *O,O*-diethyl-*S*-(*p*-chlorophenylthiomethyl) phosphorodithioate).

$(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{S}(\text{C}_6\text{H}_4)\text{Cl}$.

Properties: Amber liquid. Bp 82°C (0.1 mm Hg), d 1.29 (20°C). Essentially insoluble in water; miscible with common solvents.

Hazard: Use may be restricted. A cholinesterase inhibitor.

Use: Insecticide, acaricide.

carborane. A crystalline compound composed of boron, carbon, and hydrogen. It can be synthesized in various ways, chiefly by the reaction of a borane (penta- or deca-) with acetylene, either at high temperature in the gas phase or in the presence of a Lewis base. Alkylated derivatives have been prepared. Carboranes have different structural and chemical characteristics and should not be confused with hydrocarbon derivatives of boron hydrides. The predominant structures are the cage type, the nest type, and the web type, these terms being descriptive of the arrangement of atoms in the crystals. Active research on carborane chemistry has been conducted under sponsorship of the U.S. Office of Naval Research.

***m*-carboranedimethanol.**

CAS: 23924-78-9. mf: $\text{C}_4\text{H}_{16}\text{B}_{10}\text{O}_2$.

Hazard: Low toxicity by ingestion. A moderate eye irritant.

***o*-carboranedimethanol.**

CAS: 19610-37-8. mf: $\text{C}_4\text{H}_{16}\text{B}_{10}\text{O}_2$.

Hazard: Moderately toxic by ingestion and inhalation. A moderate eye irritant.

“Carborundum” [Carborundum]. TM for abrasives and refractories of silicon carbide, fused alumina, and other materials.

Properties: For silicon carbide, crystalline form ranges from small to massive crystals in the hexagonal system, the crystals varying from transparent to opaque, with colors from pale green to deep blue or

black; hardness Mohs 9.17; d 3.06–3.20. Noncombustible, not affected by acids, slowly oxidizes at temperatures above 1000C, good heat dissipator, highly refractory.

Use: Abrasive grains and powders for cutting, grinding, and polishing; valve-grinding compounds; grinding wheels; coated abrasive products; antislip tiles and treads; refractory grains.

carbosand. Fine sand that has been treated with an organic solution and roasted to produce a material that can be sprayed onto oil slicks to aid in sinking or dispersing them.

“Carboset” [B. F. Goodrich]. TM for water-soluble acrylic thermoset and thermoplastic products.

Use: Protective metal coatings, paints, ceramics, adhesives, textiles, paper, leather, and cosmetics.

-carbothioic. A suffix denoting an organic acid in which an atom of sulfur replaces an atom of oxygen.

-carbothionic. A suffix of organic acids in which the oxygen of the CO group has been replaced by sulfur.

“Carbowax” [Dow]. TM for polyethylene glycols and methoxypolyethylene glycols.

Grade: Available in various numbered grades, i.e., 200, 400, 1000, 4000, 6000. Usually designated by approximate molecular weight of polymer.

Use: Water-soluble lubricants; solvents for dyes, resins, proteins; plasticizers for casein and gelatin compositions, glues, zein, cork, and special printing inks; solvent and ointment bases for cosmetics and pharmaceuticals; intermediates for nonionic surfactants and alkyd resins.

carboxamide hydrochloride.

CAS: 158681-13-1. mf: $C_{22}H_{21}Cl_3N_4O \bullet ClH$.

Hazard: A poison.

carboxamidoacetamide. See malonamide.

carboxybenzene. See benzoic acid.

1-carboxyethane-2-phosphonic acid. See 3-phosphonopropanoic acid.

2-carboxyethyl acrylate. See hydracrylic acid, acrylate.

6-(2-carboxyethylthio)purine.

CAS: 608-10-6. mf: $C_8H_8N_4O_2S$.

Hazard: A poison.

2-carboxy-2'-hydroxy-5'-sulfoformazylbenzene. (*o*-[α -(2-hydroxy-5-sulfoformazyl)azobenzylidene]-hydrazino benzoic acid). $HO_3SC_6H_3(OH)N:NC(C_6H_5):NNC_6H_4COOH$.

Use: Reagent used for the colorimetric determination of zinc and copper.

carboxylase. A decarboxylase enzyme, found in plant tissues that acts on pyruvic acid, producing acetaldehyde and carbon dioxide.

Use: Biochemical research.

carboxyl group. The chemical group characteristic of carboxylic acids which include fatty acids and amino acids. It usually occupies the terminal position in the molecule and is capable of assuming a negative charge, which makes the end of the molecule water soluble. Though it is customarily shown as either COOH or CO_2H , the structure of the group is

Thus it is composed of a carbonyl group and a hydroxyl group bonded to a carbon atom. The carbon-oxygen unsaturation within the carboxyl group is of a different order from the carbon-to-carbon unsaturation in the alkyl chain in unsaturated fatty acids. For this reason, fatty acids in which no double bond is present except that in the carboxyl group are called saturated.

See fatty acid.

carboxylic acid. Any of a broad array of organic acids comprised chiefly of alkyl (hydrocarbon) groups (CH_2 , CH_3), usually in a straight chain (aliphatic), terminating in a carboxyl group (COOH). Exceptions to this structure are formic acid (HCOOH) and oxalic acid (HOOCOOH). The number of carbon atoms ranges from one (formic) to 26 (cerotic), the carbon of the terminal group being counted as part of the chain. Carboxylic acids include the large and important class of fatty acids and may be either saturated or unsaturated. A few contain halogen atoms (chloroacetic). There are also some natural aromatic carboxylic acids (benzoic, salicylic), as well as alicyclic types (abietic, chaulmoogric).

See amino acid.

carboxylic acid hydrochloride.

CAS: 164150-85-0. mf: $C_{20}H_{18}F_2N_4O_3 \bullet ClH$.

Hazard: A reproductive hazard.

carboxymethoxylamine hemihydrochloride.

$(H_2NOCH_2CO_2H)_2 \bullet HCl$. Demonstrates anticonvulsant activity by inhibiting glutamic acid decarboxylase and γ -aminobutyric- α -ketoglutaric aminotransaminase, increasing the brain γ -aminobutyric acid concentrations. Increases the sugar content of sugarcane, sugar beets, and sorghum. Forms digitoxin derivatives.

Properties: Off-white crystals. Mw 218.59, mp 156C (decomposes), hygroscopic.

Grade: 98% research.

carboxymethylcellulose. (CMC; sodium carboxymethylcellulose; CM cellulose).

CAS: 9004-32-4. A semisynthetic, water-soluble polymer in which CH_2COOH groups are substituted on the glucose units of the cellulose chain through an ether linkage. Mw ranges from 21,000 to 500,000. Since the reaction occurs in an alkaline medium, the product is the sodium salt of the carboxylic acid $\text{R-O-CH}_2\text{COONa}$.

Properties: Colorless, odorless, nontoxic, water-soluble powder or granules. D 1.59, refr index 1.51, tensile strength 8000–15,000 psi, pH (1% solution) 6.5–8.0, stable in pH range 2–10. Viscosity of 1% solution varies from 5 to 2000 cP, depending on the extent of etherification. Insoluble in organic liquids. Reacts with heavy-metal salts to form films that are insoluble in water, transparent, relatively tough, and unaffected by organic materials. Many of its colloidal properties are superior to those of natural hydrophilic colloids. It also has thixotropic properties and functions as a polyelectrolyte.

Derivation: By reaction of alkali cellulose and sodium chloroacetate.

Grade: Crude, technical (approximately 75% pure), high viscosity, low viscosity, semirefined, refined (99.5+% pure), USP, FCC.

Use: Detergents; soaps; food products (dietetic foods and ice cream), where it acts as water binder, thickener, suspending agent, and emulsion stabilizer; textile manufacturing (sizing); coating paper and paperboard to lower porosity; drilling muds; emulsion paints; protective colloid; pharmaceuticals; cosmetics.

See cellulose, modified.

carboxymethylmercaptosuccinic acid.

$\text{HOOCCH}_2\text{SCH}(\text{COOH})\text{CH}_2(\text{COOH})$.

Properties: White powder. Melting range 135–138C. Water solubility of 137 g/100 g (25C); ethanol solubility of 76 g/100 g (25C).

Use: Heavy-metal chelator and deactivator.

carboxyl-terminal residue. The amino acid residue in a polypeptide chain with a free α -carboxyl group.

carboxymethylpyridinium chloride hydrazide. See Girard's reagent.

1-carboxymethyl-1-methylpyrrolidinium iodide methyl ester.

CAS: 22041-28-7. mf: $\text{C}_8\text{H}_{16}\text{NO}_2 \cdot \text{I}$.

Hazard: A poison.

carboxymethyltrimethylammonium chloride hydrazide. See Girard's reagent.

α -(3-carboxy-1-oxosulfopropyl)- ω -hydroxy-poly(oxy-1,2-ethanediyl), C10-C16 alkyl ethers, disodium salts.

CAS: 68815-56-5.

Hazard: A severe skin irritant.

carboxypeptidase. A proteolytic enzyme found in the pancreas that catalyzes the hydrolysis of native food proteins. It acts on polypeptides, producing simpler peptides and amino acids.

Use: Biochemical research.

(*o*-carboxyphenyl)hydroxymercury. See *o*-hydroxymercuribenzoic acid.

(*p*-carboxyphenyl)hydroxymercury. See *p*-hydroxymercuribenzoic acid.

carboxyplast. A high molecular weight synthetic polymer in which the principal chain contains only carbon and oxygen.

4-carboxyresorcinol. See β -resorcylic acid.

6-carboxyuracil. See orotic acid.

carburet of sulfur. See carbon disulfide.

carburetted hydrogen. See ethylene.

carbylamine. (isocyanide; isonitrile). $\text{N}\equiv\text{C-C}_6\text{H}_5$ An unpleasantly odored compound containing the radical $\text{N}\equiv\text{C}$.

carbylic acid. A general designation for carboxylic, carbaazylic, or carboxazylic.

carcinogen. Any substance that causes the development of cancerous growths in living tissue. Such substances are usually grouped in two classifications: (1) those that are known to induce cancer in humans or animals, either by operational exposure in industry or by ingestion in feedstuffs, e.g., asbestos particulates, nickel carbonyl, trichloroethylene, benzidine and compounds, vinyl monomer, benzo-pyrene, aflatoxin, chloromethyl ether, β -naphthylamine, as well as anthracene, phenanthrene, chrysene, and other polynuclear hydrocarbons of coal tar origin; (2) experimental carcinogens that have been found to cause cancer in animals under experimental conditions, namely, by external applications, feeding, or injection of the substance. Among these are dimethyl sulfate, cyclamate compounds, ethyleneimine, and 4-dimethylaminoazobenzene. The Delany amendment to the Food, Drug, and Cosmetic Act forbids the use in human foods of any substance falling in this group. The substances mentioned above by no means comprise a complete list of carcinogens. There are approximately 3500 known and suspected carcinogenic compounds, and new ones are constantly being discovered.

cardamom oil.

Properties: Colorless or pale-yellow essential oil; strongly aromatic, camphoraceous odor and taste. Strongly dextrorotatory.

Use: Flavoring for foods, confectionery, liqueurs, pharmaceuticals.

cardanolide. A fully saturated system of digitaloid lactones in which the configuration at C₂₀ is the same as in cholesterol.

“Cardio-Green” [BD]. TM for indocyanine green, a diagnostic dye used in medicine.

“CARDIPOL” [Baker Petrolite]. TM for an oxidized hydrocarbon wax.

“CARDIS” [Baker Petrolite]. TM for an oxidized hydrocarbon wax.

“Cardosol” Brand Resin [3M]. TM for a water-soluble ketone formaldehyde condensate that can be gelled and cured by alkali or heat.

Use: Water-resistant adhesives for box board, coatings, and glass fibers and as a ceramic binder.

carene. See (+)car-3-ene.

(+)car-3-ene.

CAS: 74806-04-5. mf: C₁₀H₁₆.

Hazard: Low toxicity by ingestion and skin contact. A mild skin and eye irritant.

Δ-3-carene. 3,7,7-trimethylbicyclo[4.1.0]-hept-3-ene.

CAS: 13466-78-9. C₁₀H₁₆. A terpene hydrocarbon with both a 6-member and a 3-member ring.

Properties: Clear, colorless liquid. D 0.8668 (15C), bp 170C, refr index 1.4723 (20C). Stable to approximately 250C, resinifies with oxygen. Insoluble in water; miscible with organic solutions. Combustible.

Derivation: From wood turpentine.

Use: Solvent, intermediate.

carfentrazone-ethyl.

CAS: 128639-02-1. mf: C₁₅H₁₄Cl₂F₃N₃O₃.

Hazard: Moderately toxic.

Carinthian process. A procedure for reduction of lead ores; a small charge is roasted slowly at a low temperature, the lead being collected outside the furnace by means of an inclined hearth.

Carius (wet combustion) method. Decomposition of organic compounds containing halogen or sulfur in a sealed tube in the presence of red, fuming nitric acid at 250–300C in such a manner that halogen is converted to ionic halide and sulfur to sulfate.

Carius tube. (bomb tube). A hard, glass thick-walled tube, sealed at one end, that is approximately 40 cm long.

“Carmethose” [Novartis]. TM for sodium carboxymethylcellulose.

carmine. An aluminum lake of the pigment from cochineal. Bright-red pieces; easily powdered; soluble in alkali solution, borax; insoluble in dilute acids; slightly soluble in hot water.

Grade: Technical.

Use: Dyes, inks, indicator in chemical analysis, coloring food materials, medicines, etc.

carminic acid. C₂₂H₂₀O₁₃. The essential constituent of carmine. A tricyclic compound.

Properties: Dark, purplish-brown mass or bright-red powder. Mp (decomposes at 136C), pH 4.8 (yellow), pH 6.2 (violet). Soluble in water, alcohol, concentrated sulfuric acid; insoluble in ether, benzene, chloroform. Combustible.

Derivation: By extraction from the insects *Coccus cacti* (cochineal).

Use: Stain in microscopy, indicator in analytical chemistry, coloring proprietary medicines, pigment for fine oil colors, color photography, dyeing.

carnallite. KCl•MgCl₂•6H₂O or KMgCl₃•6H₂O.

Properties: A natural hydrated double chloride of potassium and magnesium, white, brownish, and reddish; streak white; shining, greasy luster; strongly phosphorescent; bitter taste. Deliquescent, d 1.62, Mohs hardness 1.

Occurrence: West Germany, Alsace, New Mexico.

Use: A commercial source of manufactured potash salts.

carnauba wax. (Brazil wax). The hardest and most expensive commercial wax.

Properties: Hard solid in form of yellow to greenish-brown lumps; slight odor. D 0.995 (15/15C), mp 84–86C, acid number 2–9, iodine number 13.5. Soluble in ether, boiling alcohol, and alkalis; insoluble in water. Combustible.

Derivation: Exudation from leaves of the wax palm *Copernicia cerifera* (Brazil).

Grade: By numbers and sources; crude and refined; powdered; FCC.

Use: Shoe polishes, leather finishes, varnishes, electric insulating compositions, furniture and floor polishes, carbon paper, waterproofing, to prevent sun-checking of rubber and plastic products, confectionery, cosmetics.

carnosine. (β-alanylhistidine; ignotine).

C₉H₁₄N₄O₃. An amino acid occurring in the muscle of many animals and humans. Occurs naturally in the L(+)form.

Properties: Mp 245–250C (decomposes). Soluble in water. Nitrate: crystals. Mp 222C (decomposes). Soluble in water. Hydrochloride: crystals. Mp 245C (decomposes). Soluble in water. D(–)carnosine: crystals, mp 260C.

Use: Biochemical research.

Carnot cycle. An ideal closed cycle of reversible changes with which the performance of heat engines may be compared. It consists of four revers-

ible operations: isothermal and adiabatic expansions followed by isothermal and adiabatic compressions.

carnotite. $K_2(UO_2)_2(VO_4)_2 \cdot 3H_2O$. A natural hydrated vanadate of uranium and potassium usually found in sandstones and other sedimentary rocks.

Properties: Bright lemon-yellow, dull or earthy luster (pearly or silky when coarsely crystalline). Soluble in acids. Radioactive. Usually occurs as a powder or in fine-grained aggregates.

Occurrence: Colorado, Utah, Arizona, New Mexico, South Dakota, Australia, Zaire, the former U.S.S.R..

Hazard: A radioactive poison.

Use: Ore of uranium, source of radium.

Carnot's reagent. A reagent for the determination of potassium, an alcoholic solution of sodium bismuth thiosulfate made from sodium thiosulfate and bismuth subnitrate.

Carnot theorems. (1) No heat engine working between two temperatures can have a greater efficiency than a reversible engine working between those temperatures. (2) The efficiency of any reversible heat engine working between two temperatures is independent of the nature of the engine and of the working substances and depends only on the temperatures.

carob-seed gum. (locust-bean gum). A polysaccharide plant mucilage that is essentially galactomannan (carbohydrate). Mw approximately 310,000. Swells in cold water, but viscosity increases when heated. Insoluble in organic solvents. Combustible.

Derivation: Extracted from carob seeds, from the tree *Ceratonia siliqua*.

Grade: Technical, FCC (as locust-bean gum).

Use: In foods as stabilizer, thickener, emulsifier, and packaging material; cosmetics; sizing and finishes for textiles; pharmaceuticals; paints, bonding agent in paper manufacture; drilling fluids.

Caro's acid. (peroxysulfuric acid; persulfuric acid). H_2SO_5 or $HOSO_2OOH$.

Properties: White crystals. Mp 45C (decomposes).

Derivation: Action of hydrogen peroxide on concentrated sulfuric acid; action of 40% sulfuric acid on potassium persulfate.

Hazard: Strong irritant to eyes, skin, and mucous membranes. Strong oxidizer, may explode in contact with organic materials.

Use: Caro's reagent, a pasty mass of great oxidizing power for testing aniline, pyridine, and alkaloids; dye manufacture; oxidizing agent; bleaching.

Caro's reagent. A thick mixture used in testing for aniline, composed of ammonium or potassium persulfate, which is dissolved in sulfuric acid, has great oxidizing power.

carotene. (provitamin A). $C_{40}H_{56}$. A precursor of vitamin A occurring naturally in plants. It consists of three isomers, approximately 15% α , 85% β , and 0.1% γ . Carotene is a member of a large class of pigments called carotenoids. It has the same basic molecular structure as vitamin A and is transformed to the vitamin in the liver.

Properties: Ruby-red crystals, easily oxidized on contact with air. Mp (α) 188C, (β) 184C, (γ) 178C. Insoluble in water; slightly soluble in alcohol; soluble in chloroform, carbon disulfide, ether, and benzene.

Source: Orange-yellow pigment in plants, algae, and some marine animals, especially in leaves, vegetation, and root crops, in trace concentrations. Notably present in butter and carrots.

Derivation: By extraction from carrots and palm oil; concentration by a chromatographic process from alfalfa. β -Carotene is also made by a microbial fermentation process from corn and soybean oil.

Grade: According to USP, units of vitamin A, sold as pure crystals, as solutions in various oils, as colloidal dispersions. Also FCC.

Use: Pharmaceuticals, coloring margarine and butter, feed and food additive.

β -carotene. ($C_{40}H_{56}$).

Properties: Red, shining crystals. Mw 536.44, mp 181. Insoluble in water; slightly soluble in alcohol.

Occurrence: In vegetables.

Use: Food additive.

carotene cochineal.

Use: Food additive.

carotenoid. A class of pigments occurring in the tissues of higher plants, algae, and bacteria, as well as in fungi. Also present in some animals, as squalene in shark liver oil. They include the carotenes and xanthophylls.

Properties: Yellow to deep-red, crystalline solids. Soluble in fats and oils; insoluble in water; high melting; stable to alkali but unstable to acids and to oxidizing agents; color easily destroyed by hydrogenation or by oxidation; some are optically active.

carotenoids. Lipid-soluble photosynthetic pigments made up of isoprene units.

Carothers, Wallace H. (1896–1937). Born in Iowa, Carothers obtained his doctorate in chemistry at the University of Illinois. He joined the research staff of Du Pont in 1928, where he undertook the development of polychloroprene (later called neoprene) that had been initiated by Nieuland's research on acetylene polymers. Carothers's crowning achievement was the synthesis of nylon, the reaction product of hexamethylenetetramine and adipic acid. Carothers's work in the polymerization mechanisms of fiber like synthetics of cyclic organic structures was brilliant and productive, and he is regarded as

one of the most original and creative American chemists of the early 20th century.

carrageenan. (3,6-anhydro-*d*-galactan; carra-geen).

CAS: 9000-07-1. A sulfur phycocolloid: the aqueous, usually gel-forming, cell-wall polysaccharide mucilage found in red algae (*Chondrus crispus* and several other species). It is water-extracted from a seaweed called carragen or Irish moss (east coast of southern Canada, New England, and south to New Jersey). It is a mixture of polysaccharide fractions: (1) The λ fraction is cold-water soluble, contains *d*-galactose and 35% esterified sulfate, and does not gel. (2) The κ fraction contains *d*-galactose and 3,6-anhydro-*d*-galactose (1.4:1 ratio) and 25% esterified sulfate. The κ form does not gel without addition of a solute; the properties of the gel depend on the amount and nature of the added solute. Another species of seaweed produces 100% κ from North Carolina to the tropics. Carrageenan is a hydrophilic colloid that absorbs water readily and complexes with milk proteins.

Available forms: Dehydrated, purified powder.

Grade: Technical, FCC.

Use: Emulsifier in food products, chocolate milk, toothpastes, cosmetics, pharmaceuticals, protection colloid, stabilizing aid in ice cream (0.02%).

Carrel-Dakin solution. A medicinal solution composed of sodium chloride and sodium hypochlorite solution.

carrier. (1) A neutral material such as diatomaceous earth used to support a catalyst in a large-scale reaction system. (2) A gas used in chromatography to convey the volatilized mixture to be analyzed over the bed of packing that separates the components. (3) An atomic tracer carrier: a stable isotope or a natural element to which radioactive atoms of the same element have been added for purposes of chemical or biological research. See tracer.

carrier gas. The mobile phase in gas elution chromatography.

Carroll reaction. Preparation of γ,Δ -unsaturated ketones by base-catalyzed reaction of allylic alcohols with β -ketoesters or thermal rearrangement of allyl acetoacetates.

carthamin. (carthamic acid; safflor carmine; safflor red). $C_{21}H_{22}O_{11}$.

Properties: Dark-red powder with green luster. Slightly soluble in water; soluble in alcohol; insoluble in ether; solutions rapidly decompose.

Derivation: A glucoside from *Carthamus tinctorius*.

Use: Colorant in food products, cosmetics.

“Carulite” [Carus]. TM for a family of oxidation catalysts.

Use: Applications requiring control of carbon monoxide, ozone, and hydrocarbons.

“Carusorb” [Carus]. TM for an air-filter medium.

Use: Purification of air in homes, commercial buildings, and industry.

carvacrol. (isopropyl-*o*-cresol; 2-methyl-5-isopropylphenol; 2-hydroxy-*p*-cymene).

CAS: 499-75-2.

Properties: Thick, colorless oil; thymol odor. D 0.976 (20/4C); bp 237C; fp 0C; refr index 1.523 (20C). Insoluble in water; soluble in alcohol, ether, and alkalis. Combustible.

Derivation: From *p*-cymene by sulfonation followed by alkali fusion.

Use: Perfumes, fungicides, disinfectant, flavoring, organic synthesis.

carvone.

CAS: 99-49-0. A ketone derived from the terpene dipentene. It is optically active, occurring naturally in both *d*- and *l*-forms.

Properties: Pale-yellowish or colorless liquid with a strong characteristic odor. D 0.960 (20C), bp 227–230C, refr index 1.4999 (18C). Soluble in alcohol, ether, chloroform, propylene glycol, and mineral oils; insoluble in glycerol and water. Combustible.

Derivation: The *d*-form is the main constituent of caraway and dill oils; the *l*-form occurs principally in spearmint oil and may be synthesized from *d*-limonene.

Method of purification: Rectification.

Grade: FCC (both *d*- and *l*-forms), technical.

Use: Flavoring, liqueurs, perfumery, soaps.

“Carwinate” [I]. TM for isocyanates used to make urethane elastomers, coatings, foam adhesives, rigid plastics, sealants, and one-shot flexible, semiflexible, and semirigid foams.

caryophyllene. $C_{15}H_{24}$. A mix of sesquiterpenes occurring in many essential oils. It forms the chief hydrocarbon component of clove oil.

caryophylllic acid. See eugenol.

carzinophillin A.

CAS: 1403-29-8. A natural antibiotic produced by a *Streptomyces* strain. Discovered in Japan in the 1950s, it has strong antitumor potential, though its toxicity may preclude medical use. It is a member of the so-called bis-intercalator group of antibiotics that act by interlocking between the nucleotide bases of DNA; thus it may have mutagenic activity. The molecule contains carbon, oxygen, hydrogen, and nitrogen. The structure was elucidated in 1982.

CAS. Chemical Abstracts Registry or Chicago Academy of Science.

“Casabond TX” [Swan]. TM for a textile bonding agent. Bonds nylon, rayon, cotton, and terylene to natural and synthetic rubber. Also for rubber and metal bonding, PVC bonding and plasticized variety of synthetic textiles.

Use: Technical goods, footwear, and automotive.

cascade. (1) A series of operational units or stages so arranged that the heat produced in the first unit serves as the heat source for the second unit and so on. An example of this is a triple-effect evaporator in which the latent heat of condensation is passed from one unit to another. This principle is also used in distillation, each column plate representing one stage in the cascade. In flash distillation, used in the desalination of seawater, the heat of condensation is used to warm the incoming water. (2) Coined term used to describe a large number of compounds derived from a common source, e.g., the arachidonic acid cascade.

“Cascamite” [Borden].

CAS: 9011-05-6. TM for urea-formaldehyde resins.

Use: Adhesives for particle board, plywood, various wood-gluing applications, wet-strength paper.

casarilla oil. The volatile oil obtained by steam distillation of the dried bark of *Croton eleuteria* Bennet. Light-yellow to brown-amber liquid having a pleasant, spicy odor. Soluble in most fixed oils and mineral oil; almost insoluble in glycerol and propylene glycol.

Use: Flavoring agent in foods, medicine, tobacco.

“Cascowax” [Borden].

TM for wax emulsion.

Use: Sizing agent for composite wood panels.

case hardening. A process that imparts a hard surface to steel while the interior remains soft and tough. This is accomplished by heating the steel out of contact with air while packed in carbonaceous material, cooling it to black heat, reheating to a high temperature, and quenching. The materials are usually wood charcoal with sodium, potassium, or barium carbonates, cyanides, etc.

casein.

CAS: 9005-46-3. Though commonly regarded as

the principal protein in milk (approximately 3%), casein is actually a colloidal aggregate composed of several identifiable proteins together with phosphorus and calcium. It occurs in milk as a heterogeneous complex called calcium caseinate, which can be fractionated by a number of methods. It can be precipitated with acid at pH 4.7 or with the enzyme rennet (rennin). The product of the latter method is called paracasein, the term being applied to any of the casein fractions involved, i.e., α , β , κ , etc.

Properties: White, amorphous solid; tasteless; odorless. D 1.25–1.31, hygroscopic. Stable when kept dry but deteriorates rapidly when damp. Soluble in dilute alkalis and concentrated acids; almost insoluble in water; precipitates from weak acid solutions.

Derivation: Acid casein: warm skim milk is acidified with dilute sulfuric, hydrochloric, or lactic acid, the whey drawn off, and the curd washed, pressed, ground, and dried. Rennet casein: warm skim milk is treated with an extract of the enzyme rennin (rennet). The curd contains combined calcium and calcium phosphate.

Source: Midwestern U.S., Australia, Argentina, New Zealand, Poland.

Grade: Acid-precipitated (domestic edible, imported inedible), paracasein.

Use: Cheese making, plastic items, paper coatings, water-dispersed paints for interior use, adhesives (especially for wood laminates), textile sizing, foods and feeds, textile fibers, dietetic preparations, binder in foundry sands.

casein-sodium. See sodium caseinate.

cashew gum. (anacardium gum). The exudation from the bark of the cashew-nut tree, *Anacardium occidentale*. Hard, yellowish-brown gum; partly soluble in water. Used for inks, insecticides, pharmaceuticals, mucilage, tanning agent, natural varnishes, bookbinders' gum.

cashew nutshell oil. (cashew nutshell liquid). The oil obtained from the spongy layer between the inner and outer shells of cashew nuts. The raw liquid contains approximately 90% anacardic acid, $C_{22}H_{32}O_3$, and a blistering compound containing sulfur. Most of the liquid used in commerce has been heated or treated with chemicals to make it safe to handle. The liquid is nondrying, but can be made drying by proper treatment. It polymerizes on heating and forms condensation products with aldehydes.

Hazard: (untreated) Strong irritant.

Use: Varnishes and impregnating materials, modifier for phenol-based resins, plasticizers, germicides and insecticides, coloring materials and indelible inks, lubricants, and preservatives.

casing-head gasoline. See gasoline.

cassava. See tapioca.

casse. The decolorization of wine due to action of enzymes.

Cassel brown. See Van Dyke brown.

Cassel green. See barium manganate.

Cassella's acid. (2-naphthol-7-sulfonic acid; β -naphtholsulfonic acid F; F acid). $C_{10}H_6(OH)SO_3H$.

Properties: White crystals. Mp 89C. Soluble in water and alcohol.

Derivation: Fusion of naphthalene-2,7-disulfonic acid with caustic soda.

Grade: Technical. Also available as the sodium salt (F salt).

Use: Intermediate for azo dyes.

Cassella's acid F. (2-naphthylamine-7-sulfonic acid; delta acid). $C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless crystals. Soluble in water, alcohol, and ether.

Derivation: Heating sodium 2-naphthol-7-sulfonate with aqueous ammonia and ammonium acid sulfate in an autoclave.

Use: Azo-dye intermediate.

cassia oil. (Chinese cinnamon oil; cinnamon; cassia oil; cinnamon oil; USP).

CAS: 8007-80-5.

Properties: See cinnamic aldehyde, its chief constituent.

Derivation: Distilled from leaves and twigs of *Cinnamomum cassia*.

Grade: USP (as cinnamon oil), redistilled, technical, lead free.

Use: Flavoring, perfumery, medicine, soaps.

cassiterite. (tinstone; wood tin; stream tin).

SnO_2 . Natural tin dioxide, usually in igneous rocks.

Properties: Brown, black, yellow, white color; luster adamantine or dull submetallic; streak white. Mohs hardness 6-7, d 6.8-7.1.

Occurrence: Malaya, Bolivia, Indonesia, Africa.

Use: Principal ore of tin.

"Castertrak" [Nalco]. TM for program used to control addition of water-treatment chemicals.

Use: Caster cooling systems.

castile soap. A soap made from olive oil.

Use: Detergent or antiseptic. Fabric finishing and washing.

casting. (1) In the metal industries, conversion of a molten metal (iron, steel) into bars (pigs) or products by pouring it into open troughs or channels made of foundry sand (sand casting) or into products of precise shape by forcing it into steel dies or molds under pressure (die casting).

See foundry sand; cast iron; die casting; investment casting.

(2) In the plastics industry, formation of a product either by filling an open mold with liquid monomer and allowing it to polymerize in situ or (for film and sheet) by pouring the liquid mixture onto a moving flat surface. See molding.

cast iron. Generic term for a group of metals that basically are alloys of carbon and silicon with iron. Relative to steel, cast irons are high in carbon and silicon, carbon ranging from 0.5 to 4.2% and silicon from 0.2 to 3.5%. All these metals may contain other alloys added to modify their properties. Iron castings are produced in an exceptionally wide range of sizes and weights, from piston rings a fraction of an inch in diameter and weighing less than 1 oz to steam-turbine bases 20 ft long and weighing 180,000 lb. Most cast iron is manufactured by melting a mixture of steel scrap, cast-iron scrap, pig iron, and alloys in a cupola using coke as a fuel. A small percentage is melted in electric furnaces. It is poured into molds of silica sand bonded with bentonite, fireclay, and water. A small percentage is cast into metal molds or into molds of baked or fired ceramics. Internal cavities are formed by hard but collapsible cores of sand bonded with drying oils or synthetic resins. Small molds and cores usually are made by machine, using patterns of wood or metal.

Castner process. A method of producing sodium metal from fused sodium hydroxide by means of an electrolytic cell with heavy iron anodes surrounding the cathode in the bath. Sodium is collected on an iron gauze diaphragm midway between the electrodes. Hydrogen and oxygen are also collected during the process.

castor. Perfume fixative obtained from secretions of the beaver. Synthetic types are available.

castor oil. (ricinus oil).

CAS: 8001-79-4.

Properties: Pale-yellowish or almost colorless, transparent, viscous liquid; faint, mild odor; nauseating taste. A nondrying oil. D 0.945-0.965 (25/25C), saponification value 178, iodine value 85, fp -10C. Flash p 445F (229C), autoign temp 840F (448C). Combustible. Soluble in alcohol, benzene, chloroform, and carbon disulfide; dextrorotatory.

Derivation: From the seeds of the castor bean, *Ricinus communis* (Brazil, India, the former U.S.S.R., U.S.). They are cold-pressed for the first grade of medicinal oil and hot pressed for the common qualities, approximately 40% of the oil content of the bean being obtained. Residual oil in the cake is obtained by solvent extraction. Chief constituent: Ricinolein (glyceride of ricinoleic acid).

Grade: USP No. 1; No. 3; refined; FCC.

Hazard: Undergoes spontaneous heating.

Use: Plasticizer in lacquers and nitrocellulose, production of dibasic acids, lipsticks, polyurethane coatings, elastomers and adhesives, fatty acids, surface-active agents, hydraulic fluids, pharmaceuti-

cals, industrial lubricants, electrical insulating compounds, manufacture of Turkey Red oil, source of sebacic acid and of ricinoleates, medicine (laxative). See castor oil, dehydrated; blown oil.

castor oil, acetylated. See glyceryl 1,2-tri(acetylricinoleate).

castor oil acid. See ricinoleic acid.

castor oil, blown. See blown oil.

castor oil, dehydrated. (DCO). A castor oil from which approximately 5% of the chemically combined water has been removed and that as a result has drying properties similar to those of tung oil. Dehydration is carried out commercially by heating the oil in the presence of catalysts such as sulfuric and phosphoric acids, clays, and metallic oxides. The commercial product is offered in a wide range of viscosities and analytical constants. Used in protective coatings and alkyd resins.

castor oil, hydrogenated. Principally glyceryl-tri(12)-hydroxystearate. A hard, waxy product. It is insoluble in water and organic solvents. Mp 85°C. **Use:** Hydroxystearic acid, waterproofing fabrics, cosmetics, lubricant, mold-release agent, candles, carbon paper.

castor oil, polymerized. A rubber-like polymer results from combination of castor oil with sulfur or diisocyanates; this can be blended with polystyrene to give a tough, impact-resistant product.

castor oil, sulfonated. See Turkey red oil.

castor seed oil meal. (castor cake; castor meal). The residue from extraction of oil from the castor seed (ricinus). The normal product contains 29.5% crude protein, 35.8% crude fiber, 13.2% N-free extract, and 1.0% crude fat. The total digestible nutrients are approximately 25%. The ash content of 7.5% is high in potash and phosphate.

Hazard: Contains ricin, which must be removed before internal use.

Use: Animal feeds (after removal of toxic ingredients), fertilizer.

catabolism. The phase of intermediary metabolism concerned with the energy-yielding degradation of nutrient molecules.

catabolite gene activator protein. (CAP). A specific regulatory protein that controls initiation of transcription of the genes producing the enzymes required for a bacterial cell to use some other nutrient when glucose is lacking.

CAT box. CCAAT box.

“Cata-Chek” [Ferro]. TM for catalysts.

“Catacobal” [Catal]. TM for organic and inorganic-cobalt compounds.

“Catadry” [Catal]. TM for a paint drying catalyst.

“Catal” [Catal]. TM for accelerators of unsaturated polyester.

catalase. An oxidizing enzyme occurring in both plant and animal cells. It decomposes hydrogen peroxide. It can be isolated and is used in food preservation (removing oxygen in packaged foods) and in decomposing residual hydrogen peroxide in bleaching and oxidizing processes.

catalysis. One of the most important phenomena in nature, catalysis is the loosening of the chemical bonds of two (or more) reactants by another substance in such a way that a fractionally small percentage of the latter can greatly accelerate the rate of the reaction while remaining unconsumed. See catalyst. Thus, one part by volume of catalyst can activate thousands of parts of reactants. Though the mechanism of their action is not completely known, the electronic configuration of the surface molecules of the catalyst is often the critical factor. The surface irregularities give rise to so-called active points at which intermediate compounds can form. Most industrial catalysis is performed by finely divided transition metals or their oxides. Solid catalysts may combine chemically (bond) at the surface with one or more of the reactants. This is known as chemisorption and occurs on only a small portion of the catalyst surface (i.e., at the active points); it results in changing the chemical nature of the chemisorbed molecules. Catalysis of chemical reactions by surfaces must proceed by chemisorption of at least one of the reactants. Catalysis and catalytic mechanisms permeate almost every aspect of chemistry and are of such wide-ranging importance that they have long been the subject of continuing research. Many interrelated disciplines are involved, among them organometallic reactions (stereospecific catalysts), electrochemistry, colloid and surface chemistry, coordination chemistry, and biochemistry. One example of comparatively recent investigation is so-called cluster catalysis, in which a metal is bonded to carbon monoxide to form a metallic cluster anion. Such aggregations or crystallites may be up to 12 Å in diameter. Metal cluster research is motivated by the need to develop selective catalysts for C₁ compounds, in view of the likelihood that the basic raw materials for chemistry in the future will be derived from coal or biomass rather than oil. Another research development is the creation of a uniquely shaped catalyst particle that permits greater efficiency because of the increase in surface-to-volume ratio. Such particles are known as amphora catalysts.

catalysis, heterogeneous. A catalytic reaction in which the reactants and the catalyst comprise two separate phases, e.g., gases over solids, or liquids containing finely divided solids as a disperse phase.

catalysis, homogeneous. A catalytic reaction in which the reactants and the catalyst comprise only one phase, e.g., an acid solution catalyzing other liquid components.

catalyst. Any substance of which a small proportion notably affects the rate of a chemical reaction without itself being consumed or undergoing a chemical change. Most catalysts accelerate reactions, but a few retard them (negative catalysts, or inhibitors). Catalysts may be inorganic, organic, or a complex of organic groups and metal halides (see catalyst, stereospecific). They may be gases, liquids, or solids. In some cases their action is destructive and undesirable, as in the oxidation of iron to its oxide, which is catalyzed by water vapor, and similar types of corrosion. The life of an industrial catalyst varies from 1000 to 10,000 hours, after which it must be replaced or regenerated. Though it is not a substance, light in both the visible and ultrashort wavelengths can act as a catalyst, as in photosynthesis and other photochemical reactions, e.g., as polymerization initiator and cross-linking agent. Catalysts are highly specific in their application. They are essential in virtually all industrial chemical reactions, especially in petroleum refining and synthetic organic chemical manufacturing. For details of application, see the following list. Since the activity of a solid catalyst is often centered on a small fraction of its surface, the number of active points can be increased by adding promoters that increase the surface area in one way or another, e.g., by increasing porosity. Catalytic activity is decreased by substances that act as poisons that clog and weaken the catalyst surface, e.g., lead in the catalytic converters used to control exhaust emissions. Besides inorganic substances, there are many organic catalysts that are vital in the life processes of plants and animals. These are called enzymes and are essential in metabolic mechanisms, e.g., pepsin in digestion. Synthetic organic catalysts have been developed that imitate the action of enzymes such as chymotrypsin. Such model catalysts are examples of biomimetic chemistry. They approach the catalytic activity of natural enzymes. Following is a partial list of catalysts; an asterisk indicates a destructive effect.

Substance	Reaction Type
aluminum alkyl + titanium chloride	Ziegler catalyst for stereospecific polymers
aluminum chloride	condensation (Friedel-Crafts)
aluminum oxide	hydration, dehydration
ammonia	condensation (polymers)
chromic oxide	methanol synthesis, aromatization, polymerization

Substance	Reaction Type
cobalt	hydrocarbon synthesis (Oxo process)
copper salts	oxidation (of rubber)*
ferric chloride	Friedel-Crafts
hydrogen fluoride	alkylation, condensation, dehydration, isomerization
iodine	condensation, alkylation
iron	ammonia synthesis, hydrocarbon synthesis
iron oxide	dehydrogenation (oxidation)
manganese dioxide	oxidation
molybdenum oxide	dehydrogenation, polymerization
	aromatization, partial oxidation
nickel	hydrogenation (oils to fats), methanation
phosphoric acid	polymerization, isomerization,
platinum metals	hydrogenation, aromatization, oxidation
silica-alumina	cracking hydrocarbons
silver	hydration, oxidation
sulfuric acid	isomerization, corrosion*
triethylaluminum	polymerization (stereospecific)
vanadium pentoxide	oxidation (sulfuric acid)
water (esp. + NaCl)	oxidation (corrosion)*
zeolites	cracking hydrocarbons

See catalysis; enzyme.

catalyst, amphora. Catalyst particles made from a slurry of critical viscosity by compressing it into spheres or droplets followed by unidirectional heating and air-drying on a moving belt, the spheres being supported by a powder bed material. This process results in particles from 1.5 to 6 mm in diameter. The unique feature is the formation of an internal cavity having an orifice at one point, so that the particle roughly resembles a doughnut from which a bite has been taken. Since the shape of the cavity suggests an amphora (Greek vase), the catalyst was so named. This shape affords a higher surface-to-volume ratio than is possible with solid spheres and other conventional forms, with consequent greater efficiency. A variety of materials can be used, e.g., alumina, zeolites, metallic oxides, etc. Amphora catalysts are effective in a wide range of chemical processing applications (oxidation and reforming of hydrocarbons, hydrotreating).

catalyst, negative. See inhibitor.

catalyst, organic. See enzyme.

catalyst poison. A substance that interferes with the action of a catalyst.

catalyst promoter. A compound that reduces or activates fresh catalysts at polymerization temperatures, reactivates spent catalysts, and scavenges and reacts with catalyst poisons.

catalyst, shape-selective. A catalytic solid (transition metal) introduced into a crystalline aluminosilicate (zeolite) having pores or openings of approximately 5 Å. This permits the catalyst to exert a selective effect between molecules that differ in shape rather than in the reactivity of their chemical groups. The cage structure of the zeolite effectively prevents contact of the catalyst with all molecules whose shapes and sizes exclude their entry. The ability of a catalyst to discriminate among molecules on the basis of their shapes is of great value in the cracking of straight-chain hydrocarbons and has attractive possibilities in other types of catalytic reactions.

See zeolite; cage zeolite.

catalyst, stereospecific. An organometallic catalyst that permits control of the molecular geometry of polymeric molecules. Examples are Ziegler and Natta catalysts derived from a transition metal halide and a metal alkyl or similar substances. There are many patented catalysts of this general type, most of them developed in connection with the production of polypropylene, polyethylene, or other polyolefins.

See polymer, stereospecific; Natta catalyst; Ziegler catalyst.

catalyst, thermonuclear. See carbon cycle (2).

catalytic site. See active site.

cataphoresis. The migration of colloidal particles toward an electrode under the influence of an electric current.

CAT assay. An enzyme assay. CAT stands for chloramphenicol acetyl transferase, a bacterial enzyme which inactivates chloramphenicol by acetylating it. CAT assays are often performed to test the function of a promoter. The gene coding for CAT is linked onto a promoter (transcription control region) from another gene, and the construct is "transfected" into cultured cells. Largely supplanted by the reporter gene luciferase.

catechol. See pyrocatechol.

catecholamines. Hormones, such as epinephrine, that are amino derivatives of catechol.

catecholborane. (1,3,2-benzodioxaborole). A monofunctional hydroborating agent.

Properties: A liquid. Mw 119.92, mp 12C, bp 50C (50 mm Hg), optical rotation 1.5070 degrees (20C).

Use: Preparation of alkaneboronic acid and esters from olefins.

catenane. A compound with interlocking rings that are not chemically bonded but that cannot be separated without breaking at least one valence bond. The model would resemble the links of a chain.

catenyl. An ester that has been reacted with an alkylene oxide or its polymer.

"Cat-Floc" [Nalco]. (diallyldimethylammonium chloride). TM for a quaternary ammonium polymer.

Derivation: Monomer in water solution is mixed with a catalytic amount of butylhydroperoxide and kept at 50–75C for 48 h. The solid formed is taken up in water, precipitated, and washed with acetone.

Use: Flocculating agent, textile spinning aid, antistatic agent, wet-strength improvers in paper, rubber accelerators, curing epoxy resins, surfactants, bacteriostatic and fungistatic agents.

catharometer. Device for determining rate of flow or change in composition of gases.

cathetometer. A device for exact measurement or observation of short vertical distances, which consists of a horizontal-reading telescope or microscope movable along a vertical scale.

cathode. The negative electrode of an electrolytic cell, to which positively charged ions migrate when a current is passed as in electroplating baths. The cathode is the source of free electrons (cathode rays) in a vacuum tube. In a primary cell (battery), the cathode is the positive electrode.

See anode; electrode.

cathode sputtering. See sputtered coating.

cathodic protection. The reduction or prevention of corrosion of a metallic surface by making it cathodic, e.g. by the use of sacrificial anodes for impressed currents bringing a metal, by an external current, to a potential where it is thermodynamically stable.

catholyte. The solution surrounding the cathode in an electrolytic cell.

cation. An ion having a positive charge. Cations in a liquid subjected to electric potential collect at the negative pole, or cathode.

cation exchange. See ion exchange.

cation-exchange resin. A polymeric substance with fixed negative charges used in the chromatographic separation of cationic substances, e.g. CM (carboxymethyl)-cellulose.

- cationic reagent.** One of several surface-active substances in which the active constituent is the positive ion. Used to flocculate and collect minerals that are not flocculated by oleic acid or soaps (in which the surface-active ingredient is the negative ion). Reagents used are chiefly quaternary ammonium compounds, e.g., cetyltrimethylammonium bromide.
- catlinite.** (pipestone). A fine-grained silicate mineral related to pyrophyllite, which is easily compressible, has high surface friction, and is used for gaskets in very high-pressure equipment.
- caulking compound.** See sealant.
- caustic.** (1) Unqualified, this term usually refers to caustic soda (NaOH). (2) As an adjective, it refers to any compound chemically similar to NaOH, e.g., caustic alcohol (C₂H₅ONa). (3) Any strongly alkaline material that has a corrosive or irritating effect on living tissue.
- caustic baryta.** See barium hydroxide.
- caustic embrittlement.** The corrosion resulting in cracking of steel stressed beyond its yield point, due to localized concentration of hydroxide ions breaking down the cohesion between the ferrite grains.
- causticized ash.** Combinations of soda ash and caustic soda in definite proportions and marketed for purposes where an alkali is needed ranging in causticity between the two materials. Causticized ash is usually designated by its caustic-soda content, and the range of standard marketed products embraces 7, 10, 15, 25, 36, 45, and 67% of caustic soda.
- caustic lime.** See calcium hydroxide.
- caustic potash.** See potassium hydroxide.
- caustic soda.** See sodium hydroxide.
- cavitands.** Three-dimensional stacked-layer polycyclic compounds that maintain a rigid structure and bind a variety of molecules in the cavities produced by the structure of the molecules.
- cavitation.** Formation of vapor bubbles in a liquid such as saltwater when subjected to tension, causing severe mechanical damage to the surfaces of metals exposed to it, e.g., ship propellers, steam condensers, pumps, and piping systems. The erosive effect is due to the shock waves created by collapse of the bubbles. The pressures exerted by cavitation have been calculated to be in the range of 30,000 psi. This phenomenon plays a part in corrosion of metals and in emulsion formation.
See corrosion; homogenization.
- “Cavitron” [Cerestar].** TM for cyclodextrins, alpha, beta, gamma, and their derivatives.
CAS: alpha (1006-20-3), beta (7585-39-9), gamma (17465-86-0).
Available forms: Crystalline powders.
Use: Host inclusion complexation agents for stabilization and property modification of guest molecules.
- Cb.** Symbol for columbium, an obsolete name for niobium.
- CBM.** Abbreviation for chlorobromomethane (see bromochloromethane); also for constant-boiling mixture.
See azeotropic mixture.
- cc.** (1) Abbreviation for cubic centimeter.
See milliliter.
- CC.** Abbreviation for closed cup.
See flash point, TCC.
- CCAAT box.** (CAAT box; CAT box). A sequence found in the 5' flanking region of certain genes which is necessary for efficient expression.
- CCD.** See charge-coupled device.
- Cd.** Symbol for cadmium.
- CDA.** Abbreviation for completely denatured alcohol.
See alcohol, denatured.
- CDAA.** See α -chloro-*N,N*-diallylacetamide.
- CDEC.** See 2-chloroallyldiethyldithiocarbamate.
- CDMA.** Abbreviation for the Commercial Development and Marketing Association.
- cdNA.** (complementary DNA). A DNA, usually made by reverse transcriptase, which is complementary to given mRNA and used in cloning.
- cdNA clone.** (complementary DNA). A piece of DNA copied from an mRNA. The term “clone” indicates that this cdNA has been spliced into a plasmid or other vector in order to propagate it. A cdNA clone may contain DNA copies of such typical mRNA regions as coding sequence, 5'-untranslated region, 3' untranslated region or poly(A) tail. No introns will be present, nor any promoter sequences (or other 5' or 3' flanking regions). A “full-length” cdNA clone is one which contains all of the mRNA sequence from nucleotide #1 through to the poly(A) tail.
- cdNA library.** A collection of DNA sequences that code for genes. The sequences are generated in

the laboratory from mRNA sequences.
See messenger RNA.

CDP. (1) Abbreviation for cytidine diphosphate.
(2) Abbreviation for cresyl diphenyl phosphate. See cytidine phosphates

CDTA. See *trans*-1,2-diaminocyclohexanetetraacetic acid monohydrate.

Ce. Symbol for cerium.

Cech, R. Thomas. (1947–). Awarded Nobel Prize in chemistry in 1989 jointly with Altman for the discovery that RNA acts as a biological catalyst, as well as a carrier of genetic information. Doctorate awarded in 1975 by the University of California.

cedar leaf oil. An essential oil distilled from the leaves of *Juniperus virginiana*. Strongly dextrorotatory. Used in microscopy, perfumery, flavoring.

cedrol. $C_{15}H_{26}O$. A tertiary terpene alcohol.
Properties: Colorless crystals; cedarwood odor. Mp 86C, soluble in 11 parts of 95% alcohol. Combustible.
Use: Perfumery, for woody and spicy notes; odorant for disinfectants.

cedryl acetate. $CH_3COOC_{15}H_{25}$.
Properties: Colorless liquid; light cedar odor. D 0.975–0.995, refr index 1.496–1.510. Soluble in one volume of 90% alcohol. Combustible.
Use: Perfumery.

CEELS. Abbreviation for characteristic electron energy-loss spectroscopy.

cefodizime disodium.
CAS: 86329-79-5. mf: $C_{20}H_{18}N_6O_7S_4 \cdot 2Na$.
Hazard: Low toxicity by ingestion.

cefprozil.
CAS: 92665-29-7. mf: $C_{18}H_{19}N_3O_5$.
Hazard: Moderately toxic by ingestion. Human systemic effects.

ceftiofur.
Properties: Powder.
Use: Drug (veterinary); food additive.

ceftriaxone sodium hydrate.
CAS: 74578-69-1. mf: $C_{18}H_{16}N_8O_7S_3 \cdot 2Na \cdot 7/2H_2O$.
Hazard: Moderately toxic. Low toxicity by ingestion. Human systemic effects.

“Celanar” [Celanese]. TM for a polyester film made from polyethylene terephthalate.
Properties: Transparent, biaxially oriented crystals. D 1.395, tensile strength 30,000 psi, dielectric strength 7000 volts/mil, mp 260C, service temp –60

to 150C. Outstanding dimensional stability and chemical resistance.

Use: Magnetic recording tape, drafting and engineering reproduction materials, metallic yarn, roll leaf, pressure-sensitive tapes, packaging, dielectric material in capacitors, wire and cable, motors, generators, transformers, and oils.

“Celanese CL” [Celanese]. TM for a series of polyvinyl acetate emulsions.

Available forms: 102: Fine particle size, water-resistant homopolymer emulsion. 202: Fine particle size, water-resistant copolymer emulsion. 203: Vinyl-acrylic copolymer emulsion. 204: Vinyl copolymer emulsion.

Use: Paints, adhesives, and paper-coating specialties.

“Celanese Solvent” [Celanese]. TM for a series of special solvents. Replacement for butanol and methylisobutyl carbinol in lacquers and brake fluids, distillation range 125–155C, flash p 120F (48.9) (OC).

Available forms: 203: Replacement for normal butyl alcohol in nitrocellulose lacquers, alkyd resin formulations, and thinners, distillation range 115–120C, flash p 100F (37.7C) (OC). 601: Replacement for methyl ethyl ketone in vinyl and nitrocellulose applications, distillation range 74–84C, flash p 10F (–12.2C) (OC).

Hazard: Flammable, dangerous fire risk.

“Celanthrene” [Du Pont]. TM for a group of anthraquinone disperse dyes designed especially for acetate, also suitable for application to nylon.

“Celatom” [Eagle-Picher]. TM for a group of diatomaceous silicas (diatomite) of high quality and uniformity.

Use: Filter aid; foods and beverages; absorbents, as in insecticides and fertilizers; catalyst supports; fillers for paper; paints; explosives; concrete and asphalt; chromatography.

“Celcon” [Celanese]. TM for a highly crystalline acetal copolymer based on trioxane.
See acetal resin.

celery seed oil.
Properties: From steam distillation of fruit and seed of *Apium graveolens* L. Yellow to green-brown liquid; aromatic odor. D: 0.870–0.910. Sol in fixed oils, mineral oil; sltly sol in propylene glycol; insol in glycerin.
Use: Food additive.

celestine blue. (CI 51050). $C_{17}H_{18}ClN_3O_4$.
Properties: Dark-green powder. Slightly soluble in water, ethylene glycol, and alcohol. Water solution gives purple color, alcoholic solution blue.
Use: Biological stain, mordant in dyeing.

celestite. SrSO_4 . Natural strontium sulfate, usually found in sedimentary rocks.

Properties: Colorless, white, pale-blue or red, luster vitreous to pearly. Resembles barite. D: 3.95, Mohs hardness 3–3.5.

Occurrence: U.S., Canada, Europe, Mexico.

Use: Strontium chemicals, oil-well drilling mud, sugar refining, ceramics, production of very pure sodium hydroxide.

celiac disease. (CD; celiac sprue disease).

Also referred to as gluten sensitive enteropathy (GSE). Considered to be the most undiagnosed common disease, affecting 1 in 133 people in the USA. It is a chronic inherited disease. Symptoms can include diarrhea, bloating, fatigue, constipation, osteoporosis and can ultimately result in intestinal lymphoma. Frequently misdiagnosed as irritable bowel syndrome or Crohn's Disease. Strict adherence to a gluten free diet is the only treatment currently available. This involves elimination from the diet of wheat, rye, barley, and sometimes oats and the derivatives of these grains.

Celiac Sprue Association. (CSA). A member-based nonprofit organization to help individuals with Celiac Sprue and Dermatitis Herpetiformis through education and research. Its mailing address is P.O. Box 31700, Omaha, NE 68131. Website: <http://www.csaceliacs.org>.

"Celite" [World Minerals]. TM for diatomaceous earth and related products.

"Celkate" [World Minerals]. TM for silicates with good liquid-absorption capacities.

Use: Gloss control for coatings; decolorizing specific acid absorbers.

cell. (1) The fundamental unit of biological structure, comprised of (a) an outer membrane, or wall, approximately 100 Å thick, which being semi-permeable maintains by osmosis the biochemical equilibrium of the intracellular fluids; (b) the cytoplasm, containing mitochondria, ribosomes, and other structures; and (c) the nucleus, in which lie the chromosomes and genes. An extremely complex biochemical organization, the cell is the dynamic unit of all life. Its ability to reproduce itself and to control its functions systematically is of basic importance to maintenance of life and growth. All organic matter is either found in cells or produced by cellular activity and was ultimately derived from photosynthesis. Cells are comparatively large units that can be resolved in an optical microscope; the largest single cells are represented by the eggs of oviparous animals.

See mitosis.

(2) Any self-contained unit having a specific functional purpose, as: (a) voltaic cell (battery) to generate electric current, (b) electrolytic cell to effect electrolysis, (c) fuel cell to convert chemical energy into electricity, and (d) solar cell to capture heat from sunlight. All except the last involve use of electrodes and electrolytes.

(3) Any completely enclosed hollow unit, as in a honeycomb or cellular plastic.

cell, concentration. An electrolytic cell whose emf is due to a difference in concentration of the electrolyte or active metal at the anode and cathode.

cell constant. The factor by which the observed resistance of an electrolyte is multiplied to obtain its specific resistance.

"Cell Guard NRT" [Martin Marietta].

TM for a magnesium hydroxide slurry.

Use: For refinery bleaching replacing caustic soda and sodium silicate.

cell, dry. See dry cell.

cell, electrolytic. See electrolytic cell.

cell, fuel. See fuel cell.

cellulase and carbohydrase. See carbohydrase and cellulase.

"Cellitazol" [BASF]. TM for a series of developed acetate dyestuffs.

"Celliton" [BASF]. TM for a series of disperse dyestuffs characterized by good fastness to light, washing, etc. Used for dyeing and printing acetate fibers.

cell, local. A cell whose emf is due to differences of potential between areas on a metallic surface in an electrolyte.

cell membrane. The outer membrane of a cell, which separates it from the environment. Also called a plasma membrane or plasmalemma.

cellobiose. $C_{12}H_{22}O_{11}$. The product of the partial hydrolysis of cellulose, composed of two *d*-glucose molecules.

Properties: Colorless crystals. Mp 225C (decomposes). Soluble in water; slightly soluble in alcohol; nearly insoluble in ether; insoluble in acetone.

Use: Bacteriology.

celloidin. A pure form of pyroxylin; used for embedding sections in microscopy.

“Cellolube” [Lanxess]. TM for a finisher.

Use: To give dyed and printed textiles final characteristics for water and soil repellency.

“Cellolyn” [Aqualon]. TM for a series of pale, low-melting hydroabietyl ester resins. Used for lacquers, inks, and adhesives.

cellophane. (regenerated cellulose). Film produced from wood pulp by the viscose process.

Properties: Transparent, strong, flexible, and highly resistant to grease, oil, and air. The base cellulose film is modified by softeners, flame-resisting materials, and dyes, also by coating with other materials. On exposure to heat the untreated film loses strength at 149C, decomposes at 176–204C, does not melt, burns readily, and is not self-extinguishing.

Hazard: Flammable, moderate fire risk.

Use: Wrapper or protective package for fabricated articles and industrial applications.

See rayon.

“Cellosize” [Dow]. TM for hydroxyethyl cellulose and carboxymethylcellulose.

See cellulose, modified.

“Cellosolve” [Dow]. TM for mono- and dialkyl ethers of ethylene glycol and their derivatives widely used as industrial solvents.

butyl “Cellosolve” See ethylene glycol monobutyl ether.

butyl “Cellosolve” acetate See ethylene glycol monobutyl ether acetate.

“Cellosolve” acetate See ethylene glycol monoethyl ether acetate.

“Cellosolve” solvent See ethylene glycol monohexyl ether.

methyl “Cellosolve” See ethylene glycol monomethyl ether.

cell, photovoltaic. See solar cell.

cell, primary. A device producing an electrical current from a nonreversible electrochemical reaction.

cell, reduction. An electrolytic unit in which free metal is produced by electrolysis of one of its compounds.

cell, reversible. A galvanic cell in which chemical and electrical energy can be interconverted reversibly.

cell, solar. See solar cell.

cell, storage. An electrolytic cell for the generation of electric energy that may be recharged after use by an electric current flowing in a direction opposite to the current flow by which the cell discharges.

cellular plastic. A thermosetting or thermoplastic foam composed of cellular cores with integral skins having high strength and stiffness. The cells result from the action of a blowing agent, either at room temperature or during heat treatment of the plastic mixture. The resulting product may be either flexible or rigid, the latter being machinable. The foaming action in some cases may occur in situ (foamed-in-place plastics). Cellular plastics are combustible. For details, see foam, plastic.

Use: (Flexible) Furniture, automobile interiors, mattresses, etc., where softness and resiliency are desired. (Rigid) Insulating material, boat building and similar light construction, salvage of waterlogged ships.

See foam; plastic; rubber sponge. For further information, refer to Cellular Plastics Division, Society of the Plastics Industry.

cellulase. An enzyme complex, produced by the fungi *Aspergillus niger* and *Trichoderma viride* that is capable of decomposing cellulose polysaccharides into smaller fragments, primarily glucose. It has been used as a digestive aid in medicine and in the brewing industry. Research has been devoted to experimental application of cellulase to disposal of cellulose solid wastes. The resulting glucose can be fermented to ethanol, used to grow yeast for animal-feed proteins, or used as a chemical feedstock.

Note: Cellulase derived from the thermophilic soil fungus *Thielatia terrestris* functions at a much higher temperature than other types and is thus much more effective in decomposing cellulose. This indicates its possible use in conversion of biomass to energy. Commercial development of this product is expected.

See biomass.

“Celluloid” [Celanese]. TM for a plastic consisting essentially of a solid solution of cellulose nitrate and camphor or other plasticizer plus a flame-retardant such as ammonium phosphate to minimize

flammability; available in sheets, rods, tubes, films. Also called pyroxylin.

Hazard: Flammable, dangerous fire risk. See nitrocellulose.

cellulose.

CAS: 9004-34-6. $(C_6H_{10}O_5)_n$. A natural carbohydrate high polymer (polysaccharide) consisting of anhydroglucose units joined by an oxygen linkage to form long molecular chains that are essentially linear. It can be hydrolyzed to glucose. The degree of polymerization is from 1000 for wood pulp to 3500 for cotton fiber, giving a molecular weight from 160,000 to 560,000.

Hazard: Cellulosic materials (paper, cotton, and textile wastes), when wet with water, are a dangerous fire hazard and subject to shipping regulations. TLV: 10 mg/m³. See rayon; cellophane; nitrocellulose; carboxymethylcellulose.

α -cellulose. The major component of wood and paper pulp. It is that portion of holocellulose that is insoluble in strong sodium hydroxide solution. See cellulose.

***p*-cellulose.** See phosphorylation.

cellulose acetate. (CA). A cellulose ester in which the cellulose is not completely esterified by acetic acid.

Properties: White flakes or powder. A thermoplastic resin, softening at approximately 60–97C and melting at approximately 260C. D: 1.27–1.34. Insoluble in acetone, ethyl acetate, cyclohexanol, nitropropane, ethylene dichloride. Notable for toughness, high-impact strength, and ease of fabrication. Subject to dimensional change due to cold flow, heat, or moisture absorption (1–7%). Fibers weaken above 80C and are difficult to dye uniformly; not attacked by microorganisms.

Derivation: Reacting cellulose (wood pulp or cotton linters) with acetic acid or acetic anhydride, with H₂SO₄ catalyst. The cellulose is fully acetylated (three acetate groups per glucose unit), and at the same time the sulfuric acid causes appreciable degradation of the cellulose polymer so that the product contains only 200–300 glucose units per polymer chain. At this point in the process the cellulose acetate ordinarily is partially hydrolyzed by the addition

of water until an average of 2–2.5 acetate groups per glucose unit remain. This product is thermoplastic and soluble in acetone. Fibers are produced by forcing an acetone solution through orifices of a spinnerette into a stream of warm air, which evaporates the solvent. Fibers are also produced in a similar manner from cellulose triacetate, which is insoluble in acetone but soluble in methylene chloride.

See acetate fiber; acetate film.

Available forms: Sheet, film or fiber, molded items.

Grade: Filtered and unfiltered. Also graded by percent combined acetic acid content: plastic 52–54%, lacquer 54–56%, film 55.5–56.6%, water resisting 56.5–59%, triacetate 60.0–62.5%.

Hazard: Flammable, not self-extinguishing, moderate fire risk.

Use: Acetate fiber, lacquers, protective-coating solution, photographic film, transparent sheeting, thermoplastic molding composition, cigarette filters, magnetic tapes, osmotic-cell membrane.

cellulose acetate butyrate. (CAB; cellulose acetobutyrate).

Properties: White pellets or granules. A thermoplastic resin. D 1.2. Soluble in ketones; organic acetates; lactates; methylene, ethylene, and propylene chlorides; and high-boiling solvents. Excellent weathering properties, low water absorption, low heat conductivity, high dielectric strength, high resistance to oil and grease. Combustible.

Derivation: Reaction of purified cellulose with acetic and butyric anhydrides, with sulfuric acid as catalyst and glacial acetic acid as solvent. The ratio of acetic to butyric components may be varied over a wide range.

Grade: According to percent butyryl content (17, 27, 38, 50%).

Use: Molding compositions, film and sheet, photographic film, lacquers, protective-coating solutions, taillight lenses, water-desalination membrane, piping and tubing, covering for aluminum fibers, toys, packaging, brush handles, hydrometers, miscellaneous consumer products.

cellulose acetate phthalate. A reaction product of phthalic anhydride and cellulose acetate, used for coating of tablets and capsules.

cellulose acetate propionate. (cellulose propionate). Similar to cellulose acetate butyrate

but made with propionic anhydride instead of butyric anhydride. Unusually stable; requires less plasticizer and is compatible with more plasticizers than the butyrate.

cellulose acetobutyrate. See cellulose acetate butyrate.

cellulose, colloidal. Cellulose hydrosol, solidifying to a dry, hardened material that is soluble in cupriethylene diamene.

cellulose ether. See ethylcellulose; methylcellulose.

cellulose gel. See cellulose, microcrystalline.

cellulose gum. A purified grade of carboxymethylcellulose.

cellulose, hydrated. (hydrocellulose). Cellulose that has been caused to react with water (approximately 8–12%), forming a gelatinous mass. Combustible.

Derivation: By mechanical pulverization and agitation with water; by the action of strong salt solutions, alkalies, or acids.

Use: In the manufacture of paper, vulcanized fiber, mercerized cotton, viscose rayon.

See hydration.

cellulose methyl ether. See methylcellulose.

cellulose, microcrystalline.

Properties: Fine white crystalline powder from treatment of α -cellulose with mineral acids. Insol in water, most org solvs.

Hazard: A nuisance dust.

Use: Food additive.

cellulose, modified. One of many derivatives of cellulose, formed by substitution of appropriate radicals (carboxyl, alkyl, acetate, nitrate, etc.) for hydroxyl groups along the carbon chain. Such reactions are usually not stoichiometric. Some of these products (carboxymethyl and hydroxyalkyl cellulose) are water-soluble ethers; others are organosol esters (cellulose acetate), nitrates (nitrocellulose), or xanthates (viscose). Biodegraded cellulose has been used as a microbial growth medium for protein formation. A tobacco substitute based on a cellulose modification is trademarked "Cytrel." [*Celanese*].

cellulose nitrate. See nitrocellulose.

cellulose, oxidized. (cellulosic acid). Derivative of cotton. Cellulose produced by treatment with nitrogen dioxide. Soluble in alkali but may be made to retain original form of the cellulose and much of its tensile strength.

Properties: Slightly off-white gauze, lint, or powder; slight charred odor; acid taste. Soluble in aqueous

organic bases, in dilute alkali, and in ammonium hydroxide, forming salts and esters; insoluble in water, acids, and common organic solvents. It slowly degrades at room temperatures and should be kept cool. Combustible.

Grade: USP, technical.

Use: Surgery and medicine, ion-exchange medium, thickening agent.

cellulose propionate. See cellulose acetate propionate; "Forticel."

cellulose, regenerated. See cellophane; rayon.

cellulose solubility number. The percentage by weight of a sample of cellulose that is soluble in cold caustic-soda solution under standard conditions. This is a measure of degradation.

cellulose sponge. A sponge of regenerated cellulose; highly absorbent, soft, and resilient when wet; long lasting. It will not scratch, can be sterilized by boiling, and is not affected by ordinary cleaning compounds. The pores vary in size from coarse (the size of a pea) to fine (the size of a pinhead). Yarn made of cellulose sponge consists of cotton fiber covered with the sponge product. Combustible.

Use: Washing automobiles and trucks, walls and painted surfaces, windows, etc.; general cleaning; sponge used in photographic laboratories; wet mops, cleaning pads, etc.

cellulose triacetate. A cellulose resin in which the cellulose is almost completely esterified by acetic acid.

Properties: White flakes. D 1.2. Soluble in chloroform, methylene chloride, tetrachloroethane. Combustible.

Derivation: Reaction of purified cellulose with acetic anhydride in the presence of sulfuric acid as catalyst and glacial acetic acid as solvent, followed by very slight hydrolysis.

Grade: Flake.

Use: Protective coatings resistant to most solvents, textile fibers; base for magnetic tape.

cellulose xanthate. See viscose process.

cellulosic plastic. One of a number of semisynthetic polymers based on cellulose.

See cellophane; cellulose acetate; cellulose, modified; nitrocellulose; rayon; carboxymethylcellulose.

cellulosic thiocarbonate. A reactive intermediate in the graft polymerization of certain synthetic polymers to cellulosic fibers. The latter are treated with sodium hydroxide and a sulfur-containing compound, and the cellulose thus activated is placed in an emulsion or solution of monomers. Polymerization at 50C occurs with a peroxide catalyst to

form the graft.
See graft polymer.

cell, voltaic. See voltaic cell.

cell wall. Rigid structure deposited outside the cell membrane. Plants are known for their cell walls of cellulose, as are the green algae and certain protists, while fungi have cell walls of chitin.

“Celogen” [Uniroyal]. TM for a series of blowing agents: AZ azodicarbonamide; OT phosphorus-*p*-oxybis-benzenesulfonylhydrazide; RA *p*-toluenesulfonyl semicarbazide.

“Celotex” [Celotex]. TM for structural building and insulation board produced in large sheets. Made from bagasse or wood fiber and treated to be resistant to fungi, termites, and water penetration. The name also includes roofing products, gypsum, wallboard, lath, plasters, mineral wool, and hardboard.

Celsius, A. (1701–1744). Swedish physicist who proposed the use of the centigrade temperature scale. His name is now generally applied to this scale (degrees centigrade = degrees Celsius).
See centigrade.

cement, aluminous. (high alumina cement).
A hydraulic cement that contains at least 30–35% alumina (in contrast to Portland cement, which contains less than 5%). The alumina is usually supplied by inclusion of bauxite. Aluminous cement attains its maximum strength more rapidly than Portland cement. It is also more resistant to solutions of sulfates. It exists in two modifications, sintered and fused.

cementation. A process in which steel or iron objects are coated with another metal by immersing them in a powder of the second metal and heating to a temperature below the melting point of any of the metals involved. Zinc, chromium, aluminum, copper, and other metals are applied to iron or steel in this fashion. The process is basically diffusion of one metal into the other so that intermetallic alloy layers are formed at the interface of the basis and coating metals.
See sherardizing.

cemented carbide. See carbide, cemented.

cement, hydraulic. Any mixture of fine-ground lime, alumina, and silica that will set to a hard product by admixture of water that combines chemically with other ingredients to form a hydrate. See cement; aluminous; cement, Portland.

cementite. Fe₃C. A carbide of iron formed in the manufacture of pig iron and steel. Composed of 93.33% iron and 6.67% carbon, it is very hard and

brittle and will scratch glass and feldspar but not quartz. It is about two-thirds as magnetic as pure iron under an exciting current. It occurs in ordinary steels of more than 0.85% carbon and takes its name from cement steel, made by the cementation process, which contains a great deal of this carbide.
See carbide.

cement, organic. Any of various types of rubber cement, silicone adhesives, deKhotinsky cement.
See adhesive, rubber-based; silicone; deKhotinsky cement.

cement, Portland.
CAS: 68475-76-3. A type of hydraulic cement in the form of finely divided, gray powder composed of lime, alumina, silica, and iron oxide as tetracalcium aluminoferrate (4CaO•Al₂O₃•Fe₂O₃), tricalcium aluminate (3CaO•Al₂O₃), tricalcium silicate (3CaO•SiO₂), and dicalcium silicate (2CaO•SiO₂). These are abbreviated, respectively, as C₄AF, C₃A, C₃S, and C₂S. Small amounts of magnesia, sodium, potassium, and sulfur are also present. Hardening does not require air and will occur under water. Cement may be modified with various plastic latexes in proportions up to 0.2 part latex solids to one part cement to improve adhesion, strength, flexibility, and curing properties. Water evaporation can be retarded by adding such resins as methylcellulose and hydroxyethylcellulose. For further information, refer to the Portland Cement Association, 5420 Old Orchard Road, Skokie, IL 60077-1083.

Hazard: TLV: total dust 10 mg/m³; respirable fraction 5 mg/m³.
See concrete (1).

cement, rubber. See adhesive, rubber-based.

“CE Methyl Esters” [Procter & Gamble].
TM for a series of methyl esters of straight chain (normal), even-numbered fatty acids ranging from C₈ (octanoate) to C₁₈ (octadecanoate) and including mixtures of these.
Properties: Colorless to light-yellow liquids or white solids. D approximately 0.87.
Use: Chemical intermediate, lubricants, cosmetic ingredients, formulating aids (rubber, wax, etc.).

C&EN. *Chemical & Engineering News*. Weekly publication of the American Chemical Society.

Chemical Heritage Foundation. (CHF).
Formerly the Beckman Center for History of Chemistry was established in 1982 to discover and disseminate information about historical resources and to encourage research scholarship and popular writing in the history of chemistry, chemical engineering, and the chemical process industries. The activities of the Foundation include organizing interviews and oral histories on major developments in modern chemistry; locating historical manuscript and archi-

val records of individuals, societies, trade associations, and companies important in the history of the chemical sciences; and encouraging academic research in the field. Typically, graduate students in History and Sociology of Science participate most actively in its programs. It is located at 315 Chestnut Street, Philadelphia, PA 19106-2702. Website: <http://www.chemheritage.org>
See Appendix II.

“Chemigum” [*Eliokem*]. TM for NBR elastomers, copolymers of acrylonitrile and butadiene.
Use: Adds good mechanical properties and resistance to fuels, fats and oils.

chemiosmotic coupling. Coupling of ATP synthesis to electron transfer via an electrochemical pH gradient across a membrane (inner mitochondrial membrane, bacterial plasma membrane, or thylakoid membrane).

“Chemmer Epoxy” [*Chemmer*]. TM for an encapsulating resin for mini electronics.

“CenPrem” [*Century Foods*]. TM for a tableting sugar processed into layer particle size.
Use: For mixes and tablets.

“Centara III” [*Norben*]. TM for a dietary pea fiber.
Use: Adds excellent moisture retention capacity and fiber enrichment while being devoid of color.

“Centellin” [*Sabinsa*]. TM for an extract of *Centella asiatica* skin conditioning agent.
Use: For wound healing; supports circulation.

centigrade. (Celsius). The internationally used scale for measuring temperature, in which 100 degrees is the boiling point of water at sea level (1 atm) and 0 degrees is the freezing point. A temperature given in centigrade degrees may be converted to the corresponding Fahrenheit temperature by multiplying it by 9/5 (or 1.8) and adding 32 to the product. A temperature given in Fahrenheit degrees is converted to the corresponding centigrade temperature by subtracting 32 and multiplying the remainder by 5/9. The centigrade scale was devised by the Swedish scientist Celsius; his name is officially used to designate it, even though centigrade is more meaningful.

centigrade heat unit. See chu.

centimorgan. (cM). A unit of measure of recombination frequency. One centimorgan is equal to a 1% chance that a marker at one genetic locus will be separated from a marker at a second locus due to crossing over in a single generation. In human beings, one centimorgan is equivalent, on average, to one million base pairs.
See megabase.

centipoise. (cP). 1/100 poise. The poise is the cgs-metric system unit of viscosity and has the dimensions of dyne-seconds per square centimeter or grams per centimeter-second.

centistoke. (cS). 1/100 stoke, the unit of kinematic viscosity. The kinematic viscosity in stokes is equal to the viscosity in poises divided by the density of the fluid in grams per cubic centimeter, both measured at the same temperature.

central dogma. The organizing principle of molecular biology: genetic information flows from DNA to RNA to protein.

centrifugation. A separation technique based on the application of centrifugal force to a mixture or suspension of materials of closely similar densities. The smaller the difference in density, the greater the force required. The equipment used (centrifuge) is a chamber revolving at high speed (10,000 rpm or more) to impart a force up to 17,000 times gravity. The materials of higher density are thrown toward the outer portion of the chamber while those of lower density are concentrated in the inner portion. This technique is used effectively in a number of biological and industrial operations, such as separation of the components of blood, concentration of rubber latex, and separation of fat particles from other milk components. Separation of isotopes, e.g., those of uranium, by this method is now practicable for producing enriched uranium. This method is economically superior to the gaseous diffusion process.
See ultracentrifuge.

centrifuge. See centrifugation; ultracentrifuge.

centroid diagram. A chart showing relationship of atomic electron energy levels in successive elements.

centromere. A specialized region of a chromosome which serves as the attachment point for the mitotic or meiotic spindle.

cephalin. (kephalin; phosphatidyl ethanolamine; phosphatidylserine).
 $\text{CH}_2\text{OR}, \text{CHOR}, \text{CH}_2\text{OP}(\text{O})(\text{OH})\text{OR}_3$.

Properties: Yellowish, amorphous substance; characteristic odor and taste. Insoluble in water and acetone; soluble in chloroform and ether; slightly soluble in alcohol. A group of phospholipids in which two fatty acids (R_1 and R_2) form ester linkages with the two hydroxyl groups of glycerophosphoric acid, and either ethanolamine or serine (R_3) forms an ester linkage with the phosphate group. Cephalins are therefore either phosphatidylethanolamine or phosphatidylserine. They are associated with lecithins found in brain tissue, nerve tissue, and egg yolk.
Use: Medicine, biochemical research.

cephalosporin. Any of a family of antibiotics related to penicillin, discovered in 1953; an important member of this group was synthesized by Woodward in 1966. Several cephalosporins are used clinically (cephalothin, cephaloridine, and cephalixin). The molecule contains a fused β -lactam-dihydrothiazine ring system with an *N*-acyl side chain and an acetoxy group attached to the dihydrothiazine ring. The formula for cephalosporin (C) is $C_{16}H_{21}N_3O_8S$. Cephalosporins are reported to be free from the allergic reactions common with penicillin. Development of new cephalosporin derivatives is being actively pursued.
See penicillin; antibiotic.

cephamycin. Any of a group of antibiotics related to cephalosporins and produced by several species of *Streptomyces*.

“Ceramer” [Baker Petrolite]. TM for a modified hydrocarbon wax.

ceramic. A product, manufactured by the action of heat on earthy raw materials, in which silicon and its oxide and complex compounds known as silicates occupy a predominant position (American Ceramic Society). The chief groups of the ceramics industry are as follows: (1) structural clay products (brick, tile, terra-cotta, glazed architectural brick); (2) whitewares (dinnerware, chemical and electrical porcelain, e.g., spark plugs, sanitary ware, floor tile); (3) glass products of all types; (4) porcelain enamels; (5) refractories (materials that withstand high temperatures); (6) Portland cement, lime, plaster, and gypsum products; (7) abrasive materials such as fused alumina, silicon carbide, and related products; (8) aluminum silicate fibers. A wide range of ceramics are available as ultrafine particles (10–150 microns), and ceramic foams are offered commercially.

ceramic, ferroelectric. A unique type of polycrystalline ceramic having properties that make possible the production of reliable, high-density optical memories for computers that are more efficient than conventional types. Lead zirconate titanate, heated and pressed into thin plates, is one of the compounds used. As a result of its ferroelectric properties, an applied voltage aligns the electric charges in the molecules of ceramic in the direction of the field and the polarization so induced remains indefinitely. Thus, the material accommodates itself to the requirements of the digital system, namely, binary 0 and binary 1.
See ferroelectric.

ceramic, glass. See glass ceramic.

“Ceramax” [PPG]. TM for a technical grade of barium carbonate used in the ceramic industry.
Hazard: See barium.

“Ceraphyl” [International Specialty]. TM for octyldodecyl stearyl stearate.

Available forms: Liquid.

Use: An emollient, pigment dispersant and binder. Imparts long-lasting lubricity and rich cushioned feel to the skin.

“Ceratak” [Baker Petrolite]. TM for a grade of petroleum microcrystalline wax, min mp 73.8C.

“Cerathane” 63-L [Baker Petrolite]. TM for an emulsifiable microcrystalline wax, min mp 93.3C.

“Ceraweld” [Baker Petrolite]. TM for a grade of petroleum microcrystalline wax, min mp 73.8C.

“Cercor” [Corning]. TM for thin-walled, cellular ceramic structures that can be used for a wide range of high-temperature applications.

Use: Gaseous heat exchangers, burner plates, acoustics, flame arresting, filtering, and insulation.

cerebrosides. Derivatives of sphingosine in which the amino group is connected in an amide linkage to a fatty acid and the terminal hydroxyl group is connected to a molecule of sugar, usually galactose, in glycosidic linkage. They are found in brain and nervous tissue, usually in association with sphingomyelin.

“Ceresan” [Du Pont]. TM for a series of mercury compounds used as seed disinfectants.

ceresin wax. (purified ozocerite; earth wax; mineral wax; cerosin; cerin).

Properties: White or yellow, waxy cake; white is odorless, yellow has a slight odor. D 0.92–0.94, mp 68–72C. Soluble in alcohol, benzene, chloroform, naphtha; insoluble in water. Combustible.

Derivation: Purification of ozocerite by treatment with concentrated sulfuric acid and filtration through animal charcoal.

Grade: White, yellow.

Use: Candles, sizing, bottles for hydrofluoric acid, electrical insulation, shoe and leather polishes, impregnating and preserving agent, lubricating compounds, wood filler, floor polishes, antifouling paints, waxed papers, cosmetics, ointments, matrix compositions, waterproofing textile fabrics.

ceria. See ceric oxide; rare earth.

ceric ammonium nitrate. (cerium ammonium nitrate; ammonium hexanitratocerate).
 $Ce(NO_3)_4 \cdot 2NH_4NO_3$.

Properties: Small, prismatic, yellow crystals. Soluble in water and alcohol; almost insoluble in concentrated nitric acid; soluble in other concentrated acids.

Derivation: By electrolytic oxidation of cerous ni-

trate in nitric acid solution and subsequently mixing solutions of cerium nitrate and ammonium nitrate followed by crystallization.

Hazard: Strong oxidizer, dangerous fire risk in contact with organic materials.

Use: Analytical chemistry, oxidant for organic compounds, polymerization catalyst for olefins, scavenger in the manufacture of azides.

ceric hydroxide. (ceric oxide, hydrated; cerium hydrate). $\text{CeO}_2 \cdot x\text{H}_2\text{O}$.

Properties: Whitish powder when pure. Commercially a hydrated oxide containing 85–90% ceric oxide. Soluble in concentrated mineral acids; insoluble in water.

Derivation: By treating a solution of a ceric salt with strong alkali. Reagent grade is prepared by adding a saturated solution of ceric ammonium nitrate to an excess of ammonium hydroxide.

Grade: Commercial, high purity, reagent.

Use: Production of cerium salts and ceric oxide, opacifier in glasses and enamels (imparts yellow color), shielding glass.

ceric oxide. (cerium dioxide; cerium oxide; ceria). CeO_2 .

Properties: Pale-yellow, heavy powder (white when pure). Commercial product is brown. D 7.65, mp 2600C. Soluble in sulfuric acid; insoluble in water and dilute acid. Requires reducing agent with acid to dissolve the anhydrous oxide. Noncombustible.

Derivation: By decomposition of cerium oxalate by heat. Hardness depends on firing temperature.

Grade: Technical, high purity (99.8%).

Use: Ceramics; abrasive for glass polishing; opacifier in photochromic glasses; retarder of discoloration in glass, especially radiation shielding and color TV tubes; catalyst; enamels and ceramic coatings; phosphors; cathodes; capacitors; semiconductors; refractory oxides; diluent in nuclear fuels; heat stabilizer (alumina catalyst).

ceric sulfate. (cerium sulfate). $\text{Ce}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White or reddish-yellow crystals. D 3.91. Soluble in water (decomposes); soluble in dilute sulfuric acid. Strong oxidizer.

Derivation: Action of sulfuric acid on cerium carbonate.

Hazard: Fire risk in contact with organic materials.
Use: Dyeing and printing textiles, analytical reagent, waterproofing, mildew-proofing.

ceric sulfide. (cerium sulfide). A high-temperature thermoelectric material that is stable and efficient up to 1100C.

cerin. See ceresin wax.

ceritamic acid. See ascorbic acid.

cerite. A rare-earth ore found chiefly in Sweden. A minor source of cerium.

cerium.

CAS: 7440-45-1. Ce. A rare-earth element of the lanthanide group of the periodic table. Atomic number 58, aw 140.12, valences 3, 4. Four stable isotopes.

Properties: Gray, ductile, highly reactive metal. D 6.78, mp 795C, bp 3257C. Attacked by dilute and concentrated mineral acids and by alkalis. Readily oxidizes in moist air at room temperature. It has four allotropic forms. It is the second most reactive rare-earth metal. Cerium forms alloys with other lanthanides (see misch metal); it also forms a nonmetal with hydrogen, as well as carbides and intermetallic compounds. Decomposes water.

Source: Cerite (Sweden), bastnasite (California, New Mexico), monazite (beach sands in Florida, Brazil, India, South Africa).

Derivation: Chemical processing and separation of ores.

Grade: Granules, ingots, rods (99.9% pure).

Hazard: May ignite on heating to 300F (148.9C). Strong reducing agent.

Use: Cerium salts, cerium-iron pyrophoric alloys, ignition devices, military signaling, illuminant in photography, reducing agent (scavenger), catalyst, alloys for jet engines, solid-state devices, rocket propellants, getter in vacuum tubes, diluent in plutonium nuclear fuels.

See misch metal.

Note: Cerium compounds have been found to have antiknock properties, e.g., cerium (2,2,6,6-tetramethyl-3,5-heptanedionate).

cerium-141. Radioactive cerium of mass number 141.

Properties: Half-life 21.5 days; radiation β and γ .
Derivation: From cerium-140 by capture of a neutron and emission of a γ photon.

Available forms: CeCl_3 in hydrochloric acid solution.

Hazard: Radioactive poison.

Use: Biological and medical research.

cerium-ammonium nitrate. See ceric ammonium nitrate.

cerium carbonate. See cerous carbonate.

cerium chloride. See cerous chloride.

cerium dioxide. See ceric oxide.

cerium hydrate. See ceric hydroxide; cerous hydroxide.

cerium naphthenate.

Properties: A rubbery material, very difficult to dry. Almost insoluble without small quantities of organic stabilizers.

Derivation: By saponifying naphthenic acids and treating the sodium naphthenate formed with a suitable cerium salt. The commercial product is a mixture of rare-earth soaps.

Use: See soap (2).

cerium nitrate. See cerous nitrate.

cerium oxalate. See cerous oxalate.

cerium oxide. See ceric oxide.

cerium sulfate. See ceric sulfate; cerous sulfate.

cermet. (ceramic + metal). A semisynthetic product consisting of a mixture of ceramic and metallic components having physical properties not found solely in either one alone, e.g., metal carbides, borides, oxides, and silicides. They combine the strength and toughness of the metal with the heat and oxidation resistance of the ceramic material. The composition may range from predominantly metallic to predominantly ceramic; e.g., SAP sintered aluminum contains 85% aluminum and 15% Al_2O_3 . The most important industrial cermets are titanium carbide-based, aluminum oxide-based, and special uranium dioxide types. Cermets are made by powder metallurgy techniques involving use of bonding agents such as tantalum, titanium, and zirconium. High stress-to-rupture rate; operate continuously at 982C, for short periods at 2200C.

Use: Gas turbines; rocket motor parts; turbojet engine components; nuclear fuel elements; coatings for high-temperature resistance; sensing elements in instruments; seals; bearings, etc.; in special pumps and other equipment.

“Cer-O-Cillin” [Pfizer]. TM for an antibacterial substance that differs from penicillin G in that the benzyl group is replaced with an allylmercapto-methyl group. In concentrations up to 500,000 units per cc in sterile water for injection, sterile sodium chloride for injection, or sterile 5% dextrose.

Use: Medicine.

“Cerophyl” [Isp Europe]. TM for a lipid analogue that delivers long lasting moisture to rinsed off hair products.

cerosin. See ceresin wax.

cerotic acid. (hexacosanoic acid; cerinic acid). $CH_3(CH_2)_{24}COOH$. A fatty acid obtained from beeswax, carnauba wax, or Chinese wax.

Properties: White, odorless crystals or powder. D 0.8198 (100/4C), mp 87.7C, refr index 1.4301 (100C). Insoluble in water; soluble in alcohol, benzene, ether, acetone. Combustible.

cerous carbonate. (cerium carbonate).

Properties: White powder. Soluble in mineral acids (dilute); insoluble in water.

Derivation: By adding an alkali carbonate to a solution of a cerous salt.

cerous chloride. (cerium chloride).

Properties: White crystals. Deliquescent, d 3.88 (anhydrous), mp 848C (anhydrous), bp 1727C. Soluble in water, alcohol, and acids.

Derivation: Action of hydrochloric acid on cerium carbonate or hydroxide.

Use: Incandescent gas mantles, spectrography, preparation of cerium metal, polymerization catalyst.

cerous fluoride. (cerium fluoride).

Properties: Off-white powder. D 6.16 (anhydrous), mp 1460C, bp 2300C. Insoluble in water and acids.

Derivation: By treating cerous oxalate with hydrofluoric acid.

Hazard: An irritant. TLV: (F) 2.5 mg/m³.

Use: In arc carbons to increase their brilliance; preparation of cerium metal.

cerous hydroxide. (cerium hydrate). Approximate formula $Ce(OH)_3$.

Properties: White, gelatinous precipitate; yellow, brown, or pink when impurities are present. Soluble in acids; insoluble in water and alkali.

Derivation: Chief source is monazite sand.

Grade: Pure, crude.

Use: Pure form: to produce cerium salts, impart yellow color to glass, opacifying agent in glazes and enamels. Crude form: flaming arc lamp.

cerous nitrate. (cerium nitrate).

Properties: Colorless crystals, deliquescent. Mp loses 3H₂O at 150C; bp (decomposes at 200C). Soluble in water, alcohol, and acetone.

Derivation: Action of nitric acid on cerous carbonate.

Hazard: Strong oxidizer, fire risk in contact with organic materials.

Use: Separation of cerium from other rare earths, catalyst for hydrolysis of phosphoric acid esters.

cerous oxalate. (cerium oxalate).

Properties: Yellowish-white crystalline powder; odorless; tasteless. Decomposes on heating. Soluble in dilute sulfuric and hydrochloric acids; insoluble in water, oxalic acid solution, alkalies, alcohol, and ether.

Derivation: By extraction from monazite sand with oxalic or hydrochloric acid and conversion into the oxalate, followed by crystallization.

Grade: Pure; the commercial product is a complex mixture of oxalates of cerium, lanthanum, and didymium.

Hazard: Toxic by ingestion.

Use: Medicine, isolation of cerium metals.

cerous sulfate. (cerium sulfate).

Properties: White crystals or powder. Mp 630C (dehydrated), d 2.886. Soluble in water and acids.

Derivation: Reagent grade is prepared by reducing a solution of ceric sulfate in sulfuric acid with hydrogen peroxide.

Grade: Technical and purified (reagent).

Use: Developing agent for aniline black.

certified color. See food color; FD&C colors.

cerulean blue. A light-blue pigment, essentially cobaltous stannate, $\text{CoO} \cdot x(\text{SnO}_2)$.

cerulein. See caerulein.

cerussite. PbCO_3 . Natural lead carbonate, found in the upper zone of lead deposits.

Properties: Colorless, white, gray, adamantine luster. Mohs hardness 3–3.5, d 6.55. Effervesces in nitric acid.

Occurrence: Colorado, Arizona, New Mexico, Idaho, Australia, Europe.

Use: An ore of lead.

“Cer-Vit” [Owens-Corning]. TM for a glass ceramic having linear expansion coefficient near zero. Used for specialty products, such as telescope mirrors, where minimum distortion is essential.

ceryl alcohol. $\text{C}_{26}\text{H}_{53}\text{OH}$. An alcohol obtained from Chinese insect wax.

Properties: Colorless crystals. Mp 79C. Insoluble in water; soluble in alcohol and ether. Combustible.

ceryl cerotate. $\text{C}_{26}\text{H}_{53}\text{OOC}\text{C}_{25}\text{H}_{51}$. The chief constituent of Chinese insect wax and typical of natural waxes. Colorless crystals with mp 84C.

CES. Abbreviation for cyanoethyl sucrose.

cesium. (caesium).

CAS: 7440-46-2. Cs. An alkali-metal element of group IA of the periodic table, atomic number 55, aw 132.9054, valence 1. No stable isotopes.

Properties: Liquid at slightly greater than room temperature, soft solid below the melting point. Highly reactive. Decomposes water with evolution of hydrogen, which ignites instantly. Also reacts violently with oxygen, the halogens, sulfur, and phosphorus with spontaneous ignition and/or explosion. D 1.90, mp 28C, bp 705C, Mohs hardness 0.2. Cesium has the highest position in the electromotive series; it also has the lowest melting point of any alkali metal and the lowest ionization potential of any element. Soluble in acids and alcohol.

Derivation: By thermochemical reduction of cesium chloride with calcium or by electrolysis of the fused

cyanide. Its chief ore is pollucite, found in Maine, South Dakota, Manitoba, Elba, South Africa.

Grade: Technical, 99.9%.

Hazard: Dangerous fire and explosion risk, ignites spontaneously in moist air, may explode in contact with sulfur or phosphorus, reacts violently with oxidizing materials, causes burns in contact with skin.

Use: Photoelectric cells, getter in vacuum tubes, hydrogenation catalyst, ion propulsion systems, plasma for thermoelectric conversion, atomic clocks, rocket propellant, heat-transfer fluid in power generators, thermochemical reactions, seeding combustion gases for magnetohydrodynamic generators.

cesium-137. Radioactive cesium of mass number 137.

Properties: Half-life 33 years; radiation β .

Hazard: Radioactive poison. The β decay of ^{137}Cs produces ^{137}Ba , which in turn is radioactive, emitting a 0.662 Mev γ ray with a 2.6 min half-life.

Use: Most applications of ^{137}Cs depend on the fact that any ^{137}Cs preparation has an equivalent amount of the γ -emitting ^{137}Ba daughter. Approved for sterilization of wheat, flour, potatoes, and sewage sludge.

cesium alum. See cesium aluminum sulfate.

cesium aluminum sulfate. (cesium alum).

Properties: Colorless crystals. D 2.0215, mp 117C. Soluble in water; insoluble in alcohol.

Derivation: By adding a solution of cesium sulfate to a solution of potassium alum, concentrating, and crystallizing.

Grade: Pure.

Use: Mineral waters, purification of cesium by fractional crystallizing, preparation of cesium salts.

cesium antimonide.

Hazard: Toxic by ingestion.

Use: As a high-purity binary semiconductor.

cesium arsenide.

Hazard: See arsenic and cesium.

Use: As a high-purity binary semiconductor.

cesium bromide. CsBr .

Properties: Colorless, crystalline powder. D 4.44, mp 636C, bp 1300C. Soluble in water; slightly soluble in alcohol.

Grade: Technical, single crystals.

Use: Crystals for infrared spectroscopy, scintillation counters, fluorescent screens.

cesium carbonate. Cs_2CO_3 .

Properties: White, hygroscopic, crystalline powder. Very stable. Can be heated to high temperature without loss of CO_2 . Soluble in water, alcohol, and ether.

Derivation: By passing carbon dioxide into a solution of cesium hydroxide and subsequent crystallization.

Use: Brewing, mineral waters, ingredient of specialty glasses, polymerization catalyst for ethylene oxide.

cesium chloride. CsCl.

Properties: Colorless crystals. D 3.972, mp 646C, sublimes at 1290C. Soluble in water and alcohol; insoluble in acetone.

Derivation: Action of hydrochloric acid on cesium oxide and crystallization.

Grade: Pure; low optical density; single crystals.

Use: Brewing; preparation of other cesium compounds; mineral waters; evacuation of radio tubes (positive ions supplied at surface of filament); for a density gradient in ultracentrifuge separations; fluorescent screens; contrast medium.

cesium dioxide. Cs₂O₂.

Properties: Yellow needles. D 4.25, mp 400C, decomposes at 650C. Soluble in water and acids.

Grade: Technical, pure.

Use: Cesium salts.

cesium fluoride.

CAS: 13400-13-0. CsF.

Properties: Deliquescent crystals. D 4.115, mp 682C, bp 1251C. Very soluble in water; soluble in methanol, insoluble in dioxane and pyridine.

Grade: 99% min, single crystals.

Hazard: A poison. TLV: (F) 2.5 mg/m³.

Use: Optics, catalysis, specialty glasses.

cesium hexafluorogermanate. Cs₂GeF₆.

Properties: White, crystalline solid. Mp approximately 675C, d 4.10. Slightly soluble in cold water and acids; very soluble in hot water.

Hazard: An irritant; see fluorides.

cesium hydrate. See cesium hydroxide.

cesium hydroxide. (cesium hydrate).

CAS: 21351-79-1. CsOH.

Properties: Colorless or yellowish, fused, crystalline mass. Strong alkaline reaction. Hygroscopic. Keep well stoppered. D 3.675, mp 272.3C. Very soluble in water. The strongest base known.

Derivation: By adding barium hydroxide to an aqueous solution of cesium sulfate.

Grade: Technical, 50% aqueous solution.

Hazard: A poison. TLV: 2 mg/m³.

Use: Recommended as electrolyte in alkaline storage batteries at subzero temperatures, polymerization catalyst for siloxanes.

cesium iodide. CsI.

Properties: Colorless, crystalline powder. Deliquescent. D 4.510, mp 621C, bp 1280C. Soluble in alcohol and water.

Grade: Technical, single crystals.

Use: Crystals for infrared spectroscopy, scintillation counters, fluorescent screens.

cesium nitrate.

CAS: 7789-18-6. CsNO₃.

Properties: Crystalline powder, saltpeter taste. D 3.687, mp 414C, bp (decomposes). Soluble in water and acetone; slightly soluble in alcohol.

Derivation: Action of nitric acid on cesium oxide and crystallization.

Grade: Pure, 99.0% min.

Hazard: Dangerous, may ignite organic materials on contact.

Use: Cesium salts.

cesium oxide. Cs₂O.

Properties: Orange-red crystals. D 4.36, mp 360–400C (decomposes). Very soluble in water; soluble in acids.

Grade: Technical, pure.

Use: Cesium salts.

cesium pentachlorocarbonylsmium(III).

Properties: Orange-red crystal. Air stable. Slightly soluble in water, hydrochloric acid; and insoluble in organic solvents.

cesium pentachloronitrosylsmium(II).

Properties: Dark-red crystals. Air-stable, sparingly soluble in water.

Use: Starting material for other cesium nitrosyl complexes.

cesium perchlorate. CsClO₄.

Properties: Crystals. D 3.327 (4C), mp 250C (decomposes). Soluble in water (much more in hot than cold); slightly soluble in alcohol and acetone.

Grade: 99% min.

Hazard: Dangerous fire risk, strong oxidizing agent, may ignite organic materials on contact.

Use: Optics, catalysis, specialty glasses, power generation.

cesium peroxide. See cesium tetroxide.

cesium phosphide.

Hazard: Fire risk by decomposition to phosphine, which is very toxic.

Use: As a high-purity binary semiconductor.

cesium sulfate. Cs₂SO₄.

Properties: Colorless crystals. D 4.2434, mp 1010C. Soluble in water; insoluble in alcohol.

Derivation: Action of sulfuric acid on cesium carbonate.

Grade: Pure; low optical density.

Use: Brewing, mineral waters, for density gradient in ultracentrifuge separation.

cesium tetroxide. (cesium peroxide). Cs₂O₄.

Properties: Yellow crystals. D 3.77, mp 600C. Decomposes violently in water; soluble in acids. Strong oxidizing agent.

Hazard: Fire risk in contact with organic materials.

cesium trioxide. Cs_2O_3 .

Properties: Chocolate-brown crystals. D 4.25, mp 400C, decomposes in water. Soluble in acids.

cetalkonium chloride (USAN). (cetyldimethylbenzylammonium chloride; benzylhexadecyldimethylammonium chloride). $\text{C}_{16}\text{H}_{33}\text{CH}_2\text{N}(\text{CH}_3)_2(\text{C}_{16}\text{H}_{33})\text{Cl}$. A quaternary ammonium germicide.

Properties: Colorless crystalline powder; odorless. Mp 58–60C. Soluble in water to form colorless; odorless solution with pH 7.2. Compatible with alkalies and antihistamines. Soluble in alcohol, acetone, esters, carbon tetrachloride.

Use: Germicide, fungicide, surface-active agent, mildew preventive.

cetane. See *n*-hexadecane.

cetane number. A rating for diesel fuel comparable to the octane-number rating for gasoline. It is the percentage of cetane ($\text{C}_{16}\text{H}_{34}$) that must be mixed with heptamethylnonane to give the same ignition performance under standard conditions as the fuel in question.

cetaryl alcohol. See "Lanette O" [*Henkel*].

cetene. See 1-hexadecene.

cetin. (cetyl palmitate; palmitic acid cetyl ester). $\text{C}_{15}\text{H}_{31}\text{COOC}_{16}\text{H}_{33}$.

Properties: White, crystalline, waxlike substance. Chief constituent of commercial purified spermaceti. Mp 50C, bp 360C, d 0.832, refr index 1.4398 (70C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By solution from spermaceti.

Use: Base for ointments, cerates and emulsions, manufacture of candles, soaps, etc.

cestrimonium pentachlorophenoxide.

$\text{C}_{25}\text{H}_{42}\text{Cl}_5\text{NO}$. A crystalline solid melting at 68C, used as a fungicide and as preservative for agricultural products.

cetyl alcohol. (alcohol C-16; cetylic alcohol; 1-hexadecanol, normal; primary hexadecyl alcohol; palmityl alcohol). CAS: 36653-82-4. $\text{C}_{16}\text{H}_{33}\text{OH}$. A fatty alcohol. Combustible.

Properties: White, waxy solid; faint odor. D 0.8176 (49.5C), mp 49.3C, bp 344C, refr index 1.4283 (79C). Partially soluble in alcohol and ether; insoluble in water.

Derivation: By saponifying spermaceti with caustic alkali, reduction of palmitic acid.

Method of purification: Crystals, distillation.

Grade: Technical, cosmetic, NF.

Use: Perfumery, emulsifier, emollient, foam stabilizer in detergents, face creams, lotions, lipsticks, toilet preparations, chemical intermediate, detergents,

pharmaceuticals, cosmetics, base for making sulfonated fatty alcohols, to retard evaporation of water when spread as a film on reservoirs or sprayed on growing plants.

c-cetylbetamine. An amphoteric product showing cationic properties in acid solutions, anionic properties in alkaline solutions.

Use: Alkalone peroxide bleaching systems.

cetyl bromide. $\text{C}_{16}\text{H}_{33}\text{Br}$.

Properties: Dark-yellow liquid. Fp 15C, bp 186–197C (10 mm Hg), d 0.991 (25/25C), w/gal 8.25 lb (25C), refr index 1.460 (25C), flash p 350F (176C). Soluble in ether; very slightly soluble in water and methanol. Combustible.

Use: Synthesis.

cetyldimethylbenzylammonium chloride.

See cetalkonium chloride.

cetyldimethylethylammonium bromide.

$\text{C}_{16}\text{H}_{33}(\text{CH}_3)_2\text{H}_5\text{NBr}$. A quaternary ammonium salt.

Properties: Paste.

Use: Disinfectant, deodorant, germicide, fungicide, detergents.

cetyldimethylethylammonium chloride.

$\text{C}_{16}\text{H}_{33}(\text{CH}_3)_2\text{C}_2\text{H}_5\text{NCl}$. A quaternary ammonium salt.

cetylic acid. See palmitic acid.

cetylic alcohol. See cetyl alcohol.

cetyl mercaptan. (hexadecyl mercaptan).

$\text{C}_{16}\text{H}_{33}\text{SH}$.

Properties: Liquid; strong odor. Fp 18C, bp 185–190C (7 mm Hg), d 0.8474 (20/4C), refr index 1.474 (20C), flash p 275F (135C). Combustible. **Grade:** 95% (min) purity.

Use: Intermediate, synthetic-rubber processing, surface-active agent, corrosion inhibitor.

cetyl palmitate. See cetin.

cetyl pyridinium bromide. $\text{C}_{16}\text{H}_{33}\text{C}_5\text{H}_5\text{NBr}$. A quaternary ammonium compound.

Properties: Cream-colored, waxy solid. Soluble in acetone, ethanol, and chloroform.

Use: Germicide, deodorant, laboratory reagent, surfactant.

cetylpyridinium chloride. (Ceepryn; Cepacol; Cetanium; Dobendan; 1-hexadecylpyridinium chloride; Medilave; Pristacin; Pyrisept).

CAS: 123-03-5. $\text{C}_{21}\text{H}_{38}\text{ClN}\cdot\text{H}_2\text{O}$. A quaternary ammonium salt.

Properties: (Monohydrate) White powder. Mp 77–83C, surface tension (25C) 43 dynes/cm (0.1%

aqueous solution). Soluble in water, alcohol, chloroform; very slightly soluble in benzene and ether.
Use: Antibacterial in cough lozenges and syrups; emulsifier.

cetyltrimethylammonium bromide. (hexadecyltrimethylammonium bromide).

CAS: 57-09-0. $C_{16}H_{33}(CH_3)_3NBr$. A quaternary ammonium salt.

Properties: White powder. Soluble in water, alcohol and chloroform.

Grade: Technical.

Use: Surface-active agent, germicide.

cetyltrimethylammonium chloride.

$C_{16}H_{33}(CH_3)_3NCl$. A quaternary ammonium salt. See hexadecyltrimethylammonium chloride.

cetyltrimethylammonium tosylate.

$[C_{16}H_{33}(CH_3)_3N]OSO_2C_6H_4CH_3$. A high-temperature stable quaternary ammonium compound.

Use: Germicide, surfactant.

cetyl vinyl ether. (vinyl cetyl ether).

$C_{16}H_{33}OCH:CH_2$.

Properties: Colorless liquid. D 0.822 (27C), mp 16C, bp 142C (1 mm Hg), 173C (5 mm Hg), flash p 325F (162C) (OC), refr index 1.444 (25C). Combustible.

Grade: 97%.

Hazard: Toxic by inhalation, skin irritant. Reacts strongly with organic materials.

Use: Reactive monomer that may be copolymerized with a variety of unsaturated monomeric materials, including acrylonitrile, vinyl chloride, vinylidene chloride, and vinyl acetate to yield internally plasticized resins.

ceylon cinnamon bark oil. See cinnamon leaf oil.

Cf. Symbol for californium.

CF. Abbreviation for citrovorum factor. See folic acid.

“C-Fatty Acids” [Procter & Gamble].

TM for fatty acids derived from coconut oil. The major component acids are lauric and myristic. They differ primarily in amount of unsaturated acid components and color.

Properties: Light-yellow solids that liquefy at approximately 25C. Obtained from naturally occurring triglycerides. Combustible.

Use: Intermediate, rubber compounding, cosmetic ingredients, buffing compounds, alkyd resins, emulsifiers, grease manufacture, and candles.

CFE. Abbreviation for chlorotrifluoroethylene. Also used for polychlorotrifluoroethylene resins.

CFNP. See fluoronitrofen.

CGMP. (Current Good Manufacturing Practices). Refers to the body of regulations that describe the methods, equipment, facilities, and controls required for producing human and veterinary products, medical devices, and processed food.

cgs. Abbreviation of centimeter-gram-second, a system of measurement used internationally by scientists.

chabazite. $CaAl_2Si_4O_{12} \cdot 6H_2O$. Essentially a natural hydrated calcium aluminum silicate, usually containing some sodium and potassium. A zeolite.

Properties: White, reddish, yellow, or brown color; vitreous luster. D 2.1. Mohs hardness 4–5.

Occurrence: New Jersey, Colorado, Oregon, Europe.

Use: Water treatment.

Chadwick-Goldhaber effect. Dissociation of an atomic nucleus due to absorption of γ -rays.

Chadwick, Sir James. (1891–1974). A British physicist who was awarded the Nobel Prize in 1935 for his discovery of the neutron (1932), the existence of which had been predicted by Rutherford.

See neutron.

chain. A series of atoms of a particular element directly connected by chemical bonds, which constitutes the structural configuration of a compound. Such chains are usually composed of carbon atoms and are often shown without their accompanying hydrogen. Carbon chains may be of the following types:

(1) Open or straight chain: a sequence of carbon atoms extending in a direct line, characteristic of paraffins and olefins, the former being saturated

and the latter unsaturated:

(2) Branched chain: a linear series of carbon atoms occurring in paraffinic hydrocarbons and some alcohols that is isomeric with its straight chain counterpart and has a subordinate chain of one or more carbon atoms:

(3) Closed chain or ring: a cyclic arrangement of carbon atoms giving a closed geometric structure, i.e., a pentagon or other form, characteristics of alicyclic, aromatic, and heterocyclic compounds.

See cyclic compound. (4) Side chain: a group of atoms attached to one or more of the locations in a cyclic or heterocyclic compound, e.g., tryptophan:

chain initiation. The activation of one molecule in a mass of inert molecules subject to a chain reaction.

chain isomerization. Isomerization resulting from differences in arrangement of carbon atoms.

chain mechanism. See free radical.

chain reaction. See fission; nuclear energy.

chain stopper. A substance or event that stops the growth of a chain polymerization.

chain termination. The end of a chain reaction, when an activated molecule takes part in some reaction other than the one required to continue the chain.

chain transfer. The interruption of growth of a molecule chain by formation of a new radical that may act as a nucleus for forming a new chain.

chalcocite. (copper glance). Cu_2S . Natural cuprous sulfide, occurring with other copper minerals.

Properties: Lead-gray color, tarnishing dull black, metallic luster. D 5.5–5.8, Mohs hardness 2.5–3.

Occurrence: Montana, Arizona, Utah, Nevada, Alaska, Chile, Mexico, Europe.

Use: Important ore of copper.

chalcopyrite. (copper pyrites; yellow copper). CuFeS_2 . Natural copper-iron sulfide found in metallic veins and igneous rocks. Also made synthetically.

Properties: Yellow or bronze iridescent crystals with metallic luster and greenish streak. D 4.1–4.3, Mohs hardness 3.5–4. May carry gold or silver or mechanically intermixed pyrite.

Occurrence: Montana, Utah, Arizona, Tennessee, Wisconsin, Europe, Chile, Canada.

Use: Important ore of copper, semiconductor research.

chalk. A natural calcium carbonate composed of the calcareous remains of minute marine organisms. Decomposed by acids and heat. Odorless, tasteless.

See calcite; calcium carbonate; whiting; chalk, prepared.

chalk, drop. See chalk, prepared.

chalk, French. A variety of soapstone or steatite.

See talc.

chalking. A natural process by which paints develop a loose, powdery surface formed from the film. Chalking results from decomposition of the binder, due principally to the action of UV rays.

chalk, prepared. (drop chalk; calcium carbonate, prepared).

Properties: Fine, white to grayish-white impalpable powder; often formed in conical drops. Odorless; tasteless; stable in air. Mp (decomposes at 825°C with evolution of carbon dioxide). Decomposed by acids; practically insoluble in water; insoluble in alcohol. Noncombustible.

Derivation: By grinding native calcium carbonate to a fine powder, agitating with water, allowing the coarser particles to settle, decanting the suspension, and allowing the fine particles to settle slowly.

Use: Medicine (antacid), tooth powders, calcimine, polishing powders, silicate cements.

See whiting; calcium carbonate.

chamber acid. Sulfuric acid made by the chamber process; 50° Bé sulfuric acid (62.18%).

chamber process. An obsolete method for manufacturing sulfuric acid in lead-lined chambers from sulfur dioxide, air, and steam in the presence of NO_x as catalysts. It is no longer used in the U.S.

chamois. A very soft, flexible leather made from the flesh layer of a split sheepskin by treating with fish oils, piling in contact with similarly treated skins, and allowing the fish oils to oxidize.

Chance-Claus process. The process recovers sulfur from sulfide waste by treatment with carbon dioxide and oxidation of the resulting hydrogen sulfide with air in the presence of a catalyst.

channel black. See carbon black.

channeling. (1) Establishment of flow paths in a bed of solid particles through which a disproportionate quantity of the introduced liquid passes.

(2) The direct transfer of a reaction product from the active site of one enzyme directly to the active site of a different enzyme, where it serves as a substrate.

Channing's solution. (mercury potassium iodide).

Properties: Yellow prisms. Mw 620.47. Soluble in alcohol.

Use: Medicine.

Chapman rearrangement. Thermal rearrangement of aryl imidates to *N,N*-diaryl amides.

charcoal, activated. See carbon, activated.

charcoal, animal. See bone black.

charcoal, bone. See bone black.

charcoal, vegetable. See vegetable black; carbon, activated.

charcoal, wood. A highly porous form of amorphous carbon.

Derivation: Destructive distillation of wood.

Grade: Technical, in lumps, powder briquettes.

Hazard: Dangerous fire risk in briquette form or when wet. May ignite spontaneously in air.

Use: Chemical (precipitant in the cyanide process, precipitant of iodine and lead salts from their solutions, catalyst, calcium carbide); decolorizing and filtering medium; gas adsorbent; component of black powder and other explosives; fuel; arc-light electrodes; decolorizing and purifying oils; solvent recovery; deodorant.

Chardonnet, H. (1839–1924). A native of France, he has been called the father of rayon because of his successful research in producing what was then called artificial silk from nitrocellulose. He was able to extrude fine threads of this semisynthetic material through a spinnerette-like nozzle, and the textile product was made on a commercial scale in several European countries. He was awarded the Perkin medal for this work.

charge-coupled device. (CCD). A solid-state detector that is capable of generating a measurable electric charge after being struck by a single photon. It is used in small-molecule X-ray diffractometers.

charge-mass ratio. The ratio of change of electrified particle or ion to its mass, expressed usually as *e/m*.

Charles' law. At constant pressure, the pressure of a confined gas is proportional to its absolute temperature.

See Gay-Lussac's law.

Charpy. A standard testing device for impact strength.

Chattock gauge. A differential manometer that uses the pressure difference of two columns of liquid of nearly equal density.

chaulmoogra oil. (gynocardia oil; hydnocarpus oil).

Properties: Brownish-yellow oil or soft fat; characteristic odor; somewhat acrid taste. *D* 0.940; iodine value 85–105 (based on type), optically active. Solu-

ble in ether, chloroform, benzene, solvent naphtha; sparingly soluble in cold alcohol; almost entirely soluble in hot alcohol, carbon disulfide.

Chief constituents: Glycerides of chaulmoogric and hydnocarpic acids.

Use: Largely superseded for treatment of leprosy and other infective skin diseases.

chaulmoogric acid. (hydnocarpyl acetic acid).

$\text{CH}_2\text{CH}_2\text{CHCHCH}(\text{CH}_2)_{12}\text{COOH}$. A cyclic fatty acid.

Properties: Colorless, shiny leaflets. *Mp* 68.5°C. Soluble in ether, chloroform, and ethyl acetate.

Source: Chaulmoogra oil.

Use: Medicine, biochemical research.

Chauvin, Yves. (1930–). Born in France, Chauvin won the Nobel Prize for chemistry in 2005 for his pioneering work concerning the development of the metathesis method in organic synthesis. Chauvin received his degree from the Lyons School of Chemistry, Physics and Electronics in 1954. He is honorary research director at the Institut Francis du Petrole and a member of the French Academy of Science.

chavicol. (*p*-allylphenol; 1-allyl-4-hydroxybenzene). $\text{C}_9\text{H}_8\text{O}$.

Properties: Liquid. *Mp* 16°C, *bp* 230°C, *d* 1.033 (18/4°C). Soluble in water and alcohol. Occurs in many essential oils.

CHDM. See 1,4-cyclohexanedimethanol.

checking. Development of small cracks in the surface of a material such as rubber, paint, or ceramic glaze.

“Chel” [Novartis]. TM for chelating agents based on polyaminocarboxylic acids.

Use: To reduce the harmful effects of trace metals in the blood.

chelate. The type of coordination compound in which a central metal ion such as Co^{2+} , Ni^{2+} , Cu^{2+} , or Zn^{2+} is attached by coordinate links to two or more nonmetal atoms in the same molecule, called ligands. Heterocyclic rings are formed with the central (metal) atom as part of each ring. Ligands offering two groups for attachment to the metal are termed *bidentate* (two-toothed); three groups, *tridentate*; etc. A common chelating agent is ethylenediaminetetraacetic acid (EDTA). Nitrilotriacetic acid $\text{N}(\text{CH}_2\text{COOH})_3$ and ethyleneglycol-bis(β -aminoethyl ether)-*N,N*-tetraacetic acid $(\text{HOOCCH}_2)_2\text{NCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2$ are used in analytical chemical titrations and to remove ions from solutions and soils. Metal chelates are found in biological systems, e.g., the iron-binding porphyrin group of hemoglobin and the magnesium-

binding chlorophyll of plants. Medicinally, metal chelates are used against Gram-positive bacteria, fungi, viruses, etc.

See ammine; sequestration.

“**Chem-Hoe**” [PPG]. TM for isopropyl-*N*-phenylcarbamate (IPC). A selective herbicide.

Chemical Abstracts. A weekly publication of the American Chemical Society that consists of research articles and patents in all major fields of chemistry throughout the world. It is completely computerized, including the ability to draw chemical structures as the basis for a search of the database, and available in various forms from several computerized services. It is the most indispensable information source in chemical literature and is the largest scientific abstract journal in the world. For further information, see Appendix II.

Chemical Abstracts Service. Division of the American Chemical Society responsible for the production of Chemical Abstracts.

See *Chemical Abstracts*.

chemical bond. See bond, chemical.

chemical change. Rearrangement of the atoms, ions, or radicals of one or more substances resulting in the formation of new substances often having entirely different properties. Such a change is called a chemical reaction. In some cases, energy in the form of heat, light, or electricity is required to initiate the change; then the reaction is called endothermic. When energy is given off as a result of rupture of chemical bonds, the change is said to be exothermic. Chemical changes should be distinguished from physical changes, in which only the state or condition of a substance is modified, its chemical nature remaining the same. A physicochemical change has some of the characteristics of both. Examples of the three types are

Chemical Changes

fuel + oxygen → CO₂ + water + heat (exothermic)

water + CO₂ + energy → sugar + oxygen (endothermic)

Physical Changes

water to ice or steam; crystallization; coagulation of latex distillation processes

Physiochemical Changes

cooking of food, vulcanization of rubber, tanning of leather, drying of oil- or plastic-based paints.

chemical data storage. The recording, coding, storage, and retrieval of chemical information. Early methods involved the use of punched-card systems, of which there were several types. The advent of digital computers made it possible to store

and retrieve such data as molecular structure, physical and chemical properties, and other relevant facts with much greater efficiency. The state of the art in chemical documentation is the sophisticated and extensive information bank assembled by Chemical Abstracts Service, a division of ACS. It features on-line call-up and display of the most complex organic formulas and property data for more than 12 million compounds. Personal computers are used for laboratory instrument control, data collection, and analysis.

chemical dating. Estimation of the age of geologic structures and events by measuring the amount of radioactive decay products in existing samples. The age of a uranium-containing material can be determined by measuring the percentage of lead (or helium) formed as a result of disintegration of the uranium. Uranium decays to both helium and the 206 lead isotope, but measurement of helium content is inaccurate because of its strong tendency to escape. By determining the ratio of the percentage of lead in a sample to the percentage of uranium, the age can be calculated. A more recent method, applicable to events within about 10,000 years, involves the use of the natural radioactive carbon isotope (¹⁴C). The percentage of this isotope determined in a carefully prepared sample is an index of its age, based on the half-life of ¹⁴C (5700 years), which was present in the atmospheric carbon dioxide absorbed by plants centuries ago. This method has yielded valuable results in the study of archaeological specimens, deep-sea sedimentation, and dates of volcanic and glacier activity.

chemical deposition. The precipitation of one metal from a solution of one of its salts by adding to it another metal higher in the electromotive series or a reducing agent.

chemical economics. The principles and practical application of industrial economics, in particular reference to the manufacture of chemicals and chemically derived products. Economic factors that apply mainly to the chemical industries are (1) heavy capital investment; (2) vast range of raw materials and products; (3) complex and varied production methods; (4) high-level R & D for new products, plus extensive testing for safety and acceptability; (5) market research to develop new product uses, etc.; (6) substitution of synthetics for natural products or (in some cases) the reverse; (7) utilization of by-product materials; (8) waste reclamation and pollution control.

See chemical process industry.

chemical education. The instruction and training of students at secondary, college, and graduate levels in both the theoretical and practical aspects of chemistry. Well-balanced courses include a substantial amount of laboratory experimentation in addition to lectures and textbook study. Comprehen-

sive one-year courses are offered by most colleges for nonscience majors. The more advanced curricula emphasize quantum-mechanical and thermodynamic considerations, stoichiometry, and spectroscopy. Mechanical models of molecular structure are useful in teaching organic chemistry. A few schools provide courses in industrial chemistry. Student employment in a chemical process plant for part of the semester has proved successful. Tape recordings of symposia, analytical methods and lectures in general chemistry, as well as a broad group of high-level short courses in special subjects are offered by the ACS, which also sponsors radio broadcasts on topics of popular interest in chemistry. The field is well served by two publications—the *Journal of Chemical Education* and *Chemistry*. Among the leaders in the development of chemical education may be mentioned Ira Remsen, James B. Conant, Gilbert N. Lewis, Louis Fieser, Roger Adams, and Joel Hildebrand. In recent years, the pervasive influence of computer technology has penetrated almost all of the physical sciences. Thus basic training in its applications to chemistry has become an essential adjunct to chemical education. The publication of data and scientific papers on the World Wide Web and collaboration via the Internet is of increasing importance.

See chemical literature; model; computational chemistry.

chemical efficiency. The output of a process divided by its net input.

chemical energy. The energy given off in a chemical reaction.

chemical engineering. That branch of engineering concerned with the production of bulk materials from basic raw materials by large-scale application of chemical reactions worked out in a laboratory. The unit operations of chemical engineering are those common to all chemical processing: fluid flow, heat transfer, filtration, evaporation, distillation, drying, mixing, adsorption, solvent extraction, and gas absorption, based on the fundamentals involved in every technical problem in chemical engineering: conservation, equilibrium, kinetics, and control. Conservation involves the laws of the conservation of matter and energy. The limits of any chemical process are established by its equilibrium conditions. The principles underlying the equilibrium concept (the law of mass action) are of fundamental importance (see chemical laws). Kinetics means time-dependent processes or rate processes (momentum, thermal, mass transfer, and chemical kinetics). Control involves either the systems approach or feedback or closed-loop methods, as well as considerations of the stability of the system. See equilibrium constant; stoichiometry; kinetics, chemical.

chemical equation. A representation of a chemical reaction using symbols to show the weight relationship between the reacting substances and the products.

chemical equivalent. (1) The atomic weight of an element divided by its valence. (2) The number of parts by weight of an element or radical that will combine with or displace eight parts by weight of oxygen or one part by weight of hydrogen. (3) The molecular weight of a salt divided by the valence of the particular element considered.

chemical fallout. Pollution that results from chemicals in the air being deposited on land or water surfaces.

chemical flooding. A method of enhanced oil recovery in which a mixture of detergents, alcohols, and other solvents is pumped into the porous oil-bearing strata, followed by much brine, which furnishes the pressure necessary to drive the mixture through the rocky structure. Field tests show this process to be no more than 50% efficient, and it will probably not be important in secondary oil recovery for some years. Another technique, called micellar flooding, involves the use of surfactants and a mixture of water and a high polymer. It is a two-step process: the surfactants (petroleum sulfonate and alcohol) are injected into the oil-bearing strata, followed by the water-polymer mixture. Volumes of these materials are required.

See hydraulic fracturing.

chemical force microscopy. A technique in which specific chemical groups are attached to the probe tip of an atomic force microscope.

Use: Study of adhesion and lubrication; mapping functional group microstructure in polymers and binding-recognition interactions in biological systems.

See: atomic force microscopy; scanning tunneling microscope.

chemical laws. A group of basic principles governing the combining power and reaction characteristics of elements. Among the more important are: (1) Law of mass action: the rate of a homogeneous (uniform) chemical reaction at constant temperature is proportional to the concentration of the reacting substances.

(2) Law of definite or constant composition: any chemical compound contains the same elements in the same fixed proportions by weight. Exceptions to this law occur in solid compounds, such as silicates, that are known as nonstoichiometric compounds.

(3) Law of multiple proportions: when two elements unite to form two or more compounds (e.g., nitrogen and oxygen can form five different oxides), the weight of one element that combines with a given weight of the other is in the ratio of small whole numbers. Hydrogen and oxygen unite in the ratio of

1 to 8 in water and of 1 to 16 in hydrogen peroxide. Thus, the weights of oxygen that unite with 1 g of hydrogen are in the ratio of 1 to 8.

(4) Law of conservation of mass: any chemical reaction between two or more elements or compounds leaves the total mass unchanged, the reaction products having exactly the same mass as present in the reactants, regardless of the extent to which other properties are changed.

(5) Law of Avogadro: equal volumes of gases at constant temperature and pressure contain the same number of molecules whether the gases are the same or different. 22.4 L of any gas contains 6.02×10^{23} molecules. See Avogadro's law; mole.

chemical literature. Worldwide chemical information available in the form of journals, patents, and books (handbooks, dictionaries, encyclopedias, reports of conferences and symposia, review volumes, research treatises, and textbooks). The output of journal articles has increased almost exponentially in the last 70 years. Of major importance in making this information explosion available to scientists are the abstract journals, particularly *Chemical Abstracts*, described in Appendix II. Outstanding among periodicals is the *Journal of the American Chemical Society*, in which more than 2000 articles appear yearly. Hundreds of other journals throughout the world add to the vast stream of chemical literature. In book form, there are four monumental multivolume compendia (the dates are for the original edition, but in most cases there have been several revisions): Abegg and Gmelin's *Handbuch der Anorganischen Chemie* (1870), Beilstein's *Handbuch der Organischen Chemie* (1881), Mellor's *Inorganic and Theoretical Chemistry* (1922), and Hilbron's *Dictionary of Organic Compounds* (approximately 1920). Other noteworthy reference sources are *Merck Index* (1889), *Handbook of Chemistry and Physics* (1918), Lange's *Handbook of Chemistry* (1934), *Chemical Engineers Handbook* (1934), *Ring Index* (1940), Hackh's *Chemical Dictionary* (1929), and Kirk-Othmer's *Encyclopedia of Chemical Technology* (1947). The ACS Monograph Series, established in 1919, is devoted to high-level treatises in developing areas of chemistry. Many useful series of "Advances," reviewing progress in specific fields, have appeared from time to time. Many of these publications are available for computerized information retrieval.

See chemical education.

chemically pure. (CP). Refers to an element or compound that has been purified for fine chemical work.

"Chemical Mace" [Mace]. See "Mace."

chemical microscopy. See microscopy, chemical.

chemical milling. The process of producing metal parts of predetermined dimensions by removing metal from the surface with chemicals. Acid or alkaline pickling or etching baths are used for this purpose. Immersion of a metal part will result in uniform removal of metal from all surfaces exposed to the solution. This is used by the aircraft industry for weight reduction of large parts. It is also used in the manufacturing of instruments and other components where exact tolerances are required.

chemical nomenclature. The origin and use of the names of elements, compounds, and other chemical entities, as individuals and as groups, as well as various proposals for systematizing them. It may be considered to include three major aspects: (1) the gradual sporadic development of these names, which may go back to the alchemists of the Middle Ages; (2) the proliferation of terminology due to rapid extension of organic chemistry in the mid-19th century, which led to the recommendations of the Geneva System in 1892; (3) the additional reforms adopted by the International Union of Pure and Applied Chemistry in 1930. There is yet no clear-cut elimination of the older names, in spite of changes introduced in these reformed systems. Thus, present nomenclature is in some respects a hybrid; for example, the earlier terms *paraffin* and *olefin* are still widely used instead of the more modern *alkane* and *alkene*, and *methyl alcohol* is still in common use for *methanol*. A comparatively recent development in the nomenclature of inorganic and complex compounds is use of the Stock system, in which Roman numerals indicate the oxidation state or coordination value. For example, iron(II) chloride stands for ferrous chloride (FeCl_2), and iron(III) chloride for ferric chloride (FeCl_3).

See Geneva System; benzene.

chemical oxygen demand. (COD). Refers to the amount of oxygen, expressed in parts per million, consumed under specified conditions in the oxidation of the organic and oxidizable inorganic matter contained in an industrial wastewater, corrected for the influence of chlorides.

See oxygen consumed.

chemical planetology. Application of various branches of chemistry (analytical, physical, and geochemistry) to study the composition of the surface and atmosphere of the planets, mainly Venus, Mars, and Jupiter. Much information has been obtained by spectrographic methods, and valuable additional data have resulted from space probes.

See astrochemistry.

chemical potential. The rate at which the total free energy of a phase in a system changes as the amount of a particular component changes, keeping pressure, temperature, and amounts of all other components of the phase the same.

chemical process industry. An industry whose products result from (1) one or more chemical or physicochemical changes; (2) extraction, separation, or purification of a natural product with or without chemical reactions; (3) preparation of specifically formulated mixtures of materials, either natural or synthetic. Examples are as follows (with allowance for some overlapping): (1) the plastics, rubber, leather, food, dye, and synthetic organic industries; (2) the petroleum, paper, textile, and perfume industries. (3) Many of these involve one or more unit operations of chemical engineering, as well as such basic processes as polymerization, oxidation, reduction, hydrogenation, etc., usually with the aid of a catalyst. This definition may be interpreted to include ore processing, separation, and refinement, as well as the manufacture of metal products; however, these are usually considered to comprise the metal and metallurgical industries.

chemical reaction. A chemical change that may occur in several ways, e.g., combination, replacement, by decomposition, or by some modification of these. Reactions are endothermic when heat is needed to maintain them and exothermic when they evolve heat. All chemical reactions are in balance, i.e., the numbers of atoms of the various elements in the reacting substances are always equal to the numbers of atoms in the reaction products. Common types of reactions are oxidation, reduction, ionization, combustion, polymerization, hydrolysis, condensation, enolization, saponification, rearrangement, etc. Chemical reactions involve rupture of only the bonds that hold the molecules together and should not be confused with nuclear reactions, where the atomic nucleus is involved. A reversible reaction is one in which the reaction product is unstable and thus changes back into the original substance spontaneously. In a complete reaction, the activity goes to completion and is indicated by an arrow \rightarrow ; if heat or a catalyst is used, it is indicated by a symbol or word, usually placed in small type above the arrow as:

chemical research. See applied research; fundamental research.

chemical sediment. A sediment created by precipitation of one or more minerals from natural waters.

chemical smoke. Chemically generated aerosols, used primarily for military purposes. They are of four types: (1) FS, a mixture of sulfuric anhydride and chlorosulfonic acid, used in shells and bombs and sprayed from airplanes; (2) FM, titanium tetrachloride, the same as FS but brilliant white and will drop like a curtain when sprayed; (3) HC, a mixture of hexachloroethane, aluminum, and zinc oxide,

burns to yield a white cloud; (4) WP, a white phosphorus, burns to form a white cloud of phosphoric acid, an excellent smoke producer.

See fog; smoke; chemical warfare.

chemical specialty. A chemically formulated product manufactured from chemical components and used without further processing by household and industrial customers for specific and specialized purposes.

Chemical Specialties Manufacturers

Association. (CSMA). Founded in 1914, the Chemical Specialties Manufacturers Association represents more than 250 companies engaged in the manufacture, formulation, distribution and sale of chemical specialty products for household, institutional and industrial use. The Association's mission is to: foster high standards for the industry; and concern for the health, safety and environmental impacts of its products; address legislative and regulatory challenges at the federal, state and local level; meet the needs of industry for technical and legal guidance; provide a forum to share ideas for scientific and marketing excellence. Its headquarters are at 1913 Eye Street, NW, Washington DC 20006. Website: <http://www.csma.org>

chemical stoneware. (brick, chemical). A clay pottery product widely employed to resist acids and alkalis. It is used for utensils, pipes, stopcocks, ball mills, laboratory sinks, etc.

chemical technology. A general term covering a broad spectrum of physicochemical knowledge of the materials, processes, and operations used in the chemical process industries. It includes (1) basic phenomena such as activation, adsorption, oxidation, catalysis, corrosion, surface activity, polymerization, etc.; (2) the properties, behavior, and handling of industrial materials and products (plastics, textiles, coatings, soap, foods, metals, pharmaceuticals, etc.); and (3) their formulation, fabrication, and testing (compounding, extruding, molding, assembly, and the like).

See chemical process industry.

chemical thermodynamics. That aspect of thermodynamics concerned with the relationship of heat, work, and other forms of energy to equilibrium in chemical reactions and changes of state. See thermodynamics; thermochemistry; kinetics, chemical; equilibrium constant.

Chemical Transportation Emergency Center.

See ChemTrec.

chemical warfare. The employment of a chemical agent directly for military purposes, i.e., to cause casualties by irritating, burning, asphyxiation, or poisoning; to contaminate the ground; to screen action by smoke; or to cause incendiary damage.

Includes use of all forms of toxic or irritating gases, including nerve gases, smoke-inducing agents, flammable gels such as napalm, and incendiary materials such as magnesium and thermite. Biological warfare involves the use of bacteria and other infective agents against enemy forces or populations.

chemical waste. Unusable by-products from many chemical and metal-processing operations, which often contain toxic or polluting materials, such as digester streams from paper manufacture, fluorides from aluminum manufacturing, mercury from chlor-alkali cells, tailings from asbestos production, and insecticidal wastes that become environmental threats if improperly disposed of. Disposal techniques approved by EPA are (1) landfill in which an impermeable barrier is placed between the waste and ground water, such as a layer of hard-packed clay; (2) incineration of organic materials plus use of specially equipped ships in which liquid wastes are incinerated at sea; (3) such chemical and biological methods as neutralization of acidic and basic wastes, oxidation, and activated sludge treatment of organic wastes. Dumping of wastes into lakes and watercourses is strictly forbidden. Storage in metal drums is inadequate because of corrosion and subsequent leakage. Federal authority to provide for control and safe disposal of hazardous wastes is provided by the Resource Conservation and Recovery Act (RCRA), passed by the U.S. Congress in 1976.

See radioactive waste.

Chemico process. A technique used for extracting sulfur from low-grade ores (25–50% sulfur) by means of hot water.

chemiluminescence. The emission of absorbed energy (as light) due to a chemical reaction of the components of the system. It includes the subclasses bioluminescence and oxyluminescence, in which light is produced by chemical reactions involving organisms and oxygen, respectively. Chemiluminescence occurs in thousands of chemical reactions covering a wide variety of compounds, both organic and inorganic. Emission of light by fireflies is a common example of bioluminescence.

See luminescence.

chemisorption. The formation of bonds between the surface molecules of a metal (or other material of high surface energy) and another substance (gas or liquid) in contact with it. These bonds are comparable in strength to ordinary chemical bonds and much stronger than the Van der Waals type characterizing physical adsorption. Chemisorbed molecules are often altered. Hydrogen is chemisorbed on metal surfaces as hydrogen atoms. Chemisorption of hydrocarbons may result in formation of chemisorbed hydrogen atoms and hydrocarbon fragments. Even when dissociation does not occur, the properties of the molecules are changed by the surface in impor-

tant ways. This mechanism is the activating force of catalysis. An example of chemisorption is the boundary lubrication of moving metal parts in machinery. An oil film forms a chemisorbed layer at the interface and averts the high frictional forces that would otherwise exist. Solids with high surface energies are necessary for chemisorption to occur, e.g., nickel, silver, platinum, iron.

See catalysis.

chemistry. A basic science whose central concerns are (1) the structure and behavior of atoms (elements); (2) the composition and properties of compounds; (3) the reactions between substances, with their accompanying energy exchange; and (4) the laws that unite these phenomena into a comprehensive system. Chemistry is not an isolated discipline; it merges into physics and biology. The origin of the term is obscure. Chemistry evolved from the medieval practice of alchemy. Its bases were laid by such men as Boyle, Lavoisier, Priestly, Berzelius, Avogadro, Dalton, and Pasteur.

See inorganic chemistry; organic chemistry; physical chemistry; and Appendix II A–E.

Note: Chemistry has been variously defined, to the point where definition has become a semantic exercise of questionable, if not negative, value. "Chemistry is the science of matter" and "Chemistry is a branch of physics" are two instances of such definitions. The first relegates physics to the background while the second accords it supremacy.

chemistry history. See Appendix II A–E.

chemistry in space. See space, chemistry in.

chemodynamics. A comprehensive, interdisciplinary study of chemicals in the environment with special reference to pesticides.

chemometrics. Application of computer data-analysis techniques to the classification, assimilation, and interpretation of chemical information. Its major purpose is to correlate data in such a way that trends or patterns are indicated. Molecular spectra, thermodynamic functions, and distribution of chemicals in the atmosphere in relation to rainfall are some fields in which this science has been utilized. Formal programs in chemometrics are underway at the University of Washington and Umea University in Sweden.

"Chemonite" [Baxter]. (copper arsenite, ammoniacal). TM for a wood-preservative solution prescribed by Federal Specification TT-W-549 to contain copper hydroxide (Cu(OH)₂) 1.84%, arsenate, arsenic pentoxide (As₂O₅) 1.3%, ammonia (NH₃) 2.8%, acetic acid 0.05%, and water as necessary to 100.0%.

Hazard: Toxic by ingestion.

- chemonuclear production.** Manufacture of chemicals using the energy of a nuclear reactor. Feasibility studies on making hydrogen cyanide from nitrogen and methane using fission fragments as the energy source for the heat of reaction indicated that this process cannot yet compete economically with standard methods. In the case of hydrazine, the economic aspect is more favorable because of the high cost of conventional methods.
- chemosetting.** Hardening through a chemical reaction.
- chemosmosis.** A chemical reaction with the use of a semipermeable membrane.
- chemosorption.** Adsorption in which chemical energy causes an accumulation of the disperse constituent.
- chemosterilant.** A term coined by the USDA for materials or processes that sterilize insects, usually the males, thus preventing their reproduction. γ -irradiation is one method used. The males are brought to the radiation by sex attractants.
- chemotaxis.** The tendency of certain bacteria, especially *E. coli* and *Salmonella*, to move toward nutrients and other attractants and away from repellents and toxic chemicals. Such bacteria live in a liquid medium and propel themselves through it by means of threadlike appendages called flagellae. They apparently can determine differences in the concentration of chemicals in the medium as they move through it, thus exhibiting a memory in respect to their environment.
- chemotherapy.** The treatment or prevention of a disease by administration of a chemical. The term was first used by Paul Ehrlich, discoverer of the arsphenamine treatment for syphilis (1910). He said that chemotherapy results from the interaction of chemically reactive groups on drugs with chemically active receptor groups on parasitic cells and that an effective drug must be of quite low molecular weight. His achievement was one of the great triumphs of biomedical science. More-recent important achievements are the development of antimalarials, the synthesis of sulfa drugs, the discovery and proliferative development of antibiotics (penicillin, streptomycin, etc.), and the synthesis of cortisone. Much research effort has been devoted to the chemotherapeutic investigation of cancer. An antibiotic, adriamycin, is said to be effective against certain types of cancer. Treatment with ^{60}Co , either by irradiation or as a tissue implant, has been successfully used. A broad spectrum of antidepressant drugs to treat acute mental depression is another outstanding development of chemotherapy.
- chemotroph.** An organism that obtains energy by metabolizing organic compounds derived from other organisms.
- chemotropism.** The reaction of living things to chemicals.
- CHEMRAWN.** Abbreviation of Chemical Research Applied to World Needs, a program established by the International Union of Pure and Applied Chemistry and cosponsored by the American Chemical Society and the Chemical Institute of Canada to discuss and study the problems of long-range conversion to a postpetroleum economy. The subject range includes all forms of natural raw materials, particularly those used for fuel, food, and the manufacturing of organic chemicals. The conference's first meeting was in Toronto in 1978. Website: <http://www.iupac.org/standing/chemrawn.html>
- ChemTrec.** Abbreviation of Chemical Transportation Emergency Center was founded in 1971 by the American Chemistry Council, formerly known as the Chemical Manufacturers Association, as a public service to provide 24-hour information to emergency responders at the site of emergencies involving hazardous materials. The offices are at 1300 Wilson Blvd., Arlington, VA 22209 Website: <http://www.chemtrec.org/>
- chemurgy.** Development of nonfood uses for farm products, especially such waste materials as corncobs, nutshells, etc. This term was introduced in 1935, but has since become obsolete. See biomass; biotechnology.
- chenopodium oil.** (wormseed oil; American goose-foot oil).
CAS: 8006-99-3.
Properties: Colorless or yellowish oil; characteristic penetrating odor; bitterish burning taste. D 0.965–0.990 (15C), optical rotation -4 to -8 degrees, refr index 1.4740–1.4790 (20C). Soluble in 3–10 volumes of 70% alcohol (inferior and adulterated oils do not yield a clear solution). Chief known constituents: Ascaridole ($\text{C}_{10}\text{H}_{16}\text{O}_2$); *o*-cymene; *l*-limonene.
Derivation: Distilled from the seeds and leaves of *Chenopodium ambrosioides anthelminticum*.
Use: Medicine (anthelmintic).
- chert.** An impure rock, often gray in color, that consists primarily of extremely small quartz crystals precipitated from water solutions.
- (CHF).** See Chemical Heritage Foundation.
- chi acid.** See anthraquinone-1,8-disulfonic acid.

Chicago acid. (1-amino-8-naphthol-2,4-disulfonic acid; 8-amino-1-naphthol-5,7-disulfonic acid; SS acid; 1,8,2,4-acid; 2-sulfur acid).

Properties: Gray paste, white when pure. Soluble in water and sodium hydroxide solution.

Derivation: 1-Naphthylamine-8-sulfonic acid is reacted with sulfuric acid to yield 1-naphthylamine-4,8-disulfonic acid; further reaction with 25% oleum gives 1,8-naphthosulfam-2,4-disulfonic acid, which melts at 155C with 40% NaOH.

Use: Azo dye intermediate.

Chichibabin pyridine synthesis. Condensation of carbonyl compounds with ammonia or amines under pressure to form pyridine derivatives; the reaction is reversible and produces different pyridine derivatives and by-products.

Chichibabin reaction. Amination of pyridines and other heterocyclic nitrogen compounds with alkali-metal amides.

chicle. A thermoplastic, gumlike substance obtained from the latex of the sapodilla tree native to Mexico and Central America. Softens at 32.3C. Insoluble in water, soluble in most organic solvents. Chief use is as a chewing gum, after incorporation of sugar and specific flavoring.

Hazard: Ingestion should be avoided.

Chilean nitrate. See sodium nitrate.

Chilean saltpeter. See sodium nitrate.

chimera. An organism that contains cells or tissues with a different genotype. These can be mutated cells of the host organism or cells from a different organism or species.

chimeraplasty. An experimental targeted repair process in which a desirable sequence of DNA is combined with RNA to form a chimeraplast. These molecules bind selectively to the target DNA. Once bound, the chimeraplast activates a naturally occurring gene-correcting mechanism. Does not use viral or other conventional gene-delivery vectors. See gene therapy; cloning vector.

China clay. See kaolin.

China-wood oil. See tung oil.

Chinese insect wax. A wax secreted on the leaves of plants in China by a louselike insect. Its chief ingredient is ceryl cerotate.

chinoxidin. See quinoxidine.

chiral. In chemistry this term describes asymmetric molecules that are mirror images of each other, i.e., they are related like right and left hands. Such molecules are also called enantiomers and are characterized by optical activity. See optical isomer; enantiomer.

“ChiraSelect” [Fluka]. TM for products of very high and guaranteed enantiomeric purity. The TM is restricted to compounds used as chiral derivatizing agents or as chiral standards.

chitin. (C₈H₁₃NO₃)_n. A glucosamine polysaccharide. Contains approximately 7% nitrogen and is structurally similar to cellulose. Principal constituent of the shells of crabs, lobsters, and beetles. It is also found in some fungi, algae, and yeasts.

Properties: White, amorphous, semitransparent mass. Insoluble in the common solvents; soluble in concentrated hydrochloric, sulfuric, and nitric acids.

Use: Biological research, source of chitosan.

chitosan. Deacylated derivative of chitin. Absorbs heavy metals from water and industrial waste streams; also used as dyeing assistant and in photographic emulsions.

chlodronate sodium. See sodium clodronate.

chlorphedianol hydrochloride (USAN). (α-(2-dimethylaminoethyl)-o-chlorobenzyhydrol hydrochloride). C₁₇H₂₀ClNO•HCl.

Use: In medicine.

chloracetofon. See o,o-dimethyl (2,2,2-trichloro-1.

chloracetophos.

CAS: 5952-41-0. mf: C₆H₁₀Cl₃O₅P.

Hazard: Moderately toxic.

Use: Agricultural chemical.

chloracetyl chloride. See chloroacetyl chloride.

chloral. (trichloroacetaldehyde).

CAS: 75-87-6. CCl₃CHO.

Properties: Colorless, mobile, oily liquid; penetrating odor. D 1.505 (25/4C), fp -57.5C, bp 97.7C, vap press 35 mm Hg (20C), refr index 1.4557 (20C), latent heat of vaporization 97.1 Btu/lb. Soluble in water, alcohol, ether, and chloroform; combines with water, forming chloral hydrate.

Derivation: (1) By chlorination of ethyl alcohol, addition of sulfuric acid, and subsequent distillation; (2) by chlorination of acetaldehyde.

Grade: Technical, 94% min.

Hazard: Toxic by ingestion.

Use: Manufacture of chloral hydrate and DDT.

chloral hydrate. ("knockout drops"; trichloroacetaldehyde, hydrated; trichloroethylidene glycol).

CAS: 302-17-0. $\text{CCl}_3\text{CH}(\text{OH})_2$.

Properties: Transparent, colorless crystals; aromatic, penetrating, slightly acrid odor; slightly bitter, sharp taste. D 1.901, mp 52C, bp 97.5C. Slowly volatilizes when exposed to air. Soluble in water, alcohol, chloroform, ether, olive oil, and turpentine oil.

Derivation: Action of one-fifth of its volume of water on chloral.

Grade: Technical, USP.

Hazard: Overdose toxic, hypnotic drug, dangerous to eyes.

Use: Medicine (sedative), manufacture of DDT, liniments.

chloral hydrate antipyrine. (antipyrine chloral hydrate). $\text{C}_{11}\text{H}_{12}\text{N}_2\text{OCl}_3\text{CH}(\text{OH})_2$.

Properties: Colorless crystals. Mp 67C. Moderately soluble in water; soluble in alcohol.

Use: Medicine (sedative).

chlor-alkali cell. See electrolytic cell.

α -chloralose.

CAS: 15879-93-3. $\text{C}_8\text{H}_{11}\text{Cl}_3\text{O}_6$.

Properties: Acicular solid. Mp 186C. Soluble in water, ether, and glacial acetic acid.

Derivation: By heating a mixture of chloral and glucose.

Hazard: May cause addiction, highly toxic.

Use: Coating seeds to protect them from birds.

Chloramben. (3-amino-2,5-dichlorobenzoic acid).

CAS: 133-90-4.

Use: Herbicide.

chloramine. NH_2Cl . A colorless, unstable, pungent liquid; soluble in water; decomposes (slowly in dilute solution) to form nitrogen plus hydrochloric acid and ammonium chloride. Mp -66C, soluble in alcohol and ether. (Do not confuse with chloramine-T.) Chloramine is an intermediate in the manufacturing of hydrazine.

chloramine-B. (sodium benzenesulfochloramide). $\text{C}_6\text{H}_5\text{SO}_2\text{NCINa}$.

Properties: White powder; faint chlorine odor. Soluble in water.

Use: Medicine (antiseptic).

chloramine brown 2me. See C.I. direct brown 2.

chloramine-T. (sodium *p*-toluenesulfochloramine). $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NNaCl}\cdot 3\text{H}_2\text{O}$.

Properties: White or slightly yellow crystals or crystalline powder, containing more than 11.5% and less than 13% active chlorine. Slight odor of chlorine. Decomposes slowly in air, liberating chlorine. (Not to be confused with NH_2Cl , which is also termed chloramine.) Soluble in water; insoluble in benzene, chloroform, ether; decomposed by alcohol.

Derivation: Reaction of ammonia and *p*-toluenesulfochloride under pressure. The product is reacted with sodium hypochlorite in the presence of an alkali, and the chloramine produced by crystallization.

Use: Medicine (antiseptic), reagent.

See dichloramine-T.

chloramphenicol. (*d*(-)-*threo*-1-(*p*-nitrophenyl)-2-dichloroacetamido-1,3-propanediol).

CAS: 56-75-7. $\text{C}_{11}\text{H}_{12}\text{Cl}_2\text{N}_2\text{O}_5$.

An antibiotic derived from *Streptomyces venezuelae* or by organic synthesis, it was the first substance of natural origin shown to contain an aromatic nitro group.

Properties: Fine, white to grayish-white or yellowish-white, needlelike crystals or elongated plates; bitter taste. Neutral to litmus and reasonably stable in neutral or slightly acid solutions. Mp 149–153C. The alcohol solution is dextrorotatory, while the ethyl acetate solution is levorotatory. Very slightly soluble in water; freely soluble in alcohol, propylene glycol, acetone, and ethyl acetate.

Grade: USP.

Hazard: Has deleterious and dangerous side effects. Must conform to FDA labeling requirements. Use is closely restricted.

Use: Medicine (antibiotic), antifungal agent.

chloramphenicol alcohol.

CAS: 23885-72-5. mf: $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_6$.

Hazard: Moderately toxic.

chloranil. (tetrachloroquinone; tetrachloro-*p*-benzo-quinone).

CAS: 118-75-2. $\text{C}_6\text{Cl}_4\text{O}_2$.

Properties: Yellow crystals. Mp 290C, d 1.97. Soluble in ether; insoluble in water. Good storage stability.

Derivation: From phenol, *p*-chlorophenol, or *p*-phenylenediamine by treatment with potassium chlorate and hydrochloric acid.

Hazard: Skin irritant.

Use: Agricultural fungicide, dye intermediate, electrodes for pH measurements, reagent.

chloranthrene yellow. See flavanthrene.

chlorapatite. See apatite.

chloraauric acid. See gold trichloride.

chlorazine. (generic name for 2-chloro-4,6-bis(diethylamino)-*s*-triazine).
CAS: 580-48-3.

Properties: Solid. Mp 15–18C, d 1.096 (20C). Soluble in hydrocarbons, alcohols, ketones; insoluble in water.

Use: Herbicide.

chlorazol black e (biological stain). See apomine black gx.

chlorbenseide. (*p*-chlorobenzyl-*p*-chlorophenyl sulfide).
CAS: 103-17-3. $C_{12}H_9Cl_2S$. Generic name for an agricultural toxicant.

Properties: Crystals; almond-like odor (technical grade). Mp 75–76C. Insoluble in water; soluble in aromatic hydrocarbons, acetone. Resistant to acid and alkaline hydrolysis.

Grade: Technical.

Hazard: Skin irritant.

Use: Acaricide.

chlor- compounds. Most organic compounds of chlorine retain the letter *o* in accepted chemical terminology, e.g., chlorobenzene, chloroacetic, etc., although the form without the *o* is sometimes used. Therefore, for chlor- compounds see also chloro-

chlorcyclizine hydrochloride.

$C_{16}H_{14}CH(C_2H_5)C_6H_4N_2CH_3 \cdot HCl$ and ether. Solutions acid to litmus, pH (1 to 100 solution) 4.8–5.5.

Grade: USP.

Use: Medicine (antihistamine).

chlordan. (1,2,4,5,6,7,8,8-octachloro-4,7-methano-3a,4,7,7a-tetrahydroindane).

CAS: 57-74-9. $C_{10}H_6Cl_8$.

Properties: Colorless, viscous liquid. D 1.57–1.67 (60/60F), viscosity SSU 100 sec (38C), organic chlorine 64–67% by weight, purity 98%, bp 175C (2 mm Hg), refr index 1.56–1.57 (25C). Soluble in many organic solvents; insoluble in water; miscible with deodorized kerosene; decomposes in weak alkalies.

Grade: Technical and pure.

Hazard: An animal carcinogen. Toxic by ingestion, inhalation, and skin absorption. TLV: 0.5 mg/m³.

Use: Insecticide, fumigant.

chlordiazepoxide hydrochloride (USAN).

(7-chloro-2-methylamino-5-phenyl-3,4,5,6,7,8-benzodiazepine-4-oxide hydrochloride).

$C_{16}H_{14}ClN_3O \cdot HCl$.

Properties: Crystals. Mp 212–218C. Soluble in wa-

ter; sparingly soluble in alcohol; insoluble in ether and chloroform.

Hazard: CNS depressant. Manufacture and dosage controlled by law.

Use: Medicine (tranquilizer).

chlordimeform. (TM “Galecron”; [*N'*-(4-chloro-*o*-tolyl)-*N,N*-dimethylformamine]). Ovicide, insecticide, and miticide designed for use on cotton and vegetable crops. Available in a concentrated emulsion form, it is stated to be less toxic than organophosphates and is biodegradable.

chlorendic anhydride.

(hexachloroendomethylenetetrahydrophthalic anhydride; 1,4,5,6,7,7-hexachlorobicyclo-(2,2,1)-5-heptene-2,3-dicarboxylic anhydride).

$C_9H_2Cl_6O_3$.

Properties: Fine, white, free-flowing crystals. Mp 239–240C, d 1.73. Readily soluble in acetone, benzene, toluene; slightly soluble in water, *n*-hexane, and carbon tetrachloride. Nonflammable.

Derivation: By Diels-Alder reaction of maleic anhydride and hexachlorocyclopentadiene.

Grade: Technical, pure.

Use: Flame-resistant polyester resins, hardening epoxy resins, chemical intermediate, source of chlorendic acid.

“Chlorez” [Dover]. TM for a chlorinated paraffin additive.

Use: Flame-retardant, plasticizers, and lubricants in metal-working industries.

chlorfenapyr. See 4-bromo-2-(4-chlorophenyl)-1-ethoxymethyl-5.

chlorfenvinphos. (*O,O*-diethyl-*O*-[2-chloro-1-(2,4-dichlorophenyl)vinyl]phosphate).

CAS: 470-90-6. $C_{12}H_{14}Cl_3O_4P$.

Properties: Yellowish liquid. Soluble in most organic solvents; slightly soluble in water.

Hazard: A cholinesterase inhibitor.

Use: Insecticide, nematocide, parasiticide.

“Chlorhydrol” [Reheis]. TM for aluminum chlorohydrate.

Use: Excellent antiperspirant properties.

chloric acid.

CAS: 7790-93-4. $HClO_3 \cdot 7H_2O$.

Occurrence: Only in aqueous solution.

Derivation: Reaction of barium chlorate and sulfuric acid.

Hazard: Toxic by ingestion and inhalation. Strong oxidizer, ignites organic materials on contact.

Use: Catalyst in polymerization of acrylonitrile.

chloridizing. Heating in the presence of chlorine as a step in the recovery of certain metals from their oxides or other compounds.

chlorinated acetone. See chloroacetone.

chlorinated camphene. See toxaphene.

chlorinated diphenyl. See chlorodiphenyl.

chlorinated hydrocarbon. See hydrocarbon, halogenated.

chlorinated isocyanuric acid.

Use: Dry bleach.

See dichloroisocyanuric acid; trichloroisocyanuric acid; potassium dichloroisocyanurate; sodium dichloroisocyanurate.

chlorinated lime. See lime, chlorinated.

chlorinated naphthalene. (chloronaphthalene). $C_{10}H_7Cl$. From the chlorination of naphthalene. Physical state varies from oily liquids to crystalline solids, depending on the extent of chlorination.

Hazard: (Tri- and higher) Toxic by ingestion, inhalation, and skin absorption. Strong irritants.

Use: Solvent, immersion liquid in microscopy. See oil; wax; tetrachloronaphthalene.

chlorinated paraffin. See paraffin, chlorinated.

chlorinated para red. A modification of para red that contains some chlorine. Much lighter than para or toluidine red; has excellent brilliance but poorer heat resistance.

chlorinated polyether. See "Penton."

chlorinated polyolefin. See rubber, chlorinated; polypropylene, chlorinated.

chlorinated rubber. See rubber, chlorinated.

chlorinated trisodium phosphate. See trisodium phosphate, chlorinated.

chlorination. To introduce chlorine into an organic compound or into a liquid.

chlorine.

CAS: 7782-50-5. Cl. Nonmetallic halogen element of atomic number 17, group VIIA of the periodic table. Aw 35.453, valences of 1, 3, 4, 5, 7. Two stable isotopes ^{35}Cl (75.4%) and ^{37}Cl (24.6%).

Properties: (1) Dense, greenish-yellow, diatomic gas; pungent, very irritating odor. Noncombustible, but supports combustion (oxidizing agent). Liquefaction press 7.86 atm (25C), 1 atm (-35C). Water solubility 0.64 g Cl_2 per 100 g water. D 3.21 g/L (0C, 1 atm) (air = 1.29). Thermodynamic properties: (a) critical temp 144.0C; (b) critical press 78.525 atm absolute; (c) critical vol 1.763 L/kg. Strongly electronegative.

(2) Liquid; clear amber; very irritating odor. D 1.56 (-35C), fp -101C, 1 L liquid = 456.8 L gas at 0C and 1 atm. Very low electrical conductivity. Soluble in chlorides and alcohols. Extremely strong oxidizing agent. Slightly soluble in cold water.

Occurrence: Not free in nature; component of minerals halite (rock salt), sylvite, and carnallite; chloride ion in seawater.

Derivation: (1) Electrolysis of sodium chloride brine in either diaphragm or mercury-cathode cells; chlorine is released at the anode. (2) Fused-salt electrolysis of sodium or magnesium chloride. (3) Electrolysis of hydrochloric acid. (4) Oxidation of hydrogen chloride with nitrogen oxide as catalyst and absorption of steam with sulfuric acid ("KeloChlor" process). No by-product caustic is produced.

Grade: Technical (gas and liquid), pure (99.9%).

Hazard: A military poison; TLV: 0.5 ppm. Dangerous in contact with turpentine, ether, ammonia, hydrocarbons, hydrogen, powdered metals, and other reducing materials.

Use: Manufacture of carbon tetrachloride, trichloroethylene, chlorinated hydrocarbons, polychloroprene (neoprene), polyvinyl chloride, hydrogen chloride, ethylene dichloride, hypochlorous acid, metallic chlorides, chloroacetic acid, chlorobenzene, chlorinated lime; water purification, shrinkproofing wool, flame-retardant compounds, special batteries (with lithium or zinc); processing of meat, fish, vegetables, and fruit. For information, refer to the Chlorine Institute, 2001 L St., NW, Suite 506, Washington DC 20036.

chlorine-36. Radioactive chlorine of mass number 36. Half-life approximately 440,000 years; radiation: β .

Derivation: Separated from various isotopes produced during irradiation of potassium chloride.

Available forms: As hydrochloric acid solution and as solid potassium chloride.

Hazard: MPC 4×10^{-7} mCi/mL of air.

Use: Tracer in studying the saltwater corrosion of metals, especially mechanism of steel reaction with chlorinated hydrocarbons, location and flow of saltwater in porous media, etc.

chlorine, available. The weight of free chlorine that would exert the same oxidizing action as the chlorine compound in question.

chlorine bromide. See bromine chloride.

chlorine dioxide.

CAS: 10049-04-4. ClO_2 .

Properties: Red-yellow gas. Fp -59.5C, bp 10C. Very reactive, unstable, strong oxidizer. Decomposes in water. Dissolves in alkalies, forming a mixture of chlorite and chlorate.

Derivation: Usually made at point of consumption from sodium chlorate, sulfuric acid, and methanol or from sodium chlorate and sulfur dioxide. Concen-

tration of gas is limited to 10% to reduce explosion hazard.

Grade: Sold as hydrate in frozen form.

Hazard: Explodes when heated or by reaction with organic materials. Very irritating to skin and mucous membranes. TLV: 0.1 ppm.

Use: Bleaching wood pulp, fats, and oils; controversial maturing agent for flour; water treatment (purification and taste removal); swimming pools; odor control; biocide.

chlorine heptoxide. Cl_2O_7 .

Properties: Colorless, viscous liquid. Fp -91C ; bp 82C ; d 1.86. Hydrolyzes to form perchloric acid.

Hazard: Explodes on contact with iodine or flame or by shock. Strong irritant to tissue and very toxic.

Use: Cellulose esterification catalyst.

chlorine monofluoride. (chlorine fluoride). ClF .

Properties: Colorless gas, slightly yellow when liquid. Mp -155.6C , bp -100.1C , critical temp -14C .

Hazard: Extremely reactive. Destroys glass instantly, attacks quartz readily in presence of moisture. Organic matter bursts into flame on contact. Violent reaction with water. Extremely corrosive to skin, eyes, mucous membranes, and respiratory tissues.

Use: Fluorinating reagent.

chlorine monoxide. Cl_2O .

Properties: Yellow gas; strong, unpleasant odor. Fp -120C ; bp 2.2C . Soluble in water and carbon tetrachloride.

Derivation: Reaction of mercuric oxide and chlorine.

Hazard: Explodes on contact with organic materials. Strong irritant to eyes, skin, and mucous membranes.

Use: Chlorination.

chlorine number. The number of grams of chlorine or bleaching powder absorbed by 100 g oven-dry cellulose pulp in a definite time under certain conditions. Also an indication of bleach consumption.

chlorine, residual. The amount of chlorine present in water at any time before the addition of chlorine.

chlorine trifluoride.

CAS: 7790-91-2. ClF_3 .

Properties: Nearly colorless gas, pale-green liquid or white solid. Bp 11.4C , fp -76.3C , d of gas 3.14 g/L (air = 1.29). Very reactive, comparable to fluorine.

Derivation: By reaction of chlorine and fluorine at 280C and condensation of the product at -80C . Obtained 99.0% pure.

Hazard: Explodes in contact with organic materials or with water. Dangerous fire risk. A poison, very toxic, corrosive to skin. TLV: ceiling 0.1 ppm.

Use: Fluorination, cutting oil-well tubes, reprocessing reactor fuels, oxidizer in propellants.

chlorine water. Clear, yellowish liquid; deteriorates on exposure to air and light. Made by saturating water with approximately 0.4% chlorine.

Use: Deodorizer, disinfectant, antiseptic.

chlorinolysis. The chlorination of organic compounds under conditions that rupture the carbon-carbon bonds to yield chloro compounds with fewer carbon atoms than in the original.

chloriodized oil. Chlorinated and iodinated vegetable oil. Contains 26.0–28.0% iodine in organic combination.

Properties: Pale yellow, viscous, oily liquid; faint, bland taste. Practically insoluble in water; slightly soluble in alcohol; freely soluble in benzene, chloroform, and ether.

Derivation: Formed by chemical addition of iodine monochloride to a vegetable oil.

Hazard: A poison. Very toxic by ingestion.

Use: Medicine (radiopaque medium).

chlorisondamine chloride. (4,5,6,7-tetrachloro-2(2-dimethylaminoethyl)isoindoline dimethylchloride). $\text{C}_{14}\text{H}_{20}\text{Cl}_6\text{N}_2$, a quaternary ammonium compound.

Properties: Crystals. Decomposes $258\text{--}265\text{C}$. Soluble in water and alcohol.

Use: Medicine (blood-pressure control).

chlormequat. See 2-chloroethyltrimethyl ammonium chloride.

chlormethazone. (2-(4-chlorophenyl-3-methyl)-4-meta-thiazanone-1-dioxide).

$\text{C}_{11}\text{H}_{12}\text{ClNO}_3\text{S}$.

Properties: Crystals. Mp 117C . Insoluble in water; slightly soluble in alcohol.

Use: Medicine (tranquilizer and muscle relaxant).

chloroacetaldehyde.

CAS: 107-20-0. ClCH_2CHO .

Properties: (of 40% aqueous solution) Clear, colorless liquid; pungent odor. Bp 85C , fp -16.3C , d 1.19 (25/25C), refr index 1.397 (25C), wt/gal 0.9 lb (25C). Soluble in water, acetone, methanol; at greater than 50% concentration in water, it forms an insoluble hemihydrate. Pure substance flash p 190F (87.7C).

Hazard: Corrosive to skin and mucous membranes. TLV: ceiling 1 ppm.

Use: Intermediate, fungicide.

chloroacetaldehyde dimethyl acetal. See dimethyl chloroacetal.

chloroacetamide. (α -chloroacetamide; 2-chloroethanamide). $\text{ClCH}_2\text{CONH}_2$.

Properties: Colorless to pale-yellow crystals; char-

acteristic odor. Mp 117–119C, bp 220C (decomposes). Soluble in water and alcohol; insoluble in ether.

Hazard: Strong irritant to skin and tissue.

Use: Intermediate.

chloroacetic acid. (chloroacetic acid; MCA; monochloroacetic acid).
CAS: 79-11-8. CH_2ClCOOH .

Properties: Colorless to light-brownish crystals. Deliquescent, d 1.58. Crystallizing point: α -form 61.0–61.7C, β -form 55.5–56.5C, γ -form 50C. The commercial material melts at 61–63C, boiling range 186–191C. Soluble in water, alcohol, ether, chloroform, carbon disulfide.

Derivation: Action of chlorine on acetic acid in the presence of acetic anhydride, phosphorus, or sulfur.

Grade: Technical, medicinal, 99.5% pure.

Hazard: Use in foods prohibited by FDA. Irritating and corrosive to skin.

Use: Herbicide, preservative, bacteriostat, intermediate in production of carboxymethylcellulose; ethyl chloroacetate, glycine, synthetic caffeine, sarcosine, thioglycolic acid, EDTA, 2,4-D, 2,4,5-T.

chloroacetic acid *tert*-butyl ester. See *tert*-butyl chloroacetate.

chloroacetic anhydride. (chloroethanoic anhydride; symmetrical dichloroacetic anhydride). $(\text{ClCH}_2\text{CO})_2\text{O}$.

Properties: Colorless to slightly yellow crystals; pungent odor. Mp 51–55C, bp 203C, d 1.55. Soluble in chloroform and ether. Hydrolyzes to chloroacetic acid.

Hazard: Irritating to skin and eyes, moderately toxic by inhalation.

Use: Intermediate for acetylation of amino acids, cellulose chloroacetates.

***o*-chloroacetoacetanilide.**
 $\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{Cl}$.

Properties: White crystals resemble ethyl acetoacetate in chemical reactivity. Mp 107C, vap press 0.1 mm Hg (20C). Nonflammable. Insoluble in water.
Use: Organic synthesis, dyestuffs.

chloroacetone. (monochloroacetone; 1-chloro-2-propanone; chloroacetone; chlorinated acetone).
CAS: 78-95-5. $\text{CH}_3\text{COCH}_2\text{Cl}$. A lachrymator.

Properties: Colorless liquid; pungent, irritating odor. D 1.162 (16C), bp 119C, fp –44.5C. Soluble in alcohol, ether, chloroform, and water.

Derivation: Chlorination of acetone.

Hazard: Strong irritant to tissue, eyes, and mucous membranes; toxic by ingestion and skin contact. TLV: ceiling 1 ppm.

Use: Couplers for color photography, enzyme inactivator, insecticides, perfumes, intermediate, organic synthesis, tear gas, polymerization of vinyl monomers.

chloroacetonitrile. (chloroethane nitrile; chloromethyl cyanide).
CAS: 107-14-2. ClCH_2CN .

Properties: Colorless liquid; pungent odor. D 1.202–1.2035 (25/25C), refr index 1.4210–1.4240 (25C), 5–95% distills between 124 and 129C. Soluble in hydrocarbons, alcohols; insoluble in water.

Hazard: Irritant.

Use: Fumigant, intermediate.

α -chloroacetophenone. (chloroacetophenone; phenacylchloride; phenyl chloromethyl ketone).
CAS: 532-27-4. $\text{C}_6\text{H}_5\text{COCH}_2\text{Cl}$. A strong lachrymator.

Properties: (ω isomer) White crystals; floral odor. Mp 56C, bp 247C. The para isomer has mp 20C, bp 237C. Insoluble in water; soluble in acetone, benzene, carbon disulfide.

Derivation: From chloroacetylchloride, benzene, and aluminum chloride.

Hazard: Strong irritant to eyes and tissue as gas or liquid. TLV: (α) 0.05 ppm.

Use: Pharmaceutical intermediate, riot-control gas. See "Mace."

(chloroacetoxy)tributylstannane. See tributyltin chloroacetate.

chloroacetyl chloride. (chloroacetyl chloride).
CAS: 79-04-9. ClCH_2COCl . A lachrymator.

Properties: Water-white liquid; pungent odor. D 1.495 (0C), bp 105–110C, decomposes in water.

Derivation: (1) Action of chlorine on acetyl chloride in sunlight. (2) Dropping phosphorous trichloride on chloroacetic acid.

Hazard: Irritant to eyes, corrosive to skin. TLV: 0.05 ppm.

Use: Preparation of chloroacetophenone, intermediate, tear gas.

chloroacetylurethane.
 $\text{ClCH}_2\text{CONHCOOC}_2\text{H}_5$.

Properties: Crystals. Mp 129C. Soluble in alcohol; sparingly soluble in water.

Derivation: By interaction of a urethane derivative and ethyl chloroacetate.

chloroacrolein. $\text{H}_2\text{C=CClCHO}$.

Properties: Colorless liquid. D 1.205 (15C), bp 29–31C (17 mm Hg).

Derivation: Chlorination of acrolein.

Hazard: Irritant to eyes and skin.

Use: Tear gas.

α -chloroacrylonitrile.

Properties: Readily polymerizes and copolymerizes with other unsaturated monomers. High cross-linking ability.

Derivation: Chlorination of acrylonitrile and dehydrohalogenation by cracking.

Use: Synthetic fibers, coatings and films, acrylic polymers, treatment of cotton fiber, intermediate.

2-chloroallyl diethyldithiocarbamate.(CDEC). $(C_2H_5)_2NCSSCH_2CH_2Cl$.**Properties:** Amber liquid. Bp 128–130°C (1 mm Hg). Very slightly soluble in water; soluble in benzene, alcohol, acetone, chloroform, and ether.**Available forms:** Liquid and granular.**Hazard:** Dry preparations are irritating to eyes and skin.**Use:** Herbicide, pesticide.**1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane chloride.** $C_6H_{12}N_4(CH_2CHCHCl)Cl$.**Properties:** White- to cream-colored powder. Soluble in water and methanol; almost insoluble in acetone.**Use:** Bactericide used as preservative in latexes, paints, floor polishes, joint cements, adhesives, inks, starches, etc.**chloroaluminum diisopropoxide.** $[(CH_3)_2CHO]_2AlCl$.**Properties:** White crystals. Mp 160°C (decomposes). Soluble in most organic solvents; hydrolyzes.**Use:** Catalyst and intermediate.**Hazard:** An irritant.**chloroamino-** See aminochloro-**2-chloro-5-aminobenzoic acid.****Grade:** Technical.**Use:** Intermediate in manufacture of azo dyes for textiles and plastics and as coupling agent of color pigments in color photography.***p*-chloro-aminophenol.** See 2-amino-4-chlorophenol.**2-chloro-4-*tert*-amyphenol.** $C_9H_{11}ClO$.**Properties:** Water-white liquid; aromatic odor. D 1.11 (20°C), boiling range 253–265°C, flash p 225°F (107°C). Combustible.***m*-chloroaniline.** (*m*-aminochlorobenzene).CAS: 108-42-9. $C_6H_4NH_2$.**Properties:** Colorless to light-amber liquid, tends to darken during storage. Boiling range 228–231°C, fp –10.6°C. Insoluble in water; soluble in organic solvents.**Grade:** Technical.**Use:** Intermediate for azo dyes and pigments, pharmaceuticals, insecticides, agricultural chemicals.***o*-chloroaniline.** (*o*-aminochlorobenzene).CAS: 95-51-2. $C_6H_4NH_2$.**Properties:** Amber liquid; amine odor; darkens on exposure to air. Distillation range 208–210°C, fp –2.3°C, d 1.213 (20/4°C), refr index 1.5896 (20°C). Miscible with alcohol and ether, insoluble in water.**Grade:** Technical.**Hazard:** Toxic by ingestion.**Use:** Dye intermediate, standards for colorimetric

apparatus, manufacture of petroleum solvents and fungicides.

***p*-chloroaniline.** (*p*-aminochlorobenzene).CAS: 106-47-8. $C_6H_4NH_2$.**Properties:** White or pale-yellow solid. Mp 69.5°C, distilling range 229–233°C, d 1.17. Soluble in hot water and organic solvents.**Grade:** Technical.**Hazard:** Toxic by inhalation and ingestion.**Use:** Dye intermediate, pharmaceuticals, agricultural chemicals.**4-chloroaniline-3-sulfonic acid.** $HSO_3C_6H_3ClNH_2$.**Properties:** White to light-gray powder.**Use:** Intermediate for dyes.**2-chloroanthraquinone.** $C_{14}H_7ClO_2$.**Properties:** Mp 208–211°C. Insoluble in water; soluble in hot benzene.**Derivation:** Condensing phthalic anhydride and chlorobenzene in the presence of anhydrous aluminum chloride to form *p*-chlorobenzoylbenzoic acid. Ring closure of the intermediate acid is brought about by heating in sulfuric acid solution.**Use:** Starting material for certain vat dyes.

See anthraquinone; 2-methylantraquinone.

chloroauric acid. See gold trichloride.**chloroazotic acid.** See aqua regia.**chlorobenzal.** See benzyl dichloride.**chlorobenzaldehyde.** C_6H_4CHOCI .**Properties:** Colorless to yellowish liquid (*o*-) or powder (*p*-). Boiling range 209–214°C, fp 8.0°C (min), d 1.240–1.245 (25/25°C). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.**Use:** Intermediate in the preparation of triphenyl methane and related dyes, organic intermediate.**3-chloro-4-benzamido-6-methylaniline.** $C_{12}H_{12}N_2CH_3(NHCOCH_3)$.**Properties:** White solid. Mp 198–199°C.**Use:** Azoic dyes, pigments.**chlorobenzanthrone.** $C_{17}H_9ClO$.**Properties:** All isomers: yellow needles. Soluble in alcohol, benzene, toluene, acetic acid.**Derivation:** From benzanthrone by treatment with chlorine.**chlorobenzene.** (monochlorobenzene; phenyl chloride).CAS: 108-90-7. C_6H_5Cl .

Properties: Clear, volatile liquid; almond-like odor. D 1.105 (25/25C), bp 131.6C, fp -45C, wt/gal 9.19 lb (25C), refr index 1.5216 (25C), flash p 85F (29.4C) (CC), autoign temp 1180F (637C). Miscible with most organic solvents; insoluble in water.

Derivation: By passing dry chlorine into benzene with a catalyst.

Grade: Technical.

Hazard: An animal carcinogen. Avoid inhalation and skin contact. TLV: 10 ppm. Moderate fire risk. Explosive limits 1.8–9.6%.

Use: Phenol, chloronitrobenzene, aniline, solvent carrier for methylene diisocyanate, solvent, pesticide intermediate, heat transfer.

p-chlorobenzenesulfonamide.

Properties: White; odorless powder. Mp 145–148C. Soluble in alcohol.

Grade: 98–99% purity.

Use: Intermediate for pharmaceuticals and resins.

o-chlorobenzenethiol. See *p*-chloro-*thio*-phenol.

p-chlorobenzhydrol. (*p*-chlorobenzohydrol).

Properties: White to off-white, crystalline powder. Mp 57–61C. Insoluble in water; soluble in ether, alcohol, and benzene.

Use: Organic synthesis.

“Chlorobenzilate” [Novartis]. TM for ethyl-4,4'-dichlorobenzilate.

Properties: Viscous, yellow liquid. Bp 141–142C (0.06 mm Hg); d (technical 90%) 1.2816 (20/4C). Slightly soluble in water; soluble in acetone, benzene, methanol.

Hazard: Carcinogen. Caused testicular damage in farm workers. Use has been restricted.

Use: Pesticide, acaricide.

p-chlorobenzohydrol. See *p*-chlorobenzhydrol.

2-(2-chlorobenzyl)-4,4-dimethyl-1,2-oxazolidin-3-one.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact. A reproductive hazard.

Use: Agricultural chemical.

o-chlorobenzylidene malononitrile. (CS; OCBM).

Properties: White crystals; odor of pepper. Mw 189, mp 93–95C, bp 310–315C. Insoluble in water.

Available forms: Available both unground and ground with 5% silica aerogel or treated “Cab-O-Sil.”

Hazard: Toxic by inhalation and skin contact. Strong irritant to eyes and mucous membranes. TLV: ceiling 0.05 ppm.

Use: An incapacitating agent used by the military and law-enforcement officers.

4-(4-chlorobenzyl)pyridine.

Hazard: A poison.

chlorobenzoic acid. $\text{C}_6\text{H}_4\text{COOH}$.

Properties: Nearly white, coarse powder. Mp (*o*-) 142C, (*m*-) 158C, (*p*-) 243C. Soluble in methanol, alcohol, ether, and hot water.

Use: Intermediate for the preparation of dyes, fungicides, pharmaceuticals, and other organic chemicals; preservative for adhesives and paints.

p-chlorobenzophenone. $\text{C}_6\text{H}_4\text{COC}_6\text{H}_5$.

Properties: White to off-white, crystalline powder. Mp 73–78C; bp 332C. Soluble in acetone, benzene, carbon tetrachloride, ether, and hot alcohol; insoluble in water.

Use: Intermediate.

chlorobenzotriazole.

Properties: White solid. Mp 157–159C.

Use: Intermediate and photographic chemical.

o-chlorobenzotrichloride. $\text{C}_6\text{H}_4\text{CCl}_3$.

Properties: Colorless liquid or solid. Mp 29.37C, bp 264.3C, d 1.5131 (25/4C), refr index 1.5836 (20C). Soluble in alcohol, ether, and acetone; decomposed by water.

Use: Intermediate for pharmaceuticals, dyes, and other organic chemicals.

p-chlorobenzotrichloride. $\text{C}_6\text{H}_4\text{CCl}_3$.

Properties: Water-white liquid. Boiling range 248–257C, fp approximately 3.8C, d 1.480–1.490 (25/25C). Soluble in alcohol, ether, and acetone; insoluble in water.

Use: Same as *o*-chlorobenzotrichloride.

m-chlorobenzotrifluoride. (*m*-chlorotrifluoromethylbenzene; *m*-chloro- α,α,α -trifluorotoluene).

Properties: Water-white, aromatic liquid. Bp 138C, fp -56C, refr index 1.446 (20C), flash p 122F (50C) (CC), d 1.351 (15.5/15.5C). Flammable.

Hazard: Moderate fire risk. TLV: (F) 2.5 mg/m³. **Use:** Intermediate in manufacturing of dyes and pharmaceuticals, dielectrics, insecticides.

***o*-chlorobenzotrifluoride.** (*o*-chlorotrifluoromethylbenzene; *o*-chloro- α,α,α -trifluorotoluene). CAS: 88-16-4. $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Colorless liquid with aromatic odor. D 1.379 (15.5/15.5C), refr index 1.456 (20C), bp 152C, fp -7.4C , flash p 138F (58.8C) (CC), wt/gal 11.50 lb (15.5C).

Hazard: See *m* form.

Use: Dye intermediate, chemical intermediate, solvent, and dielectric fluid.

***p*-chlorobenzotrifluoride.** (*p*-chlorotrifluoromethylbenzene; *p*-chloro- α,α,α -trifluorotoluene). CAS: 98-56-6. $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Water-white liquid, aromatic odor. Bp 139.3C, fp -36C , refr index 1.446 (20C), flash p 116F (46.6C) (CC), d 1.3533 (15.5/15.5C), wt/gal 11.28 lb (15.5C).

Hazard: See *m*-form.

Use: See *o*-chlorobenzotrifluoride.

chlorobenzoyl chloride. $\text{ClC}_6\text{H}_4\text{COCl}$.

Properties: Colorless liquid. Boiling range 227–239C; fp -4 to -6C , fp (*o*-) -4 to -6C , (*p*-) 10–12C; d 1.374–1.376 (25/15C). Soluble in alcohol, ether, and acetone; insoluble in water.

Use: Intermediate for pharmaceuticals, dyes, and other organic chemicals.

***p*-chlorobenzoyl peroxide.**

CAS: 94-17-7. $(\text{ClC}_6\text{H}_4\text{CO})_2\text{OO}$.

Properties: White, odorless powder. Decomposes violently on heating or contamination. Insoluble in water; soluble in organic solvents.

Hazard: Dangerous fire and explosion risk, explodes when heated to 38C, strong oxidizer, will ignite on contact with organic materials. Store in dark, cool locality. Toxic.

Use: Bleaching agent, polymerization catalyst.

1-(*o*-chlorobenzoyl)-2-thiobiuret.

CAS: 127019-52-7. mf: $\text{C}_9\text{H}_8\text{ClN}_3\text{O}_2\text{S}$.

Hazard: A poison.

3-(2-(4-chlorobenzylamino)ethyl)indole monohydrochloride.

CAS: 63938-62-5. mf: $\text{C}_{17}\text{H}_{17}\text{ClN}_2\bullet\text{ClH}$.

Hazard: A poison.

chlorobenzyl chloride.

CAS: 104-83-6. $\text{ClC}_6\text{H}_4\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. Boiling range 216–222C, mp (*o*-) -17C , (*p*-) 31C, d 1.270–1.280 (25/15C). Soluble in alcohol, ether, and acetone; insoluble in water.

Hazard: Irritating to skin, eyes.

Use: Intermediate for organic chemicals, pharmaceuticals, and dyes.

***p*-chlorobenzyl-*p*-chlorophenyl sulfide.**

See chlorbenside.

***p*-chlorobenzyl cyanide.** $\text{ClC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless to pale-yellow solid. Mp 27C. Soluble in acetone and alcohol.

Hazard: A poison. TLV: 5 mg(CN)/m³.

Use: Organic synthesis.

***p*-chlorobenzyl-*p*-fluorophenyl sulfide.**

See fluorbenside.

2-(*p*-chlorobenzyl)pyridine. (2-(4-chlorobenzyl)pyridine). $\text{ClC}_6\text{H}_4\text{CH}_2\text{C}_5\text{H}_4\text{N}$.

Properties: Liquid. Bp 310.5C, fp 8.4C, d 1.168 (25C), refr index 1.5865 (20C). Insoluble in water.

Use: Organic synthesis.

chlorobromo- See bromochloro-

2-chlorobutadiene-1,3. See β -chloroprene.

1-chlorobutane. See *n*-butyl chloride.

chlorobutanol. (trichloro-*tert*-butyl alcohol; 1,1-trichloro-2-methyl-2-propanol; acetone chloroform).

CAS: 57-15-8. $\text{Cl}_3\text{CC}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless to white crystals; characteristic odor and taste. Mp (anhydrous form) 97C, mp (hemihydrate) 78C, bp 167C, sublimes easily. Soluble in alcohol and glycerol, hot water, ether, chloroform, and volatile oils.

Derivation: By action of potassium hydroxide on a solution of chloroform and acetone.

Grade: USP.

Hazard: Action similar to chloral hydrate. Combustible.

Use: Plasticizer for cellulose esters and ethers, preservative for biological fluids and solutions, antimicrobial agent, anesthetic in dentistry.

4-chloro-1-butene.

CAS: 927-73-1. mf: $\text{C}_4\text{H}_7\text{Cl}$.

Hazard: Moderately toxic by ingestion.

4-chloro-2-butynyl-*m*-chlorocarbanilate.

See barban.

***s*-(4-chloro-2-butynyl) *o,o*-diethyl phosphorothioate.**

CAS: 76706-97-3. mf: $\text{C}_8\text{H}_{14}\text{ClO}_3\text{PS}$.

Hazard: A poison.

Use: Agricultural chemical.

***s*-(4-chloro-2-butynyl) diphenylphosphinothioate.**

CAS: 76706-99-5. mf: $\text{C}_{16}\text{H}_{14}\text{ClO}_3\text{PS}$.

Hazard: A poison.

Use: Agricultural chemical.

***s*-(4-chloro-2-butynyl) *o*-ethyl phenylphosphonothioate.**

CAS: 76706-98-4. mf: $\text{C}_{12}\text{H}_{14}\text{ClO}_3\text{PS}$.

Hazard: A poison.

Use: Agricultural chemical.

4-chlorobutyric acid tributylstannyl ester.

See tributyltin- γ -chlorobutyrate.

2-chlorocamphane. See 2-bornyl chloride.

chlorocarbon. A compound of carbon and chlorine or carbon, hydrogen, and chlorine, such as carbon tetrachloride, chloroform, tetrachloroethylene, etc.

chlorocarbonyl ferrocene. (ferrocenoyl chloride). $C_5H_5FeC_5H_4COCl$.

Properties: Orange-red solid. Mp 48–49C.

Use: Intermediate.

3-chloro-*n*-(5-chloro-2,6-dinitro-4-trifluoromethylphenyl)-5-trifluoromethyl-2-pyridinamine.

CAS: 79622-59-6. mf: $C_{13}H_4Cl_2F_6N_4O_4$.

Hazard: Moderately toxic by ingestion and inhalation. A reproductive hazard.

Use: Agricultural chemical.

4-chloro-2-(4-chloro-2-fluorophenyl)-5-((4-chlorophenyl)methoxy)-3(2h)-pyridazinone.

CAS: 107359-74-0. mf: $C_{17}H_{10}Cl_3FN_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-chloro-2-(4-chlorophenyl)-5-((4-chlorophenyl)methoxy)-3(2h)-pyridazinone.

CAS: 107359-39-7. mf: $C_{17}H_{10}Cl_3N_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-chloro-2-(4-chlorophenyl)-5-((6-iodo-3-pyridinyl)methoxy)-3(2h)-pyridazinone.

CAS: 122322-19-4. mf: $C_{16}H_{10}Cl_2IN_3O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

chlorochromic anhydride. See chromyl chloride.

chlorocosane. See paraffin, chlorinated.

3-chlorocoumarin. $C_9H_6O_2Cl$.

Properties: Slightly yellow, crystalline solid. Mp 118C.

Grade: Technical.

Use: Tin-plating solutions.

***p*-chloro-*m*-cresol.** See 4-chloro-3-methylphenol.

chlorodecane. [1,2,3,4,5,5,6,7,8,9,10,10-dodecachlorooctahydro-1,3,4-metheno-2-cyclobuta-

(c,d)-pentalone].

CAS: 143-50-0.

Properties: Mp 349C (decomposes). Solubility in water 0.4% at 100C.

Use: Insecticide.

α -chloro-*N,N*-diallylacetamide. (CDAA).

$CICH_2CON(CH_2CH=CH_2)_2$.

Properties: Amber liquid or granules. Bp 74C (0.3 mm Hg). Slightly soluble in water; soluble in alcohol, hexane, and xylene.

Hazard: Toxic by ingestion. Dry formulations are irritating to eyes and skin.

Use: Herbicide.

1-chloro-2-dichloroarsinoethene. See β -chlorovinyl dichloroarsine.

4-chloro-2-(3,4-dichlorophenyl)-5-((6-iodo-3-pyridinyl)methoxy)-3(2h)-pyridazinone.

CAS: 122322-18-3. mf: $C_{16}H_9Cl_3IN_3O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-chloro-1-(2,4-dichlorophenyl)vinyl diethyl phosphate. See diethyl-1-(2,4-dichlorophenyl)-2-chlorovinyl phosphate.

2-chloro-4-(diethylamino)-6-(isopropylamino)-*s*-triazine. See isodiazine.

chlorodifluoroacetic acid. $CClF_2\bullet COOH$.

Properties: Colorless, pungent liquid. Bp 122C, fp 23C. Miscible with water and most organic solvents. Strong acid, dissolves cellulose and proteins.

Use: Catalyst, particularly for esterification and condensation reactions; herbicides; intermediate.

1-chloro-1,1-difluoroethane. (chlorodifluoroethane; difluoromonochloroethane; "Freon 142").

CAS: 75-68-3. CH_3CClF_2 .

Properties: Colorless gas; nearly odorless. Bp $-9.5C$, fp $-130.8C$, d 1.194 ($-9C$), lel 9.0%, uel 14.8%. Insoluble in water.

Derivation: Chlorinating 1,1-difluoroethane in UV light.

Grade: Technical.

Hazard: Flammable gas. Explosive limits in air 9.0–14.8%.

Use: Refrigerant, solvent, intermediate.

chlorodifluoromethane. (monochlorodifluoromethane; difluorochloromethane; difluoromonochloromethane; Freon 22).

CAS: 75-45-6. $CHClF_2$.

Properties: Colorless gas; nearly odorless. D (gas at its bp) 4.82 g/L, bp $-40.8C$, fp $-160C$. Partly soluble in water.

Derivation: Reaction of chloroform with anhydrous hydrogen fluoride with antimony chloride catalyst.

Grade: Technical, 99.9% pure.
Hazard: Asphyxiant. TLV: 1000 ppm.
Use: Refrigerant, low-temperature solvent, fluoro-carbon resins, especially tetrafluoroethylene polymers.
 See chlorofluorocarbon.

2-chloro-4,5-dihydro-1,3,2-dithiarsenole.
 See ethylene chlorothioarsenate(III).

8-chloro-3,4-dihydrospiro(naphthalene-2(1h),4'(5'h)-oxazol)-2'-amine.
 CAS: 162280-52-6. mf: $C_{12}H_{13}ClN_2O$.
Hazard: A poison by ingestion.

3-chloro-5-(((4,6-dimethoxy-2-pyrimidinyl)amino)carbonyl)amino)sulfonyl)-1-methyl-1h-pyrazole-4-carboxylic acid, methyl ester.
 CAS: 100784-20-1. mf: $C_{13}H_{15}ClN_6O_7S$.
Hazard: Moderately toxic by ingestion.

5-chloro-2-dimethylaminobenzoxazole.
 CAS: 64037-20-3. mf: $C_9H_9ClN_2O$.
Hazard: Moderately toxic by ingestion.

2-chloro-9-(2,2-dimethylhydrazino)acridine.
 CAS: 29023-82-3. mf: $C_{15}H_{14}ClN_2$.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

2-chloro-*n,n*-dimethyl-3-oxobutanamide.
 CAS: 5810-11-7. mf: $C_6H_{10}ClNO_2$.
Hazard: A poison by skin contact. Moderately toxic by ingestion. A severe skin and eye irritant.

1-chloro-*n,n*-dimethyl-2-propanamine hydrochloride.
 CAS: 17256-39-2. mf: $C_5H_{12}ClN \cdot ClH$.
Hazard: A poison by ingestion. Moderately toxic by skin contact. A severe eye irritant.

1-chloro-2,4-dinitrobenzene. (dinitrochlorobenzene). $C_6H_3(NO_2)_2Cl$.
Properties: Pale-yellow needles; almond odor. D 1.69, mp 53C, bp 315C, flash p 382F (194C). Soluble in hot alcohol, ether, benzene, carbon disulfide; insoluble in water.
Derivation: Chlorination of dinitrobenzene.
Grade: Technical, fused.
Hazard: Toxic by ingestion, inhalation, and skin absorption. Combustible. Upper explosive limit 22%. A skin irritant.
Use: Dyes, organic synthesis.

2-chloro-1,5-dinitro-3-(trifluoromethyl)benzene.
 CAS: 392-95-0. mf: $C_7H_2ClF_3N_2O_4$.
Hazard: Low toxicity by inhalation. A severe skin and eye irritant.

chlorodiphenyl.
 CAS: (42% chlorine) 53469-21-9; (54% chlorine) 11097-21-9.

Properties: Colorless, mobile liquid. Bp 340–375C, flash p 383F (195C) (OC). Resistant to acids and alkalis.

Grade: 54% chlorine, 42% chlorine.
Hazard: An animal carcinogen. Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: (54% chlorine) 0.5 mg/m³; (42% chlorine) 1 mg/m³.
Use: Plasticizer for cellulose, vinyl resins, and chlorinated rubbers.
 See diphenyl.

4-chlorodiphenyl sulfone. See *p*-chlorophenyl phenyl sulfone.

1-chloro-2,3-epoxypropane. See epichlorohydrin.

2-chloroethanamide. See chloroacetamide.

chloroethane. See ethyl chloride.

chloroethane nitrile. See chloroacetonitrile.

2-chloroethanesulfonyl fluoride.
 CAS: 762-70-9. mf: $C_2H_4ClFO_2S$.
Hazard: A poison by ingestion and skin contact. Low toxicity by inhalation. A severe eye irritant.

chloroethanoic anhydride. See chloroacetic anhydride.

2-chloroethanol. See ethylene chlorohydrin.

chloroethene. See vinyl chloride.

(1-(((2-chloroethoxy)(2-chloroethyl)phosphinyl)oxy)ethyl)-phosphonic acid, 1-(bis(2-chloroethoxy)phosphinyl)ethyl 2-chloroethyl ester.
 CAS: 4351-70-6. mf: $C_{14}H_{28}Cl_3O_9P_3$.
Hazard: Moderately toxic by ingestion. Low toxicity by inhalation and skin contact. A mild skin and eye irritant.

chloroethyl alcohol. See ethylene chlorohydrin.

2-chloro-4-ethyl-amino-*s*-triazine. See atrazine.

β-chloroethylchloroformate.
 CH_2ClCH_2OCCl .
Properties: Colorless liquid. D 1.3825 (20C), bp 152.5C (752 mm Hg). Decomposed by alkaline solutions and hot water. Insoluble in cold water.
Derivation: By bubbling gaseous phosgene into ethylene chlorohydrin at 0C.

Hazard: Very irritating to eyes and skin. Toxic by ingestion and inhalation.

β -chloroethyl chlorosulfonate.

Properties: Colorless liquid; chloropicrin-like odor. Bp 101C (23 mm Hg). Darkens on long storage and decomposes with evolution of hydrogen chloride.
Derivation: Interaction of sulfuryl chloride and ethylene chlorohydrin. Also from action of sulfur trioxide on ethylene chloride below 45C.

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

2-chloroethyl-diisopropylamine hydrochloride.

Hazard: A poison by inhalation, and skin contact. A severe skin and eye irritant.

chloroethylene. See vinyl chloride.

***n*-(2-chloroethyl)-*n*-ethyl-2-bromobenzylamine.**

Hazard: A poison.

2-chloroethylphosphonic acid. (ethephon; "Ethrel"). $\text{ClCH}_2\text{CH}_2\text{PO}_3\text{H}_2$. A plant-growth regulator that increases rate of ripening of plants by promoting release of ethylene, stimulates rubber latex formation; ripening of sugarcane; flowering agent for pineapple; color enhancer.

2-chloroethyltrimethyl ammonium chloride. (chlormequat).

$\text{ClCH}_2\text{CH}_2\text{N}(\text{CH}_3)_3\text{Cl}$. A plant-growth regulator stated to be effective in shortening the height of wheat and as a ripening agent in sugarcane.

2-chloroethyl vinyl ether. (2-chloroethoxy ethane).

Properties: Colorless liquid. Bp 110C, d 1.052. Stable in caustic solution; hydrolyzes in acid solutions.
Derivation: Reaction of a mixture of sodium hydroxide and triethanolamine with 2,2'-dichlorodiethyl ether.

Hazard: Moderate fire risk. Combustible.

Use: Manufacture of cellulose ethers.

chlorofenethol. (di(*p*-chlorophenyl)methylcarbinol; 1,2-bis(*p*-chlorophenyl)ethanol).

Properties: White solid. Mp 69.5–70C. Insoluble in water; soluble in petroleum ether, ethanol, toluene.
Use: Miticide.

chlorofenvinphos. (Birlane; 2-chloro-1-(2,4-dichlorophenyl)-vinyl-diethyl phosphate).

Properties: Bp 168–170C (67C) (0.5 mm Hg).

Use: General-purpose stored-product insecticide.

chlorofluorocarbon. Any of several compounds composed of carbon, fluorine, chlorine, and hydrogen, the best known of which are trichlorofluoromethane and dichlorodifluoromethane. Their use was prohibited in 1979 except for a few specialized items because of their depleting effect on stratospheric ozone.

5-(2-chloro-6-fluoro-4-(trifluoromethyl)phenoxy)-*n*-(ethylsulfonyl)-2-nitrobenzamide.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

chloroform. (trichloromethane).

Properties: Colorless, highly refractive, heavy, volatile liquid; characteristic odor; sweet taste. D 1.485 (20/20C), bp 61.2C, fp –63.5C, wt/gal 12.29 lb (25C), refr index 1.4422 (25C). Keep from light. Miscible with alcohol, ether, benzene, carbon disulfide, carbon tetrachloride, fixed and volatile oils; slightly soluble in water.

Derivation: (1) Reaction of chlorinated lime with acetone, acetaldehyde, or ethanol; (2) by-product from the chlorination of methane.

Method of purification: Extraction with concentrated sulfuric acid and rectification.

Grade: Technical, CP, ACS, NF, reagent.

Hazard: A carcinogen. Toxic by inhalation; anesthetic; prolonged inhalation or ingestion may be fatal. TLV: 10 ppm. It has been prohibited by FDA from use in drugs, cosmetics, and food packaging, including cough medicines, toothpastes, etc. Nonflammable. Will burn on prolonged exposure to flame or high temperature.

Use: Fluorocarbon plastics, solvent, analytical chemistry, fumigant, insecticides.

chloroformoxime. ClHCNOH .

Properties: Needles; odor resembles that of hydrocyanic acid. Stable at 0C, unstable at normal temperature. Small quantities volatilize, large quantities decompose. Aqueous solutions slowly decompose. Soluble in water, alcohol, ether, benzene; slightly soluble in carbon disulfide.

Derivation: Interaction of hydrochloric acid and sodium cyanate.

Hazard: Toxic by inhalation; strong irritant to tissue.

Use: Organic synthesis, tear gas, and vesicant.

chloroformyl chloride. See phosgene.

chlorogenic acid. (3-(3,4-dihydroxycinnamoyl)quinic acid).

Properties: Crystals. Mp 208C. Slightly soluble in cold water; soluble in hot water, alcohol, acetone.

chlorohydrin. (α -chlorohydrin; 1-chloropropane-2,3-diol; glyceryl α -chlorohydrin).
CAS: 96-24-2. $\text{CH}_2\text{OHCH}_2\text{OCH}_2\text{Cl}$.

Properties: Colorless, heavy liquid; unstable; hygroscopic. The commercial grade is a mixture of the two isomers, α and β , of which α is in a greater proportion. D 1.326 (18C), bp 213C (decomposes), wt/gal 11.102 lb, fp -40C , viscosity 2.388 cP (20C). Soluble in water, alcohol, and ether; immiscible with oils. Nonflammable.

Derivation: By passing hydrogen chloride gas into glycerol containing 2% acetic acid.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation.

Use: Solvent for cellulose acetate, glyceryl phthalate resins; partial solvent for gums; intermediate in organic synthesis; antifreeze agent for dynamite.

chlorohydrin rubber. An elastomer made from epichlorohydrin. Both a homopolymer and a copolymer with ethylene oxide are available.

chlorohydroquinone. (2-chloro-1,4-dihydroxybenzene; 2,5-dihydroxychlorobenzene [Cl = 1]). $\text{ClC}_6\text{H}_3(\text{OH})_2$.

Properties: White to light-tan fine crystals. Mp 100C, bp 263C. Very soluble in water and alcohol; slightly soluble in ether.

Grade: Photographic, commercial.

Use: Photographic developer, organic intermediate, dyestuffs, bactericide.

chlorohydroxybenzene. See chlorophenol.

5-chloro-2-hydroxybenzophenone.

Properties: Yellow crystals; nearly odorless. Mp 93–95C. Soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.

Use: Light absorber, best at 320–380 nm.

2-chloro-4-(hydroxymercuri)phenol. See hydroxymercurichlorophenol.

4-chloro-1-hydroxy-3-methylbenzene. See 4-chloro-3-methylphenol.

6-chloro-3-hydroxytoluene. See 4-chloro-3-methylphenol.

chloro-IPC. (isopropyl-*n*-(3-chlorophenyl) carbamate; isopropyl-3-chlorocarbanilate; CIPC; chlorpropham).

Properties: Light-tan powder. Mp 41.4C, vap press 2 mm Hg (149C), d 1.18 (30C). Very slightly soluble in water.

Hazard: Toxic by ingestion.

Use: Preemergence herbicide, prevents sprouting of potatoes.

2-chloro-*N*-isopropylacetanilide. (*N*-isopropyl- α -chloroacetanilide).

Properties: Light-tan powder or granules. Mp 67–76C, bp 110C (0.03 mm Hg). Very slightly soluble in water; soluble in acetone, alcohol, benzene, xylene, and carbon tetrachloride.

Hazard: Toxic by ingestion and skin absorption.

Use: Herbicide.

chloroisopropyl alcohol. See propylene chlorohydrin.

s-4-chloro-*n*-isopropylcarbanilolylmethyl *o,o*-dimethyl phosphorodithioate. See anilophos.

chloro isopropyl ketone. See isobutyric acid chloride.

6-chloro-4-isopropyl-1-methyl-3-phenol.

See chlorothymol.

7-chlorolincomycin hydrochloride.

Hazard: Moderately toxic by ingestion.

chloromadinone acetate. A nonestrogenic sex hormone used in oral contraception. See antifertility agent.

chloromaleic anhydride.

Properties: Yellow liquid. D 1.5, mp 10–15C, bp 192C.

Use: Catalyst for epoxy resins, intermediate.

chloromercuriferrocene. $\text{C}_5\text{H}_5\text{FeC}_5\text{H}_5\text{HgCl}$. Orange, crystalline solid; mp 193–194. Used as an intermediate and for inorganic polymers.

Hazard: Toxic by ingestion and inhalation.

chloromercuriphenol. See 2-hydroxyphenylmercuric chloride.

chloromethane. See methyl chloride.

chloromethapyrilene citrate. See chloroth-en citrate.

2-chloro-*n*-(2-methoxy-3,6-dimethylphenyl)-*n*-((1-methylethoxy)methyl) acetamide.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

chloromethoxynil. See 5-(2,4-dichlorophenoxy)-2-nitroanisole.

3-chloro-2-methylaniline. See 2-amino-6-chlorotoluene.

3-chloro-4-methylaniline. See 4-amino-2-chlorotoluene.

5-chloro-2-methylaniline. See 2-amino-4-chlorotoluene.

chloromethylated aminated stryrene-divinylbenzene resin.

CAS: 60177-39-1.

Use: Food additive.

chloromethylated diphenyl oxide.

$C_6H_5OC_6H_5$. Up to three $-CH_2Cl$ radicals can be substituted for hydrogens.

Properties: Straw-colored liquids or white solids. Mp up to 55C, d 1.19–1.30 (25/25C), flash p 307F (152C). Insoluble in water; very soluble in ether. Combustible.

Use: Intermediate, resins, plasticizers.

chloromethylbenzene. See chlorotoluene.

1-chloro-3-methylbutane. See isoamyl chloride.

chloromethylchloroformate. $CICOOCH_2Cl$.

Properties: Mobile, colorless liquid; penetrating, irritating odor. Hydrolyzed by water. Decomposed by alkalis. D 1.465 at 15C, bp 106.5–107C, vap d 4.5, vap press 5.6 mm Hg (20C). Soluble in most organic solvents.

Hazard: Toxic by ingestion and inhalation.

chloromethylchlorosulfonate.

$CICH_2OCISO_2$.

Properties: Colorless liquid. D 1.63, bp 49–50C (14 mm Hg).

Derivation: By protracted boiling of chlorosulfonic acid with chloromethylchloroformate; also from paraformaldehyde and chlorosulfonic acid.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue.

chloromethyl cyanide. See chloroacetone-trile.

1-chloromethylethylbenzene. See ethylbenzyl chloride.

4-chloro- α -(1-methylethyl)benzeneacetic acid, (2,6-dimethyl-4-(2-propynyl)phenyl) methyl ester.

CAS: 51629-58-4. mf: $C_{23}H_{25}ClO_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-chloromethylnaphthalene. (α -naphthylmethyl chloride). $C_{10}H_7CH_2Cl$.

Properties: Colorless to greenish-yellow liquid;

sharp pungent odor. D 1.182 (25/25C), coagulation p 23C, refr index 1.6354–1.6360 (25C). Insoluble in water; soluble in usual organic solvents. Very reactive.

Hazard: Vapor irritating to eyes.

Use: A lachrymator, intermediate.

4-chloro-17- α -methyl-19-nortestosterone.

CAS: 3415-90-5. mf: $C_{19}H_{27}ClO_2$.

Hazard: A reproductive hazard.

Use: Hormone.

4-chloro-3-methylphenol. (4-chloro-1-hydroxy-3-methylbenzene; 6-chloro-3-hydroxytoluene; 4-chloro-*m*-cresol; so-called *p*-chloro-*m*-cresol). $C_6H_4CH_3OHCl$.

Properties: White or slightly pink crystals; phenolic odor. Mp 64–66C, bp 235C, volatile with steam. Soluble 1:250 in water at 25C; soluble in alkalis, organic solvents, fats, and oils.

Hazard: Irritant to skin.

Use: External germicide; preservative for glues, gums, paints, inks, textile, and leather goods.

4-chloro-2-methylphenoxyacetic acid. See MCPA.

8-chloro-4-(2-methylphenoxy)quinoline.

CAS: 124496-00-0. mf: $C_{16}H_{12}ClNO$.

Hazard: Moderately toxic by ingestion.

chloromethylphosphonic acid.

$CICH_2PO(OH)_2$.

Properties: White, hygroscopic solid. Mp 85–95C.

Use: Intermediate for flame-proofing agents, resins, lubricants, additives, plasticizers.

chloromethylphosphonic dichloride.

$CICH_2POCl_2$.

Properties: Water-white to light-straw liquid. Highly reactive. D 1.638 (25C), refr index 1.4960–1.4970 (25C).

Hazard: Toxic by inhalation; irritant to eyes, lungs, and mucous membranes.

Use: Intermediate for flame-proofing agents, resins, lubricants, additives and plasticizers.

3-chloro-2-methyl-1-propene. See β -methylallyl chloride.

chloronaphthalene. See chlorinated naphthalene.

chloronaphthalene oil.

Properties: Almost colorless, thin, mobile liquid. D 1.20–1.25 (68F), liquid down to $-25F$ ($-31.6C$), congealing p $-30F$, flash p 350F (176C), volatile at 212F (100C), bp 480–550F (248–287C). Soluble in practically all organic solvent liquids and oils. Combustible.

Derivation: By chlorinating naphthalene.

Hazard: By inhalation, strong skin irritant.

Use: Plasticizer, carbon softener and remover, heat-transfer medium, solvent for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, waxes.

α -chloro-*m*-nitroacetophenone.

Properties: Off-white, free-flowing granules. Mp approximately 95–100C. Soluble in chlorinated solvents; insoluble in water.

Use: Bacteriostat and fungistat in cutting oils, water systems, paint, plastics, textiles; chemical intermediate.

2-chloro-4-nitroaniline. (*o*-chloro-*p*-nitroaniline).

Properties: Yellow needles. Mp 107C. Soluble in alcohol, benzene, ether; slightly soluble in water and strong acids.

Derivation: (1) From 1,2-dichloro-4-nitrobenzene by heating with alcoholic ammonia. (2) From the chlorination of *p*-nitroaniline in acid solution.

Hazard: Toxic by ingestion and inhalation.

Use: Intermediate in manufacture of dyes.

4-chloro-2-nitroaniline. (*p*-chloro-*o*-nitroaniline).

Properties: Orange crystals. Mp 163C. Insoluble in water, methanol, and ether.

Hazard: Toxic by ingestion and inhalation.

Use: Dye and pigment intermediate.

4-chloro-3-nitroaniline.

Properties: Yellow to tan powder. Mp 95–97C. Soluble in alcohol and acetone; partially soluble in hot water.

Hazard: Toxic by ingestion and inhalation.

Use: Intermediate in the manufacture of azo dyes, pharmaceuticals, and other organic compounds.

2-chloro-4-nitrobenzamide. See aklomide.

***m*-chloronitrobenzene.**

Properties: Yellowish crystals. D 1.534, mp 44C, bp 236C. Soluble in most organic solvents; insoluble in water.

Derivation: By chlorinating nitrobenzene in the presence of iodine and recrystallizing.

Hazard: Toxic by inhalation and ingestion. Combustible.

Use: Intermediate for dyes.

***o*-chloronitrobenzene.**

Properties: Yellow crystals. D 1.368, bp 245.5C, mp 32C, flash p 261F (127C). Soluble in alcohol and benzene; insoluble in water

Derivation: By nitrating chlorobenzene and purifying by rectification.

Hazard: Toxic by inhalation and ingestion. Combustible.

Use: Intermediate, especially for dyes.

***p*-chloronitrobenzene.** (*p*-nitrochlorobenzene).

Properties: Yellowish crystals. D 1.520, mp 83C, bp 242C. Soluble in organic solvents; insoluble in water.

Derivation: Nitration of chlorobenzene and recrystallization.

Hazard: An animal carcinogen. Very toxic by inhalation and ingestion. Absorbed via skin. Combustible. TLV: 0.1 ppm.

Use: Intermediate, especially for dyes; manufacture of *p*-nitrophenol from which parathion is made; agricultural chemicals; rubber chemicals.

2-chloro-5-nitrobenzenesulfonamide.

Properties: Grayish-white solid. Insoluble in water; soluble in benzene.

Hazard: Toxic by ingestion.

Use: Dye and pharmaceutical intermediates.

6-chloro-3-nitrobenzenesulfonic acid, sodium salt.

Properties: Off-white, moist crystals.

Hazard: Toxic by ingestion.

Use: Intermediate for dyes and pharmaceuticals.

4-chloro-3-nitrobenzoic acid.

Properties: Light-gray or white powder. Mp 170–174C.

Hazard: Toxic by ingestion and inhalation.

Use: Intermediate for dyes, perfumes, flavors, pharmaceuticals.

4-chloro-3-nitrobenzotrifluoride. (*p*-chloro-*m*-nitrotrifluorotoluene).

Properties: Thin, oily liquid. D 1.542 (15.5/15.5C), fp –7.5C, flash p 275F (135C), refr index 1.491 (20C), bp 222C. Combustible. Soluble in organic solvents; insoluble in water.

Grade: 97.5%.

Hazard: Very toxic by inhalation and ingestion. TLV: (F) 2.5 mg/m³.

Use: Intermediate for dyestuffs, agricultural chemicals, pharmaceuticals.

4-chloro-2-nitrophenol, sodium salt.

Properties: Red needles with one water of crystallization. Soluble in hot water.

Derivation: Nitration of *p*-dichlorobenzene followed by hydrolysis.

Grade: 90% anhydrous sodium salt, containing 80% base.

Use: Dye intermediate, manufacture of 2-amino-4-chlorophenol.

1-chloro-1-nitropropane. See korax.

2-chloro-6-nitrotoluene. $\text{ClNO}_2\text{C}_6\text{H}_3\text{CH}_3$.

Properties: Solid. Mp 36.5–40C. Insoluble in water. Intermediate.

Hazard: Dangerous fire risk.

4-chloro-2-nitrotoluene. $\text{ClNO}_2\text{C}_6\text{H}_3\text{CH}_3$.

Properties: Solid. Mp 35–37C. Insoluble in water; soluble in alcohol and ether.

Hazard: Dangerous fire risk.

***p*-chloro-*m*-nitrotrifluorotoluene.** See 4-chloro-3-nitrobenzotrifluoride.

chloronitrous acid. See aqua regia.

chloropentafluoroacetone. $\text{ClF}_2\text{CCOCF}_3$.

Properties: Colorless, hygroscopic, highly reactive gas. Bp 7.8C, fp –133C, d 1.43 (25C). Nonflammable.

Hazard: Evolves heat on contact with water.

Use: Intermediate.

chloropentafluoroethane. (monochloropentafluoroethane; fluorocarbon 115).

CAS: 76-15-3. CClF_2CF_3 .

Properties: Colorless gas. Bp –37.7F, fp –106C. Insoluble in water; soluble in alcohol and ether. Has good thermal stability. Nonflammable.

Hazard: TLV: 1000 ppm.

Use: Dielectric gas.

1-chloropentane. See *n*-amyl chloride.

chlorophacinone. $\text{C}_{23}\text{H}_{15}\text{ClO}_3$.

Properties: Crystals. Mp 139C. Almost insoluble in water; soluble in common organic solvents.

Hazard: Inhibits blood coagulation.

Use: Rodenticide.

chlorophene. USAN for *o*-benzyl-*p*-chlorophenol.

***m*-chlorophenol.** (3-chloro-1-hydroxybenzene).

CAS: 108-43-0. $\text{C}_6\text{H}_4\text{OHCl}$.

Properties: White crystals; odor similar to phenol; discolors on exposure to air. D 1.245, mp 33C, bp 214C. Soluble in alcohol, ether, and aqueous alkali; slightly soluble in water.

Derivation: From *m*-chloraniline through the diazonium salt.

Hazard: Toxic by skin absorption, inhalation, or ingestion.

Use: Intermediate in organic synthesis.

***o*-chlorophenol.** (2-chloro-1-hydroxybenzene).

CAS: 95-57-8. $\text{C}_6\text{H}_4\text{OHCl}$.

Properties: Colorless to yellow-brown liquid; unpleasant, penetrating odor. Bp 175C, fp 9.3C, d 1.265 (15.5C), flash p 225F (107C). Very soluble in water; soluble in alcohol, ether, and aqueous sodium hydroxide; volatile with steam. Combustible.

Derivation: Chlorination of phenol.

Hazard: Toxic by skin absorption, inhalation, or ingestion. Strong irritant to tissue.

Use: Organic synthesis (dyes).

***p*-chlorophenol.** (4-chloro-1-hydroxybenzene).

CAS: 106-48-9. $\text{C}_6\text{H}_4\text{OHCl}$.

Properties: White crystals (yellow or pink when impure); unpleasant penetrating odor. Bp 217C, mp 42–43C, d 1.306, refr index 1.5579 (40C), flash p 250C (121C). Slightly soluble in water; soluble in benzene, alcohol, and ether. Volatile with steam. A 1% solution is acid to litmus. Combustible.

Derivation: Chlorination of phenol, from chloraniline through the diazonium salt.

Grade: NF, technical.

Hazard: Toxic by skin absorption, inhalation, or ingestion; strong irritant to tissue.

Use: Intermediate in synthesis of dyes and drugs, denaturant for alcohol, selective solvent in refining mineral oils, antiseptic.

1-(*p*-chlorophenoxy)-3,3-dimethyl-1-(1-imidazolyl)-2-butanone.

CAS: 38083-17-9. mf: $\text{C}_{15}\text{H}_{17}\text{ClN}_2\text{O}_2$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact.

Use: Agricultural chemical.

4-((3-((4-chlorophenyl)amino)-4,5-dihydro-2h-benz(g)indazol-2-yl)acetyl)morpholine.

CAS: 301644-25-7. mf: $\text{C}_{23}\text{H}_{23}\text{ClN}_4\text{O}_2$.

Hazard: A poison by ingestion.

3-((4-chlorophenyl)amino)-4,5-dihydro-*n*-(1-methylethyl)-2h-benz(g)indazole-2-acetamide.

CAS: 301644-22-4. mf: $\text{C}_{22}\text{H}_{23}\text{ClN}_4\text{O}$.

Hazard: A poison by ingestion.

3-((4-chlorophenyl)amino)-4,5-dihydro-*n*-(phenylmethyl)-2h-benz(g)indazole-2-acetamide.

CAS: 301644-24-6. mf: $\text{C}_{26}\text{H}_{23}\text{ClN}_4\text{O}$.

Hazard: A poison by ingestion.

3-((4-chlorophenyl)amino)-*n*-(2-ethoxyethyl)-4,5-dihydro-2h-benz(g)indazole-2-acetamide.

CAS: 301644-23-5. mf: $\text{C}_{23}\text{H}_{25}\text{ClN}_4\text{O}_2$.

Hazard: A poison by ingestion.

***p*-chlorophenyl benzenesulfonate.** See fenson.

2-(*o*-chlorophenyl)benzimidazole.

CAS: 3574-96-7. mf: $\text{C}_{13}\text{H}_9\text{ClN}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-(4-chlorophenyl)-1h-benz(de)isoquinoline-1,3(2h)-dione.

CAS: 6915-00-0. mf: $C_{18}H_{10}ClNO_2$.

Hazard: A poison.

***p*-chlorophenyl-*p*-chlorobenzenesulfonate.**

See ovex.

2-(4-chlorophenyl)-5-((4-chlorophenyl)methoxy)-4-iodo-3(2h)-pyridazinone.

CAS: 128758-36-1. mf: $C_{17}H_{11}Cl_2IN_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-(4-chlorophenyl)-5-((6-chloro-3-pyridinyl)methoxy)-4-iodo-3(2h)-pyridazinone.

CAS: 122322-23-0. mf: $C_{16}H_{10}Cl_2IN_3O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-chloro- α -phenyl-*o*-cresol. See *o*-benzyl-*p*-chlorophenol.

3-*p*-chlorophenyl-1,1-dimethylurea. See monuron.

3-(3-(4-(2-(4-chlorophenyl)ethyl)phenyl)-1,2,3,4-tetrahydro-1-naphthalenyl)-4-hydroxy-2h-1-benzopyran-2-one.

CAS: 90035-12-4. mf: $C_{33}H_{27}ClO_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***n*-(2-(4-chlorophenyl)ethyl)-1,3,4,5-tetrahydro-7,8-dihydroxy-2h-2-benzazepine-2-carbothioamide.**

CAS: 138977-28-3. mf: $C_{19}H_{21}ClN_2O_2S$.

Hazard: A poison.

2-(3-chlorophenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-11-4. mf: $C_{17}H_{11}ClN_2$.

Hazard: A reproductive hazard.

4-(4-chlorophenyl)-1-(1h-indol-3-ylmethyl)piperidin-4-ol.

CAS: 81226-60-0. mf: $C_{20}H_{21}ClN_2O$.

Hazard: A poison.

***m*-chlorophenyl isocyanate.** ClC_6H_4NCO .

Properties: Clear water-white to light-yellow liquid. Fp -4.4C, flash p 215F (101.6C) (COC). Combustible.

Hazard: Toxic via strong irritant to skin, eyes, and mucous membranes.

Use: Intermediate for pharmaceuticals, herbicides, and pesticides.

***p*-chlorophenyl isocyanate.** ClC_6H_4NCO .

Properties: Colorless to slightly yellow liquid or white crystals. Fp 29.9C, flash p 230F (110C) (COC). Combustible.

Hazard: Strong irritant to skin, eyes, and mucous membranes.

Use: Intermediate for pharmaceuticals, herbicides, and pesticides.

5-((4-chlorophenyl)methoxy)-2-(3,4-dichlorophenyl)-4-iodo-3(2h)-pyridazinone.

CAS: 128758-37-2. mf: $C_{17}H_{10}Cl_3IN_2O_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

(2-chlorophenyl)methyl (4-chlorophenyl)methyl-3-pyridinylcarbonimidodithioate.

CAS: 34763-34-3. mf: $C_{20}H_{16}Cl_2N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl 1,1-dimethylpropyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-25-2. mf: $C_{18}H_{21}ClN_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl dodecyl 3-pyridinylcarbonimidodithioate.

CAS: 40199-26-6. mf: $C_{25}H_{35}ClN_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl 1-ethyl-1-methylpropyl-3-pyridinylcarbonimidodithioate.

CAS: 34763-27-4. mf: $C_{19}H_{23}ClN_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***s*-((4-chlorophenyl)methyl) *o*-ethyl 3-pyridinylcarbonimidodithioate.**

CAS: 34763-52-5. mf: $C_{15}H_{15}ClN_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl heptyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-28-5. mf: $C_{20}H_{25}ClN_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3-(*o*-chlorophenyl)-2-methyl-4-quinazolone.

See 2-methyl-3-(2-chlorophenyl)chinazolone-4.

3-(*p*-chlorophenyl)-5-methylrhodanine.

$C_{10}H_8ClNOS_2$.

Properties: Yellow crystals. Mp 106-110C. Insoluble in water; soluble in acetone.

Hazard: Toxic by ingestion.

Use: Fungicide and for nematode control.

(4-chlorophenyl)methyl hexadecyl 3-pyridinylcarbonimidodithioate.

CAS: 41643-23-6. mf: C₂₉H₄₃ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl hexyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-26-3. mf: C₁₉H₂₃ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl 1-methylethyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-19-4. mf: C₁₆H₁₇ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl 1-methylpropyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-22-9. mf: C₁₇H₁₉ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***o*-((4-chlorophenyl)methyl) *s*-(2-methylpropyl)-3-pyridinylcarbonimidodithioate.**

CAS: 51308-77-1. mf: C₁₇H₁₉ClN₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***s*-((4-chlorophenyl)methyl) *o*-(2-methylpropyl)-3-pyridinylcarbonimidodithioate.**

CAS: 51308-78-2. mf: C₁₇H₁₉ClN₂OS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(2-chlorophenyl)methyl methyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-36-5. mf: C₁₄H₁₅ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-((4-chlorophenyl)methyl)-2-(nitromethylene)imidazolidine.

CAS: 69840-61-5. mf: C₁₁H₁₂ClN₃O₂.

Hazard: A poison.

Use: Agricultural chemical.

(4-chlorophenyl)methyl octadecyl 3-pyridinylcarbonimidodithioate.

CAS: 41643-24-7. mf: C₃₁H₄₇ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl octyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-29-6. mf: C₂₁H₂₇ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-chlorophenyl)methyl tetradecyl 3-pyridinylcarbonimidodithioate.

CAS: 41643-22-5. mf: C₂₇H₃₉ClN₂S₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4-(4-chlorophenyl)-6h-1,3,5-oxathiazine.

CAS: 58955-81-0. mf: C₉H₈ClNOS.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

chloro-*o*-phenylphenol. (chloro-2-phenylphenol). C₆H₃(OH)ClC₆H₅.

Properties: Clear, colorless to straw-colored, viscous liquid with faint characteristic odor. D 1.228 (20/4C), fp < -20C, boiling range (5-95%) 146-158.7C (5 mm Hg), flash p 273F (134C). Readily soluble in most organic solvents. Combustible.

Composition: (80%) 4-chloro-2-phenylphenol, (20%) 6-chloro-2-phenylphenol.

Hazard: Toxic by ingestion and inhalation.

Use: Fungicide.

***m*-chlorophenyl phenyl sulfide.**

CAS: 38700-88-8. mf: C₁₂H₉ClS.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and eye irritant.

***p*-chlorophenyl phenylsulfone.** (4-chlorodiphenyl sulfone; sulphenone). ClC₆H₄SO₂C₆H₅.

Properties: Dimorphic crystals; slight aromatic odor; tasteless. Insoluble in water; soluble in most organic solvents. Relatively stable in acids and alkalis.

Hazard: Toxic by ingestion.

Use: Insecticide and acaricide for pests (harmful to most grapes and pears).

***m*-chlorophenylpiperazine.**

CAS: 6640-24-0. mf: C₁₀H₁₃ClN₂.

Hazard: A poison.

3-(4-chlorophenyl)-*n*-(4-propylcyclohexyl)-2-propenamide.

CAS: 315706-74-2. mf: C₁₈H₂₄ClNO.

Hazard: A poison by ingestion.

3-((4-chlorophenyl)sulfonyl)-2-propenenitrile.

CAS: 1012-71-1. mf: C₉H₆ClNO₂S.

Hazard: Moderately toxic by ingestion. A moderate eye irritant.

5-(*p*-chlorophenyl)-2,3,5,6-tetrahydroimidazo(1,2-*c*)quinazolin.

CAS: 23597-98-0. mf: C₁₆H₁₄ClN₃.

Hazard: A poison by ingestion.

o-(4-((4-chlorophenyl)thio)phenyl) o-ethyl s-propyl phosphorothioate.CAS: 59010-86-5. mf: $C_{17}H_{20}ClO_3PS_2$.**Hazard:** Moderately toxic by ingestion and skin contact.**2-(p-chlorophenyl)-5h-s-triazolo(5,1-a)isoindole.**CAS: 57312-03-5. mf: $C_{15}H_{10}ClN_3$.**Hazard:** A reproductive hazard.**2-p-chlorophenyl-2-(1h-1,2,4-triazol-1-ylmethyl)hexanenitrile.** See myclobutanil.**chlorophenyltrichlorosilane.**CAS: 26571-79-9. $ClC_6H_4SiCl_3$. A mixture of isomers.**Properties:** Colorless to pale-yellow liquid. Bp 230C, d 1.439 (25/25C), refr index 1.5414 (20C), flash p 255F (124C) (COC). Readily hydrolyzed with liberation of hydrogen chloride. Combustible.**Derivation:** By Grignard reaction of silicon tetrachloride and chlorophenylmagnesium chloride.**Grade:** Technical.**Hazard:** Corrosive to wet skin.**Use:** Intermediate for silicones.**3-β-(4-chlorophenyl)tropane-2-β-carboxylic acid phenyl ester hydrochloride.**CAS: 141807-57-0. mf: $C_{21}H_{22}ClNO_2 \cdot ClH$.**Hazard:** A poison.**4-chlorophthalic acid.** $C_6H_3Cl(COOH)_2$.**Properties:** Colorless crystals. Mp 150C. Decomposes on further heating; soluble in alcohol and ether; insoluble in water.**Derivation:** Chlorination of phthalic acid.

chlorophyll. The green pigment essential to photosynthesis. It is present in all plants except fungi and bacteria. It occurs in three forms (a, b, and c), all of which are magnesium-centered porphyrins containing a hydrophilic carbocyclic ring with a lipophilic phytol tail. Chlorophyll is a photoreceptor for wavelengths up to 700 nm. It can readily transfer radiant energy to its chemical environment and thus acts as a transducer in photosynthesis. It is structurally analogous to the red blood pigment hemin. Chlorophyll has been synthesized by two different routes. Its derivatives are relatively unstable to light, oxidizing agents, and chemical reagents.

Properties: Chlorophyll a: $C_{55}H_{72}MgN_4O_5$. Blue-green, microcrystalline wax; approximately three times as plentiful as chlorophyll b: mp 117–120C. Freely soluble in ether, ethanol, acetone, chloroform, carbon disulfide, benzene; sparingly soluble in cold methanol; insoluble in petroleum ether. The alcoholic solution is blue-green with a deep-red fluorescence. Chlorophyll b: $C_{55}H_{70}MgN_4O_6$. Yellow-green, microcrystalline wax. Sparingly soluble in absolute alcohol, ether. Ether solution has a brilliant green color. Solutions with other organic solvents are usually green to yellow-green with red fluorescence. Chlorophyll c: Occurs in marine organisms and may be as important as chlorophyll b.

Derivation: Alcoholic extraction of green plants; isolation by chromatography.**Grade:** Aqueous, alcoholic, or oil solutions; water solutions are prepared by saponification of oil-soluble chlorophyll.**Use:** Colorant for soaps, oils, fats, waxes, liquors, confectionery, preserves, cosmetics, perfumes; dentistry, source of phytol, sensitizer for color film, toothpaste additive, deodorant.

See photosynthesis; porphyrin; chelate.

Note: An experimental use of chlorophyll to act as energy converter in a synthetic photovoltaic cell has aroused interest in connection with solar-energy research. The cell is termed a *synthetic leaf*, because it is an attempt to imitate the energy-trapping function of a natural leaf.

chlorophyllin. Reaction product of alcoholic potassium or sodium hydroxide and alcoholic leaf extracts. The methyl and phytol groups are replaced by alkali, but the magnesium is not replaced. Used in food coloring, dyes, deodorants, and medicine.

chloropicrin. (chloropicrin; nitrotrichloromethane; trichloronitromethane; nitrochloroform).

CAS: 76-06-2. CCl_3NO_2 .**Properties:** Pure product slightly oily, colorless, refractive liquid. D 1.692 (0C), bp 112C, fp -69.2C. Relatively stable, no decomposition by water or mineral acids. Soluble in alcohol, benzene, ether, carbon disulfide; slightly soluble in water. Non-flammable.**Derivation:** (1) Action of picric acid on calcium hypochlorite; (2) nitrication of chlorinated hydrocarbons.

Hazard: Very toxic by ingestion and inhalation; strong irritant. TLV: 0.1 ppm.

Use: Organic synthesis, dyestuffs (crystal violet), fumigants, fungicides, insecticides, rat exterminator, tear gas.

1-chloropinacolone. See 1-monochloropinacolone.

chloroplast. A chlorophyll-containing plastid found in algal and green plant cells (eukaryotic).

chloroplast chromosome. Circular DNA found in the photosynthesizing organelle (chloroplast) of plants instead of the cell nucleus where most genetic material is located.

chloroplatinic acid.

CAS: 16941-12-1. $\text{H}_2\text{PtCl}_6 \cdot 6\text{H}_2\text{O}$.

Properties: Red-brown crystals. D 1.431, mp 60C. Soluble in water, alcohol, and ether.

Derivation: By solution of platinum in aqua regia, evaporation, and crystallization.

Hazard: See platinum chloride.

Use: Electroplating, platinizing pumice and the like for catalysts, etching zinc for printing, platinum mirrors, indelible ink, ceramics (producing fine color effects on high-grade porcelain), microscopy.

β -chloroprene. (2-chlorobutadiene-1,3).

CAS: 126-99-8. $\text{H}_2\text{C}=\text{CHCCl}:\text{CH}_2$.

Properties: Colorless liquid. Bp 59.4C, d 0.9583 (20/20C), flash p -4F (-20C). Soluble in alcohol; slightly soluble in water.

Derivation: Addition of cold hydrochloric acid to vinylacetylene, chlorination of butadiene.

Grade: Pure, 95% min.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 10 ppm. NIOSH has recommended 1 ppm. Flammable, dangerous fire risk, explosive limits in air 4.0 to 20%.

Use: Manufacture of neoprene.

1-chloropropane. See propyl chloride.

3-chloropropane-1,2-diol. See chlorohydrin.

1-chloro-2-propanol. See propylene chlorohydrin.

1-chloro-2-propanone. See chloroacetone.

1- or 3-chloropropene. See allyl chloride.

2-chloropropene. (isopropenyl chloride).

CAS: 557-98-2. $\text{CH}_3\text{CCl}:\text{CH}_2$.

Properties: Colorless gas or liquid. D 0.918 (9C), fp -137.4C, bp 22.65C (1 atm).

Derivation: By treating propylene dichloride with alcoholic potassium hydroxide and fractionating from the simultaneously formed 1-chloropropene.

Grade: 95% purity.

Hazard: Toxic by ingestion and inhalation. Flammable, dangerous fire risk.

Use: Intermediate in organic synthesis, formulation of copolymers.

2-chloropropionic acid. (α -chloropropionic acid).

CAS: 598-78-7. $\text{CH}_3\text{CHClCOOH}$.

Properties: Crystals. D 1.260-1.268 (20C), bp 183-187C. Soluble in water.

Hazard: Combustible. TLV: 0.1 ppm. Toxic by skin contact.

Use: Intermediate for weed killers.

3-chloropropionic acid. (β -chloropropionic acid).

CAS: 107-94-8. $\text{CH}_2\text{ClCH}_2\text{COOH}$.

Properties: Crystals. Mp 41C, bp 200C. Soluble in water, alcohol, chloroform. Combustible.

Use: Intermediate.

3-chloropropionitrile.

CAS: 542-76-7. $\text{ClCH}_2\text{CH}_2\text{CN}$.

Properties: Colorless liquid. Fp -51C, flash p 168F (75.5C) (CC), refr index 1.4341 (25C), d 1.1363 (25C), bp 176C (decomposes). Miscible with acetone, benzene, carbon tetrachloride, alcohol, and ether.

Hazard: Toxic by ingestion, inhalation, and skin contact. Combustible.

Use: Intermediate in polymer synthesis.

4-chloro-*n*-(4-propylcyclohexyl)benzamide.

CAS: 315706-66-2. mf: $\text{C}_{16}\text{H}_{22}\text{ClNO}$.

Hazard: A poison by ingestion.

α -chloropropylene. See allyl chloride.

chloropropylene oxide. See epichlorohydrin.

3-chloropropyl mercaptan.

$\text{ClCH}_2\text{CH}_2\text{CH}_2\text{SH}$.

Properties: Liquid. Distillation range 141.1-145.6C, d 1.131 (15.5C), refr index 1.492 (20C), flash p approximately 110F (43C).

Hazard: Moderate fire risk. Combustible.

Use: Intermediate.

3-chloro-1-propyne. See propargyl chloride.

2-chloropyridine.

CAS: 109-09-1. $\text{ClC}_5\text{H}_4\text{N}$.

Properties: Oily liquid. D 1.205 (15C), bp 170C. Slightly soluble in water; soluble in alcohol and ether.

Hazard: Toxic by ingestion.

- Use:** Production of antihistamines, germicides, pesticides, and agricultural chemicals.
- 5-((6-chloro-3-pyridinyl)methoxy)-2-(3,4-dichlorophenyl)-4-iodo-3(2h)-pyridazinone.**
CAS: 122322-24-1. mf: $C_{16}H_9Cl_3IN_3O_2$.
Hazard: A poison by ingestion.
Use: Agricultural chemical.
- (1-((6-chloro-3-pyridinyl)methyl)-4,5-dihydro-1h-imidazol-2-yl)cyanamide.**
CAS: 111988-43-3. mf: $C_{10}H_{10}ClN_3$.
Hazard: A poison.
Use: Agricultural chemical.
- n*-((6-chloro-3-pyridinyl)methyl)-1,2-ethanediamine.**
CAS: 101990-44-7. mf: $C_8H_{12}ClN_3$.
Hazard: A poison.
Use: Agricultural chemical.
- ((6-chloro-3-pyridinyl)methyl)guanidine.**
CAS: 200258-65-7. mf: $C_7H_9ClN_4$.
Hazard: A poison.
Use: Agricultural chemical.
- 1-((6-chloro-3-pyridinyl)methyl)hexahydro-2-(nitromethylene)pyrimidine.**
CAS: 101336-64-5. mf: $C_{11}H_{13}ClN_4O_2$.
Hazard: A poison.
Use: Agricultural chemical.
- 1-((6-chloro-3-pyridinyl)methyl)-2-imidazolidinone.**
CAS: 120868-66-8. mf: $C_9H_{10}ClN_3O$.
Hazard: A poison by ingestion.
Use: Agricultural chemical.
- 1-((6-chloro-3-pyridinyl)methyl)-2-imidazolidinone hydrazone.**
CAS: 131206-84-3. mf: $C_9H_{12}ClN_3$.
Hazard: A poison.
Use: Agricultural chemical.
- (1-((6-chloro-3-pyridinyl)methyl)-2-imidazolidinylidene) acetonitrile.**
CAS: 141631-47-2. mf: $C_{11}H_{11}ClN_4$.
Hazard: A poison.
Use: Agricultural chemical.
- 1-((6-chloro-3-pyridinyl)methyl)-3-methyl-*n*-nitro-2-imidazolidinimine.**
CAS: 117906-15-7. mf: $C_{10}H_{12}ClN_3O_2$.
Hazard: A poison.
Use: Agricultural chemical.
- n*-((6-chloro-3-pyridinyl)methyl)-*n*'-nitroguanidine.**
CAS: 131748-56-6. mf: $C_7H_8ClN_3O_2$.
Hazard: A poison.
Use: Agricultural chemical.
- 1-((6-chloro-3-pyridinyl)methyl)-*n*-nitro-1h-imidazol-2-amine.**
CAS: 115086-54-9. mf: $C_9H_8ClN_3O_2$.
Hazard: A poison.
Use: Agricultural chemical.
- (3-((6-chloro-3-pyridinyl)methyl)-2-thiazolidinylidene)cyanamide.**
CAS: 111988-49-9. mf: $C_{10}H_9ClN_4S$.
Hazard: Moderately toxic by ingestion and inhalation. A reproductive hazard.
Use: Agricultural chemical.
- ((6-chloro-3-pyridinyl)methyl)urea.**
CAS: 200258-66-8. mf: $C_7H_8ClN_3O$.
Hazard: A poison.
Use: Agricultural chemical.
- 6-chloroquinaldine.** $C_9H_9N(CH_3)Cl$.
Properties: Brownish-black, oily, crystalline mass.
Grade: Technical.
Use: Intermediate.
- chloroquine.**
 $C_9H_5NCINHCH(CH_3)(CH_2)_3N(C_2H_5)_2$. (7-chloro-4-(4-diethylamino-1-methylbutylamino)-quinoline).
Properties: Colorless crystals; bitter taste. Insoluble in alcohol, benzene, chloroform, ether.
Derivation: Condensation of 4,7-dichloroquinoline with 1-diethylamino-4-aminopentane.
Hazard: Toxic by ingestion.
Use: Medicine (antimalarial). Usually dispensed as the phosphate.
- 5-chlorosalicylanilide.** $C_{10}H_9ClO_2$.
Properties: White crystals. Mp 209–211C. Slightly soluble in water; soluble in alcohol, ether, chloroform, and benzene.
Hazard: Toxic via ingestion.
Use: Fungicide, antimildew agent, intermediate for pharmaceuticals, dyes, pesticides.
- 5-chlorosalicylic acid.**
CAS: 321-14-2. $C_{10}H_7ClO_4$.
Properties: White crystals. Mp 174–176C. Slightly soluble in water; soluble in alcohol, ether, chloroform, and benzene.
Hazard: Toxic by ingestion.
Use: Moth-proofing, insecticide, intermediate for pharmaceuticals, dyes, pesticides.
- o*-chlorostyrene.**
CAS: 2039-87-4. C_8H_7Cl .
Properties: Mp 138.6, d 1.1 (20C), bp 188.7C. Soluble in alcohol, ether, and acetone.
Hazard: TLV: 50 ppm.
- n*-chlorosuccinimide.** (NCS).
 $COCH_2CH_2CONCl$.
Properties: White crystals. Mp 148–149C. Soluble

in water; sparingly soluble in chloroform and carbon tetrachloride.

Use: Chlorinating agent, disinfectant for swimming pools, bactericide.

3-chloro-6-sulfanilamidopyridazine. See sulfachlorpyridazine.

chlorosulfonic acid. (sulfuric chlorohydrin).
CAS: 7790-94-5. ClSO_2OH .

Properties: Colorless to light yellow, fuming, slightly cloudy liquid; pungent odor. D 1.76–1.77 (20/20C, fp -80C , bp 158C). Decomposes in water to sulfuric and hydrochloric acids. Decomposed by alcohol and acids.

Derivation: By treating sulfur trioxide or fuming sulfuric acid with hydrochloric acid.

Grade: Technical.

Hazard: Toxic by inhalation; strong irritant to eyes and skin; causes severe burns. Can ignite combustible materials. Evolves hydrogen on contact with most metals.

Use: Synthetic detergents, pharmaceuticals, sulfonating agent for dyes, pesticides, intermediates, ion-exchange resins, anhydrous hydrogen chloride, and smoke-producing chemicals.

4-chlorosulfonylbenzoic acid.

$\text{ClSO}_2\text{C}_6\text{H}_4\text{COOH}$.

Properties: Light-tan powder. Soluble in benzene; slightly soluble in ether.

Use: Intermediate.

3-(chlorosulfonyl)benzoyl chloride.

CAS: 4052-92-0. mf: $\text{C}_7\text{H}_4\text{Cl}_2\text{O}_3\text{S}$.

Hazard: Moderately toxic by ingestion and skin contact. A moderate eye irritant.

chlorosulfuric acid. See sulfuryl chloride.

4-chlorotestosterone 17-acetate.

CAS: 855-19-6. mf: $\text{C}_{21}\text{H}_{29}\text{ClO}_3$.

Hazard: A poison by ingestion. A reproductive hazard.

Use: Hormone.

chlorotetracycline. See chlortetracycline.

chlorotetrafluoroethane. (monochlorotetrafluoroethane). $\text{C}_2\text{CF}_4\text{Cl}$.

Properties: Gas; odorless; colorless. Much heavier than air. Nonflammable.

6-chloro-2,3,4,5-tetrahydro-3-methyl-1-(3-methylphenyl)-1h-3-benzazepine-7,8-diol, hydrobromide.

CAS: 67287-95-0. mf: $\text{C}_{18}\text{H}_{20}\text{ClNO}_2\cdot\text{BrH}$.

Hazard: A poison.

6-chloro-2,3,4,5-tetrahydro-1-phenyl-1h-3-benzazepine-7,8-diol, hydrobromide.

CAS: 67287-39-2. mf: $\text{C}_{16}\text{H}_{16}\text{ClNO}_2\cdot\text{BrH}$.

Hazard: A poison.

6-chloro-2,3,4,5-tetrahydro-1-phenyl-3-(2-propenyl)-1h-3-benzazepine-7,8-diol, hydrobromide.

CAS: 74115-01-8. mf: $\text{C}_{19}\text{H}_{20}\text{ClNO}_2\cdot\text{BrH}$.

Hazard: A poison.

1-chloro-2,2,5,5-tetramethyl-4-imidazolidinone.

CAS: 38951-85-8. mf: $\text{C}_7\text{H}_{13}\text{ClN}_2\text{O}$.

Hazard: A poison by ingestion. Low toxicity by skin contact.

chlorothen citrate. (chloromethapyrilene citrate). $\text{C}_{14}\text{H}_{18}\text{ClN}_3\text{S}\cdot\text{C}_6\text{H}_8\text{O}_7$.

Properties: White, crystalline powder; practically odorless. Mp $112-116\text{C}$. On further heating solidifies and remelts; $125-140\text{C}$ decomposes. Slightly soluble in alcohol and water; practically insoluble in chloroform, ether, and benzene. One percent solution is clear and colorless; pH (1% solution) $3.9-4.1$.

Grade: NF.

Use: Medicine (antihistamine).

“Chlorothen” [Dow]. TM for a series of chlorinated organic solvents.

Grade: NU and industrial are both inhibited 1,1,1-trichloroethane.

Use: Cold cleansing of metal parts; industrial solvents.

6-chloro-2-thio-2h-1,3-benzoxazine-2,4(3h)-dione.

CAS: 7672-94-8. mf: $\text{C}_8\text{H}_4\text{ClNO}_2\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

6-chloro-4-thiochromanyl-*o,o*-diethyl dithiophosphate.

CAS: 41219-31-2. mf: $\text{C}_{13}\text{H}_{18}\text{ClO}_2\text{PS}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

6-chloro-4-thiochromanyl *o,o*-dimethyl dithiophosphate.

CAS: 41219-30-1. mf: $\text{C}_{11}\text{H}_{14}\text{ClO}_2\text{PS}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***p*-chlorothiophenol.** (*p*-chlorobenzenethiol).

CAS: 106-54-7. $\text{ClC}_6\text{H}_4\text{SH}$.

Properties: Moist white to cream crystals. Mp $52-55\text{C}$, bp $205-207\text{C}$. Soluble in most organic solvents.

Hazard: Toxic by ingestion.

Use: Oil additives, agricultural chemicals, plasticizers, rubber chemical, dyes, wetting agents, and stabilizers.

chlorothymol. (6-chloro-4-isopropyl-1-methyl-3-phenol). $\text{CH}_3\text{C}_6\text{H}_2(\text{OH})(\text{C}_3\text{H}_7)\text{Cl}$.

Properties: White crystals or granular powder; characteristic odor; aromatic, pungent taste. Becomes discolored with age, affected by light. Mp 59–61C. Soluble in benzene, chloroform, dilute caustic soda, alcohol; slightly soluble in water.

Derivation: Action of sulfuryl chloride on thymol in a solution of carbon tetrachloride.

Grade: NF.

Hazard: Irritant to skin and mucous membranes in concentrated solution.

Use: Bactericide, component of antiseptic solutions.

α -chlorotoluene. See benzyl chloride.

***m*-chlorotoluene.** (3-chloro-1-methylbenzene).

CAS: 108-41-8. $\text{CH}_3\text{C}_6\text{H}_4\text{Cl}$.

Properties: Colorless liquid. D 1.07218 (20/4C), bp 161.6C, fp –48.0C, refr index 1.52 (20C).

Derivation: Diazotization of *m*-toluidine followed by treating with cuprous chloride.

Hazard: Narcotic in high concentration. Avoid inhalation.

Use: Solvent, intermediate.

***o*-chlorotoluene.** (2-chloro-1-methylbenzene).

CAS: 95-49-8. $\text{CH}_3\text{C}_6\text{H}_4\text{Cl}$.

Properties: Colorless liquid. Bp 159.2C, fp –35.1C, d 1.0776 (25/4C), refr index 1.5268 (20C). Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and *n*-heptane; slightly soluble in water.

Derivation: By catalytic chlorination of toluene.

Hazard: Toxic by inhalation. TLV: 50 ppm.

Use: Solvent and intermediate for organic chemicals and dyes.

***p*-chlorotoluene.** (4-chloro-1-methylbenzene).

CAS: 106-43-4. $\text{CH}_3\text{C}_6\text{H}_4\text{Cl}$.

Properties: Colorless liquid. Boiling range 162–166C, fp approximately 6.5C, d 1.065–1.067 (25/15C), refr index 1.5184 (22C). Soluble in alcohol, ether, acetone, benzene, and chloroform; slightly soluble in water.

Hazard: Avoid inhalation; strong irritant.

Use: Solvent and intermediate for organic chemicals and dyes.

2-chlorotoluene-4-sulfonic acid. (*o*-chloro-toluene-*p*-sulfonic acid). $\text{CH}_3\text{C}_6\text{H}_3(\text{SO}_3\text{H})\text{Cl}$.

Properties: White, glistening plates. Soluble in hot water.

Derivation: Chlorination of toluene-*p*-sulfonic acid.

Method of purification: Recrystallization from water.

Use: Dye intermediate.

2-chloro-*p*-toluidine. See 4-amino-2-chloro-toluene.

4-chloro-*o*-toluidine. See 2-amino-4-chloro-toluene.

6-chloro-*o*-toluidine. See 2-amino-6-chloro-toluene.

4-chloro-*o*-toluidine hydrochloride.

$\text{CH}_3\text{C}_6\text{H}_3(\text{Cl})\text{NH}_2\cdot\text{HCl}$.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

2-chloro-5-toluidine-4-sulfonic acid. (6-chloro-*m*-toluidine-4-sulfonic acid).

$\text{CH}_3\text{C}_6\text{H}_2(\text{NH}_2)(\text{SO}_3\text{H})\text{Cl}$.

Properties: Fine, white crystals. Soluble in dilute caustic solution.

Derivation: From *o*-chlorotoluene-*p*-sulfonic acid by nitration and subsequent reduction.

Use: Intermediate.

chlorotriazinyl dye. A fiber-reactive dye, both mono- and di- derivatives have been developed. They react readily and permanently with cellulose under alkaline conditions with 70–80% efficiency.

chlorotribenzylstannane.

CAS: 3151-41-5. mf: $\text{C}_{21}\text{H}_{21}\text{ClSn}$.

Properties: Colorless needles from EtOAc. Mp: 142–144°.

Hazard: A poison by ingestion. A skin and severe eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

chlorotributylstannane.

CAS: 1461-22-9. mf: $\text{C}_{12}\text{H}_{27}\text{ClSn}$.

Properties: Liquid. D: 1.2105 @ 20°, bp: 171–173° @ 25 mm.

Hazard: A poison by ingestion and skin contact. A severe eye irritant. Tributyl tin compounds are extremely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical.

2-chloro-6-(trichloromethyl)pyridine. See nitrapyrin.

2-chloro-1,1,3-triethoxy propane.

CAS: 10140-99-5. mf: $\text{C}_9\text{H}_{19}\text{ClO}_3$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation. A mild skin irritant.

chlorotriethylstannane. See triethyltin chloride.

2-chloro-1,1,2-trifluoroethyl difluoromethyl ether. See enflurane.

chlorotrifluoroethylene. (CFE; CTFE; trifluorochloroethylene).

CAS: 79-38-9. CIFC: CH_2 .

Properties: Colorless gas; faint ethereal odor. Bp –27.9C, fp –157.5C, d (liquid) 1.305 (20C). Decomposes in water.

Derivation: From trichlorotrifluoroethane and zinc.

Grade: Technical 99.0%.

Hazard: Dangerous fire risk. Flammable limits in air 8.4–38.7%.

Use: Intermediate, monomer for chlorotrifluoroethylene resins.

chlorotrifluoroethylene polymer. (polytrifluorochloroethylene resin; fluorothene). A polymer of chlorotrifluoroethylene, usually including vinylidene fluoride, characterized by the repeating structure (CF₂–CCl).

Properties: Colorless. D 2.10–2.15, refr index 1.43. Impervious to corrosive chemicals, resistant to most organic solvents, heat resistant. Nonflammable. Thermoplastic. Zero moisture absorption; high-impact strength; transparent films and thin sheets.

Use: Chemical piping, gaskets, tank linings, connectors, valve diaphragms, wire and cable insulation, electronic components.

See “Kel-F”; fluorocarbon polymer.

chlorotrifluoromethane. (monochlorotrifluoromethane; trifluorochloromethane).

CAS: 75-72-9. CClF₃.

Properties: Colorless gas; ethereal odor. Bp –81.4C, fp –181C, heavier than air. Nonflammable

Derivation: From dichlorodifluoromethane in vapor phase with aluminum chloride catalyst.

Grade: 99.0% min purity.

Hazard: Toxic by inhalation; slightly irritant.

Use: Dielectric and aerospace chemical, hardening of metals, pharmaceutical processing.

See chlorofluorocarbon.

2-chloro-5-trifluoromethylaniline.

C₆H₃ClCF₃NH₂.

Properties: Amber-colored oil. Fp 6–8C. Insoluble in water; soluble in alcohol and acetone. Forms water-soluble salts with mineral acids.

Hazard: Irritant to eyes and skin.

Use: Intermediate for dyes and other organic chemicals.

chlorotrifluoromethylbenzene. See chlorobenzotrifluoride.

chloro- α,α,α -trifluorotoluene. See chlorobenzotrifluoride.

chloro(triisobutyl)stannane.

CAS: 7342-38-3. mf: C₁₂H₂₇ClSn.

Properties: Solid. D: 1.1290 @ 34°, mp: 30.2°, bp: 174° @ 13 mm.

Hazard: A poison. Tributyl tin compounds are very toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

chlorotriisopropylstannane. See triisopropyltin chloride.

chlorotrimethylstannanechlorotrimethylstannane.

CAS: 1066-45-1. mf: C₃H₉ClSn.

Properties: Colorless needles. Mp: 42°, bp: 154–156°.

Hazard: A deadly poison. A reproductive hazard. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

chlorotrioctylstannane. See tri-*n*-octyltin chloride.

chlorotripropylstannane.

CAS: 2279-76-7. mf: C₉H₂₁ClSn.

Properties: Colorless liquid. D: 1.2678 @ 28°, mp: –23.5°. Sol in org solvs.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

chloro(trivinyl)stannane.

CAS: 10008-90-9. mf: C₆H₉ClSn.

Properties: Colorless liquid. Bp: 59–60° @ 6 mm.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

β -chlorovinyl dichloroarsine. (1-chloro-2-dichloroarsinoethane; dichloro[2-chlorovinyl]arsine; chlorovinylarsinedichloride; Lewisite). Two isomers, probably *cis* and *trans*, are known. ClCH:CHAsCl₂.

Properties: Colorless liquid when pure; geranium-like odor. Impurities lead to colors ranging from violet to brown, decomposed by water and alkalis. Inactivated by bleaching powder. Antidote is dimercaptopropanol.

Derivation: Condensation of arsenic trichloride with acetylene in the presence of aluminum, copper, or mercury chloride. The mixed arsines are separated by fractionating.

Hazard: Vesicant gas, a poison. See arsenic.

Use: Poison gas, skin-blistering agent.

β -chlorovinylethylethynylcarbinol. See ethchlorvynol.

β -chlorovinylmethylchloroarsine.

ClCH:CHAsClCH₃.

Properties: Liquid. Bp 112–115C (10 mm Hg). Decomposed by water.

Derivation: Interaction of acetylene and methyl dichloroarsine in the presence of aluminum chloride.

Hazard: Strong irritant poison, absorbed by skin.

chloroxine. (5,7-dichloro-8-quinolinol).

Properties: Colorless crystals. Mp 180C. Soluble in benzene, acetone, acids, and sodium hydroxide solution.

Use: Analytical reagent, antibacterial.

Chloroxuron. (3-(*p*-chlorophenoxy)phenyl)-1,1-dimethylurea).

CAS: 1982-47-4.

Use: Herbicide.

p-chloro-m-xyleneol. (4-chloro-3,5-dimethylphenol). $C_6H_2(CH_3)_2OHCl$. Crystals with phenolic odor.

Hazard: Toxic by ingestion; strong irritant, absorbed by skin.

Use: Active ingredient in germicides, antiseptics, etc., fungistat; mildew preventive; preservative; chemical intermediate.

6-chloro-3,4-xylyl methylcarbamate. (6-chloro-3,4-dimethylphenyl-N-methylcarbamate). $C_{10}H_{11}ClN_2O_2$.

Properties: Solid. Mp 120–133C.

Hazard: Toxic by ingestion and inhalation.

Use: Pesticide.

chloroxyphenamine.

CAS: 16726-46-8. mf: $C_{23}H_{31}ClN_2O_3 \cdot 2ClH$.

Hazard: Moderately toxic by ingestion.

chlorpheniramine maleate. (chlorprophenpyridamine maleate). $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$. (1-(p-chlorophenyl)-1-(2-pyridyl)3-dimethylaminopropane maleate).

Properties: White, odorless crystals. Mp 130–135C. Slightly soluble in ether; soluble in alcohol, chloroform, and water; pH (1% solution) approximately 4.8.

Grade: USP.

Use: Medicine (antihistamine).

chlorphenol red. (dichlorosulfonphthalein).

$C_6H_4SO_2OC(C_6H_3ClOH)_2$. An acid-base indicator showing color change from yellow to red over the pH range 5.2 to 6.8.

chlorpromazine. (2-chloro-10-(3-dimethylaminopropyl)-phenothiazine).

CAS: 50-53-3. $C_{17}H_{19}ClN_2S$.

Properties: Oily liquid; amine odor. Alkaline reaction, bp 200–205C (0.8 mm Hg).

Hazard: Toxic by ingestion.

Use: Medicine (antipsychotic drug).

chlorpromazine sulfone. See oxochlorpromazine.

chlorpropham. See chloro-IPC.

chlorpyrifos. See “Dursban.”

chlorquinaldol. (5,7-dichloro-8-hydroxyquinoline; 5,7-dichloro-2-methyl-8-quinolinol).

$CH_3C_9H_3N(OH)Cl_2$.

Properties: Yellow, crystalline powder; tasteless; pleasant medicinal odor. Mp 114C. Soluble in benzene, alcohol, chloroform; insoluble in water.

Use: Medicine (bactericide and fungicide).

chlortetracycline. (CTC; chlorotetracycline).

$C_{22}H_{23}ClN_2O_8$. An antibiotic produced by growth of *Streptomyces aureofaciens* in submerged cultures. It has a wide antimicrobial spectrum, including many Gram-positive and Gram-negative bacteria, rickettsiae, and several viruses. Its chemical structure is that of a modified naphthacene molecule. Also available as the hydrochloride.

Properties: Golden-yellow crystals. Mp 168–169C. Very soluble in aqueous solutions above pH 8.5; freely soluble in the “Cellosolves” dioxane and “Carbitol”; slightly soluble in water, methanol, ethanol, butanol, acetone, ethyl acetate, and benzene; insoluble in ether and naphtha.

Derivation: By submerged aerobic fermentation, filtration, solvent extraction, and crystallization.

Use: Medicine (antibiotic), feed supplement, preservative for raw fish.

chlorthion. (generic name for *O,O*-dimethyl-*O*-(3-chloro-4-nitrophenyl)thiophosphate). A phosphoric acid ester containing chlorine.

Hazard: Toxic by inhalation and ingestion, cholinesterase inhibitor, absorbed via intact skin. Use may be restricted.

Use: Insecticide.

CHOC. Abbreviation for Center of History of Chemistry.

See Appendix II D.

cholaic acid. See taurocholic acid.

cholecalciferol. (5,7-cholestadien-3- β -ol; 7-dehydrocholesterol; activated vitamin D_3).

$C_{27}H_{44}O$. A free vitamin D_3 , isolated in crystalline state from the 3,5-dinitrobenzoate, produced by irradiation, and equivalent in activity to the vitamin D_3 of tuna-liver oil.

Properties: Colorless crystals. Melting range 84–88C, specific rotation +105–112 degrees. Unstable in light and air. Insoluble in water; soluble in alcohol, chloroform, and fatty oils.

Grade: USP, FCC.

Available forms: Hermetically sealed under nitrogen.

Use: Medicine (antirachitic vitamin).

cholecystokinin tetrapeptide. See gastrin tetrapeptide amide.

choleic acid. A general term applied to the coordination complexes formed by deoxycholic acid (a bile acid) with fatty acids or other lipids and with a

variety of other compounds including such aromatics as phenol and naphthalene. These complexes are similar to those used in separation processes such as the urea adducts for large-scale purification. See cholic acid.

cholesteric. A molecular structure found in some liquid crystals, so called because it was first noted in cholesteryl alcohol (in 1888). It occurs in some optically active compounds and in mixtures of chiral compounds and nematic liquid crystals.

cholesterol. (cholesterin; 5-cholesten-3- β -ol). CAS: 57-88-5. $C_{27}H_{46}OH$. The most common animal sterol, a monohydric secondary alcohol of the cyclopentenophenanthrene (4-ring fused) system, containing one double bond. It occurs in part as the free sterol and in part esterified with higher fatty acids as a lipid in human blood serum. The primary precursor in biosynthesis appears to be acetic acid or sodium acetate. Cholesterol itself in the animal system is the precursor of bile acids, steroid hormones, and provitamin D_3 .

Properties: White or faintly yellow pearly granules or crystals; almost odorless. Affected by light. Mp 148.5C, bp 360C (decomposes), d 1.067 (20/4C), levorotatory, specific rotation (25C) -34 to 38 degrees. Sparingly soluble in water; moderately soluble in hot alcohol; soluble in benzene, oils, fats, and aqueous solutions of bile salts.

Occurrence: Egg yolk, liver, kidneys, saturated fats and oils. All body cells contain cholesterol produced by the liver (approximately 1000 mg a day).

Source: Prepared from beef spinal cord by petroleum ether extraction of the nonsaponifiable matter; purification by repeated bromination.

Grade: Technical, USP, SCW (standard for clinical work).

Use: Emulsifying agent in cosmetic and pharmaceutical products, source of estradiol.

cholestyramine. A synthetic anion-exchange polymer in which quaternary ammonium groups are attached to a copolymer of styrene and divinylbenzene. A white- to buff-colored powder having a particle size of 50–100 mesh, it is stable to 150C. Insoluble in water and organic solvents. It is effective in binding bile salts such as cholesterol. Research on test animals and in clinical trials on humans indicates that it is effective in eliminating from the body such toxic organochlorine compounds as "Kepone."

cholic acid.

CAS: 81-25-4. $C_{23}H_{40}O_3COOH$.

The most abundant bile acid. In bile, it is conjugated with the amino acids glycine and taurine as glycocholic acid and taurocholic acid, respectively, and does not occur free.

Properties: The monohydrate crystallizes in plates from dilute acetic acid. Bitter taste with sweetish aftertaste. Anhydrous form. Mp 198C. Not precipitated by digitonin. Soluble in glacial acetic acid, acetone, and alcohol; slightly soluble in chloroform; practically insoluble in water and benzene.

Derivation: From glycocholic and taurocholic acids in bile; organic synthesis.

Grade: FCC.

Use: Biochemical research, pharmaceutical intermediate, emulsifying agent in foods (up to 0.1%).

choline. (choline base; β -hydroxyethyltrimethylammonium hydroxide).

CAS: 62-49-7. $(CH_3)_3N(OH)CH_2CH_2OH$. Member of the vitamin B complex. Essential in the diet of rats, rabbits, chickens, and dogs. In humans it is required for lecithin formation and can replace methionine in the diet. There is no evidence of disease in humans caused by choline deficiency. It is a dietary factor important in furnishing free methyl groups for transmethylation; has a lipotropic function.

Source: Egg yolk, kidney, liver, heart, seeds, vegetables, and legumes; synthetic preparation from trimethylamine and ethylene chlorohydrin or ethylene oxide.

Properties: Viscous, alkaline liquid. Soluble in water and alcohol. Amounts are expressed in milligrams of choline.

Use: Medicine, nutrition, feed supplement, catalyst, curing agent, control of pH, neutralizing agent, solubilizer.

choline bicarbonate. See hydroxyethyltrimethylammonium bicarbonate.

choline bitartrate. $(C_3H_{14}NO)C_4H_5O_6$.

Properties: White, crystalline powder; odorless or faint trimethylamine-like odor; acidic taste. Hygroscopic; soluble in water and alcohol; insoluble in ether, chloroform, and benzene.

Grade: FCC.

Use: Medicine, dietary supplement, nutrient.

choline chloride.

CAS: 67-48-1. $(\text{CH}_3)_3\text{N}(\text{Cl})\text{CH}_2\text{CH}_2\text{OH}$. Animal-feed additive derived from agricultural waste or made synthetically. Available as 50% dry feed grade and 70% solution.

cholinesterase. (1) (Acetylcholinesterase) Enzyme specific for the hydrolysis of acetylcholine to acetic acid and choline in the body. It is found in the brain, nerve cells, and red blood cells and important in the mechanism of nerve action.

See nerve gas; parathion; insecticide.

Derivation: From bovine erythrocytes.

Use: Biochemical research, determination of phosphorus in insecticides and poisons. (2) "Pseudo" or nonspecific cholinesterase; prepared from horse serum. This esterase hydrolyzes other esters, as well as choline esters. It occurs in blood serum, the pancreas, and the liver.

cholinesterase inhibitor. A chemical compound that deactivates the enzyme cholinesterase, thus preventing or retarding hydrolytic breakdown of the highly toxic acetylcholine formed in the body by the nervous system. Nerve gases act in this way, as do a number of insecticides, usually organic esters of phosphoric acid derivatives. Serious poisoning and death may occur on ingestion or prolonged inhalation of such compounds. Cholinesterase can be reactivated by administration of atropine sulfate or pralidoxime iodide.

See parathion; nerve gas.

cholytaurine. See taurocholic acid.

chondroitin sulfate. A major constituent of the cartilaginous tissue in the body.

chondrus. See carrageenan.

chorionic gonadotropin. (HCG). A hormone isolated from blood and urine of pregnant women; secreted by the placenta. It is a glycoprotein containing approximately 11% galactose and having a molecular weight of approximately 100,000.

Properties: Rods or needlelike crystals. Soluble in water and glycols. Unstable in aqueous solution, stable in dry form. It enhances estrone and progesterone production. Units: One international unit equals the activity of 0.1 mg of a standard preparation.

Use: Medicine, veterinary medicine.

"Chromacyl" [Du Pont]. TM for a group of dyes that contain chromium in the molecule. Suitable for wool and nylon.

chromate. Compound in which chromium has a valence of six.

chromated zinc chloride. See zinc chloride, chromated.

chromaticity. A qualitative description of color based on hue and saturation independent of brilliance.

chromaticity coordinates. The ratios of each tristimulus value of a color to the sum of tristimulus values.

chromatic scale. The arrangement of the colors of the visible spectrum.

chromatin. A deoxyribonucleoprotein complex consisting of (1) double-stranded DNA molecules; (2) a basic protein called histone; and (3) other proteins. The latter protect the DNA from attack by enzymes. Chromatin occurs in the cell nucleus, where it forms chromosomes, the carriers of genes. Its name is derived from its sensitivity to biological stains.

See deoxyribonucleic acid; chromosome; gene.

chromatogram. A column of adsorbent gas or liquid carrying bands or zones of adsorbed molecules.

See chromatography.

chromatography. A group of laboratory separation techniques based on selective adsorption by which components of complex mixtures (vapors, liquids, solutions) can be identified. Its discoverer, Tswett (1906), named the procedure chromatography because the plant pigments used in his early experiments produced bands of characteristic color. Since the 1930s, the method has been widely applied in many variations to the analysis of colorless mixtures such as hydrocarbons, metallic salts, etc. Separation is due to redistribution of the molecules of the mixture between the thin phase (adsorption layer) and the bulk phase (adsorbent) with which it is in contact. Because the thin phase sometimes approaches molecular dimensions, the size and shape of the molecules of the mixture are of great significance. Chromatography involves the flow of a mobile (gas or liquid) phase over a stationary phase (which may be a solid or a liquid). Liquid chromatography is used for soluble substances and gas (vapor-phase) chromatography for volatile substances. As the mobile phase moves past the stationary phase, repeated adsorption and desorption of the solute occurs at a rate determined chiefly by its ratio of distribution between the two phases. If the ratio is large enough, the components of the mixture will move at different rates, producing a series of bands (chromatographs) by which their identity can be determined.

See liquid chromatography; gas chromatography; paper chromatography; thin-layer chromatography; ion-exchange chromatography; gel filtration.

chrome alum. See chromium potassium sulfate.

chrome ammonium alum. See chromium ammonium sulfate.

chrome cake. A green form of salt cake (sodium sulfate) containing a low percentage of chromium. A by-product of sodium dichromate manufacture used in the paper industry.

chrome dye. A mordant dye, most frequently one in which sodium dichromate is used as the mordant.

Use: A mordant for wool dyeing.

chrome fast orange g. See C.I. mordant orange 6, disodium salt.

chrome green. See chrome pigment.

chrome leather scarlet se. See C.I. direct red 23.

chrome liquor. A solution of basic chromic salt used in chrome tanning. It is usually a strong solution of sodium dichromate treated with sulfur dioxide or glucose and sulfuric acid.

chrome-molybdenum steel. Steel, made by any accepted method of quality steelmaking, containing both chromium and molybdenum, usually in the ranges of chromium 0.35–1.10% and molybdenum 0.08–0.35%.

chrome-nickel steel. See steel, stainless.

chrome orange. Basic lead chromate.

Use: Pigments.

chrome pigment. An inorganic pigment containing chromium. The most important types are (1) chrome oxide green, one of the most permanent and stable pigments known, the pure grade consisting of 99% Cr_2O_3 , used in paints applied to cement and lime-containing surfaces; (2) chrome green, chrome yellow, and chrome red, consisting chiefly of lead chromate and used in paints, rubber, and plastic products; (3) miscellaneous pigments such as molybdate orange and zinc yellow, based on lead and zinc compounds of chromium, respectively. All these are more stable to sunlight, weathering, and chemical action than the brighter organic dyes.

Hazard: Toxic by ingestion.

chrome potash alum. See chromium potassium sulfate.

chrome red. See chrome pigment.

chrome steel. A steel, made by any accepted method of quality steelmaking, containing chromium as alloying element, usually in the range 0.20–1.60%, although the content may be as high as 25% in specialized heat-resistant and wear-resistant

steels and in stainless steels.

See steel, stainless.

chrome tanning. See tanning.

chrome-vanadium steel. A steel, made by any accepted method of quality steelmaking, containing both chromium and vanadium, usually in the ranges of chromium 0.50–1.10% and vanadium 0.10–0.20%.

chrome yellow. See lead chromate; chrome pigment.

chromia. See chromic oxide.

chromic. Designating compounds in which the chromium is positive trivalent.

chromic acetate. (chromium acetate).

CAS: 1066-30-4. $\text{Cr}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot \text{H}_2\text{O}$.

Properties: Grayish-green powder or bluish-green, pasty mass. Soluble in water; insoluble in alcohol.

Derivation: Action of acetic acid on chromium hydroxide. The solution is evaporated and crystallized.

Hazard: Toxic by ingestion.

Use: Textile mordant, tanning, polymerization and oxidation catalyst, emulsion hardener.

chromic acid. (chromium trioxide; chromic anhydride).

CAS: 7738-94-5. CrO_3 . The name is in common use, although the true chromic acid, H_2CrO_4 , exists only in solution.

Properties: Dark purplish-red crystals. Deliquescent, d 1.67–2.82, mp 196°C. Soluble in water, alcohol, and mineral acids.

Derivation: (1) Sulfuric acid is added to a solution of sodium dichromate and the product is crystallized out; (2) sodium dichromate is fused with soda ash and limestone and then treated with sulfuric acid; (3) electrolysis.

Grade: Technical, CP.

Hazard: A human carcinogen. A poison. Corrosive to skin. TLV: 0.05 mg(Cr)/m³. Powerful oxidizing agent, may explode on contact with reducing agents, may ignite on contact with organic materials.

Use: Chemicals (chromates, oxidizing agents, catalysts), chromium-plating intermediate, medicine (caustic), process engraving, anodizing, ceramic glazes, colored glass, metal cleaning, inks, tanning, paints, textile mordant, etchant for plastics.

chromic bromide. CrBr_3 .

Properties: Black crystals. Soluble in boiling water; insoluble in cold water unless chromous salts are added.

Derivation: Passage of bromine vapor over pulverized chromium at 1000°C.

Use: Olefin polymerization catalyst.

chromic chloride. (chromium chloride; chromium trichloride; chromium sesquichloride).

CAS: 10025-73-7. (1) CrCl_3 . (2) $\text{CrCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: (1) Violet crystals. D 1.76, mp 1150C, sublimes at approximately 1300C. Insoluble in water and alcohol. (2) Greenish-black or violet deliquescent crystals, depending on whether chlorine is coordinated with the chromium. D 1.76, mp 83C. Soluble in water and alcohol; insoluble in ether.

Derivation: (1) By passing chlorine over a mixture of chromic oxide and carbon. (2) By the action of hydrochloric acid on chromium hydroxide.

Hazard: A poison. TLV: 0.5 mg(Cr)/m³.

Use: Chromium salts, intermediates, textile mordant, chromium plating including vapor plating, preparation of sponge chromium, catalyst for polymerizing olefins, waterproofing.

chromic fluoride. (chromium fluoride; chromium trifluoride).

CAS: 7788-97-8. $\text{CrF}_3 \cdot 4\text{H}_2\text{O}$ or $\text{CrF}_3 \cdot 9\text{H}_2\text{O}$.

Properties: Fine, green crystals. D (anhydrous): 3.8, mp >1000C, bp (sublimes) 1100–1200C. Insoluble in water and alcohol; soluble in hydrochloric acid.

Derivation: Interaction of chromium hydroxide and hydrofluoric acid.

Grade: Technical, high purity (CrF_3).

Hazard: Irritant to skin and eyes, especially in solution. TLV: 0.5 mg/m³.

Use: Printing and dyeing wools, moth-proofing, halogenation catalyst.

chromic hydroxide. (chromic hydrate; chromium hydroxide; chromium hydrate). $\text{Cr}(\text{OH})_3$.

Properties: Green, gelatinous precipitate. Decomposes to chromic oxide by heat. Insoluble in water; soluble in acids and strong alkalis.

Derivation: By adding a solution of ammonium hydroxide to the solution of a chromium salt.

Use: Guignet's green, catalyst, tanning agent, mordant.

chromic nitrate. (chromium nitrate).

CAS: 13548-38-4. $\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Purple crystals. Mp 60C, decomposes at 100C. Soluble in alcohol and water.

Derivation: By the action of nitric acid on chromium hydroxide.

Hazard: May ignite organic materials on contact; may be explosive when shocked or heated; powerful oxidizer. Very toxic.

Use: Catalyst, corrosion inhibitor.

chromic oxide. (chromium(III) oxide; chromia; chromium sesquioxide; green cinnabar).

CAS: 1308-38-9. Cr_2O_3 .

Properties: Bright-green, extremely hard crystals. D 5.2, mp 2435C, bp 4000C. Insoluble in water, acids, and alkalis.

Derivation: (1) By heating chromium hydroxide, (2) by heating dry ammonium dichromate, (3) by heat-

ing sodium dichromate with sulfur and washing out the sodium sulfate.

Hazard: Toxic by ingestion and inhalation. TLV: 0.5 mg/m³.

Use: Metallurgy, green paint pigment, ceramics, catalyst in organic synthesis, green granules in asphalt roofing, component of refractory brick, abrasive.

chromic phosphate. (chromium phosphate).

CAS: 7789-04-0. (1) $\text{CrPO}_4 \cdot 6\text{H}_2\text{O}$. (2) $\text{CrPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: (1) Violet crystals. D 2.12 (14C); (2) green crystals. Soluble in acids; insoluble in water.

Derivation: (1) Interaction of solutions of chromium chloride and sodium phosphate; (2) by mixing chrome alum and disodium hydrogen phosphate. Violet, amorphous powder (not the hexahydrate) is formed that becomes crystalline on contact with water. On boiling, it is converted into green crystalline hydrate.

Use: Paint pigment, catalyst.

chromic sulfate. (chromium sulfate).

CAS: 10101-53-8. (1) $\text{Cr}_2(\text{SO}_4)_3$. (2) $\text{Cr}_2(\text{SO}_4)_3 \cdot 15\text{H}_2\text{O}$. (3) $\text{Cr}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$.

Properties: (1) Violet or red powder; (2) dark-green amorphous scales; (3) violet cubes. D (1) 3.012, (2) 1.867, (3) 1.70. (1) Insoluble in water and acids; (2) soluble in water, insoluble in alcohol; (3) soluble in water and alcohol.

Derivation: Action of sulfuric acid on chromium hydroxide with subsequent crystallization.

Use: Chrome plating, chromium alloys, mordant, catalyst, green paints and varnishes, green ink, ceramics (glazes). The basic form (reduction of sodium dichromate) is used in tanning.

chrominance. The colorimetric difference between any color and a reference color of equal luminance, the reference color having a specific chromaticity.

chromite. (chrome iron ore).

CAS: 1308-31-2. FeCr_2O_4 . A natural oxide of ferrous iron and chromium, sometimes with magnesium and aluminum present. Usually occurs in magnesium and iron-rich igneous rocks.

Properties: Iron-black to brownish-black color, dark-brown streak, metallic to submetallic luster. D 3.6, Mohs hardness 5.5.

Occurrence: The former U.S.S.R., South Africa, Zimbabwe, Philippines, Cuba, Turkey.

Grade: Metallurgical, refractory, chemical.

Hazard: A human carcinogen. TLV: 0.05 mg/m³.

Use: Only commercial source of chromium and its compounds.

chromium.

CAS: 7440-47-3. Cr. Metallic element of atomic number 24, group VIB of the periodic table. Aw 51.996, valences of 2, 3, 6; four stable isotopes. Name derived from Greek for *color*.

Properties: Hard, brittle, semigray metal. D 7.1, mp 1900C, bp 2200C. Compounds have strong and varied colors. Cr ion forms many coordination compounds. Exists in active and passive forms, the latter giving rise to its corrosion resistance due to a thin surface oxide layer that passivates the metal when treated with oxidizing agents. Active form reacts readily with dilute acids to form chromous salts. Soluble in acids (except nitric) and strong alkalies, insoluble in water.

Occurrence: The former U.S.S.R., South Africa, Turkey, Philippines, Zimbabwe, Cuba.

Derivation: From chromite by direct reduction (ferrochrome), by reducing the oxide with finely divided aluminum or carbon, and by electrolysis of chromium solutions.

Available forms: (1) Chromium metal as lumps, granules, or powder; (2) high- or low-carbon ferrochromium; (3) single crystals, high-purity crystals, or powder run 99.97% pure.

Grade: (Ore) Chromium ores are classified as (1) metallurgical, (2) refractory, and (3) chemical, and their consumption in the U.S. is in that order. (1) Must contain a minimum of 48% Cr₂O₃ and have Cr-Fe ratio of 3:1; (2) must be high in Cr₂O₃ and Al₂O₃ and low in iron; (3) must be low in SiO₂ and Al₂O₃ and high in Cr₂O₃.

Hazard: Hexavalent chromium compounds are carcinogenic (OSHA) and corrosive on tissue, resulting in ulcers and dermatitis on prolonged contact. TLV: (chromium dust and fume) 0.5 mg(Cr)/m³.

Use: Alloying and plating element on metal and plastic substrates for corrosion resistance, chromium-containing and stainless steels, protective coating for automotive and equipment accessories, nuclear and high-temperature research, constituent of inorganic pigments.

chromium-51. Radioactive chromium of mass number 51.

Properties: Half-life 26.5 days, radiation γ (0.32 MeV).

Grade: USP (as sodium chromate ⁵¹Cr injection).

Hazard: Radioactive poison.

Use: Diagnosis of blood volume (as tracer).

chromium acetate. See chromic acetate.

chromium acetylacetonate.

Properties: Purple powder or red-violet crystals. Mp 216C, bp 340C. Insoluble in water; soluble in acetone and alcohol.

Derivation: Reaction of chromium chloride, acetylacetone, and sodium carbonate.

Use: Reduction of detonation of nitromethane.

chromium ammonium sulfate. (ammonium chromium sulfate; chrome ammonium alum). CrNH₄(SO₄)₂•12H₂O.

Properties: Green powder or deep-violet crystals. D 1.72, mp 94C. Soluble in water; slightly soluble in

alcohol. The aqueous solution is violet when cold, green when hot.

Grade: Technical.

Use: Mordant, tanning.

chromium boride. One of several compounds of chromium and boron, e.g., CrB, CrB₂, and Cr₃B₂. They have high melting points, are very hard and corrosion resistant, and may be suitable for use in jet and rocket engines.

Properties: CrB may be crystals. D 6.2, mp 1550C, Mohs hardness 8.5, resistivity 67 $\mu\omega$ cm (20C). CrB₂: d 5.15, mp 1850C, hardness 2010 (Knoop), resists oxidation up to 1100C. Cr₃B₂: may be crystals, d 6.1, Mohs hardness 9+.

Use: Metallurgical additives, high-temperature electrical conductors, cermets, refractories, coatings resistant to attack by molten metals.

chromium bromide. See chromous bromide.

chromium carbide. Cr₃C₂.

Properties: Orthorhombic crystals. D 6.65, microhardness 2700 kg/sq mm Hg (load 50 g), mp 1890C, bp 3800C, resistivity 95 $\mu\omega$ cm (room temperature). Highest oxidation resistance at high temperature of all metal carbides also resistant to acids and alkalies.

Use: Gage blocks and hot extrusion dies, in powder form as spray-coating material, components for pumps and valves.

chromium carbonate. See chromous carbonate.

chromium carbonyl. See chromium hexacarbonyl.

chromium chloride. See chromic chloride; chromous chloride.

chromium-copper. A copper-chromium alloy containing 8–11% chromium. Used in the manufacture of hard steels for increased elasticity.

chromium dioxide. CrO₂.

Properties: Black, semiconducting material. D 4.9. Acicular crystals having strong magnetic properties. Also in powder form.

Derivation: By heating chromic acid.

Use: Magnetic component in recording tapes, catalyst.

chromium fluoride. See chromic fluoride.

chromium hexacarbonyl. (chromium carbonyl).

Properties: White, crystalline solid. D 1.77, mp 150–151C (inert atmosphere), 210C (explodes). Slightly soluble in iodoform and carbon tetrachloride; insoluble in water, alcohol, ether, or acetic acid. More stable than most metal carbonyls, de-

composed by chlorine and fuming nitric acid, but resists bromine, iodine, water, and cold concentrated nitric acid. Decomposes photochemically when solutions are exposed to light.

Grade: 98% pure.

Hazard: Explodes at 400F (204C). Toxic by inhalation and ingestion.

Use: Isomerization and polymerization catalyst, gasoline additive, intermediate.

chromium hydrate. See chromic hydroxide.

chromium hydroxide. See chromic hydroxide.

chromium manganese antimonide. Brittle gray solid having magnetic properties when above a definite temperature, depending on the composition.

chromium naphthenate.

Properties: Dark-green liquid or violet powder.

Derivation: By addition of chromium salts to solution of sodium naphthenate and recovery of the precipitate.

Grade: 6% chromium.

Hazard: Toxic by ingestion.

Use: Paints (antichalking agent).

chromium nitrate. See chromic nitrate.

chromium oxide. See chromic oxide.

chromium oxychloride. See chromyl chloride.

chromium oxyfluoride. See chromyl fluoride.

chromium phosphate. See chromic phosphate.

chromium potassium sulfate. (chrome alum; potassium chromium sulfate; chrome pot-ash alum).

CAS: 10141-00-1. $\text{CrK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Dark, violet-red crystals; efflorescent. D 1.813, mp 89C, loses $10\text{H}_2\text{O}$ at 100C. Soluble in water.

Derivation: By reducing potassium dichromate in dilute sulfuric acid with sulfurous acid.

Hazard: Toxic by ingestion.

Use: Tanning (chrome-tan liquors), textile dye (mordant), photography (fixing bath), ceramics.

chromium sesquichloride. See chromic chloride.

chromium sesquioxide. See chromic oxide.

chromium steel. See steel, stainless; iron, stainless.

chromium sulfate. See chromic sulfate.

chromium trichloride. See chromic chloride.

chromium trifluoride. See chromic fluoride.

chromium trioxide. See chromic acid.

chromogen. See chromophore.

“Chromogene” [BASF]. TM for mordant dyestuffs used on wool and leather. Characterized by very good fastness to light, fulling, etc.

chromomere. One of the serially aligned beads or granules of a eukaryotic chromosome, resulting from local coiling of a continuous DNA thread.

chromophore. A chemical grouping that when present in an aromatic compound (the chromogen), gives color to the compound by causing a displacement of, or appearance of, absorbent bands in the visible spectrum. Dyes are sometimes classified on the basis of their chief chromophores, e.g., $-\text{NO}$, nitroso dyes; $-\text{NO}_2$, nitro dyes; $-\text{N}=\text{N}-$, azo dyes; etc.

chromosomal deletion. The loss of part of a chromosome's DNA.

chromosomal inversion. Chromosome segments that have been turned 180 degrees. The gene sequence for the segment is reversed with respect to the rest of the.

chromosome. The heredity-bearing gene carrier of the living cell derived from chromatin and consisting largely of nucleoproteins (DNA) together with other protein components (histones). See deoxyribonucleic acid; gene.

chromosome painting. Attachment of certain fluorescent dyes to targeted parts of the chromosome. Used as a diagnostic for particular diseases, e.g. types of leukemia.

chromosome region p. A designation for the short arm of a chromosome.

chromosome region q. A designation for the long arm of a chromosome.

chromosome walking. A technique for cloning everything in the genome around a known piece of DNA (the starting probe). A screen is executed against a genomic library for all clones hybridizing with the probe looking for one that extends furthest into the surrounding DNA. The most distal piece of this most distal clone is then used as a probe, so that ever more distal regions can be cloned.

“Chromosorb” [*World Minerals*]. TM for a series of screened calcined and flux-calcined diatomite aggregates. Available in non-acid-washed, acid-washed, and acid-washed dimethyldichlorosilane treatments.

Grade: Chromosorb phosphorus, W, G for analytical use; Chromosorb A for preparative chromatography.

Use: Supports in gas or liquid chromatography.

chromotropic acid. (1,8-dihydroxynaphthalene-3,6-disulfonic acid).

Properties: White needles. Soluble in water; insoluble in alcohol and ether.

Derivation: Reaction of H-acid with 10% NaOH at 280C.

Use: Azo-dye intermediate, analytical reagent.

chromous bromide. (chromium bromide).

CrBr_2 .

Properties: White crystals that change to yellow on heating. Oxidizes in moist air but stable in dry air. D 4.356, mp 842C. Soluble in water (blue color).

Hazard: Toxic by ingestion, irritant to skin and tissue. TLV: 0.5 mg(Cr)/m³.

chromous carbonate. (chromium carbonate).

CrCO_3 .

Properties: Grayish-blue, amorphous mass. D 2.75. Soluble in mineral acids; slightly soluble in water containing carbon dioxide; insoluble in alcohol.

Hazard: Toxic by ingestion; irritant to skin and tissue. TLV: 0.5 mg(Cr)/m³.

chromous chloride. (chromium chloride).

CrCl_2 .

Properties: White, deliquescent needles. D 2.878 (25C), mp 824C, active reducing agent. Very soluble in water; insoluble in alcohol and ether.

Derivation: Reaction of the metal with anhydrous hydrogen chloride.

Hazard: A poison. TLV: 0.5 mg(Cr)/m³.

Use: Reducing agent, catalyst, reagent, chromizing.

chromous fluoride. CrF_2 .

Properties: Greenish, shiny crystals. Mp 890C, d 3.80. Slightly soluble in water; insoluble in alcohol; soluble in boiling hydrochloric acid.

Derivation: Reaction of chromous chloride with hydrofluoric acid.

Hazard: A poison. Strong irritant to eyes and skin.

Use: Catalyst for alkylation and hydrocarbon cracking.

chromous formate. $\text{Cr}(\text{HCOO})_2$.

Properties: (Monohydrate) Reddish, acicular crystals. Soluble in water.

Derivation: Reaction of chromous chloride with sodium formate.

Use: Chromium electroplating solutions, catalyst for organic reactions.

chromous oxalate. $\text{CrC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Yellow, crystalline powder. D 2.468. Soluble in water; active reducing agent.

Hazard: Toxic by ingestion; irritant to skin and tissue; a poison. TLV: 0.5 mg(Cr)/m³.

chromous sulfate. $\text{CrSO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: (Pentahydrate) Blue crystals. Soluble in water; insoluble in acetone; slightly soluble in alcohol. Solutions are subject to atmospheric oxidation.

Use: Oxygen scavenger, reducing agent, analytical reagent.

“Chromoxane” [*BASF*]. TM for mordant dyestuffs. Used on wool, characterized by fairly good fastness to light, very good fastness to fulling, etc., and by a relatively bright shade.

“Chromspun” [*Eastman*]. TM for solution-dyed acetate fiber.

chromyl chloride. (chromium oxychloride; chlorochromic anhydride).

CAS: 14977-61-8. CrO_2Cl_2 .

Properties: Mobile, dark-red liquid. Bp 116C, fp -96.5C, d 1.911. Fumes in air, reacts vigorously with water to form chromic acid, chromic chloride, hydrochloric acid and chlorine. Miscible with carbon tetrachloride, tetrachloroethane, carbon disulfide. Nonconductor of electricity. Protect from light and moisture.

Derivation: By heating sodium dichromate and sodium chloride with sulfuric acid.

Hazard: TLV: 0.025 ppm. Corrosive to tissue. Strong oxidizing agent.

Use: Organic oxidations and chlorinations, solvent for chromic anhydride, chromium complexes and dyes, catalyst.

chromyl fluoride. (chromium oxyfluoride).

CrF_2O_2 .

Properties: Black crystals. Sublimes at 29.6C, polymerizes on exposure to light.

Hazard: Highly reactive, ignites hydrocarbon gases at high temperatures.

Use: Fluorination catalyst, dyeing polyolefins.

chrysamine G. $\text{C}_{26}\text{H}_{16}\text{N}_4\text{O}_6\text{Na}_2$.

Properties: Yellowish-brown powder. Very sparingly soluble in water.

Derivation: By coupling diazotized benzidine with salicylic acid.

Use: Yellow direct-cotton dyestuff.

chrysanthemummonocarboxylic acid ethyl ester. $(\text{CH}_3)_2\text{CCH}(\text{COOC}_2\text{H}_5)\text{CHCH}:\text{C}(\text{CH}_3)_2$.

Properties: Colorless to pale yellow; pleasant ester odor. D 0.924–0.927 (25/25C). Insoluble in water; soluble in alcohols and ketones.

Hazard: Toxic by ingestion.

Use: Synthesis of perfumes, pharmaceuticals, insecticides, other organic chemicals.

See cinerin I; pyrethrin I.

chryszazin. See 1,8-dihydroxyanthraquinone.

chrysene. (1,2-benzphenanthrene).

CAS: 218-01-9. $\text{C}_{18}\text{H}_{12}$ (a tetracyclic hydrocarbon).

Properties: Crystals. D 1.274 (20/4C), mp 254C, bp 448C, sublimes easily in a vacuum. Slightly soluble in alcohol, ether, glacial acetic acid; insoluble in water.

Derivation: Distillation of coal tar.

Hazard: TLV: suspected human carcinogen.

Use: Organic synthesis.

chrysoidine hydrochloride. (*m*-diaminoazobenzene hydrochloride). $(\text{C}_6\text{H}_5\text{NNC}_6\text{H}_3)(\text{NH}_2)_2 \cdot \text{HCl}$.

Properties: Red-brown powder or large black shiny crystals; green luster. Mp 117C. Soluble in alcohol and water, giving orange-brown solutions; insoluble in ether.

Use: Orange dye for cotton and silk.

chrysolite. See olivine.

chrysotile. See asbestos.

chu. Abbreviation for centigrade heat unit. It is the amount of heat required to raise the temperature of one pound of water, one centigrade degree, from 15 to 16C. It is sometimes called a pcu (pound centigrade unit).

“Chuck-Eez” [Specialty Lubes]. TM for a heavy duty boundary lubricant.

Use: To increase the clamping pressure of Power Chucks.

Chugaev reaction. Formation of olefins from alcohols without rearrangement through pyrolysis of the corresponding xanthates via *cis* elimination.

Churchill’s caustic iodine solution. A solution of 25 g iodine in an aqueous solution of 50 g potassium iodide in 100 cc of water.

chylomicron. A plasma lipoprotein composed of a triacylglycerol core and a shell of protein and phospholipid. The chylomicron carries lipid from the intestine to the tissues.

chymosin. See rennin.

chymotrypsin. A proteolytic enzyme found in the intestine that catalyzes the hydrolysis of various proteins (especially casein) and protein-digestion products to form polypeptides and amino acids.

Properties: White to yellowish-white crystals or amorphous powder; odorless. Soluble in water or saline solution.

Derivation: Crystallized extract of the pancreas gland of the ox.

Use: Biochemical research, medicine.

chymotrypsinogen. A crystalline enzyme occurring in the pancreas that gives rise to chymotrypsin.

Use: Biochemical research.

Ci. Abbreviation for curie.

C.I. acid blue 80.

CAS: 4474-24-2. mf: $\text{C}_{32}\text{H}_{28}\text{N}_2\text{O}_8\text{S}_2 \cdot 2\text{Na}$.

Hazard: Moderately toxic by ingestion.

Ciamician-Dennstedt rearrangement. Expansion of the pyrrole ring by heating with chloroform or other halogeno compounds in the alkaline solution. The intermediate dichlorocarbene, by addition to the pyrrole, forms an unstable dihalogenocyclopropane that rearranges to a 3-halogenopyridine.

ciaphos. See cyanophos.

C.I. azoic coupling component 2.

CAS: 92-77-3. mf: $\text{C}_{17}\text{H}_{13}\text{NO}_2$.

Hazard: Low toxicity by ingestion.

“Cibacet” [Novartis]. TM for disperse dyes for polyamide and cellulose acetate fibers.

“Cibacron” [Novartis]. TM for reactive dyes for cellulosic fibers.

“Cibanone” [Novartis]. TM for anthraquinone vat dyes.

“Cibaphasol” [Novartis]. TM for coacervate-forming colloidal product used in textile dyeing.

C.I. basic blue 16.

CAS: 4569-88-4. mf: $\text{C}_{30}\text{H}_{24}\text{N}_5\text{O} \cdot \text{Cl}$.

Hazard: A poison.

C.I. basic brown 4.

CAS: 8005-78-5.

Hazard: A severe eye irritant.

C.I. basic yellow 11.

CAS: 4208-80-4. mf: $\text{C}_{21}\text{H}_{25}\text{N}_2\text{O}_2 \cdot \text{Cl}$.

Hazard: Moderately toxic.

C.I. basic yellow 28.

CAS: 54060-92-3. mf: $\text{C}_{20}\text{H}_{24}\text{N}_3\text{O} \cdot \text{CH}_3\text{O}_4\text{S}$.

Hazard: A moderate eye irritant.

C.I. direct black 32, trisodium salt.

CAS: 6428-38-2. mf: $C_{48}H_{40}N_{13}O_{13}S_3 \cdot 3Na$.

Hazard: Moderately toxic. Low toxicity by ingestion.

C.I. direct brown 2.

CAS: 2429-82-5. mf: $C_{29}H_{19}N_5O_7S \cdot 2Na$.

Hazard: Low toxicity by ingestion.

C.I. direct red 13, disodium salt.

CAS: 1937-35-5. mf: $C_{32}H_{22}N_6O_7S_2 \cdot 2Na$.

Hazard: Low toxicity by ingestion.

C.I. direct red 23.

CAS: 3441-14-3. mf: $C_{35}H_{25}N_7O_{10}S_2 \cdot 2Na$.

Hazard: Low toxicity by ingestion.

cidofovir. See (s)-1-(3-hydroxy-2-phosphonyl-methoxypropyl)cytosine.

Ciechanover, Aaron. (1947–). Born in Haifa, Israel, Ciechanover won the Nobel Prize for chemistry in 2004 for his pioneering work concerning the discovery of ubiquitin-mediated protein degradation. He was awarded an M.D. from Hadassah Medical School and a doctorate in medicine in 1982 from the Technion. In 2000 he received the Albert Lasker Award for Basic Medical Research.

C.I. fluorescent brightener 85.

CAS: 17958-73-5. mf: $C_{36}H_{34}N_{12}O_{16}S_4 \cdot 2Na$.

Hazard: Low toxicity by ingestion.

C.I. fluorescent brightener 208. See disodium bisethylphenyltriaminotriazine stilbenedisulfonate.

C.I. fluorescent brightener 220.

CAS: 16470-24-9. mf: $C_{40}H_{40}N_{12}O_{16}S_4 \cdot 4Na$.

Hazard: Low toxicity by ingestion and skin contact.

C.I. mordant orange 6, disodium salt.

CAS: 3564-27-0. mf: $C_{19}H_{12}N_4O_6S \cdot 2Na$.

Hazard: Low toxicity by ingestion.

cigarette tar. The comparatively nonvolatile residue from the burning of cigarette tobacco that appears in finely divided form in the smoke. Cigarette tar is known to contain various aromatic ring compounds (especially benzo[a]pyrene), also found in coal tar, that are carcinogens. Various forms of activated carbon are used in filters to try to adsorb the toxic components of the tars that find their way into the smoke.
See smoke (5).

ciguatoxin. $C_{28}H_{52}NO_5Cl$. A complex toxic principle in bony fishes; has both fat- and water-soluble fractions. Ninhydrin test positive. It is a type of quaternary ammonium compound, and one fraction

is said to be an irreversible anticholinesterase. The pharmacology is unknown.

CIIT Centers for Health Research.

(CIIT). Founded in 1974 and formerly called the Chemical Industry Institute of Toxicology. Dedicated to the scientific, objective study of tax issues associated with the manufacture, use, and disposal of selected commodity chemicals and the dissemination of information collected. It is located at 6 Davis Drive, Box 12137 RTP, NC 27709-2137. Website: <http://www.ciit.org>

“Cimcool Cimperial 1070” [Milacron].

TM for a soluble oil metalworking fluid with extreme-pressure lubrication additive for multi-metal, multi-operation applications.

“Cimcool Cimstar 60” [Milacron].

TM for a general purpose semi-synthetic metalworking fluid with extreme pressure additive for a variety of multi-metal applications.

“Cimcool Cimtech 310” [Milacron].

TM for a heavy duty synthetic metalworking fluid for machining and grinding of aerospace aluminum alloys.

“Cimcool Cimtech 410C” [Milacron].

TM for a heavy duty synthetic metalworking fluid for ferrous metal removal operations.

“Cimcool Milform 8050” [Milacron].

TM for a synthetic patented metalforming fluid for heavy duty forming, deep-drawing, punching and piercing operations of ferrous metals.

cincholepine. See lepidine.

cinchona bark. The bark of one of several species of cinchona trees native to South America and cultivated in Indonesia, Peru, Ecuador, and western Africa. The best-known types are calisaya, loxa, and succirubra. It is used primarily as the source of natural quinine, quinidine, chinchonidine, cinchonine, and related alkaloids formerly used as antimalarials.

cinder. See slag.

cinene. See dipentene.

cinol. See eucalyptol.

cinerin I.

CAS: 8003-34-7. $C_{20}H_{28}O_3$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemum monocarboxylic acid.

Properties: A viscous liquid. Quickly oxidized in air.

Bp 200C (0.1 mm Hg). Insoluble in water; soluble in organic solvents. Incompatible with alkalis.

Hazard: Toxic by ingestion.

Use: Household insecticide.

See cinerin II; pyrethrin I; pyrethrin II.

cinerin II.

CAS: 8003-34-7. $C_{21}H_{28}O_5$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemumdicarboxylic acid monomethyl ester.

Properties: A viscous liquid. Quickly oxidized in air.

Bp 200C (0.1 mm Hg). Insoluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion.

Use: Household insecticide.

See cinerin I; pyrethrin I; pyrethrin II.

cinnabar. (natural vermilion; liver ore). HgS.

Natural mercuric sulfide occurring in veins near recent volcanic rocks and hot springs.

Properties: Red, scarlet, reddish-brown to blackish solid, streak scarlet; luster adamantine to dull earthy when impure. D 8.10, Mohs hardness 2.5. Soluble in aqua regia. Has greater optical rotation than any other substance (+325 degrees).

Occurrence: California, Nevada, Spain, Italy, Mexico, Yugoslavia.

Hazard: See mercuric sulfide.

Use: The only important ore of mercury.

cinnamaldehyde. See cinnamic aldehyde.

cinnamein. See benzyl cinnamate.

cinnamene. See styrene, monomer.

cinnamic acid. (β -phenylacrylic acid; 3-phenylpropenoic acid; cinnamyllic acid).

CAS: 621-82-9. $C_6H_5CH:CHCOOH$.

Properties: White, crystalline scales. Congealing p 133C (min), bp 300C. Soluble in benzene, ether, acetone, glacial acetic acid, carbon disulfide, oils; insoluble in water. Combustible.

Derivation: By heating benzaldehyde with sodium acetate in the presence of a dehydrating agent (acetic anhydride) or by heating benzyl chloride with sodium acetate in an autoclave. Occurs naturally in tobacco and some balsams.

Grade: Technical, refined.

Use: Medicine (anthelmintic), perfumes, intermediate.

cinnamic alcohol. (cinnamyl alcohol; phenylallylic alcohol; 3-phenyl-1-propen-1-ol; styryl carbinol).

CAS: 104-54-1. $C_6H_5CH:CHCH_2OH$.

Properties: White needles or crystals; hyacinth-like odor. Congealing p 33C (min pure) as low as 24C (technical); bp 257C. Soluble in water, alcohol, glycerol, and organic solvents. Combustible.

Derivation: (1) From oil of cassia or oil of cinnamon; occurs as an ester. (2) Reduction of cinnamic aldehyde.

Method of purification: Recrystallization.

Grade: Technical, FCC.

Use: Perfumery, particularly for lilac and other floral scents; flavoring agent; soaps; cosmetics.

cinnamic aldehyde. (cinnamaldehyde; 3-phenylpropenal; cinnamyl aldehyde).

CAS: 104-55-2. $C_6H_5CH:CHCHO$.

Properties: Yellowish oil; cinnamon odor; sweet taste. Thickens on exposure to air. D 1.048–1.052, refr index 1.618–1.623, fp –8C, bp 248C. Soluble in five volumes of 60% alcohol, very slightly soluble in water. Combustible.

Derivation: (1) From Ceylon and Chinese cinnamon oils; (2) by condensation of benzaldehyde and acetaldehyde.

Method of purification: Rectification.

Use: Flavors, perfumery.

See cassia oil.

cinnamon leaf oil.

CAS: 8015-91-6.

Properties: Extracted by steam distillation of leaves from *Cinnamomum zeylanicum* Nees. Light to dark brown liquid; spicy cinnamon, clove odor and taste. Sol in fixed oils, propylene glycol, mineral oil; insol in glycerin.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact.

Use: Food additive.

cinnamon oil. See cassia oil.

cinnamoyl chloride. (phenylacrylyl chloride). $C_6H_5CH:CHCOCl$.

Properties: Yellow crystals. Mp 35C, bp 170C (58 mm Hg), d 1.1617 (45/4C). Decomposes in water. Soluble in hydrocarbons and esters.

Hazard: Skin irritant.

Use: Reagent for determination of water, chemical intermediate.

cinnamyl acetate. $C_6H_5CH:CHCH_2OOCCH_3$.

Properties: Colorless liquid; floral spicy odor. D 1.048–1.052, refr index 1.539–1.542. Soluble in four volumes of 70% alcohol. Combustible.

Use: Perfumery (fixative), flavoring.

cinnamyl alcohol. See cinnamic alcohol.

cinnamyl aldehyde. See cinnamic aldehyde.

cinnamyl cinnamate. (styracin).

CAS: 122-69-0. $C_9H_8O_2$, C_9H_9 .

Properties: Rectangular, prismatic crystals. Mp 40C (min). Soluble in alcohol, ether, benzene.

Derivation: Esterification of cinnamic acid with cinnamic alcohol.

Use: Perfumery, flavoring.

α -cinnamyl-*n*-cyclopropylmethyl- α -ethyl-*n*-methyl-2-furfurylamine.

CAS: 137246-17-4. mf: $C_{21}H_{27}NO$.

Hazard: Moderately toxic by ingestion.

cinnamyllic acid. See cinnamic acid.

cinobufagin acetate.

CAS: 4026-97-5. mf: $C_{28}H_{36}O_7$.

Hazard: A poison.

Source: Natural product.

CIPC. See chloro-IPC.

cis-. (Latin: "on this side.") A prefix used in designating geometrical isomers in which there is a double bond between two carbon atoms. This prevents free rotation, and thus two different spatial arrangements of substituent groups or atoms are possible. When two atoms, or radicals are positioned on one side of the carbon axis or backbone, the isomer is called *cis*-; when they are on the opposite sides, the isomer is called *trans*- (Latin: "on the other side"). This is exemplified in the following formulas:

This is often called *cis-trans* isomerism. These prefixes are disregarded in alphabetizing chemical names.

cistron. A unit of DNA or RNA corresponding to one gene.

citalopram hydrobromide.

CAS: 59729-32-7. mf: $C_{20}H_{21}FN_2O \cdot BrH$.

Hazard: A poison.

citrolone. (*N*-acetylhomocysteinethiolactone).

CAS: 1195-16-0. $C_6H_9NO_2S$.

Properties: Acicular crystals. Mp 112C, maximum UV absorption 238 nm.

Use: Fogging preventive in photography.

citraconic anhydride. (methylmaleic anhydride).

CAS: 616-02-4. $C_5H_4O_3$.

Properties: Colorless liquid. Mp 7–8C, bp 213–214C, d 1.25 (15/4C). Soluble in ether.

Grade: Reagent.

Use: Reagent for alkalis, alcohols, and amines.

citral. (geranial; geranialdehyde; 3,7-dimethyl-2,6-octadienal).

CAS: 5392-40-5. $(CH_3)_2CCHC_2H_4C(CH_3)CHCHO$. Commercial material is a mixture of α and β isomers.

Properties: Mobile, pale-yellow liquid; strong lemon odor. D 0.891–0.897 (15C); refr index 1.4860–1.4900 (20C); not optically active. Soluble in five volumes of 60% alcohol; soluble in all proportions of benzyl benzoate, diethyl phthalate, glycerol, propylene glycol, mineral oil, fixed oils, and 95% alcohol; insoluble in water. Combustible.

Derivation: Principal component of lemongrass oil, which can be isolated by fractional distillation. Obtained synthetically by oxidation of geraniol, nerol, or linalool by chromic acid.

Grade: Technical, pure, FCC.

Use: Perfumes, flavoring agent, intermediate for other fragrances, vitamin A synthesis.

citric acid. (2-hydroxy-1,2,3-propanetricarboxylic acid).

$HOOCCH_2C(OH)(COOH)CH_2COOH \cdot H_2O$.

Properties: Colorless, translucent crystals or powder; odorless; strongly acidic taste; hydrated form is efflorescent in dry air. D 1.542, mp 153C (anhydrous form), decomposes before boiling. Very soluble in water and alcohol, soluble in ether. Combustible.

Occurrence: In living cells, both animal and plant.

Derivation: By mold fermentation of carbohydrates, including deep fermentation, from lemon, lime, and pineapple juice and molasses.

Grade: Both hydrous and anhydrous, technical, CP, USP, FCC.

Use: Preparation of citrates, flavoring extracts, confections, soft drinks, effervescent salts; acidifier, dispersing agent; medicines; acidulant and antioxidant in foods (for details see regulations of Meat Inspection Division of USDA), sequestering agent, water-conditioning agent and detergent builder; cleaning and polishing stainless steel and other metals; alkyd resins; mordant; removal of sulfur dioxide from smelter waste gases, abscission of citrus fruit in harvesting; cultured dairy products.

See TCA cycle.

citric acid cycle. See TCA cycle.

"Citri-Fi 100" [Fiberstar]. TM for pure citrus fiber.

Use: For fat replacement, increase of moisture content, and addition of structure to food products.

"Citri-Fi 200" [Fiberstar]. TM for an all natural citrus fiber product.

Use: Oil replacement and thickening in foods.

"Citri-Fi 200 FG" [Fiberstar]. TM for finely granulated citrus product.

Use: In bakery and meat products.

“**Citrofil**” [*Jungbunzlauer*]. TM for a plasticizer that is a carrier solvent and a food carrier solvent. It reduces hardness, increases plasticity, and induces elasticity.

Properties: High boiling point.

Use: Dried egg whites, film coated tablets, aerosol hair spray, deodorants, perfumes, flavors, cellulose acetate films, and cigarette filters.

“**Citroflex**” [*Pfizer*]. TM for a series of organic citrates.

“**Citroflex 2**” [*Reilly*]. (triethyl citrate).

CAS: 77-93-0. TM for a plasticizer.

Use: Cellulosics.

“**Citroflex 4**” [*Reilly*]. (tri-*n*-butyl citrate).

CAS: 77-94-1. TM for a plasticizer.

Use: Vinyls and cellulose.

“**Citroflex A-2**” [*Reilly*]. (acetyltriethyl citrate).

CAS: 77-89-4. TM for a plasticizer.

Use: Cellulosics.

“**Citroflex A-4**” [*Reilly*]. (acetyltri-*n*-butyl citrate).

CAS: 77-90-7. TM for a plasticizer.

Use: Vinyls, adhesives, and coatings.

“**Citroflex A-6**” [*Reilly*]. (acetyltri-*n*-hexyl citrate). TM for a plasticizer.

Use: Polymeric medical articles.

“**Citroflex B-6**” [*Reilly*]. (*n*-butyltri-*n*-hexyl citrate). TM for a plasticizer.

Use: Polymeric medical articles.

citronellal. (3,7-dimethyl-6(or 7)-octenal).

CAS: 8000-29-1. Has both *d*- and *l*-isomers. $C_9H_{16}CHO$.

Derivation: From citronella oil, of which it is the main component; also from lemongrass oil.

Use: Soap perfumery, manufacture of hydroxycitronellal, insect repellent.

citronellal hydrate. See hydroxycitronellal.

citronella oil.

CAS: 8000-29-1.

Properties: Light-yellowish, essential oil; rather pungent, citruslike odor. D 0.887–0.906, refr index 1.468–1.483; solutions are levorotatory. Soluble in 80% alcohol. Combustible.

Hazard: May not be used on food crops.

Use: Insect repellent; perfumes for soaps and disinfectants; manufacture of cironellal and geraniol; denaturant for alcohol.

citronellol. (3,7-dimethyl-6(or 7)-octen-1-ol).

CAS: 106-22-9.

$CH_2:C(CH_3)(CH_2)_3CH(CH_3)CH_2CH_2OH$. The 7-oc-tene form, which predominates.

Occurrence: Citronella, geranium, rose, savin, and other essential oils.

Use: Perfumery (floral odors, mainly rose types). See rhodinol.

citronellyl acetate. $C_{10}H_{18}OOCCH_3$.

CAS: 150-84-5.

Properties: Colorless liquid; odor somewhat like that of bergamot oil. D 0.884–0.891, bp 119–121 (15 mm Hg), optical rotation usually slightly dextrorotatory, up to +1 degree, refr index 1.450–1.452. Soluble in nine volumes of 70% alcohol. Combustible.

Derivation: Action of acetic anhydride on citronellol.

Use: Perfumery, flavoring.

citronellyl formate. $C_{10}H_{18}OOCH$.

CAS: 105-85-1.

Properties: Colorless liquid; floral odor. D 0.890–0.903 (25/25C), refr index 1.4430–1.4490 (20C). One volume dissolves in three volumes 80% alcohol; soluble in most oils. Combustible.

Grade: FCC.

Use: Flavoring.

citron yellow. See zinc yellow.

citrovorum factor. See folic acid.

citrulline. $NH_2CONH(CH_2)_3CHNH_2COOH$. An arginine derivative. An amino acid found in watermelon juice in the *l*(+) form.

Properties: Crystals from methanol-water mixture. Mp 222C. Soluble in water; insoluble in methanol and ethanol.

Use: Biochemical research.

“**Citrus Burst 7**” [*Florida Chemicals*].

TM for a citrus and vegetable derived solvent that is environmentally friendly.

Use: For parts cleaning, industrial and janitorial uses.

citrus-peel oils. Edible oils expressed from the peel or rind of grapefruit, lemon, lime, orange, and tangerine.

Properties: Color, odor, and taste characteristic of source. D 0.84–0.89, refr index 1.473–1.478, optically active, unsaponifiable. Soluble in alcohol, vegetable oils, mineral oil; orange and lemon oils are soluble in glacial acetic acid. Combustible.

Chief constituents: Limonene, citral, and terpenes in varying percentages.

Use: Flavoring agents in desserts, soft drinks, ice cream; odorants in perfumery and cosmetics, furniture polish (lemon oil).

Note: Terpene-free grades are available at much higher concentration (15–30 times the original oil). These grades have much lower optical rotation and less tendency to spoil on storage, since terpenes tend to oxidize to undesirable components such as car-

vone and *p*-cymene.
See terpeness oil.

citrus-seed oils. Edible oils expressed from the seeds of grapefruit, orange, lemon, lime, and tangerine reclaimed from cannery processing.

Properties: Nondrying; odor, color, and taste characteristic of source; bitter taste removed by alkali refining. D 0.91–0.92, saponification number 190–195, iodine number 100–110, optically inactive. Combustible. May be bleached, deodorized, or hydrogenated.

Chief constituents: Chiefly palmitic, oleic, and linoleic acids.

Use: Flavoring, food products, cosmetics, odorants in special soaps.

civet. (zibeth). Unctuous secretion from the civet cat; used as a perfume fixative. Synthetic types are available.

civettal. See 1,2,3,4-tetrahydro-6-methylquinoline.

Civex process. See reprocessing.

Cl. Symbol for chlorine; the molecular formula is Cl_2 .

cladding. The process in which two metals are bonded by being rolled together at suitable pressure and temperature. Controlled explosion is also used. At the interface, each metal diffuses sufficiently into the other to form an alloy. Cladding is generally from 5 to 20% of total thickness; but may be heavier depending on the properties desired. The base metal is usually carbon or low-alloy steel clad with stainless steel, nickel, or other protective metal. Nonferrous metals are also clad; copper with copper-nickel is used for coinage.

clade. A group of organisms that includes the most recent common ancestor of all of its members and all of the descendants of that most recent common ancestor.

cladogenesis. The development of a new clade; the splitting of a single lineage into two distinct lineages; speciation.

cladogram. A diagram, resulting from a cladistic analysis, that depicts a hypothetical branching sequence of lineages leading to the taxa under consideration. The points of branching within a cladogram are called nodes. All taxa occur at the endpoints of the cladogram.

Claisen condensation. A condensation reaction discovered in 1890 in which aldehydes react with esters of the type $\text{RCH}_2\text{COOR}'$ in the presence of metallic sodium or sodium ethylate to form unsaturated esters $\text{R}''\text{CH}=\text{C}(\text{R})\text{COOR}'$. The mechanism

of the reaction parallels that of acetoacetic ester condensation. An addition compound of the ester and sodium ethylate is first formed and then transformed into an unsaturated sodio ether; an addition compound between this ether and the aldehyde forms next; this changes to the unsaturated ester through a molecular rearrangement and cleavage of sodium hydroxide. Amides of alkali metals are excellent catalysts for the reaction, but they tend to form some amide by-products. Union with the carbonyl carbon takes place at the α -carbon in the acid.

Claisen rearrangement. Thermal rearrangement of allyl ethers of enols or phenols to γ,Δ -unsaturated ketones or omicron-allylphenols, respectively, by a 3,3-sigmatropic shift.

Claisen-Schmidt condensation. Condensation of an aromatic aldehyde with an aliphatic aldehyde or ketone in the presence of a relatively strong base (hydroxide or alkoxide ion) to form an α,β -unsaturated aldehyde or ketone.

Clapeyron equation. The equation $dp/dT = \Delta H/T\Delta V$. It states that the rate of change of vapor pressure of a liquid (expressed in ergs per cubic centimeter) with absolute temperature (in Kelvins) equals the heat of vaporization (in ergs per gram) divided by the product of the absolute temperature and the increase in volume (V , in cubic centimeters) when a gram of the liquid changes to vapor. Other consistent units may be used. The approximate Clapeyron equation, $d\ln p/dT = \Delta H/RT^2$, expresses the same relation in a less-exact form because in its derivation, it is assumed that ΔV is equal to the volume of vapor. This assumption (that the volume of liquid is negligibly small) is usually true within a few percent under ordinary conditions of temperature and pressure.

clarification. Removal of bulk water from a dilute suspension of solids by gravity sedimentation, aided by chemical flocculating agents. Large circular tanks equipped with revolving plows or rakes are used for this purpose. Important applications of clarification are for separation of wood-pulp waste from paper-mill effluents and excess water from activated sludge.

See dewatering.

clarithromycin. See 6-*o*-methylerythromycin.

Clark cell. Standard cell for measuring electrical potential with mercury and zinc amalgam electrodes in zinc sulfate solution.

Clark-Lubs indicators. Phenol red, cresol red, bromophenol blue, bromocresol purple, thymol blue, bromthymol blue, and methyl red.

clary oil.

Properties: From steam distillation of flowering tops

and leaves of *Salvia sclarea* L. (Fam. *Labiatae*). Pale yellow liquid; herbaceous odor. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol. **Use:** Food additive.

clary sage oil. See sage oil.

class A fire. Paper, wood, and rubbish fires, that can be extinguished by water. See fire extinguishment.

class B fire. Flammable liquids and grease fires, that require smothering. See fire extinguishment.

class C fire. Fires in electrical equipment, that require smothering and cooling with a nonconducting extinguishing agent such as liquefied CO₂. See fire extinguishment.

classification. In chemical-engineering parlance, the mechanical process of separating subdivided solids (crushed stone, cement, mineral aggregate, and the like) into two (or more) *classes*, each containing a specific size range. They may vary from an inch or more in diameter to powders of considerable fineness. Customary classifying equipment includes so-called grizzlies, perforated metal and vibrating screens, sifters, sieves, and similar devices. A magnetic separator is often used in conjunction with the screen to remove tramp metal. A similar method is used in the food industry for size grading of certain fruits and vegetables, e.g., peas, berries, etc.

clathrate compound. An inclusion complex in which molecules of one substance are completely enclosed within the other, as argon within hydroquinone crystals. Urea adducts are inclusion complexes of the channel or canal type. In these, the complexing urea crystals wrap around the molecule of the other substance, usually a straight-chain unbranched aliphatic hydrocarbon. Similar complexes are formed with thiourea. See inclusion complex.

Claude system. A process for the production of liquid air in which the compressed gas is made to perform work in an expansion engine and thus cool itself.

Clausius-Mosotti law. A relation between density and dielectric constant of dielectrics.

clay. A hydrated aluminum silicate. Generalized formula Al₂O₃SiO₂•xH₂O. Component of soils in varying percentages.

Properties: Fine, irregularly shaped crystals ranging from 150 microns to less than 1 micron (colloidal); reddish-brown to pale buff color, depending on iron oxide content; odorless. D approximately 2.50. Insoluble in water and organic solvents. Absorbs wa-

ter to form a plastic, moldable mass and in some cases a thixotropic gel (bentonite). Refractory material; strong ion-exchange capability; important in soil chemistry and construction engineering.

Derivation: Weathering of rocks.

Occurrence: Southeastern U.S., Wyoming, Texas, Canada, England, France, the former U.S.S.R..

Available forms: Kaolinite, montmorillonite, attapulgite, illite, bentonite, halloysite.

Grade: Natural, refined, air floated.

Hazard: Dusts may irritate to nose and throat. Suspensions of dust are a fire hazard.

Use: Ceramic products, refractories, colloidal suspensions, oil-well drilling fluids, filler for rubber and plastic products, films, paper coating, decolorizing oils, temporary molds, filtration, carrier in insecticidal sprays, catalyst support.

See fuller's earth; bentonite; ceramic; refractory; kaolin; slip clay; polyorganosilicate graft polymer.

"Cleanwiz" [Axel]. TM for mold cleaners and strippers.

cleave. (1) Of a crystal, to break or separate along definite planes defined by the crystalline structure. It may cleave in one direction, as in mica, or in several. (2) Of an alkene molecule, to divide into two compounds (aldehydes or ketones) at the double bond. This is usually done by ozone, followed by hydrolysis in the presence of powdered zinc.

Cleland's reagent. See dithiothreitol.

Clemmensen reaction. The Clemmensen method of reduction (1913) consists in refluxing a ketone with amalgamated zinc and hydrochloric acid. Acetophenone, for example, is reduced to ethylbenzene. The method is applicable to the reduction of most aromatic-aliphatic ketones to at least some aliphatic and alicyclic ketones, to the γ -keto acids obtainable by Friedel-Crafts condensations with succinic anhydride (succinoylation), and to the cyclic ketones formed by intramolecular condensation.

clenoliximab.

Properties: Monkey/human chimeric CD4 monoclonal antibodies

CAS: 182912-58-9.

Hazard: A poison.

Cleveland Open Cup. See COC.

Cleve's acid. (1-naphthylamine-6-sulfonic acid).

Properties: Colorless needles. Mp >330C. Slightly soluble in water.

Derivation: Nitration of naphthalene- β -sulfonic acid. On reduction with iron, this yields a mixture of 1-naphthylamine-6-sulfonic acid (Cleve's acid) and 1-naphthylamine-7-sulfonic acid (or Cleve's acid-1,7). The latter is separated by crystallization as the

- sodium salt, the 1,6-acid precipitates on acidification.
Use: Azo dye intermediate.
- Cleve's acid-1,7.** (1-naphthylamine-7-sulfonic acid).
 See Cleve's acid.
- cliffstone Paris white.** A special grade of whiting made from a hard grade of English chalk.
- climbazol.** See 1-(*p*-chlorophenoxy)-3,3-dimethyl-1-(1-imidazolyl)-2-butanone.
- clindamycin hydrochloride.** See 7-chloro-lincomycin hydrochloride.
- clinical chemistry.** A subdivision of chemistry that deals with the behavior and composition of all types of body fluids, including the blood, urine, perspiration, glandular secretions, etc. It involves analysis and testing of these for content of numerous metabolic constituents, as well as foreign materials; thus it also includes toxicological factors.
- clinoptilolite.** A natural, inorganic zeolite used as a selective ion-exchange medium for removal of ammonia from plant wastewater.
- clomazone.** See 2-(2-chlorobenzyl)-4,4-dimethyl-1,2-oxazolidin-3-one.
- clone.** An identical copy of an organism. Most plants, fungi, algae, and many other organisms naturally reproduce by making clones of themselves as a form of asexual reproduction.
- cloning.** Using specialized DNA technology to produce multiple, exact copies of a single gene or other segment of DNA to obtain enough material for further study. This process, used by researchers in the Human Genome Project, is referred to as cloning DNA. The resulting cloned (copied) collections of DNA molecules are called clone libraries. A second type of cloning exploits the natural process of cell division to make many copies of an entire cell. The genetic makeup of these cloned cells, called a cell line, is identical to the original cell. A third type of cloning produces complete, genetically identical animals such as the famous Scottish sheep, Dolly. See cloning vector.
- cloning vector.** DNA molecule originating from a virus, a plasmid, or the cell of a higher organism into which another DNA fragment of appropriate size can be integrated without loss of the vector's capacity for self-replication; vectors introduce foreign DNA into host cells, where the DNA can be reproduced in large quantities. Examples are plasmids, cosmids, and yeast artificial chromosomes; vectors are often recombinant molecules containing DNA sequences from several sources.
- clopidol.** (3,5-dichloro-2,6-dimethyl-4-pyridinol; Coyden).
 CAS: 2971-90-6. $C_7H_7Cl_2NO$. A penta-substituted pyridine derivative.
Properties: A solid. Mw 192.06, mp >320C. Insoluble in water.
Hazard: Toxic. TLV: 10 mg/m³.
- clopyralid.**
Use: Food additive; herbicide.
- clorprenaline hydrochloride.** See isoprophenamine hydrochloride.
- clorsulon.**
Use: Drug (veterinary); food additive.
- closed system.** A system that exchanges neither matter nor energy with the surroundings.
- clostebol acetate.** See 4-chlorotestosterone 17-acetate.
- cloud point.** In petroleum technology, the temperature at which a waxy solid material appears as a diesel fuel is cooled. This material is harmful to engine performance.
- cloud seeding.** See nucleation.
- clove oil.** (caryophyllus oil). An essential oil distilled from cloves. Optically active.
Use: Medicine (local), flavoring, dentistry, perfumery, confectionery, soaps.
- clupanodonic acid.** $C_{21}H_{35}COOH$. Derived from herring oil.
- clupeine.** A protamine (simple protein) from herring. Contains no sulfur.
Properties: Water soluble.
- cluster catalysis.** See catalysis.
- "CM" [Du Pont].** TM for a flame-retardant composition based on ammonium sulfamate and modified to prevent afterglow and improve penetration.
Properties: Fine, white granules. Soluble in water; insoluble in dry-cleaning solvents.
Use: Treatment of fabrics, paper, paper products, and other cellulosic materials.
- Cm.** Symbol for curium.
- cM.** See centimorgan.
- CMA.** Abbreviation for Chemical Manufacturers Association.
- CMC.** See carboxymethylcellulose.

CM-cellulose. Abbreviation for carboxymethyl-cellulose, used especially by biochemists.

CMHEC. Abbreviation for carboxymethyl hydroxyethyl cellulose.

CMP. Abbreviation for cytidine monophosphate. See cytidylic acid.

CMPP. Abbreviation for 2-(4-chloro-2-methylphenoxy)propionic acid. See mecoprop.

CMRA. Abbreviation for Chemical Marketing Research Association.

CMU. Abbreviation for chlorophenyldimethylurea. See monuron.

CNS. Abbreviation for central nervous system (applied to the actions of certain drugs).

Co. Symbol for cobalt.

coacervation. An important equilibrium state of colloidal or macromolecular systems. It may be defined as the partial miscibility of two or more optically isotropic liquids, at least one of which is in the colloidal state. For example, gum arabic shows the phenomenon of coacervation when mixed with gelatin.

coagulant. A substance that induces coagulation. Coagulants are used in precipitating solids or semisolids from solution, as casein from milk, rubber particles from latex, or impurities from water. Compounds that dissociate into strongly charged ions are normally used for this purpose. Blood contains the natural coagulant thrombin.

coagulation. Irreversible combination or aggregation of semisolid particles, such as fats or proteins, to form a clot or mass. This can often be brought about by addition of appropriate electrolytes, e.g., by the addition of an acid to milk or of aluminum sulfate to turbid water. Mechanical agitation and removal of stabilizing ions, as in dialysis, also cause coagulation. The clotting of blood by thrombin, of rubber particles in latex by acetic acid, and of egg white by heat are additional instances. See agglomeration (1); flocculation.

coagulation value. (flocculation value). Concentration of a coagulant that effects a standard change.

Coahran process. Recovery of acetic acid from pyroigneous acid by extracting with ether. It is an improved version of the Brewster process but is basically the same.

coal. A natural, solid, combustible material formed from prehistoric plant life, it occurs in layers or veins in sedimentary rocks. It is far more plentiful than petroleum in the U.S. an important source of heat and energy. It occurs chiefly in West Virginia and Kentucky, as well as in Wyoming and other western states. Much of it is too high in sulfur content to meet desirable pollution standards unless sulfur is removed by scrubbing. Chemically, coal is a macromolecular network composed of groups of polynuclear aromatic rings, to which are attached subordinate rings connected by oxygen, sulfur, and aliphatic bridges. This extended open structure is conducive to catalytic reactions, which in effect subdivide it into smaller molecules that can be defined readily. Coal is an important source of chemical raw materials. Pyrolysis (destructive distillation) yields coal tar and hydrocarbon gases that can be upgraded by hydrogenation or methanation to synthetic crude oil and fuel gas, respectively. Catalytic hydrogenation yields hydrocarbon oils and gasoline. Gasification produces carbon monoxide and hydrogen (synthesis gas), from which ammonia and other products can be made. Numerous processes for adapting these reactions to large-scale production of fuel oil and gasoline have been developed in the U.S., but none has yet proved economically successful. The process is being used abroad (Lurgi and Sasol methods).

Hazard: TLV: 2 mg/m³ respirable dust.

See gasification; hydrogenolysis; hydrosolvation; peat; lignite.

coal, conversion. See gasification.

coalescence. (1) The combination of globules in an emulsion as the result of molecular attraction of the surfaces. (2) The combination of one or multiple crystals of aggregates into a simple larger unit.

coalescer. Unit containing glass fibers or other suspended material to facilitate separation of immiscible liquids of similar density.

coalescing agent. A material that assists in filmmaking by helping polymer particles flow together to form a continuous film.

coal gas. (bench gas; coke-oven gas). A mixture of gases produced by the destructive distillation of bituminous coal in highly heated fire-clay or silica retorts or in by-product coke ovens.

Hazard: Flammable.

Use: Directly on open-hearth furnaces.

coal gasification. See gasification.

coal hydrogenation. See hydrogenolysis, gasification.

coal oil. The crude oil obtained by the destructive distillation of bituminous coal, or the distillate obtained from this oil.

Hazard: Flammable, moderate fire risk.

coal tar. (coal tar pitch volatiles).

CAS: 65996-93-2.

Properties: Black, viscous liquid (or semisolid); naphthalene-like odor; sharp, burning taste. D 1.18–1.23. Soluble in ether, benzene, carbon disulfide, chloroform; partially soluble in alcohol, acetone, methanol; only slightly soluble in water. Coal tar may be hydrogenated under pressure to form a petroleum-like fuel suitable for residual use. coal tar fractions obtained by distillation and the chemicals found in each are as follows: (1) light oil (up to 200C): benzene, toluene, xylenes, cumenes, coumarone, indene; (2) middle oil (200–250C); and (3) heavy oil (250–300C): naphthalene, acenaphthene, methylnaphthalenes, fluorene, phenol, cresols, pyridine, picolines; (4) anthracene oil (300–350C): phenanthrene, anthracene, carbazole, quinolines; and (5) pitch. Typical yields: 5% light oil, 17% middle oil, 7% heavy oil, 9% anthracene oil, 62% pitch. Treatment with alkalis, acids, and solvents is necessary to separate the individual chemicals.

Derivation: Obtained by destructive distillation of bituminous coal as in coke ovens. One ton of coal yields 8.8 gal of coal tar.

Grade: Crude, refined, USP.

Hazard: A human carcinogen. Toxic by inhalation. TLV: (volatiles) 0.2 mg/m³. Combustible.

Use: Raw material for plastics, solvents, dyes, drugs, and other organic chemicals. The crude or refined product or fractions thereof are also used for waterproofing, paints, pipe coating, roads, roofing, and insulation and as pesticides and sealants.

coal tar creosote. Low-cost, water-insoluble, low-volatility wood preservative.

coal tar distillate. The lighter fractions of coal tar. The terms *coal tar light oil*, *coal tar naphtha*, and *coal tar oil* are loosely defined and sometimes regarded as synonymous.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation and skin absorption. See naphtha.

coal tar dye. A dye produced from the coal tar hydrocarbons or their derivatives, such as benzene, toluene, xylene, naphthalene, anthracene, aniline, etc.

See dye, synthetic.

coal tar light oil. See coal tar distillate; light oil.

coal tar naphtha. See coal tar distillate; naphtha, solvent.

coal tar oil. See coal tar distillate.

coal tar pitch. Dark-brown to black amorphous residue left after coal tar is redistilled. It is composed almost entirely of polynuclear aromatic compounds and constitutes 48–65% of the usual grades of coal tar. Different grades have different softening points: roofing pitch softens at 65C, electrode pitch at 110–115C. Combustible.

Hazard: Volatile components (anthracene, phenanthrene, acridine) are carcinogens. TLV: 0.2 mg/m³.

Use: Binder for carbon electrodes, base for paints and coatings. Impregnation of fiber pipe for electrical conduits and drainage, foundry core compounds, briquetting coal, tar-bonded refractory brick, paving and roofing, plasticizers for elastomers and polymers, extenders, saturants, impregnants, sealants.

coating. A film or thin layer applied to a base material, called a substrate. The coatings most commonly used in industry are metals, alloys, resin solutions, and solid-liquid suspensions on various substrates (metals, plastics, wood, paper, leather, etc.). They may be applied by electrolysis, vapor deposition, vacuum evaporation, or mechanical means such as brushing, spraying, calendaring, and roller coating. Products such as cables and power cord are coated by extrusion. Such thermosetting resins as acrylics, epoxies, and polyesters appropriately compounded are available in powder form and are applied to auto bodies, machinery, and other industrial products by electrostatic spraying techniques. This process is claimed to minimize the pollution problems and waste encountered with solvent-based sprayed coatings.

See protective coating; film; paint; vacuum deposition.

cobalamin. Imprecise name for vitamin B₁₂; it refers to the molecule cyanocobalamin without the cyano- group (CN).

See cyanocobalamin.

cobalt.

CAS: 7440-48-4. Co. Metallic element of atomic number 27, group VIII of the periodic table. Aw 58.9332. Valences 2, 3; no stable isotopes. There are several artificial radioactive isotopes, the most important being ⁶⁰Co. Coordination number: 4 (divalent), 6 (trivalent).

Properties: Steel-gray, shining, hard, ductile, somewhat malleable metal; ferromagnetic, with permeability two-thirds that of iron; has exceptional magnetic properties in alloys. D 8.9, mp 1493C, bp 3100C. Attacked by dilute hydrochloric and sulfuric acids, soluble in nitric acid. Corrodes readily in air. Hardness: cast 124 Brinell, electrodeposited 300 Brinell. An important trace element in soils and necessary for animal nutrition. Cobalt has unusual coordinating properties, especially the trivalent ion. Noncombustible except as powder.

Occurrence: Principal ores are smaltite, cobaltite, chloanthite, linnæite (Canada, Zaire, Zambia).

Derivation: From ore concentration by roasting fol-

lowed (1) by thermal reduction by aluminum; (2) by electrolytic reduction of solutions of metal; or (3) by leaching with either ammonia or acid in an autoclave under elevated temperatures and pressures and subsequent reduction by hydrogen.

Available forms: Rondels ($1 \times 3/4$ in), shot, anodes, 150 and finer mesh powder to 99.6% purity, ductile strips (95% cobalt, 5% iron) and high-purity strips, 99.9% pure, single crystals.

Hazard: An animal carcinogen. Toxic by inhalation. TLV: 0.02 mg(Co)/m³. Dust is flammable.

Use: Chemical (cobalt salts, oxidizing agent); electroplating ceramics; lamp filaments; catalyst (sulfur removal from petroleum, Oxo process, organic synthesis); trace element in fertilizers; glass; drier in printing inks, paints, and varnishes; colors; cermets. Principal use in alloys, especially cobalt steels for permanent and soft magnets and cobalt-chromium high-speed tool steels. Cemented carbides, jet engines, coordination and complexing agent.

See cobaltamine.

cobalt-57. Radioactive cobalt of mass number 57.

Properties: Half-life 267 days; radiation γ , κ , X ray.

Derivation: Bombardment of a nickel target with protons.

Available forms: Cobaltous chloride in hydrochloric acid solution, cyanocobalamin cobalt-57 solution (USP).

Hazard: Radioactive poison.

Use: Biological research.

cobalt-58. Radioactive cobalt of mass number 58.

Properties: Half-life 72 days; radiation positron, γ , κ , X ray.

Available forms: Cobaltous chloride in hydrochloric acid solution.

Hazard: Radioactive poison.

Use: Biological and medical research.

cobalt-60. Radioactive cobalt of mass number 60. One of the most common radioisotopes.

Properties: Half-life 5.3 years; radiation β and γ . Radiocobalt is available in larger quantities and is cheaper than radium.

Derivation: Irradiation of cobalt oxide, Co_2O_3 , or of cobalt.

Available forms: Encapsulated pellets or wire needles, cobaltous chloride in hydrochloric acid solution, solid cobaltic oxides, labeled compounds such as cyanocobalamin (USP).

Hazard: Radioactive poison.

Use: Radiation therapy (cancer), radiographic testing of welds and castings, as a source of ions in gas-discharge devices, as the radiation source in liquid-level gauges, for locating buried telephone and electrical conduits, portable radiation units, γ -irradiation for wheat and potatoes, as a research aid in studying the permeability of porous media to flow

of oil, wearing quality of floor wax, oil consumption in internal-combustion engines, wool dyeing, etc.

cobalt acetate. See cobaltous acetate.

cobaltamine. A coordination or complexing compound containing the group $[\text{Co}(\text{NH}_3)_6]_3^+$ or its derivatives in which some of the ammonia has been replaced by other groups or ions. The names *hexamine*, *pentamine*, etc. are used to indicate the number of ammonia groups present. Prepared by adding excess ammonia to a cobaltous salt, exposing to air so that oxygen is absorbed, and boiling to oxidize the cobalt. These compounds show none of the ordinary properties of cobalt. Different types of salts with various acid radicals are known. The ammonia in the amines may be replaced, molecule for molecule, by other nitrogen compounds such as hydroxylamine or ethylene diamine, by water, by ions such as hydroxyl, chloride, nitrate, etc., or by groups such as nitro (NO_2).

See coordination compound.

cobalt ammonium sulfate. See cobaltous ammonium sulfate.

cobalt arsenate. See cobaltous arsenate.

cobalt black. See cobaltic oxide.

cobalt bloom. See erythrite (2).

cobalt blue. (Thenard's blue; cobalt ultramarine; azure blue).

Properties: Blue to green pigment of variable composition, consisting essentially of mixtures of cobalt oxide and alumina, approximating cobaltous aluminate, $\text{Co}(\text{AlO}_2)_2$. Cobalt blue is said to be the most durable of all blue pigments, being resistant to both weathering and chemicals.

Derivation: By heating alumina with (1) cobaltous oxide, or a material yielding this oxide on calcination; (2) cobalt phosphate; (3) cobalt arsenate. Greenish shades may be made by incorporating zinc oxide.

Grade: Technical (called genuine to distinguish it from the imitation, which is ultramarine blue).

Use: Pigments in oil or water, cosmetics (eye shadows, grease paints).

cobalt bromide. See cobaltous bromide.

cobalt caprylate.

Use: Food additive.

cobalt carbonate. See cobaltous carbonate, basic.

cobalt carbonyl. (cobalt tetracarbonyl; dicobalt octacarbonyl).

CAS: 10210-68-1. $\text{C}_8\text{O}_8\text{Co}_2$.

Properties: Orange-red crystals. Mw 341.94, mp 51C, vap press 1.5 mm Hg (25C). Insoluble in water, soluble in ether, alcohol, carbon disulfide, and naphtha.

Hazard: TLV: 0.1 mg(Co)/m³.

Use: Catalyst for hydroformulation, hydrogenation, hydrosilation, isomerization, carboxylation, carbonylation, and polymerization.

cobalt carbonyl hydride. See cobalt hydrocarbonyl.

cobalt chloride. See cobaltous chloride.

cobalt chromate. See cobaltous chromate.

cobalt chromate, basic. See cobaltous chromate.

cobalt difluoride. See cobaltous fluoride.

cobalt-2-ethylhexoate. (cobalt octoate). C₄H₉CH(C₂H₅)COOH. Probably the cobaltous salt of 2-ethylhexoic acid.

Properties: Blue liquid. D 1.013 (25C).

Use: Paint drier, whitener, catalyst.

cobalt-gold alloy. Made by a vapor deposition technique into magnetic films. Compositions range from 25 to 60% gold.

cobalt hydrate. See cobaltic hydroxide; cobaltous hydroxide.

cobalt hydrocarbonyl. (cobalt carbonyl hydride; tetracarbonylhydrocobalt).

CAS: 16842-03-8. C₄HCoO₄.

Properties: Gas; offensive odor. Mw 171.98, mp -26C. Slightly soluble in water.

Hazard: Flammable gas. TLV: 0.1 mg(Co)/m³.

Use: Catalyst.

cobalt hydroxide. See cobaltic hydroxide; cobaltous hydroxide.

cobaltic acetylacetonate.

CAS: 21679-46-9. Co[CH₃COCHC(CH₃)O]₃.

Properties: Dark-green or black crystals. D 1.43, mp 241C.

Derivation: Reaction of cobaltous carbonate with acetylacetonone and peroxide.

Use: Catalyst for olefins, diens, polyesters, combustion, solid propellants; polymerization; vulcanizing; coloring for synthetic resins; deposition of metal and/or oxide as memory storage for computers; intermediate for synthesis; glass tinting.

cobaltic boride. CoB.

Properties: Crystal prisms. D 7.25 (18C), mp >1400C. Decomposes in H₂O, soluble in nitric acid.

Use: Ceramics.

cobaltic fluoride. See cobalt trifluoride.

cobaltic hydroxide. (cobalt hydroxide; cobalt hydrate). Co(OH)₃, actually considered to be Co₂O₃•3H₂O.

Properties: Dark-brown powder. D 4.46, loses water at 100C. Soluble in cold concentrated acids; insoluble in water and alcohol.

Derivation: Addition of sodium hydroxide to a solution of cobaltic salt, action of chlorine on a suspension of cobaltous hydroxide, action of sodium hypochlorite on a cobaltous salt.

Use: Cobalt salts, catalyst.

cobaltic oxide. (cobalt oxide; cobalt black).

CAS: 1308-04-9. Co₂O₃. Sometimes incorrectly called cobalt peroxide.

Properties: Steel-gray or black powder. D 4.81-5.60, mp (decomposes at 895C). Soluble in concentrated acids; insoluble in water.

Derivation: By heating cobalt compounds at low temperature with excess of air.

Use: Pigment, coloring enamels, glazing pottery.

cobaltic potassium nitrite. (cobalt yellow).

CoK₃N₆O₁₂ or CoK₃(NO₂)₆.

Properties: Yellow, crystalline solid. Insoluble in alcohol; slightly soluble in water and acetic acid; decomposed by sulfuric acid.

Derivation: By adding potassium nitrite to a cobalt salt solution.

Use: Colorant for rubber, glass, and ceramic products; separation of cobalt from nickel; analytical chemistry.

cobalt iodide. See cobaltous iodide.

cobaltite. (cobalt glance). CoAsS.

Properties: Silver-white to gray mineral, metallic luster. Contains 35.5% cobalt, d 6-6.3, Mohs hardness 5.5.

Occurrence: Canada, Zaire, Sweden.

Hazard: Ddust or powder toxic when inhaled.

Use: An important cobalt ore; ceramics.

cobalt linoleate. See cobaltous linoleate.

cobalt molybdate.

CAS: 13762-14-6. CoMoO₄. A molybdenum catalyst (a gray-green powder) used in petroleum technology, in reforming and desulfurization.

cobalt monoxide. See cobaltous oxide.

cobalt naphthenate. See cobaltous naphthenate.

cobalt neodecanoate. Deep-blue paste containing 12% cobalt. Used as a drying additive for printing inks.

cobalt nitrate. See cobaltous nitrate.

cobaltocene. (dicyclopentadienylcobalt).

CAS: 1277-43-6. $(C_5H_5)_2Co$. A metallocene.

Properties: Purple crystals. Mp 172–173C. Soluble in hydrocarbons; highly reactive compound that is readily oxidized by air, water, and dilute acids.

Hazard: Toxic by ingestion.

Use: Polymerization inhibitor of olefins up to 200C, Diels-Alder reaction, catalyst, paint drier, oxygen stripping agent.

cobaltocobaltic oxide. (tricobalt tetraoxide).

Co_3O_4 .

Properties: Steel-gray to black in anhydrous form. D 6.07; changes to cobaltous oxide at 900–950C. Insoluble in water, hydrochloric and nitric acids; soluble in sulfuric acid and fused sodium hydroxide; hygroscopic.

Derivation: By heating strongly other cobalt oxides in air. Thus, the commercial oxides contain a substantial quantity of Co_3O_4 .

Use: Ceramics, pigments, catalyst, preparation of cobalt metal, semiconductors.

cobalt octoate. See cobalt-2-ethylhexoate; soap (2).

cobalt oleate. See cobaltous oleate.

cobaltous acetate. (cobalt acetate).

CAS: 71-48-7. $Co(C_2H_3O_2)_2 \cdot 4H_2O$.

Properties: Reddish-violet, deliquescent crystals. D 1.7043, mp loses H_2O at 140C. Soluble in water, acids, and alcohol.

Derivation: Action of acetic acid on cobalt carbonate with subsequent crystallization.

Grade: Technical, pure crystals, CP.

Hazard: May not be used in food products (FDA).

Use: Sympathetic inks, paint and varnish driers, catalyst, anodizing, mineral supplement in feed additives, foam stabilizer.

cobaltous aluminate. See cobalt blue.

cobaltous ammonium phosphate. (ammonium cobaltous phosphate; cobalt violet).

CoH_2NO_4P .

Properties: Violet to dark-red crystals. Insoluble in water; soluble in common acids.

Use: Plant nutrient; colorant in glass, glazes, enamels; analytical chemistry.

cobaltous ammonium sulfate. (cobalt ammonium sulfate).

$CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$.

Properties: Ruby-red crystals. D 1.902. Soluble in water; insoluble in alcohol.

Derivation: Crystals of cobaltous sulfate with ammonium sulfate.

Use: Ceramics, cobalt plating, catalyst.

cobaltous arsenate. (cobalt arsenate).

$Co_3(AsO_4)_2 \cdot 8H_2O$.

Properties: Violet-red powder. D 3.178 (15C). Soluble in acids, insoluble in water.

Derivation: Interaction of solutions of sodium arsenate and a cobalt salt.

Grade: Technical.

Use: Painting on glass and porcelain in light-blue colors, coloring glass.

See erythrite.

cobaltous bromide. (cobalt bromide).

CAS: 7789-43-7. $CoBr_2 \cdot 6H_2O$.

Properties: Red-violet crystals. D 2.46, mp 47–48C, loses $6H_2O$ at 130C. Soluble in water, alcohol, and ether. Anhydrous crystals: bright green.

Derivation: By the action of bromine on cobalt or of hydrobromic acid on cobaltous hydroxide or carbonate followed by crystallization.

Grade: Technical, CP.

Use: In hygrometers, catalyst.

cobaltous carbonate. $CoCO_3$.

Properties: Red crystals. D 4.13, mp (decomposes). Insoluble in water and ammonia; soluble in acids. The cobalt carbonate of commerce is usually the basic salt (see following entry).

Derivation: By heating cobaltous sulfate with a solution of sodium bicarbonate.

Use: Ceramics, trace element added to soils and animal feed, temperature indicator, catalyst, pigments.

cobaltous carbonate, basic.

$2CoCO_3 \cdot 3Co(OH)_2 \cdot H_2O$. The cobalt carbonate of commerce.

Properties: Red-violet crystals. Mp (decomposes). Soluble in acids; insoluble in cold water; decomposes in hot water.

Derivation: By adding sodium carbonate to a solution of cobaltous acetate followed by filtration and drying.

Use: Manufacturing cobaltous oxide, cobalt pigments, cobalt salts; intermediate.

cobaltous chloride. (cobalt chloride).

CAS: 7646-79-9. (1) $CoCl_2$, (2) $CoCl_2 \cdot 6H_2O$.

Properties: (1) Blue, (2) ruby-red crystals. D (1) 3.348, (2) 1.924; mp (1) sublimes, (2) 86.75C. Soluble in water, alcohol, and acetone.

Derivation: By the action of hydrochloric acid on cobalt; its oxide, hydroxide, or carbonate. Concentration gives (2) and dehydration (1).

Hazard: May not be used in food products (FDA). Can cause blood damage.

Use: Absorbent for ammonia, gas masks, electroplating, sympathetic inks, hygrometers, manufacture of vitamin B_{12} , flux for magnesium refining, solid lu-

bricant, dye mordant, catalyst, barometers, laboratory reagent, fertilizer additive.

cobaltous chromate. (basic cobalt chromate; cobalt chromate). CoCrO_4 .

Properties: Brown or yellowish-brown powder. Variable composition. (Pure cobaltous chromate is CoCrO_4 , gray-black crystals.) Soluble in mineral acids and solutions of chromium trioxide; insoluble in water.

Hazard: A carcinogen.

Use: Ceramics (tinting).

cobaltous citrate. $\text{Co}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Rose-red, amorphous powder. Mp 150C (loses $2\text{H}_2\text{O}$). Slightly soluble in water; soluble in dilute acids.

Use: Vitamin preparations, therapeutic agents.

cobaltous cyanide. (1) $\text{Co}(\text{CN})_2 \cdot 2\text{H}_2\text{O}$, (2) $\text{Co}(\text{CN})_2$.

Properties: (1) Buff crystals, (2) blue-violet powder; d (2) 1.872, mp (2) 280C. Insoluble in water; soluble in potassium cyanide, hydrochloric acid, ammonium hydroxide.

Hazard: Highly toxic. TLV: 5 mg(CN)/m³.

cobaltous ferrite. CoFe_2O_4 . A constituent of magnetically soft ferrites that have high permeability, low coercive force, low magnetic saturation, and high resistivity.

See ferrite.

cobaltous fluoride. (cobalt difluoride).

CAS: 10026-17-2. CoF_2 .

Properties: Rose-red crystals or powder. D 4.46, mp approximately 1200C, bp 1400C. Soluble in cold water and hydrofluoric acid. Decomposes in hot water. Ammine complexes can be prepared from the hydrate.

Hazard: Highly toxic. TLV: 2.5 mg(F)/m³.

Use: Catalyst.

cobaltous formate. $\text{Co}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Red crystals. D 2.129 (22C), mp 140C (loses $2\text{H}_2\text{O}$), decomposes at 175C. Soluble in cold water; insoluble in alcohol.

Use: Catalyst.

cobaltous hydroxide. (cobalt hydroxide; cobalt hydrate). $\text{Co}(\text{OH})_2$.

Properties: Rose-red powder. D 3.597. Soluble in acids and ammonium salt solutions; insoluble in water and alkalis.

Derivation: Addition of sodium hydroxide to a solution of cobaltous salt.

Use: Cobalt salts, paint and varnish driers, catalyst, storage-battery electrodes.

cobaltous iodide. (cobalt iodide). $\text{CoI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Brownish-red crystals. Loses iodine on exposure to air, d 2.90, loses $6\text{H}_2\text{O}$ at 27C. Soluble in

water and alcohol. Anhydrous cobaltous iodide, CoI_2 , in the form of black crystals, d 5.68, or in a yellow β -modification that gives a colorless aqueous solution.

Derivation: Heating cobalt powder with hydriodic acid; anhydrous cobaltous iodide is prepared by heating cobalt in iodine vapor.

Use: Hygrometers; determination of water in organic solvents; catalyst.

cobaltous linoleate. (cobalt linoleate).

$\text{Co}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown, amorphous powder. Soluble in alcohol, ether, and acids; insoluble in water. Combustible.

Derivation: By boiling a cobalt salt and sodium linoleate.

Use: Paint and varnish drier, especially enamels and white paints.

See soap (2).

cobaltous naphthenate.

Properties: Brown, amorphous powder or bluish-red solid. Insoluble in water; soluble in alcohol, ether, oils. Composition indefinite. Combustible.

Derivation: By treating cobaltous hydroxide or cobaltous acetate with naphthenic acid.

Use: Paint and varnish drier, bonding rubber to steel and other metals.

cobaltous nitrate. (cobalt nitrate).

CAS: 10141-05-6. $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Red crystals. Deliquescent in moist air. D 1.88 (25C), mp 56C, decomposes at 75C. Soluble in most organic solvents.

Derivation: Action of nitric acid on metallic cobalt or cobalt oxide, hydroxide, or carbonate, with subsequent crystallization.

Use: Sympathetic inks, cobalt pigments, catalysts, additive to soils and animal feeds, vitamin preparations, hair dyes, porcelain decoration.

Hazard: Oxidizing agent, dangerous fire risk in contact with organic materials.

cobaltous oleate. (cobalt oleate).

$\text{Co}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown, amorphous powder. Mp 235C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By heating cobaltous chloride and sodium oleate followed by filtration and drying.

Use: Paint and varnish driers.

See soap (2).

cobaltous oxide. (cobalt oxide; cobalt monoxide).

CAS: 1307-96-6. CoO .

Properties: Grayish powder under most conditions, can form green-brown crystals. D 6.45, mp 1935C. Soluble in acids and alkali hydroxides; insoluble in water and ammonium hydroxide.

Derivation: Calcination of cobalt carbonate or its

oxides at high temperature in a neutral or slightly reducing atmosphere.

Grade: Technical, ceramic.

Use: Pigment in paints and ceramics, preparation of cobalt salts, catalyst, porcelain enamels, coloring glass, feed additive, cobalt metal powder.

cobaltous perchlorate. $\text{Co}(\text{ClO}_4)_2$.

Properties: Red needles. D 3.327. Soluble in water, alcohol, acetone.

Hazard: Fire and explosion risk in contact with organic materials. Strong oxidizing agent.

Use: Chemical reagent.

cobaltous phosphate. (cobalt phosphate).

CAS: 13455-36-2. $\text{Co}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Reddish powder. D 2.769 (25C), loses $8\text{H}_2\text{O}$ at 200C. Slightly soluble in cold water; soluble in mineral acids.

Derivation: Interaction of solutions of cobalt salts and sodium phosphate.

Use: Cobalt pigments, coloring glass, painting porcelain, animal-feed supplement.

cobaltous resinate. (cobalt resinate). Principally cobalt abietate.

Properties: Brown-red powder. Insoluble in water; soluble in oils.

Derivation: See soap (2).

Grade: Fused, precipitated. The precipitated grade is higher in cobalt, more expensive, and more effective.

Hazard: Spontaneously flammable in air, reacts strongly with oxidizing materials.

Use: Varnish drier.

See abietic acid.

cobaltous silicofluoride. $\text{CoSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: Pale-red crystals. D 2.087. Soluble in water.

Hazard: Irritating to tissue.

Use: Ceramics.

cobaltous succinate. $\text{Co}(\text{C}_4\text{H}_4\text{O}_4) \cdot 4\text{H}_2\text{O}$.

Properties: Violet crystals. Slightly soluble in cold water; soluble in alkalis; insoluble in alcohol.

Use: Vitamin preparations, therapeutic agents.

cobaltous sulfate. (cobalt sulfate).

CAS: 10124-43-3. (1) CoSO_4 , (2) $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Red powder. D (1) 3.472, (2) 1.948; mp (1) 735C, (2) loses $7\text{H}_2\text{O}$ at 420C. Soluble in water.

Derivation: Action of sulfuric acid on cobaltous oxide.

Hazard: May not be used in food products (FDA).

Use: Ceramics, pigments, glazes, in plating baths for cobalt, additive to soils, catalyst, paint and ink drier, storage batteries.

cobaltous tungstate. (cobalt tungstate; cobalt wolframate). CoWO_4 .

Properties: Reddish-orange powder. D 8.42. Insoluble in water; soluble in hot concentrated acids.

Derivation: By adding a sodium tungstate solution to a solution of a cobalt salt.

Use: Pigment, drier for enamels, inks, paints, electronic devices, antiknock agents.

cobalt oxide. The commercial cobalt oxides are not usually definite chemical compounds but are mixtures of two or more cobalt oxides.

See cobaltic oxide; cobaltous oxide; cobaltocobaltic oxide.

cobalt phosphate. See cobaltous phosphate.

cobalt phthalocyaninesulfonate.

CAS: 30638-08-5. mf: $\text{C}_{32}\text{H}_{15}\text{CoN}_8\text{O}_3\text{S} \cdot \text{H}$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and severe eye irritant.

cobalt potassium cyanide. $\text{K}_3\text{Co}(\text{CN})_6$.

Properties: Yellow crystals. D 1.878 (25C), mp (decomposes). Soluble in water; slightly soluble in alcohol.

Grade: Pure, electronic.

Hazard: A poison. TLV: 5 mg(CN)/m³.

Use: Electronic research.

cobalt potassium nitrite. (cobalt yellow;

potassium cobaltinitrate; Fischer's salt; potassium hexanitrocobaltate III). $\text{K}_3\text{Co}(\text{NO}_2)_6$.

Properties: Yellow, microcrystalline powder. Mp (decomposes at 200C). Slightly soluble in water; insoluble in alcohol.

Derivation: By adding potassium nitrate and acetic acid to a solution of a cobalt salt.

Use: Medicine, yellow pigment, painting on glass or porcelain.

cobalt resinate. See cobaltous resinate.

cobalt selenite. $\text{CoSe}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$. A blue-red powder, insoluble in water.

cobalt silicide. A semiconductor reported to have as much as 15% efficiency in converting heat to electricity in the temperature range 20–800C.

cobalt soap. See cobaltous linoleate; cobaltous naphthenate; cobaltous oleate; cobaltous resinate; cobalt tallate.

cobalt sulfate. See cobaltous sulfate.

cobalt tallate. Cobalt derivative of refined tall oil of varying composition. Used as a drier in paints and varnishes. Combustible.

See soap (2).

cobalt tetracarbonyl. (dicobalt octacarbonyl). $\text{Co}_2(\text{CO})_8$.

Properties: Orange or dark-brown crystals; white

when pure. D 1.78, mp 51C (decomposes above this temperature). Insoluble in water; soluble in alcohol, ether, and carbon disulfide.

Derivation: Combination of finely divided cobalt with carbon monoxide under pressure.

Hazard: Toxic by ingestion and inhalation.

Use: Catalyst in Oxo process, high-purity cobalt salts.

cobalt titanate. Co_2TiO_4 .

Properties: Greenish-black crystals. D 5.07–5.12. Soluble in concentrated hydrochloric acid.

cobalt trifluoride. (cobaltic fluoride). CoF_3 .

Properties: Light-brown, free-flowing powder. D 3.88 (25C), no odor except hydrogen fluoride odor developed in moist air; stable in sealed containers; reacts readily with moisture in the atmosphere to form a dark, almost black powder; reacts with water to form a black, finely divided precipitate (cobaltic hydroxide). Insoluble in alcohol and benzene. As a fluorinating agent, yields one atom of fluorine and reverts to the difluoride. The spent cobalt difluoride may be regenerated with elemental fluorine.

Hazard: Strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Fluorination of hydrocarbons.

cobalt tungstate. See cobaltous tungstate.

cobalt ultramarine. See cobalt blue.

cobalt violet. See cobaltous ammonium phosphate.

cobalt wolframate. See cobaltous tungstate.

cobalt yellow. See cobalt potassium nitrite.

“Cobon” [LaMotte]. TM for 2-nitroso-1-naphthol used for the colorimetric determination of cobalt. Sensitivity: 0.005 ppm cobalt.

“Cobrate” [Aqualon]. TM for corrosion inhibitors used primarily for copper and copper alloys.

“Cobratec” [PMC]. TM for corrosion, staining, and tarnish inhibitors for copper and brass.
Use: Cutting oils, lubricating oils, and antifreezes.

COC. Abbreviation for Cleveland Open Cup, a standard technique of flash-point determination.

cocaine. (methylbenzoyllecgonine).
CAS: 50-36-2. $\text{C}_{17}\text{H}_{21}\text{NO}_4$. An alkaloid.

Properties: Colorless to white crystals or white powder. Mp 98C. Soluble in alcohol, chloroform, and ether; slightly soluble in water (solution is alkaline to litmus). The hydrochloric acid solution is levorotatory.

Derivation: By extraction of the leaves of *Erythroxylon coca* with sodium carbonate solution, treatment of the latter with dilute acid and extraction with ether, evaporation of the solvent, resolution of the alkaloid, and subsequent crystallization. Also synthetically from the alkaloid ecgonine.

Method of purification: Recrystallization.

Grade: Technical, NF.

Hazard: CNS stimulant, a poison. Possession is illegal in U.S.

Use: Local anesthetic (medicine, dentistry), usually as the hydrochloride.

cocamidopropyl betaine. See “Amphosol” [Stepan].

co-carboxylase. (TPP; thiamine pyrophosphate chloride). $\text{C}_{12}\text{H}_{19}\text{ClN}_4\text{O}_7\text{P}_2\text{S}\cdot\text{H}_2\text{O}$. The coenzyme of the yeast enzyme carboxylase. The key substance in decarboxylation, an energy-producing reaction in the body.

Properties: Crystals from alcohol containing some hydrochloric acid. Mp 240–244C (decomposes). Soluble in water. Dry substance very stable.

Use: Biochemical research.

cocculin. See picrotoxin.

cocculus, solid. Legal label name (air) for picrotoxin.

coccus. (1) A type of bacteria characterized by a spherical shape, e.g., pneumococcus. (2) Synonym for cochineal.

cochineal. (coccus). A red coloring matter consisting of the dried bodies of the female insects *Coccus cacti*. The coloring principle is carminic acid, $\text{C}_{22}\text{H}_{20}\text{O}_{13}$.

Grade: Technical, NF, silver grain, black grain.

Use: Coloring food, medicinal products, toilet preparations, manufacture of red and pink lakes.

cocoa. (cacao). Powder prepared from roasted, cured kernels of ripe seed of *Theobroma cacao*.

Grade: Commercial, USP.

Use: Flavoring agent for pharmaceuticals, food products, beverages.

cocoa butter. See theobroma oil.

coco amido betaine.

CAS: 61789-40-0.

Hazard: A severe eye irritant.

cocoa oil. See theobroma oil.

“Cocoloid” [Kelco]. TM for an algin-carrageenan composition, a hydrophilic colloid.

Use: Stabilizer for chocolate-milk products, sterilized cream, and other milk products.

coconut acid. Mixture of fatty acids derived from hydrolysis of coconut oil. Acid chain lengths vary from 6 to 18 carbons but are mostly 10, 12, and 14. Combustible.

Grade: Distilled, double distilled.

Use: Soaps, detergents, source of long-chain alkyl groups.

coconut amine oil condensate.

CAS: 68154-34-7.

Hazard: A severe skin irritant.

coconut cake. (coconut palm cake; copra cake). The residual product from expression of oil from the seed of the coconut.

See coconut oil meal.

coconut diethanolamide. See coconut oil acid diethanolamine.

coconut oil.

CAS: 8001-31-8.

Properties: White, semisolid fat containing C₁₂ to C₁₅; slight odor. D 0.92, saponification number 250–264, iodine number 7–10, sharp mp at 25C. Soluble in alcohol, ether, chloroform, carbon disulfide; immiscible with water. Highly digestible, resists oxidative rancidity but is susceptible to that induced by molds and other microorganisms. Non-drying. Combustible.

Chief constituents: Glycerides of lauric acid and of capric, myristic, palmitic, and oleic acids.

Derivation: Hydraulic press or expeller extraction from coconut meat followed by alkali-refining, bleaching, and deodorizing.

Grade: Crude, refined, Ceylon, Manila.

Use: Food products (margarine, hydrogenated shortenings); synthetic cocoa butter; soaps; cosmetics; emulsions; cotton dyeing; synthetic detergents; source of fatty acids, fatty alcohols, and methyl esters; base for laundering and cleaning preparations for soft leathers.

coconut oil acid diethanolamine.

CAS: 68603-42-9.

Hazard: A poison by ingestion. A moderate skin irritant.

coconut oil, esters with polyethylene glycol nonylphenyl ether.

CAS: 68333-98-2.

Hazard: A severe eye irritant.

coconut oil meal. The dried and crushed form of coconut cake recovered from the hydraulic or expeller process of extraction of oil from the meat. The usual product of commerce contains 24.2%

crude protein, 13.3% crude fiber, 35.7% nitrogen-free extract, 7.4% ether-soluble fat, and 6.0% ash. The total digestible nutrients approximate 72%.

Use: Animal feeds, fertilizer ingredient.

cocoonase. A proteolytic enzyme derived from silk moths, very similar to trypsin, isoelectric point approximately 9.5 (slightly less than for trypsin), pH approximately 8.0, mw approximately 25,000. As secreted by the insect, it is 80% pure. Identical with trypsin in catalytic specificity and mechanism of action.

cocoyl sarcosine. C₁₁H₂₃CON(CH₃)CH₂COOH. Yellow liquid, d 0.970, mp 22–28C. Combustible. Used as a detergent emulsifier.

“C-O-C-S” [FMC]. TM for insecticides containing copper oxchloride sulfate.

Use: Insecticide for fruits and vegetables.

COD. Abbreviation for chemical oxygen demand.

See oxygen consumed; biochemical oxygen demand (BOD); dissolved oxygen (DO).

codehydrogenase 1. See nicotinamide adenine dinucleotide phosphatase.

codeine. (methylmorphine).

CAS: 76-57-3. C₁₈H₂₁NO₃•H₂O. A narcotic alkaloid.

Properties: Colorless or white crystals or powder. Effloresces slowly in dry air, affected by light. Mp 154.9C. Slightly soluble in water; soluble in alcohol and chloroform. Levorotatory in acid and alcohol solutions.

Derivation: From opium by extraction and subsequent crystals; also by the methylation of morphine.

Grade: Technical, NF.

Hazard: Habit-forming narcotic, sale legally restricted.

Use: Medicine (analgesic).

coding sequence. The portion of a gene or an mRNA which actually codes for a protein. Introns are not coding sequences; nor are the 5' or 3' untranslated regions (or the flanking regions, for that matter—they are not even transcribed into mRNA). The coding sequence in a cDNA or mature mRNA includes everything from the AUG (or ATG) initiation codon and inclusion of the stop codon.

coding strand. An ambiguous term intended to refer to one specific strand in a double-stranded gene.

See: Sense strand

cod-liver oil. (morrhua oil).

Properties: Pale-yellow, viscous liquid; fixed, non-drying oil; slightly fishy odor and taste. D 0.918–0.927, saponification number 180–192, iodine number 145–180, maumene test 102–113, acid

value 204–207. Soluble in ether, chloroform, ethyl acetate, and carbon disulfide; slightly soluble in alcohol Combustible.

Chief constituents: Glycerides of palmitic and stearic acids, cholesterol, butyl alcohol esters, etc.

Derivation: From the livers of codfish (*Gadus morhua*) and other species of Galidae. These are rendered by steam heat, and the oil separated and chilled until the stearin solidifies; then it is pressed and the clear oil collected.

Method of purification: Filtration.

Grade: Pale, light brown, dark brown, NF.

Use: Medicine (for its vitamin A and D content, now largely is replaced by synthetic products), chamois-leather tanning.

codominance. Situation in that two different alleles for a genetic trait are both expressed. See autosomal dominant; recessive gene

codon. In an mRNA, a codon is a sequence of three nucleotides which codes for the incorporation of a specific amino acid into the growing protein. The sequence of codons in the mRNA unambiguously defines the primary structure of the final protein. Of course, the codons in the mRNA were also present in the genomic DNA, but the sequence may be interrupted by introns.

Coehn law. Materials of greater dielectric constant assume a higher potential than those of lower dielectric constant to an extent that is proportional to their dielectric constants.

coenocytic. Condition in which an organism consists of filamentous cells with large central vacuoles, and whose nuclei are not partitioned into separate compartments. The result is a long tube containing many nuclei, with all the cytoplasm at the periphery.

coenzyme. A comparatively low molecular weight organic substance that can attach itself to, and supplement, a specific protein to form an active enzyme system. Generally synonymous with the term *prosthetic group*.

coenzyme A. (CoA). $C_{21}H_{36}O_{16}N_7P_3S$. Essential for the formation of acetylcholine and for acetylation reactions in the body. It has been synthesized and is built up from pantothenic acid, cysteamine, adenosine, and phosphoric acid.

Properties: White powder. Water soluble; insoluble in alcohol and ether.

coenzyme I. See nicotinamide adenine dinucleotide phosphate.

coenzyme Q.

CAS: 303-98-0.
 $CH_3C_6(O)_2(OCH_3)_2[CH_2CH:C(CH_3)CH_2]_nH$. Found in animal organs and yeast. Active in the citric acid

cycle in carbohydrate metabolism. The n in the formula varies according to the source.

coercivity. The magnetic intensity required to reduce the magnetic induction in a substance from saturation to zero.

cofactor. An inorganic ion or a coenzyme required for enzyme activity.

coffearine. See trigonelline.

coffinite. $U(SiO_4)_{1-x}(OH)_{4x}$, (or $USiO_4$, with appreciable $(OH)_4$ in place of some SiO_4). A naturally occurring uranium mineral.

Properties: Black color; adamantine luster; commonly fine grained, mixed with organic matter and other minerals. D 5.1.

Occurrence: Colorado, Utah, Wyoming, Arizona.
Use: Ore of uranium (Colorado).

cogeneration. Simultaneous production of electricity and steam from the same energy source. Research has indicated a potential fuel savings of 30% by use of this process.

cognate. Describing two biomolecules that normally interact; for example, an enzyme and its normal substrate, or a receptor and its normal ligand.

coherence. The attraction between molecules of a substance that prevents separation of the substance into parts if acted upon by superficial forces.

coherent light. Light having a single wavelength, frequency, and phase.
 See laser.

cohesion. The force that holds adjacent molecules of a single material together.

cohesive ends. Two DNA ends in the same DNA molecule, or in different molecules, with short overhanging, single-stranded segments that are complementary to one another, facilitating ligation of the ends; also known as sticky ends. Usually generated by the action of restriction enzymes.

cohune oil. An edible, nondrying oil with properties similar to coconut and babassu oils. Its composition is 46% lauric acid, 16% myristic acid, 10% oleic acid, and the balance mixed acids. Obtained from a palm native to Mexico and Central America. Combustible.

"Coilife" [Westinghouse]. TM for special epoxy resin encapsulation of random-wound stators using solventless epoxy-resin formulations and rotational seasoning.

cointegrate. An intermediate in the migration of certain DNA transposons in which the donor DNA and target DNA are covalently attached.

coion. Small ions, entering a solid ion exchanger, that have the same charge as that of the fixed ions.

coisogenic. (congenic). Nearly identical strains of an organism varying only at a single locus.

coke. The carbonaceous residue of the destructive distillation (carbonization) of bituminous coal, petroleum, and coal tar pitch. The principal type is that produced by heating bituminous coal in chemical recovery or beehive coke ovens (metallurgical coke), one ton of coal yielding approximately 0.7 ton of coke. It is used chiefly for reduction of iron ore in blast furnaces and as a source of synthesis gas. Petroleum yields coke during the cracking process. Coke from petroleum residues and coal tar pitch is used for refractory furnace linings in the electrolysis of aluminum and other high-temperature service and for electrodes in electrolytic reduction of Al_2O_3 to aluminum, as well as in electrothermal production of phosphorus, silicon carbide, and calcium carbide.

coke oven gas. 53% hydrogen, 26% methane, 11% nitrogen, 7% carbon monoxide, 3% heavier hydrocarbons.

Use: To produce hydrogen.

coking. The residue of a procedure of distillation to dryness of a product containing complex hydrocarbons that break down in structure during the process.

cola. (kola; kola nuts; kola seeds; Soudan coffee; guru). Contains caffeine, theobromine.

Derivation: Seeds of *Cola nitida* or other species of *Cola*.

Source: West Africa, West Indies, India.

Use: Soft drinks.

“Colar” [Du Pont]. TM for chemical-resistant finishes having a base of polyamide-catalyzed epoxy resins.

colchicine.

CAS: 64-86-8. $C_{22}H_{25}NO_6$. An alkaloid plant hormone.

Properties: Yellow crystals or powder; odorless, or nearly so. Affected by light, mp 135–150C. Soluble in water, alcohol, and chloroform. Solutions are levorotatory.

Derivation: From *Colchicum autumnale* by extraction and subsequent crystallization. Has been synthesized.

Grade: Technical, USP.

Hazard: As little as 20 mg may be fatal if ingested.

Use: To induce chromosome doubling in plants; phytopathology.

colcothar. Red ferric oxide produced by heating ferrous sulfate in air.

Use: Pigment; abrasive in polishing glass.

cold flow. The permanent deformation of a material that occurs as a result of prolonged compression or extension at or near room temperature. Some plastics and vulcanized rubber exhibit this behavior. In metals it is known as creep.

cold light. See bioluminescence.

cold rubber. Synthetic rubber produced by polymerization at relatively low temperature, specifically SBR or butadiene-styrene elastomers produced by polymerization at approximately 4.4C rather than the usual temperature of approximately 49C. A special catalyst system is required.

cold-short. See short.

colemanite. ($Ca_2B_6O_{11} \cdot 5H_2O$). The ore of calcium borate. Used to replace boric acid in the manufacture of glass fibers. Mined in Turkey, it began to be imported into the U.S. in large volume in 1965 and is competitive with domestically produced B_2O_3 .

Properties: D 2.26–2.48.

Derivation: From kernite.

colestipol. An anion exchange resin, highly cross-linked and insoluble. A specific formula has not been ascertained. Said to be a copolymer of diethylene triamine and chloroepoxypropane. It is used as a cholesterol-sequestering agent in medicine.

“Coleus Forskohlii oil” [Sabinsa]. TM for a refined oil.

Use: As an antimicrobial, anti-acne preparation, and in perfumery.

colistin. $C_{45}H_{85}N_{13}O_{10}$. Antibiotic produced by a soil microorganism. Probably identical to polymyxin E and closely related chemically to polymyxin B since it is a polypeptide composed of amino acids and a fatty acid.

Use: Polymyxin.

collagen. A fibrous protein constituting most of the white fiber in the connective tissues of animals and humans, especially in the skin, muscles, and tendons. The most abundant protein in the animal kingdom, it is rich in proline and hydroxyproline. The molecule is analogous to a three-strand rope, in which each strand is a polypeptide chain. It has a molecular weight of approximately 100,000. Glue made from the collagen of animal hides and skins is still widely used as an adhesive. So-called "soluble" collagen is that first formed in the skin; upon aging it becomes increasingly cross-linked and less hygroscopic. Soluble collagen is used in the cosmetic industry as the basis for face creams, lotions, and hair preparations. Special forms of collagen have been developed for dialysis membranes. Microcrystalline collagen is used in prosthetic devices and other medical and surgical applications. Regenerated collagen, used in sausage casings, is made by neutralizing with acid collagen that has been purified by alkaline treatment. Collagen is converted to gelatin by boiling water, which causes hydrolytic cleavage of the protein to a mixture of degradation products.
See gelatin.

collection trap. Cooled container that collects gas-chromatographic eluant, preserving the eluant for the compound-identification step.

2,4,6-collidine. (2,4,6-trimethylpyridine).
(CH₃)₃C₅H₂N.

Properties: Colorless liquid. Bp 170.4C, fp -44.5C, d 0.913 (20/20C), refr index 1.4981 (20C). Soluble in alcohol; slightly soluble in water. Combustible.

Grade: Technical, (97.5% purity).

Use: Chemical intermediate, dehydrohalogenating agent.

colligative property. A property independent of the chemical nature of the molecules of a substance, resulting only from the number of molecules present.

collodion. A solution of pyroxylin (nitrocellulose) in ether and alcohol. USP specifications are pyroxylin 40 g, ether 750 ml, and alcohol 250 ml.

Properties: Pale-yellow, syrupy liquid; odor of ether. Immiscible with water; flash p approximately 0F (-17.7C).

Grade: Technical, USP.

Hazard: Flammable, dangerous fire risk.

Use: Cements, coating wounds and abrasions, solvent for drugs, corn removers, process engraving, lithography, photography.

See nitrocellulose.

colloidal solution. A system intermediate between a true solution and a suspension. A dispersion where the particle size is between 1 and 100 nm. Colloids have little or no tendency to dialyze and small or no freezing-point depression.

colloid, association. See association.

colloid chemistry. A subdivision of physical chemistry comprising the study of phenomena characteristic of matter when one or more of its dimensions lie in the range between 1 millimicron (nanometer) and 1 micron (micrometer). It thus includes not only finely divided particles but also films, fibers, foams, pores, and surface irregularities. Dimension, rather than the nature of the material, is characteristic. Colloidal particles may be gaseous, liquid, or solid, and occur in various types of suspensions (imprecisely called solutions), e.g., solid-gas (aerosol), solid-solid, liquid-liquid (emulsion), gas-liquid (foam). In this size range, the surface area of the particle is large with respect to its volume so that unusual phenomena occur, e.g., the particles do not settle out of the suspension by gravity and are small enough to pass through filter membranes. Macromolecules (proteins and other high polymers) are at the lower limit of this range; the upper limit is usually taken to be the point at which the particles can be resolved in an optical microscope. The first specific observations were made by Thomas Graham in approximately 1860 and were extended by Ostwald, Hatcher, and Freundlich. Though the term is often used synonymously with *surface chemistry*, in a strict sense it is limited to the size range noted in at least one dimension, whereas surface chemistry is not. Natural colloid systems include rubber latex, milk, blood, egg white, etc.
See surface chemistry; colloid, protective; emulsion.

colloid mill. See homogenization.

colloid, protective. A hydrophilic high polymer whose particles (molecules) are of colloidal size, such as protein or gum. It may be either naturally present in such systems as milk and rubber latex or intentionally added to mixes to stop coagulation or coalescence of the particles of fat or other dispersed material. Protective colloids are also called stabilizing, suspending, or thickening agents; they also act as emulsifiers. Examples are (1) hydrocarbon particles of latex, which are covered with a layer of protein that keeps them from cohering as a result of the impact due to their Brownian motion; (2) gelatin, sodium alginate, or gum arabic, which are added to ice cream to inhibit formation of ice particles and to confectionery and other food products to obtain a smooth, creamy texture. They are readily adsorbed by the suspended particles and reinforce the protective effect of proteins that may be naturally present. See thickening agent; gum, natural; gelatin.

"Colloisol" [BASF]. TM for a series of vat dyes for dyeing and printing textiles of cellulosic fibers.

cologne. (toilet water). A scented, alcohol-based liquid used as a perfume, after-shave lotion, or deodorant. Combustible.

Cologne brown. See Van Dyke brown.

colonial. Condition in which many unicellular organisms live together in a somewhat coordinated group. Unlike true multicellular organisms, the individual cells retain their separate identities and, usually, their own membranes and cell walls.

colophony. A rosin residue that remains after the volatiles have been removed by distillation of crude turpentine from any of the *Pinus* species.

colorant. Any substance that imparts color to another material or mixture. Colorants are either dyes or pigments and may be (1) naturally present in a material (chlorophyll in vegetation); (2) admixed with it mechanically (dry pigments in paints); or (3) applied to it in a solution (organic dyes to fibers).

Note: There is no generally accepted distinction between dyes and pigments. Some have proposed one on the basis of solubility or physical form and method of application. Most pigments, so called, are insoluble inorganic powders, the coloring effect being a result of their dispersion in a solid or liquid medium. Most dyes, on the other hand, are soluble synthetic organic products that are chemically bound to and actually become part of the applied material. Organic dyes are usually brighter and more varied than pigments but tend to be less stable to heat, sunlight, and chemical effects. The term *colorant* applies to black and white, as well as to actual colors. Instruments for measuring, comparing, and matching the hue, tone, and depth of colors are called colorimeters.

See dye; pigment; colorimetry; food color; FD&C color.

colorimeter. An analytical device used to measure the comparative intensity of color in solutions by comparison with standard solutions. See photoelectric colorimeter.

colorimetric analysis. Analysis based on the law that intensity of color of certain solutions is proportional to the amount of substance in the solution.

colorimetric purity. The ratio of luminance of spectrally pure light that must be mixed with reference achromatic (white) light to produce a color match for the specimen.

colorimetry. An analytical method based on measuring the color intensity of a substance or a colored derivative of it. For example, the yellow-carotene content of butter is determined by saponifying a sample of butter in an alkaline solution, extracting the carotene with ether, and measuring the intensity of yellow color in the ether extract. Colorimetric methods are used to determine very minute amounts. They are used in hospital laboratories for blood and urine analysis; in food laboratories

for determination of vitamins, preservatives, coloring matter, etc.; and in metallurgical laboratories for traces of metals in raw materials and finished products.

Color Index. (CI; C.I.). A listing of all commercial dyes, each of that has an individual number which identifies it on specifications.

color lake. See lake.

colorless dye. Synonym for optical brightener.

“Colorundum” [Grace]. TM for a balanced mixture of abrasive aggregates, mineral oxide color, and stearate for surfacing concrete floors, in a choice of colors.

Columbite. An ore of tantalum. See tantalite.

columbium. Cb. Alternate name for the element niobium. The latter name became official in 1949; columbium is still used by metallurgists.

column, distillation. See tower, distillation.

“Coly-Mycin” [Pfizer]. TM for colistin in the form of sulfate or methane sulfonate (colistimethate sodium).

colza oil. See canola.

Combes quinoline synthesis. Formation of quinolines by condensation of β -diketones with primary arylamines followed by acid-catalyzed ring closure of the intermediate Schiff base.

combination. A chemical reaction in which two substances unite to form a third; the reacting substances may be elements or compounds, but the product is always a compound, e.g., $\text{Cu} + \text{Cl}_2 \rightarrow \text{CuCl}_2$ and $2\text{NH}_3 + \text{H}_2\text{SO}_4 \rightarrow (\text{NH}_4)_2\text{SO}_4$. Polymerization is a special case of combination, where complex organic molecules of the same kind unite to form chains or clusters of high molecular weight. See polymerization.

combining number. See valence.

combining volumes, law of. When gases combine, they do so in volumes that bear a simple relationship to each other and to that of the product if gaseous.

combining weight. See equivalent weight.

combustible material. Any substance that will burn, regardless of its autoignition temperature or whether it is a solid, liquid, or gas. Although this definition necessarily includes all flammable materials as well, this fact is disregarded in official classi-

fications. As usually defined, the term *combustible* refers to solids that are relatively difficult to ignite and that burn relatively slowly and to liquids having a flash point greater than 100F (37.7C). It is difficult to generalize about the combustibility of solids. The rate and ease of combustion may depend as much on their state of subdivision as on their chemical nature. Many metals in powder or flake form will ignite and burn rapidly, whereas most are noncombustible as bulk solids. Cellulose is combustible as a textile fabric or as paper and is flammable as fine fibers (cotton linters). A plastic that burns at flame temperature will be a greater fire hazard as a foam than as a bulk solid because of the large surface area exposed to air and the thinness of the cell walls. Some polymers, such as nylon and polyvinylidene chloride, will melt and burn but not propagate flame; others, e.g., polyvinyl chloride and polyurethane, ignite at high temperature and evolve toxic fumes. Acrylics and cellulose-derived plastics, such as rayon and cellulose acetate, are readily combustible. This may be partially offset by use of fire-retardant chemicals. Glass is noncombustible in all forms.

See flammable material; hazardous material; combustion.

combustion. An exothermic oxidation reaction that may occur with any organic compound, as well as with certain elements, e.g., hydrogen, sulfur, phosphorus, magnesium. The end products of elemental combustion are oxides; end products of organic compounds are carbon dioxide and water. Examples are (1) for an element: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$; (b) for an organic compound (carbohydrate): $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O}$. Here, combustion is the reverse of photosynthesis. The heat of combustion is due to rupture of chemical bonds and formation of new compounds. Substances differ greatly in their combustibility, i.e., in their ignition points (solids and gases) or their flash points (liquids). Carbon disulfide burns almost explosively at 100C, whereas rubber hydrocarbon and nylon are difficult to ignite at any temperature. Oxygen is not combustible but actively supports combustion; no oxygen is needed if another oxidizing agent is present, as in the combustion of a mixture of hydrogen and chlorine to form hydrogen chloride. Spontaneous combustion may occur at or even below room temperature (1) by exposure to air of substances that are highly sensitive to oxidation (e.g., phosphorus); (2) by heat buildup from bacterial activity (compost, sewage sludge) or oxidation catalyzed by moisture, as in wet waste materials (paper, cotton, wool); (3) by internal heat accumulation caused by autoxidation (fish oils, linseed oil).

See oxidation; pyrophoric material; autoignition point; flash point.

combustion tube. A tube used in the combustion method of chemical analysis.

comicellization. The phenomenon wherein a surfactant in a concentration considerably below its own critical micelle concentration solubilizes an insoluble compound in a comparatively large quantity.

comirin. Exact formula undetermined. An antifungal agent produced by *Bacterium antimyceticum* composed mostly of amino acids. A gray to white powder that resists heat and acids but decomposes in the presence of alkalis; soluble in organic acids and bases; slightly soluble in water. A fungicide in paints, textile products, plant growth.

Commercial Development and Marketing Association. (CDMA). The Commercial Development and Marketing Association is the world's leading professional association dedicated to fostering, promoting and sharing business processes for long term growth and value creation in the chemical and allied industries. It provides information on world-class practices of business development, corporate growth, business strategy, marketing and related functional areas. The focus is to conduct workshops, business conferences, networking forums, and local section activities. The offices of the organization are at 1850 M Street, NW, Suite 700, Washington, DC 20036. Website: <http://www.cdmaonline.org>

comminution. Size reduction of materials by grinding, cutting, shredding, chopping, etc. Solids can be reduced to a particle size approaching 1 micron in special fine-grinding equipment. Comminution of coal by chemical means is possible via a low molecular weight compound such as sodium hydroxide or anhydrous ethanol, which penetrates the natural fault system of the coal, causing fragmentation without mechanical crushing. This permits removal of sulfur from coal without burning or grinding. Approximately 100 lbs of chemical are needed per ton of coal.

commodity chemicals. Low-value, high-volume compounds produced in dedicated plants and used for a wide variety of applications.

common intermediate. Referring to a metabolite: a chemical compound common to two enzymatic reactions, as a product of one and a substrate in the other.

common-ion effect The reversal of ionization when a compound is added to a solution of another compound with which it has a common ion, the volume being kept constant.

comparative genomics. The study of human genetics by comparisons with model organisms such as mice, the fruit fly, and the bacterium *E. coli*.

compatibility. The ability of two or more materials to exist in close and permanent association indefinitely. Liquids (solvents) are compatible if they are miscible and do not undergo phase separation on standing. Thus, water is compatible with alcohol but not with gasoline. Liquids and solids are compatible only if the solid is soluble in the liquid. Solids are compatible if they can exist in intimate contact for long periods with no adverse effect of one on the other.

“Compazine” [Glaxo-SmithKline]. TM for a brand of prochlorperazine, as the maleate or the edisylate.

competitive inhibition. A type of enzyme inhibition characterized by the inhibitor binding to the active site. The inhibition can be reversed by increasing the concentration of substrate. A competitive inhibitor is usually a structural analog of the substrate.

complement. In immunochemistry, any of a number of blood proteins that act in conjunction with antibodies to cause disintegration of invading cells. They are an essential component of immune serum.

complementary. Having a molecular surface with chemical groups arranged to interact specifically with chemical groups on another molecule.

complementary DNA. See cDNA.

complementary sequence. Nucleic acid base sequence that can form a double-stranded structure with another DNA fragment by following base-pairing rules, e.g., (A pairs with T and C with G). The complementary sequence to GTAC, for example, is CATG.

complex compound. See coordination compound.

“Complex Gel” [Centerchem]. TM for a formulated gel.

Use: To stabilize either free vitamin A or vitamin C, when packed in dual packaging with end user activating.

complexing agent. See ligand; chelate; ethylenediaminetetraacetic acid.

complex ion. An ion that has a molecular structure consisting of a central atom bonded to other atoms by coordinate covalent bonds.
See coordination compound.

complex trait. Trait that has a genetic component that does not follow strict Mendelian inheritance. May involve the interaction of two or more

genes or gene-environment interactions.
See Mendelian inheritance; additive genetic effects.

component. One of the minimum sets of substances required to generate the composition of all phases of a system in the absence of chemical reaction of any substances in a mixture.

See constituent.

composite. A mixture or mechanical combination on a macroscale of two or more materials that are solid in the finished state, are mutually insoluble, and differ in chemical nature. The major types are (1) Laminates of paper, fabric, or wood (veneer) and a thermosetting material (resin, rubber, or adhesive); examples are tire carcasses, plywood, and electrical insulating structures; (2) Reinforced plastics, principally of glass fiber and a thermosetting resin; other types of fibers such as boron, aluminum silicate, and silicon carbide may be used.

See whiskers.

(3) Cermets, which are mixtures of ceramic and metal powders, heat treated and compressed. (4) Fabrics, e.g., woven combinations of wool or cotton and a synthetic fiber. (5) Filled composites in which a bonding material, i.e., linseed oil, resin, or asphalt, is loaded with a filler in the form of flakes or small particles; examples are linoleum, glass flake-plastic mixtures for battery cases, and asphalt-gravel road-surfacing mixtures.

composting. Aerobic bacterial decomposition of solid organic wastes, both agricultural and urban, including sewage sludge. As much as 500 tons a day can be handled in the larger installations, the waste degrading quickly without external heating. Decomposition is accelerated by adding ammonium bicarbonate. The product can be used as a soil conditioner and for landfill. The waste is piled and turned frequently to provide aeration and to maintain a high temperature in the pile to destroy pathogenic organisms. The volume of composted waste is from 20 to 60% of original volume.

compound. (1) A substance composed of atoms or ions of two or more elements in chemical combination. The constituents are united by bonds or valence forces. A compound is a homogeneous entity where the elements have definite proportions by weight and are represented by a chemical formula. A compound has characteristic properties quite different from those of its constituent elements. It is decomposed by energy in the form of a chemical reaction, heat, or electric current. Example: water is a *liquid* formed by chemical combination of two *gases*; it can be separated into hydrogen and oxygen by an electric current (electrolysis); in certain reactions it is split into its constituent ions (H, OH) (hydrolysis); it is not chemically changed by heat or cold.

See mixture; homogeneous; chemical reaction. (2) Loosely, a product formula (often proprietary) of

various types, e.g., pharmaceuticals (a vegetable compound), rubber (a fast-curing compound), etc. (3) Having two sets of lenses (compound microscope).

compound 1080. Use may be restricted. See sodium fluoroacetate.

compreg. A hardwood impregnated with a phenolformaldehyde resin under heat and pressure.

compressed gas. Any material or mixture that, when enclosed in a container, has an absolute pressure exceeding 40 psi at 21.1C or, regardless of the pressure at 21.1C, has an absolute pressure greater than 104 psi(a) at 54.4C, or any flammable material having a vapor pressure greater than 40 psi abs at 37.7C (vapor pressure determined by Reid method (ASTM)). Compressed gases include liquefied petroleum gases and oxygen, nitrogen, anhydrous ammonia, acetylene, nitrous oxide, and fluorocarbon gases. Some of these are shipped in tonnage volume. For details on properties, containers, and shipping regulations, see the entries for specific gases.

compression molding. Formation of a rubber or plastic article to a desired shape, by either placing the raw mixture in a specially designed cavity or bringing it into contact with a contoured metal surface. After the material is in place, heat and pressure are supplied by a hydraulic press, the time and temperature varying with the nature of the material. For rubber products, vulcanization occurs simultaneously. Most plastic molding is now done by the injection method, which is more economically efficient.

See injection molding.

Compton effect. One of the principal processes by which high-energy electromagnetic radiation (γ -rays) interacts with or is absorbed by matter. In the Compton process the γ -ray frees an electron in matter as if the electron were unbound, dividing the momentum of the γ -ray between the ejected electron and a new γ -ray of lower energy going off in a new direction.

computational chemistry. Use of computers in organic synthesis and in chemical engineering as a more efficient means of research than conventional laboratory experimentation. The capacity of sophisticated computers for fast mathematical calculations has made them an invaluable aid in exploring and evaluating the more likely pathways for a given organic synthesis, for which there may be innumerable possible sequences. The term *heuristic* is applied to such procedures. Computers can also handle the vast complexity of quantum-mechanical calculations and aid in the elucidation of the complicated molecular structures that occur in pharmaceutical compounds and recombinant-DNA research. The Quantum Chemistry Program Exchange at Indiana

University offers many programs in this field, from subroutines to major computational systems. Chemical engineers utilize computers to develop more thermodynamically efficient procedures and to consolidate overall plant operations, especially in the areas of energy consumption, reaction rates, and hazardous waste problems.

See retrosynthesis.

Note: Notwithstanding the immense capability of computers to point the way to solutions of chemical and engineering problems, experimentation will remain the ultimate proof of theory. It is interesting to speculate how much time and effort such empirical scientists as Goodyear and Edison could have saved had computers been available to them.

Conant, James Bryant. (1893–1978). An American chemist and educator, born in Boston, who received his doctorate in chemistry from Harvard in 1916 and was president of Harvard for 20 years (1933–1953). His major scientific activities included pioneering research on chlorophyll and important contributions to the Manhattan Project. Perhaps his greatest achievements lay in the educational field, in which he exerted a strong liberalizing influence at both the collegiate and secondary-school levels. He also was ambassador to postwar Germany and educational adviser to Berlin. He wrote many books on science and education, including basic chemical texts, and received a number of scientific and educational awards.

concave. See gyratory crusher.

concentration. The amount of a given substance in a stated unit of a mixture, solution, or ore. Common methods of stating concentration are percentage by weight or by volume, normality, or weight per unit volume (as grams per cubic centimeter or pounds per gallon). The concentration of an atom, ion, or molecule in a solution may be symbolized by the use of square brackets, as $[Cl^-]$. For radioactivity, the concentration is usually expressed as millicuries per milliliter (mCi/mL) or millicuries per millimole (mCi/mM).

conchiolin. $C_{32}H_{98}N_2O_{11}$. A natural bonding agent in the calcium carbonate structure of pearls.

conchoidal. A term adopted from mineralogy by chemists to describe a type of surface formed by fracturing a hard solid by impact. Certain materials present involutively curved fracture surfaces suggestive of the shape of the shells of bivalves (conch), from which the term is derived. Examples are glass, blown asphalt, and numerous minerals.

conclite calcium. See calcium lactate.

concrete. (1) A conglomerate of gravel, pebbles, sand, broken stone, and blast-furnace slag or cinders, termed the aggregate, embedded in a matrix of

either mortar or cement, usually standard Portland cement in the U.S. Reinforced concrete and ferro-concrete contain steel in various forms.

See cement, Portland.

Use: Building and road construction, radiation shielding.

(2) A waxy solid obtained from roses by extraction with nonpolar solvents (benzene) after trace quantities of solvent have been removed. When the concrete is dewaxed by a properly chosen second solvent (alcohol), the desired essential oil remains. This is called an absolute. See absolute; perfume.

concrete, cellular. A lightweight concrete foam that may be made in several ways: (1) by adding aluminum powder to the concrete mix and applying heat, which releases hydrogen; (2) by whipping air into the mix containing an entraining agent; (3) by adding preformed foam to the mix. Such foams are made from a foaming agent such as dried blood, a stabilizer, organic solvents, and a germicide.

See foam.

concrete, reinforced. See concrete.

condensation. (1) A type of chemical reaction in which two or more molecules combine with the separation of water, alcohol, or other simple substance. The distinction from an addition reaction is not sharp, because reactions can be either stopped at the addition stage or carried a step beyond it. If a polymer is formed by condensation, the process is called polycondensation, e.g., phenolformaldehyde resin.

See Claisen condensation; aldol.

(2) The change of state of a substance from the vapor to the liquid (or solid) form.

conductance. An electrical property of a solution, defined as the reciprocal of the resistance. It is usually used in connection with electrolytic solutions.

See conduction (2).

conductometric method. A method of analysis in which the end point of a reaction is determined by conductance measurements.

conduction. (1) Transfer of heat through a substance or from one substance to another when the two substances are in physical contact (thermal conduction). Crystalline solids (especially metals and alloys) are good thermal conductors; liquids such as water and glass and high polymers such as rubber and cellulose usually are not.

(2) Transfer of an electric current through a solid or liquid (electrical conduction). In metallic or electronic conductors the current is carried by a flow of electrons, the atomic nuclei remaining stationary. This type of conduction is common to all metals and alloys, carbon and graphite, and certain solid com-

pounds (manganese dioxide, lead sulfide). In electrolytic or ionic conductors the current is carried by ions, as in solutions of acids, bases, and salts and in many fused compounds. In electrolytic conduction, as in metallic conduction, heat is generated and a magnetic field is formed around the conductor; a transfer of matter also occurs. In a few materials, such as solutions of alkali and alkaline earth metals in anhydrous liquid ammonia, both types of conduction take place simultaneously; such conductors are called mixed conductors. See semiconductor; transference number.

conduction band. A partly filled energy band whereby the electrons can move freely, allowing the material to carry an electric current.

conductivity. The property of a substance or mixture that describes its ability to transfer heat or electricity. It is the reciprocal of resistivity. See conduction.

Condy's fluid. A solution of potassium permanganate.

Use: Disinfectants.

confidentiality. In genetics, the expectation that genetic material and the information gained from testing that material will not be available without the donor's consent.

configuration. The spatial arrangement of an organic molecule that is conferred by the presence of either a double bond, about which there is no freedom of rotation, or chiral centers, around which 4 different substituent groups are arranged in a stereospecific fashion. The arrangement in either of these cases cannot be changed without breaking at least one covalent bond.

conformation. (1) A shape or arrangement in three-dimensional space that an organic molecule can assume by rotating carbon atoms or their substituents around single covalent bonds. The conformation of a molecule is not fixed, though one or another shape may be more likely to occur. The number of conformational isomers is infinite. Conformational analysis involves the study of the preferred (or most likely) conformations of a molecule in the ground, transition, and excited states. Research on the conformations of cyclohexane and various sugars has contributed much to this aspect of stereochemistry. (2) An extended, zigzag arrangement of a polypeptide chain which can be parallel or antiparallel. One of the common secondary structure in proteins.

congenic. See coisogenic.

congenital. Any trait present at birth, whether the result of a genetic or nongenetic factor. See birth defect.

Congo red. (sodium diphenyl-bis- α -naphthylamine sulfonate; CI 2120).

CAS: 573-58-0. $C_{32}H_{22}O_6N_6S_2Na_2$.

Properties: Brownish-red powder; odorless. Decomposes on exposure to acid fumes. Soluble in water and alcohol; insoluble in ether.

Derivation: Combination of tetraazotized benzidine and naphthionic acid.

Use: Dye, medicine (diagnostic aid), indicator, biological stain.

Congo resin. A variety of copal fossil resin. The natural product is insoluble in organic solvents but forms transparent gels with some alcohols and hot solvents. When thermally processed (cracked), it is soluble in all organic solvents, fatty acids, and vegetable oils. Its high acid number prevents its use in paints containing reactive pigments.

Use: High-gloss varnishes, paints for metal surfaces, wrinkle finishes.

coniferin. $C_{16}H_{22}O_8$. A glucoside contained in pine bark and other conifers. When decomposed, it yields coniferyl alcohol, which can be oxidized to vanillin. Used as a raw material for manufacture of synthetic vanillin.

coning oil. Usually an emulsified mineral oil used as lubricant for textile fibers in processing to the finished yarn. Fatty-acid esters are often used for the oil-in-water emulsions.

conjugated double bonds. Two or more double bonds that alternate with single bonds in an unsaturated compound, as in the formula for butadiene-1,3 ($H_2C=CH-CH=CH_2$) or maleic acid (the $O=C-C=C-C=O$ skeleton).

conjugated fatty acid. A fatty acid containing conjugated double bonds.

conjugated protein. A protein containing one or more prosthetic groups.

conjugated system. A chemical system characterized by a transmission of chemical reactivity from one atom to another.

conjugate acid-base pair. A proton donor and its corresponding deprotonated species; for example, acetic acid (donor) and acetate (acceptor).

conjugate layers. Two layers of a liquid system, each composed of a different ternary mixture and in equilibrium with one another.

conjugate redox pair. An electron donor and its corresponding electron acceptor form; for example, NADH (donor) and NAD⁺ (acceptor).

connate water. The watery substance entrapped in the interstices of a rock at time of deposi-

tion. It is expressed as a percentage of the pore volume occupied by such water.

Conrad-Limpach reaction. Thermal condensation of arylamines with β -ketoesters followed by cyclization of the intermediate Schiff bases to 4-hydroxyquinolines.

consensus sequence. A nominal sequence inferred from multiple, imperfect examples. Multiple lanes of shotgun sequence can be merged to show a consensus sequence. The optimal sequence of nucleotides recognized by some factor. A DNA binding site for a protein may vary substantially, but one can infer the consensus sequence for the binding site by comparing numerous examples.

conservation of energy law. (First Law of Thermodynamics). See energy.

conserved sequence. A base sequence in a DNA molecule (or an amino acid sequence in a protein) that has remained essentially unchanged throughout evolution.

conservative substitution. Replacement of an amino acid residue in a polypeptide by another residue with similar properties. For example, substitution of Lys by Arg.

consistency. Resistance to flow of a material, usually a liquid. For Newtonian liquids, consistency and viscosity are synonymous. For non-Newtonian liquids, it qualitatively represents plastic flow. The term is used by food technologists. See body (1); viscosity.

consolute. A liquid, added to a mixture of two slightly miscible liquids, which is soluble in each of these liquids.

consolute temperature. The critical solution temperature.

constantan. Generic name for an alloy containing from 40 to 45% nickel and from 55 to 60% copper. Used in thermocouples and specialized heat-measuring devices.

constant-boiling mixture. See azeotropic mixture.

constant composition law. See chemical laws (2).

constituent. Any of the elements or subgroups in a molecule of a compound. For example, nitrogen is a constituent of proteins; the carboxyl group is a constituent of fatty acids. See component.

- constitutional diagram.** See equilibrium diagram.
- constitutive ablation.** Gene expression that results in cell death.
- constitutive enzymes.** Enzymes required at all times by a cell and present at some constant level; for example, many enzymes of the central metabolic pathways. Sometimes called "housekeeping" enzymes.
- contact acid.** Sulfuric acid made by the contact process.
- contact potential.** The difference between the work functions of two metals.
- contact process.** A process for the manufacture of sulfuric acid and oleum in which the sulfur dioxide from combustion of sulfur, pyrites, or other sulfur sources is oxidized with air to sulfur trioxide by contact with a vanadium pentoxide catalyst. Most of the sulfuric acid produced in the U.S. is made by this process.
See sulfuric acid.
- contact resin.** (impression resin; low-pressure resin). A synthetic thermosetting resin characterized by cure at relatively low pressure. The usual components are an unsaturated, high molecular weight monomer, such as an allyl ester, or a mixture of styrene or other vinyl monomer with an unsaturated polyester or alkyd. Cure requires heat and a catalyst, as well as some pressure. The curing does not result in water formation as with phenol-formaldehyde resins.
- container.** This term refers not only to units used to pack chemical products for shipment but also to those used to transport them. Factors that dictate their selection include size of shipment, compatibility of the product with container material, ease of storage and handling, and cost. Common containers are
- tank cars, tank trucks, hopper cars (bulk chemicals)
 - barges (petroleum products, petrochemicals, other chemicals)
 - tankers (crude oil, refined products)
 - pipelines (gases, liquid chemicals, etc.)
 - 55-gal drums of steel, plastic, or fiberboard, with or without polyethylene lining.
 - 5-, 15-, 30-gal metal cans and pails
 - 5-gal plastic carboys
 - 1-gal metal cans
 - steel cylinders (compressed gases)
 - multiwall paper bags (dry powders)
 - glass and plastic bottles, vials, etc.
 - wooden kegs, barrels, boxes, bales; burlap bags (bulk imports, such as gums, etc.)
- 76-lb flasks (mercury)
- contaminant.** Any substance, unintentionally introduced into air, water, or food products, that has the effect of rendering them toxic or otherwise harmful. Examples are sulfur dioxide resulting from combustion of high-sulfur fuels; pesticide residues in vegetables, fish, or other food products; industrial dusts; and radioactive materials resulting from nuclear explosions.
See fallout; decontamination.
Note: Pesticide residues in foods are often referred to as unintentional additives though they are actually contaminants.
- contig.** A group of copied pieces of DNA representing overlapping regions of a particular chromosome.
- contig map.** A map depicting the relative order of a linked library of overlapping clones representing a complete chromosomal segment.
- "Continental" [Crompton & Knowles].** TM for a series of channel blacks used in natural and synthetic rubber, paints, inks, and plastics.
- "Continex" [Crompton & Knowles].** TM for furnace blacks. Used in rubber, plastics, paints, paper.
- continuous distillation.** Distillation in which a feed, usually of nearly constant composition, is supplied continuously to a fractionating column, and the product is continuously withdrawn at the top, the bottom, and sometimes at the intermediate points.
- continuous phase.** See phase (2).
- contractile vacuole.** In many protists, a specialized vacuole with associated channels designed to collect excess water in the cell. Microtubules periodically contract to force this excess water out of the cell, regulating the cell's osmotic balance.
- control.** (1) In any chemical or other scientific experiment, the reference base with which the results are compared. This base is invariably a sample of identical constitution and prepared under the same conditions from which all experimental variations are omitted. Thus, the control represents known values as far as any specific experiment is concerned. Such a sample is often called a "blank." The use of a control is vital to significant interpretation of experimental data.
(2) Automatic. See automatic control.
- "Control GP" [Aqualon].** TM for corrosion inhibitor and stabilizer for glycol natural-gas dehydrators.

controlled atmosphere. See atmosphere, controlled.

controlled release. Descriptive of a compound manufactured in such a way that its effect will be kept uniform over an extended time period; this not only provides more effective control, but also reduces the waste involved in using unnecessarily high concentrations. This principle has been applied successfully to fertilizers, pesticides, pharmaceuticals, flavors, and fragrances. It may involve (1) encapsulation of the agent; (2) incorporating it into a neutral matrix such as a rubber or plastic; (3) coating the particles with sulfur (fertilizers); (4) absorbing the agent into substrates of various types.

controlled substance. A material whose purchase or use is legally controlled. These are usually drugs of abuse.

convection. The transfer of heat from one place to another by a moving gas or liquid. Natural convection results from differences in density caused by temperature differences. Warm air is less dense than cool air; the warm air rises relative to the cool air, and the cool air sinks. Forced convection involves motion caused by pumps, blowers, or other mechanical devices.

convergence. Similarities which have arisen independently in two or more organisms that are not closely related. See homologies.

conversion ratio. In nucleonics, the ratio of the number of atoms of fissionable fuel generated to the number of atoms of fissionable fuel consumed in a reactor.

converting. A term used specifically in the paper industry to refer to (1) modification of raw paper by coating, impregnating, laminating, and corrugating (wet converting); and (2) fabrication of a multitude of finished products such as bags, cartons, packaging materials, napkins, facial tissues, cups, plates, and the like (dry converting). Specialized equipment is required for these operations, e.g., roll coaters, extrusion coaters, embossers, crepers, carton and bag-making machines, etc.

conveyor. Any device for continuous transport of raw materials, assembly units, or finished products. The more important types are as follows, all except (4), (6), and (7) being mechanically driven.

- (1) Chain
- (a) Plain chain: four or more parallel chains whose tops are a little higher than the tracks on which they move (used for flat objects, cartons, metal bars, etc.).
- (b) In floor: two parallel chains operating in metal channels about 16 inches apart and set

into the floor (used for conveying cartons of finished goods to storage or loading dock).

- (c) Enclosed chain: steel sprockets or drags, wholly enclosed; horizontal, vertical, or inclined movements are possible (used for powders, grain, vegetable products).
- (2) Belt
- (a) Light: flat, rubber/fabric structure for carrying units through a packaging or assembly line; also for feeding rubber or plastic mixes to extruder.
- (b) Heavy: rubber/fabric structure with thick cover, for long-distance conveying of bulk solids (coal, coke, gravel, ores).
- (3) Screw: an auger rotating in a metal trough or channel; used for feeding particulates to mixing equipment, handling light solids (wood chips, sawdust, etc.).
- (4) Gravity roller: cylindrical metal rollers attached to metal track or frame; used for conveying cartons or boxes where plant layout permits uniform gravity movement; the angle of incline is critical.
- (5) Bucket: metal scoops mounted on belts or steel frames (for vertical carriage of gravel, crushed stone, ores, etc.).
- (6) Pneumatic: metal tubes of varying diameters operated by positive or negative air pressure; used for light particulates (unloading bins and hopper cars and intraplant transport).
- (7) Pipeline: plastic or welded steel tubes for long-distance movement of crude oil, refined products, ammonia, natural gas, water, steam. Positive pressure required.

cooking. (1) Conversion of a foodstuff from the raw state to a palatable and more readily digestible condition by application of heat, as in boiling, frying, roasting, or baking. One or more chemical and physical changes occur: (a) hydrolysis of collagen in the connective tissue of meats; (b) softening and partial hydrolysis of cellulose and starches to sugars in fruits and vegetables; (c) denaturation and coagulation of proteins in meat, resulting in a less tightly ordered structure and improved texture; (d) coagulation of egg albumin and wheat gluten (bakery products); (e) modification or "shortening" of wheat flour by added fats that coat the particles to form a laminar structure, thus preventing formation of chains of gluten; (f) evolution of carbon dioxide by the action of leavening agents (yeast, baking powder), which cause *rising* of gas bubbles that are retained by the gluten to form a stable, solid foam; (g) browning of meats and bakery products due to reaction of sugars and amino acids (nonenzymatic); (h) deactivation of enzymes and destruction of bacteria; (i) loss or deactivation of water-soluble vitamins in meat and vegetables.

(2) In the paper industry, digestion of wood pulp with such compounds as sodium sulfate, sodium

hydroxide, and sodium sulfide to separate the lignin content from the cellulose. See pulp, paper.

coolant. (heat-transfer medium; thermofor).

Any liquid or gas having the property of absorbing heat from its environment and transferring it effectively away from its source. Coolants are used in all types of automobiles, as well as in chemical processing and nuclear engineering equipment. One of the most effective and cheapest coolants is water, which is almost universally used in automotive and ordinary reaction equipment. Air is also used. Where intense heating requires a more efficient medium, special coolants are used: liquid sodium in nuclear reactors, liquid hydrogen in high-thrust nuclear rocket engines; carbon dioxide, propylene glycol, and "Dowtherm" in chemical-processing reactors. Methoxy propanol has been introduced for diesel engines. Some coolants provide antifreeze protection.

See antifreeze.

Coolidge, William D. (1873–1975). An American physical chemist born in Massachusetts. He received a degree in electrical engineering at M.I.T. (1896) and a doctorate in physics at Leipzig (1899). In 1905, he joined the General Electric Research Laboratory, which had been established five years earlier. Here he invented the ductile tungsten filament and developed the use of tungsten in electrical switches and medical X-ray tubes. He did pioneer research in experimental metallurgy and powder metallurgy. He also had a prominent part in evaluating uranium research (1941) and in setting up the Manhattan Project. He was the recipient of many honors and awards, including induction into the National Inventors Hall of Fame in 1975.

cooperage. The manufacture of barrels, formerly of wood but now including drums made of various materials such as resin-bonded fiber, metal, and plastic.

coordinate bond. (dative bond). A covalent bond consisting of a pair of electrons donated by only one of the two atoms it joins.

coordination compound. (complex compound). A compound formed by the union of a metal ion (usually a transition metal) with a nonmetallic ion or molecule called a ligand or complexing agent. The ligand may be either positively or negatively charged (such ions as Cl^- or NH_4^+), or it may be a molecule of water or ammonia. The most common metal ions are those of cobalt, platinum, iron, copper, and nickel, which form highly stable compounds. When ammonia is the ligand, the compounds are called amines. The total number of bonds linking the metal to the ligand is called its coordination number. It is usually 2, 4, or 6 and often depends on the type of ligand involved. All ligands have electron pairs on the coordinating atom (e.g.,

nitrogen) that can be either donated to or shared with the metal ions. The metal ion acts as a Lewis acid (electron acceptor) and the ligand as a Lewis base (electron donor). The bonding is neither covalent nor electrostatic but may be considered intermediate between the two types. The charge on the complex ion is the sum of the charges on the metal ion and the ligands; for example, $4\text{NH}_3 + 2\text{Cl}^- + \text{Co}^{3+}$ forms the complex $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]^+$. The brackets enclose the metal ion and the coordinated ligands.

See chelate; sequestration; metallocene.

coordination isomerism. Isomerism due to two central atoms, one in the positive complex and one in the negative complex.

coordination number. (CN). The number of points at which ligands are attached to the metal ion in a complex. Common coordination numbers are 2, 4, and 6, exemplified by the ions $[\text{Ag}(\text{NH}_3)_2]^+$, $[\text{Ni}(\text{CN})_4]^{2-}$, and $[\text{PdCl}_6]^{2-}$.

copaiba oil. A levorotatory, essential oil obtained from a tree native to Brazil; a component of copaiba resin (a type of balsam). The sap of this tree is a turpentine-like liquid that can be used as an automotive fuel; intensive cultivation of copaiba trees for this purpose is under experimentation in Brazil.

copaiba resin. See balsam (3); copaiba oil.

copaibic acid. $\text{C}_{20}\text{H}_{30}\text{O}_2$. A monobasic acid derived from copaiba balsam.

copal. A group of fossil resins still used to some extent in varnishes and lacquers. Insoluble in oils and water. The most important types are Congo, kauri, and manila.

Cope elimination reaction. Formation of an olefin and a hydroxylamine by pyrolysis of an amine oxide.

Cope rearrangement. Thermal isomerization of 1,5-dienes by 1,3,3 shift.

"Copherol" [Henkel].

CAS: 7695-91-2. TM for natural tocopheryl acetate source of vitamin E.

Use: Antioxidant and moisturizer for topical skin-care and sunscreen products.

copigment. A material that forms an unstable addition compound with the anthocyanin pigment of flowers, such as tannin.

copolymer. An elastomer produced by the simultaneous polymerization of two or more dissimilar monomers, as SBR synthetic rubber from styrene and butadiene.

copper.

CAS: 7440-50-8. Cu. Metallic element of atomic number 29, group IB of the periodic table, aw 63.546, valences 1, 2; two stable isotopes.

Properties: Distinctive reddish color. D 8.96, mp 1083C, bp 2595C. Ductile, excellent conductor of electricity. Complexing agent, coordination numbers 2 and 4. Dissolves readily in nitric and hot concentrated sulfuric acids; in hydrochloric and dilute sulfuric acids slowly, but only when exposed to the atmosphere. More resistant to atmospheric corrosion than iron, forming a green layer of hydrated basic carbonate. Readily attacked by alkalis. A necessary trace element in human diet, and a factor in plant metabolism. Essentially nontoxic in elemental form. Noncombustible, except as powder.

Source: Azurite, azurmalachite, chalcocite, chalcopyrite (copper pyrites), covellite, cuprite, malachite from Michigan, Arizona, Utah, Montana, New Mexico, Nevada, Tennessee, Chile, Canada, the former U.S.S.R., Zambia, Zaire.

Derivation: Varies with the type of ore. With sulfide ores, the steps may be (1) concentration (of low-grade ores) by flotation and leaching, (2) roasting, (3) formation of copper *matte* (40–50% Cu), (4) reduction of *matte* to *blister* copper (96–98%), (5) electrolytic refining to 99.9+% copper.

Available forms: Ingot, sheet, rod, wire, tubing, shot, powder, high purity (impurities <10 ppm) as single crystals or whiskers.

Hazard: Flammable in finely divided form. TLV: (fume) 0.2 mg/m³, (dusts and mists) 1 mg/m³.

Use: Electric wiring; switches; plumbing; heating; roofing and building construction; chemical and pharmaceutical machinery; alloys (brass, bronze, Monel metal, beryllium-copper); electroplated protective coatings and undercoats for nickel, chromium, zinc, etc., cooking utensils; corrosion-resistant piping; insecticides; catalyst; antifouling paints. Flakes used as insulation for liquid fuels. Whiskers used in thermal and electrical composites.

copper abietate. (cupric abietate).

$\text{Cu}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Green scales. Soluble in alcohol and in oils (producing a fine-green color); insoluble in water.

Derivation: Heating copper hydroxide with abietic acid.

Use: Preservative metal paint, fungicide.

copper acetate. (cupric acetate; crystals of Venus; verdigris, crystallized).

CAS: 142-71-2. $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Greenish-blue, fine powder. D 1.9, mp 115C, decomposes at 240C. Soluble in water, alcohol and ether.

Derivation: Action of acetic acid on copper oxide and subsequent crystallization.

Use: Pesticide, catalyst, fungicide, pigments, manufacture of Paris green.

copper acetate, basic. (copper subacetate; verdigris; verdigris blue; verdigris green).

Properties: Masses of minute, silky crystals, either pale green or bright blue in color. Blue variety approximate formula $(\text{C}_2\text{H}_3\text{O}_2)_2\text{Cu}_2\text{O}$. Green variety approximate formula $\text{CuO} \cdot 2\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$. Coppery taste. The green rust with which uncleaned copper vessels become coated and which is commonly termed verdigris is a copper carbonate and must not be confused with true *verdigris*. Apart from its impurities, verdigris is a variable mixture of the basic copper acetates. Soluble in acids; very slightly soluble in water and alcohol.

Derivation: Action of acetic acid on copper in the presence of air.

Use: Paint pigment, insecticide, fungicide, mildew preventive, mordant in dyeing and printing.

copper acetoarsenite. (cupric acetoarsenite; Paris green; king's green; Schweinfurt green; imperial green). $(\text{CuO})_3\text{As}_2\text{O}_3 \cdot \text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: Emerald-green powder. Soluble in acids; insoluble in alcohol and water. Phytotoxic.

Derivation: By reacting sodium arsenite with copper sulfate and acetic acid.

Hazard: Toxic by ingestion.

Use: Wood preservative, larvicide, marine antifouling paints.

copper acetylacetonate. (copper-2,4-pentanedione). $\text{Cu}(\text{C}_5\text{H}_7\text{O}_2)_2$. Crystalline powder, slightly soluble in water and alcohol, soluble in chloroform, mp >230C. Resistant to hydrolysis. A chelating nonionizing compound.**copper amalgam.**

Properties: Hard, brown leaflets. Contains approximately 74% mercury and approximately 24% copper. Soluble in nitric acid.

Use: Dental cement.

copper aminoacetate. See copper glycinate.**copper aminosulfate.** See copper sulfate, ammoniated.**copper ammonium acetate.** (cuprous acetate, ammoniacal).

Use: In an absorption process for separating butadiene from C₄ streams at refineries or from by-products of ethylene production.

copper arsenate. Probably the basic cupric arsenate.

Properties: Light-blue, blue, or bluish-green powder. Variable composition. Contains approximately 33% copper and approximately 29% arsenic. Soluble in dilute acids, ammonium hydroxide; insoluble in alcohol, water.

Use: Insecticide, fungicide.

copper arsenite. (cupric arsenite; copper orthoarsenite; Scheele's green).

CAS: 10290-12-7. CuHAsO_3 or $\text{Cu}_3(\text{AsO}_3)_2 \cdot 3\text{H}_2\text{O}$; variable.

Properties: Fine, light-green powder. Mp (decomposes). Soluble in acids; insoluble in water and alcohol.

Use: Insecticide, fungicide, pigment, wood preservative, rodenticide.

copper arsenite, ammoniacal. See "Chemonite."

copperas. See ferrous sulfate.

copperas, blue. See copper sulfate.

copperas, green. See ferrous sulfate.

copperas, white. See zinc sulfate.

copper benzoate. $(\text{C}_6\text{H}_5\text{COO})_2\text{Cu} \cdot 2\text{H}_2\text{O}$.

Properties: Blue, crystalline powder; odorless. Mp (loses water) 110C. Slightly soluble in cold water, acids, and alcohol.

Derivation: Interaction of solutions of a benzoate and copper salt.

copper-beryllium. See beryllium-copper.

copper bis(dibutyldithiocarbamate).

CAS: 13927-71-4. mf: $\text{C}_{18}\text{H}_{36}\text{N}_2\text{S}_4 \cdot \text{Cu}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

copper, bis(1-hydroxy-2(1h)-pyridinethionato)-. See bis(2-pyridinethiol 1-oxide)copper.

copper, blister. See blinding copper.

copper blue. See mountain blue.

copper borate. See copper metaborate.

copper bromide. (cupric bromide). CuBr_2 .

Properties: Black powder or crystals, deliquescent. Mp 498C; d 4.77 (25C). Soluble in acetone, alcohol, water.

Use: Photography (intensifier), organic synthesis (brominating agent), battery electrolyte, wood preservative.

copper carbonate. (cupric carbonate; copper carbonate, basic; artificial malachite; mineral green. For the native mineral see malachite).

CAS: 12069-69-1. $\text{Cu}_2(\text{OH})_2\text{CO}_3$.

Properties: Green powder. D 3.7–4.0, decomposes at 200C. Soluble in acids; insoluble in water.

Derivation: By adding sodium carbonate to a solution of copper sulfate, filtering, and drying.

Grade: Technical, CP.

Hazard: Toxic by ingestion. TWA (fume) 0.2 mg/m³; (dust, mist) 1 mg(Cu)/m³; (Proposed: TWA (fume and respirable particles) 0.05 mg/m³; (dust, mist) 1 mg(Cu)/m³).

Use: Pigments, pyrotechnics, insecticides, copper salts, coloring brass black, astringent in pomade preparations, antidote for phosphorus poisoning, smut preventive, fungicide for seed treatment, feed additive (in small amounts).

copper chloride. (cupric chloride).

CAS: 1344-67-8. (1) CuCl_2 , (2) $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: (1) Brownish-yellow powder, hygroscopic, (2) green, deliquescent crystals, soluble in water and alcohol. D (1) 3.386 (25C), (2) 2.54 (25C); (1) mp 620C decomposes at 993C to cuprous chloride (2) loses 2H₂O at 100C.

Derivation: (1) By the union of copper and chlorine. (2) Copper carbonate is treated with hydrochloric acid and the product crystallized.

Grade: Technical, CP, reagent.

Hazard: Toxic by ingestion and inhalation.

Use: Isomerization and cracking catalyst, mordant in dyeing and printing fabrics, sympathetic ink, disinfectant, pyrotechnics, wood preservation, fungicides, metallurgy, preservation of pulpwood, deodorizing and desulfurizing petroleum distillates, photography, water purification, feed additive, electroplating baths, pigment for glass and ceramics, acrylonitrile manufacturing.

See cuprous chloride.

copper chromate. (cupric chromate, basic).

$\text{CuCrO}_4 \cdot 2\text{CuO} \cdot 2\text{H}_2\text{O}$.

Properties: Light chocolate-brown powder. Loses water at 260C. Soluble in nitric acid; insoluble in water.

Derivation: Action of chromic acid on copper hydroxide.

Hazard: A carcinogen. TLV: 0.5 mg(Cr)/m³.

Use: Mordant in dyeing, wood preservative, seed treatment fungicides.

copper cyanide. (cupric cyanide).

CAS: 544-92-3. $\text{Cu}(\text{CN})_2$.

Properties: Green powder. Keep well stoppered. Soluble in acids and alkalis; insoluble in water.

Derivation: Addition of potassium cyanide to a solution of copper sulfate; cupric cyanide is precipitated. This can be dried but is not stable.

Grade: Technical.

Hazard: Poison. TLV: (CN) 5 mg/m³.

Use: Electroplating copper on iron, intermediate (introduction of the cyanide group in place of the amino radical in aromatic organic compounds).

See cuprous cyanide.

copper, deoxidized. (copper, oxygen-free).

Copper metal specially treated (as by addition of phosphorus) to remove all or a part of the 0.05% oxygen normally present. It is more ductile than ordinary copper.

copper(II) diethyldithiocarbamate.CAS: 13681-87-3. mf: $C_{10}H_{20}N_2S_4 \bullet Cu$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**copper dihydrazine sulfate.**CAS: 33271-65-7. mf: $H_{10}N_4O_8S_2 \bullet Cu$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**copper dihydrazinium sulfate.** $(CuSO_4(N_2H_4)_2 \bullet H_2SO_4)$.**Properties:** Bluish powder. Mp >300C, starts to decompose at 140C, very slightly soluble in water (250 ppm at 80C).**Hazard:** Toxic by ingestion or inhalation. Skin and eye irritant.**Use:** Foliage fungicide.**copper, electrolytic.** Copper refined by electrolysis. The purest form of copper available commercially.**copper ethylacetoacetate.** $Cu(C_8H_9O_3)_2$.**Properties:** Blue-green powder. Mp 192–193C. Insoluble in water; soluble in most organic solvents.**Use:** Fungicide, intermediate.**copper ferrocyanide.** (cupric ferrocyanide). $Cu_2Fe(CN)_6 \bullet 7H_2O$.**Properties:** Reddish-brown powder. Insoluble in water and acids; soluble in ammonium hydroxide and potassium cyanide solutions.**Use:** Pigment in paints and enamels, analytical test for traces of copper, inorganic osmotic membranes.**copper fluoride.** (cupric fluoride). $CuF_2 \bullet 2H_2O$. The anhydrous form, CuF_2 , is also available.**Properties:** Blue crystals. D 2.93 (25C). Slightly soluble in water; soluble in acids and alcohol.**Derivation:** (1) By decomposing copper carbonate with hydrofluoric acid and subsequent crystallization; (2) fluorination of copper hydroxyfluoride at 525C.**Grade:** Technical.**Hazard:** A poison. TLV: 2.5 mg(F)/m³.**Use:** Ceramics, enamels, flux in metallurgy, high-energy batteries, fluorinating agent.**copper(II) fluoroacetate.**CAS: 20424-95-7. mf: $C_4H_4F_2O_4 \bullet Cu$.**Hazard:** A poison.**Use:** Agricultural chemical.**copper fluosilicate.** (copper silicofluoride; cupric fluosilicate; cupric silicofluoride). $CuSiF_6 \bullet 4H_2O$.**Properties:** Blue, hygroscopic crystals. D 2.158, decomposed by heat. Soluble in water; slightly soluble in alcohol.**Derivation:** Interaction of copper hydroxide and hydrofluosilicic acid.**Method of purification:** Crystallization.**Grade:** Technical.**Hazard:** A poison. TLV: (F) 2.5 mg/m³.**Use:** Dyeing and hardening white marble, treating grapevines for "white disease."**copper glance.** See chalcocite.**copper gluconate.** (cupric gluconate). $[Cu_2OH(CH_2O)_4COO]_2Cu$.**Properties:** Odorless, light-blue, fine, crystalline powder. Soluble in water; insoluble in acetone, alcohol, and ether.**Grade:** Pharmaceutical, FCC.**Use:** Feed additive, dietary supplement, mouth deodorant.**copper glycinate.** (copper aminoacetate). $(NH_2CH_2COO)_2Cu$.**Properties:** Blue, triboluminescent crystals. Mp 130C. Slightly soluble in water and alcohol; insoluble in hydrocarbons, ethers, and ketones.**Grade:** Anhydrous, hydrate.**Use:** Catalyst for rapid biochemical assimilation of iron, electroplating baths, photometric analysis, feed additive.**copper hemioxide.** See copper oxide red.**copper hydrate.** See copper hydroxide.**copper hydroxide.** (cupric hydroxide; copper oxide hydrated; copper hydrate).CAS: 20427-59-2. $Cu(OH)_2$.**Properties:** Blue powder. D 3.368, mp (decomposes). Soluble in acids and ammonium hydroxide; insoluble in water.**Derivation:** Interaction of a solution of a copper salt with an alkali.**Grade:** Technical.**Hazard:** Toxic by ingestion and inhalation.**Use:** Copper salts, mordant, cuprammonium rayon, pigment, staining paper, feed additive, pesticide and fungicide, catalyst.**copper-8-hydroxyquinoline.** See copper-8-quinolinolate.**copper indium selenide.**CAS: 12018-95-0. mf: $CuInSe_2$.**Hazard:** A reproductive hazard.**"Copper Inhibitor 50" [Du Pont].** TM for 50% disalicylalpropylenediamine and 50% aromatic solvent. Used to prevent catalytic action of copper on oxidation of natural and synthetic rubbers.**Hazard:** Flammable, moderate fire risk.**copper iodide.** See cuprous iodide.

copper lactate. (cupric lactate).

Properties: Greenish-blue crystals or granular powder. Soluble in water and ammonium hydroxide.

Use: Source of copper in copper-plating fungicides.

copper mercury iodide. See mercuric cuprous iodide.**copper metaborate.** (copper borate; cupric borate). $\text{Cu}(\text{BO}_2)_2$.

Properties: Bluish-green, crystalline powder. D 3.859. Insoluble in water; soluble in acids.

Derivation: Interaction of copper sulfate and sodium borate.

Grade: Technical, CP.

Hazard: Toxic by ingestion.

Use: Dehydrogenation catalyst, wood preservative, fire-retardant, paint and ceramic pigment, insecticides (especially wheat-rust compounds).

copper methane arsenate. $\text{CH}_3\text{AsO}_3\text{Cu}$.

Properties: Greenish solid.

Derivation: Reaction of disodium methyl arsenate with copper salts.

Hazard: Toxic by ingestion.

Use: Algicide.

copper methane arsonate.

CAS: 63869-12-5. mf: $\text{CH}_3\text{AsO}_2 \cdot \text{Cu}$.

Hazard: A poison.

copper molybdate. CuMoO_4 .

Properties: Crystals. D 3.4, mp approximately 500C. Insoluble in water.

Grade: 99.98% pure. Electronic and optical equipment.

Use: Paint pigment and protective coatings, corrosion inhibitor.

copper monoxide. See copper oxide black.**copper naphthenate.**

CAS: 1338-02-9.

Properties: Green-blue solid. High germicidal power. Soluble in gasoline, benzene, and mineral-oil distillates.

Derivation: Addition of solution of cupric sulfate to aqueous solution of sodium naphthenate.

Grade: 6, 8, 11.5% copper.

Hazard: Flammable, moderate fire risk (solution). Toxic by ingestion and inhalation.

Use: Wood, canvas, and rope preservative, insecticide, fungicide, antifouling paints.

See soap (2).

copper nitrate. (cupric nitrate).

CAS: 3251-23-8. (1) $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, (2) $\text{Cu}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Blue, deliquescent crystals. Soluble in water and alcohol. D (1) 2.32 (25C), (2) 2.074; mp

(1) 114.5C, (2) loses $3\text{H}_2\text{O}$ at 26.4C; (1) decomposes 170C.

Derivation: By treating copper or copper oxide with nitric acid. The solution is evaporated and product recovered by crystallization.

Grade: Technical, CP.

Hazard: Oxidizer, causes violent combustion or explosion with organic materials.

Use: Light-sensitive papers; analytical reagent; mordant in textile dyeing; nitrating agent; insecticide for vines; coloring copper black; electroplating; production of burnished effect on iron; paints; varnishes, enamels; pharmaceutical preparations; catalyst.

copper nitrite. (copper nitrite basic; cupric nitrite). $\text{Cu}(\text{NO}_2)_2 \cdot 3\text{Cu}(\text{OH})_2$, variable.

Properties: Green powder. Decomposes at 120C. Soluble (with decomposition) in dilute acids, ammonium hydroxide; slightly soluble in water.

copper nitrite basic. See copper nitrite.**copper octoate.** See soap (2).**copper oleate.** (cupric oleate). $\text{Cu}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown powder or greenish-blue mass. Soluble in ether; insoluble in water. Combustible.

Derivation: Interaction of copper sulfate and sodium oleate.

Use: Preserving fish nets and marine lines, fungicide, insecticide, ore flotation, lubricating oil antioxidant, emulsifying agent, fuel-oil ignition improver, catalyst.

See soap (2).

copper oxalate. (cupric oxalate). CuC_2O_4 .

Properties: Bluish-green powder, decomposes at approximately 300C to copper oxide. Insoluble in water, alcohol, and acetic acid; soluble in ammonium hydroxide.

Derivation: Reaction of oxalic acid with copper sulfate.

Hazard: Toxic by ingestion; tissue irritant.

Use: Catalyst in organic synthesis, rodent repellent in seed coatings.

copper oxide black. (cupric oxide; copper monoxide).

CAS: 1317-39-1. CuO .

Properties: Brownish-black powder. D 6.32, decomposes at 1026C. Soluble in acids; difficultly soluble in water.

Derivation: Ignition of copper carbonate or copper nitrate.

Hazard: Toxic by ingestion.

Use: Ceramic colorant, reagent in analytical chemistry, insecticide for potato plants, catalyst, purification of hydrogen, batteries and electrodes, aromatic acids from cresols, electroplating, solvent for chromic iron ores, desulfurizing oils, rayon, metallurgi-

cal and welding fluxes, antifouling paints, phosphors.

copper oxide hydrated. See copper hydroxide.

copper oxide red. (cuprous oxide; copper protoxide; copper hemioxide; copper suboxide). Cu_2O . For the native ore see cuprite.

Properties: Reddish-brown, octahedral crystals. D 5.75–6.09, mp 1235C, bp 1800C. Soluble in acids and ammonium hydroxide; insoluble in water.

Derivation: (1) Oxidation of finely divided copper. (2) Addition of bases to cuprous chloride. (3) Action of glucose on cupric hydroxide.

Grade: Technical, CP, 97% min (for pigments), also USN Type I (97%), USN Type II (90%).

Hazard: Toxic by ingestion.

Use: Copper salts, ceramics, porcelain red glaze, red glass, electroplating, antifouling paints, fungicide, catalyst, brazing preparations, photocells.

copper oxinate. See copper-8-quinolinolate.

copper oxychloride. (cupric oxychloride).
Composition variable, possibly $3\text{CuO}\cdot\text{CuCl}_2\cdot 3.5\text{H}_2\text{O}$.

Properties: Bluish-green powder. Soluble in acids, ammonia; insoluble in water.

Hazard: Toxic by ingestion and inhalation.

Use: Pigment, pesticide, fungus control in grapevines.

copper-2,4-pentanedione. See copper acetylacetonate.

copper phenolsulfonate. (copper sulfocarbonate). $[\text{C}_6\text{H}_4(\text{OH})\text{SO}_3]_2\text{Cu}\cdot 6\text{H}_2\text{O}$.

Properties: Green, prismatic crystals. Soluble in water and alcohol. Combustible.

Derivation: Interaction of barium phenolsulfonate and copper sulfate.

Use: Esterification catalyst, electroplating.

copper phosphate. (copper orthophosphate). $\text{Cu}_3(\text{PO}_4)_2\cdot 3\text{H}_2\text{O}$.

Properties: Light-blue powder. Soluble in acids, ammonium hydroxide; insoluble in water.

Use: Analysis, fungicide, catalyst, oxidation inhibitor for metals.

copper phosphide. Cu_3P_2 .

Properties: Grayish-black, metallic powder. D 6.67. Insoluble in water and hydrochloric acid; soluble in nitric acid; insoluble in hydrochloric acid.

Derivation: By heating copper and phosphorus.

Hazard: Dangerous, spontaneously flammable, and toxic phosphine evolved on reaction with water. May explode when mixed with potassium nitrate.

Use: Manufacturing phosphor-bronze.

copper phthalate. $\text{C}_8\text{H}_4\text{O}_4\text{Cu}$.

Properties: Fine, blue powder; assay min 95%; very slightly soluble in common organic solvents or water. Combustible.

Hazard: Toxic by ingestion.

Use: Fungicide.

copper phthalocyanine blue. See Pigment Blue 15.

copper phthalocyanine green. See Pigment Green 7.

copper potassium ferrocyanide. (potassium copper ferrocyanide). $\text{K}_2\text{CuFe}(\text{CN})_6\cdot\text{H}_2\text{O}$.

Properties: Brownish-red powder. Insoluble in water.

Use: Pigment.

copper protoxide. See copper oxide red.

copper pyrites. See chalcopyrite.

copper pyrophosphate. See "Unichrome" [ATOTECH].

copper-8-quinolinolate. (copper-8; copper oxinate; copper-8-hydroxyquinoline).

$\text{Cu}(\text{C}_9\text{H}_6\text{ON})_2$.

Properties: Yellow-green, nonhygroscopic, odorless powder. Insoluble in water; somewhat soluble in weak acids; soluble in strong acids. Insoluble in most organic solvents but somewhat soluble in pyridine and quinoline. Soluble copper-8 refers to the product formed by heating copper-8-quinolinolate with certain organic acids (naphthenic, lactic, stearic, etc.) or their salts. In such products, the copper-8-quinolinolate does not settle out on standing, even after dilution with various solvents.

Derivation: From 8-quinolinol and copper salt such as copper acetate.

Grade: 10% active salt (1.8% Cu) solution.

Hazard: Toxic by ingestion.

Use: Fungicide and mildew-proofing of fabrics, analysis for copper.

copper resinate. (cupric resinate).

Properties: Green powder. Soluble in ether and oils; insoluble in water. Combustible.

Derivation: By heating copper sulfate and rosin oil and filtering and drying the precipitate.

Use: Antifouling paints, insecticide.

See soap (2).

copper ricinoleate. $\text{Cu}(\text{C}_{17}\text{H}_{32}\text{OHCOO})_2$.

Properties: Green plastic solid. Soluble in water, aliphatic hydrocarbons, ketones and aromatic hydrocarbons; partially soluble in alcohols and glycols; soluble in Softening p 64C.

Hazard: Toxic by ingestion. Combustible.

Use: Fungicides, insecticides.

copper scale. A coating formed on copper after heating, composed of cupric and cuprous oxides.

copper selenate. (cupric selenate).
 $\text{CuSeO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Light-blue crystals. D 2.559; loses $4\text{H}_2\text{O}$ at 50–100C. Soluble in acids, ammonium hydroxide, water; insoluble in alcohol.

Use: Black colorant for copper.

copper silicate. A complex mixture precipitated by solutions of copper salts from sodium silicate solutions. Used in pigments, catalysts, and insecticides.

copper silicide. See silicon-copper.

copper silicofluoride. See copper fluosilicate.

copper sodium chloride. (sodium copper chloride). $\text{CuCl}_2 \cdot 2\text{NaCl} \cdot 2\text{H}_2\text{O}$.

Properties: Light-green crystals. Soluble in water.

copper sodium cyanide. See sodium copper cyanide.

copper stearate. (cupric stearate).
 $\text{Cu}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: Light-blue powder. Soluble in ether, chloroform, benzene, turpentine, hot benzene, toluene, carbon tetrachloride; insoluble in water and alcohol. Mp 125C. Combustible.

Derivation: By the interaction of copper sulfate and sodium stearate.

Use: Preservative for cellulosic materials, antifouling paints, catalyst.

copper subacetate. See copper acetate, basic.

copper suboxide. See copper oxide, red.

copper sulfate. (cupric sulfate; blue vitriol; blue stone; blue copperas). $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Blue crystals or blue, crystalline granules or powder; slowly efflorescing in air; white when dehydrated; nauseous metallic taste. Soluble in water, methanol; slightly soluble in alcohol and glycerol; d 2.284.

Derivation: Action of dilute sulfuric acid on copper or copper oxide (often as oxide ores) in large quantities with evaporation and crystallization.

Method of purification: Recrystallization.

Grade: Technical, CP, NF, also sold as monohydrate. Available as crystals or powder.

Hazard: Toxic by ingestion, strong irritant.

Use: Agriculture (soil additive, pesticides, Bordeaux mixture), feed additive, germicides, textile mordant, leather industry, pigments, electric batteries, electroplated coatings, copper salts, reagent in analytical chemistry, medicine, wood preservative, preserva-

tion of pulp wood and ground pulp, process engraving and lithography, ore flotation, petroleum industry, synthetic rubber, steel manufacture, treatment of natural asphalts. The anhydrous salt is used as a dehydrating agent.

copper sulfate, ammoniated. (cupric ammonia sulfate; ammonio-cupric sulfate; copper aminosulfate). $\text{Cu}(\text{NH}_3)_4\text{SO}_4 \cdot \text{H}_2\text{O}$.

Properties: Dark-blue, crystalline powder; decomposes in air; soluble in water; insoluble in alcohol.

Derivation: By dissolving copper sulfate in ammonium hydroxide and precipitating with alcohol.

Hazard: Toxic by ingestion.

Use: Calico printing, manufacturing copper arsenate, insecticide, treating fiber products.

copper sulfate, tribasic.
 CAS: 7758-98-7. $\text{CuSO}_4 \cdot 3\text{Cu}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: Aqua-colored powder of extremely fine particle size. Water soluble. Stable in storage, forms essentially neutral water dispersion.

Hazard: Toxic by ingestion.

Use: A fixed copper fungicide. Also micronutrient for plants. Compatible with arsenicals, organic insecticides, sulfur, and cryolite. Used as spray or dust. Does not inhibit photosynthesis.

copper sulfide. (cupric sulfide). CuS .

Properties: Black powder or lumps. D 3.9–4.6, decomposes at 220C. Soluble in nitric acid; insoluble in water. Occurs as the mineral covellite.

Derivation: By passing hydrogen sulfide gas into a solution of a copper salt.

Hazard: Toxic by ingestion.

Use: Antifouling paints, dyeing with aniline black, catalyst preparation.

See cuprous sulfide.

copper sulfocarbolate. See copper phenol-sulfonate.

copper sulfocyanide. See cuprous thiocyanate.

copper tallate. See soap (2).

copper trifluoroacetylacetonate.

Properties: Solid. Mp 188–190C.

Use: Metal analysis standards, vapor-phase deposition of metals, laser studies.

copper tungstate. (cupric tungstate).
 $\text{CuWO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Light-green powder. Soluble in ammonium hydroxide; slightly soluble in acetic acid; insoluble in alcohol and water.

Use: Polyester catalyst, semiconductors, nuclear reactors.

copper yellow. See chalcopyrite.

copper zinc chromate. Variable in composition. Used as a fungicide.

Hazard: Toxic by ingestion and inhalation. A carcinogen. TLV: 0.5 mg(Cr)/m³.

“Coppralyte” [Du Pont]. TM for a group of products for electroplating copper.

“Coprantine” [Novartis]. TM for dyes requiring after-treatment with copper compounds.

copra oil. The name applied to lower grades of coconut oil.

coptisine.

CAS: 3486-66-6. mf: C₁₉H₁₄NO₄.

Hazard: A poison.

coral. Skeletons of the coral polyps found in the warmer oceans and consisting mainly of calcium carbonate colored with ferric oxide. Coral rock is porous. It occurs in the form of reefs east of Australia and at other locations in the southwest Pacific. It has been found to be the habitat of organisms that are rich in prostaglandins.

Hazard: Will infect open wounds.

Use: Building stone, cement, road and airfield construction, jewelry.

“Coral” [B. F. Goodrich]. TM for a stereospecific, polyisoprene rubber consisting essentially of *cis*-1,4-polyisoprene.

Properties: Similar to those of natural rubber, both unvulcanized and vulcanized.

Use: Replacement for natural rubber.

cordial. See liqueur.

cordite. A smokeless powder that is a mixture of nitrocellulose and nitroglycerin, with approximately 5% petrolatum added to thicken and stabilize the mixture. Materials are dissolved in acetone and mixed. Evaporation of the excess acetone leaves a gelatinous mass, which is extruded into cords.

“Cordobond” [Ferro]. TM for epoxy repair systems, liquid coating, and dispersions.

Use: For industrial, marine applications giving strength and abrasion resistance.

core of the earth. The central part of the earth below a depth of 2900 km. It is thought to be composed largely of iron and to be molten on the outside with a solid central region.

Corey, Elias James. (1928–). An American who won the Nobel Prize for chemistry in 1990 for development of novel methods for the synthesis of complex natural compounds (retrosynthetic analysis). He specialized in synthesis of terpenes. Awarded a doctorate by M.I.T. in 1951.

Corey-Winter olefin synthesis. Synthesis of olefins from 1,2-diols and thiocarbonyldiimidazole. Treatment of the intermediate cyclic thionocarbonate with trimethylphosphite yields the olefin by *cis* elimination.

“CoRezyn” [Interplastic]. TM for a variety of polymer resins tailored for specific uses and for materials used with the polymers in making finished products.

“Corgard” [Corning]. TM for a borosilicate glass armored with an opaque, filament-wound laminate of glass fiber and a modified polyester resin.

coriander oil. An essential oil with strong, spicy taste; may be irritating when ingested. Dextrorotatory. Used chiefly to flavor gin.

coriandrol. See linalool.

Coriolis effect. The tendency of a current of air or water flowing over the surface of the earth to bend to the right in the northern hemisphere and to the left in the southern hemisphere.

cork. A form of cellulose constituting the light outer bark of the oak tree known as *Quercus suber*. It grows naturally in southern Europe and northern Africa and has been cultivated in the southwestern U.S. Its special properties are extreme lightness, relative imperviousness to water, resilient structure, and low rate of heat transfer. These account for its usefulness as bottle stoppers, insulation, wallboard, life preservers, gaskets, and sound-deadening insertions. D 0.1–0.25. Combustible.

corkboard. A mixture of ground cork and paper pulp formed into thick sheets for insulating purposes.

(+)-corlumine.

CAS: 485-51-8. mf: C₂₁H₂₁NO₆.

Hazard: A poison.

Use: Agricultural chemical.

corn endosperm oil.

Properties: Reddish-brown liquid.

Use: Food additive.

Cornforth, John. (1917–). An Australian-born chemist who won the Nobel Prize for chemistry in 1975 with V. Prelog for work on the chemical synthesis of organic compounds. Although deaf since childhood, he attained his doctorate from Oxford and held prestigious posts all over the world, as well as authoring many papers on organic and biochemical subjects.

corn oil. (maize oil).

Properties: Pale yellow liquid; characteristic taste and odor. D 0.914–0.921, saponification number

188–193, iodine number 102–128, flash p 490F (254C). Insoluble in water; soluble in ether, chloroform, amyl acetate, benzene, and carbon disulfide; slightly soluble in alcohol. Combustible. Nontoxic and nondrying. Moderate tendency to spontaneous heating.

Chief constituents: Linoleic and oleic acids (unsaturated), palmitic and stearic (saturated).

Derivation: The germ of common corn (Indian corn, *Zea mays*) is removed from the grain and pressed.

Grade: Crude, refined, USP, technical.

Use: Foodstuffs, soap, lubricants, leather dressing, factice, margarine, salad oil, hair dressing, solvent.

corn silk and corn silk extract.

Properties: Extracted from the fresh styles and stigmas of *Zea mays* L.

Use: Food additive.

cornstarch. A carbohydrate polymer derived from corn of various types, composed of 25% amylose and 75% amylopectin. A white powder that swells in water, it is the most widely used starch in the U.S. The so-called waxy variety (made from waxy corn) contains only branched amylopectin molecules. Its chief uses are as a source of glucose, in the food industry as a filler in baking powder and a thickening agent in various food products, and in adhesives and coatings. It has been proposed as an additive to plastics to promote rapid degradation in such products as bottles and waste containers. See starch.

corn steep liquor. The dilute aqueous solution obtained by soaking corn kernels in warm 0.2% sulfur dioxide solution for 48 h as the first step in the recovery of cornstarch, corn oil, and gluten from corn. The solution contains mineral matter and soluble organic material extracted from the corn. It is used as a growth medium for penicillin and other antibiotics, and it is also concentrated and used as an ingredient of cattle feeds.

corn sugar. See glucose.

corn syrup. See glucose syrup.

corn syrup, high-fructose. See high-fructose corn syrup.

corona. An electrical discharge effect that causes ionization of oxygen and the formation of ozone. It is particularly evident near high-tension wires and in spark-ignited automotive engines. The ozone formed can have a drastic oxidizing effect on wire insulation, cable covers, and hose connections. For this reason, such accessories are made of oxidation-resistant materials such as nylon, neoprene, and other synthetics.

corotoxigenin-rhamnose.

CAS: 58917-39-8. mf: $C_{29}H_{42}O_9$.

Hazard: A poison.

Source: Natural product.

coroxon. (*O,O*-diethyl-*O*-(3-chloro-4-methylcoumarin-7-yl)phosphate).

Hazard: A cholinesterase inhibitor.

Use: Insecticide, fungicide.

correlation table. See scatter diagram.

corresponding states. (reduced states). Two substances are in corresponding states when their pressures, volumes (or densities), and temperatures are proportional, respectively, to their critical pressures, volumes (or densities), and temperatures. If any two of these ratios are equal, the third must also be equal. This principle has been useful in the development of physical and thermal properties of substances.

corrosion. (1) The electrochemical degradation of metals or alloys caused by reaction with their environment, which is accelerated by the presence of acids or bases. In general, the corrodability of a metal or alloy depends on its position in the activity series. Corrosion products often take the form of metallic oxides. This is actually beneficial in the case of aluminum and stainless steel, because the oxide forms a strongly adherent coating that effectively prevents further degradation. Hence, these metals are widely used for structural purposes. The rusting of iron is a familiar example of corrosion that is catalyzed by moisture. Acidic soils are highly corrosive. Sulfur is a corrosive agent in automotive fuels and in the atmosphere (as SO_2). Sodium chloride in the air at locations near the sea is also strongly corrosive, especially at temperatures above 21°C. Copper, nickel, chromium, and zinc are among the more corrosion-resistant metals and are widely used as protective coatings for other metals. Excellent corrosion-resistant alloys are stainless steel (18 Ni–8 Cr), Monel metal (66 Ni–34 Cu), and duralumin.

(2) The destruction of body tissues by strong acids and bases. See corrosive material; protective coating; paint; tarnish.

“Corrosion Inhibitor CS” [Nalco]. TM for a synergistic combination of sodium nitrate, borax, and organic inhibitors, used to prevent corrosion of ferrous and nonferrous metal and alloy surfaces in low-makeup closed cooling and heating systems.

corrosive material. Any solid, liquid, or gaseous substance that attacks building materials or metals or that burns, irritates, or destructively attacks organic tissues, most notably the skin and, when taken internally, the lungs and stomach. Among the more widely used chemicals that have corrosive properties are the following:

acetic acid, glacial hydrofluoric acid

acetic anhydride nitric acid
 bromine potassium hydroxide
 chlorine sodium hydroxide
 fluorine sulfuric acid
 hydrochloric acid

See toxic substances.

corrosive sublimate. Obsolete term for mercuric chloride.

corticoid hormone. A hormone produced or isolated from the cortex (external layer) of the adrenal gland. Corticoid hormones now used in medicine include cortisone, hydrocortisone, deoxycorticosterone, fluorcortisone, prednisone, prednisolone, methyl prednisolone, triamcinolone, dexamethasone, corticotropin (ACTH), and aldosterone. Some occur naturally in adrenal extract; others are modifications of the natural hormones. All are now made synthetically. They are derivatives of cyclopentanophenanthrene.

See cortisone; ACTH.

corticosteroids. Steroid hormones formed by the adrenal cortex.

See: corticoid hormone.

corticosterone.

CAS: 50-22-6. $C_{21}H_{30}O_4$. One of the less active adrenal cortical steroid hormones.

Properties: Crystalline plates. Mp 180–182C. Soluble in organic solvents; insoluble in water.

Derivation: Isolation from adrenal cortex extract, synthesis from deoxycholic acid.

Use: Biochemical research, medicine.

corticotropin. See ACTH.

cortisol. See hydrocortisone.

cortisone. (11-dehydro-17-corticosterone).

CAS: 53-06-5. $C_{21}H_{28}O_5$. An adrenal, cortical, steroid hormone. It affects carbohydrate and protein metabolism.

Properties: White, crystalline solid. Mp 220–224 (decomposes). Dextrorotatory in solutions. Slightly soluble in water; sparingly soluble in ether, benzene, and chloroform; fairly soluble in methanol, ethanol, and acetone.

Derivation: From adrenal gland extract (usually from cattle) (historical method), synthetically from bile acids, from other steroids or sapogenins.

Hazard: Damaging side effects, e.g., sodium retention from ingestion.

Use: An anti-inflammation drug used in treatment of acute arthritis, Addison's disease, inflammable diseases of eyes and skin.

corundum. (emery).

CAS: 1302-74-5. Al_2O_3 .

Properties: A varicolored mineral with transparent

crystals that are very hard and resistant to attack by acids. D 3.95–4.10, mp 2050°C, bp 2977°C. Natural aluminum oxide, sometimes with small amounts of iron, magnesium, silica, etc.

Occurrence: New York, Greece, Asia Minor.

Use: Various polishing and abrasive operations, grinding wheels.

Hazard: TLV: (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%).

See aluminum oxide; diaspore; sapphire.

corynine. See yohimbine.

cosmetic. Any preparation in the form of a liquid, semiliquid, paste, or powder applied to the skin to improve its appearance, and for cleaning, softening, or protecting the skin or its adjuncts but without specific medicinal or curative effects. Cosmetics include hairsprays, shampoos, nail polish, deodorants, shaving creams, facial creams, dusting powders, rouge, etc. Detergents, common soap, and bactericidal agents are not themselves classed as cosmetics although they may be components of cosmetic mixtures. A partial list of cosmetic ingredients follows:

animal fats (lanolin)
 vegetable oils, waxes
 alcohols (glycerol, glycols)
 surfactants (alkyl sulfonates)
 UV blocking agents (PABA)
 phenylene diamine
 aluminum chlorohydrate
 FDC organic dyes
 talc (magnesium silicate)
 essential oils
 inorganic pigments
 chlorophyllins
 nitrocellulose lacquers
 steroid hormones

Knowledge of the structure and function of the skin is essential for proper cosmetic formulation (cosmetology). All ingredients must be tested for possible toxic effects, since the skin is an important means of access for poisons. Addition of proteins to cosmetic preparations is of questionable value.

cosmic rays. The nuclei and electrons of atoms, mostly hydrogen, that impinge upon the earth from all directions of space with nearly the speed of light. Also referred to as cosmic radiation or primary cosmic rays.

cosmid. Artificially constructed cloning vector containing the cos gene of phage lambda. Cosmids can be packaged in lambda phage particles for infection into E. coli; this permits cloning of larger DNA fragments (up to 45kb) than can be introduced into bacterial hosts in plasmid vectors.

cosmochemistry. See astrochemistry; chemical planetology.

“Cosmoperine” [Sabinsa]. TM for tetrahydropiperine preparation.

Use: To enhance permeation through skin surface.

“Cosol” [Neville]. TM for high-boiling coal tar solvents for use in alkyd resin enamels and synthetic lacquers.

costus root oil.

Properties: From the dried roots of *Saussurea lappa* Clarke (Fam. *Compositae*). Light yellow to brown liquid; persistent odor. D: 0.995–1.039, refr index: 1.515 @ 20°. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol.

Use: Food additive.

cotoneral abs. See C.I. direct black 32, trisodium salt.

cotransport. The simultaneous transport, by a single transporter, of two solutes across a membrane. It is either antiport or symport, depending on whether the solutes travel in opposite or the same direction.

cotton. Staple fibers surrounding the seeds of various species of *Gossypium*. Both *Egyptian* and Sea Island cotton have unusually long staple (approximately 2 inches). Cotton is the major textile fiber and an important source of cellulose, which constitutes 88–96% of the fiber. So-called *absorbent cotton* is almost pure cellulose.

Properties: Tenacity, 3–6 g/denier (dry), 4–8 g/denier (wet); elongation 3–7%; d 1.54; moisture regain 7% (21C, 65% relative humidity); yellows slowly at 121C; decomposes at approximately 148C; low permanent set; decomposed by acids; swells in caustic but is undamaged. Soluble in cuprammonium hydroxide. Subject to mildew. May be dyed by direct, vat, azoic, sulfur, and basic dyes. Combustible.

Source: U.S., Brazil, Egypt, India.

Hazard: Toxic by inhalation. TLV: (dust) 0.2 mg/m³. Moderately flammable in the form of dust or linters; fiber ignites readily. In the form of dust or linters, exposure of workers in textile mills may cause “brown lung.”

Use: Apparel, industrial and household fabrics, upholstery, medicine, thread.

See cellulose.

cotton, acetylated. Cotton fibers, threads, or fabrics treated with acetic anhydride, acetic acid, perchloric acid, and catalyst to improve the heat, rot, and mildew resistance by forming a surface coating of cellulose acetate.

Hazard: Ignites readily, not self-extinguishing.

cotton, aminized. A cotton fabric produced by reacting 2-aminoethylsulfuric acid with the cellu-

lose of the fabric in a strongly alkaline solution. The treated cotton can take acid wool dyes and can be made rot resistant and water-repellent.

cotton, cyanoethylated. Cotton treated with acrylonitrile. It is passed through a caustic bath that induces mild swelling of the fiber and catalyzes the subsequent reaction with acrylonitrile. The fabric is then neutralized with acetic acid, washed, and dried. The treatment leaves 3–5% nitrogen attached to the cellulose polymer. The cyanoethylated fiber is claimed to have permanent rot and mildew resistance, greater retention of strength after exposure to heat, improved receptiveness to dyes, and higher abrasion and stretch resistance.

cotton linters. Short, fleecy fibers that adhere to cottonseed after it has been passed once through a cotton gin. They are removed from the seed by a second ginning.

Hazard: Flammable, dangerous fire risk.

Use: Rayon manufacture, cellulosic plastics, nitrocellulose lacquers, soil-cement binder in road construction, explosives.

cotton, mercerized. Cotton that has been strengthened by passing through 25–30% solution of sodium hydroxide under tension and then washed with water; while under tension. This causes the fibers to shrink and increases their strength and attraction for colors, as well as imparting luster. A process using liquid ammonia for this purpose has been introduced in the U.K.

Cotton-Mouton effect. (magnetic double refraction). Double refraction produced in some pure liquids by a magnetic field transverse to the light beam.

cotton oil. (cotton spraying oil). A compounded oil sprayed (in the form of a fine mist) onto cotton to condition the fibers for yarn-making operations. Used to lubricate the fibers, to reduce static, “fly,” and dust, and generally to improve the suppleness and strength of the fibers.

cottonseed. The seed of the cotton plant, *Gossypium hirsutum*. It contains about 22% crude fiber, 20% protein, 20% oil, 10% moisture, and 24% N-free extract; also contains from 1 to 2% of the toxic pigment gossypol; specially processed kernels are free of this.

Hazard: Generates dangerous amounts of heat if piled or stored wet or hot. Powerful allergen; may cause asthma and other respiratory difficulties on inhalation.

Use: Source of cottonseed oil and meal, cotton linters; source of nutritional protein after removal of gossypol by centrifugation.

cottonseed meal. (cottonseed cake). The pulverized cottonseed press cake. Depending on the

extractive process, varying percentages of protein will remain in the meal, and it is normally sold with 36–45% protein content. The 42% product contains approximately 42% crude protein, 6% crude fiber, 25% N-free extract, 10% other extract (fat), and 7% ash. The total digestible nutrient averages 79%. The ash is high in potash and phosphate; some types contain gossypol.

Use: Animal feeds, fertilizer ingredient, filler for plastics.

cottonseed, modified products.

Properties: Extracted from decorticated, partially defatted, cooked, ground cottonseed kernels.

Use: Food additive.

cottonseed oil.

Properties: Pale-yellow or yellowish-brown to dark-ruby-red or black-red, fixed, semi drying oil depending on the nature and condition of the seed. The pure oil is odorless and has a bland taste. D 0.915–0.921, iodine value 109–116, flash p 486F (252C). Soluble in ether, benzene, chloroform, and carbon disulfide; slightly soluble in alcohol. Combustible.

Chief constituents: Glycerides of palmitic, oleic, and linoleic acids.

Derivation: From cottonseeds by hot pressing or solvent extraction.

Grade: Crude, refined, prime summer yellow, bleachable, USP.

Use: Leather dressing, soap stock, lubricant, glycerol, base for cosmetic creams; hydrogenated to semi-solid for use in food products; waterproofing compositions, dietary supplement.

Cottrell, Frederick G. (1877–1948). A native of California, Cottrell obtained his doctorate from Liebig in 1902. His major contribution to industrial chemistry was his discovery of a practical method of dust elimination by electrical precipitation. Used in factory stacks and other large units, this process has contributed greatly to purifying the atmosphere of industrial areas. The principle involves charging a suspended wire with electricity. This creates a field that ionizes the surrounding air, the particles assuming the charge on contact and then moving to the wall of the stack, where they are electrically discharged and precipitated.

couch roll. (Pronounced *cooch*.) A hollow suction roll on a fourdrinier paper machine over which the formed sheet or web passes as it leaves the wire. The suction is provided by a vacuum or suction box inside the roll, whose face is perforated to offer as large a vacuum area as possible. The chief feature of the couch roll is its great water-removing capacity; this gives the sheet enough strength to enable it to hold together as it passes to the pickup felts.

coumaphos. Generic name for *O,O*-diethyl-*O*-(3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl)-

phosphorothioate.

CAS: 56-72-4. $C_9H_9O_2(CH_3)ClOPS(OC_2H_5)_2$.

Properties: Crystals. Mp 91C. Insoluble in water; soluble in aromatic solvents.

Hazard: Use may be restricted; cholinesterase inhibitor.

Use: Insecticide, anthelmintic.

coumarin. (cumarin; benzopyrone; tonka bean camphor).

CAS: 91-64-5. $C_9H_6O_2$. A lactone.

Properties: Colorless crystals, flakes, or powder; fragrant odor similar to vanilla; bitter, aromatic burning taste. Mp 69C, bp 290C. Soluble in 10 vols of 95% alcohol and in ether, chloroform, and fixed volatile oils; slightly soluble in water. Combustible.

Derivation: (1) By heating salicylic aldehyde, sodium lactate, and acetic anhydride; (2) fine grades are isolated from tonka beans.

Hazard: Toxic by ingestion; carcinogenic. Use in food products prohibited (FDA).

Use: Deodorizing and odor-enhancing agent, pharmaceutical preparations.

coumarone. (benzofuran).

CAS: 271-89-6. C_8H_6O . A bicyclic ring compound derived from coal tar naphtha, the parent substance of coumarone-indene resins.

Properties: Colorless, oily liquid. D 1.09, bp 165 to 175C. Insoluble in water.

coumarone-indene resin. A thermosetting resin derived by heating a mixture of coumarone and indene with sulfuric acid, which induces polymerization. It is soft and sticky at room temperature; it hardens on heating to a resinous solid. Soluble in hydrocarbon solvents, pyridine, acetone, carbon disulfide, and carbon tetrachloride; insoluble in water, alcohol. Combustible. Said to have been the first synthetic polymer.

Use: Adhesives, printing inks, floor-tile binder, friction tape.

See "Cumar"; "Nevindene"; "Paradene."

count. (1) The external indication given by a radiation detector, such as a Geiger counter, of the amount of radioactivity to which the detector is exposed. The background counts are those that come from a source external to that being measured. (2) The number of warp and filler threads in a linear inch of a textile fabric, e.g., the count of a sheeting may be 80 x 60.

countercurrent. Descriptive of a process in which a liquid and a vapor stream, or two streams of immiscible liquids, or a liquid and a solid are caused to flow in opposite directions and past or through one another with more or less intimate contact so that the individual substances present are more or less completely transferred to that stream in which they are more soluble or stable under the conditions existing. The streams leaving such a process are

usually of higher purity that can be attained otherwise at equal cost. Distillation with a fractionating column is also a typical countercurrent process, in which rising vapor is purified by contact with descending liquid (reflux). Leaching, washing, and chemical reaction are frequently carried out in a countercurrent manner.

See liquid-liquid extraction.

coupled reactions. Two chemical reactions that have a common intermediate and thus a means of energy transfer from one to the other.

coupling. (1) The combination of an amine or phenol with a diazonium compound to give an azo compound, the reaction by which azo dyes are prepared. Thus *m*-phenylenediamine $C_6H_4(NH_2)_2$ couples with benzene diazonium chloride $C_6H_5N_2Cl$ to produce the dye chrysoidine $C_6H_5N_2C_6H_3(NH_2)_2$. See azo-dye intermediate.

(2) Oxidative coupling.

(3) An agent, e.g., a vinyl silane, used to protect fibrous glass laminates from effects of water absorption.

(4) A condensation polymerization of amino acids to form proteins; it can be done synthetically only by suppressing certain active sites on the amino acid molecules.

covalent bond. (homopolar). Sharing of electrons by a pair of atoms.

See bond, chemical.

covalent radius. The radius for each element such that the actual bond length between any two elements that form a covalent single bond is roughly equal to the sums of their covalent radii.

covering power. See opacity.

Cowles process. The direct manufacture of aluminum alloys, such as copper aluminum, from aluminum ores by reacting with carbon in an electric furnace in the presence of the alloying metal.

Cox chart. A special semilogarithmic plot of vapor pressure versus temperature especially useful for the petroleum hydrocarbons. The graph corresponding to each separate hydrocarbon is a straight line. All the lines appear to intersect at a point outside the chart.

coxistac. See salinomycin.

CP. Abbreviation for chemically pure, an accepted grade of drugs and fine chemicals that contain a minimum of impurities.
See chemically pure.

“CP-40” [Occidental]. TM for chlorination derivatives of paraffin wax.

Use: Rendering fabrics waterproof and fire-retar-

dant; fire-retardant paints; plasticizer and extender for certain plastic materials, etc.

“C-P-B” [Uniroyal]. TM for dibutyl xanthogen disulfide.

Properties: Amber-colored, free-flowing liquid. D 1.15. Soluble in acetone, benzene, gasoline, and ethylene dichloride; insoluble in water.

Use: Accelerator for pure-gum handmade drugs, sundries and medical supplies, bathing shoes, bathing caps, novelties, and cold-cure cements.

CPR. Abbreviation for cyclonene-pyrethrin-rotenone. Applied to various insecticide formulations containing as active ingredients approximately 10 parts piperonyl cyclonene, 5 parts rotenone, and 1 part pyrethrin.

CPVC. See critical pigment volume concentration.

Cr. Symbol for chromium.

“CR-39” [PPG]. TM for allyl diglycol carbonate, an optical plastic.

Properties: Clear optical plastic highly resistant to impact and abrasion. Furnished as a clear liquid. Thermosetting.

Use: Ophthalmic lenses, shields, instrument panels, marine and aircraft glazing.

cracking. A refining process involving decomposition and molecular recombination of organic compounds, especially hydrocarbons obtained by means of heat, to form molecules suitable for motor fuels, monomers, petrochemicals, etc. A series of condensation reactions takes place, accompanied by transfer of hydrogen atoms between molecules which brings about fundamental changes in their structure. Thermal cracking, the older method, exposes the distillate to temperatures of approximately 540–650C (1000–1200F) for varying periods of time; it is no longer used for gasoline, but is still of value in producing hydrocarbon gases for plastics monomers. The development of premium fuels for airplanes and automobiles resulted from the use of catalysts in cracking. In this process, hydrocarbon vapors are passed at approximately 400C (750F) over a metallic catalyst (e.g., silica-alumina or platinum); the complex recombinations (alkylation, polymerization, isomerization, etc.) occur within seconds to yield high-octane gasoline. Among the chemical changes induced are conversion of alicyclic compounds (cyclohexane) to aromatic compounds, and of straight-chain to branched-chain structures (isomerization). Cracking reactions are exothermic. Free radicals, carbonium ions, and other chain-initiating agents are involved in these rearrangements. Catalytic cracking is carried out by either the moving-bed or the fluid-bed technique. In the former the catalyst is pelleted, while in the latter it is finely divided. Instances in which cracking does

not involve production of gasoline are the steam cracking of methane or naphtha to form synthesis gas, thermal cracking of naphtha to ethylene, and thermal decomposition of methane to carbon black and hydrogen.

See catalysis; synthesis gas; fluidization; pyrolysis.

“Crag.” (Sesone).

CAS: 136-78-7. mf: $C_8H_7Cl_2O_3S \cdot Na$. TM for agricultural chemicals, including: (1) Fly repellent (active ingredient, butoxypolypropylene glycol). Colorless liquid, 100% active material. (2) Fungicide 974 (active ingredient, 3,5-dimethyltetrahydro-1,3,5-2*H*-thiadiazine-2-thione). Wettable powder, 85% active material. Irritant. (3) Glyodin solution (active ingredient, 2-heptadecyl glyoxaldine acetate), 34% active solution. (4) Herbicide-1 (SES) (active ingredient, sodium-2,4-dichlorophenoxyethyl sulfate). Water-soluble powder, 90% active material.

Hazard: Toxic by inhalation; TLV: 10 mg/m³.

Craig method. Introduction of a halogen into the α -position of pyridine by treatment of a solution of α -aminopyridine with sodium nitrite in hydrogen halide, followed by warming.

crambe-seed oil. A vegetable oil obtained from the seeds of the crambe, a plant related to mustard and rape. Growth and processing techniques have been studied by the Agricultural Research Service of USDA. The plant can be grown on marginal and strip-mined land. Its high content of erucic acid and the high protein content of its meal make it economically attractive. The oil itself is useful as an industrial lubricant, especially for molds for continuous steel casting.

Cram, Donald James. (1919–2001). Awarded the Nobel Prize for chemistry, together with Lehn, in 1987 for work in elucidating mechanisms of molecular recognition, which are fundamental to enzymic catalysis, regulation, and transport. Cram also studied three-dimensional cyclic compounds that maintained a rigid structure, accepting substrates in a structurally preorganized cavity. He called these compounds cavitands, while Lehn named them cryptands. Cram was awarded a doctorate by Harvard University in 1947.

Cram’s rule of asymmetric induction.

Rule governing the stereochemistry of addition to carbonyl compounds containing an asymmetric center. The diastereomer that is formed by approach of the reagent from the less hindered side of the carbonyl group predominates in the product. The α -substituents are schematically represented as S (small), M (medium), and L (large).

crazing. Development of minute cracks in the surface of a material, such as ceramic glaze, varnish,

paint, etc., often as a result of exposure to sunlight or weathering.

cream of tartar. See potassium bitartrate.

creatine. (*N*-methyl-*N*-guanylglycine; (α -methylguanido)acetic acid).

HN:C(NH₂)N(CH₃)CH₂COOH. A nitrogenous acid widely distributed in the muscular tissue of the body.

Properties: (Monohydrate) Prisms from water, anhydrous at 100C. Decomposes 303C. Slightly soluble in water; insoluble in ether.

Source: Commercially isolated from meat extracts.

Grade: Technical, CP.

Use: Biochemical research.

creatinine. C₄H₇N₃O. The anhydride of creatine, a metabolic waste product.

Properties: Colorless to yellow liquid. D 1.092 (25C), mp 5.5C, bp 220C. Slightly soluble in water, alcohol, benzene, chloroform, ether, acetic acid.

Creighton process. Electrochemical reduction of sugars, e.g., reduction of glucose, xylose, and galactose to sorbitol, xylitol, and dulcitol.

creosote, coal tar. (creosote oil; liquid pitch oil; tar oil).

Properties: Yellowish to dark-green-brown, oily liquid; clear at 38C or higher; naphthenic odor; frequently contains substantial amounts of naphthalene and anthracene. Autoign temp 637F (335C), d 1.06–1.10, distilling range 200–400C, flash p 165F (74C) (CC). Soluble in alcohol, benzene, and toluene; immiscible with water.

Derivation: Fractional distillation of coal tar.

Method of purification: Rectification.

Grade: Technical, crude, refined.

Hazard: Toxic by inhalation of fumes, skin and eye irritant. Use may be restricted.

Use: Wood preservative (ties, telephone poles, marine pilings, etc.), disinfectants, fungicide, biocide.

***p*-cresidine.** See 5-methyl-*o*-anisidine.

“Creslan” [Cytec]. TM for an acrylic fiber.

cresol. (methylphenol; hydroxymethylbenzene; cresylic acid).

CAS: 1319-77-3. CH₃C₆H₄OH. A mixture of isomers obtained from coal tar or petroleum.

Properties: Colorless, yellowish, or pinkish liquid; phenolic odor. D 1.030–1.047, wt/gal 8.66–8.68 lb, flash p approximately 180F (82C), mp 11–35C, bp 191–203C. Soluble in alcohol, glycol, dilute alkalis, and water.

Derivation: Coal tar (from coke and gas works), also from toluene by sulfonation or oxidation.

Grade: Various, depending on phenol content or other properties. NF grade contains not more than 5% phenol.

Hazard: Irritant, corrosive to skin and mucous membranes, absorbed via skin. TLV: 5 ppm.

Use: Disinfectant, phenolic resins, tricresyl phosphate, ore flotation, textile scouring agent, organic intermediate, manufacture of salicylaldehyde, coumarin, and herbicides, surfactant, synthetic food flavors (*para* isomer only).

See cresylic acids.

***m*-cresol.** (*m*-cresylic acid; 3-methylphenol).

CAS: 108-39-4. $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: Colorless to yellowish liquid; phenol-like odor. D 1.034, mp 12C, bp 203C, wt/gal 8.66 lb, flash p 187F (86C), autoign temp 1038F (558C). Soluble in alcohol, ether, and chloroform; soluble in water.

Derivation: By fractional distillation of crude cresol (from coal tar), also synthetically.

Method of purification: Rectification.

Grade: Technical (95–98%).

Hazard: TLV: 5 ppm.

See cresol.

***o*-cresol.** (*o*-cresylic acid; 2-methylphenol).

CAS: 95-48-7. $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: White crystals; phenol-like odor. D 1.047; mp 30.9C; flash p 178F (81C); autoign temp 1110F (598C); bp 191C; wt/gal 8.68 lb. Soluble in alcohol, ether, chloroform, and hot water.

Derivation: (1) By fractional distillation of crude cresol from coal tar. (2) Interaction of methanol and phenol.

Method of purification: Crystals.

Grade: According to fp: 25, 29, 30, 30.5C, etc.

Hazard: TLV: 5 ppm.

See cresol.

***p*-cresol.** (*p*-cresylic acid; 4-methylphenol).

CAS: 106-44-5. $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: Crystalline mass; phenol-like odor. Wt/gal 8.67 lb, d 1.039, bp 202C, mp 35.25C, flash p 187F (86C), autoign temp 1038F (558C). Soluble in alcohol, ether, chloroform, and hot water.

Derivation: (1) By fractional distillation of crude cresol; (2) from benzene by the cumene process (see phenol).

Method of purification: Crystallization.

Grade: Technical, 98%, 99.0% min purity or 34C min fp.

Hazard: TLV: 5 ppm.

See cresol.

cresolphthalein.

$\text{C}_6\text{H}_4\text{COOC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. An acid-base indicator, changes from colorless to red between pH 8.2 and 9.8, reagent.

See indicator.

cresol purple.

$\text{C}_6\text{H}_4\text{SO}_2\text{OC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. *m*-Cresolsulfonphthalein, an acid-base indicator, showing color change from red to yellow over the range pH 1.2–2.8, and from yellow to purple over the range pH 7.4–9.0.

See indicator.

cresol red.

$\text{C}_6\text{H}_4\text{SO}_2\text{OC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. *o*-Cresol-sulfonphthalein, an acid-base indicator, changes from yellow to red between pH 7.0 and 8.8.

See indicator.

cresotic acid. (cresotinic acid; hydroxytoluic acid). $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})\text{COOH}$. Ten possible isomers; most common is 2-hydroxy-3-methylbenzoic acid, also known as *o*-cresotic acid or *o*-homosalicylic acid. The description that follows is of this isomer.

Properties: White crystals or powder. Mp 166C, bp approximately 250C. Partially soluble in hot water; soluble in alcohol and ether. Combustible.

Derivation: Treatment of *o*-cresol with caustic and carbon dioxide under pressure.

Use: Dye intermediate, research on plant growth inhibition.

***m*-cresyl acetate.** (*m*-tolyl acetate).

CAS: 140-39-6. $\text{CH}_3\text{C}_6\text{H}_4\text{OCOCH}_3$.

Properties: Colorless, oily liquid; odor similar to phenol. Bp approximately 112C, distillation with steam. Insoluble in water; soluble in common organic solvents. Combustible.

Use: Medicine (antiseptic, fungicide).

***o*-cresyl acetate.** (*o*-tolyl acetate).

$\text{CH}_3\text{COOC}_6\text{H}_4\text{CH}_3$.

Properties: Liquid. Bp 208C. Nearly insoluble in cold water; soluble in hot water and organic solvents. Combustible.

Use: Flavoring.

***p*-cresyl acetate.** (*p*-tolyl acetate).

$\text{CH}_3\text{C}_6\text{H}_4\text{OCOCH}_3$.

Properties: Colorless liquid; floral odor. D 1.0532 (15C), optical rotation 0 degrees (100 mm Hg), refr index 1.500–1.504, acid value 0.7, ester value 341.6. Soluble in 2.5 volumes of 70% alcohol and in most fixed oils; insoluble in glycerol. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

cresyldiglycol carbonate. (diethylene glycol bis(cresylcarbonate)). $\text{C}_{20}\text{H}_{22}\text{O}_7$.

Properties: Colorless liquid of low volatility. D 1.19 (20/4C), bp approximately 250C (2 mm Hg), flash p 475F (246C), refr index 1.523 (20C). Insoluble in water (very stable to hydrolysis). Widely soluble in organic solvents. Compatible with many resins and plastics. Combustible.

Use: Plasticizer.

cresyldiphenyl phosphate. (cresyl phenyl phosphate). $(\text{CH}_3\text{C}_6\text{H}_4)(\text{C}_6\text{H}_5)_2\text{PO}_4$. Probably seldom a pure compound, but a mixture of *o*-, *m*-, and *p*-cresyl and phenyl phosphates.

Properties: Colorless, transparent liquid; very slight odor. D 1.20 (20/20C), fp -38C , boiling range 235–255C (4 mm Hg), flash p 450F (232C). Insoluble in water; soluble in most organic solvents except glycerol. Combustible.

Use: Plasticizer, extreme-pressure lubricant, hydraulic fluids, gasoline additive, food packaging.

cresylic acids. Commercial mixtures of phenolic materials boiling above the cresol range. An arbitrary standard in use for cresylic acids is that 50% must boil above 204C. If the boiling point is less than 204C, the material is called cresol. Cresylic acid varies widely according to its source and boiling range. A typical commercial cut, bp 220–250C, has the composition *m*- and *p*-cresols 0–1%; 2,4- and 2,5-xylenols 0–3%; 2,3- and 3,5-xylenols 10–20%; 3,4-xylenol 20–30%; and C_9 phenols 50–60%. Excellent electrical insulators.

Derivation: Petroleum, coal tar. Imported cresylic acid is derived from coal tar (gasworks), also made synthetically.

Hazard: Corrosive to skin, absorbed via skin.

Use: Phosphate esters, phenolic resins, wire enamel solvent, plasticizers, gasoline additives, laminates, coating for magnet wire for small electric motors. Disinfectants, metal-cleaning compounds, phenolic resins, flotation agents, surfactants, chemical intermediates, oil additives, solvent refining of lubricating oils, scouring compounds, pesticides.

***p*-cresyl isobutyrate.** (*p*-tolyl isobutyrate). $\text{CH}_3\text{H}_6\text{H}_4\text{OCOCH}(\text{CH}_3)_2$.

Use: Flavoring.

cresylphenyl phosphate. See cresyldiphenyl phosphate.

cresyl silicate. $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_4\text{Si}$.

Properties: Colorless liquid. Bp 450C.

Derivation: Reaction of cresol and silicon tetrachloride.

Use: Heat-transfer fluid.

cresyl-*p*-toluene sulfonate. (tolyl-*p*-toluene sulfonate). $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Brown, oily liquid; faint odor. D 1.207, flash p 365F (185C), mp 68.70C. Combustible.

Derivation: From reaction of *p*-toluenesulfonyl chloride with *p*-cresol.

Use: Plasticizer.

Crick-Watson structure. See deoxyribonucleic acid.

cricondenthem. The maximum temperature at which two phases can coexist. See phase.

Criegee reaction. Oxidative cleavage of vicinal glycols by lead tetraacetate.

cristae. Infoldings of the inner mitochondrial membrane.

critical assembly. A system of fissionable material (enriched uranium) and moderator sufficient to sustain a chain reaction at a low and controllable power level, as in a nuclear reactor. See fission; nuclear reactor.

critical constant. A maximum or minimum value for a physical constant that is characteristic of a substance, e.g., the critical temperature of a gas is the temperature above which it cannot be liquefied by an increase in pressure.

criticality. The state of a nuclear reactor when it is sustaining a chain reaction.

critical mass. The minimum mass of a fissionable material (^{235}U or ^{239}Pu) that will initiate an uncontrolled chain reaction as in an atomic bomb. The critical mass of pure ^{239}Pu is about 10 lb, and of ^{235}U about 33 lb. This phenomenon was unknown before 1940.

Critical pigment volume concentration.

(CPVC). The transition point above and below which there are substantial differences in the appearance and behavior of a paint film.

critical point. (1) The transition point between the liquid and gaseous states of a substance. (2) The temperature above which a gas cannot be liquefied however high the pressure. (3) The temperature at which internal changes take place within a metal.

critical potential. The amount of energy needed to raise an electron from a lower to a higher level.

critical solution temperature. The temperature above or below which two liquids are miscible with all proportions. Some pairs of liquids have both an upper and a lower critical solution temperature, that is, they can exist in two phases only in a medium temperature range.

critical volume. The volume of a unit mass of a substance at critical temperature and pressure.

crocein acid. (croceic acid; Bayer's acid; 2-naphthol-8-sulfonic acid).

Derivation: Sulfonation of β -naphthol with 94% sulfuric acid at 95C and recrystallization from a salt.
Use: Azo-dye intermediate.

Crocein Scarlet MOO. See Brilliant Crocein.

crocetin. $C_{20}H_{24}O_4$. A dicarboxylic carotenoid derived from saffron.

Properties: Red, rhomboid crystals. Mp 285C. Soluble in pyridine and dilute sodium hydroxide; slightly soluble in water and organic solvents. Combustible.
Use: Experimental treatment of arteriosclerosis by increasing oxygen diffusion through arterial walls, thus decreasing buildup of cholesterol.

crocidolite. A type of asbestos.
See asbestos.

crocking. Removal of a dye or pigment from the surface of a paint or textile by rubbing or attrition.

“Crodamal” [Croda]. TM for fatty acid esters.
Grade: In liquid, solid, and flake forms.

Use: As emollient esters for skin care, sun care, and stick products.

“Crodamide” [Croda]. (Erucamide) TM for slip and mold release agents.

Use: Plastics casting.

“Crodamide OR” [Croda]. TM for oleamide slip and mold release additive.

Available forms: Beads, powder, and pastilles.

Use: In manufacture of plastics.

“Croda Oleochemicals” [Croda, Japan].

TM for chemicals used in hair care, sun screen, polymer medical additives, and cleaning products.

“Crome of Nature” [Afrocare]. TM for a no-lye hair relaxer.

Use: A color changing formula that signals when Crome is ready.

“Cronox 861 OS” [Baker Petrolite]. TM for a batch treatment drilling corrosion inhibitor.

Use: As a corrosion inhibitor

crospovidone. See polyvinylpyrrolidone.

Cross-Bevan (viscose) process. Production of rayon by treatment of cellulose with alkali and

carbon disulfide to yield cellulose xanthate, solution in dilute caustic, and extrusion of the viscous “Viscose” into a coagulating bath, a 7–10% sulfuric acid solution containing 1–5% zinc sulfate and an active surface agent.

crosshead. A device attached to the head of an extrusion machine that permits the material to be extruded in opposite directions simultaneously at right angles to the barrel. It is applicable chiefly to coating of wire, cable, and small-diameter hose.

crossing over. The breaking during meiosis of one maternal and one paternal chromosome, the exchange of corresponding sections of DNA, and the rejoining of the chromosomes. This process can result in an exchange of alleles between chromosomes.

See recombination.

cross-linking. Attachment of two chains of polymer molecules by bridges, composed of either an element, a group, or a compound, that join certain carbon atoms of the chains by primary chemical bonds, as indicated in the schematic diagram.

Cross-linking occurs in nature in substances made up of polypeptide chains that are joined by the disulfide bonds of the cystine residue, as in keratins, insulin, and other proteins. Polysaccharide molecules can also cross-link to form stable gel structures (dextran). Cross-linking can be effected artificially, either by adding a chemical substance (cross-linking agent) and exposing the mixture to heat, or by subjecting the polymer to high-energy radiation. Examples are (1) vulcanization of rubber with sulfur or organic peroxides; (2) cross-linking of polystyrene with divinylbenzene; (3) cross-linking of polyethylene by means of high-energy radiation or with an organic peroxide; (4) cross-linking of cellulose with dimethylol carbamate (10% solution) in durable-press cotton textiles. Cross-linking has the effect of changing a plastic from thermoplastic to thermosetting. Thus, it also increases strength, heat and electrical resistance, and especially resistance to solvents and other chemicals.

See vulcanization; polyethylene; keratin.

cross section. (1) A measure of the probability that a nuclear reaction will occur. Usually measured in barns, it is the apparent (or effective) area presented by a target nucleus (or particle) to an oncoming particle or other nuclear radiation, such as a photon or γ -radiation. Also called capture cross section.

(2) A section made by a plane cutting through a solid. Tissue cross sections are widely used for microscopic observation.

“Crosultaines” [Croda]. (sulfobetaines). TM for tallow and coconut versions.

Use: Mild surfactants for baby shampoos, excellent for foam boosting, stabilization, and thickening.

crotonaldehyde. (2-butenal; crotonic aldehyde; β -methyl acrolein).

CAS: 4170-30-3. $\text{CH}_3\text{CH}:\text{CHCHO}$. Commercial crotonaldehyde is the *trans* isomer.

Properties: Water-white, mobile liquid; pungent, suffocating odor. Turns to a pale-yellow color in contact with light and air. A lachrymator. D 0.8531 (20/20C), bp 102C, flash p 55F (12.7C), fp -69C , vap press 30 mm Hg (20C). Very soluble in water; miscible with all proportions with alcohol, ether, benzene, toluene, kerosene, gasoline, solvent naphtha.

Derivation: Aldol condensation of two molecules of acetaldehyde.

Grade: Technical, 87% water-wet form.

Hazard: An animal carcinogen. Irritating to eyes and skin. TLV: 2 ppm. Flammable, dangerous fire risk. Explosive limits in air 2.9–15.5% by volume.

Use: Intermediate for *n*-butyl alcohol and 2-ethylhexyl alcohol, solvent, preparation of rubber accelerators, purification of lubricating oils, insecticides, tear gas, fuel-gas warning agent, organic synthesis, leather tanning, alcohol denaturant.

crotonic acid. (2-butenic acid; β -methacrylic acid).

CAS: 3724-65-0. $\text{CH}_3\text{CH}:\text{CHCOOH}$. Exists in *cis* and *trans* isomeric forms, the latter being the stable isomer used commercially. The *cis* form melts at 15C and is sometimes called isocrotonic acid.

Properties: White, crystalline solid. D 0.9730, mp 72C, bp 185C, flash p 190F (87.7C) (COC). Soluble in water, ethanol, toluene, acetone. Combustible.

Derivation: Oxidation of crotonaldehyde.

Grade: 97%.

Hazard: Strong irritant to tissue.

Use: Synthesis of resins, polymers, plasticizers, drugs.

crotonic aldehyde. See crotonaldehyde.

croton oil. (tiglium oil).

CAS: 8001-28-3.

Properties: Brownish-yellow liquid. D 0.935–0.950 (25C), refr index 1.470–1.473 (40C). Soluble in ether, chloroform, and fixed or volatile oils; slightly soluble in alcohol.

Chief constituents: Glycerides of stearic, palmitic, myristic, lauric, and oleic acids and croton resin, a vesicant.

Derivation: By expression from the seeds of *Croton tiglium*.

Hazard: Strong skin irritant, ingestion of small amounts may be fatal.

Use: Medicine (counterirritant, cathartic).

crotonylene. (2-butyne; dimethylacetylene).

$\text{CH}_3\text{C}:\text{CCH}_3$.

Properties: Liquid. Bp 27C.

Hazard: Flammable, dangerous fire risk. Moderate explosion hazard.

crotoxin. Exact formula undetermined. A toxic principle of rattlesnake venom having a polypeptide structure, one component being basic and the other acidic. Classed as a neurotoxin. Injection may be fatal.

crotoxyphos. (dimethyl-2-(α -methylbenzyloxy-carbonyl)-1-methylvinyl phosphate; *O,O*-dimethyl-*O*-(1-methyl-2-(1-phenylcarbethoxy)vinyl)phosphate; α,α -methyl-benzyl-3-(dimethoxy-phosphinyloxy)-isocrotonate).

CAS: 7700-17-6. $\text{C}_{14}\text{H}_{19}\text{O}_6\text{P}$.

Properties: Yellowish liquid. D 1.19, bp 135C at 4.0 (0.03 mm Hg), refr index 1.50. Soluble in acetone, alcohol, chlorinated hydrocarbons; slightly soluble in saturated hydrocarbons.

Hazard: A cholinesterase inhibitor.

Use: Insecticide used externally on farm animals.

crotyl alcohol. (2-buten-1-ol; 3-methylallyl alcohol).

CAS: 6117-91-5. $\text{CH}_3\text{CH}:\text{CHCH}_2\text{OH}$.

Properties: Clear, stable liquid. D 0.8550 (20/20C), boiling range 121–126C, flash p 113F (45C) (TOC). Partially soluble in water (17%); wholly soluble in alcohol and ether. Combustible.

Hazard: Toxic by ingestion, strong eye and skin irritant. Moderate fire risk.

Use: Chemical intermediate, source of monomers, herbicide and soil fumigant.

crowd ether. A cyclic molecule in which ether groups (polyethers) connected by dimethylene linkages are coordinated to a centrally located metal atom via the oxygen atoms of the ethers, which function as ligands (electron donors). Such compounds have strong complexing or chelating capabilities. In some types, silicon replaces the dimethylene linkages. They were so named because their molecular models resemble a crown.

See porphyrin; chelate.

crowd filler. A mineral filler, usually calcium sulfate or carbonate or a mixture thereof, used in paper manufacture.

crowd glass. See glass, optical.

crowd group. All the taxa descended from a major cladogenesis event, recognized by possessing the clade's synapomorphy. See stem group.

crucible. (1) A cone-shaped container having a curved base and made of a refractory material, used for laboratory calcination and combustibles. Some types are equipped with a cover. A gooch crucible has openings in its base to permit filtration with suction; named after its inventor, an American chemist. (2) In the steel industry, a special type of furnace provided with a cavity for collecting the molten metal.

crufomate. (*O*-methyl-*O*-(4-*tert*-butyl-2-chlorophenyl)methylphosphoramidate; 4-*t*-butyl-2-chlorophenylmethyl methyl phosphoramidate; ruelene).

CAS: 299-86-5.

Properties: Crystals. Mw 291.71, mp 61C. Insoluble in water; soluble in alcohol, benzene, and carbon tetrachloride. Commercial product is a yellow oil, bp 117C.

Hazard: TLV: 5 mg/m³.

Use: Systemic insecticide and anthelmintic.

crusher, gyratory. See gyratory crusher.

crust. The outermost layer of the lithosphere, consisting of felsic and mafic rocks less dense than the rocks of the mantle below.

Crutzen, Paul. (1933–). From the Netherlands who won the Nobel Prize for chemistry along with Mario Molina and Frank Sherwood Rowland in 1995 for their work in atmospheric chemistry, particularly concerning the formation and decomposition of ozone.

See Molina, Mario; Rowland, Frank Sherwood.

cryochemistry. That branch of chemistry devoted to the study of reactions occurring at extremely low temperature (–200C and lower). It permits synthesis of compounds that are too unstable or too reactive to exist at normal temperature.

cryogenics. Study of the behavior of matter at temperatures below –200C. The use of the liquefied gases oxygen, nitrogen, and hydrogen at approximately –260C is standard industrial practice. Examples: Use of liquid nitrogen for quick-freezing of foods and of liquid oxygen in steel production. Some electronic devices and specialized instruments, such as the cryogenic gyro, operate at liquid-helium temperature (approximately 4 K). Many lasers and computer circuits require low temperature. Original research in this field was carried out by W. F. Giauque in the U.S. and by Kamerlingh-Onnes in Holland.

See superconductivity.

cryolite. (Greenland spar; icestone). Na₃AlF₆. A natural fluoride of sodium and aluminum or made synthetically from fluorspar, sulfuric acid, hydrated alumina, and sodium carbonate.

Properties: Colorless to white, sometimes red,

brown, or black; vitreous to greasy luster. Hardness 2.5, d 2.95–3.0. Refr index 1.338, mp 1000C. Soluble in concentrated sulfuric acid and in fused aluminum and ferric salts.

Occurrence: Colorado; the former U.S.S.R., Greenland (only commercial source).

Derivation: Synthetic product is made by fusing NaF and aluminum fluoride.

Use: Electrolyte in the reduction of alumina to aluminum; ceramics; insecticide; binder for abrasives; electric insulation; explosives; polishes.

“Cryovac” [Grace]. TM for a light, shrink-film, transparent packaging material based on polyvinylidene chloride. Used especially for meats and other perishables.

cryptands. See cavitands.

cryptocyanine. (1,1'-diethyl-4,4'-carbocyanine iodide). C₂₅H₂₅N₃I.

Properties: Solid. Mp 250–255.

Use: Organic dye, soluble, used as a chemical shutter in laser operation.

See cyanine dye.

cryptostegia rubber. Rubber from leaves of *Cryptostegia grandiflora* and *C. madagascariensis*.

cryptoxanthin. (provitamin A; hydroxy-β-carotene). C₄₀H₅₆O. A carotenoid pigment with vitamin A activity.

Properties: Garnet-red prisms with metallic luster. Mp 170C. Soluble in chloroform, benzene, and pyridine; slightly soluble in alcohol and methanol.

Occurrence: In many plants, egg yolk, butter, blood serum. Can be made synthetically.

Use: Nutrition, medicine.

crystal. The normal form of the solid state of matter. Crystals have characteristic shapes and cleavage planes due to the arrangement of their atoms, ions, or molecules, which form a definite pattern called a lattice. Crystals may be face-centered, body-centered, cubic, orthorhombic, monoclinic, prismatic, etc. They have flat surfaces, sharp edges, and a definite angle between a given pair of surfaces. The form of a crystal is called its “habit.” Among the most important features of a crystal are its optical properties, chief of which is the index of refraction, i.e., the extent to which a beam of light is slowed on passing through the crystal. With respect to light transmission, a crystal may be isotropic or anisotropic. Anisotropic crystals can polarize light. See optical isomer; optical rotation.

Crystals also have electrical and magnetic properties now being used in computers and other electronic devices. Crystals are almost always imperfect and contain impurities (atoms of other elements). These are utilized in semiconductors. For methods of growing crystals, see nucleation.

- Single crystals are used in masers, lasers, semiconductors, miniaturized components, and computer memory systems, and as "whiskers." Many metals are now available in large, single-crystal, form and such natural crystals as ruby, garnet, sapphire, etc., are used in these applications. See crystallization; nucleation; liquid crystal; hole; vacancy.
- crystal face.** The recurring characteristic surface of a crystal or a plane parallel to it.
- crystal face, indices** Reciprocals of intercepts of a crystal plane on reference axes based on a chosen system of coordinates.
- crystal-growth step.** A ledge on the surface of a crystal, one or more lattice spacings high, where crystal growth occurs.
- crystalline rocks.** Igneous or metamorphic rock.
- crystal, liquid.** See liquid crystal.
- crystallite.** That portion of a crystal whose constituent atoms, ions, or molecules form a perfect lattice, without strains or other imperfections. Single crystals may be quite large, but crystallites are usually microscopic.
See crystal.
- crystallization.** The phenomenon of crystal formation by nucleation and accretion. The freezing of water into ice is one of the commonest examples of crystallization in nature. Industrially, it is used as a means of purifying materials by evaporation and solidification. The sugar of commerce is made in this way. Similarly, salt cake is derived from crystallization of natural brines (e.g., Searles Lake). Nucleated crystallization is also used to form polycrystalline ceramic structures.
See crystal.
- crystallogram.** A photograph of an X-ray diffraction pattern of a crystal.
- crystallographic systems.** (crystal systems). A categorization of crystals according to their degree of symmetry. They are cubic, hexagonal, orthorhombic, tetragonal, monoclinic, and triclinic. The cubic form has the highest symmetry.
- crystallography.** The study of the crystal formation of solids, including X-ray determination of lattice structures, crystal habit, and the shape, form, and defects of crystals. When applied to metals, this science is called metallography.
- crystals of Venus.** See copper acetate.
- crystal systems.** See crystallographic systems.
- crystal violet.** See methyl violet.
- "Crystamet" [Crosfield].** TM for sodium metasilicate pentahydrate.
Grade: Granular.
Use: Detergent, industrial cleaner, paper, and tiles.
- C_{2s}.** Abbreviation for dicalcium silicate as used in cement.
See cement, Portland.
- C_{3s}.** Abbreviation for tricalcium silicate as used in cement.
See cement, Portland.
- cS.** Abbreviation for centistoke.
- Cs.** Symbol for cesium.
- CS gas.** See *o*-chlorobenzylidene malononitrile.
- CSMA.** Abbreviation for the Chemical Specialties Manufacturers Association.
- C-stage resin.** (resite). The fully cross-linked phenol-formaldehyde resin, which is infusible and insoluble in all solvents.
See A-stage resin; phenol-formaldehyde resin.
- CTFE.** See chlorotrifluoroethylene.
- CTP.** Abbreviation for cytidine triphosphate.
- Cu.** Symbol for copper.
- cuam.** Abbreviation for cuprammonium, the copper ammonium radical.
- cubeb oil.**
CAS: 8007-87-2.
Properties: From steam distillation of mature, unripe fruit of *piper cubeba* L. (Fam. *Piperaceae*). Colorless to light green liquid; spicy odor, slt acrid taste. D: 0.898–0.928, refr index: 1.492–1.502 @ 20°. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol.
Hazard: A skin irritant.
Use: Food additive.
- cube root.** A powdered insecticidal preparation containing 5% rotenone.
- "Cubex" [Westinghouse].** TM for an oriented silicon-iron alloy in rolled sheet form for use as cores for transformers and other inductive devices. The alloy sheet comprises cubic grains with faces parallel to the sheet surface. In one form, the sheet is doubly oriented with two directions of easy magnetization parallel to the surface to the sheet. One direction of easy magnetization is parallel to the

rolling direction, and the second is perpendicular to the rolling direction.

cubic-centered. See body-centered structure.

cubic centimeter. (cc; mL). Unit of volume for liquids and finely divided solids.

See milliliter.

“Cubidow” [Dow]. TM for compacted salt comprising either or both calcium and sodium chloride.

cucumber alcohol. See *trans,cis*-2,6-nona-dienol.

cucurbitacin a.

CAS: 6040-19-3. mf: $C_{32}H_{46}O_9$.

Hazard: A poison.

Source: Natural product.

cue-lure. Generic name for 4-(*p*-hydroxphenyl)-2-butanone acetate.

$CH_3COCH_2CH_2C_6H_4OOCH_3$.

Properties: Liquid. Boiling range 117–124C. Insoluble in water; soluble in most organic solvents.

Use: Insect attractant.

cuen. Abbreviation for cupriethylenediamine.

cullet. In ancient glass manufacturing, chunks of glass of varying sizes and colors furnished to artisans for shaping and finishing. In modern practice, the term refers to fragments of scrap glass from production operations that are collected and recycled to the furnace for remelting.

culm. Anthracite tailings, especially prevalent in eastern Pennsylvania. They represent a considerable source of energy that could be used, for example, in fluidized-bed boilers.

cumaldehyde. See cuminic aldehyde.

“Cumar” [Neville]. TM for a series of neutral, stable, synthetic resins of the coumarone-indene type, manufactured from selected distillates of tar.

Use: Softener and tackifier in varnishes, floor tile, rubber products, printing ink, adhesives, and waterproofing materials, and in the leather, electrical, radio, paper, and other industries.

See coumarone-indene resin.

cumene. (isopropylbenzene).

CAS: 98-82-8. $C_6H_5CH(CH_3)_2$.

Properties: Colorless liquid. D 0.8620, bp 152.7C, wt/gal 7.19 lb (25C), fp -96C, refr index 1.489 (25C), flash p 115F (46C), autoign temp 795F (424C). Soluble in alcohol, carbon tetrachloride, ether, and benzene; insoluble in water. Combustible.

Derivation: (1) Alkylation of benzene with propylene (phosphoric acid catalyst), (2) distillation from coal tar naphtha fractions or from petroleum.

Grade: Technical, research, pure.

Hazard: Toxic by ingestion, inhalation, and skin absorption; a narcotic. TLV: 50 ppm. Moderate fire risk.

Use: Production of phenol, acetone, and α -methylstyrene; solvent.

cumene hydroperoxide. (α,α -dimethylbenzyl hydroperoxide).

CAS: 80-15-9. $C_6H_5C(CH_3)_2OOH$.

Properties: Colorless to pale-yellow liquid. Slightly soluble in water; readily soluble in alcohol, acetone, esters, hydrocarbons, chlorinated hydrocarbons. Flash p 175F (79.4C). Combustible.

Derivation: A solution or emulsion of cumene is oxidized with air at approximately 130C.

Hazard: Toxic by inhalation and skin absorption. Strong oxidizing agent; may ignite organic materials.

Use: Production of acetone and phenol; polymerization catalyst, particularly in redox systems, used for rapid polymerization.

cumerone. C_8H_{60} .

Properties: Colorless oily liquid. D 1.09.6, bp 165–175C. Insoluble in water.

cumic alcohol. See cuminic alcohol.

cumic aldehyde. See cuminic aldehyde.

cumidine. (*o*-isopropylaniline).

CAS: 643-28-7. $(CH_3)_2CHC_6H_4NH_2$.

Properties: Colorless liquid. D 0.957 (20/4C), fp -63C, bp 225C. Insoluble in water.

Use: Reagent in determination of tungsten.

See pseudocumidine.

cuminic alcohol. (*p*-isopropylbenzyl alcohol; cuminyl alcohol; cumic alcohol).

CAS: 536-60-7. $CH_2OH(C_6H_4)CH(CH_3)_2$. Found in caraway seed.

Properties: Colorless liquid; caraway-like odor; aromatic taste. D 0.981 (15C), bp 248C, refr index 1.522 (24C). Insoluble in water; miscible with alcohol and ether. Combustible.

Use: Flavoring.

cuminic aldehyde. (cumic aldehyde; cumaldehyde; *p*-isopropylbenzaldehyde).

CAS: 122-03-2. $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{CHO}$.

Properties: Colorless to yellow liquid; cumin odor. D 0.986 (22C), bp 235C. Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Perfumery, flavoring, synthesis.

cumin oil. A dextrorotatory essential oil used in perfumery and flavoring.

cuminum cyinum linn., extract.

CAS: 84775-51-9.

Hazard: Moderately toxic. A reproductive hazard.

Source: Natural product.

cumulene. A chain of up to 6 double-bonded carbon atoms derived from acetylene.

cumylphenol. $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{OH}$.

Properties: White to tan crystals; characteristic phenol odor. Fp 72.0C, d 1.115 g/mL (25C), distillation range 188.9–190.9C (10 mm Hg), flash p 320F (160C). Combustible.

Use: Intermediate for resins, insecticides, lubricants.

cupellation process. A process for freeing silver, gold, or other nonoxidizing metals from base metals that can be oxidized. The metallic mixture is placed in a cupel, which is a shallow, porous cup, and roasted in a blast of air. The base-metal oxides are absorbed in the cupel, leaving the pure metal to be decanted.

cupferron. (ammonium nitroso- β -phenylhydroxylamine).

CAS: 135-20-6. $\text{C}_6\text{H}_5\text{N}(\text{NO})\text{ONH}_4$.

Properties: Creamy-white crystals. Mp 163–164C. Soluble in water and alcohol.

Derivation: By treating an ether solution of β -phenylhydroxylamine with dry ammonia gas and amyl nitrite.

Use: Analytical reagent, especially for separation and precipitation of metals, e.g., copper, iron, vanadium.

cupola. A vertical furnace, similar to a blast furnace, used for melting iron or other metals for casting.

cuprammonium process. A minor process for making rayon by dissolving cellulose in an ammoniacal copper solution and reconvertng it to cellulose by treatment with acid.

cupreine. (hydroxycinchonine).

$\text{C}_{19}\text{H}_{22}\text{O}_2\text{N}_2 \cdot 2\text{H}_2\text{O}$. One of the cinchona alkaloids.

Properties: Colorless crystals. Mp (anhydrous) 198C. Soluble in alcohol; slightly soluble in water, chloroform, ether, benzene.

Derivation: From cuprea bark *Remijia pedunculata*.

Use: Medicine (antimalarial).

cupric. Form of the word *copper* used in naming copper compounds in which the copper has a valence of 2. Look for the corresponding compound under copper.

cupric chromate basic. See copper chromate.

cupric diethyldithiocarbamate. See copper(ii) diethyldithiocarbamate.

cupriethylene diamine. Purple liquid, ammoniacal odor. Dissolves cellulose products.

Hazard: Strong irritant to tissue.

cuprinol. A copper naphthenate or sodium pentachlorophenate preparation used as a wood and fabric preservative.

cuprite. (copper ore ruby; red oxide of copper). Cu_2O . Crimson, scarlet, vermilion, deep- or brownish-red; secondary mineral; adamantine or dull luster; brownish-red streak. Soluble in nitric and concentrated hydrochloric acids, d 5.85–6.15, Mohs hardness 3.5–4.

Occurrence: U.S., England, Germany, France, Siberia, Australia, China, Peru, Bolivia.

Use: Source of copper.

cupronickel. An alloy of copper and nickel used in coinage, and in condenser and heat-exchanger tubes. Most types contain from 10–30% nickel. Strongly corrosion resistant, especially to seawater.

“Cuprophenyl” [Novartis]. TM for after-coppering direct dyes for cellulosic fibers.

cuprotungsten. An alloy of copper and tungsten.

cuprous. Form of the word *copper* used in naming copper compounds in which the copper has a valence of 1.

cuprous acetate ammoniacal. See copper ammonium acetate.

cuprous acetylde. Cu_2C_2 .

Properties: Amorphous, red powder. A salt of acetylene.

Derivation: Reaction of acetylene with aqueous soluble of cuprous salts.

Hazard: Severe explosion risk when shocked or heated.

Use: Detonators and other explosive devices.

cuprous bromide. CuBr or Cu_2Br_2 .

Properties: White, crystalline solid becoming green in light. Mp 500C; d 4.71. Soluble in hydrochloric acid and ammonium hydroxide; decomposes in hot water; insoluble in acetone and sulfuric acid. Protect from light when stored.

Use: Catalyst in organic reactions.

cuprous chloride. CuCl or Cu_2Cl_2 .

Properties: White, cubic crystals. D 4.14. Mp 430C; bp 1490C. Becomes greenish on exposure to air, and brown on exposure to light. Slightly soluble in water; soluble in acids, ammonia, ether; insoluble in alcohol and acetone.

Derivation: Copper and cupric chloride solution or copper and hydrochloric acid in air.

Grade: Technical, reagent, single crystals.

Use: Catalyst, preservative and fungicide, desulfurizing and decolorizing agent in petroleum industry, absorbent for carbon monoxide.

cuprous cyanide. $\text{Cu}_2(\text{CN})_2$ or CuCN .

Properties: Cream-colored powder. D 1.9, mp 475C. Insoluble in water; soluble in sodium and potassium cyanides, hydrochloric acid, and ammonium hydroxide.

Hazard: TLV: 5 mg(CN)/m³.

Use: Electroplating, antifouling paints, insecticide, catalyst.

cuprous iodide. (copper iodide).

CAS: 7681-65-4. CuI .

Properties: White to brownish-yellow powder. D 5.653 (15C), bp 1290C, mp 606C. Soluble in ammonia and potassium iodide solutions; insoluble in water.

Derivation: Interaction of solutions of potassium iodide and copper sulfate.

Hazard: TLV: TWA (fume) 0.2 mg/m³; (dust, mist) 1 mg(Cu)/m³; (Proposed: TWA (fume and respirable particles) 0.05 mg/m³; (dust, mist) 1 mg(Cu)/m³). Toxic.

Use: Feed additive, in table salt as source of dietary iodine (up to 0.01%), catalyst, cloud seeding.

cuprous mercuric iodide. Cu_2HgI_4 .

Properties: Dark-red crystals that become dark brown to black when heated to about 65C. Soluble in water and alcohol.

Hazard: Toxic by ingestion.

Use: Temperature indicator for bearings and other moving machinery parts.

cuprous oxide. See copper oxide red.

cuprous potassium cyanide. $\text{KCu}(\text{CN})_2$.

Properties: Crystalline solid. D 2.38. Insoluble in water; soluble in dimethylsulfoxide. Decomposed by heating in water.

Derivation: By evaporating a water solution of cuprous cyanide and potassium cyanide.

Hazard: A poison by ingestion.

Use: Copper-electroplating vats.

cuprous selenide. Cu_2Se .

Properties: Dark-blue to black crystalline solid. Mp 1100C, d 6.84. Soluble in sulfuric acid (sulfur dioxide evolved); also in potassium cyanide solution.

Use: Semiconductor research.

cuprous sulfide. Cu_2S .

Properties: Black powder or lumps. D 5.52–5.82, mp approximately 1100C. Soluble in nitric acid and ammonium hydroxide; insoluble in water. Occurs as the mineral chalcocite.

Derivation: By heating cupric sulfide in a stream of hydrogen.

Grade: Technical, single crystals.

Use: Antifouling paints, solar cells, electrodes, solid lubricants, luminous paints, catalyst.

cuprous sulfite. $\text{Cu}_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. D 3.83. Soluble in ammonium hydroxide, hydrochloric acid (decomposes); insoluble in water.

Use: Catalyst, fungicide, textile dyeing.

cuprous thiocyanate. (copper sulfocyanide). CuSCN .

Properties: Yellow-white powder. D 2.843, mp 1084C. Insoluble in water; soluble in ammonia.

Use: Manufacture of organic chemicals, antifouling paints, printing textiles, primers of explosives.

“Curalon” [Uniroyal]. TM for a series of urethane curatives. “Curalon L,” a mixture of hindered aromatic primary diamines. “Curalon M,” *p,p'*-methylene-bis(*o*-chloroaniline).

curare.

CAS: 8063-06-7. A highly toxic mixture of approximately 40 alkaloids occurring in several species of South American trees. It acts on the central nervous system, and derivatives are used to some extent in medicine as a muscle relaxant.

See snake venom.

curative. (1) Any substance or agent that effects a fundamental and desirable change in a material to make it suitable for practical use, e.g., meats, rubber, tobacco. (2) Any substance that combats disease by killing bacteria or that restores health by chemical means.

See curing.

curcumenone.

CAS: 100347-96-4. mf: $\text{C}_{15}\text{H}_{22}\text{O}_2$.

Hazard: A poison.

curcumin. (tumeric yellow; 1,7-bis(4-hydroxy-methoxyphenyl)-1,6-heptadiene-3,5-dione; CI 75300). $[\text{CH}_3\text{OC}_6\text{H}_3(\text{OH})\text{CH}:\text{CHCO}]_2\text{CH}_2$.

Properties: Orange-yellow needles. Mp 183C. Soluble in water and ether; soluble in alcohol.

Derivation: The coloring principle from curcuma.

Use: Analytical reagent, food dye, biological stain. As an acid-base indicator it is brownish-red with alkalis, yellow with acids (pH range 7.4–8.6); also an indicator for boron.

cure. (1) The length of time required for a plastic compound to stay in the mold for complete reaction so it becomes infusible and chemically inert. (2) To change the physical properties of a material by chemical reaction or vulcanization. This is usually accomplished by the action of heat and catalysts.

curie. (Ci). The official unit of radioactivity, defined as exactly 3.70×10^{10} disintegrations per sec. This decay rate is nearly equivalent to that exhibited by 1 of radium in equilibrium with its disintegration products. A millicurie (mCi) is 0.001 curie. A microcurie (μ Ci) is one-millionth curie.

Curie law. The magnetic susceptibility of a paramagnetic substance varies inversely as the absolute temperature.

Curie, Marie S. (1867–1934). Born in Warsaw, Poland, she and her husband Pierre made an intensive study of the radioactive properties of uranium. They isolated polonium in 1898 from pitchblende ore. By devising a tedious and painstaking separation method, they obtained a salt of radium in 1912, receiving the Nobel Prize in physics for this achievement in 1903 jointly with Becquerel. In 1911, Mme. Curie alone received the Nobel Prize in chemistry. Her work laid the foundation of the study of radioactive elements which culminated in control of nuclear fission.

See Rutherford, Sir Ernest.

curie point. Transition temperature above which ferromagnetism ceases to exist.

Curie-Weiss law. The magnetic susceptibility of a paramagnetic substance is inversely proportional to the increase of its temperature above a certain fixed temperature characteristic of the substance.

curing. Conversion of a raw product to a finished and useful condition, usually by application of heat and/or chemicals that induce physicochemical changes. Many food products require aging under specified temperature conditions. The more common types of curing are as follows:

(1) Meats: Use of sodium chloride, sugars, sodium nitrite, sodium nitrate, ascorbic acid. These not only act as preservatives, but also aid in color retention. Some types are subsequently smoked. Conversion of collagen to gelatin occurs as a result of "hanging" meat for several days.

(2) Leather: Treatment of hides and skins with tanning agents of vegetable or mineral origin. This converts the protein structure into a firm and durable product as a result of complexing reactions. See tanning.

(3) Tobacco: Exposure for 3–5 days to temperatures from 37 to 65C to reduce moisture content, convert starches to reducing sugars, and discharge the chlorophyll, followed by aging from 1 to 5 years to remove odors and improve smoking quality.

(4) Cheese: Aging for 9–12 months at 4.5–10C to develop sharp flavor; the process is also called ripening.

(5) Rubber: Addition of sulfur and accelerator, followed by exposure to heat, which effects cross-linking. This converts the material from a thermoplastic to a thermosetting product. High-energy radiation can also be used. See vulcanization.

curium. Cm. Synthetic radioactive element of atomic number 96, aw 244, valences 3, 4. Isotopes available: 244 and 242 (gram quantities).

Properties: Silvery-white metal. D 13.5, mp 1340C. Chemically reactive. More electropositive than aluminum. An α emitter. Biologically it is a bone-seeking element. Forms compounds such as CmO_2 , Cm_2O_3 , CmF_3 , CmF_4 , $\text{Cm}(\text{OH})_3$, CmCl_3 , CmBr_3 , $\text{CmI}_3 \cdot \text{Cm}_2(\text{C}_2\text{O}_4)_3$.

Use: Thermoelectric power generation for instrument operation in remote locations on earth or in space vehicles.

See actinide series.

Curl, Robert F., Jr. (1933–). An American who won the Nobel Prize for chemistry along with Sir Harold W. Kroto and Richard E. Smalley in 1996, the 100th anniversary of Alfred Nobel's death. The trio won for the discovery of the C_{60} compound called buckminsterfullerene. He graduated from Rice University and received a Ph.D. from the University of California, Berkeley in 1957. See buckminsterfullerene; Kroto, Sir Harold W.; Smalley, Richard E.

current density. In an electroplating bath or solution, the electric current per unit area of the object or surface being plated. Expressed in amperes per square centimeter or, more usually, amperes per square decimeter.

Current Good Manufacturing Practices.

See CGMP.

Curtius rearrangement. Formation of isocyanates by thermal decomposition of acyl azides.

cutback. A coating substance or varnish that has been diluted or thinned.

"Cutless" [Regal]. TM for a turf growth regulator.

Use: To reduce the leaf blade elongation for a more compact plant form.

cutting fluid. A liquid applied to a cutting tool to assist in the machining operation by washing away the chips or serving as a lubricant or coolant. Commonly used cutting fluids are water, water solutions or emulsions of detergents and oils, mineral oils, fatty oils, chlorinated mineral oils, sulfurized mineral oils, and mixtures of the foregoing oils. Transparent grades are available.

“**Cyana**” [*Cytec*]. TM used in connection with the textile finishes obtained by applying “Aerotex” resins and similar products.

“**Cyanamer**” [*Cytec*]. TM for water-soluble polymers.

Use: Antiscalants, antiprecipitants, viscosity modifiers, corrosion inhibitors, and dispersants in a wide range of water treatment applications.

cyanamide. (1) (cyanogenamide; carbodiimide).

CAS: 420-04-2. HN:C:NH or N:CNH₂.

Properties: Deliquescent crystals. Mp 43C, d 1.08. Very soluble in water, alcohol, ether, phenols, ketones.

Hazard: Strong irritant to skin and mucous membranes; avoid inhalation or ingestion. TLV: 2 mg/m³.

(2) See calcium cyanamide.

cyanamide process. See nitrogen fixation; ammonia, anhydrous.

cyanatotributylstannane.

CAS: 4027-17-2. mf: C₁₃H₂₇NOSn.

Hazard: A poison. Tributyl tin compounds are very toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

cyanatryn.

CAS: 21689-84-9. mf: C₁₀H₁₆N₆S.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

cyanic acid. See isocyanic acid.

cyanide pulp. The mixture obtained by grinding crude gold and silver ore and dissolving the precious metal content in sodium cyanide solution.

cyanine dye. One of a series of dyes consisting of two heterocyclic groups (usually quinoline nuclei) connected by a chain of conjugated double bonds containing an odd number of carbon atoms. Example: cyanine blue C₂H₅NC₉H₇:CHC₉H₆NC₂H₅. They include the isocyanines, merocyanines, cryptocyanines, and dicyanines.

Use: Sensitizers for photographic emulsions.

cianoacetamide. (malonamide nitrile; propionamide nitrile). CNCH₂CONH₂.

Properties: White crystals. Mp 119C, bp (decomposes). Soluble in water and alcohol. Combustible.

Derivation: Ammonolysis of cyanoacetic ester or dehydration of ammonium cyanoacetate.

Hazard: Toxic by ingestion.

Use: Organic pharmaceutical synthesis, plastics.

cianoacetic acid. (malonic nitrile).

CNCH₂COOH.

Properties: White crystals, hygroscopic. Mp

66.1–66.4C; decomposes at 160C. Soluble in water, alcohol, and ether.

Derivation: Interaction of sodium chloroacetate and potassium cyanide solution.

Hazard: Toxic by ingestion.

Use: Organic synthesis.

cianoacrylate adhesive. An adhesive based on the alkyl 2-cianoacrylates (see for example methyl 2-cianoacrylate). The latter are prepared by pyrolyzing the poly(alkyl)-2-cianoacrylates produced when formaldehyde is condensed with the corresponding alkyl cyanoacetates. These adhesives have excellent polymerizing and bonding properties. To prevent premature polymerization, inhibitors are added. Supplied commercially as “Eastman 910.”

“**Cyanobrik**” [*Du Pont*].

CAS: 143-33-9. TM for sodium cyanide granular briquettes.

Use: For metal extraction, cleaning, intermediate for pharmaceuticals, dyes, inks, pigments, insecticides.

cyanocarbon. Any of a class of compounds in which the cyanide radical (–CN) replaces hydrogen in organic compounds, as in tetracyanoethylene, (CN)₂C:C(CN)₂. The compounds are quite reactive and form colored complexes with aromatic hydrocarbons.

See nitrile.

“**Cyanocel**” [*Cytec*]. TM for chemically modified (cyanoethylated) cellulose.

cyanocobalamin. (vitamin B₁₂).

CAS: 68-19-9. C₆₃H₈₈CoN₁₄O₁₄P.

The anti-pernicious-anemia vitamin. All vitamin B₁₂ compounds contain the cobalt atom in its trivalent state. There are at least three active forms: cyanocobalamin, hydroxocobalmin, nitrocobalamin. Vitamin B₁₂ is a component of a coenzyme that takes part in the shift of carboxyl groups within molecules. As such it has an influence on nucleic acid synthesis, fat metabolism, conversion of carbohydrate to fat, and

metabolism of glycine, serine, methionine, and choline.

Properties: Dark-red crystals or red powder; odorless; tasteless. Very hygroscopic. Slightly soluble in water; soluble in alcohol; insoluble in acetone and ether.

Source: (Food) Liver, eggs, milk, meats and fish. Commercial source: produced by microbial action on various nutrients (spent antibiotic liquors, sugar-beet molasses, whey), also from sewage sludge.

Grade: USP, radioactive.

Use: Medicine (blood and nerve treatment), nutrition, animal-feed supplements.

n'-cyano-*n,n*-dimethylguanidine.

CAS: 1609-06-9. mf: $C_4H_8N_4$.

Hazard: Moderately toxic by ingestion and skin contact. A mild eye irritant.

2-cyanoethyl acrylate.

$CH_2=CHCOOCH_2CH_2CN$.

Properties: Liquid. D 2.0690, bp (polymerizes when heated), fp $-16.9C$, wt/gal 8.9 lbs, flash p 255F (124C) (COC). Soluble in water. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Forms polymers and copolymers for viscosity-index improvers, adhesives, textile finishes and sizes.

cyanoethylation. Process for introducing the group $-OCH_2CH_2CH$ into an organic molecule by reaction of acrylonitrile with a reactive hydrogen such as that on a hydroxyl or amino group.

cyanoethyl sucrose. (CES).

$C_{12}H_{14}O_3(OH)_{0.7}(OC_2H_4CN)_{7.3}$.

Properties: Clear, very viscous, pale-yellow liquid. D 1.20 (20/20C), fp (sets to a glass at $-10C$), bp $>300C$, flash p $>375F$ (190C), refr index 1.615 (25C). Combustible. Viscosity decreases very rapidly when heated; has high volume resistivity, low power factor, unusually high dielectric constant.

Use: Capacitor impregnation, phosphor binding in electroluminescent panels, modification of electrical properties in coatings.

cyano(4-fluoro-3-phenoxyphenyl)methyl-3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylate.

Use: Food additive; insecticide.

cyanoformic chloride. $CNCOCl$.

Properties: Oily liquid. Bp $126-18C$ (750 mm Hg).
Derivation: Reaction between phthalocyl chloride and the amide of ethyl oxalate.

"Cyanogas" [Cytec]. TM for a pesticide containing not less than 42% calcium cyanide; evolves hydrogen cyanide gas on exposure to atmospheric moisture.

Hazard: Poisonous.

cyanogen. (dicyan; oxalonitrile).

CAS: 460-19-5. $N\equiv C-C\equiv N$

Properties: Colorless gas; pungent penetrating odor. Specific gravity 1.8064 (air = 1), fp $-28C$, bp $-20.7C$. Burns with a purple-tinged flame. Soluble in water, alcohol, and ether.

Derivation: (1) Potassium cyanide solution is slowly dropped into copper sulfate solution; (2) mercury cyanide is heated.

Grade: Technical, pure.

Hazard: Flammable limits in air 6–32%. Store away from light and heat. A very toxic material. TLV: 10 ppm.

Use: Organic synthesis, welding and cutting metals, fumigant, rocket propellant.

cyanogenamide. See cyanamide (1).

cyanogen azide. (carbonpernitride).

$N=N^+=N-C\equiv N$.

Properties: Colorless, oily liquid. Unstable at room temperature.

Hazard: Explodes when shocked or heated; store and handle in solvents, e.g., acetonitrile.

Use: Organic synthesis; has wide range of reactivity.

cyanogen bromide. (bromine cyanide).

CAS: 506-68-3. $BrC\equiv N$.

Properties: Crystals; penetrating odor. D 2.02, bp $61.2C$, mp $52C$, vap d 3.6. Slowly decomposed by cold water. Corrodes most metals. Soluble in water, alcohol, benzene, ether.

Derivation: (1) Action of bromine on potassium cyanide. (2) Interaction of sodium bromide, sodium cyanide, sodium chlorate, and sulfuric acid.

Hazard: A poison. Strong irritant to skin and eyes.

Use: Organic synthesis, parasiticide, fumigating compositions, rat exterminants, cyaniding reagent in gold extraction processes.

cyanogen chloride.

CAS: 506-77-4. $CNCl$.

Properties: Colorless gas or liquid. D 1.2, bp $12.5C$, fp $-6C$, vap d 2.1. Min purity 97 mole %. Soluble in water, alcohol, and ether.

Derivation: Action of chlorine on moist sodium cyanide suspended in carbon tetrachloride and kept cooled to $-3C$, followed by distillation.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin. TLV: ceiling 0.3 ppm.

Use: Organic synthesis, tear gas, warning agent in fumigant gases.

cyanogen fluoride. (fluorine cyanide). CNF .

Properties: Colorless gas. Forms a white, pulverulent mass if cooled strongly, and sublimes at $-72C$. Insoluble in water.

Derivation: Interaction of silver fluoride and cyanogen iodide.

Hazard: Inhalation or ingestion poison, strong irritant to eyes and skin. TLV: 2.5 mg(F)/m³.

Use: Organic synthesis, tear gas.

cyanogen iodide. (iodine cyanide). CNI.

Properties: Colorless needles; very pungent odor; acrid taste. Mp 146.5C, d 1.84. Soluble in water, alcohol, and ether.

Derivation: By heating a metal cyanide with iodine.

Hazard: Strong irritant to eyes and skin. A poison.

Use: Taxidermists' preservatives.

“Cyanogran” [Du Pont]. TM for a 98% sodium cyanide in granular form. White, crystalline solid crushed to pass 100% through 10 mesh, retained on 50 mesh.

Hazard: A deadly poison by inhalation and ingestion, strong irritant to eyes and skin.

cyanoguanidine. See dicyandiamide.

cyanomethyl acetate. (methyl cyanoethanoate). $\text{CNCH}_2\text{COOCH}_3$.

Properties: Colorless liquid. Fp -22C , bp 200C , d 1.12.

Hazard: Highly toxic.

Use: Organic synthesis, pesticide.

ciano(methylmercuri)guanidine. (methylmercury dicyandiamide).

$\text{CH}_3\text{Hg}(\text{NHC}(:\text{NH})\text{NHCN})$.

Properties: Crystals. Mp 156C . Soluble in water.

Hazard: A poison by inhalation or ingestion, strong skin irritant.

Use: Seed fungicide and disinfectant.

5-cyano-*n*-methyl-1-phenyl-1h-pyrazole-4-carboxamide.

CAS: 98477-03-3. mf: $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}$.

Hazard: Moderately toxic by ingestion.

“Cyanophenos.” $\text{C}_{15}\text{H}_{14}\text{NO}_2\text{PS}$.

Properties: Colorless crystals. Mp 80C , refr index 1.58. Partially soluble in aromatic solvents and ketones; almost insoluble in water.

Hazard: A poison.

Use: Insecticide.

ciano(4-phenoxyphenyl)methyl 4-chloro α -(1-methylethylbenzeneacetate).

CAS: 66827-38-1. mf: $\text{C}_{25}\text{H}_{22}\text{ClNO}_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(+)ciano(3-phenoxyphenyl)methyl(\bar{n})-1-(difluoromethoxy)- α -(1-methylethyl)benzeneacetate.

Use: Food additive; insecticide.

“Cyanophos.” (ciafos; *O,O*-dimethyl-*O*-(4-cyanophenyl)phosphorothioate).

CAS: 2636-26-2. $\text{C}_9\text{H}_{10}\text{NO}_2\text{PS}$.

Properties: Yellowish liquid. Bp 120C (0.1 mm Hg), fp 14C , refr index 1.54. Soluble in alcohol, methanol, acetone; slightly soluble in water. Decomposed by light and in alkaline environment.

Hazard: Poison. A cholinesterase inhibitor.

Use: Pesticide.

3-cyanopyridine. (3-azabenzonitrile; nicotinonitrile).

CAS: 100-54-9. $\text{C}_5\text{H}_4\text{NCN}$.

Properties: Colorless liquid. Bp 206.2C , mp 49.6C . Soluble in water.

Use: Organic synthesis.

4-cyanopyridine. $\text{C}_5\text{H}_4\text{NCN}$.

Properties: Colorless liquid. Bp 195.4C , mp 78.5C . Partially soluble in water; soluble in most organic solvents.

Use: Organic synthesis.

(3ar,9bs)-*n*-(4-(8-cyano-1,3a,4,9b-tetrahydro-3h-benzopyrano(3,4-c)pyrrole-2-yl)butyl)-4-.

CAS: 273203-30-8. mf: $\text{C}_{29}\text{H}_{29}\text{N}_3\text{O}_2$.

Hazard: A poison.

cyanuramide. See ammeline.

cyanurdiamide. See ammeline.

cyanuric acid. (tricarbimide; tricyanide).

CAS: 108-80-5. $\text{HOCH}(\text{OH})\text{NC}(\text{OH})\text{N}\cdot 2\text{H}_2\text{O}$.

Properties: White crystals; odorless; slight bitter taste. D 1.768, decomposes to cyanic acid at 320C . Soluble in hot water and concentrated mineral acids, insoluble in alcohol and acetone.

Use: Intermediate for chlorinated bleaches, selective herbicide, whitening agents.

See isocyanuric acid.

cyanuric chloride. (2,4,6-trichloro-1,3,5-triazine).

CAS: 108-77-0. $\text{C}_3\text{N}_3\text{Cl}_3$ (cyclic).

Properties: Crystals; pungent odor. D 1.32, mp 146C , bp 194C (764 mm Hg). Soluble in chloroform, carbon tetrachloride, hot ether, dioxane, ketones; very slightly soluble in water (hydrolyzes in cold water).

Hazard: Toxic by ingestion and inhalation.

Use: Chemical synthesis, dyestuffs, herbicides, optical brighteners.

cyanurtriamide. See melamine.

cyclain. See osmocaine.

cyclamate. Group name for synthetic nonnutritive sweetening agents derived from cyclohexylamine or cyclamic acid. The series includes sodium, potassium, and calcium cyclamates. As a result of a study made on laboratory animals in 1970, which indicated that these compounds cause genetic damage in chick embryos and cancer in rats at high dosage, their use in beverages and food products was banned in the U.S. More recent research has failed to confirm the carcinogenicity of these com-

pounds in laboratory animals even at levels up to 240 times human intake. Notwithstanding these results, FDA has not yet withdrawn its ban on use of cyclamates as food additives or as table-top sweeteners, in view of the continuing uncertainty about their safety.

See sweetener, nonnutritive.

cyclamate calcium dihydrate. See calcium cyclamate dihydrate.

cyclamen alcohol. The alcohol corresponding to cyclamen aldehyde, used as a stabilizer of cyclamen aldehyde.

cyclamen aldehyde. (methyl-*p*-isopropylphenylpropyl aldehyde).

CAS: 103-95-7. $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{CH}(\text{CH}_3)\text{CH}_2\text{CHO}$.

Properties: Colorless liquid; floral odor. D 0.949–0.959, refr index 1.507–1.520. Soluble in 1 volume of 80% alcohol, and in most oils.

Grade: FCC.

Use: Perfumery, soap perfumes, flavoring.

cyclamic acid. (USAN name for cyclohexanesulfamic acid; cyclohexylsulfamic acid).

CAS: 100-88-9. $\text{C}_6\text{H}_{11}\text{NHSO}_3\text{H}$.

Properties: Odorless, white, crystalline solid; sweet-sour taste. Mp 170C. Strong, stable acid; soluble in water and alcohol; insoluble in oils.

Hazard: Suspected carcinogen.

Use: Nonnutritive sweetener, acidulant.

See cyclamate.

cyclanilide.

CAS: 113136-77-9. mf: $\text{C}_{11}\text{H}_9\text{Cl}_2\text{NO}_3$.

Hazard: A poison. Moderately toxic by skin contact and inhalation.

cycle compound. See carbocyclic.

cyclethrin. (3-(2-cyclopentenyl)-2-methyl-4-oxo-2-cyclopentenyl ester of chrysanthemummonocarboxylic acid).

Properties: Viscous, brown liquid. Soluble in petroleum solvents and other common organic solvents. Formulated principally as liquid for spray applications corresponding to natural pyrethrins.

Hazard: Toxic by inhalation and ingestion.

Use: Insecticide with applications similar to allethrin and other analogs.

See furethrin; barthrin; ethythrins.

cyclic compound. An organic compound whose structure is characterized by one or more closed rings, it may be mono-, bi-, tri-, or polycyclic depending on the number of rings present. There are three major groups of cyclic compounds: (1) alicyclic, (2) aromatic (also called arene), and (3) heterocyclic. For more detailed information, consult specific entries.

cyclic electron flow. In chloroplasts, the light-induced flow of electrons originating from and returning to photosystem I to produce ATP without production of NADPH.

cyclic photophosphorylation. ATP synthesis driven by cyclic electron flow through photosystem I (no NADPH produced).

cyclizine hydrochloride. (1-diphenylmethyl-4-methylpiperazine hydrochloride).

CAS: 303-25-3. $(\text{C}_6\text{H}_5)_2\text{CHC}_4\text{H}_8\text{N}_2\text{CH}_3\cdot\text{HCl}$.

Properties: White, crystalline powder or small colorless crystals; odorless or nearly so; bitter taste. Mp 285C (decomposes). Slightly soluble in water, alcohol, chloroform; insoluble in ether; pH (2% solution) 4.5–5.5.

Grade: USP.

Use: Medicine (antiemetic).

cycloaliphatic epoxy resin. (cycloalkenyl epoxides). A polymer prepared by epoxidation of multicycloalkenyls (polycyclic aliphatic compounds containing carbon-carbon double bonds) with organic peracids such as peracetic acid. Resistant to high temperatures.

Use: Space vehicles, outdoor electrical installations in polluted and humid atmospheres, high-temperature adhesives.

cyclobarbital. [5-(1-cyclohexenyl)-5-ethylbarbituric acid; tetrahydrophenobarbital].

CAS: 52-31-3. $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White crystals or crystalline powder; odorless; bitter taste. Mp 170–174C. Soluble in alcohol or ether; very slightly soluble in cold water or benzene.

Derivation: Hydrogenation of phenobarbital with colloidal palladium in alcohol as a catalyst.

Hazard: See barbiturates.

Use: Medicine (hypnotic, sedative).

cyclobutane. (tetramethylene).

CAS: 287-23-0. C_4H_8 .

Properties: Colorless gas. D 0.7083 (11C), bp 13C, fp –80C, flash p <50F. Insoluble in water; soluble in alcohol and acetone.

Derivation: Catalytic hydrogenation of cyclobutene.

Hazard: Flammable, dangerous fire risk.

cyclobutene. (cyclobutylene). C_4H_6 .

Properties: Gas. D 0.733, bp 2.0C.

Derivation: From petroleum.

Hazard: Flammable, dangerous fire risk.

cyclobutylidene-cyclobutane. See bicyclobutylidene.

cyclocitrylideneacetone. See ionone.

cyclocumarol. $C_{20}H_{18}O_4$. A synthetic blood anti-coagulant.

Properties: White, crystalline powder; slight odor. Mp 164–168C. Soluble in water; slightly soluble in alcohol.

cyclodisone. See 1,5,2,4-dioxadithiepane-2,2,4,4-tetraoxide.

cyclofenil diphenol. See 4-(cyclohexylidene(4-hydroxyphenyl)methyl)phenol.

cycloheptane. (heptamethylene; suberane).

CAS: 291-64-5. C_7H_{14} .

Properties: Colorless liquid. D 0.809, bp 117, fp -12C, aniline equivalent -6, flash p >70F (20C). Soluble in alcohol; insoluble in water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Narcotic by inhalation.

Use: Organic synthesis.

cycloheptanone. (suberone).

CAS: 502-42-1. $C_7H_{12}O$.

Properties: Colorless liquid; peppermint odor. Bp 179C, d 0.95. Insoluble in water; soluble in ether and alcohol. Combustible.

Use: Research, intermediate.

cyclohexane. (hexamethylene; hexanaphthene; hexalhydrobenzene).

CAS: 110-82-7. C_6H_{12} .

Structure: A typical alicyclic hydrocarbon. It exists in two modifications called the “boat” and the “chair,” as shown. This is due to slight distortion of the bond angles in accordance with the modified version of Baeyer’s strain theory. Cyclohexane has been studied extensively on a theoretical basis in a branch of advanced chemistry called conformational analysis. See conformation.

Properties: Colorless, mobile liquid; pungent odor. D 0.779 (20/4C), bp 80.7C, mp 6.5C, refr index 1.4263, vap press 100 mm Hg at 60.8C, vap d 2.90,

aniline equivalent 7. Insoluble in water; soluble in alcohol, acetone, benzene; flash p (98% grade) -1F (-18.3C) (CC); autoign temp 473F (245C). Flammable limits in air 1.3–8.4%.

Derivation: (1) Catalytic hydrogenation of benzene. (2) Constituent of crude petroleum.

Grade: 85, 98, 99.86%, spectrophotometric.

Hazard: Flammable, dangerous fire risk. Moderately toxic by inhalation and skin contact. TLV: 300 ppm.

Use: Manufacture of nylon; solvent for cellulose ethers, fats, oils, waxes, bitumens, resins, crude rubber; extracting essential oils; chemicals (organic synthesis, recrystallizing medium); paint and varnish remover; glass substitutes; solid fuels; fungicides; analytical chemistry.

1,4-cyclohexanebis(methylamine).

$C_6H_{10}(CH_2NH_2)_2$. The commercial product is about 40% *cis* and 60% *trans*.

Properties: Clear liquid. D 0.9419 (20/4C), bp 239–244C. Miscible with water, alcohol, and most other organic solvents. Combustible.

Use: Intermediate, resins.

cyclohexanecarboxylic acid. See hexahydrobenzoic acid.

1,2-cyclohexanedicarboxylic anhydride.

See hexahydrophthalic anhydride.

1,4-cyclohexanedimethanol. (CHDM).

$C_6H_{10}(CH_2OH)_2$. *cis* and *trans* isomers are known and are present in the commercial product in about 30–70%.

Properties: Liquid. Bp 286.0C (735 mm Hg *cis* isomer), mp 41–61C, d (super cooled) 1.0381 (25/4C), flash p 330F (165C) (COC), refr index 1.4893 (20C). Soluble in water and ethyl alcohol. Combustible.

Use: Polyester films and protective coatings, reduction of reaction time in esterification.

cyclohexanesulfamic acid. See cyclamic acid.

cyclohexanol. (hexahydrophenol).

CAS: 108-93-0. $C_6H_{11}OH$.

Properties: Colorless, oily liquid; camphorlike odor; hygroscopic. D 0.937 (37.4C), mp 23C, bp 160.9C, wt/gal approximately 8 lb, flash p 154F (67.7C), refr index 1.465 (22C). Sparingly soluble in water; miscible with most organic solvents and oils. Combustible, autoign temp 572F (300C).

Derivation: Phenol is reduced with hydrogen over active nickel at 71–76.6C. The cyclohexanone is removed by condensing with benzaldehyde in the presence of alkali.

Grade: Technical (contains freezing inhibitor).

Hazard: Toxic by skin absorption and inhalation; narcotic. TLV: 50 ppm.

Use: In soap making to incorporate solvents and

phenolic insecticides; source of adipic acid for nylon; textile finishing; solvent for alkyd and phenolic resins, cellulosics; blending agent for lacquers, paints, and varnishes; finish removers; emulsified products; leather degreasing; polishes, plasticizers, plastics; germicides.

cyclohexanol acetate. (cyclohexanyl acetate).
CAS: 622-45-7. $\text{CH}_3\text{COOC}_6\text{H}_{11}$.

Properties: Colorless liquid; odor resembling that of amyl acetate. D 0.966, bp 177C, flash p 136F (57C), autoign temp 633F (333C). Miscible with most lacquer solvents and dilutions and with halogenated and hydrogenated hydrocarbons; soluble in alcohol; insoluble in water. Combustible.

Hazard: Narcotic.

Use: Solvent for nitrocellulose, cellulose ether, bitumens, metallic soaps, basic dyes, blown oils, crude rubber, many natural and synthetic resins and gums, lacquers.

cyclohexanone. (pimelic ketone; ketohexamethylene).

CAS: 108-94-1. $\text{C}_6\text{H}_{10}\text{O}$.

Properties: Water-white to pale-yellow liquid; acetone- and peppermint-like odor. Bp 156.7C, fp -32C, d 0.948, flash p 111F (44C), refr index 1.4507 (20C), vap press 135 mm Hg (100C), autoign temp 788F (420C). Slightly soluble in water; miscible with most solvents. Combustible.

Derivation: By passing cyclohexanol over copper with air at 280F, also by oxidation of cyclohexanol with chromic acid or oxide.

Hazard: Moderate fire risk. Toxic via inhalation and skin contact. TLV: 25 ppm.

Use: Organic synthesis, particularly of adipic acid and caprolactam (about 95%), polyvinyl chloride and its copolymers, and methacrylate ester polymers; wood stains; paint and varnish removers, spot removers; degreasing of metals; polishes; leveling agent dyeing and delustering silk; lubricating oil additive; solvent for cellulosics; natural and synthetic resins, waxes, fats, etc.

cyclohexanone peroxide. (1-hydroperoxycyclohexyl-1-hydroxycyclohexyl peroxide).

CAS: 78-18-2. $\text{C}_6\text{H}_{10}(\text{OOH})\text{OOC}_6\text{H}_{10}\text{OH}$.

Properties: Grayish paste. Insoluble in water; soluble in most organic solvents.

Hazard: Dangerous fire risk, powerful oxidizer.

cyclohexanyl acetate. See cyclohexanol acetate.

cyclohexene. (1,2,3,4-tetrahydrobenzene).

CAS: 110-83-8. C_6H_{10} .

Properties: Colorless liquid. D 0.811 (20/4C), bp 83C, fp -1037C, refr index 1.445 (25C), flash p 11F (-11.6C), aniline equivalent 10, wt/gal 6.7 lb (25C), autoign temp 590F (310C). Soluble in alcohol; insoluble in water.

Grade: Technical 95%, 99%, research 99.9 mole %.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation. TLV: 300 ppm.

Use: Organic synthesis, catalyst solvent, oil extraction, manufacturing of adipic and maleic acids.

3-cyclohexene-1-carboxaldehyde. (1,2,3,6-tetrahydrobenzaldehyde).

$\text{CH}_2\text{CH}=\text{CHCH}_2\text{CH}_2\text{CHCHO}$.

Properties: Liquid. D 0.9721, bp 164.2C, fp -100C, wt/gal 8.1 lbs (20C), flash p 135F (57.2C). Slightly soluble in water. Combustible.

Hazard: Strong irritant to tissue.

Use: Intermediates, improves water resistance of textiles.

cyclohexene-1-dicarboximidomethylchrysanthemate. See neopinamine.

cyclohexene oxide. $\text{C}_6\text{H}_{10}\text{O}$.

Properties: Colorless liquid; a strong odor. Bp 129-130C, d 0.967 (25/4C), refr index 1.4503 (25C), flash p 81F (27.2C). Soluble in alcohol, ether, acetone; insoluble in water.

Grade: 98% pure.

Hazard: Flammable, dangerous fire risk.

Use: Chemical intermediate.

cyclohexenylethylbarbituric acid. See cyclobarbital.

cyclohexenylethylene. See vinylcyclohexene.

cyclohexenyltrichlorosilane. $\text{C}_6\text{H}_9\text{SiCl}_3$.

Properties: Colorless liquid. Bp 202C, d 1.263 (25/25C), refr index 1.488 (25C), flash p 200F (93.3C) (COC). Readily hydrolyzed by moisture, with liberation of hydrogen chloride. Combustible.

Grade: Technical.

Hazard: Strong irritant, corrosive to skin.

Use: Intermediate for silicones.

cycloheximide. (generic name for 3-[2-(3,5-dimethyl-2-oxocyclohexyl)-2-hydroxyethyl]glutarimide).

CAS: 66-81-9.

$\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)\text{COCHCH}(\text{OH})$

A plant growth regulator. By-product in the manufacture of streptomycin.

Properties: Crystals. Mp 115.5–117C. Slightly soluble in acetone, alcohol, and chlorinated solvents.

Hazard: Toxic by ingestion.

Use: Fungicide, antibiotic, abscission of citrus fruit in harvesting, turf disease control.

cyclohexylamine. (hexahydroaniline; amino-cyclohexane).

CAS: 108-91-8. $\text{C}_6\text{H}_{11}\text{NH}_2$.

Properties: Colorless liquid; unpleasant odor. Bp 134.5C, d 0.8647 (25/25C), fp –18C. Strong organic base, pH of 0.01% aqueous solution 10.5, forms an azeotrope with water, bp 96.4C. Miscible with most solvents, flash p 90F (32.2C) (OC), autoign temp 560F (293C).

Grade: Technical (98%).

Hazard: Flammable, moderate fire risk. Toxic by ingestion, inhalation, skin absorption. TLV: 10 ppm.

Use: Boiler-water treatment, rubber accelerator, intermediate in organic synthesis.

cyclohexylbenzene. See phenylcyclohexane.

***n*-cyclohexyl-2-benzothiazolesulfenamide.**

(benzothiazyl-2-cyclohexylsulfenamide).

$\text{C}_6\text{H}_4\text{SNCSNHC}_6\text{H}_{11}$.

Properties: Cream-colored powder. D 1.27, melting range 93–100C. Insoluble in water; soluble in benzene.

Use: Rubber accelerator.

cyclohexyl bromide. $\text{C}_6\text{H}_{11}\text{Br}$.

Properties: Liquid, not more than faintly yellow, penetrating odor, d 1.32–1.34 (25/25C), refr index 1.4926–1.4936 (25C).

((cyclohexylcarbonyl)oxy)tributylstannane.

See tributyltin cyclohexanecarboxylate.

1-(cyclohexylcarbonyl)-1,2,3,6-tetrahydropyridine.

CAS: 63697-52-9. mf: $\text{C}_{12}\text{H}_{19}\text{NO}$.

Hazard: Moderately toxic by ingestion. A moderate eye irritant.

Use: Agricultural chemical.

cyclohexyl chloride.

CAS: 542-18-7. $\text{C}_6\text{H}_{11}\text{Cl}$.

Properties: Colorless liquid. Fp –43C, bp 142C, flash p 89F (31.6C), d 0.992.

Hazard: Flammable, moderate fire risk.

2-cyclohexylcyclohexanol. $\text{C}_6\text{H}_{11}\text{H}_{10}\text{OH}$.

Properties: Colorless liquid. Fp 29C, bp 271–277C, d 0.977 (25/25C), wt/gal 8.13 lbs, refr index 1.495 (25C), flash p 255F (124C). Soluble in methanol and ether; slightly soluble in water. Combustible.

cyclohexyl 4-(1,1-(dimethylethyl)phenyl)methyl-3-pyridinylcarbonimidodithioate.

CAS: 42754-23-4. mf: $\text{C}_{23}\text{H}_{30}\text{N}_2\text{OS}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2-cyclohexyl-4,6-dinitrophenol. See dinitro-cyclohexylphenol.

1-cyclohexylethanol.

CAS: 1193-81-3. mf: $\text{C}_8\text{H}_{16}\text{O}$.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin and mild eye irritant.

4-(cyclohexylidene(4-hydroxyphenyl)methyl)phenol.

CAS: 5189-40-2. mf: $\text{C}_{19}\text{H}_{20}\text{O}_2$.

Hazard: A reproductive hazard.

cyclohexylidenemalononitrile.

CAS: 4354-73-8. mf: $\text{C}_9\text{N}_{10}\text{N}_2$.

Hazard: A poison.

cyclohexyl isocyanate.

CAS: 3173-53-3. $\text{C}_6\text{H}_{11}\text{NCO}$.

Use: To form cyclohexyl carbamates or ureas for agricultural chemicals or pharmaceutical use.

cyclohexyl methacrylate.

$\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_6\text{H}_{11}$.

Properties: Colorless monomeric liquid; pleasant odor. Bp 210C, refr index 1.4578 (20C), d 0.9626 (20/20C), viscosity 5.0 cP (25C). Insoluble in water. Combustible.

Use: Optical lens systems, dental resins, encapsulation of electronic assemblies.

2-cyclohexyl-4-methylphenol.

CAS: 1596-09-4. mf: $\text{C}_{13}\text{H}_{18}\text{O}$.

Hazard: Moderately toxic by ingestion. A severe eye irritant.

***p*-cyclohexylphenol.** $\text{C}_6\text{H}_{11}\text{C}_6\text{H}_4\text{OH}$.

Properties: Crystals. Mp 120C (min). Combustible.

Grade: Technical.

Use: Intermediate for resins and organic synthesis.

cyclohexyl phenyl phosphate.

CAS: 4281-67-8. mf: $\text{C}_{18}\text{H}_{21}\text{O}_4\text{P}$.

Hazard: Moderately toxic by ingestion. A mild eye irritant.

***n*-cyclohexylpiperidine.** $\text{C}_6\text{H}_{11}\text{NC}_5\text{H}_{10}$.

Properties: Yellow liquid. Refr index 1.4856 (20C). Combustible.

Use: Intermediate.

cyclohexyl stearate. $\text{C}_6\text{H}_{11}\text{OOC}_{17}\text{H}_{35}$.

Properties: Pale-yellow powder. D 0.882 at 30/15.5C, mp 26–28C. Soluble in benzene, toluene, and acetone; insoluble in water.

Use: Plasticizer for natural and synthetic resins.

cyclohexylsulfamic acid. See cyclamic acid.

***n*-cyclohexyl-*p*-toluenesulfonamide.**

Properties: Yellow-brown fused mass, relatively light stable. Mp 86C, bp 350C. Soluble in alcohol, esters, ketones, aromatic hydrocarbons, and vegetable oils; insoluble in water. Compatible with a wide variety of resins including most of the cellulosic and vinyl resins. Combustible.

Use: Resin plasticizer.

cyclohexyl trichlorosilane.

Properties: Colorless to pale-yellow liquid. Bp 206C, d 1.226 (25/25C), refr index 1.4759 (25C), flash p 185F (85C) (COC). Readily hydrolyzed by moisture with liberation of hydrogen chloride. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and cyclohexylmagnesium chloride.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation, strong irritant to tissue.

Use: Intermediate for silicones.

“Cyclolube” [Crompton & Knowles]. TM for a series of oils composed principally of cycloparaffins. Used as plasticizers for nonpolar polymers, lubricants for polar polymers, and extenders for relatively saturated polymers.

cyclomethylcaine. (3-(2-methylpiperidine)propyl-*p*-cyclohexyloxybenzoate).

Properties: White, crystalline powder; odorless. Sparingly soluble in water, alcohol, and chloroform; very slightly soluble in acetone, ether, and dilute acids.

Use: Medicine (topical anesthetic).

cyclone. A dust-collecting device consisting of a cylindrical chamber the lower portion of which is tapered to fit into a cone-shaped receptacle placed below it. The dust-laden air enters through a vertical slotlike duct on the upper wall of the chamber at the rate of at least 100 f/sec. Since the particles enter at a tangent, they whirl in a circular or cyclonic path within the chamber. The centrifugal force exerted on the particles is proportional to their weight and to the square of their velocity. The particles slide along the walls of the chamber and gradually circulate down into the conical receptor while the clean air escapes through a central pipe at the bottom. The dust accumulates in the cone and is discharged at intervals or continuously. The larger the particles, the more efficient the removal; in simple cyclones particles those less than 50 microns in diameter are not retained, but improved models retain particles as small as 20

microns. Cyclones are also used in cleaning and firing pulverized coal.

cyclonite. (*sym*-trimethylenetrinitramine; hexahydro-1,2,5-trinitro-*sym*-triazine; trinitrotrimethylenetriamine; cyclotrimethylenetrinitramine; RDX).

Properties: White, crystalline solid. D 1.82, mp 203.5C. Soluble in acetone; insoluble in water, alcohol, carbon tetrachloride, and carbon disulfide; slightly soluble in methanol and ether.

Derivation: Reaction of hexamethylenetetramine with concentrated nitric acid.

Hazard: High explosive, easily initiated by mercury fulminate. Toxic by inhalation and skin contact. TLV: 1.5 mg/m³.

Use: Explosive 1.5 times as powerful as TNT.

3-cyclooctadiene.

$HC:CH(CH_2)_3CH:CHCH_2CH_2$. Intermediate for such compounds as suberic acid, 1,5-cyclooctadiene. A butadiene dimer.

Properties: Liquid. Fp -56.39C, distillation range 301-303F (technical), bp 149.34C (pure), d 0.88328 (20/4C), wt/gal 7.38 lbs, vap press 0.50 psia (37.7C), refr index 1.4933 (20C), flash p 100F (37.7C). Combustible.

Derivation: Catalytic dimerization of butadiene.

Grade: Technical 95%, 99%, 99.8 mole %.

Hazard: Moderate fire risk.

Use: Resin intermediate, third monomer in EPT rubber.

cyclooctane. C_8H_{16}

Properties: Colorless liquid. D 0.835, bp 148C, mp 14C. Combustible.

1,3,5,7-cyclooctatetraene.

Properties: Colorless liquid. Fp -7C, bp 140C, d 0.943 (0/4C), refr index 1.5394 (20C). It behaves like an aliphatic hydrocarbon, is relatively reactive, and resinifies on standing in air. Combustible.

Derivation: Nickel-catalyzed polymerization of acetylene, a reaction discovered by Reppe in Germany about 1940. The mechanism has several possible pathways.

Use: Organic research
See polyacetylene.

cycloolefin. An alicyclic hydrocarbon having two or more double bonds, e.g., the very reactive and

widely used cyclopentadiene derived from coal tar, as well as cyclohexadiene and cyclooctatetraene, containing six and eight carbon atoms, respectively. The latter has four double bonds and is a polymer of acetylene.

cycloparaffin. An alicyclic hydrocarbon in which three or more of the carbon atoms in each molecule are united in a ring structure and each of these ring carbon atoms is joined to two hydrogen atoms or alkyl groups. The simplest members are cyclopropane (C_3H_6), cyclobutane (C_4H_8), cyclopentane (C_5H_{10}), cyclohexane (C_6H_{12}), and derivatives of these such as methylcyclohexane ($C_6H_{11}CH_3$).

Hazard: All members of the cycloparaffin series are narcotic and may cause death through respiratory paralysis. For most of the members there appears to be a narrow range between the concentration causing deep narcosis and those causing death.

1,3-cyclopentadiene.

CAS: 542-92-7. C_5H_6 .

Properties: Colorless liquid. D 0.805, bp 42.5C. Insoluble in water; soluble in alcohol, ether, and benzene.

Derivation: From coal tar and cracked petroleum oils.

Hazard: Decomposes violently at high temperature. Toxic. TLV: 75 ppm.

Use: Chemical intermediate, organic synthesis (Diels-Alder reaction), starting material for synthetic prostaglandin, chlorinated insecticides, formation of sandwich compounds by chelation, e.g., cyclopentadienyl iron dicarbonyl dimer [$C_5H_5Fe(CO)_2$]₂.

cyclopentamine hydrochloride. (1-cyclopentyl-2-methyl-aminopropane hydrochloride).

$C_5H_9CH_2(CH_3)NHCH_3 \cdot HCl$.

Properties: White, crystalline powder; mild characteristic odor; bitter taste. Mp 113.0–116.0C. Freely soluble in water, alcohol, and chloroform; soluble in benzene; slightly soluble in ether; pH (1% solution) approximately 6.2.

Grade: NF.

Use: Medicine (vasoconstrictor).

cyclopentane. (pentamethylene).

CAS: 287-92-3. C_5H_{10} .

Properties: Colorless liquid. D 0.7445 (20/4C); bp 49.27C; fp -94C; refr index 1.406 (20/D), flash p

-35F (-37.2C). Soluble in alcohol; insoluble in water.

Derivation: Catalytic cracking of cyclohexane.

Grade: Technical, 95%, 99%, research.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion and inhalation. TLV: 600 ppm.

Use: Solvent for cellulose ethers, motor fuel, azeotropic distillation agent.

1,2,3,4-cyclopentanetetracarboxylic acid.

$C_5H_6(COOH)_4$.

Properties: Crystalline powder. Mp 195–196C. Soluble in water but insoluble in most organic solvents.

Use: Curing agent for resins; imparts thermal stability and high-temperature properties.

1,2,3,4-cyclopentanetetracarboxylic acid dianhydride.

$C_5H_6(C_2O_3)_2$.

Properties: White solid. Mp 220–221C. Moderately soluble in dimethyl formamide, butyrolactone, and dimethylsulfoxide; only slightly soluble in acetone; insoluble in hydrocarbons.

Use: Curing agent for epoxy resins.

cyclopentanol. (cyclopentyl alcohol).

$CH_2CH_2CH_2CH_2CH_2O$.

Properties: Colorless, viscous liquid; pleasant odor. D 0.946 (20/4C), refr index 1.4575 (20C), fp -19C, bp 139–140C, flash p 124F (51C). Slightly soluble in water; soluble in alcohol. Combustible.

Hazard: Moderate fire risk.

Use: Perfume and pharmaceutical solvent, intermediate for dyes, pharmaceuticals, and other organics.

cyclopentanone.

CAS: 120-92-3. C_5H_8O .

Properties: Water-white, mobile liquid; distinctive ethereal odor somewhat like peppermint. Bp 131C; d 0.943; refr index 1.437; flash p 87F (30.5C) (CC); insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, moderate fire risk. Narcotic in high concentration.

Use: Intermediate for pharmaceuticals, biologicals, insecticides, and rubber chemicals.

cyclopentanone oxime. C_5H_8NOH . Nearly

colorless and odorless, crystalline solid; mp 56C; bp 196C; soluble in water, alcohol. Used as intermediate in synthesis of the amino acids, proline and ornithine.

cyclopentene.

CAS: 142-29-0.

Properties: Colorless liquid. D 0.772, bp 44C, fp -135.21C, refr index 1.4225 (20/D), flash p -20F (-29C).

Grade: Technical, research (99.89 mole %).

Hazard: Flammable, dangerous fire risk. Moderate narcotic action.

Use: Organic synthesis, polyolefins, epoxies, cross-linking agent.

cyclopentenylacetone. [1-(1-cyclopentenyl)-2-propanone]. $\text{C}_5\text{H}_7\text{CH}_2\text{COCH}_3$.

Properties: Clear, colorless liquid; ketone odor. Bp 170C; refr index 1.4545-1.4550 (25C). Combustible.

Use: Organic synthesis.

cyclopentylacetone. (1-cyclopentyl-2-propanone). $\text{C}_5\text{H}_9\text{CH}_2\text{COCH}_3$.

Properties: Liquid. D 0.893 (25/25C), bp 180-184C, refr index 1.4420 (25C). Combustible.

Use: Organic synthesis.

cyclopentyl alcohol. See cyclopentanol.

cyclopentyl bromide. (bromocyclopentane). $\text{C}_5\text{H}_9\text{Br}$.

Properties: Clear, mobile liquid; sweet aromatic odor. Bp 137-138C, d 1.3866 (20/4C), wt/gal 11.6 lb (20C), refr index 1.4885 (n 20/D), flash p 108F (42.2C) (CC). Insoluble in water. Combustible.

Hazard: Moderate fire risk; moderately toxic.

Use: Organic synthesis (pharmaceuticals).

1-cyclopentyl-2-methylaminopropane hydrochloride. See cyclopentamine hydrochloride.

cyclopentyl phenyl ketone. $\text{C}_5\text{H}_9\text{COC}_6\text{H}_5$.

Properties: Colorless to light-yellow liquid. Bp 145-146C (15 mm Hg). Soluble in most common organic solvents; insoluble in water. Combustible.

Use: Pharmaceutical intermediate.

1-cyclopentyl-2-propanone. See cyclopentylacetone.

cyclopentylpropionic acid.

Properties: Liquid. Bp 130-132C (12 mm Hg), flash p 116F (46.6C). Insoluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Intermediate, wood preservatives.

cyclopentylpropionyl chloride. (cyclopentylpropionic acid chloride). $\text{C}_5\text{H}_9\text{CH}_2\text{CH}_2\text{COCl}$.

Properties: Liquid. Bp 81-82C (10 mm Hg), flash p 104F (40C). Soluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Intermediate.

cyclophane. A term applied in organic research to two molecules, e.g., of benzene, that are connected by covalent bonds involving all their carbon atoms (superphane). Such molecules exhibit a high degree of strain. In other types some of the carbon atoms are not involved. Cyclophanes can be made by a reaction mechanism in which dimerization of benzocyclobutenes plays a part.

cyclophosphamide.

CAS: 50-18-0. $\text{C}_7\text{H}_{15}\text{Cl}_2\text{N}_2\text{O}_2\text{P}$. A nitrogen mustard.

Properties: Crystalline solid. Mp 41C. Slightly soluble in benzene, alcohol, carbon tetrachloride; very slightly soluble in ether and acetone.

Hazard: An experimental carcinogen by injection.

Use: Antineoplastic for treatment of leukemia, etc., tested for use in chemical shearing of sheep, and as an insect chemosterilant.

cyclopropane. (trimethylene).

CAS: 75-19-4. C_3H_6 .

Properties: Colorless gas; characteristic odor resembling that of solvent naphtha; pungent taste. D 0.72-0.79, bp -32.9C, fp -126.6C. Soluble in alcohol and ether; partially soluble in water. Autoign temp 928F (497C).

Derivation: Reduction of dibromocyclopropane with zinc dust.

Grade: Technical, USP, 99.5% min.

Hazard: Highly flammable. Forms flammable and explosive mixtures with air or oxygen. Explosive limits in air 2.4-10.3% by volume. Moderately toxic by inhalation. Narcotic in high concentration.

Use: Organic synthesis, anesthetic.

cyclopropanespirocyclopropane. See spiro-pentane.

n-cyclopropyl-n'-(2,5-difluorophenyl)urea.

CAS: 81356-60-7. mf: $\text{C}_{10}\text{H}_{10}\text{F}_2\text{N}_2\text{O}$.

Hazard: A poison. Moderately toxic by skin contact. A mild skin and eye irritant.

cyclosilane. See silane.

"Cyclo Sol" [Shell]. TM for a series of hydrocarbon solvents composed of 50-99% aromatic hydrocarbons.

Hazard: Flammable, dangerous fire risk.

cyclotrimethylenetrinitramine. See cyclonite.

cyclotron. A circular electromagnetic device for accelerating positively charged particles (protons, deuterons, alpha particles). It was invented in 1929 by E. O. Lawrence (1901-1958) at the University of

California at Berkeley. It is now used chiefly for basic nuclear research. The acceleration is achieved by successive applications of small accelerations at low voltage synchronized with the rotational period of the particles in a magnetic field. Energies of over 700 MeV for protons and over 900 MeV for alpha particles have been attained. The energized particles emerging from the cyclotron impinge upon a target nucleus, resulting in formation of radioactive isotopes, neutrons, and ionizing radiation. The first plutonium was made in a cyclotron in 1939. Powerful cyclotrons with huge electromagnets are in use in physical research laboratories throughout the world. See bombardment.

cycloversion. A process using bauxite as a catalyst for (1) desulfurization, (2) reforming, and (3) cracking of petroleum to form high-octane gasoline.

cyclody. A coined term referring to the cyclic alkyd coatings prepared from "Polycyclol 1222," used in baking metal primers and air-drying maintenance paints.

"Cycocel" [Cytec]. TM for a plant growth regulator (2-chloroethyltrimethyl ammonium chloride) said to be effective for cereal grains, tomatoes, and peppers.

"Cydril" [Cytec]. TM for a drilling mud additive, shale stabilizer and viscofier.
Use: Reduces drilling costs by stabilizing the well bore.

cyhexatin. ("Plictran" [Dow]; TCHH; TCHTH; trichlohexyltin hydroxide).
CAS: 13121-70-5. $C_{18}H_{34}OSn$.
Properties: White crystals. Mw 385.16, mp 195–198C, vap press nil. Insoluble in water; soluble in acetone, chloroform, and methanol.
Hazard: TLV: 5 mg/m³.
Use: An acaricide.

cymene. (cymol; isopropyltoluene; methylpropylbenzene).
CAS: *m*- 535-77-3; *o*- 527-84-4; *p*- 99-87-6; mixed 25155-15. $CH_3C_6H_4CH(CH_3)_2$.
The *o*-, *m*-, and *p*-isomers are known.

Properties: Colorless, transparent liquids with aromatic odor. Combustible. D: *o*- 0.8748, *m*- 0.862, *p*- 0.8551. Fp: *o*- -71C, *m*- -64C, *p*- -68C. Bp: *o*- 177C, *m*- 175.6C, *p*- 176.5C. Refr index: *p*- 1.489

(20C). Soluble in alcohol, ether, and chloroform; insoluble in water. Flash p (*p*-) 127F (51C) (CC).
Derivation: Mixed cymenes are produced from toluene by alkylation. *p*-Cymene occurs in several essential oils and is made from monocyclic terpenes by dehydrogenation. These terpenes can be made from turpentine or obtained as a by-product from the sulfite digestion of spruce pulp in paper manufacture.

Method of purification: Washing with sulfuric acid, water, and alkali.

Grade: Technical.

Hazard: Moderate fire risk. Moderately toxic by ingestion.

Use: Solvents, synthetic-resin manufacture, metal polishes, organic synthesis (oxidation to hydroperoxides used as catalysts for synthetic-rubber manufacture; cymene alcohols are made by hydrogenating the hydroperoxides). Pure *p*-cresol and carvacrol are made from *p*-cymene.

cynaustine hydrochloride.

CAS: 17958-39-3. mf: $C_{15}H_{25}NO_4 \bullet ClH$.

Hazard: A poison.

Source: Natural product.

cypermethrin. (cyano(3-phenoxyphenyl)methyl; 3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate).

CAS: 52315-07-8.

Use: Insecticide.

cyperquat.

CAS: 48134-75-4. mf: $C_{12}H_{12}N$.

Hazard: Moderately toxic.

5- α -cyprinol.

CAS: 2952-70-7. mf: $C_{27}H_{48}O_5$.

Hazard: A poison.

cyproconazole.

CAS: 94361-06-5. mf: $C_{15}H_{18}ClN_3O$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact. A mild eye irritant.

Use: Agricultural chemical.

"Cyracure" [Dow]. TM for cycloaliphatic epoxides.

Use: For uv-light-cured coatings such as varnishes, inks, industrial coatings, and sealants.

Cys. Abbreviation for cysteine.

cysteamine. See 2-aminoethanethiol.

cysteine. (α -amino- β -thiolpropionic acid; β -mercaptoalanine).

CAS: 52-90-4. $HSCH_2CH(NH_2)COOH$. A nonessential amino acid derived from cystine, occurring naturally in the L(+) form.

Properties: Colorless crystals. Soluble in water, ammonium hydroxide, and acetic acid; insoluble in

ether, acetone, benzene, carbon disulfide, and carbon tetrachloride.

Derivation: Hydrolysis of protein; degradation of cystine. Found in urinary calculi.

Available forms: Available commercially as L(+)-cysteine hydrochloride.

Use: Biochemical and nutrition research, reducing agent in bread doughs (up to 90 ppm).

cystine. (β,β' -dithiobisalanine; di[α -amino- β -thiolpropionic acid]).

CAS: 56-89-3.
 $\text{HOOCCH}(\text{NH}_2)\text{CH}_2\text{SSCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino acid.

Properties: White, crystalline plates. Soluble in water; insoluble in alcohol. Optically active. DL-cystine, mp 260C. D(+)-cystine, mp 247–249C. L(-)-cystine, mp 258–261C with decomposition.

Derivation: Hydrolysis of protein (keratin), organic synthesis. Occurs as small hexagonal crystals in urine.

Grade: FCC.

Use: Biochemical and nutrition research, nutrient and dietary supplement.

“Cystokon” [Mallinckrodt]. TM for a 30% solution of sodium acetrizoate.

cythion. Proprietary malathion.

Use: Insecticide.

cytidine.

CAS: 65-46-3. $\text{C}_9\text{H}_{13}\text{N}_3\text{O}_5$. The nucleoside consisting of D-ribose and cytosine.

Properties: White, crystalline powder. Soluble in water, acid, alkali; insoluble in alcohol.

Derivation: From yeast ribonucleic acid. Also available as the hemisulfate, $(\text{C}_9\text{H}_{13}\text{N}_3\text{O}_5)_2 \cdot \text{H}_2\text{SO}_4$.

Use: Biochemical research.

cytidine phosphates. Nucleotides used by the body in growth processes. Important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (CMP; see cytidylic acid), diphosphate (CDP), and triphosphate (CTP).

cytidylic acid. (cytosylic acid; cytidinephosphoric acid; cytidine monophosphate; CMP).

$\text{C}_9\text{H}_{14}\text{N}_3\text{O}_8\text{P}$. The monophosphoric ester of cytosine, i.e., the nucleotide containing cytosine D-ribose and phosphoric acid. The phosphate may be esterified to the 2, 3, or 5 carbon of ribose, yielding cytidine-2'-phosphate, cytidine-3'-phosphate, or cytidine-5'-phosphate, respectively.

Properties: (Cytidine-3'-phosphate) White, crystalline powder; odorless; mild sour taste. Mp: crystals from 50% alcohol 230–233C (with decomposition); crystals from water 227C (with decomposition). Slightly soluble in water and dilute alkalies; insoluble in alcohol and other organic solvents.

Derivation: (commercial product) From yeast nucle-

ic acid by hydrolysis. The 5'-monophosphate is made synthetically by phosphorylation and hydrolysis of isopropylidene cytidine.

Use: Biochemical research.

cytochemistry. The branch of biochemistry devoted to study of the chemical composition of cells and cell membranes, including chromosomes, genes, and the complex reactions involved in cell growth and replication, as well as the mechanism of enzyme activity.

See molecular biology.

cytochrome. A class of iron-porphyrin proteins of great importance in cell metabolism. They are pigments occurring in the cells of nearly all animals and plants. Several types have been identified. Cytochrome carbon is the most abundant and has been obtained in pure forms. The cytochromes and cytochrome oxidase have important functions in cell respiration. The latter is an iron-porphyrin-containing protein that is an important enzyme in cell respiration. It catalyzes the oxidation of cytochrome carbon and is reduced itself in the reaction. It is then reoxidized by oxygen.

See porphyrin.

cytogenetics. The study of the physical appearance of chromosomes.

See karyotype.

cytokinesis. The final separation of daughter cells following mitosis.

cytokinins. See kinin.

cytological band. An area of the chromosome that stains differently from areas around it.

See cytological map.

cytological map. A type of chromosome map whereby genes are located on the basis of cytological findings obtained with the aid of chromosome mutations.

cytoplasm. The extra nuclear components of the living cell, containing mitochondria, plastids, sporesomes, etc. This, together with the nucleus, constitutes the protoplasm. The chemical constituents are chiefly proteins, plus a high percentage of water.

cytoplasmic trait. A genetic characteristic in which the genes are found outside the nucleus, in chloroplasts or mitochondria. Results in offspring inheriting genetic material from only one parent.

“Cytosar” [Pfizer]. TM for cytosine arabinoside.

cytosine. (2-oxo-4-aminopyrimidine).

CAS: 71-30-7. $\text{C}_4\text{H}_5\text{N}_3\text{O}$. A pyrimidine found in both ribonucleic and deoxyribonucleic acids and

certain coenzymes. One member of the base pair GC (guanine and cytosine) in DNA.

Properties: (Monohydrate) Lustrous platelets. Decomposes at 320–325C. Slightly soluble in water and alcohol; insoluble in ether.

Derivation: Isolation following hydrolysis of nucleic acids; organic synthesis.

Use: Biochemical research.

See base pair; nucleotide.

cytosine arabinoside. (Ara-C; 1-β-D-arabino-furanosyl cytosine).

CAS: 147-94-4. $C_9H_{13}N_3O_5$. A drug synthesized in 1969 at Salk Institute. It is useful in combating myelocytic leukemia in adults and has been approved by the FDA as a prescription drug.

cytosine monophosphate. See cytidylic acid.

cytoskeleton. Integrated system of molecules within eukaryotic cells which provides them with shape, internal spatial organization, motility, and it may assist in communication with other cells and the environment. Red blood cells, for instance, would be spherical instead of flat if it were not for their cytoskeleton.

cytosol. The aqueous phase of the cytoplasm (including dissolved solutes and enzymes, but excluding all organelles). It is most commonly the product of centrifugation at 100,000 xg for 1 h.

cytosylic acid. See cytidylic acid.

“Cytotec” [Searle]. TM for misoprostol.

Use: Drug.

“Cyttox” [Cytec]. TM for microbiocide. Controls the formation of slime in effluents, boiler waters, and processing streams.

Use: This microbiocide is active against a broad spectrum of microorganisms, including bacteria, fungi, yeasts, and algae.

“Cytrel” [Celanese]. TM for a tobacco substitute derived from cellulose. It is free from nicotine and has 15–30% of the tar content of tobacco.

“Cytrol” Amitrol-T TM for 3-amino-1,2,4-triazole liquid-formulation herbicide.

“Cyzine” [Cytec]. TM for 10% 2-acetyl-amino-5-nitrothiazole feed supplement.

D

D. Symbol for deuterium.

d. (D-) Prefix indicating the right-handed enantiomer of an optical isomer. Usually printed as a small capital letter.

See L; glyceraldehyde; asymmetry; enantiomer.

d-. (d-). Prefix indicating that a substance is dextrorotatory. A plus sign (+) is now preferred.

2,4-D. (2,4-dichlorophenoxyacetic acid).

CAS: 94-75-7. $\text{Cl}_2\text{C}_6\text{H}_3\text{OCH}_2\text{COOH}$.

Properties: White to yellow crystalline powder. Stable, mp 138C, bp 160C (0.4 mm Hg). Difficultly soluble in water or oils; soluble in alcohols.

Derivation: Reaction of 2,4-dichlorophenol and chloroacetic acid in aqueous sodium hydroxide.

Available forms: Sodium salt (60–85% acid), amine salts (10–60% acid), esters (10–45% acid). These forms are dispersible in water or oils (esters) and can be applied as sprays.

Grade: Technical.

Hazard: Irritant. Use may be restricted. TLV: 10 mg/m³.

Use: Selective weed killer and defoliant, fruit drop control.

DAA. Abbreviation for diacetone acrylamide.

DACE. See S,N-diacetylcysteine monoethyl ester.

“Dacron” [Du Pont]. TM for a polyester fiber made from polyethylene terephthalate. Available as filament yarn, staple, tow, and fiberfill.

Properties: D 1.38, mp 250C, tensile strength (psi) 4–5 g/denier (about 50–60 thousand psi), break elongation 10–36%, moisture regain 0.4%, high elastic recovery, good insect resistance. Difficult to ignite; self-extinguishing. Soluble in *m*-cresol (hot), trifluoroacetic acid, and *o*-chlorophenol.

Derivation: Reaction of dimethyl terephthalate and ethylene glycol. The resulting polymer is melt-extruded through a spinnerette and stretched.

Use: Textile fabrics and suitings, often combined with wool and other fibers; cordage; fire hose. See dimethyl terephthalate; terephthalic acid.

dactimicin sulfate.

CAS: 73245-91-7. mf: $\text{C}_{18}\text{H}_{36}\text{N}_6\text{O}_6 \bullet 2\text{H}_2\text{O}_4\text{S} \bullet \text{H}_2\text{O}$.

Hazard: A poison.

dactinomycin. (USAN for actinomycin D).

$\text{C}_{62}\text{H}_{86}\text{N}_{12}\text{O}_{16}$. An antibiotic produced from *Streptomyces*. Used in medicine.

Dakin reaction. Replacement of the aldehyde or acetyl groups in phenolic aldehydes or ketones by a hydroxyl group by means of hydrogen peroxide.

Dakin’s solution. An aqueous solution containing 0.5% sodium hypochlorite, used as an antiseptic, especially for wound treatment.

Dakin-West reaction. Reaction of α -amino acids with acetic anhydride in the presence of base to give α -acetamido ketones. The reaction occurs via the intermediate azlactone.

“Dalamar” [Du Pont]. TM for an azo yellow pigment.

dalapon.

CAS: 75-99-0. $\text{CH}_2\text{CCl}_2\text{COOH}$. Generic name for 2,2-dichloropropionic acid. The sodium salt (sodium 2,2-dichloropropionate) is commonly used.

Properties: (free acid) Liquid. Bp 185–190C (760 mm Hg), 90–92C (14 mm Hg), d 1.389 (22.8 4C). Very soluble in water and alcohol; soluble in ether. (sodium salt): Crystals; salty taste. Decomposes 174–176C. Corrosive to iron. Soluble in water; aqueous solutions hydrolyze above 70C.

Hazard: Strong irritant to eyes and skin. TLV: 1 ppm.

Use: Herbicide.

“Dalpad” [Dow]. TM for a coalescing agent, a stable, low-odor, low-temperature film-forming aid for polyvinyl acetate and acrylic latex paints.

dalton. A unit of mass equal to 1/12 the mass of the ¹²O.

See atomic weight.

Dalton, John. (1766–1844). The first theorist since the Greek philosopher Democritus to conceive of matter in terms of small particles. The founder of the atomic theory on which all succeeding chemical investigation has been based (1807). His essential concept of the indivisibility of the atom was not called into question until 1910 when radioactive decay was established by Rutherford. Dalton’s theories relating to pressures of gases and atomic combinations led to the basic generalizations stated in the law of multiple proportions, the law of constant composition, and the law of conservation of matter. See Priestley, Joseph; chemical laws.

Dalton’s law of partial pressures. In any mixture of gases each constituent exerts its pressure independently as if the other constituents were ab-

sent, and the solubility of mixed gases in liquid is proportional to the partial pressure of each.

“DAMA” [*Albemarle*]. TM for fatty dialkyl methylamines.

dammar. A group of tree-derived resins soluble in hydrocarbon and chlorinated hydrocarbon solvents, partially soluble in alcohols, insoluble in water. Used in colorless and overprint varnishes, cellulosic lacquers, alkyd baking enamels, and paper and textile coatings.

dandy roll. A light roller covered with wire cloth that rides on the formed sheet near the dry end of the fourdrinier wire. Its purpose is to provide a closer finish to the sheet as well as to impress a screen pattern on the upper surface of the sheet similar to that made by the wire on the under surface. Paper so marked is called “wove” in the trade. The dandy roll may also impress a pattern of parallel lines, in which case the paper is called “laid.” It is also used to apply watermarks.

dansyl. 1-dimethylaminonaphthalene-5-sulfonyl, derivatives of *N*-terminal amino acid residues.

dansyl chloride. (5-dimethylamino-1-naphthalenesulfonyl chloride; dimethylaminonaphthalenesulfonyl chloride)
Properties: Mw 269.8, mp 69–71C.

danthron. See 1,8-dihydroxyanthraquinone.

DAP. (1) Abbreviation for diallyl phthalate. (2) Abbreviation for diammonium phosphate. See ammonium phosphate, dibasic.

“Dapon” [*FMC*]. TM for a series of diallyl phthalate resins. Used for molding compounds, prepreps, and coatings.

dapsone (USAN and USP name). (4,4'-sulfonyldianiline).
CAS: 80-08-0. C₁₂H₁₂N₂O₂S
Properties: Crystals. Mp 176C, vap d 8.3. Nearly insoluble in water; soluble in acetone and alcohol.
Hazard: A poison.
Use: Used in leprosy treatment and veterinary medicine.

“Daran” [*Grace*]. TM for polyvinylidene chloride latexes used in packaging materials.
Use: Barrier coatings for packaging papers, paperboards, plastic films, and specialty saturants.

“Daratax” [*Grace*]. TM for specialty vinyl acetate acrylic copolymers.
Available forms: Latex emulsions.
Use: For paint, coating, adhesive, textile, and industrial applications.

Darcy’s law. The volumetric rate of flow of water through a sand filter bed is directly proportional to the cross-sectional area of the bed and the pressure difference across the bed, and inversely proportional to the thickness of the bed.

“Darex” [*Grace*]. TM for styrene-butadiene latexes and related vehicles.
Use: Textile coatings, rug backings, saturants, shoe products, coatings, paints, and adhesives.

“Dariloid” [*Kelco*]. TM for sodium alginate blends.

“Dariloid KB” [*Kelco*]. TM for propylene glycol alginate blends.

“Darling Ladies” [*Fu-E Life*]. TM for five supplements including collagen, herbs, vitamins, minerals and calcium.

dark reactions. See carbon fixation reactions.

Darzens condensation. Formation of α- and β-epoxy esters (glycidic esters) by the condensation of aldehydes or ketones with esters of α-haloacids; the corresponding thermally unstable glycidic acids yield aldehydes or ketones on decarboxylation.

Darzens-Nenitzescu synthesis of ketones.
Acylation of olefins with acid chlorides or anhydrides catalyzed by Lewis acids. When performed in the presence of a saturated hydrocarbon, the product is the saturated ketone.

Darzens synthesis of tetralin derivatives.
Cyclization of compounds such as α-benzyl-α-allylacetic acid by moderate heating in concentrated sulfuric acid to yield tetralin derivatives.

DAS. Abbreviation for 4,4'-diamino-2,2'-stilbenedisulfonic acid.

data warehouse. A collection of databases, data tables, and mechanisms to access the data on a single subject.

dating chemical. See chemical dating.

dativ bond. See coordinate bond.

daturic acid. See *n*-heptadecanoic acid.

daughter element. The element formed when another element undergoes radioactive decay. The latter is called the parent. The daughter may or may not be radioactive.

daunomycin. (daunorubicin).
CAS: 20830-81-3. C₂₇H₂₉NO₁₀. An antibiotic.
Properties: Reddish needles. Bp (decomposes)

190C. Soluble in water and methyl alcohol; insoluble in chloroform and benzene.

Hazard: A carcinogen (OSHA).

Davy, Sir Humphry. (1778–1829). Born in Cornwall, Davy was the first to isolate the alkali metals and recognize the identity of chemical and electrical energy. A pioneer in the science of electrochemistry, he carried out basic studies of electrolysis of salts and water, and his application of electricity to the decomposition of molten caustic potash led to the isolation of metallic potassium.

“Daxad” [Grace]. TM for anionic, polymer-type dispersing agents. Supplied as light-colored powders or aqueous solutions. Effective dispersant for aqueous suspensions of insoluble dyestuffs, polymers, clays, tanning agents, and pigments. **Use:** Manufacture of dyestuff pastes, textile backings, latex paints and paper coatings, retanning and bleaching of leather, dye resist in leather dyeing, dispersion of pitch in paper manufacture, prefloc prevention in the manufacture of synthetic rubber.

“Daypro” [Searle]. TM for oxaprozin.
Use: Drug.

“Dazzle” [Velocity]. TM for a dishwasher stable rinse agent not compatible with strong oxidizing agents.

Db. Symbol for dubnium.

2,4-DB. Abbreviation for 2,4-dichlorophenoxybutyric acid.

DBC. Abbreviation for 1,4-dichlorobutane.

DBCP. Abbreviation for 1,2-dibromo-3-chloropropane.

DBM. Abbreviation for dibutyl maleate.

DBMC. Abbreviation for 4,6-di-*tert*-butyl-*m*-cresol.

DBP. Abbreviation for dibutyl phthalate.

DBPP. See dibutylphenyl phosphate.

DBS. Abbreviation for dibutyl sebacate.

D & C. Product certified for use in drugs and cosmetics.

DCA. Abbreviation for deoxycorticosterone acetate.

DCCD. See *n,n'*-methanetetrayl biscyclohexanamine.

DCHP. Abbreviation for dicyclohexyl phthalate.

DCO. Abbreviation for dehydrated castor oil. See castor oil, dehydrated.

DCP. Abbreviation for dicapryl phthalate.

DCPA. Abbreviation for dimethyl-2,3,5,6-tetrachloroterephthalate.

DCPC. Abbreviation for dichlorophenyl methyl carbinol.
See di(*p*-chlorophenyl)ethanol.

DDB. Abbreviation for dodecylbenzene.

DDBSA. Abbreviation for dodecylbenzenesulfonic acid.
See sodium dodecylbenzenesulfonate.

DDD. Abbreviation for dichlorodiphenyl-dichloroethane.
See TDE.

DDDA. Abbreviation for dodecanedioic acid.

DDDM. Abbreviation for 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane.
See dichlorophene.

DDE. Abbreviation for dichlorodiphenyl-dichloroethylene, (ClC₆H₄)₂C:CCl₂. It is a degradation product of DDT found as an impurity in DDT residues.

2,4'-DDE. See 1,1-dichloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)ethylene.

DDFC. See gemicitabine.

DDH. Abbreviation for dichlorodimethylhydantoin.

DDM. (1) Abbreviation for diaminodiphenylmethane. (2) Abbreviation for *n*-dodecylmercaptan.

DDNP. Abbreviation for diazodinitrophenol.

DDP. Abbreviation for dodecyl phthalate.

DDQ. See 2,3-dichloro-5,6-dicyanobenzoquinone.

DDS. Abbreviation for diaminodiphenylsulfone.

DDT. (dichlorodiphenyltrichloroethane; dichlorophane; chlorophenothane; 1,1,1-trichloro-2,2-bis(chlorophenyl)ethane).
CAS: 50-29-3. (ClC₆H₄)₂CHCCl₃.

Properties: Colorless crystals or white to slightly off-white powder; odorless or with slight aromatic odor. Insoluble in water; soluble in acetone, ether, benzene, carbon tetrachloride, kerosene, dioxane, and pyridine. Not compatible with alkaline materials.

Derivation: Condensing chloral or chloral hydrate with chlorobenzene in presence of sulfuric acid.

Grade: Technical, purified, aerosol, USP, as chlorophenothane.

Hazard: Toxic by ingestion, inhalation, and skin absorption, especially in solution. Lethal dosage for humans estimated to be 500 mg/kg of body weight (solid material). Since DDT is not biodegradable and is ecologically damaging, its agricultural use in the U.S. was prohibited in 1973 (though its manufacturing for export is permitted). A confirmed human carcinogen. DDT can be used for a few specialized purposes, e.g., to combat the tussock moth.

TLV: 1 mg/m³. FDA tolerance: 5 ppm in foods.

Use: Insecticide for tobacco and cotton, pesticide (tussock moth).

DDVP. Abbreviation for dimethyl dichlorovinyl phosphate.

See dichlorovos.

DE. Abbreviation for dextrose equivalent.

DEA. Abbreviation for diethanolamine, also abbreviation for Drug Enforcement Administration, a government agency that replaced the Bureau of Narcotics.

DEAC. Abbreviation for diethylaluminum chloride.

deacetylndromedotoxin. See grayanotoxin iii.

deacetylhydroandromedotoxin. See grayanotoxin ii.

deacetyllyoniatoxin.

CAS: 28894-74-8. mf: C₂₀H₃₂O₆.

Hazard: A poison.

Dacon process. A method of converting hydrogen chloride to chlorine by oxidation of hydrogen chloride with oxygen at 400–500C over a copper-salt catalyst, 2HCl + O → Cl₂ + H₂O. It is a means of producing chlorine without caustic and of utilizing the large amounts of by-product hydrogen chloride from the chlorination of organic compounds. When conducted in the presence of an organic compound that reacts with the chlorine formed, it is known as oxychlorination, e.g., CH₂=CH₂ + 2HCl + O → CH₂ClCH₂Cl + H₂O.

DEAE. Abbreviation for diethylaminoethyl.

DEAE-cellulose. (diethylaminoethyl cellulose). A cellulose ether containing the group (C₂H₅)₂NCH₂CH₂ bound to the cellulose in an ether linkage. An anionic ion-exchange material.

Use: Chromatography.

DEAE-dextran. A diethylaminoethyl ether of dextran, an electropositively charged polymer.

deamination. The enzymatic removal of amino groups from biomolecules, such as amino acids or nucleotides.

deanol. See 2-dimethylaminoethanol.

debloming agent. A substance added to mineral oils to mask fluorescence. Nitronaphthalene and yellow coal tar dyes are among such products.

Debye characteristic temperature. A parameter relating to the lattice specific heat of a solid. The temperature at which the specific heat of a simple specific cubic crystal equals 5.67 calories per degree per mole.

Debye-Huckel theory. A theory advanced in 1923 for quantitatively predicting the deviations from ideality of dilute electrolytic solutions. It involves the assumption that every ion in a solution is surrounded by an ion atmosphere of opposite charge. Results deduced from this theory have been verified for dilute solutions of strong electrolytes, and it provides a means of extrapolating the thermodynamic properties of electrolytic solutions to infinite dilution.

Debye, Peter J. M. (1884–1966). A Dutch chemist and physicist who received the Nobel Prize in 1936 for his pioneer studies of molecular structure by X-ray diffraction methods. The interference patterns are still called Debye-Sherrer rings. He also made outstanding contributions to knowledge of polar molecules and to fundamental electrochemical theory.

See Debye-Huckel theory.

DEC. Abbreviation for β-diethylaminoethyl chloride hydrochloride.

decaborane.

CAS: 17702-41-9. B₁₀H₁₄.

Properties: Colorless crystals. Stable indefinitely at room temperature; decomposes slowly into boron and hydrogen at 300C. D 0.94 (25/4C), d 0.78 (100C), mp 99.7C, bp 213C. Slightly soluble in cold water; hydrolyzes in hot water; soluble in benzene, hexane, alcohol, carbon tetrachloride, toluene.

Derivation: By-product of the pyrolysis of diborane.

Grade: Technical 95%, high purity 99%.

Hazard: May explode in contact with heat or flame or with oxygenated and halogenated solvents. Ig-

nites in contact with oxygen. Absorbed by skin. TLV: 0.05 ppm.

Use: Catalyst, corrosion inhibitor, fuel additive, stabilizer, rayon delustrant, mothproofing agent, dye-stripping agent, reducing agent, fluxing agent, oxygen scavenger, propellant.

decachlorooctahydro-1,2,4-metheno-2H-cyclobuta[cd]-pentalen-2-one. See kepone.

decacafentin.

CAS: 15652-38-7. mf: $C_{28}H_{36}P \bullet C_{18}H_{15}BrClSn$.

Hazard: A poison by skin contact. Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: A pesticide.

decaglycerol. See polyglycerol.

decahydronaphthalene.

CAS: 91-17-8. $C_{10}H_{18}$. *cis* and *trans* forms are known.

Properties: Colorless liquid; aromatic odor. *cis*: d 0.8927 (20/4C), fp -43.2C, bp 194.6C, refr index 1.48113 (20C). *trans*: d 0.8700 (20/4C), fp -31.5C, bp 185.5C, refr index 1.46968 (20C). Flash p 136F (57.7C) (CC), autoign temp 482F (250C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: By treatment of naphthalene in a fused state (above 100C) with hydrogen in the presence of a copper or nickel catalyst.

Grade: Technical.

Hazard: Moderate fire risk. Irritant to eyes and skin.

Use: Solvent for oils, fats, waxes, resins, rubber, etc. Substitute for turpentine; cleaning machinery; stain-remover; shoe creams; floor waxes; cleaning fluids; lubricants; motor-fuel additive.

Δ-decalactone. Artificial flavoring for margarine. Approved by FDA.

“Decalin” [Du Pont]. TM for decahydronaphthalene.

decamethrin. (1R-(1-α(S*),3-α))-cyano(3-phenoxyphe-nyl)methyl-3-(2,2-dibromovinyl)-2,2-dimethylcyclopropanecarboxylate).

CAS: 52918-63-5.

Use: Insecticide.

decamethyltetrasiloxane. $C_{10}H_{30}O_3Si_4$.

Properties: Colorless liquid. Bp 195C, fp -70C, d 0.853, refr index 1.34. Soluble in light hydrocarbons and benzene; slightly soluble in alcohol. Stable over wide temperature range.

Use: Silicone oils, antifoam agent in lubricating oils.

n-decanal. (capraldehyde; capric aldehyde; n-decyl aldehyde; aldehyde C-10).

$CH_3(CH_2)_8CHO$.

Properties: Colorless to light-yellow liquid; floral-

fatty odor. D 0.831–0.838 (15C), refr index 1.427–1.431 (20C). Soluble in 80% alcohol, fixed oils, volatile oils, mineral oil; insoluble in water and glycerol. Combustible.

Derivation: Occurs in lemon grass, citronella, orange, and many other oils. Synthetically by oxidation of the corresponding alcohol or reduction of the acid.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

n-decane. (decyl hydride).

CAS: 124-18-5. $CH_3(CH_2)_8CH_3$.

Properties: Colorless liquid. D 0.7298, bp 174C, fp -30C, refr index 1.4114 (20C), flash p 111F (44C) (CC), autoign temp 482F (250C). Soluble in alcohol; insoluble in water. Combustible.

Grade: Technical, 95%, 99%, research.

Hazard: Moderate fire risk. Narcotic.

Use: Organic synthesis, solvent, standardized hydrocarbon, jet-fuel research.

decanedioic acid. See sebacic acid.

decanoic acid. See capric acid.

1-decanol. (n-decyl alcohol; alcohol C-10).

$CH_3(CH_2)_8CH_2OH$.

Properties: Colorless, water-white liquid; sweet odor. D 0.829, bp 232.9C, mp 6C, flash p 180F (OC) (82.2C); refr index 1.4372 (20C). Insoluble in water (25C); soluble in alcohol and ether. Combustible.

Derivation: Reduction of coconut-oil fatty acids, from C₉olefin and synthesis gas, by the Oxo process.

Grade: Technical, high purity.

Use: Plasticizers, detergents, synthetic lubricants, solvents, perfumes, flavorings, antifoam agent.

decanoyl chloride. (sometimes called caproyl chloride). $CH_3(CH_2)_8COCl$. Available in bottles, carboys, and drums. Intermediate, polymerization initiator.

decanoyl peroxide.

$CH_3(CH_2)_8C(O)OOC(O)(CH_2)_8CH_3$.

Properties: Soft, white granules. Mp 38–42C (decomposes). Insoluble in water and alcohol; soluble in ether and benzene.

Hazard: Strong oxidizer, fire risk in contact with organic materials.

Use: Polymerization catalyst.

decarboxylase. One of a group of enzymes in the living cell that removes carbon dioxide from various carboxylic acids without oxidation.

decay. Spontaneous disintegration of an unstable atomic nucleus (e.g., uranium, radium), with emission of α, β, and γ radiation, and eventual formation of another element of lower atomic weight.

See radioactivity; half-life.

cis-4-decenal.CAS: 21662-09-9. mf: C₁₀H₁₈O.**Properties:** Colorless to sltly yellow liquid; fatty, orangelike odor. D: 0.847, refr index: 1.442–1.444. Sol in alc, fixed oils; insol in water.**Hazard:** Low toxicity by ingestion and skin contact. A skin irritant.**Use:** Food additive.**1-decene.** See decylene.**decision theory.** A branch of applied mathematics based on probability theory and concerned with choice in a nondeterministic environment.**deck.** The platen of a compression molding press.**deckle.** A strip or bar placed along the sides of a fourdrinier wire to equalize the flow of the pulp slurry and give the sheet a straight edge. When a ragged or “deckle” edge is desired on certain specialty papers the strip is removed.**“Declomycin” [Cytel].** TM for dimethylchlor-tetracycline hydrochloride.**decoction.** Pharmaceutical term for a liquid produced by boiling one or more drugs in water and filtering.**decoic acid.** See capric acid.**decolorizing agent.** Any material that removes color by a physical or chemical reaction. Charcoals, blacks, clays, earths, or other materials of highly adsorbent character used to remove undesirable color, as from sugar, vegetable and animal fats and oils, etc. Also refers to bleaches involving a chemical reaction for removing color.**decomposition.** A fundamental type of chemical change. In simple decomposition, one substance breaks down into two simpler substances, e.g., water yields hydrogen and oxygen. In double decomposition, two compounds break down and recombine to form two different compounds, e.g., 2HCl + CaCO₃ → CaCl₂ + H₂CO₃. In some cases, heat is absorbed, and in others it is evolved. Decomposition may occur as a result of (1) reaction at room temperature (NaOH + HCl → NaCl + H₂O), (2) heating in air (C + H₂O → CO + H₂), (3) electrolysis (inorganic compounds), (NaCl_{aq} + e → Na⁺ + Cl⁻), (4) bacterial or enzymic action (fermentation, C₆H₁₂O₆ → 2C₂H₅OH + 2CO₂), (5) radiation (photodecomposition), as in the breakdown of chlorofluorocarbons in the upper atmosphere and of biodegradable polymers exposed to sunlight (6) heating in absence of air (thermal decomposition), in which carbonaceous raw materials such as coal and natural gas are converted into carbon and volatile organic compounds without undergoing combustion (coal → coke, coal, tar and coal gas). The term thermal decomposition is virtu-

ally synonymous with pyrolysis and destructive distillation.

See degradation; pyrolysis; destructive distillation.

decontamination. Removal of radioactive poisons from skin, clothing, equipment, etc. Skin can often be decontaminated by washing with soap and water; application of titanium dioxide paste or a saturated solution of potassium permanganate followed by a rinse of 5% sodium bisulfite is approved procedure. Contaminated clothing should not be sent to commercial laundries or burned in open incinerators. Water, steam, and detergents are effective on painted or metal surfaces.**decoquinat.**CAS: 18507-89-6. mf: C₂₄H₃₅NO₅.**Properties:** Crystals. Mp: 86–87°.**Use:** Drug (veterinary); food additive.**decortication.** Removal of the hard coating (cortex) from certain vegetables, nuts, fruits, etc., by either mechanical or manual means.

See hydraulic barking.

decyl acetate. (acetate C-10).CH₃(CH₂)₉OOCCH₃.**Properties:** Liquid; floral orange-rose odor. Bp 187–190C, d 0.862–0.864, refr index 1.426. Soluble in 80% alcohol, ether, benzene, glacial acetic acid; insoluble in water. Combustible.**Grade:** Technical.**Use:** Perfumery.**n-decyl alcohol.** See 1-decanol.**n-decyl aldehyde.** See *n*-decanal.**n-decylamine.** CH₃(CH₂)₉NH₂.**Properties:** Water-white liquid; amine odor. Boiling range 215–221C, d 0.797 (20/20C), refr index 1.437 (20C), flash p 210F (99C). Combustible.**Hazard:** An irritant.**decyl carbinol.** See 1-undecanol.**decylene.** (1-decene). C₁₀H₂₀ or H₂C:CH(CH₂)₇CH₃.**Properties:** Colorless liquid. D 0.7396 (20/4C), bp 172C, fp –66.3C, refr index 1.4220 (20C), flash p 130F (55C), autoign temp 455F (235C). Soluble in alcohol; insoluble in water. Combustible.**Grade:** Technical, high purity.**Use:** Organic synthesis of flavors, perfumes, pharmaceuticals, dyes, oils, resins.**decyl-hydride.** See *n*-decane.**decylic acid.** See capric acid.**decyl mercaptan.** C₁₀H₂₁SH.**Properties:** Liquid; strong odor. Fp –26C, bp 114C

(13 mm Hg), d 0.8410 (20/4C), refr index 1.4536 (20C). Combustible.

Grade: 95% (min) purity.

Use: Intermediate, synthetic rubber processing.

decyl-octyl methacrylate.

Use: Monomer for plastics, molding powders, solvent coatings, adhesives, oil additives, emulsions for textile, leather and paper finishing.

decylthiuronium chloride.

CAS: 5392-26-7. mf: $\text{C}_{11}\text{H}_{24}\text{N}_2\text{S}\cdot\text{ClH}$.

Hazard: A poison.

decyltriphenylphosphonium

bromochlorotriphenylstannate. See decaferntin.

“DEET” [Reilly]. (*N,N'*-diethyl-*n*-toluamide).

CAS: 134-62-3. TM for a broad-spectrum insect repellent.

“DEF” [Bayer]. TM for *S,S,S*-tributyl phosphorothioate.

defecation. Purification, used specifically in the industrial clarification of sugar solutions.

“Defenz” [Premier]. TM for a specially formulated homeopathic solution of iodized sodium chloride containing biologically important trace minerals.

Use: Food supplement.

deflagration. Very rapid autocombustion of particles of explosive as a surface phenomenon. Usually initiated by contact with a flame or spark, but may be caused by impact or friction. Deflagration is characteristics of low explosives.

See detonation.

defoaming agent. (antifoaming agent). A substance used to reduce foaming due to proteins, gases, or nitrogenous materials that may interfere with processing. Examples include 2-octanol, sulfonated oils, organic phosphates, silicone fluids, dimethylpolysiloxane, etc. For restrictions on their use in foods, see FDA regulations.

defoliant. An herbicide that removes leaves from trees and growing plants. They may be either organic or inorganic. Some examples: (organic) phenoxacetic acids, trichloropicolinic acid, carbamates, and nitro compounds; (inorganic) arsenic compounds, cyanides, thiocyanates, and chlorates. Several of the more persistent types have been used in military operations. Many defoliantes are toxic. See 2,4-D; 2,4,5-T; Agent Orange.

DEG. (1) Abbreviation for diethylene glycol. (2) Abbreviation for diethanolglycine.

degenerate code. A code in which a single element in one language is specified by more than one element in a second language.

degenerate system. A system having several distinct wave functions corresponding to the same energy level.

DEGN. Abbreviation for diethylene glycol dinitrate.

degradation. A type of decomposition characteristic of high molecular weight substances such as proteins, polymers, branched-chain sulfonates, etc. It may result from oxidation, heat, sunlight, solvents, bacterial action, or, in the case of body proteins, infectious microorganisms. See biodegradability; decomposition.

degras. Crude wool grease obtained by solvent washing of wool. It is a dark-brown semisolid with strong unpleasant odor and high water-absorbing capacity. A type known as moellen degreas is a by-product of tanning chamois leather with various fish oils. The chief use of degreas is as the source of lanolin; minor uses are in leather dressing and printing inks.

Available forms: Neutral, common, technical.

degree of polymerization. (DP). The number of monomer units in an average polymer molecule in a given sample. For natural cellulose it is about 3000, but in most polymers it is still higher. It can be controlled by appropriate processing techniques. DP is an important factor in plastics technology, as it directly affects the viscosity of solutions and properties of the end product. See polymerization; shortstopping agent.

degree of substitution. The average number of (alcohol) groups per polymer that have been replaced.

degrees of freedom. The number of variables (e.g., pressure, temperature, or concentration) that can be changed without producing a change in the number of phases in a system. The number of these variables must be fixed arbitrarily to completely define the system.

deguelin. $\text{C}_{23}\text{H}_{22}\text{O}_8$.

Properties: Greenish powder. Mp 170C. Soluble in alcohol; insoluble in water.

Hazard: Toxic by inhalation; skin irritant.

Use: Insecticide.

“DEH” [Dow]. TM for a variety of polyamines and polyamides suitable for curing epoxy resins.

dehairing. See unhairing.

dehumidification. The removal of moisture (water vapor) from air. Also sometimes extended to analogous processes of removing a vapor from a gas mixture.

“Dehydran 1208” [Cognis]. TM for coatings based on polyester polyacrylates, PUR, and epoxy resins.

Use: Solvent-free water-borne and solvent-borne coatings, contains silicones.

“Dehydran 1293” [Cognis]. TM for a defoamer for coatings based on polymer emulsions.

Use: Application to curtain coating.

“Dehydratine” [Grace]. TM for bituminous water barrier coatings.

dehydration.

(1) Removal of 95% or more of the water from a material, usually a foodstuff, by exposure to high temperature by various means. Its primary purpose is to reduce the volume of the product, increase its shelf life, and lower transportation costs. Special equipment for dehydration includes tunnel dryers, vacuum (shelf) dryers, drum dryers, etc., in which the bulk product is exposed to a hot-air environment. Another method is spray drying, in which a liquid product is ejected from a nozzle into hot air; dried milk and egg white are prepared in this way. The term *dehydration* is not applied to loss of water by evaporation or sun drying. See drying.

(2) Removal of one or more molecules of H₂O from a chemical compound, e.g., of ethanol to ethylene.

“Dehydrite” [Thomas]. TM for anhydrous granular magnesium perchlorate.

Use: A desiccant.

dehydroabietic acid. C₂₀H₂₈O₂. Solid, used as a basis for thermoplastic resins.

dehydroacetic acid. (DHA, methylacetopyrnone).
CAS: 520-45-6.

$\text{CH}_3\text{C}:\text{CHC}(\text{O})\text{CH}(\text{COCH}_3)\text{C}(\text{O})$.

Properties: Colorless crystals; odorless; tasteless. Mp 108.5C, bp 270C. Partially soluble in acetone and benzene; insoluble in water. Highly reactive. Combustible.

Derivation: (1) By action of *N*-bromosuccinimide on ketene dimer, (2) by strong heating of acetoacetic ester.

Grade: Technical, FCC.

Hazard: Toxic by ingestion.

Use: Fungicide and bactericide, plasticizer, chemical intermediate, medicated toothpastes.

5,6-dehydro-*n*-acetylloine.

CAS: 194205-01-1. mf: C₁₀H₁₄N₂O₂.

Hazard: A poison.

Source: Natural product.

dehydroascorbic acid.

OCOCOC(=O)CHCH₂OCH₂OH. The oxidized form of ascorbic acid with the same vitamin activity.

Properties: Needles. Mp 225C (decomposes). Acid soluble in water at 60C.

Derivation: Synthesized from ascorbic acid.

Use: Nutrition, medicine.

7-dehydrocholesterol. (provitamin D₃).

CAS: 434-16-2. C₂₇H₄₄O•H₂O. A sterol found in the skin of humans and animals that forms vitamin D₃ upon UV irradiation.

Properties: Slender platelets from ether-methanol. Mp 150C. Insoluble in water; soluble in organic solvents.

Use: Nutrition, medicine, biochemical research. See cholecalciferol.

dehydrocholic acid. C₂₄H₃₄O₅. A polycyclic compound.

Properties: White, fluffy powder, odorless; bitter taste. Mp 231–240C. Almost insoluble in water; slightly soluble in ether and alcohol; soluble in chloroform, glacial acetic acid, and solutions of alkali hydroxides and carbonates.

Derivation: Oxidation of cholic acid.

Grade: NF.

Use: Medicine, pharmaceutical intermediate.

dehydrocurdione.

CAS: 38230-32-9. mf: C₁₅H₂₂O₂.

Hazard: A poison.

dehydrocyclodimerization.

A method of converting paraffin (straight-chain) hydrocarbons containing from three to five carbon atoms into aromatic (ring-type) hydrocarbons. Its main steps are (1) removal of hydrogen from the paraffins; (2) dimerization of the resulting olefins; (3) aromatization of the dimerized olefins and diolefins; and (4) isomerization or transalkylation to C₈ to C₁₀ alkylbenzene isomers. Metallic catalysts are essential in some or all of these steps. The process is not in large-scale use.

dehydroepiandrosterone acetate.

See 3-β-hydroxyandrost-17-one acetate.

dehydrogenases. Enzymes catalyzing the removal of pairs of hydrogen atoms from their substrates.

See oxidase.

dehydrogenation. The process whereby hydrogen is removed from compounds by chemical means. Dehydrogenation of primary alcohols yields the group of compounds called aldehydes. It is considered to be a form of oxidation, as two hydrogen atoms, each of which contains an electron, have been removed. An example is the reaction $\text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_3\text{CHO} + \text{H}_2$

11-dehydro-17-hydroxycorticosterone. See cortisone.

dehydroisoandrosterone. See DHEA.

dehydrothio-*p*-toluidine.

Properties: Long, yellowish, iridescent needles. Mp 191C, bp 434C. Solutions have a violet-blue fluorescence. Soluble in alcohol; very slightly soluble in water.

Derivation: By heating *p*-toluidine and primuline base with sulfur and separation from the primuline base by distillation in vacuo.

Use: Dyestuffs, intermediate.

de-icing compound. See calcium chloride; sodium chloride; alcohol.

de-inking. The removal of printing inks from paper by use of strong alkaline solutions such as soda-ash liquor, caustic soda, or lime which dissolve varnish and free the ink carbon. Removal of the carbon is accomplished by use of colloidal agents such as talc or bentonite and by mechanical agitation with water.

deionizing. (demineralizing). A method for purifying water that involves two steps. First, soluble salts are converted into acids by passing through a hydrogen exchanger. Second, they are removed by an acid adsorbent or synthetic resin.

Deisenhofer, Johann. (1943–). Awarded Nobel Prize for chemistry in 1988, along with Huber and Michel, for work that revealed the three-dimensional structure of closely linked proteins that are essential to photosynthesis. Doctorate awarded in 1974 by Max Planck Institute for Biochemistry, Germany.

deKhotinsky cement. A thermoplastic adhesive mixture of shellac and pine tar. It is not attacked by water, sulfuric acid, nitric acid, hydrochloric acid, carbon disulfide, benzene, gasoline, or turpen-

tine; very little affected by ether, chloroform, alkalis, but readily dissolved by ethanol.

“Delac” [Uniroyal]. TM for a series of delayed-action rubber accelerators.

Delapine reaction. Preparation of primary amines by reaction of alkyl halides with hexamethylenetetramine followed by acid hydrolysis of the formed quaternary salts.

deletion. A loss of part of the DNA from a chromosome; can lead to a disease or abnormality. See chromosome; mutation.

deletion map. A description of a specific chromosome that uses defined mutations—specific deleted areas in the genome—as biochemical signposts, or markers for specific areas.

deletion mutation. A mutation resulting from the deletion of one or more nucleotides from a gene.

delhi hard. A ferrous alloy (d 7.75, mp 500C) containing, in addition to iron, 16.5–18% chromium, 1.1% carbon, 0.75–1% silicon, 0.35–0.5% manganese. It is resistant to cold ammonium hydroxide in all concentrations and to mine and seawaters and moist sulfurous atmospheres.

deliquescent. Tending to absorb atmospheric water vapor and become liquid. The term refers specifically to water-soluble chemical salts in the form of powders that dissolve in the water absorbed from the air. Such salts should be kept closely stoppered or otherwise enclosed. See hygroscopic.

“Delrin” [Du Pont]. TM for a type of acetal resin. White and colors available. Also supplied as pipe and fittings. Thermoplastic.

Use: Injection-molded and extruded parts, door handles, bushings, other mechanical items; underground pipe; automotive parts.

“Delsan” [Du Pont]. TM for fungicide-insecticide seed treatment containing 60% thiram and 15% dieldrin.

Hazard: Toxic by ingestion and inhalation.

delta acid. See Casella's acid F.

delustrant. A substance used to produce dull surfaces on a textile fabric. Chiefly used are barium sulfate, clays, chalk, etc. They are applied in the finishing coat.

De Mayo reaction. Synthesis of 1,5-diketones by photoaddition of enol derivatives of 1,3-diketones to olefins, followed by a retro-aldol reaction.

4-demethoxydaunorubicin hydrochloride.CAS: 57852-57-0. mf: $C_{26}H_{27}NO_9 \cdot ClH$.**Hazard:** A poison.**5-*o*-demethylavermectin ala.** See avermectin b_{1a} .**1-demethyltoxoflavine.**CAS: 5016-18-2. mf: $C_6H_5N_5O_2$.**Hazard:** A poison.**demeton.** (Systox).CAS: 8065-48-3. $C_8H_{19}O_3PS_2$. A mixture of *O,O*-diethyl-*O*-2-(ethylthio) ethyl phosphorothioate (demeton-*O*) and *O,O*-diethyl-*S*-2-(ethylthio)ethyl phosphorothioate (demeton-*S*).**Properties:** (Mixture) Pale-yellow liquid. Bp 134C (2 mm Hg), d 1.118. Slightly soluble in water; soluble in most organic solvents.**Hazard:** Toxic by skin absorption; cholinesterase inhibitor. Use may be restricted. TLV: 0.01 ppm.**Use:** Systemic insecticide (absorbed by plant, which then becomes toxic to sucking and chewing insects).**demeton methyl.** (*O,O*-dimethyl-*S*,2-(ethylthio)ethyl phosphorothiolate).

CAS: 8022-00-2.

Use: Systemic insecticide.**demineralization.** Removal from water of mineral contaminants, usually present in ionized form. The methods used include ion-exchange techniques, flash distillation, or electrodialysis. Acid mine wastes may be purified in this way, thus alleviating the pollution problem.

See desalination; deionizing.

Demjanov rearrangement. Deamination of primary amines by diazotization to give rearranged alcohols.**Democritus.** A Greek philosopher (approximately 465 bc). The first thinker of record to conceive of matter as existing in the form of small indivisible particles, which he called atoms. However, this concept was overshadowed by Aristotle's theories, and it was not until some 2000 years later that it was developed by John Dalton in England—an astonishing length of dormancy for one of the most creative ideas in the history of science.

See Dalton, John.

demulsification. The process of destroying or "breaking" an unwanted emulsion, especially water-in-oil types occurring in crude petroleum. Both chemical and physical means are used. Chemical means include addition of polyvalent ions to neutralize electrical charges or of a strong acid; physical means include heating, centrifuging, or use of high-potential alternating current.

See emulsion; nonylphenol.

demurrage. A fee imposed on shippers of chemicals and other products by the railroads for retaining freight cars at loading docks for more than a given period of time (usually 24 hr).**"DEN" [Dow].** TM for a series of epoxy novolacs for multifunctional resins for all uses where maximum chemical or heat resistance is required.**denatonium benzoate.** See "Bitrex" [*Macfarlan*].**denaturant.** See alcohol, denatured.**denaturation.** A change in the molecular structure of globular proteins that may be induced by bringing a protein solution to its boiling point or by exposing it to acids or alkalies, or to various detergents. Denaturation reduces the solubility of proteins and prevents crystallization. It involves rupture of hydrogen bonds so that the highly ordered structure of the native protein is replaced by a looser and more random structure. It is usually irreversible but in some cases is reversible, depending on the protein and the treatment involved.

Alteration of the specific native conformation of a polypeptide chain, protein, or nucleic acid. See degradation.

denatured alcohol. See alcohol, denatured.**dendrimer.** A tree-like highly branched polymer molecule (Greek dendra = tree). Dendrimers are synthesized from monomers with new branches added in discrete steps ('generation') to form a tree-like architecture. A high level of synthetic control is achieved through step-wise reactions and purifications at each step to control the size, architecture, functionality, and monodispersity.**denier.** A unit used in the textile industry to indicate the fineness of a filament. If 9000 m of a filament weighs 1 g, the filament is 1 denier; if 10,000 m weighs 1 g, the filament is 1 grex. Sheer women's hosiery usually runs from 15 to 10 denier.**"Denomega" [Borregaard].** TM for nutritional oils from marine raw materials.**Use:** In foods and supplements.**de novo pathway.** Pathway for synthesis of a biomolecule from simple precursors, such as synthesis of purine nucleotides from Asp, CO₂, Gly, formate and Glu: Distinguish from a salvage pathway.**"Denox" [Carus].** TM for "300 Highlighter" series, a group of products.**Use:** Treating denim with stone washing and other finishes.

density. Mass per unit volume expressed in grams per cubic centimeter for solids and liquids, and usually as grams per liter for gases. Densities of some common substances follow:

	g/cc	g/L
sulfur	2.06	
aluminum	3.7	
sodium	0.967	
glycerol	1.27	
water*	1.0	
chlorine	3.214	
carbon dioxide		1.977
air**		1.293
oxygen		1.429
hydrogen		0.0899

*Basis of comparison for solids and liquids. **Basis of comparison for gases. For discussion of density vs. specific gravity, see specific gravity. Apparent density is the mass of a unit volume of powder, usually expressed in grams per cubic centimeter, determined by a specified method (MPA definition, MPA Standard 9-50T). *Bulk density* is an alternative term for *apparent density*. See current density.

“Deo-Base” [*Crompton & Knowles*]. TM for light petroleum distillate, superfine grade of kerosene without its objectionable odor.

deodorant. A substance used to remove or mask an unpleasant odor. It may or may not have a distinctive odor of its own. Deodorants act (1) by adsorption (activated carbon, charcoal, chlorophyllin), (2) by replacement (pine oil or other perfume), (3) by neutralization (aluminum chlorohydrate), and (4) by oxidation or hydrogenation, e.g., of fish oils. The cosmetic industry supplies a wide variety of deodorants and antiperspirants, chiefly based on neutralization. Mouthwashes and breath “sweeteners” often contain calcium iodate, thymol, peppermint, or a similar substance to mask or replace odors. See odor; cosmetic.

deoxidizer. An agent that removes oxygen from a compound or from a molten metal.

deoxy-. Preferred prefix indicating replacement of hydroxyl by hydrogen in the parent compound. The meaning is the same as that of desoxy, and the two prefixes are used interchangeably.

deoxyanisoin. (4'-methoxy-2-(*p*-methoxyphenyl)acetophenone). $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_2\text{C}_6\text{H}_4\text{OCH}_3$.
Properties: Off-white to buff, crystalline powder; sweet, faint, cinnamon-like odor. Mp 110–112C.
Use: Intermediate.

deoxybenzoin. (α -phenylacetophenone, benzyl phenyl ketone). $\text{C}_6\text{H}_5\text{CH}_2\text{COC}_6\text{H}_5$.

Properties: Colorless crystals. Mp 53–60C. Slightly soluble in hot water; soluble in alcohols and ketones.
Use: Intermediate.

deoxycholic acid. (desoxycholic acid).
CAS: 83-44-3. $\text{C}_{24}\text{H}_{40}\text{O}_4$. A bile acid, contains one less hydroxyl group than cholic acid.

Properties: Crystals. Mp 172–173C. Not precipitated by digitonin. Practically insoluble in water and benzene, slightly soluble in chloroform and ether, soluble in acetone and solutions of alkali hydroxides and carbonates, freely soluble in alcohol. Also available as sodium salt. Forms coordination compounds with fatty acids.

Derivation: Isolation from bile, organic synthesis.
Grade: Technical, FCC (as desoxycholic acid).

Use: Medicine, precursor for organic synthesis of cortisone, emulsifying agent in foods (up to 0.1%).

deoxycorticosterone. (4-pregnen-21-ol-3,20-dione; 11-deoxycorticosteroid).

CAS: 64-85-7. $\text{C}_{21}\text{H}_{30}\text{O}_3$. An adrenal cortical steroid hormone. Active in causing the retention of salt and water by the kidney.

Properties: Crystalline plates. Mp 141–142C. Freely soluble in alcohol and acetone.

Derivation: From adrenal cortex extract, synthesis from other steroids.

Use: Medicine (usually as acetate).

deoxyribonuclease. One of a group of enzymes that cause the splitting of deoxyribonucleic acids. Pancreatic deoxyribonuclease, the most widely studied, cleaves the acid at the 3'-phosphate bond. Other deoxyribonucleases cleave the 5'-phosphate bond.

deoxyribonucleic acid. (DNA). A complex sugar-protein polymer of nucleoprotein that contains the complete genetic code for every enzyme in the cell. It occurs as a major component of the genes, which are located on the chromosomes in the cell nucleus. The DNA molecule is a unique and intricate structure first elucidated in England by the chemists Crick and Watson in 1953. It is composed of from 3000 to several million nucleotide units arranged in a double helix containing phosphoric acid, 2-deoxyribose, and the nitrogenous bases adenine, guanine, cytosine, and thymine. The spiral consists of two chains of alternating phosphate and deoxyribose units in continuous linkages. The nitrogenous bases project toward the axis of the helix and are joined to each other by hydrogen bonds. Adenine always unites with thymine, and cytosine

with guanine. The complementarity of the bases on the joined chains allows each chain to act as a template for replication of the other when the chains are separated, thus producing two new strands of DNA. The sequence of the bases on the chains varies with the individual, and it is this sequence that expresses the genetic code. DNA works in conjunction with ribonucleic acid (RNA). Synthesis of self-replicating DNA was reported in 1967. Elucidation of the structure of the DNA molecule is under continuing research. Studies on synthetic DNA indicate that the helix may have a left-handed rather than a right-handed form. See ribonucleic acid; gene; nucleic acid; genetic code; replication; recombinant DNA.

deoxyribonucleotides. Nucleotides containing 2-deoxy-D-ribose as the pentose component.

D-deoxyribose. $\text{CH}_2\text{OHCH}_2\text{OCH}_2\text{OCH}_2\text{CHO}$. A five carbon-atom sugar that is unusual in that there is no oxygen atom attached to the second carbon atom. It is a constituent of deoxyribonucleic acid.

DEP. Abbreviation for diethyl phthalate.

2,4-DEP. (tris-(2,4-dichlorophenoxy)ethyl phosphite). An herbicide.

“Depakene” [Abbott]. TM for sodium valproate.

Department of Transportation. (DOT)

The Federal agency that has been responsible since 1967 for the regulation and control of transportation of hazardous materials. Website: <http://www.dot.gov/>

DEPC. (1) Abbreviation for diethyl pyrocarbonate. (2) Abbreviation for γ -diethylaminopropyl chloride hydrochloride.

dephlegmation. Partial condensation of vapor from a distillation operation to produce a liquid richer in higher-boiling constituents than the original vapor. The residual vapor is richer in the lower-boiling constituents.

depilatory. A substance used to remove hair from skin. Sulfides are largely used for this purpose. The leather industry uses large amounts of sodium sulfide for unhairing hides. The cosmetic industry also offers various sulfide preparations for removing unwanted body hair.

depropine citrate. See elargin.

depurator. A system of filters, scrubbers, or electrostatic devices.

Use: For removing impurities from the air or from solvents.

dequalinium chloride. $\text{C}_{30}\text{H}_{40}\text{Cl}_2\text{N}_4$.

Properties: Crystals. Mp 326C. Soluble in water.

Use: Bacteriostat, antiseptic.

“DER” [Dow]. TM for a series of epoxies including liquid resins, solid resins and solutions, flexible resins, and flame-retardant resins.

“Deraspan” [Dow]. TM for a group of epoxy resins and curing agents.

derived unit. A unit derived from the fundamental units of time, length, and mass, such as units of speed or density.

“Dermasoft” [Lucas Meyer]. TM for skin care products.

derris root. The root of the shrubs *Derris elliptica* and *D. malaccensis*. Chief active constituent is rotenone. Used as an insecticide.

DES. Abbreviation for diethylstilbestrol.

16-desacetyl-16-anhydroacoschimperoside

p.

CAS: 20819-47-0. **mf:** $\text{C}_{30}\text{H}_{44}\text{O}_8$.

Hazard: A poison.

Source: Natural product.

desalination. (Desalting). Any of several processes for removing dissolved mineral salts from oceanwater and other brines. The most important are (1) Distillation with reuse of vapors by compressive distillation or multiple-effect evaporation. Solar distillation has been in use on the Greek islands for some years. (2) Electrodialysis, an ion-exchange method more efficient for purification of brackish

water than seawater (see demineralization). (3) Reverse osmosis, which uses pressure applied to the surface of a saline solution that is separated from pure water by a semipermeable membrane that ions cannot easily penetrate.

See osmosis. The pressure forces the water component of the solution through the membrane, thus effectively separating the components of the solution. Membranes used are cellulose acetate or graphitic oxide. This method is planned for use in a desalination plant proposed for the brackish waters of the lower Colorado River that is said to be the world's largest. It is also used in a Potomac River installation. (4) Flash distillation appears to be the most effective method so far developed for seawater desalination, accounting for about 90% of world production capacity.

There are approximately 350 desalination plants in the U.S., producing over 65 million gallons of fresh water a day. Development is under control of the Office of Saline Water, Dept. of Interior.

desaturases. Enzymes (dehydrogenases) that catalyze the introduction of double bonds into the hydrocarbon portion of fatty acids.

“Descote” [Partical Dynamics].

CAS: 98-92-0. TM for niacinamide tablet formulations.

Use: As a taste masker.

desert. A terrestrial environment that receives less than about 25 cm (10 inches) of rain per year, and consequently supports only a few kinds of plants.

desiccant. A hygroscopic substance such as activated alumina, calcium chloride, silica gel, or zinc chloride. Such substances adsorb water vapor from the air and are used to maintain a dry atmosphere in containers for food packaging, chemical reagents, etc.

See molecular sieve.

desiccator. A tightly closed vessel containing a desiccant. Used in the laboratory for drying test materials. Some types have partial vacuum.

“Desicote” [Glaxo-SmithKline]. TM for a mixture of hydrophobic monomers stabilized in chlorinated hydrocarbon and aromatic solvents. Rapidly decomposes on contact with sorbed water on glass surfaces, leaving surface water-repellent.

desiodothyroxine. See thyronine.

desmethylcyproheptadine.

CAS: 14051-46-8. mf: C₂₀H₁₉N.

Hazard: A reproductive hazard.

n-desmethyldamoxifen.

CAS: 31750-48-8. mf: C₂₅H₂₇NO.

Hazard: A reproductive hazard.

s-desmethylozoplicone.

CAS: 151776-26-0. mf: C₁₆H₁₅ClN₆O₃.

Hazard: A poison.

“Desmodur” [Bayer AG]. TM for a group of isocyanates and isocyanate prepolymers for urethane coatings, foams, adhesives, etc.

“Desmophen” [Bayer AG]. TM for a group of polyesters and polyethers for cross-linking with isocyanates.

“Desmophen A” [Bayer AG]. (urethane acrylics). TM for polyacrylate resins.

Use: In chemical- and weather-resistant polyurethane coatings.

“DeSolite” [DSM China]. TM for a product for application to artificial grass.

desolvation. In aqueous solution, the release of bound water surrounding a solute, such as an enzyme.

desorption. The process of removing an adsorbed material from the solid on which it is adsorbed. See adsorption. Desorption may be accomplished by heating, by reduction of pressure, by the presence of another more strongly adsorbed substance, or by a combination of these means.

desoxy-. See deoxy-

desoxycholate amphotericin b. See fungizone intravenous.

desoxycholic acid. FCC name for deoxycholic acid.

d-desoxyephedrine. See *d*-1-phenyl-2-methylaminopropan.

Despretz law. States that the temperature of maximum density of water is lowered from 4C on the addition of a solute by an amount proportional to the concentration of the solution.

destructive distillation. An operation in which a highly carbonaceous material, such as coal, oil shale, or tar sands, is subjected to high temperature in the absence of air or oxygen, resulting in decomposition to solids, liquids, and gases. As the solid end product is carbon, the term *carbonization* is often used. Other terms with the same general meaning as destructive distillation are *pyrolysis* and *thermal decomposition*. Destructive distillation of coal is carried out in the temperature range of 350–1000C, yielding coal tar, coal gas, and char (coke, carbon).

detergent. Any substance that reduces the surface tension of water, specifically a surface-active agent that concentrates at oil-water interfaces, exerts emulsifying action, and thus aids in removing soils. The older and still widely used types are the common sodium soaps of fatty acids, which are relatively weak. The much stronger synthetic detergents are classed as anionic, cationic, or nonionic, depending on their mode of chemical action. The latter functions by a hydrogen-bonding mechanism. The most widely used group comprises linear alkyl sulfonates (LAS), often aided by "builders." LAS are preferable to alkyl benzene sulfonates (ABS) because they are readily decomposed by microorganisms (biodegradable). LAS are straight-chain compounds having 10 or more carbon atoms in the chain. The branched-chains characteristic of ABS resist decomposition; these have been largely replaced by LAS because of water pollution.

See surface tension; emulsion; wetting agent; soap (1); alkylate (3); biodegradability; eutrophication; builder detergent.

"Detergent 8" [Alconox].r TM for aqueous detergents.

Properties: Liquid.

Use: A detergent that removes rosins, fluxes, and resins from printed circuit boards prior to coating. It is phosphate-free and biodegradeable.

determinate error. An error that can be identified and thus corrected or reduced.

"Detojet" [Alconox]. TM for a low foaming, heavy duty alkaline detergent.

Use: For use in labware washers, parts washers, sprays and ultrasolic systems.

detonation. The extremely rapid, self-propagating decomposition of an explosive accompanied by a high-pressure-temperature wave that moves at 1000–9000 msec. May be initiated by mechanical impact, friction, or heat. Detonation is a characteristic of high explosives, which vary considerably in their sensitivity to shock, nitroglycerin being one of the most dangerous in this respect.

See explosive, high; deflagration.

deuterium. (heavy hydrogen). Symbol D. An isotope of hydrogen whose nucleus contains one neutron and one proton and is therefore twice as heavy (aw 2.014) as the nucleus of normal hydrogen. The ratio in nature is 1 part deuterium to 6500 parts normal hydrogen.

See deuteron.

Properties: Almost identical with hydrogen. D 2.0 (H=1), fp -254.4C (121 mm Hg), bp -249.5C , autoign temp 1085F. Noncorrosive.

Derivation: Electrolysis of high-purity heavy water, fractional distillation of liquid hydrogen.

Grade: 98, 99.5 atom %.

Hazard: Highly flammable and explosive. Explosive range 4–74%.

Use: Bombardment of atomic nuclei, tracer element, thermonuclear reactions.

See deuterio-; heavy water.

deuterium oxide. See heavy water.

deutero- (deuterated). Prefix indicating that one or more of the hydrogens in a compound is the deuterium isotope. Example: deuteroborane solution, used for labeling olefinic unsaturation. The adjective form, deuterated, has the same meaning. Deuterated ethylene, sometimes written ethylene-1,1-D₂, has the formula CH₂:CD₂.

deuteron. (deuteron). A nuclear particle having mass and a positive charge of 1, identical with the nucleus of the deuterium atom.

Devarda's metal. (Devarda's alloy).

Properties: Gray powder. Contains copper, aluminum, and zinc in the proportion of 50:45:5. Slightly soluble in hydrochloric acid.

Grade: Reagent (20-mesh and finer).

Use: Analysis (testing for nitrogen).

developer. (1) A term applied in the dyeing industry to certain organic compounds that in combination with some other organic compound already deposited upon the fiber will develop a colored compound, or if united with a dye already upon the fiber will form a new coloring matter possessing a more desirable or faster color.

(2) A substance used in photography to convert a latent image to a visible one by chemical reduction of a silver compound to metallic silver more rapidly in the portions exposed to light than in those not exposed. Such reducing agents as hydroquinone, pyrogallol, and *p*-phenylenediamine are used.

See photographic chemistry.

devitrification. Formation of unwanted crystals of silica on heating or cooling. The term is used largely in the glass industry. The tendency to devitrify results from the unstable nature of glasses. It usually occurs if the melt is cooled too slowly.

De Vry's reagent. Contains molybdate ion.

Use: Test reagent for alkaloids.

devulcanization. Technically a misnomer, since vulcanization is irreversible. The term is used to describe the softening of a vulcanizate caused by heat and chemical additives during reclaiming.

dewatering. Removal of gross water from a suspension or sludge by filtration, expression, centrifugation, or clarification. Paper pulp is dewatered by the fourdrinier wire; rubber latex may be concentrated in a centrifuge, in which half or more of the water is removed. Sludges and organic wastes are also

dewatered centrifugally.
See drying; dehydration; centrifugation; clarification.

dew of death. See β -chlorovinylchloroarsine.

dew point. The temperature at which air is saturated with moisture, or in general the temperature at which a gas is saturated with respect to a condensable component.

“Dexedrine” [Glaxo-SmithKline]. TM for dextroamphetamine sulfate.

dexniguldipine hydrochloride. See (-)-niguldipine hydrochloride.

“Dexon” [Bayer]. TM for *p*-dimethylamino-benzenediazo sodium sulfonate.

dextran. (macrose). Certain polymers of glucose that have chain like structures and molecular weights up to 200,000. Produced from sucrose by *Leuconostoc* bacteria. Occurs as slimes in sugar refineries, on fermenting vegetables, or in dairy products. Clinical dextran is standardized to a low molecular weight (75,000); made by partial hydrolysis and fractional precipitation of the high molecular weight particles.

Properties: Stable to heat and storage. Soluble in water making very viscous solutions. Solutions can be sterilized. Combustible.

Use: Blood plasma substitute or expander, confections, lacquers, oil-well drilling muds, filtration gel, food additive.

dextranase. A enzyme reported to be effective in reducing dental caries.

dextran sulfate. See sodium dextran sulfate.

dextrin. (starch gum). A group of colloidal products formed by the hydrolysis of starches. Industrially, it is made by treatment of various starches with dilute acids or by heating dry starch. The yellow or white powder or granules are soluble in boiling water and insoluble in alcohol and ether.

Use: Adhesives, thickening agent, sizing paper and textiles, substitute for natural gums, food industry, glass-silvering compositions, printing inks, felt manufacture, substitute for lactose in penicillin manufacture, fuel in pyrotechnic devices.

dextrorotatory. Having the property when in solution of rotating the plane of polarized light to the right or clockwise. Dextrorotatory compounds are given the prefix *d* or (+) to distinguish them from their levorotatory, *l* or (-) isomers. The plus (+) and minus (-) signs are preferred.

See optical rotation.

dextrose. Glucose is the preferred term.
See glucose.

dextrose equivalent. (DE). The total amount of reducing sugars expressed as dextrose that is present in a corn syrup, calculated as a percentage of the total dry substance. The usual technique for determining DE in the corn-products industry is the volumetric alkaline copper method.
See glucose syrup.

DFDD. (difluorodiphenyldichloroethane).
 $C_{14}H_{10}Cl_2F_2$.

Properties: Colorless crystals. Mp 75C.

Hazard: Toxic by ingestion and skin contact.

Use: Contact insecticide.

DFDT. (difluorodipheynltrichloroethane).
 $FC_6H_5)_2CHCCl_3$. Fluorine analog of DDT.

Properties: A low-melting white solid; odor resembling ripe apples. Mp 45.5C. Insoluble in water; soluble in organic solvents.

Derivation: By condensing chloral and fluorobenzene in the presence of sulfuric acid or chlorosulfonic acid.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Use may be restricted.

Use: Contact insecticide.

“DFL No. 3” [Du Pont]. TM for a solution of buffered phosphate esters, used as a lubricant release agent and corrosive inhibitor for synthetic rubber driers.

DFP. Abbreviation for diisopropyl fluorophosphate.

DHA. Abbreviation for (1) dihydroxyacetone, (2) DHEA.

DHEA. (androstenolone; dehydroisoandrosterone; DHA; diandron; 17-hormoforin; prasterone).

CAS: 53-43-0. $C_{19}H_{28}O_2$. An androgenic steroid, a metabolic product of the adrenal steroid hormones with about one-third of the androgenic activity of androsterone.

Properties: Dimorphous needles: mp 140–14C. Leaflets: mp 152–153C. Mw 288.47. Soluble in benzene, alcohol, and ether; sparingly soluble in chloroform and petroleum ether.

Derivation: Isolated from male urine, synthesis from cholesterol or sitosterol, extracted from wild yams.

Use: A hormone used in health food products, medicine, biochemical research.

D-homo rearrangement of steroids. Originally discovered in 17 β -hydroxy-20-ketosteroids, but thoroughly studied in the 17 α -hydroxy-20-keto series, this reaction involves an acid- or base-catalyzed acyloin rearrangement that yields a 6-membered D-ring.

“DHP-MP” [BASF]. TM for 1,4-bis(2-hydroxypropyl)-2-methylpiperazine.

DHS. Abbreviation for dihydrostreptomycin.

Di. Symbol for didymium.

di- Prefix meaning two.
See bi-.

diabetes mellitus. A complex endocrine-metabolic disease resulting from insulin deficiency; characterized by a failure in glucose transport from the blood into cells at normal glucose concentrations, resulting in hyperglycemia.

diacetic acid. See acetoacetic acid.

diacetin. (glyceryl diacetate).
 $\text{CH}_2\text{O}(\text{OCCH}_3)\text{CH}_2\text{OCH}_2\text{O}(\text{OCCH}_3)$.

Properties: Hygroscopic liquid. A mixture of isomers. D 1.18, bp approximately 259C, refr index 1.44. Miscible with water, benzene, and alcohol. The commercial mixture gels approximately -30C. Combustible.

Derivation: Heating one mole of glycerol with two moles of glacial acetic acid.

Grade: Technical.

Use: Plasticizer and softening agent, solvent for cellulose derivatives, “Glyptal” resins, shellac.

diacetone acrylamide. (DAA). $\text{C}_9\text{H}_{15}\text{NO}_2$. A vinyl monomer.

Properties: White, crystalline solid; purity 99+%. Mp 57C, bp (8 mm Hg) 120C. Highly soluble in water and most organic solvents. (The DAA homopolymer is insoluble in water); polymerizes readily.

Use: Imparts water tolerance and vapor permeability to copolymer films; latex and water-based coating compositions; adhesion improver for cellulose, concrete, glass; cross-linking agent in polyester resins; color photography.

diacetone alcohol. (diacetone; 4-hydroxy-4-methylpentanone-2; 4-hydroxy-2-keto-4-methylpentane).

CAS: 123-42-2. $\text{CH}_3\text{COCH}_2\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless liquid; pleasant odor. D 0.9406 at 20/20C, bp 169.1C, flash p varies from <73F (23C) to 100F (38C) or higher depending on grade, wt/gal 7.8 lb (20C), viscosity 0.032 cP (20C), fp -42.8C, refr index 1.42416 (20C), autoign temp 1118F (603C). Miscible with alcohols, aromatic and halogenated hydrocarbons, esters, and water. A constant-boiling mixture with water has bp 99.6C and contains approximately 13% diacetone alcohol.

Derivation: Condensation of acetone.

Grade: Technical, acetone-free, reagent.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.8–6.9. An irritant. TLV: 50 ppm.

Use: Solvent for nitrocellulose, cellulose acetate, various oils, resins, waxes, fats, dyes, tars, lacquers,

dopes, coating compositions, wood preservatives, stains, rayon and artificial leather, imitation gold leaf, dyeing mixtures, antifreeze mixtures; extraction of resins and waxes; preservative for animal tissue; metal-cleaning compounds; hydraulic compression fluids; stripping agent (textiles); laboratory reagent. The technical grade containing acetone has greater solvent power.

diacetonyl sulfide. $(\text{CH}_3\text{COCH}_2)_2\text{S}$.

Properties: Crystals. Bp 136–137C (15 mm Hg), mp 47C.

Derivation: Interaction of chloroacetone and hydrogen sulfide gas.

diacetoxytetra-butyl-distannoxane. See bis(acetoxydibutylstannane) oxide.

diacetyl. (biacetyl; butanedione; diketobutane; dimethyl diketone; dimethylglyoxal).

CAS: 431-03-8. $\text{CH}_3\text{COCOCCH}_3$.

Properties: Yellow liquid; strong odor. D 0.990 (15/15C), mp >3C to >4C, bp 88–91C, refr index 1.3933 (18C), flash p >80F (26C). Soluble in water, alcohol, and ether.

Derivation: Special fermentation of glucose, synthesis from methyl ethyl ketone.

Grade: Technical, flavor grade, FCC.

Hazard: Flammable, dangerous fire risk.

Use: Aroma carrier in food products.

diacetylaminoozotoluene. (4-*o*-tolylazo-*o*-diacetotoluide).

$[\text{CH}_3\text{C}_6\text{H}_4\text{NNC}_6\text{H}_3(\text{CH})\text{N}(\text{CH}_3\text{CO})_2]$.

Properties: Crystalline powder. Color varies from yellowish-red through rose to red. Mp 74–76C. Acted upon by atmospheric water vapor. Soluble in alcohol, chloroform, ether; fats, oils, and greases; insoluble in water.

Use: Medicine (external).

S,N-diacetylcysteine monoethyl ester.

CAS: 19547-89-8. mf: $\text{C}_9\text{H}_{15}\text{NO}_4\text{S}$.

Hazard: Moderately toxic.

diacetylene. $\text{HC}\equiv\text{C}-\text{C}\equiv\text{CH}$. An unsaturated hydrocarbon containing two triple bonds with the type formula $\text{C}_n\text{H}_{2n+6}$. The simplest is butadiyne or biacetylene, a gas that boils at 10C. Combustible.

Hazard: Ignites spontaneously in contact with moist silver salts, may explode at -25C.

1,2-diacetyethane. See acetylacetone.

1,1'-diacetylferrocene. $(\text{C}_5\text{H}_5\text{COCH}_3)_2\text{Fe}$. Red, crystalline solid, mp 122–124C. Used as an intermediate.

See ferrocene.

diacetylmethane. See acetylacetone.

diacetylmorphone. (diamorphone; heroin).

CAS: 561-27-3. $C_{17}H_{17}NO(C_2H_5O_2)_2$.

Properties: White, crystals or crystalline powder; odorless; bitter taste. Mp 173C. Soluble in alcohol.

Derivation: By acetylation of morphine.

Hazard: Addictive narcotic; ingestion of less than 1 grain may be fatal. Cannot be legally sold in U.S.

diacetyl peroxide. See acetyl peroxide.

diacetyl tartaric acid esters of mono- and diglycerides.

Properties: Vary from sticky, viscous liquid to waxy solid; faint acid odor. Sol in oil, methanol, acetone, acetic acid, water.

Use: Food additive.

diacolation. To percolate and extract drugs using a solvent under pressure.

diagenesis. The set of processes, including solution, that alter sediments at low temperatures after burial.

“Diak” [Du Pont]. TM for a series of rubber accelerators used to vulcanize “Viton” fluoroelastomer and polyacrylate elastomers.

dialdehyde starch. See starch dialdehyde.

dialifor. (*S*-(2-chloro-1-phthalamidoethyl)-*O*,*O*-diethylphosphorothionate).

CAS: 10311-84-9.

Properties: White crystals. Mp 167–169C. Insoluble in water; soluble in common organic solvents.

Hazard: Toxic by ingestion, cholinesterase inhibitor.

Use: Acaricide; pesticide against codling moth, red spider mite, etc., of deciduous fruit.

dialkylchloroalkylamine hydrochloride.

A group of amine salts having the formula $RCl \cdot HCl$, when R represents such groups as $(CH_3)_2NCH_2CH_2$ (β -dimethylaminoethyl chloride hydrochloride), $(CH_3)_2NCH_2CH(CH_3)$ (β -dimethylaminoisopropyl chloride hydrochloride), etc. Used in organic synthesis.

di-allate. See 2,3-dichloroallyl diisopropylthiocarbamate.

diallyl adipate. $C_3H_5OOC(CH_2)_4COOC_3H_5$.

Properties: Liquid. Color-maximum #100 Pt-Co, characteristic odor, d 1.025 (20C). Combustible.

Use: Monomer.

diallylamine. (di-2-propenylamine).

CAS: 124-02-7. $(CH_2=CHCH_2)_2NH$.

Properties: Liquid. D 0.7889 (20C), bp 112C, fp –100C, refr index 1.4404 (20C). Soluble in water. Combustible.

Derivation: From allylamine and allylbromide.

Hazard: Toxic by inhalation and skin absorption.

Use: Intermediate.

diallylbarbituric acid. (5,5-diallylbarbituric acid).

CAS: 52-43-7. $C_{10}H_{12}N_2O_3$.

Properties: White, crystals or crystalline powder; odorless; slightly bitter taste. Mp 171–173C. Soluble in alcohol or ether; slightly soluble in water.

Hazard: See barbiturates.

Use: Medicine (sedative).

5,5'-diallyl-2,2'-biphenyldiol. See 2,2'-bichavicol.

diallyl chlorendate. $(C_3H_5OOC)_2C_7H_2Cl_6$. Solid, fp 29.5C, viscosity 4.0 cP (20C), d 1.47 (20C). Used as a monomer for allyl resins especially in flame-retardant compositions.

diallyl cyanamide. $(H_2C=CHCH_2)_2NCN$.

Properties: Liquid. Fp <–70C, bp 222C, d 0.90. Insoluble in water; soluble in organic solvents.

Derivation: Reaction of allyl bromide and disodium cyanamide.

Hazard: Yields very toxic cyanide fumes on heating.

Use: Organic intermediate, polymers.

diallyldibromo stannane.

CAS: 17381-88-3, mf: $C_6H_{10}Br_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diallyl diglycolate. See diglycolic acid, diallyl ester.

diallyl diglycollate. $(C_3H_5OOCCH_2)_2O$.

Properties: Liquid. Color-maximum #100 Pt-Co, characteristic odor, d (20C) 1.1113.

Use: Monomer.

diallyldimethylammonium chloride. See “Cat-floc.”

diallyl isophthalate. $C_6H_4(COOH_2C=CHCH_2)_2$.

Properties: Monomer is liquid. Color-maximum #175 Pt-Co, mild characteristic odor, d 1.124 (20C). Prepolymer is solid. D 1.256 (25C).

Use: Molding and laminating, cross-linker for polyesters.

diallyl maleate. $C_3H_5OOCCH=CHCOOC_3H_5$.

CAS: 999-21-3.

Properties: Colorless or straw-colored liquid. Bp 109–110C (3 mm Hg), d 1.077 (20C), refr index 1.4699 (20C). Polymerizes readily when exposed to light or temperature above approximately 50C. Combustible.

Hazard: Toxic by ingestion, irritating to skin.

Use: Polymers and copolymers, insecticide formulations.

diallylmelamine.

Properties: White, crystalline solid. Mp 142C, d 1.24 (30C). Combustible.

Hazard: Toxic by ingestion, irritating to skin, evolves cyanide on heating.

Use: Monomer for resins.

diallyl phosphite. $(\text{CH}_2=\text{CHCH}_2\text{O})_2\text{PHO.}$

Properties: Water-white liquid. Fp 0C, bp 62C (1 mm Hg), refr index 1.444 (25C), d 1.080 (25/15C). Combustible.

Use: Synthesis of organophosphorus compounds.

diallyl phthalate. (DAP).

CAS: 131-17-9. $\text{C}_6\text{H}_4(\text{COOCH}_2\text{CH:CH}_2)_2$. The name is also used for the polymer.

Properties: Nearly colorless, oily liquid. D 1.120 (20/20C), fp -70C (viscous liquid), boiling range 158–165C (4 mm Hg), odor mild lachrymatory, flash p 330F (165.5C), viscosity 13 cP (20C). Limited solubility in gasoline, mineral oil, glycerol, glycols, and certain amines. Soluble in most other organic liquids. Insoluble in water. Combustible.

Hazard: Toxic by ingestion.

Use: Primary plasticizer that will polymerize if not inhibited, a monomer that will polymerize with heat and catalyst. Forms low-pressure laminates with various fillers such as glass cloth, paper, etc., for electrical insulation.

diallyl sulfide. See allyl sulfide.**diallyltin dibromide.** See diallyldibromostannane.

dialysis. The separation of small molecules from macromolecules in a solution by means of a semi-permeable membrane such as parchment or collodion. The rates of diffusion of the small and the large molecules are so widely different that the former will readily pass through the membrane, whereas the latter will penetrate with extreme difficulty. For example the diffusion rates are about 2.3 for sodium chloride, 7 for cane sugar, and from 50 to 100 for proteins and other macromolecules. This differential led Thomas Graham to define substances that would pass through the membrane easily as crystalloids and those having a tendency to be retained by the membrane as colloids.

See colloid chemistry; electro dialysis; Graham, Thomas.

diamide hydrate. See hydrazine hydrate.**diamine.** See hydrazine.**3,6-diaminoacridine.** See acriflavine.**m-diaminoazobenzene hydrochloride.** See chrysoidine hydrochloride.**diaminoazoxytoluene.** (azoxytoluidine).

Properties: Yellow or orange crystals. Mp 168C. Soluble in alcohol; insoluble in water, Combustible.

Derivation: By alkaline reduction of *p*-nitro-*o*-toluidine.

Use: Dye intermediate.

3,3'-diaminobenzidine. (3,3',4,4'-biphenyltetramine). $(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{C}_6\text{H}_3(\text{NH}_2)_2$.

Properties: Solid. Mp 178–180C.

Use: Copolymerized with diphenyl isophthalate to make high-temperature-resistant polybenzimidazoles.

1,3-diaminobutane.

Properties: Water-white liquid; amine odor. Boiling range 143–150C, d 0.858 (20/20C), refr index 1.450 (20C), flash p 125F (51.6C). Combustible.

Hazard: Toxic by ingestion and skin absorption.

2,6-diamino-4-butylamino-s-triazine. See *n*-butylmelamine. **α,ϵ -diaminocaproic acid.** See lysine.**diaminochryszin.** $(\text{NH}_2)_2(\text{OH})_2\text{C}_{14}\text{H}_4\text{O}_2$. (1,8-diamino-4,5-dihydroxyanthraquinone).

Use: Colorimetric determination of boron.

trans-1,2-diaminocyclohexanetetraacetic acid monohydrate. (CDTA).

Properties: White, crystalline solid. Mp 200–220C. Very slightly soluble in water and insoluble in most common organic solvents. Partially soluble in dimethyl formamide and dimethyl sulfoxide upon heating. Forms stable complexes.

Use: Chelating agent similar to ethylenediaminetetraacetic acid.

diaminodiethyl sulfide. $\text{S}(\text{CH}_2\text{CH}_2\text{NH}_2)_2$.

Properties: Mobile, colorless liquid; amine-like odor. Bp 230–240C, d 1.054 (25C). Miscible with water and benzene, insoluble in aliphatic hydrocarbons. Combustible.

1,8-diamino-4,5-dihydroxyanthraquinone.

See diaminochryszin.

diaminodihydroxyarsenobenzene dihydrochloride. See arshphenamine.**di-*p*-aminodimethoxydiphenyl.** See dianisidine.

4,4'-diamino-3,3'-dimethyldicyclohexylmethane. See bis(4-amino-3-methylcyclohexyl)methane.

diaminodiphenic acid. (benzidinedicarboxylic acid). $C_6H_3(CO_2H)NH_2C_6H_3(CO_2H)NH_2$.

Properties: White crystals. Soluble in alcohol and ether; insoluble in water.

Derivation: By boiling *m*-nitrobenzaldehyde with caustic soda, reducing with zinc dust, and acidifying.

Hazard: See benzidine.

Use: Dyestuff.

***p*-diaminodiphenyl.** See benzidine.

diaminodiphenylamine. $HN(C_6H_4NH_2)_2$.

Properties: Yellowish crystals. Mp 158C. Soluble in alcohol and ether; insoluble in water.

Use: Dye intermediate, detection of hydrogen cyanide.

diaminodiphenylethylene. See *p*-diaminos-tilbene.

***p,p'*-diaminodiphenylmethane.** (4,4'-methylenedianiline; MDA).

CAS: 101-77-9. $H_2NC_6H_4CH_2C_6H_4NH_2$.

Properties: Light-brown crystals. Mp 92–93C, bp 398–399C, flash p 440F. Slightly soluble in cold water; very soluble in alcohol, benzene, ether. Combustible.

Hazard: A human carcinogen. Toxic by inhalation and skin contact. TLV: 0.1 ppm.

Use: Determination of tungsten and sulfates, polymer and dye intermediate, corrosion inhibitor, epoxy-resin hardening agent, isocyanate resins, polyamides.

diaminodiphenylthiourea. (diaminothiocabanilide). $(NH_2C_6H_4NH)_2CS$.

Properties: Colorless plates or crystalline solid. Mp 195C. Soluble in alcohol and ether; sparingly soluble in water.

Derivation: By boiling *p*-phenylenediamine with carbon disulfide.

diaminodiphenylureadisulfonic acid.

$CO(NHC_6H_4NH_2SO_3H)_2$.

Properties: Colorless, needlelike crystals. Slightly soluble in water.

Derivation: Action of phosgene upon either *p*-phenylenediaminesulfonic acid or 4-nitroaniline-3-sulfonic acid.

Use: Dye manufacture.

3,3'-diaminodipropylamine. See 3,3'-imino-bispropylamine.

diaminoditolyl. See *o*-tolidine.

***p,p'*-diaminoditolylmethane.**

$NH_2C_7H_6CH_2C_7H_6NH_2$.

Properties: Glistening, crystalline plates. Mp 149C. Soluble in alcohol and ether.

Derivation: By heating formaldehyde and *o*-toluidine.

1,2-diaminoethane. See ethylenediamine.

6,9-diamino-2-ethoxyacridine lactate monohydrate. See ethodin.

diaminoethyl ether tetraacetic acid.

$(HOOCCH_2)_2NCH_2CH_2OCH_2CH_2N(CH_2COOH)_2$.

Properties: Slightly soluble in water. Purity 98% min.

Use: A chelating agent.

1,6-diaminohexane. See hexamethylenediamine.

3,6-diamino-10-methylacridinium chloride. See acriflavine.

diaminonaphthalene. See naphthalenediamine.

1,5-diaminopentane. See cadaverine.

2,3-diaminophenazine. $C_{12}H_{10}N_4$.

Properties: Brownish, needlelike crystals. Mp 265C. Soluble in alcohol and benzene; sublimes on heating.

Use: Analytical reagent for detection of metals.

2,5-diaminophenol. $C_6H_3OH(NH_2)_2$.

Properties: Colorless crystals. Mp 68C. Soluble in water.

Derivation: By reduction of 2,5-dinitrophenol.

Hazard: May be skin irritant.

Use: Organic synthesis.

2,4-diaminophenol hydrochloride. (amidol). $C_6H_3(NH_2)_2OH \cdot 2HCl$.

Properties: Grayish-white crystals. Soluble in water; slightly soluble in alcohol.

Derivation: By interaction of dinitrophenol with iron and hydrochloric acid.

Use: Photographic developer, dyeing furs and hair, analytical reagent.

2,4-diamino-6-phenyl-*s*-triazine. See benzoguanamine.

1,2-diaminopropane. (propylenediamine; 1,2-propanediamine). $NH_2CH_2CH(NH_2)CH_3$.

Properties: Colorless, very hygroscopic, strongly alkaline liquid. D 0.8732 (20/20C), refr index 1.4460 (20C), flash p 92F (33C), bp 117C. Very soluble in water. Ammoniacal odor.

Grade: Technical, 75%, 90%, 98% solution.

Hazard: Dangerous fire risk. Toxic by ingestion and skin absorption.

Use: Synthesis of medicinals, dyes, rubber accelerators, electroplating, analytical reagent.

1,3-diaminopropane. (1,3-propanediamine).
 $\text{NH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Water-white mobile liquid; amine odor. D 0.8881 (20/20)C, bp 139.7C, fp -12C, refr index 1.459 (20C), flash p 120F (49C) (OC). Completely soluble in water, methanol, and ether. Combustible.

Hazard: Moderate fire risk. Strong irritant to eyes and skin.

Use: Intermediate.

***n,n'*-diaminopropylethylenediamine.** See 1,5,8,12-tetraazadodecane.

2,6-diaminopyridine. $\text{NC}_5\text{H}_3(\text{NH}_2)_2$.

Properties: Crystals. Mp 120.8C, bp 285C. Soluble in water. Combustible.

Derivation: From 2-aminopyridine.

2,6-diamino-4-(2-pyridyl)-s-triazine.

CAS: 25007-79-8. mf: $\text{C}_8\text{H}_8\text{N}_6$.

Hazard: A poison.

***p*-diaminostilbene.** (diaminodiphenylethylene). $\text{C}_6\text{H}_4(\text{NH}_2)\text{CHCHC}_6\text{H}_4(\text{NH}_2)$.

Properties: Colorless needles or plates. Mp 227C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Reduction of dinitrostilbene.

4,4'-diamino-2,2'-stilbenedisulfonic acid. (DAS).

$\text{C}_6\text{H}_3(\text{NH}_2)(\text{SO}_3\text{H})\text{CHCHC}_6\text{H}_3(\text{SO}_3\text{H})(\text{NH}_2)$.

Properties: Yellowish, microscopic needles. Soluble in alcohol and ether; insoluble in water.

Derivation: Boiling sodium salt of *p*-nitrotoluene-*o*-sulfonate in water and caustic soda and reduction with zinc dust.

Hazard: Toxic by ingestion.

Use: Dyestuffs.

diaminothiocarbanilide. See diaminodiphenylthiourea.

di- α -amino- β -thiolpropionic acid. See cystine.

diaminotoluene. See toluene-2,4-diamine.

4,6-diamino-*m*-toluenesulfonic acid. See *m*-tolylenediaminesulfonic acid.

4,6-diamino-*s*-triazine-2-ol. See ammeline.

2,5-diaminovaleric acid. See ornithine.

diammine(benzylmalonato)platinum (II).

CAS: 63919-17-5. mf: $\text{C}_{10}\text{H}_{14}\text{N}_2\text{O}_4\text{Pt}$.

Properties: IDLH 4 mg/m³ (as Pt).

Hazard: A poison. TWA 0.002 mg(Pt)/m³

***cis*-diamminedibromoplatinum(II).**

CAS: 15978-91-3. mf: $\text{Br}_2\text{H}_6\text{N}_2\text{Pt}$.

Properties: IDLH 4 mg/m³ (as Pt).

Hazard: A poison.

diammonium berylliumtetrafluoride. See ammonium fluoroberyllate.

diammonium ethylenebisdithiocarbamate.

$\text{NH}_4\text{S}_2\text{CNH}(\text{CH}_2)_2\text{NHCS}_2\text{NH}_4$.

Properties: Mp 72.5C. Very soluble in water.

Grade: 42% solution in water.

Use: Fungicide, intermediate, corrosion inhibitor. See nabam.

diammonium hydrogen phosphate. See ammonium phosphate, dibasic.

diammonium phosphate. See ammonium phosphate, dibasic.

diamond. An allotropic form of carbon that crystallizes isometrically and consists of carbon atoms covalently bound by single bonds only in a predominantly octahedral structure.

This accounts for its extreme hardness (Mohs 10) and great stability.

Properties: High refractive index (2.42), d 3.50, coefficient of friction 0.05, highest thermal conductivity of any substance, transparent to infrared, mp 3700C, bp 4200C. The purest diamonds used for gems are mined in South Africa, lower grades in Brazil, Venezuela, India, Borneo, Arkansas. Also made synthetically by heating carbon and a metal catalyst in an electric furnace at about 3000F under high pressure.

Use: Special surgical knives, windows in space probes, high-capacity transmitters. See diamond, industrial.

diamond, industrial. Low-grade diamonds (bort and carbonado) as well as those made synthetically in an electric furnace (3000F, 1.3 million psi).

Use: Oil-well drill bits, primary grinding of steel, wire-drawing dies, glass and metal cutting, grinding wheels.
See abrasive.

diamond pyramid hardness. See hardness.

diamthazole dihydrochloride.

$C_{15}H_{23}N_3OS \cdot 2HCl$. (6-(2-diethylaminoethoxy)-2-dimethylaminobenzothiazole dihydrochloride).

Properties: Crystals. Decomposes 269C. Soluble in water, ethanol, and methanol.

Use: Topical therapy (medicine), antifungal agent.

di-*n*-amylamine. (di-*n*-pentylamine).

CAS: 2050-92-2. (C_5H_{11})₂NH.

Properties: Colorless liquid. Bp 202–3C (745 mm Hg), d 0.77–0.78 (20C), refr index 1.430 (20C), flash p 124F (51.1C). Very slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: From reaction of amyl chloride and ammonia.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Use: Rubber accelerators, flotation reagents, dye-stuffs and corrosion inhibitors, solvent for oils, resins, and some cellulose esters.

***N,N*-diamylaniline.** (mixed isomers).

$C_5H_3N(C_5H_{11})_2$.

Properties: Dark-amber liquid. D 0.898 (20C), boiling range 276–292C, faint aniline odor, flash p 260F (126C). Combustible.

Use: Organic dyes.

di-*tert*-amyl disulfide.

$CH_3CH_2C(CH_3)_2SSC(CH_3)_2CH_2CH_3$.

Properties: Liquid. D 0.931 (15.5/15.5C), vacuum distillation range 86–102C, refr index 1.495 (20C), flash p 220F (104.4C). Combustible.

α -(diamylaminomethyl)-1,2,3,4-tetrahydro-9-phenathrenemethanol.

CAS: 27074-70-0. mf: $C_{26}H_{39}NO$.

Hazard: A poison.

diamylene. $C_{10}H_{20}$.

Properties: Colorless liquid, fp <–50C, bp 150C, flash p 118F (47.7C) (OC), d 0.77. Combustible.

Hazard: Moderate fire risk.

Use: Solvent, organic synthesis.

2,5-di(*tert*-amyl)hydroquinone. (DAHQ,

2,5-di[*tert*-pentyl]hydroquinone).

(C_5H_{11})₂C₆H₂(OH)₂.

Properties: Buff powder. Mp 176C, d 1.05 (25C). Slightly soluble in water; soluble in alcohol and benzene.

Use: Antioxidant for uncured rubber and for unsaturated resins and oils; food packaging, polymerization inhibitor.

diamyl maleate. ($CHCOOC_5H_{11}$)₂.

Properties: Water-white liquid. D 0.981 (20C), boiling range 263–300C, odor faintly alcoholic, flash p 270F (132C). Combustible.

diamyl phenol. (1-hydroxy-2,4-diamylben-

zene). (C_5H_{11})₂C₆H₂OH. Commercial form is a mixture of isomers including both secondary amyl and tertiary amyl groups, mainly in 2,4 positions.

Properties: Light-straw-colored liquid with mild phenolic odor; miscible with both aliphatic and aromatic hydrocarbons, insoluble in water and 10% aqueous alkalis. Boiling range (ASTM 5–95%) 280–295C, d 0.930 (20C), wt/gal 7.8 lb (20C), flash p 260F (126)(TOC). Combustible.

Hazard: Irritant to skin.

Use: Synthetic resins, lubricating-oil additives, rust preventives, plasticizers, synthetic detergents, antioxidants and antiskinning agents, rubber chemicals, rodenticide, fungicide.

diamyl phthalate.

CAS: 131-18-0. $C_6H_4(COOC_5H_{11})_2$.

Properties: Colorless, oily liquid; nearly odorless. D 1.022 (20C), wt/gal 8.52 lb (20C), refr index 1.488 (25C), bp 342C, fp <–55C, flash p 357F (180C) (CC). Combustible.

Derivation: By esterification of phthalic anhydride with amyl alcohol in the presence of approximately 1% concentrated sulfuric acid as catalyst.

Use: Plasticizer.

diamyl sodium sulfosuccinate.

$C_{14}H_{25}NaO_7S$.

Properties: White powder. Soluble in water, acetone, carbon tetrachloride, glycerol.

Derivation: Action of alcohol on maleic anhydride, followed by addition of sodium bisulfite.

Use: Wetting agent, emulsion polymerization.

diamyl sulfide. (amyl sulfide). (C_5H_{11})₂S. A mixture of isomers.

Properties: Yellow liquid; obnoxious odor. D 0.85–0.91 (20/20C), distillation range 170–180C, flash p 185F (85C) (OC), refr index 1.477 (19C). Combustible.

Hazard: Irritating by inhalation, ingestion, and skin absorption.

Use: Organic sulfur compounds by addition reactions, flotation agent in metallurgical processes, odorant.

diandron. See DHEA.

dianhydrosorbitol. See sorbide.

1,4,3,6-dianhydrosorbitol. See isosorbide.

1,2-dianilinoethane. $C_{14}H_{16}N_2$.

Properties: Colorless crystals. Mp 67C, bp 228C (12 mm Hg). Soluble in alcohol and ether.

Derivation: Heating aniline with dichloro- or dibromoethane.

Use: Manufacture of antihistamines, resin and rubber stabilizer, reagent for aldehydes.

dianisidine. (di-*p*-aminodi-*m*-methoxydiphenyl; 3,3'-dimethoxybenzidine).

CAS: 119-90-4. $[C_6H_3(OCH_3)NH_2]_2$.

Properties: Colorless crystals. Mp 137C, flash p 403F (206C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: The methyl ether of *o*-nitrophenol is reduced by zinc dust and caustic soda to the hydrazo compound, which is then rearranged with hydrochloric acid.

Hazard: See anisidine, benzidine.

Use: Azo-dye intermediate.

dianisidine diisocyanate. (3,3'-dimethoxybenzidine 4,4'-diisocyanate).

CAS: 91-93-0. $[OCN(CH_3O)C_6H_3]_2$.

Properties: Grey to brown powder. Mp 112C min. Soluble in ketones and esters.

Hazard: Toxic by inhalation and ingestion, skin irritant.

Use: Polymers and adhesive systems, high-strength backbone or cross-linking intermediate.

diaphragm cell. A type of electrolytic cell for the production of sodium hydroxide and chlorine from sodium chloride brine. The cell contains anode and cathode compartments separated by a porous diaphragm or membrane to prevent mixing of the solutions. Asbestos fibers are usually used for this diaphragm, though a recent development is a plastic material made from perfluorosulfonic acid (see "Nafion"). The brine is fed continuously to the anode compartment, where chlorine is released at the graphite anode and flows through the diaphragm to the steel cathode, where hydrogen is liberated. Sodium hydroxide accumulates in the liquid and is continuously drained from the cathode compartment. The Hooker cell and the Vorce cell are two widely used types of diaphragm cell.

"Diaron" [Reichhold]. TM for powdered melamine adhesives.

diasolysis. The process of diffusion of organophilic compounds in organic solvent through gum, plastic, or rubber membranes for separating hydrophilic and colloidal substances that do not dialyze.

diaspore. $Al_2O_3 \cdot H_2O$. A natural hydrous aluminum oxide occurring in bauxite and with corundum and dolomite.

Properties: White, gray, yellowish, and greenish; luster vitreous to pearly. D 3.35–3.45, Mohs hardness 6.5–7.

Occurrence: Arkansas, Missouri, Pennsylvania, Switzerland, the former U.S.S.R., Czechoslovakia.

Use: Refractory, abrasive.

diastase malt. A commercial mixture containing amylolytic enzymes.

Properties: Yellowish-white, amorphous powder or syrupy liquid. Soluble in water; almost insoluble in alcohol.

Derivation: The filtrate from the mash of malted grain is concentrated at low temperature in vacuum. The sugar acts as preservative. The diastase hydrolyzes starch to malt sugar.

Use: Desizing of textiles, bread making, malted foods, converting starch to sugar.

See amylase.

diastereoisomer. (diastereomer). In any group of four optical isomers occurring in compounds containing two asymmetric carbon atoms, such as 4-carbon sugars, there are two pairs of enantiomers (structures that are mirror images of each other) indicated by the letters D and L. The two D and the two L isomers are not mirror images, and these are called diastereoisomers. For example, in the structures below, (1) and (2) are enantiomers and so are (3) and (4); (1) and (3) are diastereoisomers, as are (2) and (4).

See optical isomer; enantiomer; epimer; anomer.

diatomaceous earth. (diatomite; kieselguhr; infusorial earth).

CAS: 61790-53-2.

Properties: Soft, bulky, solid material (88% silica) composed of skeletons of small prehistoric aquatic plants related to algae (diatoms). They have intricate geometric forms. Available as light-colored blocks, bricks, powder, etc. True d 1.9–2.35, bulk density from 5 to 15 lb/cu ft. Insoluble in acids except hydrogen fluoride, soluble in strong alkalis. Absorbs 1.5–4 times its weight of water, has high oil absorption capacity. Poor conductor of sound, heat, and electricity. Noncombustible.

Occurrence: Western U.S., Europe, Algeria, the former U.S.S.R.

Grade: Natural, chemical, airfloatated.

Hazard: TLV: TWA (nuisance particulate) 10 mg/

m³ of total dust (when toxic impurities are not present, e.g., quartz <1%).

Use: Filtration; clarifying and decolorizing; insulation; absorbent; mild abrasive; drilling-mud thickener; extender in paints, rubber, and plastic products; ceramics; paper coating; anticaking agent in fertilizers; asphalt compositions; chromatography; refractories; acid-proof liners; catalyst carrier.

diatomic. Descriptive of a gas whose molecules are composed of two atoms, e.g., O₂, N₂, Cl₂, H₂. Gases in which the element is present as single atoms are called monatomic, e.g., Ar, Ne.

diatomite. See diatomaceous earth.

diatrizoate sodium. See sodium diatrizoate.

1,4-diazabicyclo[2.2.2]octane.

Properties: Crystals. Hygroscopic. Mp 158C, bp 174C, forms crystalline hydrate, sublimes easily. Soluble in water and organic solvents.

Use: Possible catalyst for urethane foams and coatings, chemical intermediate.

diazepam. (USAN for 7-chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one).

CAS: 439-14-5. C₁₆H₁₃ClN₂O.

Properties: Slightly yellowish, crystalline powder; practically no odor. Mp 131.5–134.5C. One g of diazepam dissolves in about 350 mL of water, in approximately 15 mL of 95% ethanol, or in approximately 2 mL of chloroform.

Hazard: Central nervous system depressant; addictive; manufacture and usage restricted.

Use: Medicine (tranquilizer).

1,3-diazine. (pyrimidine; miazine).

Properties: Liquid or crystalline mass; penetrating odor. Mp 20–22C, bp 123–124C. Soluble in water, alcohol, and ether.

See pyrimidine.

“Diazinon” [Chevron].

CAS: 333-41-5.

[C(CH₃)₂CHC₂N₂H(CH₃)O]PS(OC₂H₅)₂. TM for *O,O*-diethyl-*O*-(2-isopropyl-4-methyl-6-pyrimidinyl) phosphorothioate.

Properties: Colorless liquid. Bp 83–84C (0.002 mm Hg). Slightly soluble in water; freely soluble in petroleum solvents, alcohol, and ketones. More stable in alkaline than neutral or acid solutions.

Hazard: Toxic by ingestion, inhalation, and skin absorption; cholinesterase inhibitor; use may be restricted; TLV: 0.1 mg/m³.

Use: Insecticide (use against fire ants permitted by EPA).

diazoaminobenzene. (1,3-diphenyltriazene; benzeneazoanilide).

CAS: 136-35-6. C₆H₅NNNHC₆H₅.

Properties: Golden-yellow scales. Mp 96C. Soluble in alcohol, ether, and benzene; insoluble in water.

Derivation: Interactions of nitrous acid and an alcoholic solution of aniline.

Hazard: Explodes on heating to 150C dangerous.

Use: Organic synthesis, dyes, insecticide.

p-diazobenzenesulfonic acid. C₆H₄SO₃N₂.

Properties: White or slightly red crystals or white paste. Soluble in water and ether; insoluble in alcohol.

Derivation: From sulfanilic acid, sodium nitrite, and sulfuric acid.

Hazard: Explodes when shocked or heated.

Use: Dyestuffs, reagent.

diazo compound. A compound of the general formula Ar–N=N–X, in which Ar is an aromatic radical and X an inorganic group, such as halogen or nitrate.

p-diazodimethylaniline zinc chloride

double salt. (*p*-dimethylaminobenzene diazonium chloride, zinc chloride double salt; *p*-diazotized aminodimethylaniline zinc chloride double salt). (CH₃)₂NC₆H₄N₂Cl•ZnCl₂.

Properties: Yellow to orange (light-sensitive) crystals. Specification: Moisture content 5–20%, zinc 17–23%, chloride 31–35%.

Hazard: Irritant.

Use: Rapid diazotype coupler used in coatings for light-sensitive paper.

2-diazo-4,6-dinitrobenzene-1-oxide. See diazodinitrophenol.

diazodinitrophenol. (2-diazo-4,6-dinitrobenzene-1-oxide; 5,7-dinitro-1,2,3-benzoxadiazole; DDNP).

CAS: 87-31-0. (NO₂)₂C₆H₃ON₂ (bicyclic).

Properties: Yellow, crystalline compound; darkens rapidly on exposure to sunlight. D 1.6. Soluble in nitrobenzene, acetone, acetic acid, and nitroglycerin; desensitized by water.

Derivation: Diazotization of picramic acid in aqueous solution with sodium nitrite and hydrochloric acid.

Hazard: Explodes when shocked or heated to 180C; dangerous, an initiating explosive.

Use: Primary charge in blasting caps.

p-diazodiphenylamine sulfate.

(C₆H₅)₂NHC₆H₄N₂)₂SO₄.

Properties: Yellow-green solid; unpleasant odor. Sensitive to light. Soluble in water.

Use: Used as a light-sensitive diazo compound for

coating on reproduction paper, giving direct positive prints of various colors with different developers or coupling agents.

1,2-diazole. See pyrazole.

diazomethane. (azimethylene).

CAS: 334-88-3. $\text{H}_2\text{C}=\text{N}^+=\text{N}^-$.

Properties: Yellow gas at room temperature. Fp -145C , bp -23C , d 1.45.

Hazard: Severe explosion risk when shocked; may explode on contact with alkali metals, rough surfaces, or heat (100C); toxic by inhalation, a carcinogen (OSHA). TLV: 0.2 ppm.

Use: Organic synthesis (methylating agent).

1-diazo-2-naphthol-4-sulfonic acid.

$\text{C}_{10}\text{H}_5\text{N}_2\text{OSO}_3\text{H}$.

Properties: Yellow needles in paste or dry form. Slightly soluble in water. Also available as sodium salt. Mp 168C. Combustible.

Derivation: Diazotization of 1-amino-2-naphthol-4-sulfonic acid and filtering of the diazo compound.

Hazard: May explode if heated above 100C.

Use: Azo dyes, valuable chrome-dyestuff component.

diazo paper. Paper that is coated with a diazo light-sensitive dye.

diazotization. The reaction of a primary aromatic amine with nitrous acid in the presence of excess mineral acid to produce a diazo ($-\text{N}=\text{N}-$) compound. Widely used in organic synthesis, especially production of dyes.

diazotizing salt. See sodium nitrite.

DIBA. See diisobutyl adipate.

DIBAC. Abbreviation for diisobutylaluminum chloride.

DIBAL-H. Abbreviation for diisobutylaluminum hydride.

dibasic. See monobasic.

dibenzalacetone. (dibenzylidene acetone).

$\text{C}_6\text{H}_5\text{HC}=\text{CHCOHC}=\text{CHC}_6\text{H}_5$.

Properties: (*cis-trans*) Yellow crystals. Mp 60C.

Derivation: Reaction of benzaldehyde and acetone. There are three geometric isomers (*trans-trans*, *cis-trans*, *cis-cis*).

Use: Suntan lotions, cosmetics.

dibenz(a,h)acridine 3,4-diol-1,2-epoxide.

CAS: 125276-72-4. mf: $\text{C}_{21}\text{H}_{13}\text{NO}_3$.

Hazard: Experimental carcinogenic data reported.

1,2:5,6-dibenzanthracene. See dibenz(a,h)anthracene.

dibenz(a,h)anthracene.

CAS: 53-70-3. mf: $\text{C}_{22}\text{H}_{14}$.

Properties: Silvery leaflets from AcOH. Mp: 266–267°.

Hazard: A confirmed carcinogen. A poison.

dibenzanthrone. (volanthrone). $\text{C}_{34}\text{H}_{16}\text{O}_2$. Violet-blue vat dye.

Properties: Bluish-black powder. Soluble in nitrobenzene and concentrated sulfuric acid.

Derivation: From benzanthrone.

Use: Intermediate.

3,3'-dibenzanthronyl. (also called the 13,13'-compound). $\text{C}_{34}\text{H}_{18}\text{O}_2$.

Properties: Dark-yellow needles. Mp 412C. Soluble in concentrated sulfuric acid.

Use: Intermediate.

4,4'-dibenzanthronyl. (also called the 2,2'-compound). $\text{C}_{34}\text{H}_{18}\text{O}_2$.

Properties: Yellow needles. Mp 320C. Soluble in nitrobenzene; slightly soluble in benzene, alcohol, ether.

Use: Intermediate.

dibenzarsenolic acid See 9-arsafluorenic acid.

2,3,6,7-dibenzoanthracene. See pentacene.

dibenzocycloheptadienone. $\text{C}_{15}\text{H}_{12}\text{O}$. A tricyclic compound.

Properties: Light-yellow to amber solid. Mp 28.5C, bp 203–204C (7 mm Hg), d 1.1635 (20C), refr index (20C) 1.6324. Soluble in alcohol and most organic solvents; insoluble in water. Combustible.

Use: Intermediate.

dibenzo(b,jk)fluorene. See benzo(k)fluoranthene.

dibenzofuran. See diphenylene oxide.

“Dibenzo G-M-F” [Unioyal].

$(\text{C}_6\text{H}_5\text{COON})_2\text{C}_6\text{H}_4$. TM for dibenzoyl-*p*-quinodioxime.

Properties: Brownish-gray powder. D 1.37, starts to decompose above 200C, good storage stability. Insoluble in acetone, benzene, gasoline, ethylene dichloride, and water.

Grade: Available in superdispersing grades.

Use: Nonsulfur vulcanizing agent, in tire-curing bags, gaskets, and wire insulation to impart heat resistance.

See benzoyl peroxide.

dibenzopyran. See xanthene.

(+)-dibenzo(a,l)pyrene-11,12-dihydrodiol.

CAS: 153857-27-3. mf: $\text{C}_{24}\text{H}_{16}\text{O}_2$.

Hazard: Experimental carcinogenic data reported.

(–)-(11r,12r)-dibenzo(a,l)pyrenedihydrodiol.CAS: 189880-63-5. mf: $C_{24}H_{16}O_2$.**Hazard:** Experimental carcinogenic data reported.**dibenzopyrone.** See xanthone.**dibenzopyrrole.** See carbazole.**dibenzothiophene.****Properties:** Colorless crystals. Mp 97–98C. Combustible.**Use:** Cosmetics and pharmaceuticals, intermediate.**dibenzoxazepine.**CAS: 12770-99-9. mf: $C_{13}H_9NO$.**Hazard:** A severe human skin irritant.**dibenzoyl.** See benzil.**trans-1,2-dibenzoylethylene.** $C_6H_5CO-CHCHCOC_6H_5$.**Properties:** Yellow-orange crystals. Mp 111C. Soluble in glacial acetic acid, ethyl acetate, benzene, and chloroform; sparingly soluble in alcohol; insoluble in water and petroleum ether. Combustible.**Use:** Enzyme inhibitor, bactericide, and intermediate.**dibenzoylmethane.** (1,3-diphenyl-1,3-propanedione). $C_6H_5COCH_2COC_6H_5$.**Properties:** Crystals. Mp 80C, bp 219–221C (18 mm Hg). Partially soluble in alcohol; soluble in ether, chloroform, and aqueous sodium hydroxide. Combustible.**Use:** Colorimetric determination of uranium.**dibenzoyl peroxide.** See benzoyl peroxide.**dibenzoyl-p-quinonedioxime.** See “Dibenzo G-M-F.”**2,4-dibenzoylresorcinol.****Properties:** Light-yellow crystals; nearly odorless. Mp 125–128C. Soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.**Use:** Light absorber, best at 280–370 microns.**dibenzyl.** See *sym*-diphenylethane.***N,N*-dibenzylamine.** $HN(CH_2C_6H_5)_2$.**Properties:** Colorless to light-yellow, oily liquid; ammonia-like odor. Bp 300C (partial decomposition), mp –26C, d 1.017 (20C), refr index 1.5730–1.5740 (25C), distilling range 168–172C (10 mm Hg). Insoluble in water, soluble in alcohol and ether. Combustible.**Hazard:** Toxic by ingestion and inhalation.**Use:** Intermediate, rubber activator, reagent for metals.***N,N*-dibenzyl-p-aminophenol.****Properties:** Brown powder. Mp >110C. Soluble in acetone, benzene, anhydrous methanol.***N,N*-dibenzylaniline.** $C_6H_5N(CH_2C_6H_5)_2$.**Properties:** Yellowish-white crystals. Mp 70C, bp >300C. Soluble in alcohol and ether; insoluble in water.**Hazard:** See aniline.**Use:** Manufacture of dyes.**dibenzyl disulfide.** (benzyl disulfide).**Properties:** Pink solid; odor similar to benzaldehyde. Mp 70–72C. Dissolves in most organic solvents; very slightly soluble in water. Combustible.**Use:** Antioxidant and antisludging agent for petroleum oils, extreme-pressure lubricating oils and greases, silicone oils.**dibenzyl ether.** (benzyl ether).**Properties:** Colorless, unstable liquid; faint, almond odor. D 1.035, bp 298–300C, flash p 275F (135C). Insoluble in water; soluble in most organic solvents. Combustible.**Grade:** Technical.**Hazard:** Irritant and narcotic.**Use:** Plasticizer for various resins, perfumery (solvent for nitro-musks), flavoring.**dibenzylidene acetone.** See dibenylacetone.***N,N*-dibenzylmethylamine.****Properties:** Colorless to light-yellow liquid. D 0.99 (25C), refr index 1.5560–1.5590 (25C), distilling range 152–158C (11 mm Hg). Partially soluble in water; soluble in organic solvents. Combustible.**Use:** Intermediate, oil-soluble rust inhibitor, cutting oils, hydraulic fluids, lubricants.**dibenzyl sebacate.****Properties:** Light-straw-colored liquid. Mp 28C, bp 265C (4 mm Hg), d 1.055 (30/20C), complete non-volatility, gives excellent low-temperature flexibility, flash p 450F (232C). Combustible.**Use:** Plasticizer, especially for plastic linings for containers.**dibenzyl succinate.** See benzyl succinate.**dibenzyltin bis(dibutylidithiocarbamate).**

See

bis(dibutylidithiocarbamate)dibenzylstannane.

2,5-dibiphenylyloxazole. (BBO). $C_{27}H_{21}NO$.

Properties: Crystalline solid. Mp 237–239C.

Grade: Purified.

Use: Scintillation counter or a wavelength shifter in soluble scintillators.

dibismuth trisulfate. See bismuth trisulfate.

diborane. (diboron hexahydride; boroethane).

CAS: 19287-45-7. B_2H_6 .

Properties: Colorless gas; repulsive odor. Bp $-92.5C$, fp $-165C$, density 0.18 g/mL ($17C$), flash p $-130F$ ($-90C$), autoign temp $100-125F$ ($38-51C$). Soluble in carbon disulfide; decomposes in water. Highly reactive.

Derivation: Reaction of lithium hydride and boron trifluoride catalyzed by ether at $25C$.

Grade: Technical 95%, high purity 99+%.

Hazard: Highly flammable, dangerous fire risk, reacts violently with oxidizing materials including chlorine. Toxic by inhalation, strong irritant. TLV: 0.1 ppm .

Use: Synthesis of organic boron compounds and metal borohydrides, polymerization catalyst for ethylene, fuel for air-breathing engines and rockets, reducing agent, doping agent for p-type semiconductors.

dibromoacetylene. (dibromomethyne).

CAS: 624-61-3. $BrC\equiv CBr$.

Properties: Heavy, colorless liquid; disagreeable odor. D approximately 2, mp $76-76.5C$. Soluble in most organic solvents.

Derivation: (1) Interaction of magnesium dibromoacetylene and an ethereal solution of cyanogen bromide; (2) Interaction of tribromoethylene and alcoholic potash.

Hazard: Explodes on contact with oxygen or on heating. Dangerous!! Toxic by inhalation and injection, strong irritant.

Use: Organic synthesis (halogenated ethylene).

9,10-dibromoanthracene. $C_6H_4C_2Br_2C_6H_4$ (tricyclic).

Properties: Yellow crystals. Mp $226C$, sublimes. Soluble in chloroform, slightly soluble in alcohol and ether, insoluble in water.

Derivation: Bromination of anthracene.

Use: Organic synthesis.

o-dibromobenzene. (benzene dibromide).

CAS: 26249-12-7. $C_6H_4Br_2$.

Properties: Heavy liquid; pleasant, aromatic odor. Bp $225.5C$, fp $7.13C$, d 1.9767 ($25/4C$), refr index 1.6155 ($20C$). Combustible. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and *n*-heptane; insoluble in water.

Derivation: Interaction of benzene with an excess of bromine in presence of iron.

Use: Solvent for oils, motor fuels, top-cylinder compounds, organic synthesis, ore flotations.

p-dibromobenzene. (benzene dibromide).

CAS: 26249-12-7. $C_6H_4Br_2$.

Properties: Colorless crystals. Mp $89C$, bp $219C$, d 2.261 , refr index 1.5743 ($99C$). Soluble in alcohol and ether.

Use: Organic synthesis of dyestuffs and drugs, manufacture of intermediates, fumigant.

N,N-dibromobenzenesulfonamide.

$C_6H_5SO_2NBr_2$.

Properties: Solid. Mp $109-111C$. Active bromine 50.4% .

Use: Halogenating agent.

dibromochloromethane.

CAS: 124-48-1. $CHBr_2Cl$.

Properties: Clear, colorless, heavy liquid. D 2.38 , bp $116C$.

Hazard: Irritant and narcotic.

Use: Organic synthesis.

1,2-dibromo-3-chloropropane. (DBCP).

CAS: 96-12-8. $CH_2BrCHBrCH_2Cl$.

Properties: Colorless (when pure) liquid. D 2.05 ($20C$), bp $195.5C$, fp $6.7C$, refr index 1.5530 ($20C$), flash p $170F$ ($76.6C$) (TOC). Slightly soluble in water, miscible with oils. Combustible.

Hazard: A carcinogen, reported to cause sterility. Use regulated by EPA. OSHA standard of 1 ppb . No longer made in the U.S.

Use: Pesticide, nematocide, soil fumigant.

2,6-dibromo-4-cyanophenyl octanoate.

CAS: 1689-99-2. mf: $C_{15}H_{17}Br_2NO_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dibromodibutylstannane.

CAS: 996-08-7. mf: $C_8H_{18}Br_2Sn$.

Properties: Mp: 20° .

Hazard: A poison by ingestion. Moderately toxic by skin contact. TWA 0.1 mg(Sn)/m^3 ; STEL 0.2 mg(Sn)/m^3 (skin).

dibromodiethyl sulfide. $(CH_2CH_2Br)_2S$. The bromine analog of mustard gas.

Properties: White crystals. D 2.05 ($15C$), bp $240C$ (decomposes), mp $31-34C$. Soluble in alcohol, benzene, ether; insoluble in water.

Derivation: Action of hydrobromic acid on an aqueous solution of thiodiglycol.

Hazard: Toxic by inhalation, strongly irritant poison gas.

Use: Organic synthesis.

dibromodiethyl sulfone. $(BrCH_2CH_2)_2SO_2$.

Properties: Plates. Mp $111-112C$. Soluble in alcohol, benzene, ether.

Derivation: Interaction of dibromodiethyl sulfide, chromic anhydride, and dilute sulfuric acid.

dibromodiethyl sulfoxide. $(BrCH_2CH_2)_2SO$.

Properties: Glittering crystals. Mp 100–101C. Soluble in alcohol, benzene, ether.

Derivation: Interaction of benzoyl peroxide and a hot solution of dibromodiethyl sulfide in chloroform.

dibromodifluoromethane. (difluorodibromomethane).

CAS: 75-61-6. CF_2Br_2 .

Properties: Colorless, heavy liquid. Fp -141C , bp 24.5C , d 2.288 (15/4C), refr index 1.399 (12C). Insoluble in water; soluble in methanol and ether. Nonflammable.

Derivation: Vapor-phase bromination of difluoromethane.

Grade: Pure (95.0% min).

Hazard: Irritant. TLV: 100 ppm.

Use: Synthesis of dyes, pharmaceuticals, quaternary ammonium compounds, fire-extinguishing agent.

6,8-dibromo-dihydro-1,3-benzoxazine-2-thione-4-one.

CAS: 23611-68-9. mf: $\text{C}_8\text{H}_3\text{Br}_2\text{NO}_2\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,3-dibromo-5,5-dimethylhydantoin.

$\text{BrNCONBrCOC}(\text{CH}_3)_2$.

Properties: Free-flowing, cream-colored powder; slight bromine odor. Mp 187–191C (decomposes). Quite stable at 75C; soluble in benzene, chloroform, glacial acetic acid; slightly soluble in water and carbon tetrachloride; insoluble in hexane. Contains 55% active bromine, which is slowly released in aqueous solution.

Derivation: Bromination of dimethylhydantoin.

Use: Controlled bromination and oxidation of organic compounds, water treatment, polymerization catalyst, potential germicide and sanitizer.

dibromodimethyl stannane. See dimethyltin dibromide.

dibromodiphenylstannane.

CAS: 4713-59-1. mf: $\text{C}_{12}\text{H}_{10}\text{Br}_2\text{Sn}$.

Properties: White or colorless crystals. Mp: 38° ; bp: 230° @ 42 mm. Sol in alc and ether.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

1,2-dibromoethane. See ethylene dibromide.

4,5'-dibromofluorescein. $\text{C}_{20}\text{H}_{10}\text{Br}_2\text{O}_5$.

Properties: Yellow powder (clean shade). Mp 265–267C.

Grade: 99+%.

Use: Lipstick dye.

2,4-dibromofluorobenzene. $\text{C}_6\text{H}_3\text{Br}_2\text{F}$.

Properties: Colorless liquid. D 2.047 (20C), bp

214C, refr index 1.5790 (25C). Insoluble in water; soluble in alcohol, acetone, ether, benzene, chloroform, ethyl acetate, and glacial acetic acid.

Hazard: Irritant to skin and eyes.

Use: Intermediate for agricultural and pharmaceutical chemicals.

dibromoformoxime. CBr_2NOH .

Properties: Crystals. Mp 70–71C, distills between 75 and 85C (3 mm Hg).

Hazard: Evolves highly toxic fumes on heating. A military poison.

dibromoiodoethylene. Br_2CCHI .

Properties: Liquid. D 2.952 (24C), bp 91C (15 mm Hg).

Derivation: Reaction of iodine and dibromoacetylene.

dibromomalonic acid. $\text{HOOC}\cdot\text{CBr}_2\cdot\text{COOH}$.

Properties: Light-yellow needles or prisms. Mp 147C (decomposes).

Use: Intermediate for drugs and fine chemicals.

dibromomalonyl chloride. $\text{ClOCCBr}_2\text{COCl}$.

Properties: Yellowish, oily liquid. Bp 75–77C (15 mm Hg).

Use: Chemical intermediate.

dibromomethane. See methylene bromide.

dibromomethyl ether. $(\text{CH}_2\text{Br})_2\text{O}$.

Properties: Colorless liquid. D 2.2, bp 154–155C, fp -34C . Decomposed by water; soluble in acetone, benzene, ether.

Derivation: (1) The reaction product of paraformaldehyde and sulfuric acid is treated with ammonium bromide; (2) interaction of hydrobromic acid and paraformaldehyde.

Hazard: Evolves highly toxic fumes on heating, strong irritant to eyes. Fire risk in contact with oxidizers.

Use: Military poison (lachrymator).

9,10-dibromooctadecanoic acid. (9,10-dibromostearic acid).

$\text{CH}_3(\text{CH}_2)_7\text{CHBrCHBr}(\text{CH}_2)_7\text{CO}_2\text{H}$.

Properties: Yellow solid or liquid. D 1.2458 (30/4C), mp 29–30C, refr index 1.4893 (42C). Insoluble in water; soluble in alcohols, ketones, aromatic and chlorinated hydrocarbons. Also available as methyl ester.

Grade: Technical (amber liquid).

Use: Chemical intermediate.

1,5-dibromopentane. See pentamethylene dibromide.

1,3-dibromopropane. See trimethylene bromide.

dibromopropanol. (2,3-dibromo-1-propanol).
CAS: 96-13-9. $\text{CH}_2\text{BrCHBrCH}_2\text{OH}$.

Properties: Colorless liquid. D 2.120 (20/4C), bp 219C. Soluble in acetone, alcohol, ether, and benzene.

Hazard: A carcinogen.

Use: Intermediate in preparation of flame retardants, insecticides, and pharmaceuticals.

dibromoquinonechlorimide. $\text{C}_6\text{H}_2\text{Br}_2\text{ClNO}$.
A reagent used for spot visualizations in chromatographic systems.

Properties: Yellow powder. Slightly soluble in water; moderately soluble in hot alcohol.

Hazard: Highly sensitive to heat; explodes at 120C, decomposes with rapid heat evolution at 60C.

3,5-dibromosalicylaldehyde. (3,5-dibromo-2-hydroxybenzaldehyde). $\text{Br}_2(\text{OH})\text{C}_6\text{H}_3\text{CHO}$.

Properties: Pale-yellow crystals. Mp 86C. Slightly soluble in water; soluble in ether, benzene, chloroform, alcohol, and acetic acid.

Use: Medicine (external), fungicide.

4',5-dibromosalicylanilide. See dibromsalan.

9,10-dibromostearic acid. See 9,10-dibromooctadecanoic acid.

2,5-dibromoterephthalic acid.

$\text{C}_6\text{H}_2\text{Br}_2(\text{COOH})_2$. A flame-retardant monomer for production of polyester fibers that are made by reacting this acid with dimethyl terephthalate and ethylene glycol. Permanent lowering of flammability is said to be gained by this method of incorporating bromine in molecular combination.

sym-dibromotetrafluoroethane.

Properties: Liquid. Bp 47.3C, d 2.18 (21.1C). Non-flammable.

Use: Refrigerant, fire-extinguishing agent, control fluid.

1,2-dibromo-1,1,5-trichloropentane.

Hazard: Moderately toxic by ingestion.

dibromsalan. (USAN for 4',5-dibromosalicylanilide). $\text{BrC}_6\text{H}_3(\text{OH})\text{CONHC}_6\text{H}_4\text{Br}$.

Hazard: A suspected carcinogen; use in cosmetics prohibited (FDA).

Use: Disinfectant.

dibucaine. (2-*n*-butoxy-*N*-(2-diethylaminoethyl) cinchoninamide).

Properties: Colorless or almost colorless powder; odorless. Mp 62–65C. Somewhat hygroscopic; affected by light. Soluble in alcohol and acetone; slightly soluble in water. Also available as the hydrochloride.

Grade: NF.

Hazard: Possibly allergenic.

Use: Medicine (anesthetic).

dibutoline sulfate. $(\text{C}_{15}\text{H}_{33}\text{N}_2\text{O}_2)_2\text{SO}_4$. Bisdiethylcarbamate of ethyl(2-hydroxyethyl)dimethylammonium sulfate.

Properties: Hygroscopic powder. Decomposes 166C. Soluble in water and benzene.

Use: Surface-active agent in medicine.

2,5-dibutoxyaniline. $\text{C}_6\text{H}_3(\text{OC}_4\text{H}_9)_2\text{NH}_2$.

Properties: Mp 18C. Insoluble in water; soluble in organic solvents.

Hazard: See aniline.

Use: Dyes, synthesis.

1,4-dibutoxybenzene. See hydroquinone di-*n*-butyl ether.

dibutoxyethyl adipate.

Properties: Colorless, oily liquid; mild, butyl-like odor. D 0.997 (20/20C); fp –34C; boiling range 205–215 (4 mm Hg); flash p 370F (187C); refr index 1.442 (25C); wt/gal 8 lb. Soluble or only slightly soluble in mineral oil, glycerol, glycols, and some amines; soluble in most other organic liquids. Combustible.

Use: Primary plasticizer for most resins, imparting flexibility at very low temperature as well as stability to UV light.

dibutoxyethyl phthalate. (*n*-butylglycol phthalate).

Properties: Colorless liquid. Fp –55C, d 1.06 (20C), bp 270C, wt/gal 8.86 lb, fast to light, water-resistant, flash p 407F (208C). Soluble in organic solvents. Combustible.

Use: Plasticizer for polyvinyl chloride, polyvinyl acetate, and other resins.

dibutoxymethane. $\text{CH}_2(\text{OC}_4\text{H}_9)_2$.

Properties: Colorless liquid. Wt/gal 6.97 lb (20C), refr index 1.40615 (20C), d 0.838 (20/20C), flash p 140F (60C) (CC), boiling range 164–186C. Insoluble in water. Combustible.

Hazard: Moderate fire risk.

dibutoxytetraglycol. (tetraethylene glycol di-butyl ether). $(\text{C}_4\text{H}_9\text{OC}_2\text{H}_4\text{OC}_2\text{H}_4)_2\text{O}$.

Properties: Practically colorless liquid; characteristic odor. D 0.9436 (20/20C), wt/gal 7.85 lb (20C), bp 237C (50 mm Hg), 330C, vap press <0.01 mm Hg (20C), fp –20C, flash p 355F (180C), solubility of water in product 4.8% by wt (20C), refr index 1.4357. Slightly soluble in water (1.3% by weight). Combustible.

Use: Solvent, especially for DDT.

***N,N*-di-*n*-butyl acetamide.** $\text{CH}_3\text{CON}(\text{C}_4\text{H}_9)_2$.

Properties: Colorless liquid. D 0.890 (20C), boiling range 245–250C, faint odor, flash p 225F (107C). Combustible.

di-*n*-butylamine.

CAS: 111-92-2. (C₄H₉)₂NH.

Properties: Colorless liquid; amine odor. Bp 159.6C, fp -62C, d 0.7613 (20/20C), wt/gal 6.33 lb (20C), refr index 1.4175 (20C), flash p 125F (51.6C) (OC). Partially soluble in water; soluble in alcohol and ether; miscible with hydrocarbons. Combustible.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Use: Corrosion inhibitor; intermediate for emulsifiers, rubber accelerators, dyes, insecticides, and flotation agents; inhibitor for butadiene.

di-*sec*-butylamine. (CH₃CHCH₂CH₃)₂NH.

Properties: Water-white liquid; amine odor. Boiling range 132–135C, d 0.754 (20/20C), refr index 1.412 (20C), flash p 75F (23.9C).

Hazard: Flammable, dangerous fire risk. Toxic by ingestion and inhalation.

dibutylamine pyrophosphate.

Grade: Available as 40% solution in ethanol-acetone.

Hazard: Flammable, dangerous fire risk.

Use: Anticorrosion agent in lacquers and cotton solutions, for light and heat stabilization of vinyl chloride and vinyl copolymer resins.

N,N-di-*n*-butylaminoethanol. (2-*N*-dibutylaminoethanol).

CAS: 102-81-8. (C₄H₉)₂NCH₂CH₂OH.

Properties: Colorless liquid; faint amine-like odor. D 0.859 (20C), boiling range 224–232C, flash p 200F (93.3C). Combustible.

Hazard: Toxic by ingestion and skin absorption. TLV: 0.5 ppm.

Use: Synthesis.

dibutylammonium oleate. See "Barak."

di-*n*-butylammonium tetrafluoroborate.

(C₄H₉)₂NH₂BF₄.

Properties: Solid. Mp 266C.

Use: Lubricating, surface treating, fluxing of aluminum.

N,N-di-*n*-butylaniline. C₆H₅N(C₄H₉)₂.

Properties: Amber liquid; faint aniline odor. D 0.904 (20C), boiling range 267–275C, refr index 1.519 (20C), flash p 230F (110C). Soluble in alcohol and ether; insoluble in water. Combustible.

Hazard: See aniline.

2,5-di-*tert*-butylbenzoquinone.

[C(CH₃)₃]₂C₆H₂O₂.

Properties: Yellow crystals. Mp 149–151C. Insoluble in water; soluble in ethyl acetate, acetone, benzene; slightly soluble in ethyl alcohol.

Hazard: See quinone.

Use: Oxidant, polymerization catalyst.

dibutylbutyl phosphonate.

C₄H₉P(O)(OC₄H₉)₂.

Properties: Colorless liquid; mild odor. D 0.948 (20/4C), bp 127–128C (2.5 mm Hg), flash p 310F (154.4C) (COC). Stable, insoluble in water, miscible with most common organic solvents. Combustible.

Use: Heavy-metal extraction and solvent separation, gasoline additives, antifoam agent, plasticizer, textile conditioner, and antistatic agent.

dibutyl chlorophosphate. (C₄H₉O)₂P(O)Cl.

Properties: Water-white liquid. Bp 103–106C (1.5 mm Hg), d 1.0742 (25C), refr index 1.4289 (25C). Soluble in alcohols; hydrolyzes slowly.

Use: Intermediate in organic synthesis.

4,6-di-*tert*-butyl-*m*-cresol. (DBMC; 4,6-*tert*-butyl-3-methylphenol). [C(CH₃)₃]₂CH₃C₆H₂OH.

Properties: Crystalline solid. Mp 62.1C, bp 282C, d 0.912 (80/4C), viscosity 9.9 centistokes (80C), 1.42 centistokes (160C), flash p 262F (127.7C) (OC), Combustible. Very soluble in ethanol, benzene, carbon tetrachloride, ethyl ether, and acetone; essentially insoluble in water, ethylene glycol, and 10% aqueous sodium hydroxide.

Use: Rubber reclaiming, surface-active agents, resins and plasticizers, antioxidants and perfumes.

2,6-di-*tert*-butyl-*p*-cresol. (2,6-*tert*-butyl-4-methylphenol; butylated hydroxytoluene; BHT).

CAS: 128-37-0. [C(CH₃)₃]₂CH₃C₆H₂OH.

Properties: White, crystalline solid. Fp 70C, bp 265C, d 1.048 (20/4C), viscosity 3.47 centistokes (0C), 1.54 centistokes (120C), refr index 1.4859 (75C), flash p 275F (135C) (COC). Soluble in methanol, ethanol, isopropanol, "Cellosolve" (12C), naphtha, benzene, methyl ethyl ketone, and linseed oil; insoluble in water and 10% sodium hydroxide. Combustible.

Grade: Technical, feed, FCC.

Hazard: Use in foods restricted. TLV: 10 mg/m³.

Use: Antioxidant for petroleum products, jet fuels, rubber, plastics, and food products, food packaging, animal feeds. Satisfies ASTM D910–64T for use in aviation gasoline.

di-*n*-butyl(dibutyryloxy)stannane.

CAS: 28660-63-1. mf: C₁₆H₃₂O₄Sn.

Hazard: A poison by ingestion. A severe eye and skin irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

n,n-di-tert-butylethylenediamine.CAS: 4062-60-6. mf: C₁₀H₂₄N₂.**Hazard:** A poison by ingestion. A mild skin irritant.**dibutyl-di(2-ethylhexyloxy-carbonylmethyl-thio)stannane.**CAS: 10584-98-2. mf: C₂₈H₅₆O₄S₂Sn.**Hazard:** Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**dibutyl-difluorostannane.**CAS: 563-25-7. mf: C₈H₁₈F₂Sn.**Hazard:** A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**dibutyl-(diformyloxy)stannane.**CAS: 7392-96-3. mf: C₁₀H₂₀O₄Sn.**Hazard:** A poison by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**2,2-dibutyl-dihydro-6h-1,3,2-oxathiastannin-6-one.** See dibutyltin mercaptopropionate.**dibutyl-diiodostannane.**CAS: 2865-19-2. mf: C₈H₁₈I₂Sn.**Hazard:** A poison by ingestion. Moderately toxic by skin contact. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**2,6-di-tert-butyl-α-dimethylamino-p-cresol.**

("Ethyl" Antioxidant 703).

(C₄H₉)₂C₆H₂OH[CH₂N(CH₃)₂].**Properties:** Light-yellow, crystalline solid. Mp 93.9C, flash p 280F (137.7C) (OC). Insoluble in water and 10% sodium hydroxide; soluble in organic solvents. Combustible.**Use:** Antioxidant in gasoline and oils, including jet-engine oils.**dibutyl-dipentanyloxy-stannane.**CAS: 3465-74-5. mf: C₁₈H₃₆O₄Sn.**Hazard:** A poison by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**di-tert-butyl diperphthalate.** (CH₃)₃COO-COC₆H₄COOC(CH₃)₃. Available as a 50% solution in dibutyl phthalate.**Properties:** Clear liquid. Flash p 145F (62.7C) (OC). D 1.056. Insoluble in water; soluble in most organic solvents. Combustible.**Hazard:** May ignite organic materials, strong oxidizer, may explode when shocked or in contact with reducing materials.**Use:** High-temperature polymerization catalyst for vinyl and polyester resins.**dibutyl-diphenyl tin.**(CH₃CH₂CH₂CH₂)₂Sn(C₆H₅)₂.**Properties:** Clear, slightly greenish liquid. Contains

30.7% Sn. Bp 175C (2 mm Hg), refr index 1.563 (17.5C), d 1.19. Combustible.

Hazard: Toxic. TLV: (as Sn) 0.1 mg/m³, toxic by skin absorption.**dibutyl-dipropionyloxy-stannane.**CAS: 3465-73-4. mf: C₁₄H₂₈O₄Sn.**Hazard:** A poison by ingestion. A severe skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**di-tert-butyl disulfide.** C(CH₃)₃SSC(CH₃)₃.**Properties:** Liquid. D 0.9291, boiling range 190–207C, refr index 1.491 (20C), flash p approximately 170F (76.6C). Combustible.**Use:** Intermediate, diesel- and jet-fuel additive, lubricant additive.**dibutyl-dithiocarbamic acid-s-tributylstannyl ester.**CAS: 67057-34-5. mf: C₂₁H₄₅NS₂Sn.**Hazard:** A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**((dibutyl-dithiocarbamoyl)oxy)tributylstannane.**

See dibutyl-dithiocarbamic acid-s-tributylstannyl ester.

n-dibutyl ether. See butyl ether.**dibutyl fumarate.**(C₄H₉)OOCCH:CHCOO(C₄H₉).**Properties:** Colorless liquid. D 0.9873 (20C), bp 285.2C, fp –15.6C, refr index 1.4466 (20C), flash p 300F (149C). Insoluble in water. Combustible.**Use:** Monomeric plasticizers, copolymers, intermediate.**dibutyl hexahydrophthalate.**C₆H₁₀(COOC₄H₉)₂.**Properties:** Liquid. D 1.005, bp 185–190C, flash p 305F (151.6C). Combustible.**Use:** Plasticizer for nitrocellulose.**9-(2,2-dibutylhydrazino)acridine monohydrochloride.**CAS: 28846-39-1. mf: C₂₁H₂₇N₃•ClH.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,5-di-tert-butylhydroquinone.**[C(CH₃)₃]₂C₆H₂(OH)₂.**Properties:** White powder. Mp 210–212C. Soluble in acetone, alcohol, benzene; insoluble in water, aqueous alkali.**Use:** Polymerization inhibitor, antioxidant, stabilizer against UV deterioration of rubber.**dibutyl 2-hydroxyethyl phosphate.** See 2-hydroxyethyl dibutyl phosphate.

di-*n*-butyl itaconate.

Properties: Clear, colorless liquid; slight odor. Bp 145C (10 mm Hg), d 0.9833 (22C), refr index 1.442 (25C). Insoluble in water. Combustible.

Use: Resins, lubricating oil additives, plasticizers.

***N,N*-di-*n*-butyl lauramide.**

Properties: Straw-colored liquid; odor of lauric acid. D 0.861 (20C), boiling range 200–230C (3 mm Hg), flash p 375F (190C). Combustible.

dibutyl maleate. (DBM).

Properties: Colorless, oily liquid. Bp 280.6C, sets to a glass below –85C, d 0.9964 (20/20C), wt/gal 8.3 lb (20C), flash p 285F (140.5C) (OC). Insoluble in water. Combustible.

Use: Copolymers, plasticizers, intermediate.

4,6-di-*t*-butyl-2-(α -methyl-4-methoxybenzyl) phenol. See 2,4-bis(1,1-dimethylethyl)-6-(1-(4.**2,6-di-*tert*-butyl-4-methylphenol.** See 2,6-di-*tert*-butyl-*p*-cresol.**4,6-di-*tert*-butyl-3-methylphenol.** See 4,6-di-*tert*-butyl-*m*-cresol.**dibutyl oxalate. (COOC₄H₉)₂.**

Properties: Water-white, high-boiling liquid; mild odor. Bp 240–250C, refr index 1.425, fp –30C, wt/gal approximately 8.24 lb (20C), flash p 220F (104.4C) (CC). Miscible with most alcohols, ketones, esters, oils, hydrocarbons. Combustible.

Derivation: By the standard esterification process using normal butyl alcohol and oxalic acid.

Grade: According to ester content 90%, 95%, 99–100%.

Hazard: Toxic by ingestion and inhalation, strong skin irritant.

Use: Organic synthesis, solvent.

2,2-dibutyl-1,3,2-oxathiaannolane.

Hazard: A poison by ingestion. Moderately toxic by skin contact. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

di-*tert*-butyl peroxide. (tert-butyl peroxide; DTBP).

Properties: Clear, water-white liquid. D 0.791 (25/25C), fp –40C, bp 111C, refr index 1.389 (20C), flash p 65F (18.3C) (CC). Soluble in styrene, ketones, most aliphatic and aromatic hydrocarbons; insoluble in water.

Hazard: Flammable, dangerous fire hazard. Strong oxidizer, may ignite organic materials or explode when shocked or in contact with reducing materials.

Use: Polymerization catalyst for resins, including olefins, styrene, styrenated alkyds, and silicones; ignition accelerator for diesel fuel; organic synthesis; intermediate.

2,4-di-*tert*-butylphenol.

Properties: Tan, crystalline solid. Mp 52C, bp 152–157C (25 mm Hg), d 0.907 (60/4C), wt/gal 7.57 lb (60C), flash p 265F (129C). Soluble in methanol and ether; very slightly soluble in water. Combustible.

Hazard: See phenol.

Use: Intermediate, antioxidant, stabilizer, germicide.

2,6-di-*tert*-butylphenol.

Properties: Light-straw colored, crystalline solid. Mp 37C, d 0.914 (20C), bp 253C, flash p 245F (118C). Soluble in alcohol and benzene; insoluble in water. Combustible.

Hazard: See phenol.

Use: Intermediate, antioxidant, satisfies ASTM D910–64T for use as antioxidant in aviation gasoline.

***N,N'*-di-*sec*-butyl-*p*-phenylenediamine.**

Properties: Amber to red liquid (normally supercooled below 18C). D 0.94 (15.5/15.5C), fp 20C, flash p 290F (COC). Soluble in gasoline, absolute alcohol, and benzene; insoluble in water or caustic solutions. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant to tissue, causes skin burns.

Use: Oxidation inhibitor and stabilizer in gasoline (satisfies ASTM D910–64T as antioxidant in aviation gasoline), prevents decomposition of tetraethyl lead in gasoline.

dibutyl phenyl phosphite. (DBPP; phosphoric acid, dibutyl phenyl ester).

Properties: Clear liquid; butanolic odor. Mw 286.26, sp g 0.0691 (23/25C), bp 131–132C, vap press 0.007 mm Hg 25C, flash p 129C. Insoluble in water.

Hazard: Combustible. TLV: 0.3 ppm.

Use: Hydraulic fluids.

dibutyl phosphite. (di-*n*-butyl phosphite).

Properties: Pale-amber liquid. Mw 210.21, mp (decomposes above 100C), vap press <1 mm Hg (20C).

Hazard: TLV: 1 ppm. Respiratory-tract irritant.

Use: Organic catalyst and antifoaming agent.

dibutyl phosphite.

Properties: Water-white liquid. Bp 95C (1 mm Hg), d 0.9860 (25C), refr index 1.4228 (25C), flash p

120F (49C). Soluble in common organic solvents. Combustible.

Hazard: Moderate fire risk.

Use: Solvent, antioxidant, intermediate.

dibutyl phthalate.

CAS: 84-74-2. $C_8H_{16}(COOC_4H_9)_2$.

Properties: Colorless, stable, oily liquid; odorless. D 1.0484 (20/20C), fp $-35C$, viscosity 0.203 cP (20C), distillation range 227–235 (37 mm Hg), flash p 340F (171C) (COC), wt/gal 8.72 lb (20C), refr index 1.4915 (25C), bp 340.0C, vap press 1.11 mm Hg (150C). Miscible with common organic solvents; insoluble in water. Autoign temp approximately 750F (398.8C). Combustible

Derivation: By treating *n*-butyl alcohol with phthalic anhydride followed by purification, which results in a product unusually free from odor and color.

Grade: Technical, 99–100% dibutyl phthalate.

Hazard: Toxic. TLV: 5 mg/m³.

Use: Plasticizer in nitrocellulose lacquers, elastomers, explosives, nail polish and solid rocket propellants; solvent for perfume oils; perfume fixative; textile lubricating agent; safety glass; insecticides; printing inks; resin solvent; paper coatings; adhesives; insect repellent for textiles.

2,5-di-*tert*-butylquinone. $[C(CH_3)_3]_2C_6H_2O_2$.

Properties: Yellow powder. Mp 149–151C. Insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzene.

Hazard: Fire risk in contact with organic materials.

Use: Oxidizing agent.

dibutylsebacate. (DBS).

$C_4H_9OCO(CH_2)_8OCOC_4H_9$.

Properties: Clear, colorless, liquid; odorless. Bp 349C (760 mm Hg), 180C (3 mm Hg), fp $-11C$, d 0.936 (20/20C), wt/gal 7.81 lb (20C); refr index 1.4395 (25C); flash p 350F (176C). Insoluble in water. Combustible.

Grade: Technical.

Use: Plasticizer, rubber softener, dielectric liquid, cosmetics and perfumes, sealing food containers, flavoring.

dibutylstannane. See dibutyltin dihydride.

N,N-dibutylstearamide. $C_{17}H_{35}CON(C_4H_9)_2$.

Properties: Yellow liquid. D 0.860 (20/20C), boiling range 173–175C (0.4 mm Hg), flash p 420F (215C), fatty-acid odor. Combustible.

di-*n*-butyl succinate. $C_{12}H_{22}O_4$.

Properties: Colorless liquid. Bp 120C, fp $-29C$, d 0.977, refr index 1.43.

Derivation: Reaction of butyl alcohol with succinic acid.

Use: Insect repellent.

di-*tert*-butyl sulfide. (butyl sulfide).

$[(CH_3)_3C]_2S$.

Properties: Liquid. Fp $-11C$, boiling range 297–303F, d 0.8316, wt/gal 6.93 lb, refr index 1.451 (20C), flash p 125F (51.6C). Combustible.

Hazard: Moderate fire risk.

Use: Intermediate, flavoring.

dibutyl tartrate.

$C_4H_9OOCCH_2OCH_2OCOC_4H_9$.

Properties: Light-tan liquid. Mp 21C, bp approximately 204C (26 mm Hg), refr index 1.4463 (20C), flash p 195F (90.5C) (CC), combustible, autoign temp 544F (284.4C), wt/gal 9.07 lb (20C). Miscible with the common organic solvents, oils, hydrocarbons.

Use: Solvent and plasticizer for cellulose esters and ethers, elastomers, lubricant; rubberized fabrics; lacquers; dopes; transfer inks.

dibutyl(tetrachlorophthalato)stannane.

CAS: 23535-89-9. mf: $C_{16}H_{18}Cl_4O_4Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dibutylthiourea. $C_4H_9NHCSNHC_4H_9$.

Properties: White to light-tan powder. Mp 59–69C. Slightly soluble in water; soluble in methanol, ether, acetone, benzene, ethyl acetate; insoluble in gasoline.

Use: Corrosion inhibitor for pickling cast iron or carbon steel, reducing corrosion of ferrous metals and aluminum alloys in brine, intermediate.

dibutyl-tin bis(isooctylthioglycollate). See bis(isooctylloxycarbonylmethylthio)dibutyl stannane.

dibutyltinbis(lauryl) mercaptide.

$(C_4H_9)_2Sn(SC_{12}H_{25})_2$.

Properties: Yellow liquid, tin content 18.5%, soluble in toluene and heptane.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Antioxidant and metal cleaning (or protective) agent.

di-*n*-butyltin bismethanesulfonate.

CAS: 73927-86-3. mf: $C_{10}H_{24}O_6S_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dibutyltin bis(methyl maleate). See bis(methoxymaleoyloxy)dibutylstannane.

dibutyltin bis(trifluoroacetate). See bis(trifluoroacetoxo)dibutyltin.

dibutyltin diacetate.

CAS: 1067-33-0. $(C_4H_9)_2Sn(C_2H_3O_2)_2$.

Properties: Clear, yellow liquid. Bp 130C (2 mm Hg), fp $<12C$, flash p 290F (143C). Soluble in water and most organic solvents. Combustible.

Derivation: Reaction of acetic acid with dibutyltin oxide.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Stabilizer for chlorinated organics, catalyst for condensation reactions.

dibutyltin dibromide. See dibromodibutylstannane.

dibutyltin dicaprylate. See bis(octanoyloxy)di-*n*-butyl stannane.

dibutyltin dichloride.

CAS: 683-18-1. (C₄H₉)₂SnCl₂.

Properties: White, crystalline solid. Mp 43C, bp 135C (10 mm Hg), d 1.36 (24/4C), refr index 1.4991 (51C), flash p 335F (168C). Insoluble in cold water; hydrolyzed by hot water; soluble in many organic solvents. Combustible.

Derivation: Reaction of butylmagnesium chloride with tin tetrachloride.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Organotin intermediate.

dibutyltin di-2-ethylhexoate.

CAS: 2781-10-4. (C₄H₉)₂Sn(OCOC₁₀H₂₀CH₃)₂.

Properties: Waxy, white solid. Mp 52.54C. Insoluble in water; soluble in most organic solvents.

Derivation: Reaction of dibutyltin oxide with 2-ethylhexoic acid.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Catalyst for silicone curing, polyether foams.

dibutyltin difluoride. See dibutyldifluorostannane.

di-*n*-butyltin diformate. See dibutyl(diformyloxy)stannane.

di-*n*-butyl tin di(hexadecylmaleate).

CAS: 19706-58-2. mf: C₄₈H₈₈O₈Sn.

Hazard: A poison by ingestion. An eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dibutyltin dihydride.

CAS: 1002-53-5. mf: C₈H₂₀Sn.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³. STEL 0.2 mg/m³ (skin). Not classifiable as a human carcinogen.

dibutyltin diiodide. See dibutyldiiodostannane.

dibutyltin dilaurate.

CAS: 77-58-7. (C₄H₉)₂Sn(OCOC₁₀H₂₀CH₃)₂.

Properties: Clear, pale-yellow liquid. D 1.066, mp 23C, fp 8.0C, wt/gal 8.84 lb (20C), flash p 440F (226C). Soluble in acetone and benzene; insoluble in water. Combustible.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Stabilizer for vinyl resins, lacquers, elastomers; catalyst for urethane and silicones.

di-*n*-butyltin di(monononyl)maleate.

CAS: 69239-37-8. mf: C₄₂H₇₆O₈Sn.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

di-*n*-butyltin dipentanoate. See dibutyldipentanoyloxystannane.

di-*n*-butyltin dipropionate. See dibutyldipropionyloxystannane.

di-*n*-butyltin di(tetradecanoate). See bis(tetradecanoyloxy)dibutylstannane.

dibutyltin maleate.

CAS: 15535-69-0. [(C₄H₉)₂Sn(OOCCH₂)₂].

Properties: White, amorphous powder. Mp 110C, flash p 400F (204C). Insoluble in water; soluble in benzene and organic esters. Combustible.

Derivation: Reaction of maleic acid with di-butyltin oxide.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Stabilizer for polyvinyl chloride resins, condensation catalyst.

dibutyltin mercaptopropionate.

CAS: 78-06-8. mf: C₁₁H₂₂O₂SSn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dibutyltin-*o,s*-mercaptopropionate. See dibutyltin mercaptopropionate.

dibutyltin methyl maleate. See bis(methoxymaleoyloxy)dibutylstannane.

dibutyltin octanoate. See bis(octanoyloxy)di-*n*-butyl stannane.

dibutyltin oxide.

CAS: 818-08-6. [(C₄H₉)₂SnO]₂.

Properties: White powder. Mp (decomposes). Insoluble in water. Combustible.

Derivation: Hydrolysis of dibutyltin dichloride with caustic.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Condensation catalyst, intermediate for other organotins.

dibutyltin sulfide.

CAS: 4253-22-9. [(C₄H₉)₂SnS]₂.

Properties: Colorless, oily liquid. Combustible.

Derivation: Reaction of dibutyltin oxide with hydrogen sulfide.

Hazard: TLV: 0.1 mg(Sn)/m³, toxic by skin absorption.

Use: Vinyl stabilizer, antioxidant, lubricating additive.

dibutyltin tetrachlorophthalate. See dibutyl(tetrachlorophthalato)stannane.

2,6-di-*t*-butyl-*p*-tolyl methylcarbamate.
See terbutol.

2,6-di-*tert*-butyl-*p*-tolyl-*N*-methylcarbamate.
[(CH₃)₃C]₂CH.C₆H₄.OOCNHCH₃. White solid, mp 200C, insoluble in water, soluble in alcohol.
Use: Herbicide.

1,1-dibutylurea. (*n,n*-dibutylurea).
NH₂CON(C₄H₉)₂.

Properties: Liquid. Mp 22–25C, boiling range 118–119C (2–3 mm Hg), flash p 279F (137C). Soluble in alcohol and ether. Combustible.

Use: Thermoplastic resins by copolymerization with urea with formaldehyde catalyst.

dibutylxanthogen disulfide. See “C-P-B.”

DIC. Abbreviation for β-diisopropylaminoethyl chloride hydrochloride.

dicalcium magnesium aconitate. (calcium magnesium aconitate). [C₂H₃(COO)₃]₂Ca₂Mg.
Properties: White, crystalline powder or lumps.
Derivation: Precipitation from molasses with lime.
Use: Conversion to aconitic acid, tributyl aconitate, and similar ester plasticizers.

dicalcium orthophosphate. See calcium phosphate, dibasic.

dicalcium orthophosphite. See calcium phosphite.

dicalcium phosphate dihydrate. See calcium phosphate, dibasic.

dicalcium silicate. 2CaO•SiO₂. One of the components of cement. Noncombustible.

Occurrence: Obtained as a by-product in electric furnace operation

Use: Used to neutralize acid soils.
See cement, Portland.

“Dicalite.” TM for a group of products made from either diatomite or perlite, used in filters and filter-aids.
See diatomaceous earth.

dicamba. Generic name for 3-6-dichloro-*o*-anisic acid (2-methoxy-3,6-dichlorobenzoic acid). HOOC(Cl)C₆H₂Cl(OCH₃).
Properties: Crystals. Mp 114–116C. Slightly solu-

ble in water; moderately soluble in xylene; very soluble in alcohol.

Use: Herbicide, pest control.

dicapryl adipate. C₈H₁₇OOC(CH₂)₄COOC₈H₁₇.
Properties: Almost water-white liquid. Bp 213–216.5C (4 mm Hg), flash p 352F (177C). Combustible.

Use: Plasticizer for vinyl resins and cellulose esters.

dicapryl phthalate. (DCP, di-(2-*o*-tyl)phthalate). (C₈H₁₇OOC)₂C₆H₄.

Properties: Colorless, viscous liquid. Bp 227–234C (4.5 mm Hg), fp –60C, refr index 1.480 (20C), d 0.965 (25C), flash p 395F (201C). Insoluble in water; compatible with vinyl chloride resins and some cellulosic resins. Combustible.

Use: Monomeric plasticizer for vinyl and cellulosic resins.

dicapryl sebacate.
C₈H₁₇OOC(CH₂)₈COOC₈H₁₇.

Properties: Light straw-colored liquid. Bp 231.5–239C (4 mm Hg). Nonvolatile, gives excellent low-temperature flexibility, flash p 445F (229C). Combustible.

Use: Plasticizer for vinyl resins and acrylonitrile rubber.

dicapthon. (generic name for *O*-(2-chloro-4-nitrophenyl) *O,O*-dimethyl phosphorothioate). (CH₃O)₂P(:S)OC₆H₃(Cl)NO₂.

Properties: White solid. Mp 51–52C. Insoluble in water; soluble in acetone, cyclohexanone, ethylacetate, toluene, and xylene.

Hazard: Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

1,2-dicarbadodecaborane(12).

CAS: 16872-09-6. mf: C₂H₁₂B₁₀.

Hazard: Moderately toxic by ingestion and inhalation.

dicarboxylate. See sodium (*r,r*)-5-(2-((2-(3-chlorophenyl))-2).

dicarboxylic acid. A carboxylic acid containing two –COOH groups, e.g., adipic, oxalic, phthalic, sebacic, and maleic acids.

dicatechol borate 1,3-di(*o*-tolyl)guanidine salt.

CAS: 16971-82-7. mf: C₁₅H₁₇N₃•Cl₂H₈BO₄•H.

Hazard: Moderately toxic by ingestion.

di-(C9-C11 alkyl) phthalate.

CAS: 68515-49-1.

Hazard: Experimental reproductive effects.

dicetyl. See dotriacontane.

dicetyl ether. (dihexadecyl ether).

Properties: Crystals. Mp 54C, bp decomposes at 300C, d 0.8117 (54/4C).

Use: Electrical insulators, water repellents, lubricants in plastic molding and processing, antistatic substances, chemical intermediate.

dicetyl sulfide. (dihexadecyl thioether; dihexadecyl sulfide). (C₁₆H₃₃)₂S.

Properties: Solid. Mp 57–58C, bp (decomposes), d 0.8253 (60/4C).

Use: Organic synthesis (formation of sulfonium compounds).

dichlobenil. (generic name for 2,6-dichlorobenzonitrile). Cl(Cl)C₆H₃CN.

Properties: White solid. Mp 144C. Almost insoluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Herbicide.

dichlofenthion. (*O,O*-diethyl-*O*-2,4-dichlorophenyl phosphorothioate).

CAS: 97-17-6. C₁₀H₁₃Cl₂O₃PS.

Properties: Colorless liquid. Bp 165C (0.3 mm Hg), d 1.30, refr index 1.52. Slightly soluble in water; soluble in organic solvents.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Pesticide.

dichlone. (generic name for 2,3-dichloro-1,4-naphthoquinone).

CAS: 117-80-6. C₁₀H₄Cl₂O₂.

Properties: Yellow needles. Mp 193C. Soluble in xylene and *o*-dichlorobenzene; slightly soluble in ethyl alcohol, glacial acetic acid, and carbon tetrachloride; almost insoluble in water.

Hazard: Toxic by ingestion and inhalation, irritant to skin and eyes.

Use: Seed disinfectant, fungicide for foilage and textiles, insecticide, organic catalyst.

dichloramine-T. (*p*-toluenesulfondichloroamide). CH₃C₆H₄SO₂NCl₂.

Properties: Pale-yellow crystals containing not less than 28% nor more than 30% active chlorine. Chlorine odor; stable when pure, decomposed slowly by air, rapidly by impurities, petrolatums, kerosene, olive oil, and alcohol. Soluble in glacial acetic acid, chlorinated paraffin hydrocarbons, eucalyptol, benzene, chloroform, and carbon tetrachloride; almost insoluble in water; mp 80C.

Derivation: Product of the reaction between toluene-*p*-sulfonamide and calcium hypochlorite solution is acidified with acetic acid and extracted with chloroform. The chloroform solution is dried chemically, filtered, and evaporated.

Use: Germicide, antibacterial.

See chloramine-T.

dichlorimipramine.

CAS: 3589-22-8. mf: C₁₉H₂₂Cl₂N₂.

Hazard: A poison.

dichloroacetaldehyde. CHCl₂CHO.

Properties: Colorless liquid; penetrating pungent odor. D 1.436 (25C), wt/gal 12.1 lb, flash p 140F (60C) (CC). Combustible.

Hazard: Moderate fire hazard. Toxic by ingestion and inhalation, strong skin irritant.

Use: Manufacture of insecticides.

dichloroacetic acid.

CAS: 79-43-6. CHCl₂COOH.

Properties: Colorless liquid. D 1.5724 (13C), fp -4C, bp 193–194C. Soluble in water, alcohol, and ether.

Derivation: Chlorination of acetic acid in presence of iodine.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin.

Use: Intermediate, pharmaceuticals, medicine.

α,α-dichloroacetophenone. C₆H₅COCHCl₂.

Properties: Crystals. D 1.34 (15C), bp 247C (decomposes) mp 20–21.5C.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin.

dichloroacetyl chloride. Cl₂CHCOCl.

Properties: Fuming liquid; acrid odor. D 1.5315 (16/4C), bp 107–108C, refr index 1.4638 (16C); soluble in ether; decomposes in water and alcohol.

Hazard: Strong irritant to skin and eyes.

Use: Intermediate.

dichloroacetylene.

CAS: 7572-29-4. ClC≡CCl.

Properties: A liquid. Mw 94.93, mp -66C, bp (explosives). Soluble in alcohol, acetone.

Occurrence: Thermal decomposition of trichloroethylene; closed-circuit anesthesia using trichloroethylene and soda-lime absorption of carbon dioxide. May be synthesized by passing trichloroethylene over alkaline materials at 70F.

Hazard: Confirmed carcinogen. TLV: ceiling 0.1 ppm.

2,3-dichloroallyl diisopropylthiolcarbamate. (diallate). [(CH₃)₂CH]₂NCOSCH₂C(Cl):CHCl.

Properties: Brown liquid. Bp 159C (9 mm Hg). Almost insoluble in water; soluble in acetone, benzene, chloroform, kerosene, and xylene.

Hazard: Toxic. Absorbed by skin. Use may be restricted.

Use: Herbicide.

2,4-dichloro-6-aminophenol. (2-amino-4,6-dichlorophenol). C₆H₃Cl₂NO.

Properties: Acicular crystals. Mp 95C. Soluble in benzene; less so in carbon disulfide. The hydrochloride is soluble in water and alcohol.

Use: Azo-dye intermediate.

2,5-dichloroaniline. $C_6H_3NH_2Cl_2$.

Properties: Light-brown or amber-colored crystalline mass. Mp 47–50C, bp 251–252C. Slightly soluble in water; soluble in alcohol, benzene, and dilute hydrochloric acid. Combustible.

Derivation: Nitration of *p*-dichlorobenzene with subsequent reduction.

Hazard: See aniline.

Use: Dye intermediate.

3,4-dichloroaniline.

CAS: 95-76-1. $C_6H_3NH_2Cl_2$.

Properties: Crystals. Mp 68–72C, bp 272C, flash p 331F (166C). Slightly soluble in water; soluble in most organic solvents. Combustible.

Derivation: Nitration of *o*-dichlorobenzene with subsequent reduction.

Hazard: See aniline.

Use: Intermediate for manufacture of dyes and pesticides.

dichlorobenzaldehyde. $C_6H_3CHOCl_2$. Includes 2,4-, 2,5-, and 3,4-isomers.

Properties: White, crystalline solid. Bp 233C, mp 65–67C (2,4-), 35C (3,4-). 2,4-Isomer soluble in methanol, ethanol, ether, and acetone; insoluble in water. 2,5-Isomer soluble in ethanol and ether. 3,4-Isomer soluble in ethanol, ether, and acetone; slightly soluble in methanol and amyl ether; insoluble in water.

Use: Intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

dichlorobenzalkonium chloride.

$C_{21}H_{36}Cl_2N$.

Properties: Colorless crystals; very bitter taste. Soluble in alcohol and water.

Derivation: Reaction of *N*-dimethyldodecylamine with 3,4-dichlorobenzyl chloride.

Hazard: Skin irritant.

Use: Algicide, antiseptic, sterilant.

m-dichlorobenzene. (1,3-dichlorobenzene).

CAS: 541-73-1. $C_6H_4Cl_2$.

Properties: Colorless liquid. D 1.288 (20/4C), bp 172C, fp –24C, refr index 1.547 (20.9C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Use: Fumigant and insecticide.

o-dichlorobenzene. (1,2-dichlorobenzene).

CAS: 95-50-1. $C_6H_4Cl_2$.

Properties: Colorless liquid; pleasant odor. A mixture of isomers containing at least 85% *o*- and varying percentages of *p*- and *m*-. Autoign temp 1198F (647C), d 1.284, wt/gal 10.7 lb, bp 172–179C, fp –17C, flash p 150F (65.5C). Miscible with most organic solvents; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Method of purification: Rectification.

Grade: Purified, technical.

Hazard: Toxic by inhalation and ingestion. TLV: 25 ppm.

Use: Manufacture of 3,4-dichloroaniline; solvent for a wide range of organic materials and for oxides of nonferrous metals; solvent carrier in production of toluene diisocyanate; dye manufacture; fumigant and insecticide; degreasing hides and wool; metal polishes; industrial odor control; heat transfer.

p-dichlorobenzene. (1,4-dichlorobenzene; PDB).

CAS: 106-46-7. $C_6H_4Cl_2$.

Properties: White crystals; volatile (sublimes readily); penetrating odor. D 1.458, bp 173.7C, mp 53C, flash p 150F (65.5C) (CC). Soluble in alcohol, benzene, and ether; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Grade: Technical.

Hazard: Toxic by ingestion, irritant to eyes. TLV: 75 ppm.

Use: Moth repellent, general insecticide, germicide, space odorant, manufacture of 2,5-dichloroaniline, dyes, intermediates, pharmacy, agriculture (fumigating soil).

See “Santochlor” [*Solutia*].

N,N-dichlorobenzenesulfonamide.

$C_6H_3SO_2NCl_2$.

Properties: Solid, fine, white crystals. Mp 68–71C.

Use: A source of positive chlorine.

3,3'-dichlorobenzidine.

CAS: 91-94-1. $C_6H_3Cl_2N_2$.

Properties: Gray to purple, crystalline solid. Mp 165C. Insoluble in water; soluble in alcohol and ether.

Hazard: A tumorigen and carcinogen; absorbed by skin. TLV: suspected human carcinogen.

Use: Intermediate for dyes and pigments, curing agent for isocyanate-terminated resins for urethane plastics.

2,4-dichlorobenzoic acid. $Cl_2C_6H_3COOH$.

Properties: White to slightly yellowish powder. Mp 158–162C. Soluble in alcohol, ether, acetone, 5% caustic; insoluble in water and heptane.

Use: Intermediate for antimalarials, dyes, fungicides, pharmaceuticals, and other organic chemicals.

3,4-dichlorobenzoic acid. $Cl_2C_6H_3COOH$.

Properties: White to slightly yellowish powder. Mp 202–204C. Soluble in alkali, alcohol, ether, and

acetone; slightly soluble in diacetone; insoluble in water, ethylene dichloride, and toluene.

Use: Intermediate for pharmaceuticals, dyes, etc.

2,6-dichlorobenzonitrile. See dichlobenil.

3,4-dichlorobenzotrichloride. $\text{Cl}_2\text{C}_6\text{H}_3\text{CCl}_3$.

Properties: Water-white liquid. Boiling range 276–285C, fp approximately 24.0C, d 1.585–1.590 (25/15C). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.

Use: Intermediate for pharmaceuticals, dyes, etc.

dichlorobenzoyl chloride. $\text{Cl}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Colorless liquid. Boiling range 250–260C, fp 15–16C, d 1.500–1.510 (25/15C). Soluble in alcohol, ether, and acetone; slightly soluble in heptane; insoluble in water. Combustible.

Use: Intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

3,5-dichlorobenzoyl chloride.

CAS: 2905-62-6. mf: $\text{C}_7\text{H}_3\text{Cl}_3\text{O}$.

Hazard: Moderately toxic by ingestion. A moderate skin and mild eye irritant.

dichlorobenzyl chloride. $\text{Cl}_2\text{C}_6\text{H}_3\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. Boiling range 245–252C; d 1.415–1.420 (25/15C). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.

Use: Intermediate for organic chemicals, pharmaceuticals and dyes, insecticide.

1,1-dichloro-2,2-bis(*p*-chlorophenyl)ethane.

See TDE.

3,3'-dichlorobiphenyl.

CAS: 2050-67-1. mf: $\text{C}_{12}\text{H}_8\text{Cl}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,1-dichloro-2,2-bis(*p*-ethylphenyl)ethane.

(diethyldiphenyldichloroethane; "Perthane").

$\text{C}_{18}\text{H}_{20}\text{Cl}_2$.

Properties: Crystals. Mp 56C. Insoluble in water; soluble in acetone, kerosene, diesel fuel.

Hazard: Toxic. Absorbed by skin.

Use: Insecticide, formulated as emulsifiable concentrate or wettable powder. Used against insects, especially moths.

1,4-dichlorobutane. (tetramethylene dichloride; DCB). $\text{ClCH}_2(\text{CH}_2)_2\text{CH}_2\text{Cl}$.

Properties: Colorless, mobile liquid; pleasant odor. D 1.141 (20/4C), bp 155C, flash p 104F (40C) (OC), refr index 1.4542 (20C). Insoluble in water; soluble in most common organic solvents. Combustible.

Hazard: Moderate fire risk.

Use: Organic synthesis, including adiponitrile.

1,3-dichlorobutene-2. $\text{ClH}_2\text{CCH:CClCH}_3$.

Properties: Clear to straw-colored liquid. Bp 125–130C, flash p 80F (26.6C) (COC). Insoluble in water; soluble in organic solvents.

Hazard: Flammable, moderate fire risk. Toxic by inhalation.

1,4-dichlorobutene-2.

CAS: 764-41-0. $\text{ClH}_2\text{CCH:CHCH}_2\text{Cl}$.

Properties: Colorless liquid; distinct odor. Bp 158C (60C) (20 mm Hg), mp 3.5C, d 1.1858 (25/4C), refr index 1.4863 (25C). Miscible with benzene, alcohol, carbon tetrachloride; immiscible with ethylene glycol, glycerol, and water. Combustible.

Grade: Available as 95–98% *trans* isomer, 2–5% *cis* isomer. Above constants are for the pure *trans*-isomer.

Hazard: Irritant to skin and eyes, causes blisters. Moderate fire hazard.

Use: Intermediate.

dichlorocarbene. CCl_2 .

Properties: Exists only at low temperature and pressure, fp –114C, bp –20C, decomposes on distillation at normal pressure to hexachloroethane and hexachlorobenzene.

Derivation: Reaction of carbon tetrachloride vapor with carbon at 1300C and 10^{-3} mm Hg.

Hazard: Explosive reaction with carbon, forms phosgene on reaction with oxygen.

Use: Research.

1,1'-dichlorocarbonylferrocene. (ferrocenoyl dichloride). $[\text{C}_5\text{H}_4(\text{COCl})_2]_2\text{Fe}$.

Properties: Red, crystalline solid. Mp 93–95C.

Use: Intermediate.

1,1-dichloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)ethylene.

CAS: 3424-82-6. mf: $\text{C}_{14}\text{H}_8\text{Cl}_4$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4,6-dichloro-*N*-(2-chlorophenyl)-1,3,5-triazin-2-amine. $\text{ClC}_6\text{H}_4\text{NHC}_3\text{N}_3\text{Cl}_2$.

Properties: Tan, crystalline solid. Mp 159–160C. Insoluble in water.

Hazard: See aniline.

Use: Foliage fungicide.

dichloro(2-chlorovinyl)arsine. See β -chlorovinyl dichloroarsine.

3,3'-dichloro-4,4'-diaminodiphenylmethane.

See 4,4'-methylenebis(2-chloroaniline).

dichlorodibenzofuran.

CAS: 43047-99-0. mf: $\text{C}_{12}\text{H}_6\text{Cl}_2\text{O}$.

Hazard: A poison.

Use: Agricultural chemical.

1,3-dichloro-2-(3,4-dichlorophenoxy) benzene.CAS: 130892-66-9. mf: C₁₂H₆Cl₄O.**Hazard:** A reproductive hazard.**2,3-dichloro-5,6-dicyanobenzoquinone.**
(DDQ).
$$\begin{array}{c} \text{OCC(Cl):C(Cl)COC(CN):C(CN)} \\ \text{OCC(Cl):C(Cl)COC(CN):C(CN)} \end{array}$$
Properties: Bright, yellow-orange solid. Mp 213–215C.**Use:** Highly selective oxidizing agent for organic compounds.**2,2'-dichlorodiethyl ether.** See *sym*-dichloroethyl ether.**dichlorodiethylformal.** See dichloroethylformal.**dichlorodiethylstannane.**CAS: 866-55-7. mf: C₄H₁₀Cl₂Sn.**Properties:** Water-white crystals. Mp: 85°, bp: 277°.**Hazard:** A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**dichlorodiethyl sulfide.** (mustard gas; dichloroethyl sulfide). S(CH₂CH₂Cl)₂.**Properties:** Yellow liquid. Bp 228C, fp 14C, d 1.27, flash p 220F (104C).**Derivation:** Bubbling ethylene through sulfur chloride, also from thiodiglycol and hydrogen chloride.**Grade:** Pure, technical (containing excess sulfur as a polysulfide).**Hazard:** Vesicant war gas, causes conjunctivitis and blindness. Can be decontaminated by chloroamines or bleaching powder. Vapor is extremely poisonous and can be absorbed via skin.**Use:** Organic synthesis, poison gas, medicine.**dichlorodiethyl sulfone.** (ClCH₂CH₂)₂SO₂.**Properties:** Colorless crystals. Bp 179–181C (14–15 mm Hg), mp 52C. Soluble in alcohol, chloroform, and ether; slightly soluble in water.**Hazard:** Strong irritant to eyes and skin.**dichlorodiethyltin.** See dichlorodiethylstannane.**2,2-dichloro-1,1-difluoroethyl methyl ether.**
(methoxyflurane). HCCl₂CF₂OCH₃.**Properties:** Clear, colorless liquid; fruity odor. Bp 104.65C, fp –35, d 1.4223 (25C). Completely stable in the presence of alkali, air, light, or moisture. Slightly soluble in water. Combustible.**Grade:** ND.**Use:** Anesthetic.**dichlorodifluoromethane.** (difluorodichloromethane; fluorocarbon-12).CAS: 75-71-8. CCl₂F₂.**Properties:** Colorless, odorless, noncorrosive gas. Bp –29.8C, fp –158C, critical pressure 43.2 atm. Insoluble in water; soluble in most organic solvents. Nonflammable.**Derivation:** (1) Reaction of carbon tetrachloride and anhydrous hydrogen fluoride, in the presence of an antimony halide catalyst; (2) high-temperature chlorination of vinylidene fluoride (vinylidene fluorides made by addition of hydrogen fluoride to acetylene).**Grade:** 99.9% min purity.**Hazard:** Narcotic in high concentration. TLV: 1000 ppm.**Use:** Refrigerant in air conditioner; plastics, blowing agent, low-temperature solvent, leak-detecting agent, freezing of foods by direct contact, chilling cocktail glasses.

See chlorofluorocarbon.

dichlorodihexylstannane.CAS: 2767-41-1. mf: C₁₂H₂₆Cl₂Sn.**Hazard:** A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**6,8-dichloro-dihydro-1,3-benzoxazine-2-thione-4-one.**CAS: 23611-67-8. mf: C₈H₃Cl₂NO₂S.**Hazard:** A poison.**Use:** Agricultural chemical.**dichlorodiisononyl stannane.** See bis(trimethylhexyl)tin dichloride.**dichlorodiisopropylstannane.** See diisopropyltin dichloride.**1,3-dichloro-5,5-dimethylhydantoin.**
(DDH).

CAS: 118-52-5.

$$\begin{array}{c} \text{CINCONCIOC(CH}_3\text{)}_2 \\ \text{CINCONCIOC(CH}_3\text{)}_2 \end{array}$$
Properties: White powder with mild chlorine odor. Mp approximately 130C, sublimes approximately 100C without decomposition. Contains approximately 36% active chlorine. Slightly soluble in water with gradual liberation of hypochlorous acid; soluble in benzene, chloroform, ethylene dichloride, alcohol. Combustible with evolution of chlorine at 210C.**Derivation:** Chlorination of dimethylhydantoin.**Grade:** Technical.**Hazard:** Toxic by inhalation, skin irritant. TLV: 0.2 mg/m³.**Use:** Household laundry bleach, water treatment, mild chlorinating agent, pharmaceutical intermediate, catalyst.**2,3-dichloro-*n,n*-dimethyl-6-quinoxaline-sulfonamide.**CAS: 2347-47-9. mf: C₁₀H₃Cl₂N₅O₂S.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.

- dichlorodimethylsilane.** See dimethyldichlorosilane.
- 2,5-dichloro-4,6-dinitrophenyl crotonate.**
CAS: 24291-70-1. mf: $C_{10}H_6Cl_2N_2O_6$.
Hazard: Low toxicity by ingestion.
Use: Agricultural chemical.
- 3,6-dichloro-2,4-dinitrophenyl methacrylate.**
CAS: 24291-69-8. mf: $C_{10}H_6Cl_2N_2O_6$.
Hazard: Moderately toxic by ingestion.
Use: Agricultural chemical.
- dichlorodioctylstannane.** See di-*n*-octyltindichloride.
- dichlorodipentylstannane.** See dipentyltin dichloride.
- dichlorodiphenyldichloroethane.** See TDE.
- dichlorodiphenyldichloroethylene.** See DDE.
- dichlorodiphenylstannane.** See diphenyltin dichloride.
- dichlorodiphenyltrichloroethane.** See DDT.
- dichlorodipropylstannane.**
CAS: 867-36-7. mf: $C_6H_{14}Cl_2Sn$.
Properties: Colorless crystals. Mp: 82.5–83°, bp: 118–121° @ 10 mm.
Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).
- dichlorodipropyltin.** See dichlorodipropylstannane.
- dichlorodivinylstannane.** See divinyltin dichloride.
- 1,1-dichloroethane.** See ethylidene chloride.
- 1,2-dichloroethane.** See ethylene dichloride.
- 3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylic acid, cyano(3-phenoxyphenyl) methyl ester, (1- α (S*),3- β)-(+-)-.**
CAS: 71697-59-1. mf: $C_{22}H_{19}Cl_2NO_3$.
Hazard: A poison.
Use: Agricultural chemical.
- dichloroether.** See *sym*-dichloroethyl ether.
- 1,2-dichloro-1-ethoxyethane.**
CAS: 623-46-1. mf: $C_4H_8Cl_2O$.
Hazard: Human systemic effects.
- dichloroethoxymethane.** See dichloroethylformal.
- 1,2-dichloroethyl acetate.**
 $CH_3COOCH(CICH_2Cl)$.
Properties: Water-white liquid. D 1.296 (20C), boiling range, 58–65C (13 mm Hg), fp <–32C, refr index 1.444 (20C), bp (decomposes), flash p 307F (152C). Combustible. Miscible with alcohol and ethyl ether; immiscible with water.
Hazard: Toxic by inhalation.
Use: Organic synthesis.
- p*-di(2-chloroethyl)aminophenylamine.**
See melphalan.
- dichloroethylarsine.** See ethyldichloroarsine.
- dichloroethyl carbonate.** $(CICH_2CCH_2O)_2CO$.
Properties: Colorless liquid. Slowly hydrolyzed by alkalis; volatile in steam. D 1.3506 (20C), bp 240C (partial decomposition). Insoluble in water.
Derivation: By heating ethylene chlorohydrin and trichloromethylchloroformate together (under reflux).
- sym*-dichloroethylene.** (1,2-dichloroethylene; acetylene dichloride; dichloroacetylene).
CAS: 540-59-0. CIHC:CHCl. Exists as *cis* and *trans* isomers.
Properties: Colorless, low-boiling liquid; pleasant odor. Decomposes slowly on exposure to air, light, and moisture. Soluble in most organic solvents; slightly soluble in water. *trans* isomer: d 1.257, bp 47–49C. *cis* isomer: d 1.282, bp 58–60C, flash p 39F (3.9C), fp –80C.
Derivation: Two stereoisomeric compounds made by the partial chlorination of acetylene.
Grade: Technical, as *cis*, *trans*, and mixture of both.
Hazard: Flammable, dangerous fire hazard. Toxic by ingestion, inhalation, and skin contact; irritant and narcotic in high concentration. TLV: 200 ppm.
Use: General solvent for organic materials, dye extraction, perfumes, lacquers, thermoplastics, organic synthesis.
- sym*-dichloroethyl ether.** (dichloroether; dichloroethyl oxide; bis(2-chloroethyl) ether; 2,2'-dichlorodiethyl ether).
CAS: 111-44-4. $CICH_2CH_2OCH_2CH_2Cl$.
Properties: Colorless liquid; odor like that of ethylene dichloride. Bp 178.5C, d 1.2220 (20/20C), wt/gal 10.2 lb (20C), refr index 1.457 (20C), flash p (CC) 131F (55C), fp –51.8C, autoign temp 696F (368C). Miscible with most organic solvents; insoluble in water. Combustible.
Derivation: Chlorination of ethyl ether.
Grade: Technical.
Hazard: Moderate fire hazard. Toxic by inhalation and ingestion, strong irritant. TLV: 5 ppm, toxic by skin absorption.
Use: General solvent, selective solvent for produc-

tion of high-grade lubricating oils, textile scouring and cleansing, fulling compounds, wetting and penetrating compounds, paints, varnishes, lacquers, finish removers, spotting and dry cleaning, soil fumigant, intermediate and cross-linker in organic synthesis.

dichloroethylformal. (dichlorodiethylformal). $\text{CH}_2(\text{OCH}_2\text{CH}_2\text{Cl})_2$.

Properties: Colorless liquid. Bp 218.1C, fp -32.8C , d 1.2339 (20/20C), wt/gal 10.3 lb (20C), flash p 230F (110C) (OC). Slightly soluble in water; decomposed by mineral acids. Combustible.

Hazard: Toxic by inhalation and ingestion, strong irritant.

Use: Solvent, intermediate for polysulfide rubber.

dichloroethyl oxide. See *sym*-dichloroethyl ether.

di-2-chloroethyl phthalate. See bis(2-chloroethyl) phthalate.

dichloroethyl sulfide. See dichlorodiethyl sulfide.

2,4-dichloro-6-fluorophenyl *p*-nitrophenyl ether. See fluoronitrofen.

dichloroformoxime. CCl_2NOH .

Properties: Colorless, prismatic crystals; disagreeable, penetrating odor. High vap press; slowly decomposes at normal temperature, the rate depending on temperature and humidity. Bp 53–54C (18 mm Hg), mp 39–40C. Soluble in water, alcohol, ether, and benzene.

Derivation: (1) Action of chlorine on fulminic acid, HONC, (2) reduction of trichloronitrosomethane with either aluminum amalgam or hydrogen sulfide.

Hazard: Strong irritant to skin and eyes.

Use: A military poison.

1,3-dichloro-1,1,2,2,3,3-hexafluoropropane.

CAS: 662-01-1. mf: $\text{C}_3\text{Cl}_2\text{F}_6$.

Hazard: Low toxicity by inhalation.

α -dichlorohydrin. (α -propenyldichlorohydrin; 1,3-dichloro-2-propanol; *sym*-dichloroisopropyl alcohol). $\text{CH}_2\text{ClCH}_2\text{OCH}_2\text{Cl}$.

Properties: Colorless, slightly viscous, unstable liquid; faint chloroform-like odor. D 1.36–1.39, fp -4C , bp 174C, refr index 1.47–1.48, flash p 165F (73.9C), vap press 7 mm Hg. The commercial product is a mixture of two isomers. Miscible with most organic solvents, vegetable oils; slightly soluble in water. Combustible.

Derivation: Interaction of glycerol and dry hydrogen chloride gas and subsequent distillation.

Hazard: Moderate fire risk. Toxic by inhalation and ingestion.

Use: General solvent, intermediate in organic synthe-

sis, paints, varnishes, lacquers, watercolor binder, photographic lacquers.

5,7-dichloro-8-hydroxyquinoline. See chlorquinaldol.

1,3-dichloroisobutylene.

CAS: 3375-22-2. mf: $\text{C}_4\text{H}_6\text{Cl}_2$.

Hazard: Low toxicity by inhalation.

1,3-dichloro-5-isocyanobenzene.

CAS: 60357-67-7. mf: $\text{C}_7\text{H}_4\text{Cl}_2\text{N}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

dichloroisocyanuric acid. (dichloro-*s*-triazine-2,4,6-trione).

OCNCICONCICONH .

Properties: White, slightly hygroscopic, crystalline powder, granules. D (loose bulk, approximate) powder 34 lb/cu ft, granular 53 lb/cu ft. Active ingredient approximately 70% available chlorine, decomposes 225C.

Hazard: Oxidizer, may ignite organic materials on contact. Irritant to eyes.

Use: Household dry bleaches, dishwashing compounds, scouring powders and detergent sanitizers, replacement for calcium hypochlorite.

dichloroisocyanuric acid potassium salt.

See potassium dichloroisocyanurate.

***sym*-dichloroisopropyl alcohol.** See α -dichlorohydrin.

dichloroisopropyl ether.

CAS: 108-60-1. $[\text{ClCH}_2\text{C}(\text{CH}_3)\text{H}]_2\text{O}$.

Properties: Colorless liquid. D 1.1135 (20/20C), bp 187.4C (760 mm Hg), vap press 0.10 mm Hg (20C), flash p 185F (85C), wt/gal 9.3 lb (20C), coefficient of expansion 0.00096 K^{-1} (20C), viscosity 0.0230 cP (20C). Miscible with most oils and organic solvents; immiscible with water. Combustible.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Solvent for fats, waxes, greases, extractant, paint and varnish removers, spotting agents and cleaning solutions.

dichloromethane. Legal label name for methylene chloride.

dichloromethane diphosphonate. See sodium clodronate.

3',4'-dichloro-2-methylacrylanilide. See di-cryl.

dichloromethylchloroformate.

ClCOOCHCl_2 .

Properties: Colorless liquid. D 1.56 (15C), bp 110–111C, vap d 5.7 (air=1.29). Decomposed by water and alkalis; soluble in alcohol, benzene, and ether.

Derivation: (1) By chlorinating methyl formate, (2) by chlorinating methyl chloroformate. In both methods, the mixture of chloro derivatives is then separated by fractionation.

Hazard: Strong irritant to eyes and skin.

sym-dichloromethyl ether. $O(CH_2Cl)_2$.

Properties: Colorless, volatile liquid; suffocating odor. D 1.315 (20C); bp 105C. Decomposed by heat and water; soluble in acetone, benzene, ethyl alcohol, and methyl alcohol; insoluble in water.

Derivation: (1) Action of chlorine on methyl ether, (2) interaction of hydrochloric acid and formaldehyde with subsequent dehydration of the chloromethyl alcohol formed.

Hazard: A carcinogen by ingestion and inhalation. Strong irritant to eyes and mucous membranes.

5,7-dichloro-2-methyl-8-quinolinol. See chlorquinaldol.

dichloromethylsilane. CH_3SiHCl_2 .

Properties: Colorless liquid. Bp 41C, d 1.113 (25/25C), refr index 1.3983 (20C). Combustible.

Hazard: Corrosive to tissue.

Use: Intermediate.

dichloromethyl sulfate. $(ClCH_2O)_2SO_2$.

Properties: Colorless, liquid; odorless. D 1.60 (20C), bp 96–97C (14 mm Hg). Soluble in alcohol, benzene, and ether. Combustible.

Derivation: (1) By bubbling sulfur trioxide through (cooled) dichloromethyl ether, (2) by heating chlorosulfonic acid with formaldehyde.

dichloromonofluoromethane. (dichlorofluoromethane; fluorodichloromethane; fluorocarbon 21).

CAS: 75-43-4. $CHCl_2F$.

Properties: Colorless heavy gas; nearly odorless. Bp 8.9C, fp –135C, d 1.426 (0C), critical pressure 51.0 atm. Soluble in alcohol and ether; insoluble in water. Nonflammable.

Derivation: Reaction of chloroform and hydrogen fluoride.

Grade: Technical.

Hazard: Toxic by inhalation. TLV: 10 ppm.

Use: Solvent, refrigerant. See chlorofluorocarbon.

dichloronaphthalene. See chlorinated naphthalenes.

2,3-dichloro-1,4-naphthoquinone. See dichlone.

1,2-dichloro-4-nitrobenzene. $Cl_2C_6H_3NO_2$.

Properties: Solid. Mp 43C, bp 255–256C, d 1.4266

(100/4C). Insoluble in water; soluble in hot alcohol and ether.

Hazard: Fire risk by spontaneous reaction.

Use: Intermediate.

2,5-dichloronitrobenzene. $Cl_2C_6H_3NO_2$.

Properties: Pale-yellow crystals. D 1.669 (22C), mp 55C, bp 266C. Insoluble in water; soluble in chloroform and hot alcohol.

Hazard: Fire risk by spontaneous reaction.

Use: Intermediate.

1,1-dichloro-1-nitroethane.

CAS: 594-72-9. $H_3CC(Cl)_2NO_2$.

Properties: Bp 124C, d 1.4153 (20/20C), flash p 168F (75.5C) (OC). Combustible.

Hazard: Strong irritant. TLV: 2 ppm.

Use: Grain fumigant, solvent.

4,6-dichloro-3-((1e)-3-oxo-3-(phenylamino)-1-propenyl)-1h-indole-2-carboxylic acid.

CAS: 153436-22-7. mf: $C_{18}H_{12}Cl_2N_2O_3$.

Hazard: A poison.

1,3-dichloro-1,1,2,2,3-pentafluoropropane.

CAS: 507-55-1. mf: $C_3HCl_2F_5$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

3,3-dichloro-1,1,1,2,2-pentafluoropropane.

CAS: 422-56-0. mf: $C_3HCl_2F_5$.

Hazard: Low toxicity ingestion, inhalation, and skin contact.

dichloropentane.

CAS: 30586-10-8. $C_6H_{10}Cl_2$. A mixture of the dichloro derivatives of both normal pentane and isopentane. About 40% are amylene dichlorides having two chlorine atoms attached to adjacent carbon atoms.

Properties: Light-yellow liquid. D 1.06–1.08 (20C), acidity as hydrochloric acid not over 0.025% (distillation = 95%, 130–200C), flash p <80F (26C), wt/gal 8.94 lb. Water solubility negligible; water azeotrope at 80–97C = approximately 66% $C_6H_{10}Cl_2$.

Hazard: Flammable, dangerous fire risk.

Use: Solvent for oils, greases, rubber resins, and bituminous materials; removal of tar; reclaiming rubber; paint and varnish removers; degreasing of metals; insecticide; soil fumigant; removal of wax deposits on oil-well equipment.

dichlorophenarsine hydrochloride. (3-amino-4-hydroxyphenyldichloroarsine hydrochloride). $C_6H_3(AsCl_2)(OH)NH_2 \cdot HCl$.

Properties: White, hygroscopic powder. Mp 200C. Soluble in water and solutions of alkali hydroxides and carbonates, and in dilute mineral acids.

Hazard: Toxic by ingestion.

Use: Medicine (syphilis treatment).

dichlorophene. (2,2'-dihydroxy-5,5'-dichloro-diphenylmethane; DDDM).

CAS: 97-23-4. $(C_6H_3ClOH)_2CH_2$.

Properties: Light-tan, free-flowing powder; weakly phenolic odor. Mp 177C, vap press 10^{-4} mm Hg (100C) and about 10^{-10} mm Hg (25C) (extrapolated value). Soluble in acetone and alcohols; slightly soluble in benzene, toluene, carbon tetrachloride; insoluble in water.

Derivation: Condensation of *p*-chlorophenol with formaldehyde in the presence of sulfuric acid.

Grade: Pure and technical.

Hazard: Toxic by ingestion.

Use: Fungicide and bactericide, textile preservative, some dermatological and cosmetic applications, veterinary medicine.

2,4-dichlorophenol.

CAS: 120-83-2. $Cl_2C_6H_3OH$.

Properties: White, low-melting solid. Bp 210C, mp 45C, flash p 237F (113C). Soluble in alcohol and carbon tetrachloride; slightly soluble in water. Combustible.

Derivation: By chlorination of phenol.

Hazard: Toxic by ingestion, strong irritant to tissue.

Use: Organic synthesis.

2,4-dichlorophenoxyacetic acid. See 2,4-D.

2,4-dichlorophenoxybutyric acid. (2,4-DB). $Cl_2C_6H_3O(CH_2)_3COOH$. Mp 118–120C, used as a herbicide.

2-(2,4-dichlorophenoxy)ethyl benzoate.

See sesin.

di(4-chlorophenoxy)methane.

$(ClC_6H_4O)_2CH_2$.

Properties: Solid. Mp 65C. Insoluble in water and oils; soluble in ether and acetone.

Use: Acaricide.

5-(2,4-dichlorophenoxy)-2-nitroanisole.

CAS: 32861-85-1. mf: $C_{13}H_9Cl_2NO_4$.

Hazard: Low toxicity by ingestion and skin contact.

Use: Agricultural chemical.

(r)-2-(2,4-dichlorophenoxy)propanoic acid.

CAS: 15165-67-0. mf: $C_9H_8Cl_2O_3$.

Hazard: A poison by ingestion. Low toxicity by inhalation and skin contact.

Use: Agricultural chemical.

2-(2,4-dichlorophenoxy)propionic acid.

(dichloroprop). $Cl_2C_6H_3OCH(CH_3)COOH$.

Properties: Solid. Mp 117–118C. Soluble in acetone, alcohol, and ether; insoluble in water.

Use: Herbicide.

(2,4-dichlorophenoxy)tributylstannane.

CAS: 39637-16-6. mf: $C_{18}H_{30}Cl_2OSn$.

Hazard: A poison. Tributyl tin compounds are ex-

remely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

2,4-dichlorophenyl benzenesulfonate.

$Cl_2C_6H_3OSO_2C_6H_5$.

Properties: Waxy solid. Vap press 2.7×10^{-4} mm Hg (30C). Insoluble in water; soluble in most organic solvents.

Use: Acaricide, insecticide.

2-(3,4-dichlorophenyl)-1h-benz(de)isoquinoline-1,3(2h)-dione.

CAS: 222420-28-2. mf: $C_{18}H_9Cl_2NO_2$.

Hazard: A poison.

O-(2,4-dichlorophenyl)-O,O-diethyl phosphorothioate.

$Cl_2C_6H_3OP(S)(OC_2H_5)_2$.

Properties: (Pure compound) Liquid. Bp 120–123C (0.2 mm Hg). Slightly soluble in water; miscible with most organic solvents.

Hazard: Cholinesterase inhibitor. Absorbed by skin, use may be restricted.

n-(2,4-dichlorophenyl)-n-(4,5-dihydro-2-thiazolyl)-3-pyridinemethanamine.

CAS: 89985-01-3. mf: $C_{15}H_{13}Cl_2N_3S$.

Hazard: Moderately toxic by ingestion.

3-(3,4-dichlorophenyl)-1,1-dimethylurea.

See diuron.

di(p-chlorophenyl)ethanol.

(1,1-bis(*p*-chlorophenyl)ethanol; di(*p*-chlorophenyl)methylcarbinol; DMC; DCPC).

$CH_3C(C_6H_4Cl)_2OH$.

Properties: Colorless crystals. Mp 70C. Insoluble in water, soluble in common organic solvents.

Derivation: Reaction of 4,4'-dichlorobenzophenone with methylmagnesium bromide followed by treatment with water.

Use: Insecticide.

2-(3,4-dichlorophenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-12-5. mf: $C_{17}H_{10}Cl_2N_2$.

Hazard: A reproductive hazard.

3,4-dichlorophenyl isocyanate.

$Cl_2C_6H_3NCO$.

Properties: White to yellow crystals. Strong irritant to tissue, especially eyes and mucous membranes.

Use: Chemical intermediate, organic synthesis.

3-(3,4-dichlorophenyl)-1-methoxy-1-methylurea. See linuron.

di(p-chlorophenyl)methylcarbinol. See

di(*p*-chlorophenyl)ethanol.

o-(2,4-dichlorophenyl)-o-methyl isopropylphosphoramidothioate.

(DMPA). $Cl_2C_6H_3OP(S)(OCH_3)NHCH(CH_3)_2$.

Properties: Solid. Mp 51.4C, vap press 2 mm Hg (150C). Slightly soluble in water (5 ppm); freely soluble in acetone, benzene, and carbon tetrachloride.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Herbicide, insecticide.

(2,6-dichlorophenyl)methyl methyl 3-pyridinylcarbonimidodithioate.

CAS: 34763-39-8. mf: $C_{14}H_{12}Cl_2N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2,4-dichlorophenyl-4-nitrophenyl ether.

$Cl_2C_6H_3OC_6H_4NO_2$.

Properties: Dark-brown solid. Setting point 62.5C.

Soluble in acetone, methanol, and xylene.

Hazard: Toxic by ingestion.

Use: Herbicide.

3-(2,4-dichlorophenyl)-*n*-(4-propylcyclohexyl)-2-propenamide.

CAS: 315706-77-5. mf: $C_{18}H_{23}Cl_2NO$.

Hazard: A poison.

2-(4-(2,4-dichlorophenoxy)phenoxy)-methylpropionate. See illoxan.

((2,5-dichlorophenylthio)methylcarbamic acid, 2,3-dihydro-2,2-dimethyl-7-benzofuranyl ester.

CAS: 50673-11-5. mf: $C_{18}H_{17}Cl_2NO_3S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dichlorophenyltrichlorosilane. $Cl_2C_6H_3SiCl_3$.

A mixture of isomers.

Properties: Straw-colored liquid. D 1.562, bp 260C, refr index 1.5638 (20C), flash p 286F (141C) (COC). Readily hydrolyzed with liberation of hydrogen chloride; soluble in benzene and perchloroethylene. Combustible.

Derivation: Chlorination of phenyltrichlorosilane.

Grade: Technical.

Hazard: Strong irritant to skin and eyes.

Use: Intermediate for silicones.

3,6-dichlorophthalic acid. $C_6H_2Cl_2(COOH)_2$.

Properties: Colorless, thick crystals. Soluble in hot water.

Derivation: By oxidizing dichloronaphthalene tetrachloride (see chloronaphthalene) with nitric acid.

dichloroprop. See 2-(2,4-dichlorophenoxy)propionic acid.

1,2-dichloropropane. See propylene dichloride.

1,3-dichloro-2-propanol. See α -dichlorohydrin.

1,3-dichloropropene. (1,3-dichloropropylene). CAS: 542-75-6. $CHCl:CHCH_2Cl$.

Properties: Exists in *cis* and *trans* isomeric forms, both colorless liquids. D 1.225 (10/4C), flash p 95F (35C) (OC). Insoluble in water; soluble in acetone, toluene, octane. Bp *cis* 104C, *trans* 112C, refr index (20C) *cis* 1.469, *trans* 1.475.

Derivation: Chlorination of propylene.

Hazard: Confirmed carcinogen. Toxic by skin absorption. TLV: 1 ppm. Flammable, moderate fire risk. Strong irritant.

Use: Organic synthesis, soil fumigants.

dichloropropene-dichloropropane mixture.

Hazard: A poison via ingestion, inhalation, or absorbed through the skin; corrosive to tissue (skin and eyes).

Use: Pesticide, insecticide.

3,4-dichloropropionanilide. See propanil.

2,2-dichloropropionic acid. See dalapon.

2,4-dichloro-*n*-(4-propylcyclohexyl)benzamide.

CAS: 315706-69-5. mf: $C_{16}H_{21}Cl_2NO$.

Hazard: A poison.

3-(2,4-dichloro-5-(2-propynyloxy)phenyl)-5-(1,1-dimethylethyl)-1,3,4-oxadiazol-2(3h)-one. See 5-*tert*-butyl-3-(2,4-dichloro-5-propargyloxyphenyl)-1,3,4.

3,6-dichloro-2-pyridinecarboxylic acid.

See clopyralid.

2,6-dichloroquinonechlorimide. Reagent used for spot visualizations in chromatographic systems.

Hazard: Explodes readily on slight heating.

2,6-dichlorostyrene.

CAS: 6607-45-0. $C_6H_3(CH:CH_2)Cl_2$.

Properties: Colorless liquid. Bp 92–94C (5 mm Hg), flash p 225F (107C) (OC). Insoluble in water; soluble in most organic solvents. Polymerizes slowly on standing unless inhibited. Combustible.

Use: Monomer and comonomer in plastic research.

***p*-N,N-dichlorosulfamylbenzoic acid.** See halazone.

dichlorosulfonphthalein. See chlorphenol red.

dichlorotetrafluoroacetone. $CClF_2COCClF_2$.

Properties: Colorless liquid. Bp 45.2C, fp <-100C. Soluble in water and most organic solvents; stable to acids but not alkalis.

Hazard: Toxic by ingestion and inhalation.

Use: Solvent in acidic media, complexing agent for active hydrogen-compound separation.

sym-dichlorotetrafluoroethane. (fluorocarbon-114; tetrafluorodichloroethane).

CAS: 76-14-2. $\text{CClF}_2\text{CClF}_2$.

Properties: Colorless, nonflammable gas; nearly odorless. Bp 3.55C, fp -94C, critical press 32.3 atm. Insoluble in water.

Derivation: By treating perchloroethylene with hydrogen fluoride.

Grade: Technical 95%.

Hazard: An asphyxiant. TLV: 1000 ppm.

Use: Solvent, fire extinguishers, refrigerant and air conditioner fluid, blowing agent, dielectric fluid. See chlorofluorocarbon.

2,5-dichlorothiophene. $\text{C}_4\text{H}_2\text{Cl}_2\text{S}$ (cyclic).

Properties: Colorless to light-yellow liquid. Bp 161C. Combustible.

Use: Intermediate.

dichlorotoluene. (chlorobenzyl chloride).

$\text{C}_6\text{H}_3\text{CH}_2\text{Cl}_2$.

Properties: Colorless liquid. Boiling range 200–300C, fp approximately -13C, d 1.245–1.247 (25/15C), refr index 1.5480 (22C). Soluble in alcohol, ether, and acetone; insoluble in water. Exists as *o*- and *p*- isomers. Combustible.

Hazard: Irritant, see benzyl chloride.

Use: High-boiling solvent, intermediate for organic synthesis.

α,α -dichlorotoluene. See benzyl dichloride.

dichloro-sym-triazine-2,4,6-trione. See dichloroisocyanuric acid.

β,β' -dichlorovinylchloroarsine.

$(\text{ClCH:CH})_2\text{AsCl}$.

Properties: Yellowish liquid. Bp 230C (decomposes), d 1.70.

Hazard: Toxic by inhalation and ingestion, strong irritant to skin and mucous membranes.

Use: Military poison.

2,2-dichlorovinyl dimethyl phosphate. See dichlorovos.

β,β' -dichlorovinylmethylarsine.

$(\text{ClCH:CH})_2\text{AsCH}_3$.

Properties: Liquid. Bp 140–145C (10 mm Hg).

Derivation: Interaction of acetylene and methylchloroarsine in the presence of aluminum chloride.

Hazard: Toxic by inhalation and ingestion, strong irritant to skin and mucous membranes.

Use: Military poison.

dichlorovos. (2,2-dichlorovinyl dimethyl phosphate; DDVP).

CAS: 62-73-7. $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{CH:CCl}_2$.

Properties: Liquid. Bp 120C (14 mm Hg). Slightly soluble in water and glycerol; miscible with aromatic and chlorinated hydrocarbon solvents and alcohols.

Hazard: Cholinesterase inhibitor, a poison. TLV: 0.1 ppm, toxic by skin absorption.

Use: Insecticide, fumigant.

dichloroxylenol. (2,4-dichloro-3,5-dimethylphenol). $\text{C}_8\text{H}_8\text{Cl}_2\text{O}$.

Properties: Crystals. Mp 95C. Partially soluble in acetone, diethyl ketone, and chloroform; almost insoluble in water.

Use: Mold inhibitor, antibacterial agent, preservative.

2,4-dichlorophenoxyacetic acid octyl ester.

See octyl 2,4-dichlorophenoxyacetate.

dichroic. A term used in crystallography to denote crystals that refract incident light in two directions, thus displaying two colors when observed from different angles, e.g., calcite.

See anisotropic; birefringent.

dichroism. The property of some crystals of exhibiting different colors according to the direction of the light ray due to difference in extent of absorption of the various rays.

dichromate. A compound in which two chromium atoms with a valency of six are present, as in potassium dichromate.

dichromatic. Characterizing certain dyes and indicators for which different colors may be seen, depending on the thickness of the solution viewed.

dicobalt octacarbonyl. See cobalt tetracarbonyl.

dicofol. (generic name for 4,4'-dichloro- α -trichloromethylbenzhydrol).

dicomarol. See bishydroxycoumarin.

dicopper(I) acetylide.

CAS: 1117-94-8. $\text{CuC}\equiv\text{CCu}$.

Properties: Mw 151.10.

Hazard: TLV: (fume) 0.2 mg/m³; (dust, mist) 1 mg(Cu)/m³; (Proposed: (fume and respirable particles) 0.05 mg/m³; (dust, mist) 1 mg(Cu)/m³). Explodes on impact or heating to 100°C.

dicresyl glyceryl ether. (glyceryl ditolyl ether). This may be a mix of *o*-, *m*-, and *p*-isomers. $\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_2\text{CH}_2\text{OCH}_2\text{OC}_6\text{H}_4\text{CH}_3$.

Properties: Similar to cresyl glyceryl ether. D 1.136, refr index 1.549, boiling range 328–340C.

dicresyl glyceryl ether acetate.

$\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_2\text{CHOOCCH}_2\text{OC}_6\text{H}_4\text{CH}_3$.

Properties: Fairly stable liquid. D 1.115, bp 360C, refr index 1.53. Combustible.

dicrotophos. See "Bidrin."

dicryl. (generic name for 3',4'-dichloro-2-methylacrylanilide).

CAS: 2164-09-2. $C_{12}H_6Cl_2NHCOC(CH_3)CH_2$.

Properties: Solid. Mp 128C. Insoluble in water; soluble in acetone, alcohol, isophorone, and dimethyl sulfoxide.

Use: Herbicide, pest control.

“Dicrylan” [Novartis]. TM for a group of products that includes silicone elastomers and other polymeric chemicals used for coating textile fabrics.

dicumene chromium.

CAS: 12001-89-7. mf: $C_{18}H_{24} \bullet Cr$.

Hazard: A confirmed carcinogen. Poison by skin contact. Moderately toxic by ingestion. A skin and eye irritant. TWA 0.05 mg(Cr)/m³; Confirmed Human Carcinogen

dicumyl peroxide. [$C_6H_5C(CH_3)_2O$]₂.

Hazard: Strong oxidizer, may ignite organic materials on contact.

Use: Polymerization catalyst and vulcanizing agent.

“Di-cup” [Aqualon]. TM for a series of vulcanizing and polymerization agents containing dicumyl peroxide.

dicyan. See cyanogen.

dicyanidamide. (cyanoguanidine).

$NH_2C(NH)(NHCN)$.

Properties: Pure-white crystals. D 1.400 (25C), stable when dry, melting range 207–209C. Soluble in liquid ammonia; partly soluble in hot water. Non-flammable.

Derivation: Polymerization of cyanamide in the presence of bases.

Grade: 99% pure, technical.

Use: Fertilizers; nitrocellulose stabilizer; organic synthesis, especially of melamine, barbituric acid, and guanidine salts; pharmaceutical products; dye-stuffs; explosives; retarding rancidity in fats and oils; fireproofing compounds; case-hardening preparations; cleaning compounds; soldering compounds; accelerator; thinner for oil-well drilling muds; stabilizer in detergent compositions; modifier for starch products; catalyst for epoxy resins.

dicyanine. See cyanine dye.

m-dicyanobenzene. See m-phthalodinitrile.

o-dicyanobenzene. See phthalonitrile.

1,3-dicyanobenzene. See m-phthalodinitrile.

1,4-dicyanobutane. See adiponitrile.

2,4-dicyanobutene-1. See methylene glutaronitrile.

dicyclohexyl. See bicyclohexyl.

dicyclohexyl adipate. $(CH_2CH_2COOC_6H_{11})_2$.

Properties: White crystals; odorless. D 0.913–0.919 (15/15C), bp 256C, fp –0.1C, d 45 lb/cu ft, acidity (as adipic acid) <0.05%. Compatible with most natural and synthetic resins. Soluble in most organic solvents; insoluble in water.

Use: Plasticizer.

dicyclohexylamine.

CAS: 101-83-7. $(C_6H_{11})_2NH$.

Properties: Colorless liquid; faint amine odor. D 0.913–0.919 (15/15C), bp 256C, fp –0.1C, refr index 1.4823 (25C), flash p 210F (98.9C). Slightly soluble in water; miscible with organic solvents. Strongly basic.

Hazard: Toxic by ingestion, strong irritant to skin and mucous membranes. Combustible.

Use: Intermediate; insecticides; plasticizer; corrosion inhibitors; antioxidants in rubber, lubricating oils, fuels; catalyst for paint, varnishes, and inks; detergents, extractant.

dicyclohexyl carbodiimide. $C_6H_{11}NCNC_6H_{11}$.

Properties: White crystals; heavy sweet odor. Set point 29–30C, bp 138–140C (2 mm Hg). Soluble in organic solvents.

Use: Chemical intermediate, coupling agent in peptide synthesis.

dicyclohexylphenyltin hydroxide.

CAS: 53413-47-1. mf: $C_{18}H_{28}OSn$.

Hazard: A poison by ingestion. A moderate skin irritant.

dicyclohexyl phthalate. (DCHP).

$C_6H_4(COOC_6H_{11})_2$.

Properties: White, granular solid; nonvolatile; mildly aromatic odor. D 1.20 (25/25C), mp 62–65C, flash p 405F (207C). Soluble in most organic solvents; insoluble in water; compatible with a large number of polymers. Combustible.

Use: Plasticizer for nitrocellulose, ethyl cellulose, chlorinated rubber, polyvinyl acetate, polyvinyl chloride, and other polymers.

See “Morflex 150” [Reilly].

dicyclopentadiene.

CAS: 77-73-6. $C_{10}H_{12}$.

Properties: Liquid. D 0.979 (20/20C), bp 172C, mp 33.6C, bulk d 8.2 lb/gal (60F), refr index 1.5073 (31C), flash p 90F (32.2C). Soluble in alcohol; insoluble in water.

Derivation: Olefin manufacture.

Hazard: Flammable, moderate fire risk. Toxic by ingestion. TLV: 5 ppm.

Use: Chemical intermediate for insecticides, EPDM elastomers, metallocenes, paints and varnishes, flame retardants for plastics.

dicyclopentadiene dioxide. $C_{10}H_{12}O_2$.

Properties: White, crystalline powder. Mp 180–184C, d 1.331 (25C). Slightly soluble in water; soluble in acetone and benzene.

Use: Intermediate for epoxy resins; plasticizers; protective coatings.

dicyclopentadienyl cobalt. See cobaltocene.

dicyclopentadienyl iron. (bis-cyclopentadienyl iron).

CAS: 102-54-5. The first organometallic “sandwich” compound (synthesized in 1951), which served as a prototype for metallocenes. Such compounds are based on cyclic unsaturates combined with a transition metal or its halide.

Hazard: Toxic TLV; 10 mg/m³.

See ferrocene.

dicyclopentadienyl nickel. See nickelocene.

dicyclopentadienyl osmium. See osmocene.

dicyclopentadienyl titanium dichloride.

See titanocene dichloride.

dicyclopentadienyl zirconium dichloride.

See zirconocene dichloride.

DIDA. See diisodecyl adipate.

didecyl adipate. (CH₂CH₂COOC₁₀H₂₁)₂.

Properties: Light-colored liquid. D 0.9181 (20/20C), bulk d 7.7 lb/gal (20C), bp 245C (5 mm Hg), vap press (0.58 mm Hg (100C), viscosity 26.3 cP (20C), flash p 425F (218C). Insoluble in water. Combustible.

Use: Plasticizer.

didecylamine. [CH₃(CH₂)₉]₂NH.

Properties: Light-straw-colored liquid; faint amine odor. Boiling range 195–215C (12 mm Hg), d 0.840 (20/20C) (solid). Combustible.

didecyl ether. (C₁₀H₂₁)₂O.

Properties: Liquid. Mp 16C, bp 170–180C (6 mm Hg), d 0.819 (20/4C), refr index 1.4418 (20C). Combustible.

Grade: 95% (min) purity.

Use: Electrical insulators, water repellent, lubricant in plastic molding and processing, antistatic agent, intermediate.

didecyl phthalate. (DDP).

CAS: 84-77-5. C₆H₄(COOC₁₀H₂₁)₂.

Properties: Light-colored liquid. D 0.9675 (20/20C) bulk d 8.05 lb/gal (20C), bp 261C (5 mm Hg), vap press 0.3 mm Hg (200C), viscosity 113.2 cP (20C), flash p 445F (229C). Insoluble in water. Combustible.

Use: Plasticizer, especially for vinyl resins.

didecyl sulfide. (didecyl thioether).

(C₁₀H₂₁)₂S.

Properties: Liquid. Solidifies at 22.2C, bp 205–206C (4 mm Hg), d 0.831 (20/4C), refr index 1.4569 (33.5C). Combustible.

Grade: 95% (min) purity.

Use: Organic synthesis (formation of sulfonium compounds).

didecyl thioether. See didecyl sulfide.

2',3'-didehydro-3'-deoxythymidine. See stavudine.

didodecylamine. See dilaurylamine.

didodecyl ether. See dilauryl ether.

didodecyltin dichloride.

CAS: 5827-58-7. mf: C₂₄H₅₀Cl₂Sn.

Hazard: Low toxicity by ingestion.

didodecyl-3,3'-thiodipropionate. See dilauryl thiodipropionate.

didodecyl thioether. See dilauryl sulfide.

DIDP. See diisodecyl phthalate.

didymium. Di. Commercial mixture of rare-earth elements obtained from monazite sand by extraction followed by the elimination of cerium and thorium. The name is used like that of an element in naming mixed oxides and salts. The approximate composition of didymium from monazite, expressed as rare-earth oxides, is 46% La₂O₃, 10% Pr₆O₁₁, 32% Nd₂O₃, 5% Sm₂O₃, 0.4% yttrium earth oxides, 1% CeO₂, 3% Gd₂O₃, 2% others. Commercially used didymium salts are acetate, carbonate, chloride, fluoride, nitrate, etc.

didymium oxide. Di₂O₃.

Properties: Brown powder. Insoluble in water; soluble in acids.

Use: (As salts) Coloring and decolorizing glass, in temperature-compensating capacitors for radio, television, and radar. In carbon-arc cores (fluoride), in stainless steel (oxide), metallurgical research, textile treatment.

die. A device, usually of steel, having a specific shape or design that it imparts to such materials as metals and plastics either by impact (stamping), by the contour of a negative cavity (casting), or by passing the material through it (extrusion). Diamond dies may be used for wiredrawing. The terms “die” and “mold” are virtually synonymous in the sense of a negative cavity into which a molten metal or plastic is introduced under pressure, the former being used in reference to metals, and the latter for plastics, rubber, etc.

See die casting; investment casting; injection molding; extrusion.

die casting. Shaping of metal products by forcing a molten metal or alloy under high pressure into a negative-cavity die by means of a hydraulic ram. The die is usually made of an alloy steel. Metals commonly used for die casting are zinc, aluminum, copper, lead and their alloys, some of which also include silicon. Die castings can be held to tolerances as low as 0.001–0.0015 inches, and sizes 75–100 lb (Al) are possible. The largest end-use area for die castings is automobile and airplane parts. They are also used in washing and drying machines, in electrical equipment and appliances, and for various military applications.

Dieckmann reaction. Base-catalyzed intramolecular cyclization of esters of dicarboxylic acids to give β -ketoesters.

dieldrin. (HEOD).
CAS: 60-57-1. $C_{12}H_{10}OCl_6$. (Not less than 85% of 1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-*endo,exo*-5,1,2,3,4,10,10-hexa-8-dimethanonaphthalene and not less than 15% active related compounds.) Endrin is a stereoisomer of dieldrin.

Properties: Light-tan, flaked solid. Mp 175C. Insoluble in water, methanol, aliphatic hydrocarbons; soluble in acetone, benzene. Compatible with most fertilizers, herbicides, fungicides, and insecticides.

Derivation: By oxidation of aldrin with peracids.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Use restricted to nonagricultural applications. Carcinogenic. TLV: 0.25 mg/m³.

Use: Insecticide.

See endrin.

dielectric. A substance with very low electrical conductivity, i.e., an insulator. Such substances have electrical conductivity of less than one-millionth mho/cm. Those with a somewhat higher conductivity (10^{-6} to 10^{-3} mho/cm) are called semiconductors. Among the more common solid dielectrics are glass, rubber and similar elastomers, and wood and other cellulose. Liquid dielectrics include hydrocarbon oils, askarel, and silicone oils.

See transformer oil.

dielectric cohesion. The molecular force of a dielectric that opposes an electric field tending to ionize the molecules.

dielectric constant. An index of the ability of a substance to attenuate the transmission of an electrostatic force from one charged body to another, as in a condenser. The lower the value, the greater the attenuation. The standard measurement apparatus utilizes a vacuum whose dielectric constant is 1. In reference to this, various materials interposed between the charged terminal have the following val-

ues at 20C: air 1.00058, glass 3, benzene 2.3, acetic acid 6.2, ammonia 15.5, ethanol 25, glycerol 56, and water 81. The exceptionally high value for water accounts for its unique behavior as a solvent and in electrolytic solutions. Most hydrocarbons have high resistance (low conductivity). Dielectric-constant values decrease as the temperature rises.

dielectric strength. The maximum electric field that an insulator or dielectric can withstand without breakdown, usually measured in kV/cm. At breakdown, a considerable current passes as an arc, usually with more or less decomposition of the material along the path of the current.

Diels-Alder reaction. An important organic reaction for the synthesis of 6-membered rings discovered in 1928. It involves the addition of an ethylenic double bond to a conjugated diene, i.e., a compound containing two double bonds separated by one single bond, as in 1,3-butadiene ($CH_2=CH-CH=CH_2$) or cyclopentadiene. The ease of addition of the ethylenic compound is greatly enhanced by adjacent carbonyl groups; hence maleic anhydride reacts quantitatively with hexachlorocyclopentadiene to form chlorendic anhydride.

Diels, Otto P. H. (1876–1954). A German chemist who won a Nobel Prize in chemistry with Alder in 1950. He was awarded the prize for diene synthesis work which led to improved methods of analyzing and synthesizing organic compounds. His research resulted in the discovery of carbon suboxide, methods of dehydrating cyclical hydrocarbons using selenium, and determination of the structure of steroids. A student of Fischer's, Diels graduated from the University of Berlin.

dien. Abbreviation of diethylenetriamine as used in formulas for coordination compounds.

See *en*; *pn*; *py*.

diene. See diolefin.

“Diene” [Firestone]. TM for solution-polymerized polybutadiene rubber.

Use: In tires, high-impact polystyrene, and ABS.

dienestrol.

$HO-C_6H_4-C(CH_3)C(CH_3)C_6H_4-OH$. (3,4-bis(*p*-hydroxyphenyl)-2,4-hexadiene). A synthetic with estrogenic activity.

Properties: Colorless, needles or powder; odorless. Mp 227C. Soluble in alcohol; practically insoluble in water; sensitive to light.

Grade: NF.

Use: Medicine (estrogenic hormone).

dienone-phenol rearrangement. Transformation of a 4,4-disubstituted cyclohexadienone into a 3,4-disubstituted phenol upon acid treatment.

diesel ignition improver. A substance such as amyl nitrate that is added to diesel fuels to improve fuel ignition and to raise the cetane number.

diesel oil. (fuel oil no. 2).

CAS: 68476-34-6. Fuel for diesel engines obtained from distillation of petroleum. Its efficiency is measured by the cetane number. It is composed chiefly of unbranched paraffins; its volatility is similar to that of gas oil. Flash p 110–190F, d <1. Combustible.

Hazard: Moderate fire risk. Environmental hazard.

Use: Fuel for trucks, ships, and other automotive equipment, drilling muds, mosquito control (coating on breeding waters).

See fuel oil.

“Diesel-Treat” [Nalco]. TM for dry, granular, orange sodium dichromate used as a corrosion inhibitor. Sold in 50-lb drums.

Use: Closed cooling systems; particularly diesel engines, cooling tower systems.

dietary food supplement. Any food product to which enough vitamins and minerals have been added to furnish more than 50% of the recommended daily allowance in a single serving (FDA). Such foods must have added ingredients identified on labels.

diethanolamine. (DEA; di(2-hydroxyethyl)amine).

CAS: 111-42-2. $(\text{HOCH}_2\text{CH}_2)_2\text{NH}$.

Properties: Colorless crystals or liquid. Active base. Mp 28.0, bp 269C, d 1.092 (30/20C), flash p 306F (152C) (OC). Very soluble in water and alcohol; insoluble in ether, benzene. Combustible.

Derivation: Ethylene oxide and ammonia.

Hazard: Toxic. TLV: 0.46 ppm.

Use: Liquid detergents for emulsion paints, cutting oils, shampoos, cleaners, and polishes; textile specialties; absorbent for acid gases; chemical intermediate for resins, plasticizers, etc.; solubilizing 2,4-D; humectant; dispersing agent.

diethanololeamide. See oleic acid diethanolamide.

***N,N*-diethanolglycine.** (DEG).

$(\text{HOCH}_2\text{CH}_2)_2\text{NCH}_2\text{COOH}$.

Use: Chelating agent. Also available as the sodium salt.

diethofencarb. See isopropyl 3,4-diethoxycarbaniate.

2,5-diethoxyaniline. $\text{NH}_2\text{C}_6\text{H}_3(\text{OC}_2\text{H}_5)_2$.

Properties: White to gray powder. Mp 83–85C. Insoluble in water; soluble in organic solvents.

Hazard: See aniline.

Use: Intermediate.

1,4-diethoxybenzene. See hydroquinone diethyl ether.

1,1-diethoxyethane. See acetal.

1,2-diethoxy ethylene.

CAS: 16484-86-9. mf: $\text{C}_6\text{H}_{12}\text{O}_2$.

Hazard: Moderately toxic.

diethoxyethyl phthalate. See diethyl glycol phthalate.

diethylacetal. See acetal.

diethyl acetaldehyde. See 2-ethylbutyraldehyde.

***N,N*-diethylacetamide.** $\text{CH}_3\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid. D 0.920 (20C), boiling range 182–186C, faint odor, flash p 170F (76.6C). Combustible.

Hazard: Toxic by ingestion.

diethylacetic acid. See 2-ethylbutyric acid.

***N,N*-diethylacetoacetamide.**

$\text{CH}_3\text{COCH}_2\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Liquid. D 0.9950 (20/20C), bp (decomposes), fp –70C (sets to glass below this temperature), flash p 250F. Miscible with water. Combustible.

Use: Intermediate for pigments.

diethyl adipate. $\text{C}_2\text{H}_5\text{OCO}(\text{CH}_2)_4\text{OCOC}_2\text{H}_5$.

Properties: Colorless liquid. D 1.002 (25C), refr index 1.426 (25C), bp 245C, fp –21C. Insoluble in water. Combustible.

Use: Plasticizer.

4'-(*n,n*-diethylalanyl)methanesulfonanilide hydrochloride.

CAS: 60735-64-0. mf: $\text{C}_{14}\text{H}_{22}\text{N}_2\text{O}_3\text{S}\cdot\text{ClH}$.

Hazard: Moderately toxic by ingestion.

diethylaluminum chloride.

CAS: 96-10-6. (aluminum diethyl monochloride; DEAC). $(\text{C}_2\text{H}_5)_2\text{AlCl}$.

Properties: Colorless pyrophoric liquid. Bp 208C, fp –50C.

Derivation: Reaction of triethylaluminum with ethylaluminum sesquichloride.

Hazard: Pyrophoric and highly flammable in air, reacts violently with water. Dangerous fire and explosion hazard.

Use: Polyolefin catalyst, intermediate in production of organometallics.

diethylaluminum hydride. $(\text{C}_2\text{H}_5)_2\text{AlH}$. A pyrophoric mix with triethylaluminum.

Derivation: Action of ethylene and hydrogen on aluminum.

Hazard: Highly flammable in air, reacts violently with water. Dangerous fire and explosion hazard.
Use: Catalyst, reducing agent.

diethylamine.

CAS: 109-89-7. $(C_2H_5)_2NH$.

Properties: Colorless liquid; ammoniacal odor; alkaline reaction. Bp 55.5C, fp -49.8C, d 0.7062 (20/20C), wt/gal 5.91 lb (20C), autoign temp 594F (312C), flash p <-15F (<-26C). Miscible with water, alcohol, most organic solvents.

Derivation: From ethyl chloride and ammonia under heat and pressure.

Grade: Technical.

Hazard: Highly flammable, dangerous fire risk. Flammable limits in air 1.8–10.1%. Toxic by ingestion, strong irritant. TLV: TWA 5 ppm; STEL 15 ppm; not classifiable as a carcinogen.

Use: Rubber chemicals, textile specialties, selective solvent, dyes, flotation agents, resins, pesticides, polymerization inhibitors, pharmaceuticals, petroleum chemicals, electroplating, corrosion inhibitors.

α -diethylaminoaceto-2,6-xylylide. See lidocaine.

4-(diethylamino)-2-butanone.

CAS: 3299-38-5. mf: $C_8H_{17}NO$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

5-diethylamino-2-aminopentane. (1-diethylamino-4-aminopentane).

$CH_3CH(NH_2)(CH_2)_2CH_2N(C_2H_5)_2$.

Properties: Liquid; amine odor. D 0.82, bp 142–144C. Soluble in water, alcohol, and ether. Combustible.

Use: Pharmaceuticals.

diethylaminoaniline. See *p*-aminodiethylaniline.

diethylaminocellulose. (DEAE cotton). A cellulose derivative containing a tertiary amine group that acts as a catalyst for epoxide reactions. It is also used in ion-exchange fractionations. It is made by adding β -chloroethyldiethylamine hydrochloride to cellulose in sodium hydroxide. Repeated treatments increase the nitrogen content of the cotton (cellulose) to over 1%, with beneficial effect on crease resistance. Combustible.

See epoxide.

2-diethylaminoethanethiol hydrochloride.

$(C_2H_5)_2NCH_2CH_2SH \cdot HCl$.

Properties: Solid. Mp 170C. Soluble in water and alcohol; insoluble in benzene.

Use: Pharmaceutical intermediate, pesticides, polymerization promoter.

diethylaminoethanol. (*N,N*-diethylethanolamine).

CAS: 100-37-8. $(C_2H_5)_2NCH_2CH_2OH$.

Properties: Colorless, hygroscopic liquid base combining the properties of amines and alcohols. Bp 161C, d 0.88–0.89 (20/20C), vap press 21 mm Hg (20C), flash p 140F (60C) (OC), wt/gal 7.14 lb (20C), fp -70C. Soluble in water, alcohol, benzene. Combustible.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by ingestion and skin absorption. TLV: 10 ppm.

Use: Water-soluble salts, fatty acid derivatives, textile softeners, pharmaceuticals, antirust compositions, emulsifying agents in acid media, derivatives containing tertiary amine groups, curing agent for resins.

diethylaminoethoxyethanol.

$(C_2H_5)_2NC_2H_4OC_2H_4OH$.

Properties: Colorless liquid. D 0.930–0.950 (20/20C), boiling range (95%) 215.0–228.0C. Combustible.

Use: Intermediate.

2-(2-(diethylamino)ethoxy)ethanol.

CAS: 140-82-9. mf: $C_8H_{19}NO_2$.

Hazard: A poison by ingestion and skin contact. A severe eye and mild skin irritant.

β -diethylaminoethyl chloride hydrochloride. (DEC).

CAS: 869-24-9. $(C_2H_5)_2NCH_2CH_2Cl \cdot HCl$. Intermediate in the manufacture of pharmaceuticals and as an organic intermediate for attaching the diethylaminoethyl radical.

N,N'-diethyl-3-amino-4-methoxybenzenesulfonamide.

$NH_2(CH_3O)C_6H_3SO_2N(C_2H_5)_2$.

Properties: White to pink crystals. Mp 100–103C. Insoluble in water and ether; partially soluble in alcohol.

Use: Intermediate.

1-diethylamino-2-methylbenzene. See *N,N*-diethyl-*o*-toluidine.

7-diethylamino-4-methylcoumarin.

(MDAC; 4-methyl-7-[diethylamino]coumarin).

$CH_3C_6H_4O(O)N(C_2H_5)_2$.

Properties: Granular, light-tan color. Mp 68–72C. Gives a bright blue-white fluorescence in very dilute solutions. Soluble in aqueous acid solutions, resins, varnishes, vinyls, and nearly all common organic solvents; slightly soluble in aliphatic hydrocarbons.

Use: Optical bleach in textile industry, in coatings for paper, labels, book covers, etc; to lighten plastics, resins, varnishes, and lacquers; invisible marking agent.

5-diethylamino-2-pentanone. (1-diethylamino-4-pentanone). $CH_3CO(CH_2)_3N(C_2H_5)_2$.

Properties: Liquid; an amine odor. Combustible.
Use: Pharmaceuticals.

9-diethylaminoethyl-2-phenylimidazo(1,2-a)benzimidazole dihydrochloride.

CAS: 23572-32-9. mf: $C_{21}H_{24}N_4 \cdot 2ClH$.

Hazard: Moderately toxic by ingestion.

m-diethylaminophenol. $C_6H_4OHN(C_2H_5)_2$.

Properties: White, crystalline solid. Mp 78C, bp 276–280C. Soluble in alcohol, caustic soda, ether.

Derivation: Diethylaniline is sulfonated with oleum, and the resulting diethylaniline-*m*-sulfonic acid fused with caustic soda.

Hazard: See phenol.

Use: Dyes.

3-diethylaminopropylamine.

$(C_2H_5)_2NCH_2CH_2CH_2NH_2$.

Properties: Water-white liquid; amine odor. Bp 169C, fp –100C (sets to a glass), d 0.82 (20/20C), refr index 1.442 (10C), flash p 138F (58.9C) (OC), Combustible.

Hazard: Moderate fire risk. Irritant to skin.

Use: Curing agent for epoxy resins, intermediate.

γ -diethylaminopropyl chloride hydrochloride. (DEPC).

$(C_2H_5)_2NCH_2CH_2CH_2Cl \cdot HCl$.

Use: Manufacture of pharmaceuticals, intermediate for attaching the diethylaminopropyl radical.

3-(diethylamino)propyl isopropyl(phenyl) glycolate hydrochloride.

CAS: 15422-00-1. mf: $C_{18}H_{29}NO_3 \cdot ClH$.

Hazard: A poison.

10-(2-(diethylamino)propyl)-10h-pyrido(3,2-b)(1,4)benzothiazine.

CAS: 67465-66-1. mf: $C_{18}H_{23}N_3S$.

Hazard: A poison by ingestion.

N,N-diethylaniline.

CAS: 91-66-7. $(C_2H_5)_2NC_6H_5$.

Properties: Colorless to yellow liquid. D 0.9351, fp –38 to –39C, bp 215–216C, flash p 185F (85C). Slightly soluble in alcohol and ether; soluble in water. Combustible.

Derivation: By heating aniline hydrochloride with alcohol at 180C under pressure.

Grade: Technical.

Hazard: See aniline.

Use: Organic synthesis, dyestuff intermediate.

diethylbarbituric acid. See barbital.

diethylbenzene.

CAS: 25340-17-4. $(C_2H_5)_2(C_6H_5)_2$.

Grade: The commercial product is either a mixture of isomers or the *p*-isomer.

Available forms: *p*-Isomer available in both pure and technical grades.

Properties: Colorless liquid. Boiling range 179.8–184.8C, d 0.865 (25/25C), flash p 132F (55.5C). Soluble in alcohol, benzene, carbon tetrachloride, ether; insoluble in water; wt/gal 7.22 lb; refr index 1.49; autoign temp 806F (430C). Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Use: Intermediate, solvent.

diethylbis(octanoyloxy)stannane.

CAS: 2641-56-7. mf: $C_{20}H_{40}O_4Sn$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

o,o-diethyl *o*-(4-(1-(((butylamino) carbonyloxy)imino)ethyl)phenyl) phosphorothioic acid ester.

CAS: 22936-20-5. mf: $C_{17}H_{27}N_2O_5PS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

di(2-ethylbutyl) azelate.

$C_6H_{13}OOC(CH_2)_2COOC_6H_{13}$.

Properties: Pale-yellow to water-white liquid. D 0.9340 (20/20C), viscosity 56 sec Saybolt (100F), flash p 385F (196C), fp <–40C, acid number <1.0, faint odor. Stable to heat, light, and hydrolysis. Combustible.

Use: As plasticizer for polyvinyl chloride and its copolymers and for cellulose esters.

di(2-ethylbutyl) phthalate. (dihexyl phthalate). $C_6H_4(COOC_6H_{13})_2$.

Properties: Oily, slightly aromatic liquid. D 1.010–1.016 (20/20C), bp 350C (735 mm Hg), acidity (as phthalic acid) 0.01% max, fp –50C, ester content 98% max, flash p 381F (193C). Combustible.

Grade: Technical.

Use: Plasticizer for cellulose ester and vinyl plastics.

diethylcadmium. $(C_2H_5)_2Cd$.

Properties: Colorless, oily liquid. Bp 64C (19 mm Hg), fp –21C. Pyrophoric,

Derivation: Reaction of cadmium acetate with triethylaluminum.

Hazard: Ignites spontaneously in air, dangerous fire hazard.

See cadmium.

Use: TEL production, synthesis of ketones from acid chlorides.

diethylcarbamazine citrate.

CAS: 1642-54-2. $C_{10}H_{21}N_3O_7 \cdot C_6H_8O_7$ (1-diethylcarbamy-4-methylpiperazine dihydrogen citrate).

Properties: White, crystalline powder; odorless or slight odor. Mp 135–138C. Slightly hygroscopic; very soluble in water; sparingly soluble in alcohol; practically insoluble in acetone, chloroform, and ether.

Grade: USP.

Use: Medicine (anthelmintic).

***N,N'*-diethylcarbanilide.** See *sym*-diethyldiphenylurea.

diethyl carbinol. See 3-pentanol.

1,1'-diethyl-4,4'-carbocyanine iodide. See cryptocyanine.

diethyl carbonate. (ethyl carbonate).

CAS: 105-58-8. (C₂H₅)₂CO₃.

Properties: Colorless liquid; mild odor. Stable, d 0.975 (20/4C), bp 125C, fp -43C, flash p 77F (25C) (OP). Miscible with alcohols, ketones, esters, aromatic hydrocarbons, some aliphatic solvents; insoluble in water. Combustible.

Derivation: The steps in its manufacture are (1) reacting chlorine and carbon monoxide to produce phosgene (COCl₂); (2) reacting phosgene with ethanol to make ethyl chlorocarbonate (ClCO₂C₂H₅); and (3) reacting ethyl chlorocarbonate with anhydrous ethanol to produce diethyl carbonate.

Grade: Technical.

Hazard: Flammable, dangerous fire risk.

Use: Solvent for nitrocellulose, cellulose ethers, many synthetic and natural resins; organic synthesis; adhering rare earths to cathodes.

diethyl chlorophosphate. (C₂H₅O)₂P(O)Cl.

Properties: Water-white liquid. Bp 60C (2 mm Hg), d 1.1915 (25C), refr index 1.4153 (25C). Soluble in alcohols. Combustible.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption; cholinesterase inhibitor.

Use: Intermediate in organic synthesis.

diethylcyclohexane. (C₂H₅)₂C₆H₁₀.

Properties: Liquid. D 0.8037 (20/20C), bp 174C, fp -100C, insoluble in water, flash p 125F (51.6C) (OC), autoign temp 465F (240.5C). Combustible.

Hazard: Moderate fire risk.

***N,N*-diethylcyclohexylamine.** C₆H₁₁N(C₂H₅)₂.

Properties: Colorless liquid. Bp 194.5C. Soluble in ether and benzene; slightly soluble in water. Combustible.

Grade: Technical.

Use: Solvent, intermediate.

diethyl-1-(2,4-dichlorophenyl)2-chlorovinyl phosphate. (C₂H₅O)₂PO•OC(C₆H₃Cl₂)•CHCl.

Properties: Liquid. Bp 167-170C (5 mm Hg). Insoluble in water; miscible with acetone, ethanol, kerosene, and xylene.

Hazard: Cholinesterase inhibitor.

Use: Insecticide.

diethyldichlorosilane.

CAS: 1719-53-5. (C₂H₅)₂SiCl₂.

Properties: Colorless liquid. Bp 130.4C, d 1.053 (25/25C), refr index 1.4309 (25C), flash p (COC)

77F (25C). Readily hydrolyzed with liberation of hydrogen chloride.

Derivation: Reaction of powdered silicon and ethyl chloride at 300C, in presence of copper powder.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Corrosive to tissue.

Use: Intermediate for silicones.

diethyl (2-(diethoxymethylsilyl)ethyl) phosphonate.

CAS: 18048-06-1. mf: C₁₁H₂₇O₅PSi.

Hazard: A poison by ingestion and skin contact. A moderate skin and severe eye irritant.

***O,O*-diethyl-*S*,2-diethylaminoethyl phosphorothioate hydrogen oxalate.**

See tetram.

diethyl diethylmalonate.

(C₂H₅)₂C(COOC₂H₅)₂.

Properties: Colorless liquid; sweet odor. D 0.984 (25/25C).

Use: Intermediate.

diethyldiiodostannane.

CAS: 2767-55-7. mf: C₄H₁₀I₂Sn.

Properties: Very sltly sol white crystals or white needles. Mp: 44°, bp: 240-245° (decomp).

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diethyl 2,3-dimercaptosuccinate.

CAS: 17660-58-1. mf: C₈H₁₄O₄S₂.

Hazard: Moderately toxic.

***o,o*-diethyl *o*-(4-(1-(((dimethylamino) carbonyloxy)imino)ethyl)phenyl) phosphorothioic acid ester.**

CAS: 22942-43-4. mf: C₁₅H₂₃N₂O₅PS.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

diethyl 2,6-dimethyl-4(2-pyridyl)-1,4-dihydro-3,5-pyridine-dicarboxylate.

CAS: 23125-28-2. mf: C₁₈H₂₂N₂O₄.

Hazard: A poison.

diethyldiphenyldichloroethane. See 1,1-dichloro-2,2-bis(*p*-ethylphenyl)ethane.

diethyl diselenide. See ethyl diselenide.

***sym*-diethyldiphenylurea.** (*N,N'*-diethylcarbanilide; ethyl centralite; carbamate).

C₂H₅(C₆H₅)NCON(C₆H₅)C₂H₅.

Properties: White crystalline, solid; peppery odor. Mp 79C, bp 325-330C, d 1.12 (20C), flash p 302F (150C). Insoluble in water; soluble in organic solvents.

Use: Stabilizer for nitrocellulose-based smokeless powder and in solid rocket propellants.

diethylenediamine. See piperazine.

1,4-diethylene dioxide. See 1,4-dioxane.

diethylene disulfide. See 1,4-dithiane.

diethylene ether. See 1,4-dioxane.

diethylene glycol. (dihydroxydiethyl ether; diglycol; DEG).

CAS: 111-46-6. $\text{CH}_2\text{OHCH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless, syrupy liquid; practically odorless; sweetish taste. Bp 245.0C, fp -80C , d 1.1184 (20/20C), wt/gal 9.35 (15C), refr index 1.446 (25C), surface tension 48.5 dynes/cm (25C), viscosity 0.30 cP (25C), vap press 0.01 mm Hg (30C), flash p 255F (123.9C), autoign temp 444F (228.9C). Extremely hygroscopic. Noncorrosive. Lowers freezing point of water; miscible with water, ethanol, acetone, ether, ethylene glycol; immiscible with benzene, toluene, carbon tetrachloride.. Combustible.

Derivation: By-product of manufacture of ethylene glycol.

Grade: Technical.

Hazard: Hazardous for household use in concentration of 10% or more (FDA).

Use: Production of polyurethane and unsaturated polyester resins, triethylene glycol; textile softener; petroleum solvent extraction; dehydration of natural gas, plasticizers, and surfactants; solvent for nitrocellulose and many dyes and oils; humectant for tobacco, casein, synthetic sponges, paper products; cork compositions, bookbinding adhesives, dyeing assistant, cosmetics, antifreeze solutions.

diethylene glycol acetate. See diethylene glycol monoacetate.

diethylene glycol bis(allyl carbonate). (allyl diglycol carbonate).

CAS: 142-22-3. $\text{O}[\text{CH}_2\text{CH}_2\text{OCOO}(\text{C}_3\text{H}_5)]_2$.

Properties: Liquid. Fp -4C , bp 160C (4 mm Hg), d 1.143 (20C), viscosity 9 cP (20C).

Use: Monomer for allyl resins, particularly in optically clear castings.

diethylene glycol bis(*n*-butyl carbonate).

See butyl diglycol carbonate.

diethylene glycol bis(chloroformate). See diglycol chloroformate.

diethylene glycol bis(cresyl carbonate).

See cresyl diglycol carbonate.

diethylene glycol bis(2,2-dichloropropionate). A herbicide.

See "Garlon."

diethylene glycol bis(phenyl carbonate).

See phenyl diglycol carbonate.

diethylene glycol diacetate. (diglycol acetate). $(\text{CH}_3\text{COOCH}_2\text{CH}_2)_2\text{O}$.

Properties: Colorless liquid. D 1.1159, bp 250C, mp 19.1C, flash p 275F (135C), vap press 0.02 mm Hg. Miscible with water. Combustible.

Grade: Technical.

Use: Solvent for cellulose esters, printing inks, lacquers.

diethylene glycol dibenzoate.

$\text{C}_6\text{H}_5\text{COO}(\text{CH}_2)_2\text{O}(\text{CH}_2)_2\text{OOC}\text{C}_6\text{H}_5$.

Properties: Liquid. Bp 225–227C (3 mm Hg), flash p 450F (232C). Combustible.

Use: Plasticizer.

diethylene glycol dibutyl ether. (dibutyl "Carbitol").

CAS: 112-73-2. $\text{C}_4\text{H}_9\text{O}(\text{C}_2\text{H}_4\text{O})_2\text{C}_4\text{H}_9$.

Properties: Almost colorless liquid. D 0.8853 (20/20C), bulk d 7.36 lb/gal (20C), bp 256C, vap press 0.02 mm Hg (20C), fp -60.2C , viscosity 2.39 cP (20C), flash p 245F (118C). Slightly soluble in water. Combustible.

Use: High-boiling, inert solvent with application in extraction processes and in coatings and inks; diluent in vinyl chloride dispersions; extractant for uranium ores.

diethylene glycol dicarbamate. See diglycol carbamate.

diethylene glycol diethyl ether. (diethyl "Carbitol"; ethyl diglyme).

CAS: 112-36-7. $\text{C}_2\text{H}_5\text{O}(\text{C}_2\text{H}_4\text{O})_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid. Very stable. D 0.9082 (20/20C), bp 189C, flash p 180F (82.2C), wt/gal 7.56 lb (20C), fp -44.3C . Soluble in hydrocarbons and water. Combustible.

Use: Solvent for nitrocellulose, resins, lacquers; high-boiling medium and solvent for organic synthesis.

diethylene glycol dimethyl ether. (diglyme; diglycol methyl ether).

$\text{CH}_3(\text{OCH}_2\text{CH}_2)_2\text{OCH}_3$.

Properties: Colorless liquid; mild odor. Bp 162.0C, fp -68.0C , d 0.9451 (20/20C), flash p 153F (67.2C), viscosity 1.089 cP (20C). Miscible with water and hydrocarbons. Combustible.

Grade: Technical.

Use: Solvent, anhydrous reaction medium for organometallic synthesis.

diethylene glycol dinitrate. (DEGN; diglycol nitrate; dinitroglycol).

CAS: 693-21-0. $(\text{O}_2\text{NOCH}_2\text{CH}_2)_2\text{O}$.

Properties: Liquid. D 1.377 (25/4C), fp -11.3C , bp 161C. Slightly soluble in water and alcohol; soluble in ether.

Hazard: Severe explosion hazard when shocked or heated. Toxic by ingestion.

Use: Plasticizer in solid rocket propellants.

diethylene glycol dipelargonate.

(C₈H₁₇COOCH₂CH₂)₂O. A simple ester of pelargonic acid. Acid number 2.0, bp 229C (5 mm Hg), pour point 10F, viscosity (SUV at 110C) 36 sec, flash p 410F (210C). Combustible.

Use: Secondary plasticizer for vinyl resins.

diethylene glycol distearate. See diglycol stearate.**diethylene glycol ethyl ether acrylate.**

See ethylcarbitol acrylate.

diethylene glycol isopropyl ether. See isopropyl carbitol.

diethylene glycol monoacetate. (diethylene glycol acetate). HO(CH₂)₂(CH₂)₂OOCCH₃. Miscible with water and aromatic hydrocarbons. Solvent for nitrocellulose, cellulose acetate, camphor, and rosin.

diethylene glycol monobutyl ether. (butyl "Carbitol"). C₆H₁₃OCH₂CH₂OCH₂CH₂OH.

Properties: Colorless liquid; faint butyl odor. Bp 230.6C, d 0.9536 (20/20C), wt/gal 7.94 lb (20C), refr index 1.4316 (20C), viscosity 0.0649 cP (20C), vap press 0.01 mm Hg (20C), specific heat 0.546 cal/g K (20–25C), flash p 172F (77.7C), autoign temp 442F (227.7C), coefficient of expansion 0.00088 K⁻¹ to 20C, fp –68.1C. Soluble in oils and water. Combustible.

Grade: Technical.

Use: Solvent for nitrocellulose, oils, dyes, gums, soaps, polymers; plasticizer intermediate.

diethylene glycol monobutyl ether acetate. (butyl "Carbitol" acetate).

CAS: 124-17-4. CH₃CO(OC₂H₄)₂OC₂H₅.

Properties: Colorless liquid. D 0.9810 (20/20C), bp 246.7C, vap press <0.01 mm Hg (20C), flash p 240F (115.5C), wt/gal 8.16 lb (20C), nitrocellulose-xylene dilution ratio 1:8, coefficient of expansion 0.0010 K⁻¹ (20C), fp –32.3C, viscosity 0.0356 cP (20C), autoign temp 570F (298.8C). Miscible with most organic liquids. Combustible.

Grade: Technical.

Use: Solvent for oils, resins, gums, also for cellulose nitrate and polymeric coatings; plasticizer in lacquers and coatings.

diethylene glycol monoethyl ether. ("Carbitol" solvent).

CAS: 111-90-0. CH₂OHCH₂OCH₂CH₂OC₂H₅.

Properties: Colorless, hygroscopic liquid; mild, pleasant odor; slightly viscous; stable. Bp 195–202C, d 1.0272 (20/20C), refr index 1.425 (25C), flash p 205F (96.1C), wt/gal 8.55 lb (20C). Miscible with water and the common organic solvents. Combustible.

Grade: Technical.

Use: Solvent for dyes, nitrocellulose, and resins; mu-

tual solvent for mineral-oil-soap and mineral-oil-sulfonated-oil mixtures; nonaqueous stains for wood, for setting the twist and conditioning yarns and cloth; textile printing, textile soaps, lacquers, organic synthesis; brake-fluid diluent.

diethylene glycol monoethyl ether acetate.

("Carbitol" acetate).

CAS: 112-15-2. CH₃COOCH₂OCH₂CH₂OC₂H₅.

Properties: Colorless liquid. D 1.0114 (20/20C), bp 217.4C, vap press 0.05 mm Hg (20C), flash p 230F (110C), wt/gal 8.4 lb (20C), coefficient of expansion 0.00105, fp –25C, refr index 1.418 (30C), viscosity 0.0279 cP (20C). Soluble in water; miscible with most organic solvents. Combustible.

Grade: Technical.

Use: Solvent for cellulose esters, gums, resins; coatings and lacquers; printing inks.

diethylene glycol monohexyl ether. (n-hexyl "Carbitol").

CAS: 112-59-4. C₆H₁₃OC₂H₄OC₂H₄OH.

Properties: Water-white liquid. D 0.9346 (20/20C), 7.8 lb/gal (20C), bp 259.1C, vap press <0.01 mm Hg (20C), fp –33C, viscosity 8.6 cP (20C), flash p 285F (140.5C). Combustible.

Use: High-boiling solvent.

diethylene glycol monolaurate. See diglycol laurate.**diethylene glycol monomethyl ether.** [(2-β-methyl "Carbitol"), methoxyethoxy ethanol].

CAS: 111-77-3. CH₃OCH₂CH₂OCH₂CH₂OH.

Properties: Colorless liquid. Refr index 1.4264 (27C), d 1.0211 (20/4C), bp 194C, soluble in water, flash p 200F (93.3C), wt/gal 8.51 lb (20C). Combustible.

Use: Solvent, brake-fluid component, intermediate.

diethylene glycol monomethyl ether acetate. (methyl "Carbitol" acetate).

CAS: 629-38-9. CH₃COOC₂H₄OC₂H₄OCH₃.

Properties: Colorless liquid. Bp 209.1C, flash p 180F (82.2C) (OC), d 1.04 (20/20C), vap press 0.12 mm Hg (20C). Combustible.

Use: Solvent.

diethylene glycol monooleate. See diglycol oleate.**diethylene glycol monoricinoleate.** See diglycol ricinoleate.**diethylene glycol monostearate.** See diglycol monostearate.**diethylene glycol phthalate.** See diglycol phthalate.**diethylene glycol stearate.** See diglycol stearate.

diethylene oxide. See 1,4-dioxane.

diethylenetriamine.

CAS: 111-40-0. $\text{NH}_2\text{C}_2\text{H}_4\text{NHC}_2\text{H}_4\text{NH}_2$.

Properties: Yellow liquid; ammoniacal odor. Bp 206.7C, fp -39C , d 0.9542 (20/20C), vap press 0.37 mm Hg (20C), flash p 215F (101.6C), wt/gal 7.9 lb (20C), viscosity 0.0714 cP (20C), coefficient of expansion 0.00088 K^{-1} . Strongly alkaline, hygroscopic, somewhat viscous; soluble in water and hydrocarbons. Corrosive to copper and its alloys.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant to eyes and skin. TLV: 1 ppm.

Use: Solvent for sulfur, acid gases, various resins, dyes; saponification agent for acidic materials; fuel component. See hydrysine.

diethylenetriamine pentaacetic acid.

CAS: 67-43-6.
 $\text{HOOCCH}_2\text{N}[\text{CH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2]_2$.

Properties: White, crystalline solid. Mp 230C (decomposes). Slightly soluble in cold water; soluble in hot water.

Grade: Technical.

Use: Chelating agent.

***N,N*-diethylethanolamine.** See diethylaminoethanol.

diethyl ether. See ethyl ether.

diethyl ethoxymethylenemalonate.

$\text{C}_2\text{H}_5\text{OCH}_2\text{C}(\text{COOC}_2\text{H}_5)_2$.

Properties: Liquid. D 1.0855 (15/15C), refr index 1.4625 (20C), bp 279–281C (decomposes), flash p 190F (87.7C). Insoluble in water.

Grade: 98% (min purity). Combustible.

Use: Synthesis.

***uns*-diethylethylene.** See 2-ethyl-1-butene.

***N,N*-diethylethylenediamine.**

CAS: 100-36-7. $(\text{C}_2\text{H}_5)_2\text{NC}_2\text{H}_4\text{NH}_2$.

Properties: Colorless liquid. Bp 145.2C, sets to a glass below -100C , d 0.8211 (20/20C), wt/gal 6.8 lb (20C), flash p 115F (46.1C) (OC). Miscible with water. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Use: Intermediate.

***p,p'*-(1,2-diethylethylene)diphenol.** See hexestrol.

diethyl ethylmalonate. $\text{C}_2\text{H}_5\text{CH}(\text{COOC}_2\text{H}_5)_2$.

Properties: Colorless liquid; ester odor. D 0.9994 (25/25C). Combustible.

Use: Intermediate.

diethyl ethylphosphonate.

$\text{C}_2\text{H}_5\text{P}(\text{O})(\text{OC}_2\text{H}_5)_2$.

Properties: Colorless liquid; mild odor. D 1.025 (20/4C), bp 82–83C (11 mm Hg), flash p 220F (104.4C) (COC). Stable; miscible with most common organic solvents; slightly soluble in water; soluble in alcohol. Combustible.

Use: Heavy-metal extraction and solvent separation, gasoline additives, antifoam agent, plasticizer, textile conditioner and antistatic agent.

***o,o*-diethyl *s*-(2-(ethylthio)-6-methyl-4-pyrimidinyl) phosphorodithioate.**

CAS: 32522-68-2. mf: $\text{C}_{11}\text{H}_{20}\text{N}_2\text{O}_2\text{PS}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,1'-diethyl ferrocenoate. (1,1'-ferrocene dicarboxylic acid diethyl ester).

$(\text{C}_2\text{H}_5\text{OOC})_2\text{C}_2\text{H}_4\text{Fe}$.

Properties: Orange crystals. Mp 38–40C.

Use: Intermediate, high-temperature plasticizer.

diethylgermanium dichloride.

$(\text{C}_2\text{H}_5)_2\text{GeCl}_2$.

Properties: Colorless liquid. Fp -38C , bp 175C. Decomposed by water.

Use: Biocide, intermediate.

diethylglycol phthalate. (diethoxyethyl phthalate). $(\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OOC})_2\text{C}_6\text{H}_4$.

Properties: Water-white to pale-straw liquid. D 1.115–1.120 (20/20C), wt/gal 9.31 lb, flash p 343F (172C). Combustible.

Use: Plasticizer.

di(2-ethylhexyl) adipate. (DOA; dioctyl adipate).

CAS: 103-23-1.

$[\text{CH}_3\text{CH}_2\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Light-colored, oily liquid. D 0.9268 (20/20C), refr index 1.4472, flash p 385F (196C), pour point -75C , bp 417C (214C at 5 mm Hg), vap press 2.60 mm Hg (200C), viscosity 13.7 cP (20C), wt/gal 7.7 lb (20C). Insoluble in water. Combustible.

Grade: 99% min.

Use: Plasticizer, commonly blended with general purpose plasticizers such as DOP and DIOP; in processing polyvinyl and other polymers; solvent; aircraft lubricants.

di(2-ethylhexyl)amine. (dioctylamine).

CAS: 20830-75-5. $[\text{C}_2\text{H}_5\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2]_2\text{NH}$.

Properties: Water-white liquid; slightly ammoniacal odor. D 0.8062 (20/20C), 6.7 lb/gal (20C), bp 281.1C, vap press 0.01 mm Hg (20C), viscosity 3.70 cP (20C), refr index 1.4420 (20C), flash p 270F (132C). High solubility in hydrocarbons; low solubility in water. Combustible.

Hazard: Moderately toxic.

Use: Synthesis of dyestuffs, insecticides, emulsifying agents, etc.

di(2-ethylhexyl)aminoethanol. See di(2-ethylhexyl)ethanolamine.

di(2-ethylhexyl) azelate. (DOZ; dioctyl azelate). $(\text{C}_2\text{H}_5)_7[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Colorless liquid; odorless. D 0.919 (20/20C), refr index 1.4472, bp 376C, flash p 430F (221C). Combustible.

Grade: 99% pure.

Use: Plasticizer for vinyls, especially used as low-temperature plasticizer; base for synthetic lubricants.

di(2-ethylhexyl)ethanolamine. (di(2-ethylhexyl)aminoethanol; dioctylaminoethanol). $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2]_2\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid. Wt/gal 7.2 lb, flash p 280F (137C). Insoluble in water. Combustible.

Use: Emulsifier, acid-stable wetting agent.

di(2-ethylhexyl) ether.

CAS: 10143-60-9. $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2]_2\text{O}$.

Properties: Colorless, stable liquid; mild odor. D 0.8121 (20/20C), 6.6 lb/gal (20C), bp 269.4C, vap press less than 0.01 mm Hg (20C), sets to glass below -95C, viscosity 2.89 cP (20C), refr index 1.4525 (20C). Almost insoluble in water. Combustible.

Use: High-boiling, inert reaction medium; component of certain foam breakers.

di(2-ethylhexyl)-2-ethylhexyl phosphonate.

(bis(2-ethylhexyl)-2-ethylhexyl phosphonate).

$\text{C}_8\text{H}_{17}\text{PO}(\text{OC}_8\text{H}_{17})_2$.

Properties: Colorless liquid; mold odor. D 0.908 (20/4C), bp 160-161C (0.26 mm Hg), flash p 420F (215C). Insoluble in water; miscible with most common organic solvents. Combustible.

Use: Heavy-metal extraction, solvent separation, gasoline additive, antifoam agent, plasticizer, stabilizer, textile conditioner and antistatic agent.

di(2-ethylhexyl) fumarate. (dioctyl fumarate; DOF).

CAS: 141-02-6. $\text{C}_8\text{H}_{17}\text{OOCCH}:\text{CHCOOC}_8\text{H}_{17}$.

Properties: Clear, mobile liquid. D 0.937-0.940 (25/25C), bp 211-220C, flash p 365F (185C). Combustible.

Use: Monomer for polymerization and copolymerization.

di(2-ethylhexyl) hexahydrophthalate. (dioctyl hexahydrophthalate).

$\text{C}_6\text{H}_{10}[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Light-colored liquid. D 0.9586 (20/20C), 8.0 lb/gal (20C), bp 216C (5 mm Hg), vap press 2.2 mm Hg (200C), viscosity 42.1 cP (20C), flash p 425F (218C). Insoluble in water. Combustible.

Use: Plasticizer.

di(2-ethylhexyl) hydrogen phosphate.

(bis(2-ethylhexyl) hydrogen phosphate).

$(\text{C}_8\text{H}_{17})_2\text{HPO}_4$.

Properties: Solid. D 0.972 (20/4C), flash p 340F (171C) (COC). Insoluble in water.

Use: Heavy-metal extraction.

di(2-ethylhexyl) isophthalate. (dioctyl isophthalate). $\text{C}_8\text{H}_{17}[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Colorless liquid. Bp 258C (10 mm Hg), d 0.984 (20/20C), 8.2 lb/gal, pour point -46C, viscosity 86.5 cP (20C). Insoluble in water. Combustible.

Use: Plasticizer.

di(2-ethylhexyl) maleate. (dioctyl maleate; DOM).

CAS: 142-16-5. $\text{C}_8\text{H}_{17}\text{OOCCH}:\text{CHCOOC}_8\text{H}_{17}$.

Properties: Liquid. Bp 209C (10 mm Hg), fp sets to glass below -60C, d 0.9436 (20/20C), wt/gal 7.9 lb (20C), flash p 365F (185C) (OC). Insoluble in water. Combustible.

Use: Copolymers, intermediate.

di(2-ethylhexyl) phosphite. (bis(2-ethylhexyl) phosphite). $(\text{C}_8\text{H}_{17}\text{O})_2\text{PHO}$.

Properties: Mobile, colorless liquid; mild odor. High degree of thermal stability. D 0.937 (20/4C), bp 163-164C (3 mm Hg), refr index 1.444 (25C), flash p 330F (165C). Insoluble in water (hydrolyzes very slowly); miscible with most common organic solvents. Combustible.

Use: Lubricant additive, intermediate, adhesive.

di(2-ethylhexyl) phosphoric acid. (di-*n*-octyl phosphoric acid; di[2-ethylhexyl] hydrogen phosphate).

CAS: 298-07-7. $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2]_2\text{HPO}_4$.

Properties: Strongly acidic liquid. D 0.973 (25/25C), fp -60C, refr index 1.4420 (25C), flash p 385F (196C), wt/gal 8.2 lb. Insoluble in water; soluble in organic solvents. Combustible.

Use: Metal extraction and separation, intermediate for wetting agents and detergents.

di(2-ethylhexyl) phthalate. (di-*sec*-octyl phthalate; dioctyl phthalate; DOP).

CAS: 117-81-7. $\text{C}_6\text{H}_4[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Light-colored, odorless liquid. D 0.9861 (20/20C), pour p -46C, refr index 1.4836, flash p 425F (218C), 8.20 lb/gal (20C), bp 231C (5 mm Hg) vap press 1.32 mm Hg (200C), viscosity 81.4 cP (20C). Insoluble in water; miscible with mineral oil. Combustible.

Derivation: Reaction of 2-ethylhexanol and phthalic anhydride.

Hazard: TLV: 5 mg/m³.

Use: Plasticizer for many resins and elastomers.

di(2-ethylhexyl) sebacate. (dioctyl sebacate).

CAS: 122-62-3. $\text{C}_4\text{H}_8(\text{COOC}_8\text{H}_{17})_2$.

Properties: Pale straw-colored liquid. D 0.91 (25C),

refr index 1.447 (28C), bp 248C (4 mm Hg), fp -55C, flash p 410F (210C) (COC). Insoluble in water; partially compatible with cellulose acetate and cellulose acetate butyrate; compatible with ethyl cellulose, polystyrene, polyethylene, vinyl chloride, and vinyl chloride acetate. Combustible.

Use: Plasticizer.

di(2-ethylhexyl) sodium sulfosuccinate.

See dioctyl sodium sulfosuccinate.

di(2-ethylhexyl) succinate. (dioctyl succinate). $C_8H_{17}OCOCH_2CH_2COOC_8H_{17}$.

Properties: Liquid. Bp 257C (50 mm Hg), fp sets to glass below -60C, d 0.9346 (20/20C), wt/gal 7.8 lb (20C), flash p 315F (157C) (OC), vap press <0.01 mm Hg (20C). Solubility in water <0.01% by wt (20C). Combustible.

Use: Plasticizer, intermediate.

di-2-ethylhexyltin dichloride.

CAS: 25430-97-1. mf: $C_{16}H_{34}Cl_2Sn$.

Properties: Crystals.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diethylhydroxylamine.

CAS: 3710-84-7. $(C_2H_5)_2NOH$.

Properties: Liquid. Refr index 1.4238 (20C). Combustible.

Grade: 85%.

Use: Photographic developer, antioxidant, corrosion inhibitor.

diethyl isoamylethylmalonate.

$(C_2H_5)(C_5H_{11})C(COOC_2H_5)_2$.

Properties: Colorless liquid; sweet odor. D 0.950 (25/25C). Combustible.

Use: Intermediate.

diethyl ketone. (metacetone; propione; 3-pentanone; ethyl propionyl).

CAS: 96-22-0. $C_2H_5COC_2H_5$.

Properties: Colorless, mobile liquid; acetone-like odor. Autoign temp 846F (452C), bp 101C, d 0.816, fp -42C, flash p 55F (12.78C) (OC). Soluble in alcohol and ether; slightly soluble in water.

Derivation: By distilling sugar with an excess of lime.

Method of purification: Rectification.

Grade: Technical.

Hazard: Flammable, dangerous fire hazard. TLV: 200 ppm.

Use: Medicine, organic synthesis.

diethyl maleate.

CAS: 141-05-9. $C_2H_5OOCCH:CHCOOC_2H_5$.

Properties: Water-white liquid. D 1.0687, bulk d 8.92 lb/gal (20C), refr index 1.4400 (20C), bp 225C, fp approximately -115C, viscosity 3.567 cP (20C), flash p 200F (93.3C) (COC), dielectric constant 2.18 (calc) (25C), surface tension 3.70 dynes/cm (20C).

Readily soluble in alcohol, diethyl ether, paraffinic hydrocarbons, and common organic solvents; soluble in water; readily hydrolyzed by alkaline solutions. Combustible.

Derivation: Reaction of maleic anhydride with ethanol in the presence of a catalyst.

Hazard: Irritant to eyes and skin.

Use: Organic synthesis, flavoring.

diethyl malonate. See ethyl malonate.

diethylmalonylurea. See barbital.

o,o-diethyl *s*-(5-methoxy-1,3,4-thiadiazol-2-yl)methyl phosphorothioate.

CAS: 38090-84-5. mf: $C_8H_{15}N_2O_4PS_2$.

Hazard: A poison by ingestion.

o,o-diethyl *o*-(4-(1-(((methylamino)carbonyloxy)imino)ethyl)phenyl) phosphorothioic acid ester.

CAS: 22941-83-9. mf: $C_{14}H_{21}N_2O_5PS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

diethyl(1-methylbutyl) malonate.

$[C_3H_7CH(CH_3)]CH(COOC_2H_5)_2$.

Properties: Colorless liquid; ester odor. D 0.969 (25/25C).

Use: Intermediate, organic synthesis.

o,o-diethyl *o*-(4-(1-(((1-methylethyl)amino)carbonyloxy)imino)ethyl) phenyl) phosphorothioic acid ester.

CAS: 22936-17-0. mf: $C_{16}H_{25}N_2O_5PS$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

diethylmethylmethane. See 3-methylpentane.

O,O-diethyl-*O-p*-nitrophenyl phosphorothioate.

See parathion.

n,n-diethyl-*n*-(1,2,3,4,4a,5,10,10a-octahydro-6-hydroxy-1-propylbenzo(g)qui nolin-3-yl)-sulfamide, (3- α ,4a- α ,10a- β)-(+-)-.

CAS: 87056-78-8. mf: $C_{20}H_{33}N_3O_3S$.

Hazard: Human systemic effects reported. A reproductive hazard.

diethyl oxalate. See ethyl oxalate.

diethyl oxide. See ethyl ether.

di(*p*-ethylphenyl)dichloroethane. See 1,1-dichloro-2,2-bis(*p*-ethylphenyl)ethane.

***N,N*-diethyl-*p*-phenylenediamine.** See *p*-aminodiethylaniline.

diethyl phenyltin acetate.CAS: 64036-46-0. mf: C₁₂H₁₈O₂Sn.**Hazard:** A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**diethylphosphinic acid anhydride with diethyl phosphorothionate.**CAS: 7506-77-6. mf: C₈H₂₀O₄P₂S.**Hazard:** Moderately toxic.**diethyl phosphite.**CAS: 762-04-9. (C₂H₅O)₂P(O).**Properties:** Water-white liquid. Bp 138C, d 1.069 (25C), refr index 1.4061 (25C), flash p 195F (90.5C) (COC). Soluble in water and common organic solvents. Combustible.**Use:** Paint solvent, lubricant additive, antioxidant, reducing agent, intermediate for flame-retardants and insecticides, phosphorylating agent.**O,O-diethyl phosphorochloridothioate.**

(ethyl PCT).

CAS: 2524-04-1. (C₂H₅O)P(S)Cl.**Properties:** Colorless to light-amber liquid. D 1.196 (25/25C), fp less than -75C, bp 49C (below 1 mm Hg), refr index 1.4705 (25C). Insoluble in water; soluble in most organic solvents. Stable at room temperature, slowly isomerizes at 100C.**Hazard:** Cholinesterase inhibitor, irritant to eyes and lungs.**Use:** Intermediate for pesticides, oil and gasoline additives, flame retardants, flotation agents.**4-(o,o-diethylphosphorothioyl)benzaldoximino-n-butylcarbamate.**CAS: 22942-02-5. mf: C₁₆H₂₅N₂O₅PS.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**4-(o,o-diethylphosphorothioyl)benzaldoximino-n-morpholinylcarbamate.**CAS: 22935-72-4. mf: C₁₆H₂₃N₂O₆PS.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**diethyl phthalate.** (ethyl phthalate; DEP).CAS: 84-66-2. C₆H₄(CO₂C₂H₅)₂.**Properties:** Water-white, stable liquid; odorless; bitter taste. Fp -40.5C, refr index 1.5002 (25C), surface tension 37.5 dynes/cm (20C), viscosity 31.3 centistokes (OC), vap press 14 mm Hg (163C), 30 mm Hg (182C), 734 mm Hg (295C), bp 298C, flash p 325F (162.7C) (OC), wt/gal approximately 9.31 lb (20C), d 1.120 (25/25C). Miscible with alcohols, ketones, esters, aromatic hydrocarbons; partly miscible with aliphatic solvents; insoluble in water. Combustible.**Derivation:** By reacting phthalic anhydride with ethanol followed by careful purification.**Grade:** Technical.**Hazard:** Toxic by ingestion and inhalation, strongirritant to eyes and mucous membranes, narcotic. TLV: 5 mg/m³.**Use:** Solvent for nitrocellulose and cellulose acetate, plasticizer, wetting agent, insecticidal sprays, camphor substitute, plastics, perfumery as fixative and solvent, alcohol denaturant, mosquito repellents, plasticizer in solid rocket propellants.**2,2-diethyl-1,3-propanediol.**HOCH₂C(C₂H₅)₂CH₂OH.**Properties:** Colorless liquid. Mp 61.3C, bp 160C (50 mm Hg), d 0.949 (at melting point), wt/gal 8.2 lb (60C), flash p 215C (101.6C) (OC). Soluble in water. Combustible.**Grade:** Technical, pharmaceutical.**Hazard:** Toxic by ingestion.**Use:** Emulsifying agent, intermediate, medicine.**diethyl s-propyl phosphorothioate.** See ethyl propyl phosphorothioate.**O,O-diethyl-O-2-pyrazinyl phosphorothioate.** See thionazin.**diethylpyrocarbonate.** (DEPC).**Properties:** Colorless liquid; sweet esterlike odor. Refr index 1.395-1.398 (25C). Miscible with ethanol and methanol.**Grade:** FCC.**Hazard:** Toxic. Use in food products prohibited (FDA); irritant to eyes and skin.**Use:** Fermentation inhibitor.**diethylstannium diiodide.** See diethyldiiodostannane.**diethylstilbestrol.** (stilbestrol; DES; 3,4-bis(*p*-hydroxyphenyl)-3-hexene).CAS: 56-53-1. A nonsteroid, synthetic estrogen, always in the *trans* form. It is the most active of the commonly used stilbene compounds.**Properties:** White, crystalline powder; odorless. Mp 169-172C. Almost insoluble in water; soluble in alcohol, chloroform, ether, fatty oils, and dilute alkali hydroxide.**Derivation:** From anethole hydrobromide, from anisole, from anisoin.**Grade:** USP.**Hazard:** A carcinogen. Under USDA regulations, no residues are permitted in tissues of slaughtered animals; not permitted in cattle feeds (FDA).**Use:** Biochemical research, medicine (prevents spontaneous abortion), veterinary medicine.

**diethyl succinate.**CAS: 123-25-1. $(-\text{CH}_2\text{COOC}_2\text{H}_5)_2$.

Properties: Colorless liquid; faint pleasant odor. Bp 216.2C, fp -21C , d 1.0418 (20/20C), wt/gal 8.7 lb (20C), refr index 1.4201 (20C), flash p 230F (OC) (110C). Miscible with alcohol and ether; slightly soluble in water, Combustible.

Use: Plasticizer, intermediate, flavoring.

diethyl sulfate. (ethyl sulfate).CAS: 64-67-5. $(\text{C}_2\text{H}_5)_2\text{SO}_4$.

Properties: Colorless liquid; faint ethereal odor; irritating aftereffects. D 1.1803, bp 208C (decomposes), vap press 0.19 mm Hg (20C), flash p 220F (104.4C), autoign temp 817F (436C), wt/gal 9.8 lb (20C), fp -24.4C , viscosity 1.79 cP (20C). Noncorrosive. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Action of fuming sulfuric acid on ethanol.

Method of purification: Rectification in vacuo.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Ethylating agent in organic synthesis.

diethyl sulfide. See ethyl sulfide.**diethyl tartrate.** $\text{C}_8\text{H}_{14}\text{O}_6(\text{C}_2\text{H}_5)_2$.

Properties: Colorless, thick, oily liquid. Bp 280C, mp 17C, D 1.204 (20/4C). Soluble in water and alcohol. Combustible.

Use: Plasticizer for automobile lacquers; solvent for nitrocellulose, gums, and resins.

***o,o*-diethyl *o*-tetrahydrofurfuryl ester phosphorothioic acid.**CAS: 3513-92-6. mf: $\text{C}_9\text{H}_{10}\text{O}_4\text{PS}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,3-diethylthiourea.CAS: 105-55-5. $\text{C}_3\text{H}_5\text{NHC(S)NHC}_2\text{H}_5$.

Properties: Buff solid. Mp 68–71C. Slightly soluble in water; soluble in methanol, ether, acetone, benzene, and ethyl acetate; insoluble in gasoline.

Use: Inhibitor of corrosion in metal pickling solutions; accelerator; activator in elastomers.

diethyltin chloride. See dichlorodihexylstannane.

diethyltin di(10-camphorsulfonate).CAS: 73940-85-9. mf: $\text{C}_{24}\text{H}_{40}\text{O}_8\text{S}_2\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diethyltin dicaprylate. See diethylbis(octanoyloxy)stannane.

diethyltin diiodide. See di-2-ethylhexyltin dichloride.

diethyltin dioctanoate. See diethylbis(octanoyloxy)stannane.

***N,N*-diethyl-*m*-toluamide.** (deet).CAS: 134-62-3. $\text{CH}_3\text{C}_6\text{H}_4\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid; mild bland odor. Bp 160C (19 mm Hg), d 0.996–1.002 (25/25C), refr index 1.5200–1.5235 (25C). Soluble in water, alcohol, ether, and benzene. Combustible.

Grade: USP.

Hazard: Toxic by ingestion, irritant to eyes and mucous membranes.

Use: Insect repellents, resin solvent, film formers.

***N,N*-diethyl-*m*-toluidine.** $\text{CH}_3\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Light-amber oil. Bp 231C, refr index (20C) 1.5361.

Hazard: See toluidine.

Use: Dye intermediate.

***N,N*-diethyl-*o*-toluidine.** (1-diethylamino-2-methylbenzene). $\text{CH}_3\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Prisms from water. Mp 72.3C, bp 209C. Soluble in water, alcohol, and ether.

Derivation: From *o*-toluidine.

Hazard: See toluidine.

Use: Dye intermediate.

See "DEET" [Reilly].

***O,O*-diethyl-*O*-3,5,6-trichloro-2-pyridyl phosphorothioate.** $\text{Cl}_3\text{C}_5\text{NHOP(S)(OC}_2\text{H}_5)_2$.

Properties: Solid. Mp 41.5–43C. Soluble in acetone, benzene, ether; almost insoluble in water.

Hazard: Cholinesterase inhibitor.

Use: Insecticide.

3,9-diethyl-6-tridecanol. (heptadecanol). $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{C}_2\text{H}_4\text{CH}(\text{OH})\text{C}_2\text{H}_4\text{CH}(\text{C}_2\text{H}_5)_2$.

Properties: White solid. D 0.8475, bp 309C, flash p 310F (154C) (OC), refr index 1.4531 (20C). Insoluble in water. Combustible.

Use: Intermediate for synthetic lubricants, defoamers, and surfactants.

1,1-diethylurea. $\text{NH}_2\text{CON}(\text{C}_2\text{H}_5)_2$. White solid; mp 75C; soluble in water, alcohol, and benzene. When copolymerized with simple urea by the use of formaldehyde, it yields modified resins that differ in

nature from those made from monosubstituted ureas. These resins tend to be permanently thermoplastic.

diethylzinc. (ethylzinc; zinc ethyl; zinc diethyl).

CAS: 557-20-0. $\text{Zn}(\text{C}_2\text{H}_5)_2$. The first known organo-metallic compound.

Properties: Colorless, pyrophoric liquid. D 1.207 (20°C), fp -28°C, bp 118°C. Soluble in most hydrocarbons.

Derivation: Action of ethyl iodide on zinc and sodium-zinc, or by interaction of zinc chloride with triethyl aluminum.

Grade: Technical.

Hazard: Ignites spontaneously on contact with air, dangerous fire hazard, decomposes violently in water.

Use: Organic synthesis, catalyst for polymerization of olefins, high-energy aircraft and missile fuel, production of ethyl mercuric chloride.

differential centrifugation. Separation of cell organelles or other particles of different density by their different rates of sedimentation in a centrifugal field.

differential gravimetric analysis. (DGA).

A variation of differential thermal analysis in which additional information is obtained by determining the rate of change in weight during the heating process.

differential scanning calorimetry. (DSC).

Determines the electrical energy input rate necessary to establish zero temperature difference between a substance and a reference material against either time or temperature as they both are subjected to a controlled temperature change.

differential thermal analysis. (DTA). The

method of precisely measuring the temperature and the rate of temperature change as heat is added to or abstracted from a sample of material that is in a controlled constant environment. The method determines whether the sample is a pure substance or a mixture and yields information about its composition and thermal properties.

differentiation. Specialization of cell structure and function during embryonic growth and development.

diffraction, neutron. An analytical technique analogous to X-ray diffraction, in which an incident beam of neutrons is scattered by the atoms of a crystal. Because elements that are close to each other in the periodic table differ considerably in their neutron-scattering ability, neutron diffraction is capable of distinguishing between them. For example, carbon, nitrogen, and oxygen atoms can be readily identified by neutron diffraction whereas they ap-

pear almost identical by the X-ray method. More accurate determination of the bond lengths of light atoms and distribution of molecular bonding electrons is also possible. Details of molecular structure that can only be inferred by other techniques can often be observed directly by neutron diffraction. Investigations using this method include hydrogen bonding, so-called metal cluster compounds (C-H-M relationships), and electronic charge distributions.

diffraction, X-ray. A method of spectroscopic analysis involving the reflection or scattering of x-radiation by the atoms of a substance (lattice) as the rays pass through it. The rays are reflected by the atoms at an angle that is characteristic of the substance, yielding a spectrum that indicates its atomic or molecular structure. The spectra thus obtained are well defined and specific; from them the properties of elements and the structure of both crystalline and amorphous materials can be obtained. For example, unvulcanized rubber gives an amorphous pattern, while vulcanized rubber is crystalline; the cellulose macromolecule has alternating crystalline and amorphous areas. X-ray diffraction was one of the earliest and most successful methods of instrumental analysis; developed by Bragg and van Laue early in this century, it was used with dramatic effect by Moseley (1912) in establishing the location of several elements in the periodic system.

See lattice; crystal; x-radiation.

diffusion. The spontaneous mixing of one substance with another when in contact or separated by a permeable membrane or microporous barrier. The rate of diffusion is proportional to the concentration of the substances and increases with temperature. Diffusion occurs most readily in gases, less so in liquids, and least in solids. The theoretical principles are stated in Fick's laws. In gases, diffusion takes place counter to gravity, and the rate at which different gases diffuse into a particular gas (e.g., air) is inversely proportional to the square root of the density. For example, carbon dioxide and chlorine vapor will diffuse in air until a uniform mixture results. Diffusion occurs in the cell walls of plants and animals (osmosis). Many substances diffuse through a parchment membrane.

See dialysis; diffusion, gaseous; osmosis.

diffusion current. Limiting current reached by electrolytic migration of ions, in a solution, under the application of a potential difference to the electrodes.

diffusion, gaseous. A technique used for separating the light isotope of uranium (^{235}U) from the heavy isotope (^{238}U). The uranium is allowed to diffuse through a series of microporous barriers whose apertures are of molecular dimensions, in the form of the gas uranium hexafluoride; this is a mix of $^{238}\text{UF}_6$ and $^{235}\text{UF}_6$ in a ratio code of 140:1. Because of

the vastly greater number of the heavier molecules and the extremely small difference in their masses, the mix must pass through a barrier a great many times to obtain a high concentration of the ^{235}U isotope. Assuming that the diffusion rate of two gases through a porous barrier is inversely proportional to the square root of their molecular weights, the ideal separation factor is the square root of the product M_1 times M_2 , where M_2 is the molecular weight of $^{238}\text{UF}_6$, and M_1 that of $^{235}\text{UF}_6$. This method is still in use for uranium enrichment for nuclear fuel.

diffusion layer. The liquid layer around an electrode, within which the electrolyte concentration changes.

diffusion length. A property of materials used in reactors for moderators or reflectors. It is a measure of the distance a thermal neutron diffuses after it is thermalized until it is captured. It is related to the density of the material and to the scattering and absorption cross sections.

diflufenzopyr. See 2-(1-(((3,5-difluorophenyl)amino)carbonyl)hydrazono)ethyl).

diflubenzuron. (*N*-((4-chlorophenyl)aminocarbonyl)-2,6-difluorobenzamide; 1-(4-chlorophenyl)-3-(2,6-difluorobenzoyl)urea).
CAS: 35367-38-5.
Use: Insecticide.

difluophosphoric acid. See difluorophosphoric acid.

2,4-difluoroaniline. $\text{C}_6\text{H}_5\text{F}_2\text{N}$.
Properties: Liquid. Bp 170°C (753 mm Hg), fp -7.5°C , density 10.7 lb/gal, flash p 158F (70°C).
Use: Organic synthesis.

1,1,1-difluorochlorethane. See 1,1,1-chlorodifluoroethane.

difluorochloromethane. See chlorodifluoromethane.

difluorodiazine. FN:NF.
Properties: Gas. Can exist as *cis* and *trans* isomers.
Grade: All *trans* isomer, 95–99.8%.
Hazard: See fluorine.
Use: *trans* form: preparation of ionic fluorine compounds; *cis* form: polymerization initiator.

difluorodibromomethane. See dibromodifluoromethane.

difluorodichloromethane. See dichlorodifluoromethane.

difluorodimethylstannane.
CAS: 3582-17-0. mf: $\text{C}_2\text{H}_6\text{F}_2\text{Sn}$.

Properties: White crystals. Bp: decomp @ $<360^\circ$. Sol in water.
Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

difluorodiphenyltrichloroethane. See DFDT.

1,1-difluoroethane. (ethylidene fluoride).
CAS: 75-37-6. CH_3CHF_2 .
Properties: Colorless, gas; odorless. Bp -24.7°C , fp -117°C , d 1.004 (-25°C), refr index 1.255 (20°C). Insoluble in water.
Derivation: By adding hydrogen fluoride to acetylene.
Grade: Technical, 98%.
Hazard: Flammable, dangerous fire risk. Flammable limits in air 3.7–18%. Narcotic in high concentration.
Use: Intermediate.

1,1-difluoroethylene. (Air) Legal label name for vinylidene fluoride.

difluoromethane. CH_2F_2 .
Properties: Gas. Bp -51.6°C . Soluble in alcohol; insoluble in water. High thermal stability.
Use: Refrigeration, organic synthesis.

difluoromonochloroethane. Legal label name for 1,1,1-chlorodifluoroethane.

difluoromonochloromethane. See chlorodifluoromethane.

2-(1-(((3,5-difluorophenyl)amino)carbonyl)hydrazono)ethyl)-3-pyridinecarboxylic acid, 98.1%.
CAS: 109293-97-2. mf: $\text{C}_{15}\text{H}_{12}\text{F}_2\text{N}_4\text{O}_3$.
Hazard: A reproductive hazard.
Use: Agricultural chemical.

difluorophosphoric acid. (difluorophosphoric acid). HPO_2F_2 .
Properties: Mobile, strongly fuming, colorless liquid. D 1.583 (25/4°C), fp -75°C , bp 116°C. Corrosive to glass and fabric. Noncombustible.
Hazard: When heated, corrosive to tissue.
Use: Chemical polishing agent, protective coatings for metal surfaces, catalyst.

difluron.
CAS: 35367-38-5. $\text{C}_{14}\text{H}_9\text{ClF}_2\text{N}_2\text{O}_2$.
Properties: Solid. Mp 239°C. Sparingly soluble in water.
Hazard: Toxic by ingestion.
Use: Larvicide.

“Difolatan.” See *cis-n*-[1,1,2,2-tetrachloroethyl]thio]-4-cyclohexene-1,2-dicarboximide.

difurylmethane. See 2-(2-furfuryl)furan.

digester. A cylindrical metal vessel, used chiefly in the preparation of wood pulp for papermaking, in which lignin is separated from cellulose by chemical means. It operates at approximately 150 psi and 170C. The wood is fed to the digester in the form of chips, and cooking liquor is added. Standard digesters are 12 ft in diameter and 45 ft high, with a wall thickness of 2 inches. These hold about 20 cords of wood, and some are even larger. The cooking cycle varies from 2.5 hr for board stock to 5 hr for bleached paper. Heat supply is by circulating steam and heat exchanger, though some types have direct steam injection. Digesters are designed for both batch and continuous operation. They are also used in reclaiming fabricated rubber products (tires, boot, and shoe, etc.).
See pulp, paper; digestion (2).

digestion. (1) The physiological processes involved in the assimilation of nutrients from ingested foods by the animal organism. Hydrochloric acid in the gastric juice plays a prominent part, aided by the saliva which initiates carbohydrate breakdown, and bile and pancreatic secretions in the intestine. Numerous types of enzymes catalyze these processes. (2) In chemical engineering, the term refers to several processes: (a) the preferential dissolution of certain mineral constituents in some ore concentrates, (b) the liquefaction of organic waste materials by microbiological action as in activated sludge, (c) the removal of lignin from wood by hot chemical solutions in the manufacture of chemical cellulose and paper pulp, (d) the separation of fabric from scrap tires by hot sodium hydroxide solution in the reclaiming of rubber. The equipment for (c) and (d) is called a digester.
See metabolism; nutrition.

digitalis. A drug obtained from dried leaves of the purple foxglove, native to southern Europe but grown in the U.S. Used in treatment of cardiac diseases, both human and animal. Allergic reactions are infrequent. Contains both digitonin and digitoxin.
Hazard: An overdose can be fatal.

digitonin.
CAS: 11024-24-1. $C_{56}H_{92}O_{29}$. A saponin derived from digitalis seeds.
Use: Determination of cholesterol (an insoluble addition compound is formed), analytical reagent.

digitoxin.
CAS: 71-63-6. $C_{41}H_{64}O_{13}$. Most active glycoside of *Digitalis purpurea*.
Properties: White, leaflets or powder; odorless; bitter taste. Mp 255–256C. Slightly soluble in water or ether; soluble in alcohol.
Derivation: From digitalis leaves, usually *Digitalis purpurea* (foxglove).
Grade: USP.
Hazard: Toxic by ingestion; overdose can be fatal.
Use: Medicine (cardiac treatment).

diglycerol. See polyglycerol.

diglycidyl ether. (DGE; di(2,3-epoxypropyl) ether).
CAS: 2238-07-5. $C_6H_{10}O_3$.
Properties: A colorless liquid; strong, irritating odor. Mw 130.14, d 1.262 (25C), bp 260C, vap d 3.78 (25C), vap press 0.09 mm Hg.
Hazard: A suspected carcinogen. TLV: 0.1 ppm. Severe eye and respiratory tract irritant.
Use: Intermediate.

1,3-diglycidyoxybenzene. See resorcinol diglycidyl ether.

diglycoaldehyde. See inosine dialdehyde.

diglycol. See diethylene glycol.

diglycol acetate. See diethylene glycol diacetate.

diglycol carbamate. (diethylene glycol di-carbamate). $O(CH_2CH_2OCONH_2)_2$.
Properties: White, crystalline solid. Relatively stable to acid hydrolysis, but less stable to basic conditions.
Use: Manufacture of resins.

diglycol chloroformate. [diethylene glycol bis(chloroformate)]. $O(CH_2CH_2OCOCl)_2$.
Properties: Liquid. Bp 125–127C (5 mm Hg), flash p 295F (146C). Soluble in acetone, alcohol, ether, chloroform, and benzene. Combustible.
Use: Preparation of nonvolatile plasticizers or modifying agent.

diglycol chlorohydrin.
CAS: 628-89-7. $ClCH_2CH_2OCH_2CH_2OH$.
Properties: Colorless liquid. D 1.1698, bp 196.8C, flash p 225F (107C), vap press 0.17 mm Hg. Miscible with water. Combustible.
Hazard: Toxic by ingestion and inhalation; an irritant.

diglycolic acid. $O(CH_2COOH)_2$.
Properties: White, crystalline solid. Mp 148C. Soluble in water and alcohol; pH of 10% aqueous solution 1.4. Forms a nonhygroscopic monohydrate at relative humidities above 72% at 25C.
Use: Manufacture of resins and plasticizers, organic synthesis, sequestering agent, emulsion breaker in petroleum.

diglycolic acid, diallyl ester.
CAS: 5441-63-4. mf: $C_{10}H_{14}O_5$.
Hazard: A poison by ingestion. Moderately toxic by skin contact.
Use: Agricultural chemical.

diglycol laurate. (diethylene glycol monolaurate). $C_{11}H_{23}COOC_2H_4OC_2H_4OH$.

Properties: Light-straw-colored, oily liquid; practically odorless. Edible. D 0.96, flash p 290F (143C). Insoluble in water; soluble in methanol, ethanol, toluene, naphtha, and mineral oil; miscible in certain proportions with cottonseed oil, acetone, and ethyl acetate. Combustible.

Derivation: Lauric acid ester of diethylene glycol.
Use: Emulsifying agent for oils and hydrocarbon solvents; emulsions for lubrication, sizing and finishing of textiles, paper, and leather; fluid emulsions of oils for hand lotions, hair dressings, etc.; cutting and spraying oils; dry-cleaning soap base; antifoaming agent.

diglycol methyl ether. See diethylene glycol dimethyl ether.

diglycol monostearate. (diethylene glycol monostearate).

CAS: 106-11-6. $C_{17}H_{35}COOC_2H_4OC_2H_4OH$.

Properties: Small, white flakes

Available forms: Regular or water-dispersible types.
Use: Emulsifier and thickener in cosmetics, mold release lubricant for die casting, temporary binder for ceramics and grinding wheels.

diglycol nitrate. See diethylene glycol dinitrate.

diglycol oleate. (diethylene glycol monooleate). $C_{17}H_{33}COOC_2H_4OC_2H_4OH$.

Properties: Light-red, oily liquid; fatty odor. D 0.93, iodine value 65–75, titer below 0C, pH 7.7–8.2 (25C) (5% aqueous dispersion). Soluble in ethanol, naphtha, ethyl acetate, methanol; partly soluble in cottonseed oil; insoluble in water. Combustible.

Derivation: Oleic acid ester of diethylene glycol.
Use: Emulsifying agent for fluid water-in-oil emulsions for the manufacture of furniture and automobile polish, water-emulsion paints, agricultural sprays.

diglycol phthalate. (diethylene glycol phthalate). $C_6H_4(COOC_2H_4OH)_2$.

Properties: Pale-yellow, liquid resin. D 1.29, saponification value 430–450, acid value 170–175. Soluble in methanol, ethanol, acetone, ethyl acetate; partly soluble in toluene, naphtha, mineral oil, cottonseed oil; insoluble in water. Combustible.

Use: Plasticizer, emulsifier.

diglycol ricinoleate. (diethylene glycol monoricinoleate). $C_{17}H_{32}(OH)COOC_2H_4OC_2H_4OH$.

Properties: Light-yellow liquid. Fp less than –60C, d 0.980 (25C). Soluble in alcohol, acetone, and ethyl acetate; insoluble in water. Combustible.

Use: Plasticizer for high polymers and elastomers.

diglycol stearate. (diethylene glycol distearate). $C_{17}H_{35}COOC_2H_4)_2O$.

Properties: White, waxlike solid; faint fatty odor. Mp 54–55C, d 0.9333 (20/4C). Disperses in hot

water; soluble in hot alcohol, oils, and hydrocarbons. Combustible.

Derivation: Stearic acid ester of diethylene glycol.
Grade: Technical, cosmetic.

Use: Emulsifying agent for oils, solvents, and waxes; lubricating agent for paper and cardboard; suspending medium for powders in the manufacture of polishes, cleaners, and textile delusterants; temporary binder for abrasive powders and clays for ceramic insulation; protective coating for hygroscopic powders; thickening agent; pharmaceuticals.

diglyme. See diethylene glycol dimethyl ether.

digoxin.

CAS: 20830-75-5. $C_{41}H_{64}O_{14}$. A cardiotonic digitalis glycoside.

Properties: Colorless to white crystals, or white, crystalline powder; odorless. Melts at approximately 235C (decomposes). Insoluble in water, chloroform, and ether; soluble in pyridine and dilute alcohol.

Derivation: From the leaves of *Digitalis lanata*.

Grade: USP.

Hazard: See digitalis.

Use: Medicine (cardiac diseases).

diheptyl-*p*-phenylenediamine. See N,N' -bis(1,4-dimethylpentyl)-*p*-phenylenediamine.

dihexadecylamine. See dipalmitylamine.

dihexadecyl ether. See dicetyl ether.

dihexadecyl sulfide. See dicetyl sulfide.

dihexadecyl thioether. See dicetyl sulfide.

dihexyl. See *n*-dodecane.

di-*n*-hexyl adipate. $(-CH_2CH_2COOC_6H_{13})_2$.

Properties: Liquid, colorless, water-white to maximum 100 Pt-Co. D 0.939 (20C), refr index 1.438 (25C), surface tension 32.7 dynes/cm (20C), viscosity 8.8 cP (20C), bp 183–192C (4 mm Hg) (midpoint 191C), flash p 325F (162.7C). Water solubility 0.1% (25C); gasoline and oil solubility complete. Combustible.

Use: Low-temperature plasticizer for SBR elastomers.

di-*n*-hexylamine. $[CH_2(CH_2)_5]_2NH$.

Properties: Water-white liquid. Bp 233–243C, d 0.788 (20/20C), refr index 1.434 (20C), flash p 220F (104.4C). Combustible.

Hazard: Toxic by ingestion and skin absorption.

di-*n*-hexyl maleate.

CAS: 105-52-2. $C_8H_{13}OOCCH:CHCOOC_6H_{13}$.

Properties: Liquid. D 0.9602 (20/20C), bp 179C (10 mm Hg), refr index 1.449 (20C), vap press <0.01

mm Hg (20C), fp -70C , viscosity 10.2 cP (20C). Soluble in water $<0.01\%$ by wt (20C). Combustible.

Use: Preparation of resins.

dihexyl phthalate. See di(2-ethylbutyl) phthalate.

dihexyl sebacate.

Properties: Light-straw-colored liquid. Bp 203C (4 mm Hg), flash p 415F (212C). Combustible.

Derivation: By reacting dodecyl alcohol with sebacic acid.

Use: Plasticizer for vinyl resins.

dihexyltin dichloride. See dichlorodihexylstannane.

dihydrazine sulfate. $(\text{N}_2\text{H}_4)_2 \cdot \text{H}_2\text{SO}_4$

Properties: White, crystalline flakes. Mp approximately 104C, decomposes at approximately 180C. Soluble in water; insoluble in most organic solvents.

Grade: 95% is available commercially.

Hazard: An irritant.

Use: Reducing agent.

dihydric. Containing two hydroxyl groups connected to different carbon atoms, e.g., a dihydric alcohol. Dihydric alcohols are collectively called glycols (diols).

See ethylene glycol.

dihydroabietyl alcohol. (hydroabietyl alcohol). $\text{C}_{19}\text{H}_{31}\text{CH}_2\text{OH}$.

Properties: Solid. D 1.007–1.008, refr index 1.5280, vap press 1.5×10^{-3} mm Hg (25C), mp 32–33C, flash p 375F (190C). Insoluble in water. Combustible.

Use: Plasticizer.

1,8-dihydroacenaphthylene. See acenaphthene.

4,5-dihydro-2-amino-1-((6-chloro-3-pyridinyl)methyl)-1h-imidazole-4,5-diol.

CAS: 200258-64-6. mf: $\text{C}_9\text{H}_{11}\text{ClN}_4\text{O}_2$.

Hazard: A poison.

Use: Agricultural chemical.

2,3-dihydro-1,3-benzoxazine-4h-2-thione-4-one See 2-thio-2h-1,3-benzoxazine-2,4(3h)-dione.

dihydrochalcone. Any of a group of disaccharide sugars having a sweet taste. They are derived from such flavanones as naringin and hesperidin. Research on the conversion of these compounds into acceptable synthetic sweeteners has been in progress for some years.

See flavanone.

dihydrocholesterol. (β -cholestanol; 3- β -hydroxycholestane).

CAS: 360-68-9. $\text{C}_{27}\text{H}_{47}\text{OH}$. A sterol found in the feces.

Properties: White crystals. Mp (monohydrate) 142C, optical rotation $\alpha +23$ (25C) degrees. Soluble in fat solvents; insoluble in water.

Derivation: By a series of oxidation and reduction reactions from cholesterol.

Use: Biochemical research, pharmaceutical preparations.

4,5-dihydro-3-(4-chlorophenyl)-4-methyl-1-(((4-(trifluoromethyl)phenyl)amino)carbonyl)-1h-pyrazole-4-carboxylic acid methyl ester.

CAS: 99832-61-8. mf: $\text{C}_{20}\text{H}_{17}\text{ClF}_3\text{N}_3\text{O}_3$.

Hazard: Moderately toxic by ingestion.

4,5-dihydro-((6-chloro-3-pyridinyl)methyl)-1h-imidazol-2-amine.

CAS: 115970-17-7. mf: $\text{C}_9\text{H}_{11}\text{ClN}_4$.

Hazard: A poison.

Use: Agricultural chemical.

4,5-dihydro-1-((6-chloro-3-pyridinyl)methyl)-2-(nitroamino)-1h-imidazole-4,5-diol.

CAS: 155802-65-6. mf: $\text{C}_9\text{H}_{10}\text{ClN}_5\text{O}_4$.

Hazard: A poison.

Use: Agricultural chemical.

dihydrocoumarin. See benzodihydropyrone.

***n*-((3*s*)-2,3-dihydro-6-(2,6-difluorophenyl)methoxy)-3-benzofuranyl-*n*-hydrourea, *xy*.**

CAS: 162750-10-9. mf: $\text{C}_{16}\text{H}_{14}\text{F}_2\text{N}_2\text{O}_4$.

Hazard: A reproductive hazard.

20,22-dihydrodigitoxin.

CAS: 3786-76-3. mf: $\text{C}_{41}\text{H}_{66}\text{O}_{13}$.

Hazard: Low toxicity.

Source: Natural product.

2,3-dihydro-2,2-dimethyl-7-benzofuranyl (butoxysulfinyl)methylcarbamate.

CAS: 77267-60-8. mf: $\text{C}_{16}\text{H}_{23}\text{NO}_5\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2,3-dihydro-2,2-dimethyl-7-benzofuranyl (butylthio)methylcarbamate.

CAS: 50673-08-0. mf: $\text{C}_{16}\text{H}_{23}\text{NO}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2,3-dihydro-2,2-dimethyl-7-benzofuranyl (dodecylthio)methylcarbamate.

CAS: 50673-09-1. mf: $\text{C}_{24}\text{H}_{39}\text{NO}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2,3-dihydro-2,2-dimethyl-7-benzofuranyl ((4-fluorophenyl)thio)methylcarbamate.CAS: 50802-69-2. mf: C₁₈H₁₈FNO₃S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,3-dihydro-2,2-dimethylbenzofuranyl-7-(methyl)(*t*-butoxyfulfinyl)carbamate.**CAS: 77267-59-5. mf: C₁₆H₂₃NO₃S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,3-dihydro-2,2-dimethyl-7-benzofuranylmethyl((4-nitrophenyl)thio)carbamate.**CAS: 50802-70-5. mf: C₁₈H₁₈N₂O₅S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,3-dihydro-2,2-dimethyl-7-benzofuranyl methyl(phenoxysulfinyl)carbamate.**CAS: 77267-47-1. mf: C₁₈H₁₉NO₃S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,3-dihydro-2,2-dimethyl-7-benzofuranylmethyl(1,1,2,2-tetrachloroethyl)thiocarbamate.**CAS: 50673-06-8. mf: C₁₄H₁₅Cl₄NO₃S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,3-dihydro-2,2-dimethyl-7-benzofuranyl-methyl((trichloromethyl)thio)carbamate.**CAS: 37430-50-5. mf: C₁₃H₁₄Cl₃NO₃S.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**2,5-dihydro-1,2-dimethyl-3-(2-naphthalenyl)-1h-pyrrole, rel-(2*r*,3*r*)-2,3-dihydroxybutanedioate (1:1).**CAS: 326800-80-0. mf: C₁₆H₁₇N•C₄H₆O₆.**Hazard:** A poison.**6-(2,5-dihydro-1,2-dimethyl-1h-pyrrol-3-yl)-2-naphthalenol hydrochloride.**CAS: 326800-75-3. mf: C₁₆H₁₇NO•ClH.**Hazard:** A poison.**9,10-dihydro-9,10-dioxoanthracene-1,8-disulfonic acid, disodium salt.**CAS: 903-46-8. mf: C₁₄H₆O₃S₂•2Na.**Hazard:** Moderately toxic.**6,7-dihydrodipyrido(1,2-*a*:2',1'-*c*)pyrazidinium salt.** See diquat.**9,10-dihydroergocornine.**CAS: 25447-65-8. mf: C₃₁H₄₁N₅O₅.**Hazard:** A reproductive hazard.**dihydroetorphine hydrochloride.**CAS: 155536-45-1. mf: C₂₃H₂₅NO₄•ClH.**Hazard:** A reproductive hazard.**dihydrofolic reductase.** An enzyme acting as an essential catalyst of DNA synthesis.**dihydrogen ferrous EDTA.** See ethylenediaminetetraacetic acid (note).**6,15-dihydrohydroxy-5,9,14,18-anthrazinetetrone.**CAS: 1324-28-3. mf: C₂₈H₁₄N₂O₅.**Hazard:** Moderately toxic.**dihydro-2(3)-imidazolone.** See ethylene urea.**2,3-dihydroindene.** See indan.**1,2-dihydro-4-iodo-1,5-dimethyl-2-phenyl-3h-pyrazol-3-one.** See iodophenazone.**1-((1-(4-(3,4-dihydro-2(1h)-isoquinolinyl)butyl)-1,2,3,4-tetrahydro-7-methyl-2,4-dioxo-3-phenylpyrido(2,3-d)pyrimidin-5-yl)carbonyl)piperidine.**CAS: 272774-96-6. mf: C₃₃H₃₇N₅O₃.**Hazard:** A poison.**2,5-dihydro-3-(6-methoxy-2-naphthalenyl)-1,2-dimethyl-1h-pyrrole, rel-(2*r*,3*r*)-2,3-dihydroxybutanedioate (1:1).**CAS: 326800-79-7. mf: C₁₇H₁₉NO•C₄H₆O₆.**Hazard:** A poison.**4,5-dihydro-*n*-(1-methylethyl)-3-(phenyl-amino)-2h-benz(g)indazole-2-acetamide.**CAS: 301644-18-8. mf: C₂₂H₂₃N₄O.**Hazard:** A poison by ingestion.**4,5-dihydro-6-methyl-4-((3-pyridinylmethylene)amino)-1,2,4-triazin-3(2h)-one, (e)-.**CAS: 123312-89-0. mf: C₁₀H₁₁N₅O.**Hazard:** A poison.**Use:** Agricultural chemical.**4,5-dihydro-*n*-nitro-1-(3-pyridinylmethyl)-1h-imidazol-2-amine.**CAS: 105828-05-5. mf: C₉H₁₁N₅O₂.**Hazard:** A poison.**Use:** Agricultural chemical.**dihydronivalenol.**CAS: 24393-94-0. mf: C₁₅H₂₂O₇.**Hazard:** A poison.**Source:** Natural product.**9,20-dihydro-9-oxoanthracene.** See anthrone.

2,3-dihydroperfluoropentane.CAS: 138495-42-8. mf: $C_5H_2F_{10}$.**Hazard:** Low toxicity by ingestion, inhalation, and skin contact.**2,2-dihydroperfluoropropane.** See

1,1,1,3,3,3-hexafluoropropane.

4-((4,5-dihydro-3-(phenylamino)-2h-benz(g)indazol-2-yl)acetyl)morpholine.CAS: 301644-21-3. mf: $C_{23}H_{24}N_4O_2$.**Hazard:** A poison by ingestion.**4,5-dihydro-3-(phenylamino)-*n*-(phenylmethyl)-2h-benz(g)indazole-2-acetamide.**CAS: 301644-20-2. mf: $C_{26}H_{24}N_4O$.**Hazard:** A poison by ingestion.**dihydrocrotinin.**CAS: 17617-46-8. mf: $C_{15}H_{18}O_6$.**Hazard:** A poison.**3,4-dihydro-1-propyl-4,4,6-trimethyl-2(1h)-pyrimidinethione.**CAS: 18957-53-4. mf: $C_{10}H_{18}N_2S$.**Hazard:** A poison.**2,3-dihydropyran.** C_5H_8O .**Properties:** Colorless, mobile liquid; etherlike odor. Bp 84.3C, fp -70C, d 0.927 (20/4C), refr index 1.4180 (25C), flash p 0F (-17.7C). Soluble in water and alcohol.**Hazard:** Highly flammable, dangerous fire risk. Toxic by ingestion and inhalation.**Use:** Intermediate.**1,2-dihydro-3,6-pyridazinedione.** See maleic hydrazide.**dihydrostreptomycin.** (DHS). $C_{21}H_{41}N_7O_{12}$. A derivative of streptomycin in which the carbonyl group of the streptose portion has been reduced by the addition of two hydrogen atoms. It has antibiotic properties similar to streptomycin, but its toxicity has limited its usefulness for treatment of tuberculosis.**2,5-dihydrothiophene-1,1-dioxide.** (sulfolene). $O_2SCH_2CH:CHCH_2$.**Properties:** Solid. Bp (decomposes), d 1.314 (70C), flash p 235F (112C). Partially soluble in water, acetone, and toluene. Combustible.**1,2-dihydro-2,2,4-trimethylquinoline.** ("Agerite" Resin D). $C_{12}H_{15}N$.**Properties:** Brown pellets or flakes. D 1.03 (25C), melting range 75-100C (initial melt).**Use:** Rubber antioxidant.**dihydroxyacetone.** (DHA; dihydroxypropanone). $HOCH_2COCH_2OH$.**Properties:** Colorless, crystalline solid. Mp 80C. Hygroscopic; soluble in water and alcohol.**Derivation:** Action of sorbose bacterium on glycerol.**Use:** Intermediate, emulsifier, humectant, plasticizers, fungicides, cosmetics (creates synthetic suntan).**2,4-dihydroxyacetophenone.** See 4-acetylresorcinol.**dihydroxyaluminum sodium carbonate.** $Al(OH)_2OOCNa$. White powder.**Derivation:** Reaction of aluminum isopropoxide and an aqueous soluble of sodium bicarbonate.**Use:** Medicine (antacid).**1,3-dihydroxy-2-amino-4-octadecene.** See sphingosine.**1,8-dihydroxyanthranol.** See anthralin.**1,2-dihydroxyanthraquinone.** See alizarin.**1,4-dihydroxyanthraquinone.** See quinizarin.**1,5-dihydroxyanthraquinone.** (anthrarufin). $C_{14}H_6O_2(OH)_2$.**Properties:** Yellow crystals. Mp 280C. Soluble in alcohol; sparingly soluble in water.**Derivation:** By heating anthraquinone with boric acid and sulfuric anhydride.**Use:** Intermediate for alizarin and indanthrene dyes.**1,8-dihydroxyanthraquinone.** (chrysozin; danthron). $C_{14}H_6O_2(OH)_2$.**Properties:** Orange powder or reddish-brown needles. Mp 191C. Soluble in alcohol; sparingly soluble in water.**Derivation:** From 1,8-anthraquinone potassium disulfonate.**Grade:** Technical, NF.**Use:** Dyes, medicine.**1,8-dihydroxy-anthrone.**CAS: 1143-38-0. mf: $C_{14}H_{10}O_3$.**Hazard:** A mild skin irritant.**5,5-dihydroxy barbituric acid.**CAS: 3237-50-1. mf: $C_4H_4N_2O_5$.**Hazard:** Moderately toxic by ingestion.***m*-dihydroxybenzene.** See resorcinol.***o*-dihydroxybenzene.** See pyrocatechol.***p*-dihydroxybenzene.** See hydroquinone.**2,4-dihydroxybenzenecarboxylic acid.** See *β*-resorcylic acid.

2,4-dihydroxybenzoic acid. See β -resorcylic acid.

2,5-dihydroxybenzoic acid. See gentisic acid.

3,5-dihydroxybenzoic acid. See α -resorcylic acid.

2,4-dihydroxybenzophenone.

Properties: Light-yellow, crystalline solid. Mp 142C, bp 194C (1 mm Hg), d 5.8 lb/gal (20C). Insoluble in water; soluble in ethanol, methanol, methyl ethyl ketone, and ethyl acetate.

Use: UV absorber in polymers.

2,5-dihydroxybenzoquinone. $\text{C}_6\text{H}_2(\text{OH})_2\text{O}_2$

Properties: Yellow-orange solid. Mp 216C (decomposes). Soluble in concentrated sulfuric acid; slightly soluble in ethanol, acetone, water, benzene.

Derivation: From hydroquinone.

Hazard: Irritant to eyes and skin.

Use: Metal chelating, insecticides, polymerization inhibitor, tanning agent, dyestuff manufacture.

2,3-dihydroxybutane. See 2,3-butylene glycol.

2,5-dihydroxychlorobenzene. See chlorohydroquinone.

3-(3,4-dihydroxycinnamoyl)quinic acid.
See chlorogenic acid.

dihydroxydiaminomercurobenzene.

$\text{OHNH}_2\text{C}_6\text{H}_3\text{HgC}_6\text{H}_3\text{OHNH}_2$. A mercury compound analogous to arsenamine.

Use: In medicine as a source of mercury.

Hazard: See mercury.

2,2'-dihydroxy-5,5'-dichlorophenylmethane.
See dichlorophene.

dihydroxydiethyl ether. See diethylene glycol.

2,2'-dihydroxy-5,5'-difluorodiphenyl sulfide.
 $\text{FC}_6\text{H}_3(\text{OH})\text{S}(\text{OH})\text{C}_6\text{H}_3\text{F}$

Properties: White, amorphous solid. Mp 119–121C. Soluble in acetone, ether, chloroform, ethanol, ethyl acetate, and glacial acetic acid; moderately soluble in benzene; insoluble in water.

Use: Fungicide (textile, agricultural chemical).

2,4-dihydroxy-3,3-dimethylbutyric acid.
See pantolactone.

***n*-(2,4-dihydroxy-3,3-dimethylbutyryl)- β -alanine.** See pantothenic acid.

5,7-dihydroxydimethylcoumarin. $\text{C}_{11}\text{H}_{10}\text{O}_4$.
Properties and uses closely resemble those of 5,7-dihydroxy-4-methylcoumarin.

dihydroxydiphenylsulfone. (sulfonyl bisphenol). $(\text{C}_6\text{H}_4\text{OH})_2\text{SO}_2$. The commercial product is a mixture of isomers.

Properties: White, free-flowing crystals; odorless. Mp 215–240C. Soluble in alcohol and acetone; insoluble in water.

Grade: Technical.

Use: Electroplating, phenolic resins, polyvinyl chloride, intermediate.

5,5'-dihydroxy-7,7'-disulfonic-2,2'-dinaphthylurea. (6,6'-ureylenebis-1-naphthol-3-sulfonic acid).

Properties: (Crude) Light-gray paste. Soluble in water; very soluble in alkaline solutions.

Derivation: Phosgenation of J acid.

Use: Dye intermediate.

(1*r*,2*s*,3*s*,4*r*)-3,4-dihydroxy-1,2-epoxy-1,2,3,4-tetrahydrodibenz(c,h)acridine.

Hazard: Experimental carcinogenic data reported.

***p*-di-(2-hydroxyethoxy)benzene.** See hydroquinone di(β -hydroxyethyl) ether.

di(2-hydroxyethyl)amine. See diethanolamine.

***N,N*-dihydroxyethyl ethylenediamine.**

Properties: Solid crystals. Mp 98C, bp 196C (10 mm Hg), flash p 355F (179C). Combustible.

Use: Manufacture of textile-finishing assistants.

dihydroxyethyl sulfide. See thiodiglycol.

***N,N*-dihydroxyethyl-*m*-toluidine.**

Properties: Light-gray solid. Mp 62C, distillation range 175–185C (2 mm Hg).

2,2'-dihydroxy-3,5,6,3',5',6'-hexachlorodiphenylmethane. See hexachlorophene.

1,3-dihydroxy-4-hexylbenzene. See hexylresorcinol.

3',4'-dihydroxy-2-(isopropylamino)acetophenone hydrochloride.

$\text{C}_6\text{H}_3(\text{OH})_2\text{COCH}_2\text{NH}(\text{C}_3\text{H}_7)\bullet\text{HCl}$. Light-colored, crystalline powder with a faint odor.

Hazard: Moderately toxic.

Use: Intermediate.

5,8-dihydroxy-3-methoxyxanthone-1-*o*-glucoside. See swertianolin.

3,4-dihydroxy- α -(methylaminomethyl)benzyl alcohol. See epinephrine.

5,7-dihydroxy-4-methylcoumarin.

Properties: Yellow to white solid, fluoresces blue, absorbs UV light. Melting range 270–285C. Insoluble in water, benzene, ether; soluble in alcohol and sodium hydroxide.

Derivation: From phloroglucinol.

Use: In suntan oils as a sunscreen, in wall paints as a whitening agent.

1,1'-dihydroxymethylferrocene.

Properties: Yellow, crystalline solid. Mp 85–86C.

Use: Intermediate.

See ferrocene.

1,3-dihydroxynaphthalene. (naphthoresorcinol). $\text{C}_{10}\text{H}_8(\text{OH})_2$.

Properties: Transparent, crystalline plates. Mp 124–125C. Soluble in alcohol, ether, and water. Combustible.

Derivation: By heating naphthalene-1,3-disulfonic acid with alkali at 230C under pressure.

Grade: Technical, reagent.

Use: Dyes; pharmaceuticals; analytical reagent for sugars, oils, glucuronic acid.

Note: There are several other isomeric forms of dihydroxynaphthalene, (1,5-; 1,6-; 1,7-; 1,8-; 2,3-; 2,6-; 2,7-). They are derived by heating a naphthalene disulfonic acid isomer with caustic soda and are soluble in alcohol and ether, and sparingly soluble in water; mp ranges from 136C (1,6-) to 260C (2,6-).

Use: Organic dyes.

2,8-dihydroxy-3-naphthoic acid.

Properties: Light-green powder. Mp 235–240C. Slightly soluble in hot water; soluble in alcohol and acetone.

Use: Intermediate.

1,8-dihydroxy-10-(1-oxopentyl)-9(10h)-anthracenone.

Hazard: A skin irritant.

L-dihydroxyphenylalanine. (L-dopa). An amino acid used in treating Parkinson's disease, manganese poisoning, and muscular dystonia. Derived from several types of beans including vanilla; also made synthetically.

17- α ,21-dihydroxy-14- α -pregn-4-ene-3,20-dione 21-iodoacetate.

Hazard: A poison.

1,2-dihydroxypropane. See 1,2-propylene glycol

dihydroxypropanone. See dihydroxyacetone.

***n*-(1,3-dihydroxy-2-propyl)valiolamine.**

Hazard: Low toxicity by ingestion. A reproductive hazard.

dihydroxystearic acid. $\text{C}_{17}\text{H}_{33}(\text{OH})_2\text{COOH}.$

Properties: White crystals; odorless; tasteless. Mp 135C. Soluble in alcohol and ether; insoluble in water.

Derivation: By heating dibromide of isooleic acid with silver oxide.

Use: Cosmetics, lotions.

dihydroxysuccinic acid. See tartaric acid.

3,5-dihydroxytoluene. See orcin.

DII. Abbreviation for diesel ignition improver.

diindiol. The reaction product of diacetylene and acetone or another ketone.

diiodoacetylene. (diiodoethyne).

Properties: White crystals; unpleasant odor. Mp 78.5C (decomposes). Light acts upon it, causing a gradual change in color to red and a separation of iodine. Soluble in alcohol, ether, benzene; insoluble in water.

Derivation: By dissolving iodine in liquid ammonia and passing acetylene into the solution.

Hazard: Highly volatile. Toxic by inhalation; vapors irritating to eyes and mucous membranes.

Use: Organic synthesis, military poison.

2,2'-diiododiacetamide.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin irritant.

sym-diiiododibromoethylene. BrIC:ClBr.

Properties: Crystals. Mp 95–96C.

Derivation: Reaction of iodine and dibromoacetylene.

Use: Organic synthesis.

diiiodoethyl sulfide. $(\text{ICH}_2\text{CH}_2)_2\text{S}.$

Properties: Bright-yellow prisms. Mp 62C. Slowly decomposes, the rate being accelerated by light and by heat. Hydrolyzed by alkali solutions. Soluble in alcohol, benzene, ether; insoluble in water.

Derivation: Interaction of dichlorodiethyl sulfide with an acetic acid solution of sodium iodide.

Hazard: Toxic by ingestion and inhalation; strong irritant.

4,4'-diiodofluorescein. (CI 45425A, Solvent #73). $C_{20}H_{10}I_2O_3$.

Properties: Orange powder. Soluble in alcohol; slightly soluble in water.

Use: Dyeing textiles, etc., analytical reagent.

diiodomethane. See methylene iodide.

3,5-diiodosalicylic acid. $I_2C_6H_3(OH)COOH$.

Properties: White to pale-pink, crystalline powder. Slightly soluble in water.

Use: Source of iodine for animal nutrition.

diiodothyronine. (3,5-diiodothyronine).

$HOC_6H_4OC_6H_3I_2CH_2CH(NH_2)COOH$. A thyronine derivative that is an intermediate obtained in the manufacture of synthetic thyroxine, also probably an intermediate in the synthesis of thyroxine by the thyroid gland.

diisobutyl adipate. (DIBA).

CAS: 141-04-8. $[C_2H_5COOCH_2CH(CH_3)_2]_2$.

Properties: Colorless liquid; odorless. D 0.950 (25C), bp 278–280C, fp –20C, wt/gal 7.95 lb, acidity (as adipic acid) less than 0.05%. Compatible with most natural and synthetic polymers. Soluble in most organic solvents; insoluble in water. Combustible.

Use: Plasticizer.

diisobutylaluminum chloride. (DIBAC).

CAS: 1779-25-5. $[(CH_3)_2CHCH_2]_2AlCl$.

Properties: Colorless liquid. Bulk d 0.905, fp –39.5C.

Derivation: Reaction of isobutylene and hydrogen with aluminum chloride.

Hazard: Strong irritant to tissue.

Use: Polyolefin catalyst.

diisobutylaluminum hydride. (DIBAL-H).

CAS: 1191-15-7. $[(CH_3)_2CHCH_2]_2AlH$.

Properties: Colorless liquid. Pyrophoric. Fp –80C, bulk d 0.798, bp 105C (0.2 mm Hg). Miscible with hydrocarbon solvents; dilute solutions nonpyrophoric.

Derivation: Reaction of isobutylene and hydrogen with aluminum.

Hazard: Ignites spontaneously in air, dangerous fire risk.

Use: Reducing agent in pharmaceuticals.

diisobutylamine.

CAS: 110-96-3. $[(CH_3)_2CHCH_2]_2NH$.

Properties: Water-white liquid. D 0.745 (20C), boiling range 136–140C, amine odor, flash p 85F (29.4C).

Hazard: Flammable, moderate fire risk. Toxic by ingestion.

Use: Intermediate.

diisobutylcarbinol. See 2,6-dimethyl-4-heptanol.

diisobutyl carbinyl acetate. See *n*-nonyl acetate.

diisobutylene. A group of isomers of the formula C_4H_8 , of which 2,4,4-trimethylpentene-1 and 2,4,4-trimethylpentene-2 are the most important, since they are formed in appreciable amounts when isobutene (isobutylene) is polymerized.

Properties: Colorless liquids. D 0.7227 (15.5C), boiling range 101–104C, flash p 20F (–6.6C).

Hazard: Fire risk. Narcotic in high concentrations. **Use:** Alkylation, intermediate, antioxidants, surfactants, lubricant additive, plasticizers, rubber chemicals.

α -diisobutylene. See 2,4,4-trimethylpentene-1.

β -diisobutylene. See 2,4,4-trimethylpentene-2.

diisobutyl ketone. (2,6-dimethyl-4-heptanone).

CAS: 108-83-8. $(CH_3)_2CHCH_2COCH_2CH(CH_3)_2$.

Properties: Colorless liquid; stable; mild odor. D 0.8089 (20/20C), bp 168.1C, vap press 1.7 mm Hg (20C), flash p 140F (60C), bulk density 6.7 lb/gal (20C), fp –41.5C, coefficient of expansion 0.00101 K^{-1} (20C). Miscible with most organic liquids; immiscible with water. Combustible.

Grade: Technical.

Hazard: Toxic. TLV: 25 ppm.

Use: Solvent for nitrocellulose, rubber, synthetic resins; lacquers; coating compositions; organic synthesis; roll-coating inks; stains.

diisobutyloxostannane.

CAS: 61947-30-6. mf: $C_8H_{18}OSn$.

Hazard: A poison by ingestion. An eye and severe skin irritant. TWA 0.1 $mg(Sn)/m^3$; STEL 0.2 $mg(Sn)/m^3$ (skin).

diisobutyl phenol. See octyl phenol.

diisobutyl phthalate.

CAS: 84-69-5. $C_6H_4[COOCH_2CH(CH_3)_2]_2$.

Properties: Liquid. Refr index 1.4900 (25C), d 1.040 (20/20C), flash p 385F (196C), bp 327C. Combustible.

Use: Plasticizer.

diisobutyl sodium sulfosuccinate.

$C_{12}H_{21}NaO_7S$.

Properties: The commercial product is a mixture of three esters in the form of a fine, white powder; quite soluble in water and glycerol; insoluble in acetone, benzene, and carbon tetrachloride; surface tension of 1% water solution is 50 dynes/cm.

Hazard: Irritant to eyes, skin, and mucous membranes.

Use: Surfactant, emulsifier.

diisobutyltin oxide. See diisobutylloxostannane.

diisocyanate. An organic compound with two isocyanate groups ($-\text{NCO}$), formed by treating diamines, (e.g., toluene-2,4-diamine, hexamethylene-diamine, *p,p'*-diaminodiphenylmethane) with phosphine. Combustible.

Use: Production of polyurethane foams and elastomers, in phenol-formaldehyde resins to improve water and alkali resistance; bonding rubber to rayon or nylon.

See polyurethane.

1,3-diisocyanatomethylbenzene polymer with Niax E 488.

CAS: 87177-09-1.

Hazard: A Moderately toxic by skin contact.

diisodecyl adipate. (DIDA).

$\text{C}_{10}\text{H}_{21}\text{OOC}(\text{CH}_2)_4\text{COOC}_{10}\text{H}_{21}$.

Properties: Light-colored, oily liquid; mild odor. D 0.918 (20/20C), fp -71C , boiling range 239–246C (4 mm Hg), refr index 1.450 (25C), bulk d 7.5 lb/gal, flash p 225F (107.2C). Insoluble in glycerol, glycols, and some amines; soluble in most other organics. Combustible.

Use: Primary plasticizer for polymers.

diisodecyl-4,5-epoxytetrahydrophthalate.

(“Flexol” PEP). $\text{OC}_6\text{H}_8(\text{COOC}_{10}\text{H}_{21})_2$.

Properties: Liquid. D 0.9867 (20/20C), bulk density 8.2 lb/gal, pour p 38C, oxirane oxygen 3%. Combustible.

Use: Plasticizer-stabilizer resistant to fungi, in vinyl plastics for outdoor use.

diisodecyl phthalate. (DIDP).

$\text{C}_6\text{H}_4(\text{COOC}_{10}\text{H}_{21})_2$.

Properties: Clear liquid; mild odor. D 0.966 (20/20C), fp -50C , bp 250–257C (4 mm Hg), refr index 1.483 (25C), viscosity 108 cP (20C), bulk density 8 lb/gal, flash p 450F (232C). Insoluble in glycerol, glycols, and some amines; soluble in most other organics. Combustible.

Grade: Technical.

Hazard: An irritant.

Use: Plasticizer.

See: di-(C9-C11 alkyl) phthalate.

diisononyl adipate.

$[\text{C}_9\text{H}_{19}\text{OOC}(\text{CH}_2)_4\text{COOC}_9\text{H}_{19}]_n$. A low-volatility plasticizer based on isononyl alcohol. Combustible.

diisononyl phthalate.

CAS: 68515-48-0.

Hazard: A reproductive hazard.

diisononyltin dichloride. See bis(trimethylhexyl)tin dichloride.

diisooctyl acid phosphate.

CAS: 27215-10-7. $(\text{C}_8\text{H}_{17})_2\text{HPO}_4$.

Hazard: Irritant to skin and eyes.

diisooctyl adipate. (DIOA).

$\text{C}_8\text{H}_{17}\text{OOC}(\text{CH}_2)_4\text{COOC}_8\text{H}_{17}$.

Properties: A light-straw-colored liquid; mild odor. D 0.924 (25C), bp 214–226C (4 mm Hg), fp $>75\text{C}$, flash p 370F (187C). Combustible.

Use: Plasticizer, especially at low temperatures.

diisooctyl azelate. (DIOZ).

$\text{C}_8\text{H}_{17}\text{OOC}(\text{CH}_2)_2\text{COOC}_8\text{H}_{17}$. Liquid diester of azelaic acid, bp 237C (5 mm Hg), pour p -85F , acid number 1.0, viscosity (min) 3.2 cs (210F), d 0.92 (20C), flash p 415F (212C). Combustible.

Use: Plasticizer for vinyl resins, base for synthetic lubricants.

diisooctyl phthalate. (DIOP).

CAS: 27554-26-3. $(\text{C}_8\text{H}_{17}\text{COO})_2\text{C}_6\text{H}_4$. Isomeric esters obtained from phthalic anhydride and the mixed octyl alcohols made by the Oxo process.

Properties: Nearly colorless, viscous liquid; mild odor. Bp 370C, d 0.980–0.983 (20/20C), bulk d 8.20 lb/gal (20C), flash p 450F (232C). Insoluble in water; compatible with vinyl chloride resins and some cellulosic resins. Combustible.

Grade: Technical.

Use: Plasticizer for vinyl, cellulosic and acrylate resins, and synthetic rubber.

See isooctyl alcohol.

diisooctyl sebacate. (DIOS).

$\text{C}_8\text{H}_{17}\text{OOC}(\text{CH}_2)_2\text{COOC}_8\text{H}_{17}$.

Properties: Liquid. D 0.915 (25/25C), flash p 440F (226C), pour p -40C , viscosity 24 cP (20C), bulk d 7.65 lb/gal. Combustible.

Use: Plasticizer.

diisopentylloxostannane.

CAS: 63979-62-4. mf: $\text{C}_{10}\text{H}_{22}\text{OSn}$.

Hazard: A poison by ingestion. An eye and severe skin irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diisopentyltin oxide. See diisopentylloxostannane.

diisopropyl. See 2,3-dimethylbutane.

diisopropanolamine. (DIPA).

$(\text{CH}_3\text{CH}_2\text{OCH}_2)_2\text{NH}$.

Properties: White, crystalline solid. D 0.9890 (45/20C), bp 248.7C, bulk d 8.2 lb/gal (45C), vap press 0.02 mm Hg (42C), mp 42C, viscosity 1.98 cP (45C), flash p 260F (126C). Miscible with water. Combustible.

Use: Emulsifying agents for polishes, textile specialties, leather compounds, insecticides, cutting oils, and water paints.

diisopropylamine.CAS: 108-18-9. $[(\text{CH}_3)_2\text{CH}]_2\text{NH}$.

Properties: Colorless, volatile liquid; amine odor. Bp 84.1C, fp -96.3C, d 0.7178 (20/20C), bulk d 6.0 lb/gal (20C), refr index 1.3924 (20C), flash p 30F (-1.11C) (OC). Slightly soluble in water; soluble in most organic solvents.

Derivation: From isopropyl chloride and ammonia.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion, inhalation, and skin absorption. TLV: 5 ppm.

Use: Intermediate, catalyst.

diisopropylaminoethanol. See *N,N*-diisopropylethanolamine.

2-(diisopropylamino)ethyl chloride hydrochloride. See 2-chloroethyldiisopropylamine hydrochloride.

 β -diisopropylaminoethyl chloride hydrochloride. (DIC).
 $[(\text{CH}_3)_2\text{CH}]_2\text{NCH}_2\text{CH}_2\text{Cl}\cdot\text{HCl}$.

Use: Organic synthesis especially for introduction of the β -diisopropylaminoethyl radical.

***m*-diisopropylbenzene.**

Properties: Colorless liquid. D 0.8559 (20/4C), fp -63C, bp 231C, refr index 1.4883 (20C), flash p 170F (76.6C), autoign temp 840F. Insoluble in water; miscible with alcohol, ether, acetone, benzene, and carbon tetrachloride. Combustible.

Use: Solvent, intermediate.

***p*-diisopropylbenzene.**

Properties: White solid. Mp 64C, d 0.8568 (20/4C), bp 210C, refr index 1.4898 (20C). Insoluble in water; miscible with alcohol, ether, acetone, benzene, and carbon tetrachloride. Combustible.

Use: Solvent, intermediate.

diisopropylbenzene hydroperoxide.

Available forms: A 52% solution in a nonvolatile solvent. Colorless to pale-yellow liquid, strong oxidizing agent.

Hazard: Dangerous fire risk in contact with organic materials.

***N,N*-diisopropylbenzothiazyl-2-sulfenamide.**
 $\text{C}_6\text{H}_4\text{NC}[\text{SN}(\text{C}_3\text{H}_7)_2]\text{S}$. Rubber accelerator.

diisopropyl carbinol. (2,4-dimethylpentanol-3). $[(\text{CH}_3)_2\text{CH}]_2\text{CH}_2\text{O}$.

Properties: Colorless liquid. Bp 140C, fp approximately -70C, bulk density 6.9 lb/gal, flash p 120F (48.9C). Combustible.

Hazard: Moderate fire risk.

Use: Solvent, organic synthesis (intermediate), denaturant.

diisopropyl cresol. Antioxidant or stabilizer in medicine (external).

See isopropyl cresol.

***N,N'*-diisopropylldiamidophosphoryl fluoride.** (mipafox).
 $(\text{CH}_3)_2\text{CHNHP}(\text{F})\text{NHCH}(\text{CH}_3)_2$.

Hazard: Cholinesterase inhibitor. TLV: (F) 2.5 mg/m³.

Use: Insecticide.

diisopropyl dixanthogen. $(\text{C}_7\text{H}_7\text{OCS}_2)_2$.

Properties: Yellow to greenish pellets. D 1.28, mp 52C (min), purity 98% (min). Insoluble in water; soluble in ethyl alcohol, acetone, benzene, and gasoline.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Modifier in polymerization reactions, additive for lubricants, flotation reagent, fungicide, weed killer.

***N,N*-diisopropylethanolamine.** (diisopropylaminoethanol). $[(\text{CH}_3)_2\text{CH}]_2\text{NCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. D 0.8742 (20C), vap press 0.08 mm Hg (20C), fp -39.3C, bp 191C, flash p 175F (79.4C). Slightly soluble in water. Combustible.

Hazard: Strong irritant to tissue.

Use: Organic synthesis.

diisopropyl ether. See isopropyl ether.

diisopropyl fluorophosphate. (DFP; isofluorophate).

CAS: 55-91-4. $[(\text{CH}_3)_2\text{CHO}]_2\text{POF}$. Oily liquid, forms hydrogen fluoride in the presence of moisture. One member of a series of compounds, the fluorophosphate alkyl esters, characterized by extremely high toxicity, marked mitotic effects noted even in concentrations that are chemically undetectable.

Hazard: Cholinesterase inhibitor.

Use: Insecticide.

3,5-diisopropyl-4-hydroxyphenyl methylcarbamate. See methylcarbamic acid 4-hydroxy-3,5-diisopropylphenyl ester.

diisopropyl ketone. (2,4-dimethylpentanone-3). $[(\text{CH}_3)_2\text{CH}]_2\text{CO}$.

Properties: Colorless liquid. Bp 123.7C, bulk d 6.9 lb/gal.

Use: Solvent.

2,6-diisopropyl-naphthalene. $C_{16}H_{20}$.

Properties: Clear, yellowish-brown liquid; faint, sweet odor. Boiling range 290–295C; flash p 284F (140C) (COC); d 0.95 (30C); bulk density 7.9 lb/gal; insoluble in water. Combustible.

Hazard: Avoid inhalation of vapors and prolonged skin contact.

Use: Organic intermediate.

diisopropyl oxide. See isopropyl ether.

diisopropylloxostannane.

CAS: 23668-76-0. mf: $C_6H_{14}OSn$.

Properties: Solid. Insol in water.

Hazard: A poison by ingestion. An eye and severe skin irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diisopropyl peroxydicarbonate. (isopropyl

percarbonate; isopropyl peroxydicarbonate; IPP). CAS: 105-64-6.

$(CH_3)_2CHOC(O)OOC(O)OCH(CH_3)_2$.

Properties: Colorless, crystalline solid. D 1.080 (15.5/4C), mp 8–10C, refr index 1.4034 (20C). Almost insoluble in water; miscible with aliphatic and aromatic hydrocarbons, esters, ethers, chlorinated hydrocarbons.

Derivation: By reaction of sodium peroxide with isopropyl chloroformate.

Grade: Stabilized and unstabilized.

Hazard: Spontaneous decomposition at room temperature releases flammable and corrosive products; dangerous fire hazard; explodes on heating. Store in open containers at low temperature with adequate ventilation.

Use: Low-temperature polymerization catalyst.

2,6-diisopropylphenol. $C_6H_3OH[CH(CH_3)_2]_2$.

Properties: Light-straw-colored liquid. Fp 18C, d 0.955 (20C), bp 242C, flash p 240F (115.5C). Soluble in toluene and alcohol; insoluble in water. Combustible.

Use: Intermediate for synthetic polymers, plasticizers, surface-active agents.

diisopropyl-*p*-phenylenediamine.

$H_3C_2NHC_6H_4NHC_2H_5$.

Properties: Dark-red liquid. D 0.88. Soluble in alcohol.

Use: Gasoline antioxidant and sweetener (permissible for aviation gasoline, ASTM D910-64T).

***o,o*-diisopropylthiolphosphoric acid.** See isopropyl phosphorothioate.

N,N'-diisopropylthiourea.

$CH_3(CH_2)CHNHCSNHCH(CH_3)_2$.

Properties: Grayish-white solid. Mp 138.5–142.5C.

Slightly soluble in water; soluble in methanol, acetone, and ethyl acetate, insoluble in ether, benzene and gasoline.

Use: Corrosion inhibitor; metal pickling with hydrochloric acid or sulfuric acid, for reducing corrosion of ferrous metals and aluminum alloys in brine; intermediate.

diisopropyltin dichloride.

CAS: 38802-82-3. mf: $C_6H_{14}Cl_2Sn$.

Properties: Colorless crystals. Sol in water. Mp: 84°

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diisopropyltin oxide. See diisopropylloxostannane.

o,o-diisopropyl-*s*-tricyclohexyltin phosphorodithioate.

CAS: 49538-98-9. mf: $C_{24}H_{47}O_2P_2S_2Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dikaryotic. Having two different and distinct nuclei per cell; found in the fungi. A dikaryotic individual is called a dikaryon.

diketene. (acetyl ketene).

CAS: 674-82-8.

$CH_2=C(CH_3)C(O)O$.

Properties: Colorless, nonhygroscopic liquid; pungent odor. Readily polymerizes on standing. D 1.096 (20/20C), fp -7.5C, bp 127.4C, flash p 93F (33.9C) (TOC). Soluble in common organic solvents

Derivation: By spontaneous polymerization of ketene obtained by thermal decomposition of acetone or from bromoacetyl bromide and zinc.

Hazard: Flammable, moderate fire risk. An irritant.

Use: Production of acetoarylamides, pigments and toners, pesticides, food preservatives, pharmaceutical intermediates.

diketobutane. See diacetyl.

2,5-diketohexane. See acetylacetone.

2,5-diketopyrrolidone. See succinimide.

2,5-diketotetrahydrofuran. See succinic anhydride.

Dilan. A 1:2 mix of Proilan and Bulan used as an insecticide.

Hazard: Toxic.

dilatancy. A system is said to be dilatant if its rate of increase of strain decreases with increased shear. Among the better-known systems exhibiting dilatant behavior are pastry doughs, highly pigmented

paints, and many other industrially important materials. Dilatancy is usually associated with suspension, especially those containing high a concentration of suspended matter, which is often of colloidal dimensions.

“**Dilaudid**” [*Abbott*]. Proprietary name for the drug dihydromorphine hydrochloride.

dilaurylamine. (didodecylamine). $(C_{12}H_{25})_2NH$. **Properties:** Liquid. Mp 45C, d 0.89. Almost insoluble in water.

Use: Chemical intermediate.

dilauryl ether. (didodecyl ether). $(C_{12}H_{25})_2O$. **Properties:** Liquid. Mp 33C, bp 190–195C (1 mm Hg), d 0.8147 (33/4C). Combustible.

Grade: 95% (min) purity.

Use: Electrical insulators, water repellents, lubricants for plastic molding and processing, antistatic substances, chemical intermediates.

dilauryl phosphite. $(C_{12}H_{25}O)_2PHO$.

Properties: Water-white liquid. Combustible.

Use: Synthesis of organophosphorus compounds for extreme-pressure lubricants, adhesives, textile finishing agents, pesticides; catalyst in polymerization of unsaturated compounds.

dilauryl sulfide. (didodecyl thioether).

$(C_{12}H_{25})_2S$.

Properties: Liquid. Mp 40–40.5C, bp 260–263C (4 mm Hg), d 0.8275 (40/4C). Combustible.

Grade: 95% (min) purity.

Use: Organic synthesis (formation of sulfonium compounds).

dilauryl thiodipropionate. (didodecyl-3,3'-thiodipropionate; thiodipropionic acid, dilauryl ester). $(C_{12}H_{25}OOCCH_2CH_2)_2S$.

Properties: White flakes having sweetish odor. Mp 40C, d 0.975 (solid 25C). Insoluble in water; soluble in most organic solvents; extremely resistant to heat and hydrolysis. Combustible.

Grade: FCC.

Use: Antioxidant, additive for high-pressure lubricants and greases, plasticizer and softening agent, antioxidant for edible fats and oils (up to 0.02% oil content).

dilinoleic acid. $C_{34}H_{62}(COOH)_2$.

Properties: Light-yellow, viscous liquid; slight odor. D 0.921 (100C), refr index 1.4851 (40C), iodine value 80. Combustible.

Use: Modifier in alkyd and polyamide resins, polyester or metallic soap for petroleum additive, emulsifying agent, adhesives, shellac substitute, to upgrade drying oils.

dilithium *n*-acetyl-*l*-aspartate.

CAS: 32093-26-8. mf: $C_6H_7NO_5 \cdot 2Li$.

Hazard: A poison.

dilithium sodium phosphate. Li_2NaPO_4 . A commercial source of lithium found in Searles Lake brine.

dilituric acid. See 5-nitrobarbituric acid.

dill oil. See dill seed oil, American type.

dill oil, Indian type. See dill seed oil, Indian type.

dill seed oil, American type.

Properties: From steam distillation of the stalks, leaves, and seeds of *Anethum graveolens* L. Yellowish liquid. D: 0.884–0.900, refr index: 1.480 @ 20°. Sol in propylene glycol; insol in glycerin.

Use: Food additive.

dill seed oil, Indian type.

Properties: From steam distillation of the dried ripe fruit of *Anethum sowa* D.C. (Fam. *Umbelliferae* (FCC III). Yellowish liquid; harsh caraway odor and taste. D: 0.925–0.980, refr index: 1.486 @ 20°. Sol in fixed oils and mineral oil; sltly sol in propylene glycol; insol in glycerin.

Use: Food additive.

diluent. (1) An ingredient used to reduce the concentration of an active material to achieve a desirable and beneficial effect. Examples are combination of diatomaceous earth with nitroglycerin to form the much less shock-sensitive dynamite; addition of sand to cement mixes to improve workability with no serious loss of strength; addition of an organic liquid having no solvent power to a paint or lacquer to reduce viscosity and achieve suitable application properties.

See thinner).

(2) Low-gravity materials used primarily to reduce cost, e.g., blown asphalt, wood floc, etc., in rubber and plastic mixes. In this sense, there is no clear distinction between a diluent and an extender.

(3) An ingredient of rocket fuels, such as helium, hydrazine, or hydrogen.

dilution ratio. (hydrocarbon tolerance). The maximum number of unit volumes of hydrocarbon that can be added per unit volume of active solvent to cause the first trace of gelation to occur, when the concentration of nitrocellulose in the solution is 8 g/100 mL. This may be used to evaluate the solvent power of active solvents by comparing them with a standard hydrocarbon, or to evaluate hydrocarbon solvents by comparing them with an active solvent. See solvent; lacquer.

dimagnesium orthophosphate. See magnesium phosphate, dibasic.

dimagnesium phosphate. See magnesium phosphate, dibasic.

dimedone. (1,1-dimethyl-3,5-diketocyclohexane). $(\text{CH}_3)_2\text{C}_6\text{H}_8\text{O}_2$.

Properties: Greenish-yellow needles or prisms. Mp 148–149C. Slightly soluble in cold water and naphtha; soluble in alcohol, chloroform, benzene.

Use: Reagent for the detection of ethyl alcohol and the identification of aldehydes.

dimefox. (bis(dimethylamino) fluorophosphate; tetramethyldiamidophosphoric fluoride; BFPO).

CAS: 115-26-4. $[(\text{CH}_3)_2\text{N}]_2\text{POF}$.

Properties: Liquid; fishy odor. D 1.1151 (20/4C), bp 67C (4.0 mm Hg) 86C (15 mm Hg), refr index 1.4267 (20C). Soluble in water, ether, benzene.

Hazard: Cholinesterase inhibitor, use may be restricted. TLV: 2.5 mg(F)/m³.

Use: A systemic pesticide primarily for ornamental and non-food plants.

dimenhydrinate. (2-(benzohydroxy)-*N,N*-dimethylethylamine-8-chlorotheophyllinate; "Dramamine").

CAS: 523-87-5. $\text{C}_{17}\text{H}_{22}\text{NO}\cdot\text{C}_7\text{H}_6\text{ClN}_4\text{O}_2$.

Properties: White, crystalline powder; odorless. Mp 102–107C, pH (saturated solution) 6.8–7.3. Freely soluble in alcohol and chloroform; soluble in benzene; sparingly soluble in ether; slightly soluble in water.

Grade: USP.

Hazard: Can cause drowsiness. Driving and using machinery may be hazardous.

Use: For prevention and treatment of nausea and vomiting in relation to motion sickness. It can also be used for some balance disorders of the inner ear, e.g., Merniere's disease.

"Dimension" [General Electric]. TM for Nylon 6 alloy.

Use: Injection and blow molding and extrusion.

dimer. An oligomer whose molecule is composed of two molecules of the same chemical composition. For example, 1,4-dioxane is a dimer of ethylene oxide. A dimer acid is a high molecular-weight dibasic acid that is liquid (viscous), stable, and resistant to high temperatures, and polymerizes with alcohols and polyols to yield a variety of products such as plasticizers, lubricating oils, hydraulic fluids. It is produced by dimerization of unsaturated fatty acids at mid-molecule and usually contains 36 carbons. Trimer acid, which contains three carboxyl groups and 54 carbons, is similar. See polymer.

dimercaprol. USP name for 2,3-dimercaptopropanol.

2,3-dimercaptopropanol. (BAL; British Anti-Lewisite; dimercaprol; 1,2-diethioglycerol). CAS: 59-52-9. $\text{CH}_2(\text{SH})\text{CH}(\text{SH})\text{CH}_2\text{OH}$.

Properties: Colorless, oily, viscous liquid; strong odor of mercaptans. Bp 80C (1.9 mm Hg) 140C (40

mm Hg), mp 77C, d 1.2385 (25/4C), refr index 1.5720 (25C). Soluble in vegetable oils; moderately soluble in water with decomposition; soluble in alcohol.

Derivation: Bromination of allyl alcohol followed by reaction with NaSH.

Grade: USP, as dimercaprol.

Use: Antidote to Lewisite, organic arsenicals, and heavy metals.

dimerized fat acids, residual. The acids obtained by heat polymerization of methyl esters of semidrying oils, removal of unpolymerized monomers, and saponification of residual esters. It consists chiefly of mixture of polymers of linoleic acid.

dimetan. (5,5-dimethyldihydroresorcinol dimethylcarbamate). $\text{C}_{11}\text{H}_{17}\text{NO}_3$.

Properties: Yellow crystals. Mp 43–45C. Slightly soluble in water and oils; readily soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide, especially for aphids.

dimethazone. See 2-(2-chlorobenzyl)-4,4-dimethyl-1,2-oxazolidin-3-one.

dimethicone. $\text{CH}_3[\text{Si}(\text{CH}_3)_2\text{O}]_n\text{Si}(\text{CH}_3)_3$.

Properties: Colorless silicone oil consisting of dimethylsiloxane polymers (range in viscosity from 0.65 to 1,000,000 centistokes at room temperature). Viscosity grades higher than 50 centistokes are immiscible with water, miscible with chloroform, and ether.

Use: Ointments and topical drug ingredient, skin protectant.

dimethisoquin hydrochloride. (3-butyl-1-(2-dimethylaminoethoxy)isoquinoline hydrochloride).

$\text{CH}_3(\text{CH}_2)_2\text{CH}_2\text{C}_9\text{H}_9\text{NOCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2\cdot\text{HCl}$.

Properties: White powder; odorless; bitter numbing taste. Mp 144–147C. Freely soluble in alcohol; soluble in water; pH (1% solution) 3.5–5.0.

Grade: NF.

Use: Medicine (topical anesthetic).

dimethoate. (*O,O*-dimethyl-*S*-(*N*-methylcarbamoylmethyl) phosphorodithioate).

CAS: 60-51-5. $(\text{CH}_3\text{O})_2\text{PSSCH}_2\text{CONHCH}_3$.

Properties: White solid. Mp 51–52C. Moderately soluble in water; soluble in most organic solvents except hydrocarbons.

Hazard: A cholinesterase inhibitor; use has been restricted.

Use: Insecticide (dry formulations not permitted).

dimethoxane. (6-acetoxy-2,4-dimethyl-*m*-dioxane).

CAS: 828-00-2. $\text{CH}_3\text{COOC}_4\text{H}_8\text{O}_2(\text{CH}_3)_2$.

Properties: Clear-yellow to light-amber liquid. D 1.069–1.076 (25/25C), refr index 1.431–1.438

(20C), bp 66–68C (3 mm Hg), fp <–25C. Soluble in or miscible with water and organic solvents. Combustible.

Use: Preservative for cosmetics, inks, emulsions; gasoline additive.

1,2-dimethoxy-4-allylbenzene. See methyl eugenol.

2,5-dimethoxyaniline. $\text{NH}_2\text{C}_6\text{H}_3(\text{OCH}_3)_2$.

Properties: Gray flakes. Mp 69–73C. Insoluble in cold water; soluble in organic solvents and hot water.

Hazard: See aniline.

Use: Intermediate for dyes, pharmaceuticals, and insecticides; antioxidant.

1,2-dimethoxybenzene. See veratrole.

1,3-dimethoxybenzene. See resorcinol dimethyl ether.

1,4-dimethoxybenzene. See hydroquinone dimethyl ether.

2,3-dimethoxybenzaldehyde.

CAS: 86-51-1. mf: $\text{C}_9\text{H}_{10}\text{O}_3$.

Hazard: A poison by ingestion.

2,5-dimethoxybenzaldehyde.

$(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CHO}$.

Properties: Flaked solid. Mp 46–49C. Soluble in organic solvents; insoluble in water. Combustible.

Use: Organic synthesis.

dimethoxybenzidine. See dianisidine.

3,3'-dimethoxybenzidine-4,4'-diisocyanate.

See dianisidine diisocyanate.

3,4-dimethoxybenzyl alcohol.

$\text{C}_6\text{H}_3(\text{OCH}_3)_2\text{CH}_2\text{OH}$.

Properties: Viscous, brown liquid or low-melting solid. Combustible.

Use: Organic synthesis.

2,4-dimethoxy-5-chloroaniline.

$\text{NH}_2(\text{Cl})\text{C}_6\text{H}_2(\text{OCH}_3)_2$.

Properties: Violet-gray crystals. Mp 70–71C. Insoluble in water; soluble in alcohol, benzene, and other organic solvents.

Grade: 98.5%.

Hazard: See aniline.

Use: Intermediate for dyes and other organics.

dimethoxydimethylsilane.

CAS: 1112-39-6. mf: $\text{C}_4\text{H}_{12}\text{O}_2\text{Si}$.

Hazard: Low toxicity by inhalation. A moderate eye irritant.

***p,p'*-dimethoxydiphenylamine.**

$(\text{CH}_3\text{OC}_6\text{H}_4)_2\text{NH}$. A rubber antioxidant.

1,2-dimethoxyethane. See ethylene glycol dimethyl ether.

(2-dimethoxyethyl) adipate.

$\text{CH}_3\text{OC}_2\text{H}_4\text{OOC}(\text{CH}_2)_4\text{COOC}_2\text{H}_4\text{OCH}_3$.

Properties: Liquid. D 1.075 (25C), refr index 1.439 (25C), bp 185–190C (11 mm Hg), fp –16C. Slightly soluble in water. Combustible.

Use: Plasticizer.

di(2-methoxyethyl) phthalate. (DMEP).

CAS: 117-82-8. $\text{C}_6\text{H}_4(\text{COOCH}_2\text{CH}_2\text{OCH}_3)_2$.

Properties: Oily liquid; mild odor. D 1.172 (20/20C), bp 340C, fp –45C, flash p 381F (194C) (OC). Combustible.

Use: Plasticizer, especially for cellulose acetate; solvent.

1-(3,5-dimethoxy-4-hydroxycinnamoyl)-4-hexahydroazepinylcarbonylmethylpiperazine.

CAS: 57061-77-5. mf: $\text{C}_{23}\text{H}_{33}\text{N}_3\text{O}_5$.

Hazard: Moderately toxic by ingestion.

4-(3,5-dimethoxy-4-hydroxycinnamoyl)-*n*-propyl-1-piperazineacetamide.

CAS: 57061-73-1. mf: $\text{C}_{20}\text{H}_{29}\text{N}_3\text{O}_5$.

Hazard: Moderately toxic by ingestion.

7,8-dimethoxyisoquinoline.

CAS: 16503-95-0. mf: $\text{C}_{11}\text{H}_{11}\text{NO}_2$.

Hazard: A poison by ingestion.

dimethoxymethane. See methylal.

2,5-dimethoxy-4-methylamphetamine.

(STP; DOM). A hallucinogenic, habit-forming drug, used in medicine; manufacture and use controlled by law in the U.S.

See amphetamine.

3,4-dimethoxy-3',4'-methylenedioxy stilbene.

CAS: 76306-39-3. mf: $\text{C}_{17}\text{H}_{16}\text{O}_4$.

Hazard: Moderately toxic by ingestion.

2,5-dimethoxymethylamphetamine. See STP (hallucinogen).

dimethoxymethylsilane. See methyl dimethoxysilane.

3,4-dimethoxyphenethylamine. See homoveratrylamine.

3,4-dimethoxyphenylacetic acid. See homoveratric acid.

3-((2-((2-(3,4-dimethoxyphenyl)ethyl)amino)-2-oxoethyl)amino)-*n*-methylbenzamide.

CAS: 104775-36-2. mf: $\text{C}_{20}\text{H}_{25}\text{N}_3\text{O}_4$.

Hazard: Low toxicity by ingestion.

2,6-dimethoxyphenyllithium.

Properties: White to tan, free-flowing, pyrophoric powder. Moderately soluble in toluene and benzene; slightly soluble in ethyl ether; stable indefinitely in sealed containers.

Hazard: Ignites spontaneously in air.

1-(3,4-dimethoxyphenyl)-2-nitro-1-propene.

Properties: Yellow crystals. Mp 68–75C.

Use: Intermediate.

3-(dimethoxyphosphinyloxy)-N,N-dimethyl-cis-crotonamide.

Properties: Brown liquid. Bp 400C. Miscible with water, ethanol, xylene; very slightly soluble in kerosene.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Insecticide.

dimethoxystrychnine. See brucine.**dimethoxytetraglycol.** (tetraethylene glycol dimethyl ether; bis(2-methoxyethoxyethyl ether; tetraglyme).

Properties: Water-white, liquid; practically odorless. D 1.0132 (20/20C), bp 275.8C, 189C (100 mm Hg), vap press <0.01 mm Hg (20C), flash p 285F (141C), bulk density 8.4 lb/gal (20C), fp –29.7C, viscosity 0.0405 cP (20C), coefficient of expansion 0.00091 (20C). Stable; soluble in hydrocarbons and water. Combustible.

Grade: Technical.

Use: Solvent.

dimethrin. Generic name for 2,4-dimethylbenzyl-2,2-dimethyl-3-(2-methylpropenyl)cyclopropane carboxylate (2,4-dimethylbenzyl chrysanthemumate).

Properties: Amber liquid. D 0.986 (20C), bp 175C (3.8 mm Hg). Insoluble in water; soluble in petroleum hydrocarbons, aromatic petroleum derivatives, alcohols, and methylene chloride; decomposed by strong alkali.

Hazard: Toxic by ingestion.

Use: Insecticide.

dimethyl. See ethane.**dimethylacetal.** (ethylidenedimethyl ether).

Properties: Colorless liquid; strongly aromatic odor. Soluble in water, alcohol, ether, and chloroform. D 0.848 (25C), bp 62–63C, flash p approximately 80F (26.6C).

Derivation: By heating acetaldehyde with methyl alcohol and glacial acetic acid and distilling.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion and inhalation.

Use: Medicine, organic synthesis.

N,N-dimethyl acetamide. (DMAC).

Properties: Colorless liquid. Bp 166C, d 0.9366 (25C), refr index 1.4351 (25C), flash p 171F (77C). Miscible with water, aromatics, esters, ketones, and ethers. Combustible.

Derivation: From acetic anhydride and dimethylformamide.

Grade: Technical, high-purity certified.

Hazard: Toxic by inhalation, absorbed by skin, strong irritant. TLV: TWA 10 ppm (skin); not classifiable as a human carcinogen.

Use: Solvent for plastics, resins, gums and electrolytes; intermediate; catalyst; paint remover; high purity solvent for crystallization and purification.

N,N-dimethylacetacetamide.

Properties: Liquid. Bp 220C, d 1.048–1.053 (20/20C), refr index 1.4379 (20C), flash p 252F (122C) (COC). Miscible with water and organic solvents. Combustible.

Use: Chemical intermediate.

2,4-dimethylacetophenone.

Properties: Colorless liquid; odor of mimosa. D 0.994–0.997, refr index 1.532–1.534. Soluble in four volumes of 60% alcohol. Combustible.

Use: Perfumery, flavoring.

dimethylacetyl chloride. See isobutyric acid chloride.**dimethylacetylene.** See crotonylene.**2,5-dimethyl-3-acetylfuran.** See 3-acetyl-2,5-dimethylfuran.**dimethylallyl.** See 2,5-dimethylhexadiene-1,5.**dimethylamine.** (DMA).

Properties: (Anhydrous) Gas with ammoniacal odor. (25% Water solution) d 0.6865 (–6C), bp 6.88C, fp –92.2C, flash p 0F (–17.7C), bulk density approximately 7.8 lb/gal; soluble in alcohol and ether, autoign temp (anhydrous) 806F (430C).

Derivation: Interaction of methanol and ammonia over a catalyst at high temperatures. The mono-, di-, and trimethylamines are all produced.

Method of purification: Azeotropic or extractive distillation.

Grade: Technical (anhydrous, 25%, and 40% aqueous solutions), 99%.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2.8–14%. Irritant. TLV: TWA 5 ppm;

STEL 15 ppm; not classifiable as a human carcinogen

Use: Acid-gas absorbent, solvent antioxidants, manufacture of dimethylformamide and dimethylacetamide, dyes, flotation agent, gasoline stabilizers, pharmaceuticals, textile chemicals, rubber accelerators, electroplating, dehairing agent, missile fuels, pesticide propellant, rocket propellants, surfactants, reagent for magnesium.

dimethylamine-epichlorohydrin copolymer.

CAS: 25988-97-0.

Use: Food additive.

n'-dimethylaminoacetylpartricin a dimethylaminoethylamide diasparrat.

CAS: 143563-20-6. mf: $C_7H_7NO_4 \bullet 1/2 C_{67}H_{103}N_5O_{19}$.

Hazard: A poison.

dimethylaminoaniline. See *p*-aminodimethylaniline.

dimethylaminoazobenzene. (methyl yellow; butter yellow).

CAS: 60-11-7. $C_6H_5NNC_6H_4N(CH_3)_2$.

Properties: Yellow, crystalline leaflets. Mp 116C. Soluble in alcohol, ether, strong mineral acids, and oils; insoluble in water.

Derivation: Action of benzenediazonium chloride on dimethyl aniline.

Hazard: Toxic by inhalation and skin absorption. A carcinogen. May not be used in foods or beverages (FDA).

Use: Organic research, indicator, dyes.

p-dimethylaminobenzaldehyde.

CAS: 100-10-7. $C_6H_4[N(CH_3)_2]CHO$.

Properties: Yellow, crystalline plates. Mp 73C, bp 176–177C (17 mm Hg). Soluble in alcohol and ether. Combustible.

Derivation: By mixing dimethylaniline, anhydrous chloral, and phenol, and allowing the mixture to stand. The phenol is removed by shaking with dilute caustic soda, and the residue dissolved in water and hydrochloric acid and crystallized.

Grade: Technical, reagent.

Hazard: Toxic by ingestion.

Use: Dyes, medicine, reagent.

dimethylaminobenzene. See xylidine.

p-dimethylaminobenzene diazonium chloride, zinc chloride double salt. See

p-diazodimethylaniline; zinc chloride double salt.

p-dimethylaminobenzenediazo sodium sulfonate. ("Dexon").

CAS: 140-56-7. $(CH_3)_2NC_6H_4NNSO_3Na$.

Properties: Solid. Melts with decomposition above 200C. Soluble in water.

Hazard: Toxic by ingestion.

Use: Fungicide for protection of germinating seed and seedlings.

3-dimethylaminobenzoic acid.

$(CH_3)_2NC_6H_4COOH$.

Properties: Pale-yellow crystals. Mp 147–153C.

Use: Intermediate.

8-((dimethylamino)carbonyl)-5-oxo-2,4,9-trimethyl-6,11-dioxo-3-thia-2,4,7,10-tetraazadodeca-7,9-dienoic acid, 2,3-dihydro-2,2-dimethyl-7-benzofuranyl ester.

CAS: 90293-54-2. mf: $C_{21}H_{29}N_5O_6S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

8-((dimethylamino)carbonyl)-5-oxo-2,4,9-trimethyl-6,11-dioxo-3-thia-2,4,7,10-tetraazadodeca-7,9-dienoic acid, 1-naphthalenyl ester.

CAS: 90293-53-1. mf: $C_{21}H_{25}N_5O_6S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

8-((dimethylamino)carbonyl)-5-oxo-2,4,9-trimethyl-6,11-dioxo-3-thia-2,4,7,10-tetraazadodeca-7,9-dienoic acid, 4-nonylphenyl ester.

CAS: 90293-55-3. mf: $C_{26}H_{41}N_5O_6S$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

n-((8-((dimethylamino)carbonyl)-2,4,9-trimethyl-1,5-dioxo-6,11-dioxo-3-thia-2,4,7,10-tetraazadodeca-7,9-dien-1-yl)oxy)-ethanimidothioic acid, methyl ester.

CAS: 90293-52-0. mf: $C_{14}H_{21}N_6O_6S_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dl-dimethylamino-4,4-diphenyl-3-heptanone hydrochloride. See methadone hydrochloride.

3-(dimethylamino)-1-(2,2-diphosphonoethyl)pyrazinium inner salt.

CAS: 203264-12-4. mf: $C_6H_{15}N_3O_6P_2$.

Hazard: A reproductive hazard.

2-dimethylaminoethanol. (deanol; dimethylethanolamine).

CAS: 108-01-0. $(CH_3)_2NCH_2CH_2OH$.

Properties: Colorless liquid; amine odor. Bp 134.6C, fp –59.0C, d 0.8879 (20/20C), bulk density 7.4 lb/gal (20C), refr index 1.4300 (20C), flash p 105F (40.5C) (OC). Miscible with water, acetone, ether, and benzene. Combustible.

Derivation: Prepared from ethylene oxide and dimethylamine.

Grade: Anhydrous and 70% aqueous solution.

Hazard: Moderate fire risk.

Use: Intermediate in the synthesis of dyestuffs, textile auxiliaries, pharmaceuticals, and corrosion inhibitors; curing epoxy, amine, and polyamide resins; emulsifier in paints and coatings.

β -dimethylaminoethyl chloride hydrochloride. (DMC).

$(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{Cl}\cdot\text{HCl}$.

Use: Manufacture of antihistamines and other pharmaceuticals. Organic intermediate for introduction of β -dimethylaminoethyl radical.

2-(dimethylamino)ethylhydrazine. See 2-hydrazino-*n,n*-dimethylethanamine.

dimethylaminoethyl methacrylate.

$\text{CH}_2=\text{C}(\text{CH}_3)\text{COOCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.

Properties: Liquid. D 0.933 (25C), bp 182–190C, refr index 1.4376 (25C), flash p 165F (73.9C) (TOC). Combustible.

Hazard: Irritant to skin, eyes, and mucous membranes; strong lachrymator.

Use: Binders for coatings, textile chemicals, dispersing agents for nonaqueous systems, antistatic agents, stabilizers for chlorinated polymers, ion-exchange resins, emulsifying agents, cationic precipitating agents.

2-(2-(dimethylamino)ethyl)pyridine hydrochloride.

CAS: 25877-27-4. mf: $\text{C}_9\text{H}_{14}\text{N}_2\cdot\text{ClH}$.

Hazard: A poison.

5-(2'-(*n,n*-dimethylamino)-2'-methyl)ethyl-10,11-dihydro-5h-dibenz(b,f)azepine.

CAS: 2064-23-5. mf: $\text{C}_{19}\text{H}_{24}\text{N}_2$.

Hazard: A poison.

dimethylaminomethyl phenol.

$\text{C}_6\text{H}_4\text{OHCH}_2\text{N}(\text{CH}_3)_2$. Exists as *o*-, *m*- and *p*-isomers; the commercial material is a mixture of *o*- and *p*-.

Properties: Dark-red liquid; phenolic odor, free of methylamine. D 1.010 (25/25C), refr index 1.530 (25C), distillation range 80–130C (2 mm Hg), water content (Karl Fischer) 0.5%. Soluble in organic solvents; moderately soluble in water.

Hazard: See phenol.

Use: Antioxidants, stabilizers, catalysts, intermediates.

4-dimethylamino-3-methylphenolmethyl carbamate (ester).

$(\text{CH}_3)_2\text{NC}_6\text{H}_3(\text{CH}_3)\text{OOCNHCH}_3$.

Properties: Tan, crystalline solid. Mp 93–94C. Slightly soluble in water; moderately soluble in aromatic solvents; unstable in highly alkaline media.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

2-(dimethylamino)-*n*-(((methyl((2-phenyl-1,3-dioxan-5-yl)methoxy)

sulfinyl)amino)carbonyloxy)-2-oxoethanimidothioic acid, methyl ester.

CAS: 81862-00-2. mf: $\text{C}_{18}\text{H}_{25}\text{N}_3\text{O}_7\text{S}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dimethylaminonaphthalenesulfonyl chloride.

See dansyl chloride.

5-dimethylamino-1-naphthalene sulfonyl chloride. See dansyl chloride.

2-(dimethylamino)-2-oxoethyl-*n*-(((methylamino)carbonyloxy)ethanimidothioate.

CAS: 92065-83-3. mf: $\text{C}_8\text{H}_{15}\text{N}_3\text{O}_3\text{S}$.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

2-dimethylamino-1-phenylpropane. See *n,n,\alpha*-trimethylphenethylamine.

5-dimethylamino-3-piperidinoacetylindole.

CAS: 24955-83-7. mf: $\text{C}_{13}\text{H}_{16}\text{N}_2\text{O}$.

Hazard: A poison.

1-dimethylamino-2-propanol.

$(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{OCH}_3$.

Properties: Water-white liquid; amine odor. Bp 125.6C, d 0.850 (20/20C), refr index 1.421 (20C), flash p 90F (32C). Soluble in water and most organic solvents.

Hazard: Flammable, moderate fire risk.

Use: Organic synthesis.

3-dimethylaminopropylamine.

$(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Colorless liquid. Bp 123C, fp –70C (sets to a glass below this temperature), d 0.8100 (30C), refr index 1.4328 (25C), flash p 95F (35C) (TCC). Soluble in water and organic solvents.

Hazard: Flammable, moderate fire risk. Toxic by ingestion and inhalation, strong irritant.

Use: Curing agent for epoxy resins, organic intermediate.

1-dimethylamino-2-propyl chloride. (β -dimethylaminoisopropyl chloride).

$(\text{CH}_3)_2\text{NCH}_2\text{CHClCH}_3$.

Properties: Yellow liquid that darkens with age. Distillation range 113–120C, refr index 1.422–1.423 (25C).

Use: Intermediate.

1-dimethylamino-3-propyl chloride.

(DMPC). $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{Cl}$.

Use: Intermediate for pharmaceutical and organic synthesis.

α -(3-(dimethylamino)propyl)-5-(1,1-dimethylethyl)-1-phenyl-1h-pyrazole-4-

methanol.CAS: 296269-50-6. mf: $C_{10}H_{20}N_3O$.**Hazard:** A poison by ingestion. **α -(3-(dimethylamino)propyl)-1,5-diphenyl-1h-pyrazole-4-methanol.**CAS: 296269-51-7. mf: $C_{21}H_{25}N_3O$.**Hazard:** A poison by ingestion.**1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride.** See EDC (reagent). **α -(3-(dimethylamino)propyl)-5-ethyl-1-phenyl-1h-pyrazole-4-methanol.**CAS: 296269-47-1. mf: $C_{17}H_{25}N_3O$.**Hazard:** A poison by ingestion.**dimethylaminopropylmethacrylamide.**(DMAPMA). $H_2C=C(CH_2COOCH_2N(CH_3)_2)$ **Properties:** Pale-yellow liquid. Flash p 140C (CC), refr index 1.4763, d 0.94, bulk density 7.8 lb/gal.**Use:** Reactive cationic monomer, incorporation of amine group into polymers. **α -(3-(dimethylamino)propyl)-5-(1-methylethyl)-1-phenyl-1h-pyrazole-4-methanol.**CAS: 296269-49-3. mf: $C_{18}H_{27}N_3O$.**Hazard:** A poison by ingestion. **α -(3-(dimethylamino)propyl)-5-methyl-1-phenyl-1h-pyrazole-4-methanol.**CAS: 296269-46-0. mf: $C_{16}H_{23}N_3O$.**Hazard:** A poison by ingestion. **α -(3-(dimethylamino)propyl)-1-phenyl-5-propyl-1h-pyrazole-4-methanol.**CAS: 296269-48-2. mf: $C_{18}H_{27}N_3O$.**Hazard:** A poison by ingestion. **α -(3-(dimethylamino)propyl)-1-phenyl-1h-pyrazole-4-methanol.**CAS: 296269-45-9. mf: $C_{15}H_{21}N_3O$.**Hazard:** A poison by ingestion.**2-dimethylaminopyridine.**CAS: 5683-33-0. mf: $C_7H_{10}N_2$.**Hazard:** A poison.**4-dimethylamino-3,5-xylyl-N-methyl carbamate.** $(CH_3)_2N(CH_2)_2C_6H_2OOCNHCH_3$.**Properties:** White, crystalline solid. Mp 85C. Almost insoluble in water; soluble in benzene, alcohol, and chloroform.**Hazard:** Toxic by ingestion.**Use:** Systemic insecticide.***N,N*-dimethylaniline.** (aniline, *N,N*-dimethyl).CAS: 121-69-7. $C_8H_9N(CH_3)_2$.**Properties:** Yellowish to brownish, oily liquid. D

0.954, mp 2.5C, bp 192.5–193.5C, flash p 145F (62.7C) (CC), refr index 1.5582, autoign temp 700F (370C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By heating a mixture of aniline, aniline hydrochloride, and methyl alcohol (free from acetone) in an autoclave and distilling.**Grade:** Technical, reagent, 99.9% pure.**Hazard:** Toxic material absorbed by skin. TLV: TWA 5 ppm; STEL 10 ppm (skin); not classifiable as a human carcinogen.**Use:** Dyes, intermediates, solvent, manufacture of vanillin, stabilizer (acid acceptor), reagent.**2-(3,4-dimethylanilino)-2-oxazoline.** See 3,4-xylidino-2-oxazoline.**dimethyl anthranilate.** (*N*-methyl methyl anthranilate).CAS: 85-91-6. $CH_3OOCCH_2NHCH_3$.**Properties:** Colorless or pale-yellow liquid; grape-like odor. D 1.132–1.138 (15C), refr index 1.578–1.581 (20C). Soluble in three volumes or more of 80% alcohol, and in benzyl benzoate, diethyl phthalate, fixed oils, mineral oils, and volatile oils; insoluble in glycerol; slightly soluble in propylene glycol. Congealing p 18C (4% impurity) to 10C (20% impurity). Combustible.**Derivation:** Methylation of methyl anthranilate or esterification of *N*-methylantranilic acid.**Use:** Perfumes, flavorings, and drugs.**dimethylarsinic acid.** See cacodylic acid.**2,2'-dimethyl-2,2'-azodibutyronitrile.** See 2,2'-azobisisovaleronitrile.**1,2-dimethylbenzene.** See *o*-xylene.**1,3-dimethylbenzene.** See *m*-xylene.**1,4-dimethylbenzene.** See *p*-xylene.**3,3-dimethylbenzidine.** See *o*-tolidine.**dimethylbenzylcarbonyl acetate.** See α,α -dimethylphenethyl acetate.**2,5-dimethylbenzyl chloride.** (2,5-dimethyl- α -chlorotoluene; α -chloro-*p*-xylene). $C_6H_3(CH_3)_2CH_2Cl$.**Properties:** Colorless to pale-yellow liquid; sharp pungent odor. D 1.035–1.045 (25/25C), bp 221–226C, refr index 1.5350–1.5360 (25C). Soluble in alcohols and ethers; insoluble in water. Combustible.**Hazard:** Irritant to eyes and mucous membranes, a lachrymator.**Use:** Intermediate for pharmaceuticals, dyes, perfumes, plasticizers, resins, wetting agents, germicides, etc.

2,4-dimethylbenzyl chrysanthemumate.

See dimethrin.

 α,β -dimethylbenzyl hydroperoxide. See cumene hydroperoxide.**dimethylbenzyl phosphonate.** $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{CH}_2\text{C}_6\text{H}_5$.**Properties:** Water-white liquid. Bp 114C (0.75 mm Hg).**Use:** Extraction of mineral salts from special solutions, fire-retardant, low-temperature plasticizer.**3,3'-dimethyl-4,4'-biphenylene diisocyanate.**(4,4'-bi-*o*-tolylene diisocyanate).**Properties:** Flaked, white, crystalline solid. Mp 69C min. Assay 98% min.**Use:** High-strength elastomers, coatings, rigid plastics.***n,n'*-dimethyl-4,4'-bipyridinium dibromide.**

See paraquat dibromide.

1,1'-dimethyl-4,4'-bipyridinium salt. See paraquat.**dimethylbis(phenylthio)stannane.** See bis(phenylthio)dimethyltin.**dimethyl brassylate.** $\text{CH}_3\text{OOC}(\text{CH}_2)_{11}\text{COOCH}_3$. An ester of a 13-carbon saturated aliphatic dibasic acid. Waxy, low-melting solid, made by an ozone oxidation process.**Use:** Preparation of ethylene brassylate, a synthetic musk; chemical intermediate.**2,3-dimethyl-1,3-butadiene.** C_6H_{10} .**Properties:** Dark liquid. Bp 70C, fp -76C, d 0.727, refr index 1.43.**Derivation:** Shale oil fractions, by distillation of pinacol.**Use:** Manufacture of elastomers.**2,2-dimethylbutane.** See neohexane.**2,3-dimethylbutane.** (diisopropyl).CAS: 79-29-8. $(\text{CH}_3)_2\text{CHCH}(\text{CH}_3)_2$.**Properties:** Colorless liquid. D 0.9700, bp 202.4C, fp -12.8C, bulk density 8.1 lb/gal. Very soluble in water. Combustible.**1,3-dimethyl butanol.** See amyl methyl alcohol.**2,3-dimethylbutene-1.** $\text{CH}_3\text{CH}(\text{CH}_3)\text{C}(\text{CH}_3)=\text{CH}_2$.**Properties:** Liquid. Fp -157.27C, bp 55.6C, d 0.678 (20/4C); bulk density 5.68 lb/gal (60F), refr index 1.390 (20C), flash p -20F (-28.9C).**Hazard:** Flammable, dangerous fire and explosion risk.**Use:** Perfume synthesis, isomerization reactions.**2,3-dimethylbutene-2.** $\text{CH}_3\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_3$.**Properties:** Liquid. Fp -74.3C, bp 73.2C, d 0.708 (20.4C), bulk density 5.94 lb/gal (60F), refr index 1.412 (20C), flash p 0F (-17.7C).**Hazard:** Flammable, dangerous fire and explosion risk.**Use:** Isomerization reactions.***n,n*-dimethylbutylamine.** See butyldimethylamine.**2,4-dimethyl-6-tert-butyl phenol.** $(\text{CH}_3)_2\text{C}_6\text{H}_2\text{OH}[\text{C}(\text{CH}_3)_3]$.**Properties:** A low-viscosity, straw-colored liquid. D 0.961. Readily soluble in gasoline and oils. Combustible.**Use:** Antiskinner; antioxidant, mainly for gasoline (ASTM D91064T).**dimethylcadmium.** $\text{C}_2\text{H}_6\text{Cd}$.**Properties:** Liquid; unpleasant odor. Fp -4.0C, bp 105C, d 1.98, refr index 1.54. Soluble in hydrocarbon solvents.**Hazard:** Explodes on heating to 150C, pyrophoric.**Use:** Polymerization catalyst, organic synthesis.**dimethylcarbamoyl chloride.** (dimethylcarbonyl chloride).CAS: 79-44-7. $(\text{CH}_3)_2\text{NCOCl}$.**Properties:** A colorless liquid that hydrolyzes rapidly. Bp 165C, fp -33C, d 1.67.**Hazard:** TLV: A suspected human carcinogen and a strong lachrymator.**Use:** Chemical intermediate in production of dyes, pharmaceuticals, and pesticides.**dimethylcarbate.** (*cis*-dimethyl ester-5-norbornene-2,3-dicarboxylic acid).CAS: 5826-73-3. $\text{C}_{11}\text{H}_{14}\text{O}_4$. Generic name for bicyclo(2,2,1)-5-heptene-2,3-dicarboxylic acid dimethyl ester.**Properties:** Clear, oily liquid or crystalline solid. D 1.165 (35/4C). Insoluble in water.

Derivation: Esterification of Diels-Alder condensation product of maleic anhydride and cyclopentadiene.

Hazard: Toxic by ingestion and inhalation.

Use: Insect repellent.

dimethylcarbinol. See isopropyl alcohol.

dimethylcarbonate. Legal label name for methyl carbonate.

dimethylchloroacetal.

(chloroacetaldehydedimethylacetal).

$\text{ClCH}_2\text{CH}(\text{OCH}_3)_2$.

Properties: Colorless liquid with a pleasant odor. Boiling range 126–132C, flash p 110F (43.3C), d 1.082–1.092 (25/4C), refr index 1.4110–1.4130 (25C), purity 97% (min), bulk density 9.07 lb/gal. Combustible.

Grade: Technical.

Hazard: Moderate fire risk.

Use: Organic synthesis, pharmaceuticals, solvent.

dimethylchloroacetoacetamide. See 2-chloro-*n,n*-dimethyl-3-oxobutanamide.

2,5-dimethyl- α -chlorotoluene. See 2,5-dimethylbenzyl chloride.

dimethylchlortetracycline hydrochloride.

$\text{C}_{21}\text{H}_{27}\text{ClN}_4\text{O}_6 \cdot \text{HCl}$.

Properties: Yellow, crystalline powder; odorless; bitter taste. Partially soluble in water; slightly soluble in alcohol.

Grade: NF.

Use: Medicine (antibiotic)

dimethyl *l*-curine dimethiodide. See *n,n',o,o'*-tetramethylcurinium diiodide.

dimethyl cyanamide. $(\text{CH}_3)_2\text{NCN}$.

Properties: Colorless, mobile liquid. Fp –41C, d 0.876, bp 160C, flash p 160F (71.1C) (TCC). Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Chemical intermediate, solvent.

dimethylcyclohexane. (hexahydroxylene).

Mix of *o*-, *m*-, and *p*-isomers. $\text{C}_6\text{H}_{10}(\text{CH}_3)_2$.

Properties: Water-white liquid; mild odor. D 0.776 (15/15C), boiling range 120–129C, fp <–65C, flash p approximately 50F (10C) (CC). Soluble in most common solvents; almost insoluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Synthesis, special solvent.

Note: There are several isomers of dimethylcyclohexane, i.e., 1,3-; 1,4-; *cis*-1,2-; *trans*-1,2-. They have properties and uses closely similar to those given above. All are flammable.

dimethyl-1,4-cyclohexane dicarboxylate.

$\text{CH}_3\text{OOC}\text{C}_6\text{H}_{10}\text{COOCH}_3$.

Properties: Partially crystalline solid. D 1.102 (35/4C), consists of approximately 60% *cis* and 40% *trans* isomers, bp (mixed isomer) 265C, bulk density 9.18 lb/gal (20C). Soluble in all proportions in most organic solvents.

Use: Plasticizers, polymers.

***N,N*-dimethylcyclohexylamine.**

$(\text{CH}_3)_2\text{NC}_6\text{H}_{11}$.

Properties: Water-white liquid. Distilling range 157–160C, d 0.8490 (20/20C), fp approximately –77C, flash p 110F (43.3C) (COC). Partly soluble in water; miscible with alcohol, benzene, acetone. Combustible.

Hazard: Moderate fire risk.

Use: Catalyst for polyurethane foams, intermediate for rubber accelerators, treatment of textiles.

1,2-dimethylcyclopentane. $\text{C}_5\text{H}_8(\text{CH}_3)_2$.

Properties: Colorless liquid. *cis*: bp 99.5C, d 0.772 (20C); *trans*: bp 91.8C, d 0.751 (20C). Combustible.

Grade: Technical.

Use: Organic synthesis.

dimethyl dialkyl ammonium chloride.

Use: Food additive.

2,2'-dimethyl-1,1'-dianthraquinone.

$\text{C}_{30}\text{H}_{18}\text{O}_4$.

Properties: Yellow crystals. Mp 365–367C. Soluble in hot nitrobenzene, aniline, and chlorobenzene.

Use: Dye intermediate.

2,5-dimethyl-2,5-di(*tert*-butylperoxy)hexane.

$\text{C}_4\text{H}_9\text{OOC}(\text{CH}_3)_2\text{CH}_2\text{CH}_2\text{C}(\text{CH}_3)_2\text{OOC}_4\text{H}_9$.

Properties: Stable, colorless liquid. Bp 50–52C (0.1 mm Hg), active oxygen 10.5% min, fp 8C, flash p 185F (85C). Soluble in alcohol; insoluble in water. Combustible.

Hazard: Strong oxidizer, may ignite organic materials. Irritant to eyes and skin.

Use: Catalyst in polyethylene cross-linking, styrene polymerization, polyester resins.

dimethyl dicarbonate.

CAS: 4525-33-1. mf: $(\text{CH}_3\text{OCO})_2\text{O}$.

Properties: Bp: 44–47° @ 5 mm.

Use: Food additive; fungicide.

dimethyldichlorosilane. (dichlorodimethylsilane).

CAS: 75-78-5. $(\text{CH}_3)_2\text{SiCl}_2$.

Properties: Colorless liquid. Bp 70C, fp –86C, d 1.062 (20C), refr index 1.4023 (25C), flash p 16F (–8.9C) (COC). Reacts with water to form complex mixture of dimethylsiloxanes and liberates hydrogen chloride. Soluble in benzene and ether.

Derivation: Action of silicon on methyl chloride in presence of a copper catalyst or by Grignard reaction from methyl chloride and silicon tetrachloride.

Grade: Technical.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Intermediate for silicone products.

dimethyldichlorovinyl phosphate. See dichlorovos.

1,2-dimethyl-3-diethylaminopropyl *p*-isobutoxybenzoate. See ganglefene.

2,2-dimethyl-2,3-dihydrobenzofuran-7-yl-*n*-(4-bromophenylthio)-*n*-methylcarbamate.

CAS: 50539-74-7. mf: C₁₈H₁₈BrN₃O₃S.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

5,5-dimethyldihydroresorcinol dimethylcarbamate. See dimetan.

dimethyl diisopropyl pyrophosphate.

CAS: 63919-09-5. mf: C₈H₂₀O₇P₂.

Hazard: A poison.

1,1-dimethyl-3,5-diketocyclohexane. See dimedone.

dimethyldiketone. See diacetyl.

***n*,5-dimethyl-4-((dimethylamino)carbonyl)-*n*-((4-(1,1-dimethylethyl)phenyl)thio)-2,7-dioxa-3,6-diazaocta-3,5-dienamide.**

CAS: 90293-48-4. mf: C₁₉H₂₈N₄O₄S.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***N,N'*-dimethyl-*N,N'*-di(1-methylpropyl)-*p*-phenylene diamine.** Forms a continuous protective film.

Properties: Volatile, reddish-brown liquid.

Use: Antiozonant in rubber.

***N,N*-dimethyl-*N,N*-dinitrosterephthalamide.**

C₆H₄[CON(CH₃)NO]₂.

Use: Blowing agent liberating nitrogen at 100C, with a residue of dimethyl terephthalate.

dimethyldioxane.

CAS: 25136-55-4.

$\text{OCH}(\text{CH}_3)\text{CH}_2\text{OCH}_2\text{CH}(\text{CH}_3)$.

Properties: Water-white liquid. D 0.9268, bp 117.5C, flash p 75F (23.9), vap press 154.4 mm Hg at 20C. Soluble in water.

Hazard: Flammable, dangerous fire risk.

2,2-dimethyl-1,3-dioxolane-4-methanol.

C₆H₁₂O₃.

Properties: Colorless, liquid; odorless. Bp 82C (10 mm Hg), d 1.065, refr index 1.43, flash p 194F (90C). Soluble in water and most organic solvents. Optically active. Combustible.

Use: General solvent, plasticizer.

***N,N*-dimethyl-2,2-diphenyl acetamide.**

See diphenamid.

3,3-dimethyl-1,4-dithian-2-one-*o*-((methyl((trichloromethyl)thio)amino)carbonyl)oxime.

CAS: 55391-31-6. mf: C₉H₁₃Cl₃N₂O₂S₃.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dimethylenemethane. See allene.

3,4,3',4'-dimethylenedioxy stilbene.

CAS: 76306-40-6. mf: C₁₆H₁₂O₄.

Hazard: Moderately toxic by ingestion.

2-dimethylethanolamine. See 2-dimethylaminoethanol.

dimethyl ether. (methyl ether; methyl oxide; wood ether).

CAS: 115-10-6. CH₃OCH₃.

Properties: Colorless compressed gas or liquid. D 0.661, bp -24.5C, fp -141.4C, flash p -42F (-41C), autoign temp 662F (350C). Soluble in water, alcohol, and organic solvents.

Derivation: By dehydration of methanol.

Grade: Technical, 99.5%.

Hazard: Highly flammable, dangerous fire and explosion hazard.

Use: Refrigerant, solvent, extraction agent, propellant for sprays, chemical reaction medium, catalyst and stabilizer in polymerization.

dimethylethoxysilane. See ethoxydimethylsilane.

2-((1,1-dimethylethyl)amino)ethanol. See *t*-butylethanolamine.

(*e*)-1-((1,1-dimethylethyl)azo)cyclopentanol.

See (*e*)-1-*t*-butylazo-1-hydroxycyclopentane.

dimethylethyl carbinol. See *tert*-amyl alcohol.

1,1-dimethylethyl chloroacetate. See *tert*-butyl chloroacetate.

dimethylethylene. See butene-2.

***n',n''*-dimethylethylenedihydrazine.** See 1,1'-(1,2-ethanediyl)bis(1-methylhydrazine).

***sym*-dimethylethylene glycol.** See 2,3-butylene glycol.

5,5-dimethyl-2-(ethylimino)-1,3-dithiolan-4-one-*o*-((methylamino)carbonyl)oxime.

CAS: 71108-04-8. mf: C₉H₁₅N₃O₂S₂.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

(4-(1,1-dimethylethyl)phenyl)methyl ethyl 3-pyridinylcarbonimidodithioate.

CAS: 51308-53-3. mf: $C_{19}H_{24}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

s-((4-(1,1-dimethylethyl)phenyl)methyl) o-ethyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-61-3. mf: $C_{19}H_{24}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-(1,1-dimethylethyl)phenyl)methyl heptyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-60-2. mf: $C_{24}H_{34}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-(1,1-dimethylethyl)phenyl)methyl hexyl 3-pyridinylcarbonimidodithioate.

CAS: 51308-58-8. mf: $C_{23}H_{32}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-(1,1-dimethylethyl)phenyl)methyl methyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-52-2. mf: $C_{18}H_{22}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

s-((4-(1,1-dimethylethyl)phenyl)methyl) o-octyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-71-5. mf: $C_{25}H_{36}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(4-(1,1-dimethylethyl)phenyl)methyl pentyl-3-pyridinylcarbonimidodithioate.

CAS: 51379-04-5. mf: $C_{22}H_{30}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

s-((4-(1,1-dimethylethyl)phenyl)methyl) o-pentyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-67-9. mf: $C_{22}H_{30}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

s-((4-(1,1-dimethylethyl)phenyl)methyl) o-propyl-3-pyridinylcarbonimidodithioate.

CAS: 51308-62-4. mf: $C_{20}H_{26}N_2OS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

α -(5-(1,1-dimethylethyl)-1-phenyl-1h-pyrazol-4-yl)-1-piperidinebutanol.

CAS: 296269-57-3. mf: $C_{22}H_{33}N_3O$.

Hazard: A poison by ingestion.

2-(1,1-dimethylethyl)pyrimidine.

CAS: 61319-99-1. mf: $C_8H_{11}N_2$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin irritant.

O,O-dimethyl-S-2-(ethylsulfanyl)ethyl phosphorothioate. (oxydemetonmethyl).

$(CH_3O)_2P(O)SC_2H_4SOC_2H_5$.

Properties: Amber liquid. Bp 106C (0.01 mm Hg), d 1.28 (20/4C). Miscible with water.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Systemic insecticide.

dimethyl ferrocenoate. (1,1'-ferrocenedicarboxylic acid dimethyl ester). $(C_5H_4COOCH_3)_2Fe$.

Properties: Orange, crystalline solid. Mp 114–115C. See ferrocene.

N,N-dimethyl formamide. (DMF).

CAS: 68-12-2. $HCON(CH_3)_2$.

Properties: Water-white liquid. A dipolar aprotic solvent. Bp 152.8C, fp –61C, refr index 1.4269 (25C), d 0.953–0.954 (15.6/15.6C), flash p 136F (57.7C), autoign temp 833F (445C). Miscible with water and most organic solvents (except halogenated hydrocarbons). Combustible.

Derivation: Reaction of methyl formate with dimethylamine.

Hazard: Moderate fire risk. Toxic by skin absorption. Strong irritant to skin and tissue. TLV: 10 ppm.

Use: Solvent for vinyl resins and acetylene, butadiene, acid gases; polyacrylic fibers; catalyst in carboxylation reactions; organic synthesis; carrier for gases.

dimethylfuran.

$OC(CH_3)CHCH(CH_3)$.

Properties: Colorless liquid. D 0.8900, bp 94C, flash p 45F (7.2C). Insoluble in water.

Hazard: Flammable, dangerous fire risk.

dimethyl glycol phthalate.

$C_6H_4(COOCH_2CH_2OCH_3)_2$.

Properties: Colorless liquid. D 1.17, bp 230C. Combustible.

Use: Solvent mix for cellulose esters, plasticizing mix for cellulose esters.

dimethylglyoxal. See diacetyl.

dimethylglyoxime. (butane dioxime).

$CH_3C(NOHC)(NOHC)CH_3$.

Properties: White crystals or powder. Mp 242C. Soluble in alcohol and ether, insoluble in water.

Use: Analytical chemistry, especially as a reagent for nickel, biochemical research.

2,6-dimethyl-4-heptanol. (diisobutylcarbinol). $[(CH_3)_2CHCH_2]_2CH_2O$.

Properties: Colorless liquid. Refr index 1.423 (21C), d 0.8121 (20C), fp (sets to a glass at approximately -65C), bp 178C (750 mm Hg); insoluble in water, soluble in alcohol and ether; flash p 162F (72.2C) (TOC). Combustible.

Use: Surface-active agents, lubricant additives, rubber chemicals, flotation agents, antifoam agent.

2,6-dimethyl-4-heptanone. See diisobutyl ketone.

2,6-dimethyl-5-hepten-1-al.

$(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Yellow liquid. Moderately stable but not likely to cause discoloration. D 0.845–0.855 (25/25C), refr index 1.441–1.447 (20C), flash p 144F (62.2C) (TCC). Soluble in two parts of 70% alcohol. Combustible.

Use: Perfumery.

2,6-dimethylheptene-3.

$(\text{CH}_3)_2\text{CHCH}:\text{CHCH}_2\text{CH}(\text{CH}_3)_2$. Mixed *cis* and *trans* isomers.

Properties: Liquid. Distillation range 128–129C, d 0.722 (60/60F), refr index 1.412 (20C), flash p 70F (21.1C) (TOC).

Grade: 95%.

Hazard: Flammable, dangerous fire risk.

2,5-dimethylhexadiene-1,5. (dimethylallyl).

$\text{CH}_2:\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{C}(\text{CH}_3):\text{CH}_2$.

Properties: Water-white liquid; hydrocarbon odor. D 0.740–0.760 (25/25C), refr index 1.426–1.429 (25C), ASTM distillation 90% between 114–123C, flash p 56F (13.3C). Soluble in hydrocarbons; insoluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Solvent.

2,5-dimethylhexane-2,5-dihydroperoxide.

$(\text{CH}_3)_2\text{C}(\text{OOH})\text{CH}_2\text{CH}_2\text{C}(\text{OOH})(\text{CH}_3)_2$.

Properties: Fine powder, 90% peroxide. Mp 102–104C. Insoluble in hydrocarbons; slightly soluble in water, soluble in alcohols.

Hazard: Dangerous fire risk, strong oxidizer. Store away from organic materials.

Use: High-temperature catalyst for polyester premix compounds and silicone resins.

dimethylhexanediol. (2,5-dimethylhexane-2,5-diol). $(\text{CH}_3)_2\text{COH}(\text{CH}_2)_2\text{COH}(\text{CH}_3)_2$.

Properties: White crystals. Mp 88.5–89C, bp 204–215C, d 0.898 (20/20C). Soluble in water, acetone, and alcohol; insoluble in benzene, carbon tetrachloride, and kerosene. Combustible.

Use: Chemical intermediate.

2,5-dimethylhexane-2,5-diperoxybenzoate.

$\text{C}_{22}\text{H}_{26}\text{O}_6$.

Properties: Fine, white granules. Mp 114C. Insoluble in alcohols and hydrocarbons; soluble in acetone and chlorinated hydrocarbons.

Hazard: Strong oxidant, fire risk in contact with organic materials.

Use: Oxidizing agent, polymerization agent.

dimethylhexynediol. (2,5-dimethyl-3-hexyne-2,5-diol). $(\text{CH}_3)_2\text{CHOC}\equiv\text{CCOH}(\text{CH}_3)_2$.

Properties: White crystals. Mp 94–95C, bp 205–206C, d 0.949 (20/20C). Soluble in water; slightly soluble in benzene, carbon tetrachloride, naphtha; very soluble in acetone, alcohol, and ethyl acetate.

Use: Wiredrawing lubricant, antifoaming agent, coupling agent in resin coatings, chemical intermediate.

dimethylhexynol. (3,5-dimethyl-1-hexyne-3-ol). $\text{HC}\equiv\text{CCOH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; camphorlike odor. Bp 150–151C, sets to a glass approximately -68C, d 0.8545 (20/20C), slightly soluble in water, flash p 134F (56.6C) (TOC). Combustible.

Hazard: Moderate fire risk.

Use: Stabilizer for chlorinated organic compounds, surface active agent, intermediate, solvent lubricant.

5,5-dimethylhydantoin. (DMH).

CAS: 77-71-4. $\text{HNCONHCOC}(\text{CH}_3)_2$.

Properties: White, crystalline solid. Mp 178C. Soluble in water, alcohol, and ether.

Derivation: (1) From acetone, urea, and ammonium carbonate; (2) from acetone, potassium cyanate and hydrogen cyanide.

Hazard: Central nervous system depressant.

Use: Synthesis, preparation of water-soluble polymers.

dimethylhydantoin-formaldehyde polymer.

Properties: Light-colored, brittle resin containing 0.3% max of formaldehyde. D 1.30, softening point 59–80C. Dissolves readily in cold and hot water, methanol, ethylacetate, methyl ethyl ketone, chloroform, methylene chloride, and hot glycerol; insoluble in benzene, xylene, diethyl ether, trichloroethylene, and carbon tetrachloride.

Use: Sizing, adhesives, blending agent, aerosol hair sprays.

1,1-dimethylhydrazine.

CAS: 57-14-7. $(\text{CH}_3)_2\text{NNH}_2$. An unsymmetrical compound.

Properties: Colorless, hygroscopic liquid; ammonia-like odor. Fumes in air; evolves heat on contact with water. Fp -58C, bp 63C, d 0.782 (25C), flash p approximately 5F (-15C), autoign temp 480F (249C). Soluble in water and alcohol.

Derivation: (1) Reaction of dimethylamine and chloramine; (2) catalytic oxidation of dimethylamine and ammonia.

Hazard: Flammable, dangerous fire risk. A suspected human carcinogen; toxic by skin absorption. Corrosive to skin. TLV: TWA 0.5 ppm; suspected human carcinogen.

Use: Component of jet and rocket fuels, chemical

synthesis, stabilizer for organic peroxide fuel additives, absorbent for acid gases, photography, plant growth control agent.

9-(2,2-dimethylhydrazino)acridine.

CAS: 28846-35-7. mf: C₁₅H₁₅N₃.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

9-(2,2-dimethylhydrazino)acridine monohydrochloride.

CAS: 1086-34-6. mf: C₁₅H₁₅N₃•ClH.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

9-(2,2-dimethylhydrazino)acridine mono(methyl sulfate).

CAS: 28846-38-0. mf: C₁₅H₁₅N₃•CH₃O₄S.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dimethylhydroquinone. See hydroquinone dimethyl ether.

dimethylhydroxybenzene. See xylenol.

3,7-dimethyl-7-hydroxyoctenal. See hydroxycitronellal.

dimethyl isophthalate. See "Morflex 1129" [Reilly].

dimethylisopropanolamine.

(CH₃)₂NCH₂CH(OH)CH₃.

Properties: Colorless liquid. D 0.8645 (25/20C), bulk d 7.4 lb/gal (20C), bp 125.8C, miscible with water, viscosity 1.51 cP (20C), vap press 9 mm Hg (20C), fp (sets to a glass at approximately -85C), refr index 1.4189 (20C), flash p 95F (35C) (OC). Solubility of water in compound complete at 20C.

Hazard: Flammable, moderate fire risk.

Use: Synthesis of methadone, other chemical syntheses. Combining the properties of tertiary amine and secondary alcohol.

4,4-dimethyl-1-isopropyl-2-nonyl-2-imidazoline.

CAS: 74038-78-1. mf: C₁₇H₃₄N₂.

Hazard: A poison.

dimethyl itaconate.

CH₂C(COOCH₃)CH₂(COOCH₃).

Properties: White crystals; slight odor. Mp 36C, bp 91.5C (10 mm Hg), d 1.27 (24C), refr index 1.441 (20C). Slightly soluble in water. Combustible.

Use: Polymers and copolymers, plasticizers, intermediate.

dimethylketol. See acetylmethylcarbinol.

dimethylketone. See acetone.

o,o-dimethyl malathion. See carbomethoxy malathion.

dimethyl maleate. CH₃OOCCH:CHCOOCH₃.

Properties: Colorless liquid. D 1.153, bulk density 9.62 lb/gal, bp 200.4C, flash p 235F (112C). Combustible.

dimethyl malonate.

CAS: 108-59-8. CH₂(COOCH₃)₂.

Properties: Colorless liquid. Bp 180-181C, fp -62C, refr index 1.4140, flash p 194F (90C). Very slightly soluble in water; soluble in alcohol and ether. Combustible.

Use: Chemical intermediate.

dimethylmethane. See propane.

5,5-dimethyl-2-((1-methylethyl)imino)-1,3-dithiolan-4-one-o-((methylamino)carbonyl)oxime.

CAS: 71108-05-9. mf: C₁₀H₁₇N₃O₂S₂.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

5,5-dimethyl-2-((1-methylethyl)imino)1,3-dithiolan-4-one, o-((methyl((trichloromethyl)thio)amino)carbonyl)oxime.

CAS: 71108-06-0. mf: C₁₁H₁₆Cl₃N₃O₂S₃.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

3,5-dimethyl-n-(2-methylphenyl)-4-nitro-1h-pyrazole-1-acetamide.

CAS: 302542-44-5. mf: C₁₄H₁₆N₄O₃.

Hazard: Moderately toxic by ingestion.

3,5-dimethyl-n-(4-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 302542-60-5. mf: C₁₄H₁₇N₃O.

Hazard: Moderately toxic by ingestion.

3,5-dimethyl-n-(2-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 173381-90-3. mf: C₁₄H₁₇N₃O.

Hazard: Moderately toxic by ingestion.

3,5-dimethyl-n-(3-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 302542-50-3. mf: C₁₄H₁₇N₃O.

Hazard: Moderately toxic by ingestion.

o,o-dimethyl s-((5-(methylthio)-1,3,4-thiadiazol-2-yl)methyl)phosphorodithioate.

CAS: 38090-92-5. mf: C₆H₁₁N₂O₂PS₄.

Hazard: A poison by ingestion.

(4,4-dimethyl-5-(((methyl((trichloromethyl)thio)amino)carbonyl)oxy)imino)-1,3-dithiolan-2-ylidene)

propanedinitrile.CAS: 71108-21-9. mf: $C_{11}H_9Cl_1N_4O_3S_3$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**2,6-dimethylmorpholine.**

CAS: 141-91-3.

$$\overline{\text{OCH}(\text{CH}_3)\text{CH}_2\text{NHCH}_2\text{CH}(\text{CH}_3)}$$
Properties: Liquid. D 0.99346, bp 146.6C, fp -85C, bulk d 7.8 lb/gal, flash p 112F (44.4C). Soluble in water. Combustible.**Hazard:** Moderate fire risk.**Use:** Corrosive inhibitors, stabilizers for chlorinated solvents, rubless floor polishes, rubber accelerators, germicides, and textile finishing agents.**2-(2,6-dimethyl-4-morpholiniothio)benzothiazole.**C₁₃H₁₆N₂O₂S₂.**Properties:** Cream to light-yellow powder. Mp 88C, d 1.26 (25C).**Use:** Delayed-action vulcanization accelerator.**1,2-dimethyl-3-(2-naphthalenyl)(2r,3s)-rel-3-pyrrolidinol drochloride.**CAS: 302959-32-6. mf: $C_{16}H_{19}NO \bullet ClH$.**Hazard:** A poison.**2,3-dimethyl-1,4-naphthoquinone.**CAS: 2197-57-1. mf: $C_{12}H_{10}O_2$.**Hazard:** Moderately toxic by ingestion.**dimethyl- α -naphthylamine.**C₁₀H₇N(CH₃)₂.**Properties:** Colorless liquid. D 1.045, bp 275C. Soluble in alcohol and ether; insoluble in water.**Derivation:** Action of methyl sulfate on α -naphthylamine.**Grade:** CP, analytical.**Use:** Determination of nitrates.**dimethyl- β -naphthylamine.**C₁₀H₇N(CH₃)₂.**Properties:** Crystalline solid. D 1.039 (70/70C), mp 46C, bp 305C. C₂H₅(CH₃)COHC=CCOH(CH₃)C₂H₅**Properties:** White crystals. Mp 55-56C, bp 222C, d 0.923 (solid 20C), 0.908 (liquid 60C). Moderately soluble in water; slightly soluble in kerosene; very soluble in acetone, alcohol, benzene, and carbon tetrachloride. Combustible.**Use:** Surface-active agent, intermediate.**dimethylolethylene urea.**

$$\overline{\text{OCN}(\text{CH}_2\text{OH})\text{CH}_2\text{CH}_2\text{N}(\text{CH}_2\text{OH})}$$

Use: Wrinkle-resistant textile finishes.

dimethylolpropionic acid. (DMPA; 2,2-bis(hydroxymethyl)propionic acid).
 $\text{CH}_2\text{C}(\text{CH}_2\text{OH})_2\text{COOH}$.

Properties: Off-white, crystalline solid. Mp 192–194C. Soluble in water and methanol; slightly soluble in acetone; insoluble in benzene.

Use: Water-soluble alkyd resins, textile finishing, cosmetics, plasticizers.

dimethylolurea. (DMU; 1,3-bis(hydroxymethyl)urea).

Properties: Colorless crystals. Mp 126C (technical 85–90C), d 1.34 (20C), slight formaldehyde odor. Soluble in water and methanol; insoluble in ether. Capable of polymerization.

Derivation: Combination of urea and formaldehyde in the presence of salts or alkaline catalysts.

Hazard: Irritant to skin.

Use: First stage of urea formaldehyde resins; impregnating wood to increase hardness and fire resistance and to form self-binding laminations for plywood manufacture; permanent-press fabrics.

2,2-dimethyl-3-(3-oxo-3-(2,2,2-trifluoro-1-(trifluoromethyl) ethoxy)-1-propenyl)cyclopropanecarboxylic acid, cyano(3-phenoxyphenyl)methyl ester, (1r-(1- α (s*),3- α (z))).

CAS: 101007-06-1.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion.

Use: Agricultural chemical.

2,3-dimethylpentaldehyde.

$\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CHO}$. A branched-chain heptanal.

Properties: Liquid. D 0.8293, bp 140.5C, fp –110C, bulk density 6.91 lb/gal (20C), flash p 94F (34.4C). Slightly soluble in water.

Hazard: Flammable, moderate fire risk.

Use: Intermediate.

2,4-dimethylpentane.

$(\text{CH}_3)_2\text{CHCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. D 0.6684 (25C), bp 80.5C, refr index 1.382 (20C), flash p 10F (–12.1C), fp –119C. Soluble in alcohol; insoluble in water.

Grade: 95%, 99%, research, 99.7 mole %.

Hazard: Flammable, dangerous fire hazard.

Use: Organic synthesis. *Note:* Other isomers (2,2-; 2,3-; 3,3-) of closely similar properties are available.

2,4-dimethylpentanol-3. See diisopropylcarbinol.

2,4-dimethylpentanone-3. See diisopropyl ketone.

α,α -dimethylphenethyl acetate. (dimethylbenzylcarbonyl acetate).

$\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{CH}_3)_2\text{OOCCH}_3$.

Properties: Colorless liquid; floral, fruity odor. Refr index 1.4910–1.4950 (20C) in supercooled liquid form, d 0.995–1.002 in supercooled liquid form, mp 29–30C. Solidifies at room temperature. Soluble in mineral oil; insoluble in glycerol. Combustible.

Grade: FCC.

Use: Flavoring agent.

dimethylphenol. See xylenol.

dimethyl-*p*-phenylenediamine. See *p*-aminodimethylaniline.

***n*-(2,3-dimethylphenyl)maleimide.** See *n*-2,3-xylylmaleimide.

***n*-(2,6-dimethylphenyl)-*n*-(methoxyacetyl)-alanine methyl ester.** See metalaxyl.

***n*-(2,6-dimethylphenyl)-*n*-methoxyalanine methyl ester.**

CAS: 123298-28-2. mf: $\text{C}_{13}\text{H}_{19}\text{NO}_3$.

Hazard: Moderately toxic by ingestion and inhalation.

Use: Agricultural chemical.

1-(2,4-dimethylphenyl)-3-(4-(2-methoxyphenyl)-1-piperazinyl)-1-propanone.

CAS: 302561-65-5. mf: $\text{C}_{22}\text{H}_{28}\text{N}_2\text{O}_2 \cdot \text{ClH}$.

Hazard: A poison.

2,3-dimethyl-1-phenyl-3-pyrazolin-5-one.

See antipyrine.

dimethyl phosphite. $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{H}$.

Properties: Mobile, colorless liquid; mild odor. D 1.200 (20/4C), refr index 1.400 (25C), bp 72–73C (25 m/ H), flash p 205F (96C). Soluble in water; miscible with most common organic solvents. Combustible.

Use: Lubricant additive, intermediate, adhesive.

***O,O*-dimethyl phosphorochloridothioate.**

(methyl PCT).

CAS: 2524-03-0. $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{Cl}$.

Properties: Colorless to light-amber liquid. Bp 66–67C (16 mm Hg) d 1.320 (25C), refr index 1.4795 (25C). Soluble in alcohol, benzene, acetone, carbon tetrachloride, chloroform, ethyl acetate; slightly soluble in hexane; insoluble in water.

Grade: 96–100% purity.

Hazard: Strong irritant to eyes, skin, and mucous membranes; cholinesterase inhibitor; use may be restricted.

Use: Intermediate for insecticides, pesticides, fungi-

cides, oil and gasoline additives, plasticizers, corrosive inhibitors, flame-retardants, flotation agents.

dimethyl phthalate.

CAS: 131-11-3. $C_6H_4(COOCH_3)_2$.

Properties: Colorless, oily liquid. Refr index 1.5138 (25C), heat of combustion 5769 cal/g, d 1.189 (25/25C), bp 282C, flash p 300F (149C), bulk density 9.93 lb/gal (68F), vap press <0.1 mm Hg (20C), autoign temp 1032F (555C). Miscible with alcohol and ether; insoluble in water and paraffinic hydrocarbons; slightly soluble in mineral oil. Combustible.

Grade: Technical.

Hazard: Irritant to eyes and mucous membranes, not absorbed by skin. TLV: 5 mg/m³.

Use: Plasticizer for nitrocellulose and cellulose acetate, resins, rubber, and in solid rocket propellants; lacquers; plastics; rubber; coating agents; safety glass; molding powders; insect repellent.

N,N'-dimethylpiperazine. (1,4-dimethylpiperazine). $(CH_3)_2C_4H_8N_2$.

Properties: Colorless, mobile liquid. D 0.8565 (20/4C), bp 131C, fp -1C, flash p 176F (80C) (TOC). Combustible.

Use: Curing agent for polyurethane foams, intermediate for cationic surface-active agents. *Note:* Two other isomers are available, *cis*-2,5- and *trans*-2,5-; neither is flammable, but both are combustible.

2,6-dimethylpiperidine. (2,6-lupetidine).

$(CH_3)_2C_5H_8NH$.

Properties: Liquid. Bp 127.9C, d 0.8199 (20/20C), refr index 1.4383 (20C). Miscible with water at 20C. Combustible.

Use: Intermediate.

1,1-dimethylpiperidinium chloride. See mepiquat chloride.

dimethylpolysiloxane. A liquid defoaming agent, refr index 1.40, viscosity 300 centistokes.

Hazard: Use in foods limited to 10 ppm (0 ppm in milk).

dimethyl-POPOP. See 1,4-bis[2-(4-methyl-5-phenyloxazolyl)]benzene.

2,2-dimethylpropane. See neopentane.

2,2-dimethyl-1,3-propanediol. See neopentyl glycol.

2,10-dimethyl-6-(2-propenyloxy)-4,8-dioxo-3,9-dithia-2,10-diazaundecanedioic acid, di-1-naphthalenyl ester, 3,9-dioxide.

CAS: 81862-18-2. mf: $C_{30}H_{30}N_2O_9S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1,1-dimethylpropynylamine. See 2-methyl-3-butyn-2-amine.

3,6-dimethylpyrazine-2-thiol.

CAS: 5788-49-8.

Hazard: A reproductive hazard.

dimethylpyridine. See 2,6-lutidine.

2,6-dimethyl-3,5-pyridine dicarboxylic acid, dimethylester.

CAS: 182620-63-9. mf: $C_{14}H_{14}N_2O_4$.

Hazard: A poison.

2,5-dimethylpyrrole.

CAS: 625-84-3. mf: C_6H_9N .

Properties: Colorless to yellow oily liquid. D: 0.935–0.945 @ 20/4°, refr index: 1.503–1.506, bp: 165° @ 760 mm. Very sol in alc, and ether; very sltly sol in water.

Use: Food additive.

n,n-dimethyl-3-(pyrrolidin-1-yl)propionamide.

CAS: 22041-39-0. mf: $C_9H_{18}N_2O$.

Hazard: A poison.

2,9-dimethylquinacridone.

CAS: 980-26-7. mf: $C_{22}H_{16}N_2O_2$.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion.

2,7-dimethylquinoline. $(CH_3)_2C_9H_7N$.

Properties: Liquid. Fp approximately -40C, distillation range 140–150C (20 mm Hg). Soluble in benzene and diethyl ether. Combustible.

Use: Organic synthesis, dye intermediate.

o,o'-dimethyl *s,s'*-2,3-quinoxalinediyl thiocarbonate. See 2,3-bis(carbomethoxymercapto)quinoxaline.

dimethyl resorcinol. See resorcinol dimethyl ether.

dimethyl sebacate. $[(CH_3)_2COOCH_2]_2$.

Properties: Liquid, water-white. D 0.9896 (20/20C), mp 24.5C, flash p 293F (145C), bp approximately 294C, refr index 1.4376 (20C). Combustible.

Grade: Technical.

Use: Solvent or plasticizer for nitrocellulose, vinyl resins; intermediate.

dimethylsilicone. General term for a family of silicones of composition $[(CH_3)_2SiO]_x$, the more volatile materials formed on hydrolysis of dimethyldichlorosilane. Colorless oils with boiling point ranging from 134C (for x = 3) to 188C (20 mm Hg) (for x = 9).

Use: Transformer liquid, brake fluids.

See polydimethylsiloxane.
