dimethyl sulfate. (methyl sulfate).CAS: 77-78-1. $(\text{CH}_3)_2\text{SO}_4$.**Properties:** Colorless liquid. Soluble in alcohol, ether, and water. D 1.3516, fp -26.8C , bp 188C (decomposes), flash p 182F (83.3C) (CC). Combustible.**Derivation:** By adding fuming sulfuric acid to methanol and distilling in vacuo.**Grade:** Technical.**Hazard:** Strong irritant, absorbed by skin, a carcinogen, induces tumors in animals, protective clothing required. TLV: TWA 0.1 ppm; animal carcinogen.**Use:** Methylating agent for amines and phenols, polyurethane-based adhesives.**dimethyl sulfide.** (methyl sulfide).CAS: 75-18-3. $(\text{CH}_3)_2\text{S}$.**Properties:** Colorless, volatile liquid; disagreeable odor. D 0.845 (20C), fp -83C , bp 37.5C , evolves sulfur dioxide when heated, autoign temp 403F (206C), flash p 0F (-17.7C). Soluble in alcohol and ether; insoluble in water.**Derivation:** (1) From kraft pulping black liquor by heating with inorganic sulfur compounds; (2) by interaction of a solution of potassium sulfide and methyl chloride in methanol.**Hazard:** Flammable, dangerous fire risk, moderate explosion risk. Flammable limits in air 2.2–19.7%.**Use:** Gas odorant, solvent for many inorganic substances, catalyst impregnator.**2,4-dimethylsulfolane.** $\text{C}_6\text{H}_{12}\text{O}_2\text{S}$.**Properties:** Slightly yellow liquid. Bp 280C , d 1.13, flash p 290F (143C), refr index 1.47. Slightly soluble in water; partially soluble in alkanes and alkenes; miscible with most aromatics.**Hazard:** Toxic by ingestion.**Use:** Solvent extraction (liquid-liquid and vapor-liquid).**dimethylsulfone.** (methylsulfone; methylsulfonylmethane). $\text{C}_2\text{H}_6\text{O}_2\text{S}$.**Properties:** Colorless crystals. Mp 110C , bp 237C . Soluble in water, alcohol, and acetone.**Derivation:** Oxidation of dimethyl sulfide.**Use:** Solvent.**dimethyl sulfoxide.** (methyl sulfoxide; DMSO).CAS: 67-68-5. $(\text{CH}_3)_2\text{SO}$.**Properties:** Colorless, hygroscopic liquid; nearly odorless; slightly bitter taste. Bp 189C , mp 18.5C , d 1.10 (20/20C), specific heat 0.7 cal/g K, flash p 203F (95C) (OC), dielectric constant 48.9 (20C). Extremely powerful aprotic solvent. Soluble in water, alcohol, benzene, acetone, chloroform. Combustible.**Derivation:** Oxidation of dimethyl sulfide with nitrogen tetroxide under anhydrous conditions; sulfide waste liquors.**Hazard:** Readily penetrates skin and other tissues;

approved by FDA for humans, but must comply with FDA regulations.

Use: Solvent for polymerization and cyanide reactions; analytical reagent; spinning polyacrylonitrile and other synthetic fibers; industrial cleaners, pesticides, paint stripping; hydraulic fluids; preservation of cells at low temperatures; diffusion of drugs, etc., into blood stream by topical application; medicine (antiinflammatory); veterinary medicine; plant pathology and nutrition; pharmaceutical products; metal-complexing agent.**dimethyl terephthalate.** (DMT).CAS: 120-61-6. $\text{C}_6\text{H}_4(\text{COOCH}_3)_2$.**Properties:** Colorless crystals. Mp 140C , sublimes above 300C . Insoluble in water; soluble in ether and hot alcohol.**Derivation:** Oxidation of *p*-xylene or mixed xylene isomers with concurrent esterification.**Use:** Polyester resins for film and fiber production, especially polyethylene terephthalate; intermediate.**dimethyl 2,3,5,6-tetrachloroterephthalate.** $\text{C}_6\text{Cl}_4(\text{COOCH}_3)_2$.**Properties:** Crystals. Mp 156C . Insoluble in water; slightly soluble in acetone and benzene.**Use:** Herbicide.**1,3-dimethyl-2-tetradecyl-2-thiopseudourea hydriodide.**CAS: 5339-43-5. mf: $\text{C}_{17}\text{H}_{36}\text{N}_2\text{S}\cdot\text{HI}$.**Hazard:** Moderately toxic.**2,2-dimethyl-3-(2,3,3,3-tetrafluoro-1-propenyl)cyclopropanecarboxylic acid, (3-phenoxyphenyl)methyl ester, (1- α ,3- β (e))-(+)-.**CAS: 73176-66-6. mf: $\text{C}_{22}\text{H}_{30}\text{F}_4\text{O}_3$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**3,5-dimethyltetrahydro-1,3,5(2H)thiadiazine-2-thione.**CAS: 533-74-4. $\text{C}_5\text{H}_{10}\text{N}_2\text{S}_2$.**Properties:** Crystals. Mp 100C , d 1.30 (20C). Slightly soluble in water and alcohol; soluble in acetone.**Hazard:** Toxic by ingestion and inhalation.**Use:** Herbicide, nematocide, preservative for adhesives and proteinaceous additives, fungicide.

See "Crag."

3,4-dimethyl-2,5-thiomorpholinedione, 2-(*o*-((methyl((trichloromethyl)thio)amino)carbonyl)oxime).CAS: 66637-35-2. mf: $\text{C}_9\text{H}_{12}\text{Cl}_3\text{N}_3\text{O}_3\text{S}_2$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**dimethyltin bis(dibutylthiocarbamate).**

See bis(dibutylthiocarbamate)

dimethylstannane.

dimethyl-tin bis(isooctylthioglycollate).

See bis(isooctylloxycarbonylmethylthio)dimethylstannane.

dimethyltin dibromide.

CAS: 2767-47-7. mf: $C_2H_6Br_2Sn$.

Properties: Colorless or white crystals. Mp: 76°, bp: 208–213°. Sol in water and org solvs.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dimethyltin dichloride.

CAS: 753-73-1. $(CH_3)_2SnCl_2$.

Properties: White crystals. Mp 106–108C. Soluble in water, alcohol, and hydrocarbons.

Hazard: Toxic material by skin absorption. TLV: 0.1 mg(Sn)/m³.

Use: Electroluminescence, PVC stabilizer, catalyst.

dimethyltin difluoride. See difluorodimethylstannane.**dimethyltin oxide.**

CAS: 2273-45-2. $(CH_3)_2SnO$.

Properties: White powder. 98.5% Min purity.

Hazard: Toxic material by skin absorption. TLV: 0.1 mg(Sn)/m³.

Use: Intermediate, PVC stabilizer.

dimethyl-*o*-toluidine. See *n,n*-dimethyl-*o*-toluidine.**dimethyl-*p*-toluidine.** See *n,n,4*-trimethylaniline.***n,n*-dimethyl-*o*-toluidine.**

CAS: 609-72-3. mf: $C_9H_{13}N$.

Properties: A liquid. Bp: 184.8°.

Hazard: Moderately toxic by ingestion.

***o,o*-dimethyl (2,2,2-trichloro-1-(chloroacetoxy)ethyl)phosphonate.**

CAS: 74940-61-7. mf: $C_6H_9Cl_4O_3P$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***N,N'*-dimethylurea.** (DMU; *sym*-dimethylurea; 1,3-dimethylurea).

CAS: 96-31-1. $(CH_3NH)_2CO$.

Properties: Colorless prisms. D 1.14, mp 106C, bp 270C. Soluble in water and alcohol; insoluble in ether.

Use: Intermediate in synthesis of drugs.

1,3-dimethylxanthine. See theophylline.**3,7-dimethylxanthine.** See theobromine.**dimetilan.** Generic name for 1-dimethylcarbamoyl-5-methyl-3-pyrazolyl dimethylcarbamate.

Properties: Colorless to red-brown solid. Mp

68–71C, bp 200C (13 mm Hg). Soluble in water and most organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide.

“Dimezone S” [James Robinson]. TM for a line of photographic chemicals.**dimolybdenum trioxide.** See molybdenum sesquioxide.**dimpylate.** See “Diazinon.”**Dimroth rearrangement.** Rearrangement of *N*-alkylated or arylated iminoheterocycles to the corresponding alkylamino or arylamino heterocycles.**dimyristylamine.** (ditetradecylamine).

$(C_{14}H_{29})_2NH$.

Properties: Solid. Mp 52C, d 0.89. Almost insoluble in water.

Use: Intermediate.

dimyristyl ether. (ditetradecyl ether).

$(C_{14}H_{29})_2O$.

Properties: Liquid. Mp 38–40C, bp 238–248C (4 mm Hg) d 0.8127 (45/4C). Combustible.

Grade: 95% (min) purity.

Use: Electrical insulators, water repellents, lubricants in plastic molding, antistatic substances, chemical intermediates.

dimyristyl sulfide. (ditetradecyl sulfide, dimyristyl thioether). $(C_{14}H_{29})_2S$.

Properties: Solid. Mp 49–50C, bp (decomposes), d 0.8258 (50/4C).

Grade: 95% (min) purity.

Use: Organic synthesis (formation of sulfonium compounds).

***N,N'*-di-β-2-naphthyl-*m*-phenylenediamine.**

$C_6H_4(NHC_{10}H_7)_2$.

Properties: Colorless needles. Mp 191C. Sparingly soluble in alcohol; insoluble in water and ether.

Derivation: By heating *m*-phenylenediamine with β-naphthol and extraction with alcohol.

Use: Organic synthesis.

***N,N'*-di-β-naphthyl-*p*-phenylenediamine.**

(*sym*-di-β-naphthyl-*p*-phenylamine; DNPD).

$C_6H_4(NHC_{10}H_7)_2$.

Properties: Gray powder. D 1.25, set point 225C (min), purity 98% (min). Insoluble in water; slightly soluble in acetone and chlorobenzene.

Use: Antioxidant, stabilizer, polymerization inhibitor, intermediate in organic synthesis.

dinERIC. Solution of two immiscible solvents with a single solute soluble in each.

dinERIC interface. (liquid-liquid interface).

Boundary surface between two immiscible liquids.

dinitolmide. See zoalene.

dinitraniline orange. (permanent orange). A pigment made from dinitroaniline and β -naphthol. It is a reddish shade of orange that has excellent light-fastness.

Hazard: Toxic by ingestion.

dinitroaminophenol. See picramic acid.

2,4-dinitroaniline. (2,4-dinitraniline).

CAS: 97-02-9. $C_6H_3NH_2(NO_2)_2$.

Properties: Yellow crystals. Slightly soluble in alcohol; insoluble in water. D 1.615, mp 188F, flash p 435F (223C). Combustible.

Derivation: Nitration of *p*-nitroaniline with hot mixed acid.

Grade: Technical, pure.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Intermediate for azo pigments, toner pigment in printing inks, corrosion inhibitor.

2,4-dinitroanisole. (2,4-dinitriphenyl methyl ether). $CH_3OC_6H_3(NO_2)_2$.

Properties: Colorless to yellow, monoclinic needles from water or alcohol. Mp 88C, d 1.341 (20/4C), sublimes. Slightly soluble in hot water; soluble in alcohol and ether.

Hazard: Toxic by ingestion.

Use: Ovicide, effective against moths, furniture and carpet beetles, cockroaches, and body lice.

3,5-dinitrobenzamide.

Use: Drug (veterinary); food additive.

dinitrobenzene.

CAS: *o*- 528-29-0; *m*- 99-65-0; *p*- 100-25-4. $C_6H_4(NO_2)_2$. *m*-, *o*-, and *p*- isomers.

Properties: Yellow crystals. D *m*- 1.546, *o*- 1.565, *p*- 1.6; mp *m*- 89.9C, *o*- 117.9C, *p*- 172–173C; bp *m*- 302.8C, *o*- 319C, *p*- 299C. Soluble in chloroform and ethyl acetate; sparingly soluble in benzene; slightly soluble in water.

Derivation: Nitration of nitrobenzene with hot mixed acid.

Hazard: *o*-isomer explodes when shocked or heated. Toxic by inhalation and ingestion, absorbed by skin. TLV: 0.15 ppm (skin).

Use: Organic synthesis, dyes, camphor substitute in cellulose nitrate.

***m*-dinitrobenzene.** (1,3-dinitrobenzene; 2,4-dinitrobenzene).

CAS: 99-65-0. $C_6H_4N_2O_4$.

Properties: Yellowish crystals from alcohol. Mw 168.12, mp 89C, bp 291C.

Hazard: A suspected carcinogen. A human poison by ingestion. TLV: TWA 0.15 ppm. Mixture with

nitric acid is a high explosive. Mixture with tetranitromethane is a high explosive very sensitive to sparks.

See *o*-dinitrobenzene and *p*-dinitrobenzene.

***o*-dinitrobenzene.** (1,2-dinitrobenzene).

CAS: 528-29-0. $C_6H_4N_2O_4$.

Properties: Colorless needles or plates from alcohol. Mw 168.12, mp 118C, bp 319C, flash p 302F (CC), d 1.571 (0C/4C), vap d 5.79. Soluble in EtOH and $CHCl_3$; slightly soluble in water.

Hazard: A suspected carcinogen and poison by inhalation and ingestion. TWA 0.15 ppm (skin). Combustible. A severe explosion hazard when shocked or exposed to heat or flame.

Use: In bursting charges and to fill artillery shells. See *n*-dinitrobenzene and *p*-dinitrobenzene.

***p*-dinitrobenzene.**

CAS: 100-25-4. $C_6H_4N_2O_4$.

Properties: White crystals, needles or prisms from alcohol. Mw 168.12, mp 173C, bp 299C. Volatile with steam.

Hazard: A suspected carcinogen and poison by ingestion. TWA 0.15 ppm (skin). Mixture with nitric acid is a high explosive.

See *n*-dinitrobenzene and *o*-dinitrobenzene.

1,2-dinitrobenzene. See *o*-dinitrobenzene.

1,3-dinitrobenzene. See *m*-dinitrobenzene.

2,4-dinitrobenzene. See *m*-dinitrobenzene.

2,4-dinitrobenzenethiol.

CAS: 2218-96-4. mf: $C_6H_4N_2O_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

5,7-dinitro-1,2,3-benzoxadiazole. See diazodinitrophenol.

3,5-dinitrobenzoyl chloride.

$2NO_2(C_6H_3COCl)$.

Properties: Yellow crystals. Mp 66–68C, bp 196C (12 mm Hg). Decomposed by water and alcohol.

Hazard: An irritant.

Use: Reagent for amino acids and presence of alcohols in acetals and ketals.

2-(2,4-dinitrobenzyl)pyridine.

$C_8H_9N_3$. Behaves photochromically.

Use: To make plastics sensitive to light.

See photochromism.

2,4-dinitro-6-*sec*-butylphenol. (2-*sec*-butyl-4,6-dinitrophenol; dinoseb; DNBP).
CAS: 88-85-7. $\text{CH}_3(\text{C}_2\text{H}_5)\text{CHC}_6\text{H}_2(\text{NO}_2)_2\text{OH}$. A plant growth regulator.

Properties: Reddish-brown liquid. Slightly soluble in water; soluble in alcohol and other organic solvents. Forms salts with metals and organic bases.

Hazard: Possible fire risk. Absorbed by skin, strong irritant.

Use: Insecticide and ovicide, but must be used in the dormant growth season or as a salt to reduce toxicity. Herbicide for preemergence treatment, increases yield of corn 5–10%.

dinitrochlorbenzene. See 1-chloro-2,4-dinitrobenzene.

4,6-dinitro-*o*-cresol. (dinitro-*o*-cresol; 4,6-dinitro-2-methylphenol).

CAS: 534-52-1. $\text{CH}_3\text{C}_6\text{H}_3(\text{NO}_2)_2\text{OH}$.

Properties: Yellow solid. Mp 85.8C. Slightly soluble in water; soluble in alcohol, acetone, ether.

Hazard: Toxic, absorbed by skin, use may be restricted. TLV: 0.2 mg/m³.

Use: Dormant ovicidal spray for fruit trees (highly phytotoxic and cannot be used successfully on actively growing plants), herbicide, insecticide.

2,6-dinitro-*p*-cresol. (DNPC).
 $(\text{NO}_2)_2\text{CH}_2\text{C}_6\text{H}_3\text{OH}$.

Properties: Light-yellow, crystalline solid.

Grade: Presscake (36–43% active 2,6-DNCP).

Use: Parent compound for intermediates, dyes, and pharmaceuticals.

4,6-dinitro-*o*-cresol barium derivative.

CAS: 63989-83-3.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dinitrocyclohexylphenol. (2-cyclohexyl-4,6-dinitrophenol; dinitro-*o*-cyclohexylphenol; DNOCHP).

CAS: 131-89-5. $\text{C}_6\text{H}_{11}\text{C}_6\text{H}_2(\text{NO}_2)_2\text{OH}$.

Properties: Crystalline solid.

Use: Control of mites on citrus fruits.

3,5-dinitro-*n*⁴,*n*⁴-dipropylsulfanilamide.

See oryzalin.

2,4-dinitrofluorobenzene. (1-fluoro-2,4-dinitrobenzene; DNFB). $\text{C}_6\text{H}_3\text{F}(\text{NO}_2)_2$.

Properties: Crystals. Mp 26C; bp 137C. Soluble in ether, benzene, propylene glycol.

Hazard: Toxic by ingestion, mutagenic, and carcinogenic.

Use: Alkylating agent, reagent in elucidating amino acid sequence in proteins.

dinitrogen tetroxide. See nitrogen dioxide; nitrogen oxides; NO_x .

dinitrogen trioxide. See nitrogen trioxide; nitrogen oxides; NO_x .

dinitroglycol. See diethylene glycol dinitrate.

2,4-dinitro-4-hydroxydiphenylamine.

$(\text{NO}_2)_2\text{C}_6\text{H}_3\text{NHC}_6\text{H}_4\text{OH}$.

Properties: Yellow solid. Mp 190C. Insoluble in water.

Derivation: Condensation of 2,4-dinitro-1-chlorobenzene and *p*-aminophenol.

dinitro(1-methylheptyl)phenyl crotonate.

See dinocap.

4,6-dinitro-2-methylphenol. See 4,6-dinitro-*o*-cresol.

dinitronaphthalene. $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$. Isomers: (1) 1,5-; (2) 1,8-.

Properties: (1) Yellowish-white needles; (2) yellowish-white, thick, crystalline tablets; mp (1) 217C; (2) 172C; (1) sparingly soluble in pyridine; (2) soluble in pyridine; bp (1) sublimes; (2) decomposes.

Derivation: By dissolving α -nitronaphthalene in sulfuric acid and adding nitric acid.

Method of purification: Crystallization.

Hazard: Moderate fire and explosion risk.

Use: Dyes, especially sulfur colors; intermediates.

2,4-dinitro-1-naphthol-7-sulfonic acid.

(flavianic acid). $\text{C}_{10}\text{H}_6\text{O}_8\text{N}_2\text{S}$.

Properties: Yellow needles. Mp 151C. Very soluble in water.

Use: Intermediate, precipitant for organic bases, reagent for amino acids.

dinitrophenol. $\text{C}_6\text{H}_3\text{OH}(\text{NO}_2)_2$.

CAS: 25550-58-7. Commercial product is usually a mixture of 2,3-, 2,4-, and 2,6-isomers.

Properties: Yellow crystals, (2,3) d 1.681, mp 144C; (2,4) d 1.683, mp 114–115C; (2,6) mp 63C. Soluble in alcohol, ether, benzene, and chloroform; slightly soluble in water.

Derivation: (1) By heating phenol with dilute sulfuric acid, cooling the product, and then nitrating, keeping the temperature approximately 50C; (2) by nitration with mixed acid with careful temperature control.

Method of purification: Crystallization.

Hazard: Severe explosion hazard when dry. Absorbed by skin; dust inhalation may be fatal.

Use: Dyes, especially sulfur colors; picric acid, picramic acid, preservation of lumber, manufacture of the photographic developer diaminophenol hydrochloride, explosives manufacture; indicator, reagent for potassium and ammonium ions.

dinitrophenylhydrazine. $(\text{NO}_2)_2\text{C}_6\text{H}_3\text{NHNH}_2$.

Properties: Red, crystalline powder. Mp about 200C. Slightly soluble in water and alcohol; soluble in moderately dilute inorganic acids; readily soluble in diglyme.

Hazard: Severe explosion and fire risk.

Use: Explosive; reagent for aldehydes and ketones.

dinitrophenylmethane. See dinitrotoluene.

2,4-dinitrophenyl methyl ether. See 2,4-dinitroanisole.

3,5-dinitrosalicylic acid.

Properties: Yellow crystals. Mp 174C. Slightly soluble in water; soluble in alcohol and benzene.

Derivation: Nitration of salicylic acid.

Use: Determination of glucose.

dinitrosopentamethylenetetramine.

(DNPT). $(\text{NO})_2\text{C}_5\text{H}_{10}\text{N}_4$. A bicyclic compound.

Properties: Light-cream-colored powder. Decomposes in air at 190–200C. Soluble in dimethyl formamide; somewhat soluble in pyridine, methyl ethyl ketone, and acetonitrile. Combustible.

Hazard: May explode at 200C (390F).

Use: Blowing agent for rubber and plastics.

2,4-dinitrosoresorcinol.

Properties: Light-brown powder. Mp 162–163C. Decomposes, sometimes violently; soluble in water and most organic solvents.

Grade: Technical (13.7% N).

Hazard: Severe explosion risk when shocked or heated. An irritant.

Use: Chelation of heavy metals, cross-linking agent, blasting caps and explosive primers.

3,5-dinitro-*o*-toluamide. See zoalene.

dinitrotoluenes. (dinitrophenylmethane; methyl dinitrobenzene).

CAS: 25321-14-6. $\text{C}_7\text{H}_6\text{N}_2\text{O}_4$.

Properties: Mw: 182.15

Hazard: Confirmed carcinogen and poison. TWA 0.2 mg/m³ (skin); animal carcinogen. Flammable.

2,4-dinitrotoluene. (DNT).

CAS: 121-14-2. $\text{C}_6\text{H}_3\text{CH}_3(\text{NO}_2)_2$. (1) 2,4-; (2) 3,4-; (3) 3,5-.

Properties: Yellow crystals. D (1) 1.3208; (2) 1.32; (3) 1.277; mp (1) 70.5C; (2) 61C; (3) 92.3C. Soluble in alcohol and ether; very slightly soluble in water. A commercial grade, consisting of a mixture of the three isomers, is an oily liquid. Combustible.

Derivation: Nitration of nitrotoluene with mixed acid.

Method of purification: Crystallization.

Hazard: Absorbed by skin.

Use: Organic synthesis, toluidines, dyes, explosives.

dinker. A machine for cutting forms from flat sheets of plastic, rubber, metal, paper, etc., by impact of a metal die.

dinocap. Generic name for 2-(2-methylheptyl)-4,6-dinitrophenyl crotonate. $\text{CH}_3\text{CH}:\text{CHCOOC}_6\text{H}_2(\text{NO}_2)_2\text{CH}(\text{CH}_3)\text{C}_6\text{H}_{13}$.

Properties: Brown liquid. Bp 138–140C (0.05 mm Hg). Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Acaricide, fungicide.

dinonyl adipate. Ester of nonyl alcohol.

Properties: Colorless liquid. Bp 201–210C (1 mm Hg), d 0.926 (25C), refr index 1.4523 (20C), viscosity 14.9 centistokes (100F). Combustible.

Use: Plasticizer where special low-temperature properties are desired.

dinonyl carbonate. $(\text{C}_9\text{H}_{19})_2\text{CO}_3$.

Properties: Ester of nonyl alcohol, colorless liquid. Bp 135–140C (0.3 mm Hg), d 0.894 (25C), refr index 1.4427 (20C).

Hazard: Combustible.

dinonyl ether. $\text{C}_9\text{H}_{19}\text{OC}_9\text{H}_{19}$.

Properties: Colorless liquid. Bp 148–153C (5 mm Hg), d 0.817 (25C), refr index 1.4405 (20C). Can be made from nonyl alcohol plus nonyl halide by the Williamson synthesis. Combustible.

dinonyl maleate.

$\text{C}_9\text{H}_{19}\text{OOCCH}:\text{CHCOOC}_9\text{H}_{19}$. Ester of nonyl alcohol.

Properties: Colorless liquid, bp 157–167C (0.1 mm Hg), d 0.941 (25C), refr index 1.4586 (20C), viscosity 6900 centistokes (–40F), 17.47 centistokes (100F), 3.50 centistokes (210F). Combustible.

dinonylphenol. $(\text{C}_9\text{H}_{19})_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Colorless liquid. Insoluble in water; soluble in common organic solvents. Combustible.

Hazard: See phenol.

Use: Solvent.

dinonyl phthalate. (DNP). $\text{C}_6\text{H}_4(\text{COOC}_9\text{H}_{19})_2$. Ester of nonyl alcohol.

Properties: Colorless liquid. Bp 205–220C (1 mm Hg), d 0.979 (25C), refr index 1.4871 (20C), viscosity 55.3 centistokes (37.7C), flash p 420F (215C). Combustible.

Use: General-purpose, low-volatility plasticizer for vinyl resins; pure grade as stationary liquid phase in chromatography.

dinoseb. Legal label name (air) for 2,4-dinitro-6-*sec*-butylphenol.

DIOA. Abbreviation for diisooctyl adipate.

dioctadecylamine. See distearylamine.

2,6-dioctadecyl-*p*-cresol. See 2,6-distearyl-*p*-cresol.

dioctadecyl ether. See distearyl ether.

dioctadecyl sulfide. See distearyl sulfide.

3,3'-dioctadecyl thiodipropionate. See distearyl thiodipropionate.

dioctyl adipate. See di(2-ethylhexyl) adipate.

dioctylamine. See di-(2-ethylhexyl)amine.

dioctylaminoethanol. See di(2-ethylhexyl)ethanolamine.

dioctyl azelate. See di(2-ethylhexyl) azelate.

dioctyl chlorophosphate. (dioctyl phosphorochloridate). $(C_8H_{17}O)_2P(O)Cl$.

Properties: Water-white liquid. D 0.991 (25C), refr index 1.445 (25C). Decomposes on distillation. Soluble in common inert organic solvents; insoluble in water. Combustible.

Use: Intermediate, insecticide.

di(*n*-octyl-*n*-decyl) adipate. (DNODA).

Properties: Clear, oily liquid. D 0.912–0.920 (25/25C); refr index 1.443–1.447 (25C). Combustible.

Use: Low-temperature plasticizer.

di(*n*-octyl-*n*-decyl) phthalate. (DNODP).

Properties: Clear, oily liquid; slight odor. Acidity (as phthalic acid) 0.01% max, d 0.968–0.977 (25/25C), crystallizing point –30C, bp 232–267C (4 mm Hg), flash p 426F (219C). Combustible.

Use: Plasticizer for polyvinyl chloride and other vinyls.

dioctyldi(lauroyloxy)stannane.

CAS: 3648-18-8. mf: $C_{40}H_{80}O_4Sn$.

Hazard: Mildly toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

di-*n*-octyldiphenylamine.

$C_8H_{17}C_6H_4NHC_6H_4C_8H_{17}$.

Properties: Light-tan powder. D 0.99, mp 80–90C. Soluble in benzene, gasoline, acetone, and ethylene dichloride; insoluble in water.

Use: Antioxidant for petroleum-based and synthetic lubricants and plastics.

dioctyldiphenyltin.

CAS: 103270-64-0. mf: $C_{28}H_{44}Sn$.

Hazard: A severe skin and eye irritant.

dioctyl ether. $(C_8H_{17})_2O$.

Properties: Liquid. Fp –7C, bp 291.7C, d 0.805 (17/4C) refr index 1.4329 (24C). Combustible.

Grade: 95% (min) purity.

Use: Electrical insulator, water repellent, mold lubricant, antistatic agent, intermediate.

dioctyl(ethylenedioxybis(carbonylmethylthio))stannane. See di-*n*-octyltin ethyleneglycol dithioglycolate.

dioctyl fumarate. See di(2-ethylhexyl) fumarate.

dioctyl hexahydrophthalate. See di(2-ethylhexyl) hexahydrophthalate.

dioctylmethylamine. See *n*-methyl-*n*-octyl-1-octanamine.

dioctyloxostannane.

CAS: 870-08-6. mf: $C_{16}H_{32}OSn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

***N,N'*-di-*n*-octyl-*p*-phenylenediamine.**

$C_8H_{17}(NHC_8H_{17})_2$.

Properties: Colorless liquid. Bp approximately 390C, d 0.912 (15C), pour p –4C, flash p (Pensky-Martin) 395F (201C) refr index 1.5129 (20C). Completely miscible with methanol, pentane, and benzene; vap press (absolute) 0.33 mm Hg (150C). Combustible.

Use: Antioxidant, antiozonant for gasoline, mercaptans, synthetic rubber.

dioctyl phosphite. (dioctyl phosphonate).

$(C_8H_{17}O)_2P(O)H$.

Properties: Water-white liquid. Bp 150–155C (2–3 mm Hg), d 0.929 (25C), refr index 1.4418 (25C).

Soluble in common organic solvents. Combustible.

Use: Solvent, antioxidant, intermediate.

dioctylphosphoric acid. See di(2-ethylhexyl)phosphoric acid.

dioctyl phosphorochloridate. See dioctyl chlorophosphate.

dioctyl phthalate. See di(2-ethylhexyl) phthalate.

di(2-octyl) phthalate. See dicapryl phthalate.

dioctyl sebacate. See di(2-ethylhexyl) sebacate.

dioctylsodium sulfosuccinate. (di(2-ethylhexyl)sodium sulfosuccinate; sodium dioctyl sulfosuccinate).

CAS: 577-11-7.

$C_8H_{17}OOCCH_2CH(SO_3Na)COOC_8H_{17}$. An anionic surface-active agent.

Properties: White, waxlike solid; characteristic odor. Soluble in water; freely soluble in alcohol, glycerol, carbon tetrachloride, acetone, xylene. Saponification value 240–253; stable in acid and neutral solutions; hydrolyzes in alkaline solutions.

Derivation: By esterification of maleic anhydride with 2-ethylhexyl alcohol followed by addition of sodium bisulfite.

Hazard: Use in food products restricted.

Grade: NF, FCC.

Use: Food additive (processing aid in sugar industry, stabilizer for hydrophilic colloids), wetting agent, dispersant, emulsifier.

dioctylstannylene maleate. See dioctyltin maleate.

dioctyl succinate. See di(2-ethylhexyl) succinate.

dioctyl sulfide. (dioctyl thioether). (C_8H_{17})₂S.

Properties: Liquid. Mp 0.5C, bp 180C (10 mm Hg), d 0.8419 (17/17C), refr index 1.4606 (20C). Combustible.

Grade: 95% (min) purity.

Use: Organic synthesis (formation of sulfonium compounds).

dioctylthioacetoxystannane.

CAS: 15535-79-2. mf: $C_{18}H_{36}O_2SSn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dioctyl thioether. See dioctyl sulfide.

dioctyl thiopropionate. See 3,3'-(2-ethylhexyl) thiodipropionate.

dioctylthioxostannane.

CAS: 3572-47-2. mf: $C_{16}H_{34}SSn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

di-*n*-octyltin bis(butyl maleate). See bis(butoxymaleoyloxy)dioctylstannane.

di-*n*-octyltin bis(2-ethylhexyl maleate).

CAS: 10039-33-5. mf: $C_{40}H_{72}O_8Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

di-*n*-octyltin bis(2-ethylhexyl) mercaptoacetate.

CAS: 15571-58-1. mf: $C_{36}H_{72}O_4S_2Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dioctyltinbis(isooctyl maleate). See bis(isooctyloxymaleoyloxy)dioctylstannane.

di(*n*-octyl)tin-*S,S'*-bis-(isooctylmercaptoacetate).

CAS: 26401-97-8. A heat stabilizer for PVC food-packaging materials, especially for clear plastic bottles. Approved by FDA for all foods except malt beverages, carbonated soft drinks, milk, and other dairy products.

di-*n*-octyltin bis(laurylthioglycolate).

CAS: 69226-43-3. mf: $C_{44}H_{88}O_4S_2Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dioctyltin bis(monolauryl maleate). See di(*n*-octyl)tin bis-*o,o'*-(monolauryl maleate).

di(*n*-octyl)tin bis-*o,o'*-(monolauryl maleate).

CAS: 7324-77-8. mf: $C_{48}H_{88}O_8Sn$.

Hazard: A severe eye irritant.

di-*n*-octyltindichloride.

CAS: 3542-36-7. mf: $C_{16}H_{34}Cl_2Sn$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin).

di-*n*-octyltin dilaurate. See dioctyl-di(lauroyloxy)stannane.

di-*n*-octyltin dimonobutylmaleate. See bis(butoxymaleoyloxy)dioctylstannane.

di-*n*-octyltin ethyleneglycol dithioglycolate.

CAS: 69226-44-4. mf: $C_{22}H_{42}O_4S_2Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dioctyltin maleate.

CAS: 16091-18-2. mf: $C_{20}H_{36}O_4Sn$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

di-*n*-octyltin mercaptide.

CAS: 58229-88-2.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dioctyltin oxide. See dioctylloxostannane.

di-*n*-octyltin sulfide. See dioctylthioxostannane.

dioctyltin thioglycolate. See dioctylthioacetoxystannane.

“Diofan” [BASF]. TM for dispersions of vinylidene copolymers for paper coating.

diol. Synonym for glycol or dihydric alcohol.

diolefin. (diene; alkadiene). An aliphatic compound (olefin) containing two double bonds, e.g., butadiene.

DIOP. Abbreviation for diisooctyl phthalate.

DIOS. Abbreviation for diisooctyl sebacate.

dioxacarb. (*O*-(1,3-dioxolan-2-yl)-phenyl-*N*-methylcarbamate).
CAS: 6988-21-2.

Properties: Mp 114–15C, vap press 0.3 mm Hg (20C). Soluble in water to 0.6%.

Use: Control cockroaches and stored-product pests.

1,4-dioxacyclotridecane-5,13-dione. See ethylene azelate.

1,5,2,4-dioxadithiepane-2,2,4,4-tetraoxide.

CAS: 99591-73-8. mf: C₃H₆O₆S₂.

Hazard: A poison by ingestion.

1,4-dioxane. (diethylene ether; 1,4-diethylene dioxide; diethylene oxide; dioxyethylene ether; dioxane).

CAS: 123-91-1.

Properties: Colorless liquid; ethereal odor. Bp 101.3C, fp 10–12C, d 1.0356 (20/20C), 8.61 lb/gal (20C), refr index 1.4221 (20C), flash p 65F (18.3C) (ASTM OC), autoign temp 356F (180C). Stable. Miscible with water and most organic solvents.

Derivation: (1) From ethylene glycol by treatment with acid; (2) from β,β-dichloroethyl ether by treatment with alkali.

Grade: Reagent, technical, spectrophotometric, scintillation.

Hazard: Flammable, dangerous fire risk, may form explosive peroxides. Toxic by inhalation, absorbed by skin, a carcinogen. TLV: (technical grade) TWA 25 ppm; animal carcinogen.

Use: Solvent for cellulose and wide range of organic products; lacquers; paints; varnishes; paint and varnish removers; wetting and dispersing agent in textile processing, dye baths, and stain and printing compositions; cleaning and detergent preparations; cements; cosmetics; deodorants; fumigants; emulsions; polishing compositions; stabilizer for chlorinated solvents; scintillation counters.

4,9-dioxadodecane-1,12-diamine. See 1,4-bis(3-aminopropoxy)butane.

dioxathion. (“Delnav”; *p*-dioxane-2,3-diylethyl phosphorodithioate).

CAS: 78-34-2. C₄H₆O₂[SPS(OC₂H₅)₂]₂.

Properties: Viscous, brown liquid. Fp –20C, bulk d

1.257 (26C). Insoluble in water; soluble in hexane. The technical material is a mixture of *cis* and *trans* isomers.

Hazard: Toxic by inhalation, ingestion, and skin absorption; cholinesterase inhibitor; use may be restricted. TLV: TWA 0.2 mg/m³; not classifiable as a human carcinogen

Use: Insecticide, miticide.

2,2-dioxide. See propane sultone.

dioxin. The commonly accepted, though chemically imprecise, name for the compound 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD), which is only one of more than 70 members of the family of chlorinated dioxins. It was found to be a contaminant of the herbicide 2,4,5-T (trichlorophenoxyacetic acid) some ten years after the latter was approved for use; it was then banned by FDA for most purposes. Synthesized in 1957, dioxin is a white, crystalline solid in pure form. It was present as a contaminant in defoliants used in Vietnam (Agent Orange), and its toxicity was widely publicized. Though it is undoubtedly harmful to humans, no deaths have occurred. It is a carcinogen, teratogen, and mutagen. Its toxicity to laboratory animals varies widely with the species; it is lethally toxic to guinea pigs, but hamsters appear relatively unaffected. Where soil contamination occurs, the concentration is no greater than several parts per million at most. Wastes contaminated with dioxin must be disposed of in officially approved landfills. Human toxicology is under continuing investigation.

“Dioxitol” [Shell]. TM for diethylene glycol monoethyl ether, bp 202C, d 0.990 (20/20C).

3,5-dioxo-1,2-diphenyl-4-*n*-butylpyrazolidine. See phenylbutazone.

1,3-dioxolane. (ethylene glycol formal).

CAS: 646-06-0.

 OCH₂CH₂OCH₂. A cyclic acetal.

Properties: Water-white liquid. D 1.065, bp 74C, flash p 35F (1.67C) (OC), vap press 70 mm Hg (20C) bulk density 8.2 lb/gal (20C). Soluble in water; stable under neutral or slightly alkaline conditions.

Derivation: Reaction of formaldehyde with ethylene glycol.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation and ingestion.

Use: Low-boiling solvent and extractant for oils, fats, waxes, dyes, and cellulose derivatives.

dioxolone-2. See ethylene carbonate.

dioxopurine. See xanthine.

dioxyanthraquinone. See dihydroxyanthraquinone.

dioxybenzene. See dihydroxybenzene.

1,1'-(dioxy)dimethylcyclohexanol.

CAS: 49796-88-5. mf: $C_{14}H_{26}O_4$.

Hazard: Moderately toxic by ingestion.

dioxyethylene ether. See 1,4-dioxane.

DIOZ. Abbreviation for diisooctyl azelate.

DIPA. Abbreviation for diisopropanolamine.

dipalmitylamine. (dihexadecylamine).

$(C_{16}H_{33})_2NH$.

Properties: Solid. Mp 65C, d 0.83. Slightly soluble in water.

Use: Intermediate.

dipentaerythritol.

$(CH_2OH)_3CCH_2OCH_2C(CH_2OH)_3$. Occurs in technical pentaerythritol, an off-white, free-flowing powder. The molecule contains six primary hydroxyl groups, all esterifiable. Mp 212–220C, d 1.33 (25/4C).

Use: Paints and coatings.

dipentamethylenethiuram tetrasulfide.

$[CH_2(CH_2)_4NCS]_2S_4$.

Properties: Light-gray powder. D 1.53, mp 110C min. Soluble in chloroform, benzene, acetone; insoluble in water.

Use: Ultraaccelerator for rubber.

dipentene. (cinene; limonene, inactive; *dl-p*-mentha-1,8-diene; cajeputene).

CAS: 138-86-3. $C_{10}H_{16}$. Commercial form is high in dipentene content, but also contains other terpenes and related compounds in varying amounts.

Properties: Colorless liquid; lemonlike odor. D 0.847 (15.5/15.5C), bp 175–176C, refr index 1.473 (20C), flash p 113F (45C) (CC), fp –97C, wt/gal 7.15 lb (15.5C), autoign temp 458F (236C). Miscible with alcohol; insoluble in water.

Derivation: (1) From various essential oils; (2) by close fractionation of wood turpentine; (3) by-product in making synthetic camphor.

Grade: Steam-distilled, destructively distilled.

Hazard: Moderate fire risk. Combustible.

Use: Solvent for oleoresinous products, rosin, ester gum, alkyd resins, waxes, metallic soap driers, rubber, etc.; rubber compounding and reclaiming; dispersing agent for oils, resins, resin-oil combinations, pigments, and driers; paints, enamels, lacquers, and varnishes; general wetting and dispersing agent; printing inks; perfumes; flavors; floor waxes and furniture polishes; synthetic resins, polyterpenes.

dipentene dioxide. (limonene dioxide).

CAS: 96-08-2. $C_{10}H_{16}O_2$.

Properties: Liquid. D 1.0287 (20C), bp 242C, fp –100C. Soluble in water.

Use: Intermediate for plasticizers, epoxy resins; pharmaceuticals.

dipentene glycol. See terpin hydrate.

dipentene monoxide. (limonene monoxide).

$C_{10}H_{16}O$.

Properties: Liquid. D 0.929 (20C), fp –6C, bp 75C, flash p 152F (66C). Combustible.

Use: Organic intermediate, epoxy resins.

“Dipentite” [Occidental]. TM for diphenylpentaerythritol diphosphate.

di-*n*-pentylamine. See di-*n*-amylamine.

2,5-di(*tert*-pentyl)hydroquinone. See 2,5-di(*tert*-amyl)hydroquinone.

dipentyloxostannane.

CAS: 2273-46-3. mf: $C_{10}H_{22}OSn$.

Hazard: A poison by ingestion. An eye and severe skin irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dipentyltin dichloride.

CAS: 1118-42-9. mf: $C_{10}H_{22}Cl_2Sn$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dipentyltin oxide. See dipentyloxostannane.

diphacinone. Generic name for 2-diphenylacetyl-1,3-indandione.

Use: Rodenticide.

See diphenadione.

diphemanil methyl sulfate. (4-diphenylmethylene-1,1-dimethylpiperidinium methyl sulfate).

$(C_6H_5)_2CCCH_2CH_2N(CH_3)_2CH_2CH_2 \bullet CH_3SO_4$.

Properties: White, crystalline solid; faint characteristic odor; bitter taste. Mp 189–196C. Very slightly soluble in ether; slightly soluble in alcohol, chloroform, and water; stable to heat and light; somewhat hygroscopic; pH (1% solution) 4.0–6.0.

Grade: NF.

Use: Medicine (anticholinergic).

diphenadione. (2-diphenylacetyl-1,3-indandione; diphacinone).

CAS: 82-66-6. $C_{23}H_{16}O_3$.

Properties: Yellow, odorless crystals or crystalline powder. Mp 145–147C. Practically insoluble in water; soluble in acetone and acetic acid.

Hazard: Prevents blood clotting.

Use: Medicine (anticoagulant), rodenticide.

diphenamid.

CAS: 957-51-7. Generic name for *N,N*-dimethyl-2,2-diphenylacetamide. $(C_6H_5)_2CHCON(CH_3)_2$.

Properties: White solid. Mp 134.5–135.5C. Soluble in water, acetone, dimethyl formamide, and phenyl "Cellosolve."

Hazard: Toxic by ingestion.

Use: Herbicide, plant growth regulator.

diphenatril. See diphenylacetonitrile.

diphenhydramine hydrochloride. [(2-benzhydryloxy)-*N,N*-dimethylethylamine hydrochloride]. $(C_6H_5)_2CHOCH_2CH_2N(CH_3)_2 \cdot HCl$.

Properties: White, crystalline powder; odorless; darkens slowly on exposure to light. Mp 166–170C. Solutions practically neutral to litmus paper; soluble in water, alcohol, and chloroform; very slightly soluble in benzene and ether.

Grade: USP.

Hazard: Toxic. Prescription only; do not use with alcohol or other central nervous system depressants.

Use: Medicine (antihistamine).

diphenic acid. (2,2'-biphenyldicarboxylic acid). $HOOC-C_6H_4-C_6H_4-COOH$.

Properties: White needles. Mp 228–229C. Soluble in hot water.

Use: Synthesis of dyes, detergents, pharmaceuticals.

diphenolic acid. See 4,4-bis(4-hydroxyphenyl)pentanoic acid.

diphenprofos. See *o*-(4-((4-chlorophenyl)thio)phenyl) *o*-ethyl *s*-propyl.

diphenyl. (biphenyl).

CAS: 92-52-4. $C_6H_5C_6H_5$. Several crystalline forms are known.

Properties: White scales; pleasant odor. D approximately 1, mp 70C, bp 256C, flash p 235F (112.7C). Soluble in alcohol and ether; insoluble in water.

Derivation: (1) By slowly passing benzene through a red-hot iron tube; (2) by heating bromobenzene and sodium with subsequent distillation.

Hazard: Toxic. TLV: 0.2 ppm.

Use: Organic synthesis, heat-transfer agent, fungistat in packaging of citrus fruit, plant disease control, manufacture of benzidine, dyeing assistant for polyesters.

See chloridiphenyl.

diphenylacetic acid. $(C_6H_5)_2CHCOOH$.

Properties: Colorless, crystals; odorless. Bp (sub-

limes), mp 147.8–148.2C. Soluble in hot water, alcohol, ether, chloroform.

diphenylacetonitrile. (diphenatril).

$(C_6H_5)_2CHCN$.

Properties: Yellow, crystalline powder. Mp 73–73.5C. Insoluble in water; very soluble in alcohol.

Use: Preparation of diphenylacetic acid, synthesis of antispasmodics, herbicide.

diphenylacetylene. See tolan.

2-diphenylacetyl-1,3-indandione. See diphenadione.

diphenylamine. (DPA; *N*-phenylaniline).

CAS: 122-39-4. $(C_6H_5)_2NH$.

Properties: Colorless to grayish crystals. D 1.159, mp 52.85C, bp 302C, flash p 307F (152.7C), autoign temp 1173F (633C). Soluble in carbon disulfide, benzene, alcohol, and ether; insoluble in water. Combustible.

Derivation: By heating equal formula weights of aniline and aniline hydrochloride in an autoclave. The product is boiled with dilute hydrochloric acid to remove the unaltered aniline, and the residue is distilled.

Grade: Technical, refined, flake, and fused.

Hazard: Toxic by ingestion. TLV: TWA 10 mg/m³; not classifiable as a human carcinogen.

Use: Rubber antioxidants and accelerators, solid rocket propellants, pesticides, dyes, pharmaceuticals, veterinary medicine, storage preservation of apples, stabilizer for nitrocellulose, analytical chemistry.

diphenylamine chloroarsine. (adamsite;

phenarsazine chloride; DM).

CAS: 578-94-9. $C_6H_4(AsCl)(NH)C_6H_4$.

Properties: Canary-yellow crystals. Sublimes readily, d 1.65, mp 195C, bp 410C (decomposes). Insoluble in water; soluble in benzene, xylene, carbon tetrachloride.

Derivation: By heating diphenylamine with arsenic trichloride.

Hazard: Toxic by inhalation and ingestion, strong irritant.

Use: Military poison gas, wood treating.

diphenylaminochloroarsine.

CAS: 16758-26-2. mf: $C_{12}H_{10}AsClN$.

Hazard: Low toxicity by inhalation. Human systemic effects. A mild eye irritant.

9,10-diphenylanthracene. $C_{14}H_8(C_6H_5)_2$.

Properties: Crystals. Mp 248–250C. Insoluble in water and alcohol; slightly soluble in toluene.

Grade: Purified.

Use: Primary fluor or wavelength shifter in soluble scintillators.

1,2-diphenylbenzene. See *o*-terphenyl.

1,4-diphenylbenzene. See *p*-terphenyl.

***m*-diphenylbenzene.** See *m*-terphenyl.

diphenylbenzidine. $C_6H_5HNC_6H_4C_6H_4NHC_6H_5$.

Properties: White powder. Mp 242C. Insoluble in water; slightly soluble in alcohol and acetone; soluble in boiling toluene, sensitive to light.

Derivation: Diphenylamine and fuming sulfuric acid.

Hazard: May be carcinogenic; see benzidine.

Use: Determination of zinc and nitrites.

2,7-diphenylbenzo(lmn)(3,8)phenanthroline-1,3,6,8(2h,7h)-tetrone.

CAS: 24259-89-0. mf: $C_{26}H_{14}N_2O_4$.

Hazard: A poison.

2,5-diphenyl-*p*-benzoquinone.

$C_6H_5C_6H_2O_2C_6H_5$.

Properties: Greenish-yellow solid. Mp 210–214C. Slightly soluble in styrene, benzene, acetone, and ethyl acetate.

Use: Polymerization inhibitor.

diphenylbis(phenylthio)stannane. See diphenylbis(phenylthio)tin.

diphenylbis(phenylthio)tin.

CAS: 1103-05-5. mf: $C_{24}H_{20}S_2Sn$.

Properties: White solid from EtOH. Mp: 65–66°. Sol in org solvs.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

diphenylbromoarsine. $(C_6H_5)_2AsBr$.

Properties: White crystals. Mp 54–56C.

Derivation: (1) By heating hydrobromic acid and diphenylarsenious oxide together for approximately 4 h at 115–120C; (2) by action of arsenic tribromide on triphenyl arsine at 300–350C.

Hazard: Strong irritant. A poison.

1,3-diphenyl-2-buten-1-one. See dyponone.

diphenylcarbazine. $(C_6H_5NHNH)_2CO$.

Properties: White crystals or flakes. Mp 173C, decomposes in light. Insoluble in water; soluble in alcohol and acetone.

Derivation: Phenylhydrazine and urea.

Use: Determination of chromium and other metals, indicator for iron.

diphenylcarbinol. See benzhydrol.

diphenyl carbonate.

CAS: 102-09-0. $(C_6H_5O)_2CO_3$.

Properties: White, crystalline solid. Can be halogenated and nitrated in characteristic manner. Readily undergoes hydrolysis and ammonolysis. Bp 302C,

mp 78C, d 1.1215 (87/4C). Soluble in acetone, hot alcohol, benzene, carbon tetrachloride, ether, glacial acetic acid, and other organic solvents; insoluble in water.

Grade: Technical.

Use: Plasticizer and solvent, synthesis of polycarbonate resins.

diphenyl, chlorinated. See chlorodiphenyl.

diphenylchloroarsine.

CAS: 712-48-1. $(C_6H_5)_2AsCl$.

Properties: Colorless crystals or dark-brown liquid that slowly becomes semisolid. D 1.363 (40C) (solid), or 1.356 (45C) (liquid), bp 333C (in CO₂ atm), mp 41C. Decomposed by water (slowly). Soluble in carbon tetrachloride, chloropicrin, phenyldichloroarsine; almost insoluble in water.

Derivation: Benzene and arsenic trichloride are heated in presence of aluminum chloride.

Hazard: A poison. Toxic by inhalation, strong irritant to tissue.

Use: Military poison gas.

diphenyldecyl phosphite. $(C_6H_5O)_2POC_{10}H_{21}$.

Properties: Nearly water-white liquid. D 1.023 (25/15.5C), mp 18C, refr index 1.5160 (25C). Combustible.

Use: Chemical intermediate, stabilizer for polyvinyl and polyolefin resins.

2,4'-diphenyldiamine. (2,4'-biphenyldiamine; 2,4'-diaminodiphenyl). $C_{12}H_{12}N_2$.

Properties: Crystalline needles. Mp 45C, bp 360C. Slightly soluble in alcohol and ether.

Derivation: Reduction of azobenzene with tin and hydrochloric acid.

Use: Azo-dye manufacture, tungsten determination.

diphenyldichlorosilane.

CAS: 80-10-4. $(C_6H_5)_2SiCl_2$.

Properties: Colorless liquid. Bp 305C, fp –22C, d 1.19 (20C), refr index 1.5773 (25C), flash p 288F (142C)(COC). Readily hydrolyzed by moisture with liberation of hydrogen chloride. Combustible.

Derivation: (1) Reaction of powdered silicon and chlorobenzene in the presence of copper powder as catalyst; (2) reaction of phenylmagnesium chloride with silicon tetrachloride.

Grade: Technical.

Hazard: Strong irritant to tissue.

Use: Intermediate for silicone lubricants.

diphenyldi-*n*-dodecylsilane.

$(C_6H_5)_2Si(C_{12}H_{25})_2$.

Properties: Colorless oil.

Derivation: Reaction of didodecyldichlorosilane with phenyllithium.

Use: High-temperature lubricant.

diphenyldiimide. See azobenzene.

diphenyldimethoxysilane. $(C_6H_5)_2Si(OCH_3)_2$.

Properties: Liquid. D 1.080 (25C), bp 191C (53 mm Hg), refr index 1.5404 (25C). Soluble in acetone, benzene, methyl alcohol. Combustible.

Use: Treatment of powders, glass, paper, and fabrics.

diphenyleneimine. See carbazole.

α -diphenylenemethane. See fluorene.

diphenylene oxide. (dibenzofuran).

CAS: 132-64-9. $C_{12}H_8O$ (tricyclic).

Properties: Crystalline solid. Mp 87C, bp 288C. Insoluble in water; slightly soluble in alcohol, ether, and benzene.

Derivation: From coal tar.

Use: Insecticide.

uns-diphenylethane. (1,1-diphenylethane).

$(C_6H_5)_2CHCH_3$.

Properties: Colorless liquid. Bp 286C, d 1.004 (20C), fp -21.5C, flash p 264F (129C). Soluble in chloroform, ether, carbon disulfide. Combustible.

Derivation: Action of acetaldehyde on benzene in presence of concentrated sulfuric acid.

Use: Solvent for nitrocellulose, organic synthesis.

sym-diphenylethane. (bibenzyl; dibenzyl; 1,2-diphenylethane). $C_6H_5CH_2CH_2C_6H_5$.

Properties: White, crystalline needles or small plates. D 0.9782, bp 284C, mp 52C. Soluble in alcohol, chloroform, ether, carbon disulfide; insoluble in water.

Derivation: (1) By treating benzyl chloride with metallic sodium; (2) by action of benzyl chloride on benzylmagnesium chloride.

Use: Organic synthesis.

1,2-diphenylethanedione monoxime. See α -benzil monoxime.

diphenyl ether. See diphenyl oxide.

diphenylethylene. See stilbene.

***N,N*-diphenylethylenediamine.** (ethylidiphenyldiamine). $C_6H_5NHCH_2CH_2NHC_6H_5$.

Properties: Cream-colored solid. D 1.14, softening point 64C. Insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline.

Use: Antioxidant in rubber compounding.

diphenylglycolic acid. See benzilic acid.

***N,N'*-diphenylguanidine.** (DPG; melaniline). CAS: 102-06-7. $HN:C(NHC_6H_5)_2$.

Properties: White powder; bitter taste; slight odor. D 1.13, mp 147C, decomposes above 170C. Soluble in ethanol, carbon tetrachloride, chloroform, hot benzene, and toluene; slightly soluble in water.

Derivation: Treatment of aniline with cyanogen chloride.

Hazard: Toxic by ingestion.

Use: Basic rubber accelerator, primary standard for acids.

1,6-diphenylhexatriene. (DPH).

$C_6H_5HC:CHCH:CHCCH:CHC_6H_5$.

Use: Wavelength shifter in scintillation-counting solutions.

diphenyl isodecyl phosphite. See isodecyl diphenyl phosphite.

diphenyl isophthalate. (DPIP).

$C_6H_5OOC C_6H_4COOC C_6H_5$.

Use: Manufacture of polybenzimidazoles, high-temperature-resistant polymers.

diphenyl ketone. See benzophenone.

diphenylmethane. (benzylbenzene).

$(C_6H_5)_2CH_2$.

Properties: Long, colorless needles. D 1.0056, mp 26.5C, bp 264.7C, flash p 266F (130C). Soluble in alcohol, chloroform, hexane, benzene, ether; insoluble in liquid ammonia. Combustible.

Derivation: Condensation of benzyl chloride or methylene chloride and benzene in presence of aluminum chloride.

Hazard: Toxic by ingestion.

Use: Organic synthesis, dyes, perfumery.

diphenylmethane-4,4'-diisocyanate. (MDI; methylene-di-*p*-phenylene isocyanate; methylene(bisphenyl isocyanate)).

CAS: 101-68-8. $CH_2(C_6H_4NCO)_2$.

Properties: Light-yellow, fused solid. Solidification point 37C, d 1.197 (70C). Soluble in acetone, benzene, kerosene, and nitrobenzene. Combustible.

Derivation: *p,p'*-Diaminodiphenylmethane and phosgene.

Hazard: Toxic by inhalation of fumes; strong irritant. TLV: 0.005 ppm.

Use: Preparation of polyurethane resin and spandex fibers; bonding rubber to rayon and nylon.

diphenyl methanephosphonate. See methanephosphonic acid, diphenyl ester.

diphenylmethanol. See benzhydrol.

diphenylmethyl bromide. (benzhydryl bromide). $BrCH(C_6H_5)_2$.

Properties: Solid. Mp 45C, bp 193C (26 mm Hg). Decomposes in hot water; soluble in alcohol; very soluble in benzene.

Hazard: Strong irritant to eyes and skin.

Use: Organic synthesis.

diphenylmethylchlorosilane.

Properties: Colorless liquid. D 1.107 (25C), bp 295C, flash p 135F (57.2C). Combustible.

Derivation: Grignard reaction of diphenyldichlorosilane with methylmagnesium chloride.

Hazard: Moderate fire risk.

Use: Intermediate, end stopper for silicone oils.

diphenylnaphthylenediamine.

Properties: Silvery, crystalline plates. Mp 164C. Slightly soluble in alcohol; insoluble in water.

Derivation: By heating 2,7-dihydroxynaphthalene with aniline and aniline hydrochloride.

Use: Organic synthesis.

diphenylnitrosamine. See *p*-nitrosodiphenylamine.

diphenylolpropane disodium salt. See Bisphenol A disodium salt.

2,5-diphenyloxazole. (DPO).

Properties: White, fluffy solid. Mp 70–72C.

Grade: Scintillation.

Use: Primary fluor used in scintillation counters or as wavelength shifters.

diphenyl oxide. (phenyl ether; diphenyl ether).

CAS: 101-84-8. $(\text{C}_6\text{H}_5)_2\text{O}$.

Properties: Colorless crystals or liquid, geranium-like odor. D 1.072–1.075, mp 27C, bp 259C, flash p 239F (115C), autoign temp 1144F (618C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Reaction of bromobenzene and sodium phenate heated under pressure.

Grade: Technical, perfume, industrial.

Hazard: TLV: TWA 1 ppm; STEL 2 ppm (vapor). Toxic by inhalation of vapor.

Use: Perfumery, particularly soaps; heat-transfer medium resins for laminated electrical insulation; chemical intermediate for such reactions as halogenation, acylation, alkylation, etc.

diphenylpentaerythritol diphosphite.

Properties: White powder. Bp 190–200C (0.1 mm Hg).

Use: Stabilizer for resins.

N,N'-diphenyl-*m*-phenylenediamine.

Properties: Crystalline needles. Mp 95C. Soluble in hot alcohol; insoluble in water. Combustible.

Derivation: By heating resorcinol with aniline in presence of calcium chloride and zinc chloride.

Use: Organic synthesis.

N,N'-diphenyl-*p*-phenylenediamine.

(DPPD).

CAS: 74-31-7. $(\text{C}_6\text{H}_5)_2\text{NH}_2\text{C}_6\text{H}_4$.

Properties: Gray powder. D 1.28, mp 145–152C, purity 9.2% (min). Insoluble in water; soluble in acetone, benzene, monochlorobenzene, and isopropyl acetate. Combustible.

Use: Flex-resistant antioxidant in rubbers; stabilizer; polymerization inhibitor; retards copper degradation; intermediate for dyes, drugs, plastics, and detergents.

diphenyl phosphite. $(\text{C}_6\text{H}_5\text{O})_2\text{PHO}$.

Properties: Clear, straw-colored liquid. Mp 12C, refr index 1.557 (25C), d 1.221 (25/15C), flash p 350F (176C). Combustible.

Use: Synthesis of organophosphorus compounds.

diphenyl phthalate. $\text{C}_6\text{H}_4(\text{COOC}_6\text{H}_5)_2$.

Properties: Yellow-white powder. Mp 68–70C, d 1.28 (20C), flash p 435F (224C), bp 405C, bulk d 10.68 lb/gal, refr index 1.572 (74C). Combustible.

Use: Plasticizer for ethylcellulose, nitrocellulose, and various polymers.

diphenyl-4-piperidylmethane.

Properties: White solid. Fp 99.7C min. Difficultly soluble in water; readily soluble in dilute acids; moderately soluble in organic solvents.

Use: Intermediate.

1,3-diphenyl-1,3-propanedione. See dibenzoylmethane.

N,N'-diphenylpropylenediamine.

Properties: Clear, deep-reddish-brown, thick liquid. D 1.07, stable in storage. Insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline; readily disperses. Combustible.

Use: Antioxidant for rubber latexes.

diphenylpropylphosphine. See propyldiphenylphosphine.

diphenyl-4-pyridylcarbinol.

Properties: White solid. Mp 236–241C. Very weak base. Slightly soluble in most organic solvents; soluble in hot glacial acetic acid.

Use: Intermediate.

diphenyl-4-pyridylmethane.

Properties: White to pale-yellow, crystalline solid. Bp 234C, fp 123C min. Moderately soluble in common organic solvents.

Use: Intermediate.

diphenylstannane.

CAS: 1011-95-6. mf: $C_{12}H_{12}Sn$.

Properties: Yellow powder; air and light sensitive crystals from pet ether/ CH_2Cl_2 . Mp: 226°. Insol in water.

Hazard: A poison. Ignites on contact with fuming nitric acid. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical.

diphenylsilanediol. $(C_6H_5)_2Si(OH)_2$.

Properties: White solid. Mp 130–150.

Derivation: Hydrolysis of diphenyldichlorosilane.

Use: Silicone chemical.

p,p'-diphenylstilbene.

$C_{14}H_{10}$

Properties: Crystals. Mp 308–310C.

Use: In purified form as fluor in plastic scintillators.

diphenylsulfone. $C_{12}H_{10}SO_2$.

Properties: White, crystalline solid. Mp 128C, bp 376C. Soluble in benzene and hot alcohol; insoluble in water.

Derivation: Reaction of benzene with sulfuric acid.

Hazard: Toxic by ingestion.

Use: Larvicide and ovicide.

N,N-diphenylthiourea. See thiocarbanilide.

diphenyltin. See diphenylstannane.

diphenyltin dibromide. See dibromodiphenylstannane.

diphenyltin dichloride.

CAS: 1135-99-5. mf: $C_{12}H_{10}Cl_2Sn$.

Properties: Colorless crystals from pet ether. Decomp by water. Mp: 42°, bp: 333–337° (decomp).

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical; drug.

diphenyltin oxide polymer.

CAS: 31671-16-6. mf: $(C_{12}H_{10}OSn)_x$

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

1,3-diphenyltriazene. See diazoaminobenzene.

diphenylurea. (carbanilide).

$(NHC_6H_5)_2CO$

Properties: Colorless prisms. Soluble in alcohol and ether; very slightly soluble in water. D 1.239, mp 235C, bp 260C.

Use: Organic synthesis.

diphenyl-*o*-xenyil phosphate.

$(C_6H_5O)_2(C_6H_5C_6H_4O)PO$.

Properties: D 1.20 (20C), refr index 1.582–1.590 (60C), boiling range 250–285C (5 mm Hg), flash p 225F. Insoluble in water. Combustible.

Use: Plasticizer.

diphosgene. Legal label name (air) for trichloromethyl chloroformate.

diphosphopyridine nucleotide. See nicotinamide adenine dinucleotide phosphate.

diphosphoric acid. See pyrophosphoric acid.

dipicrylamine. See hexanitrodiphenylamine.

dipicryl sulfide. Legal label name (air) for hexanitrodiphenyl sulfide.

1,3-di-4-piperidylpropane. (4-di-pip).

$(HNC_5H_9)CH_2CH_2CH_2C_5H_9NH$.

Properties: Solid. Fp 67C, bp 329C. Soluble in water. A stable, high-boiling, strong organic base.

Use: Intermediate.

diploid. A full set of genetic material consisting of paired chromosomes, one from each parental set. Most animal cells, except the gametes, have a diploid set of chromosomes. The diploid human genome has 46 chromosomes.

See haploid.

diploid life cycle. Occurs when the only multicellular stage in an organism's life cycle is diploid.

dip oil. Tar acid oil with about 25% tar acids.

Use: An insecticide for animals.

dipole, electric. An assemblage of atoms or subatomic particles having equal electric charges of opposite sign separated by a finite distance; for instance, the hydrogen and chlorine atoms of a hydrogen chloride molecule.

See polar.

dipole moment, electric. In many molecules, the atoms and their electrons and nuclei are so arranged that one part of the molecule has a positive electrical charge while the other part is negatively charged. Such a molecule, therefore, becomes a small electric dipole. Electric fields cause the molecule to turn in one direction or another, depending on the orientation of the field. The dipole moment (μ) is the distance between the charge centers multiplied by the quantity of charge in electrostatic units.

See polar.

dipotassium dimagnesium trisulfate. See magnesium potassium sulfate.

dipotassium orthophosphate. See potassium phosphate, dibasic.

Dippel's oil. (bone oil). Dark-brown oil obtained from distillation of bones. Contains pyridine and substituted pyridines.

Use: To denature alcohol.

dipropargyl. (bipropargyl; 1,5-hexadiyne).
HC:CCH₂CH₂C:CH.

Properties: Colorless liquid. D 0.805, bp 85C, fp -6.0C. Soluble in alcohol; insoluble in water.

Hazard: Moderate fire and explosion risk when exposed to heat.

di-2-propenylamine. See diallylamine.

di-*n*-propylamine.

CAS: 142-84-7. (C₃H₇)₂NH.

Properties: Water-white liquid; amine odor. Fp -63C, d 0.741 (20C), bp 109C., bulk density 6.1 lb/gal, flash p 63F (17.2C) (TOC). Soluble in water.

Hazard: Flammable, dangerous fire risk. Skin irritant.

Use: Intermediate.

2-(*r,s*)-(di-*n*-propylamino)-6-(4-methoxyphenylsulfonylmethyl)-1,2,3,4-tetrahydronaphthalene.

CAS: 175442-95-2. mf: C₂₄H₃₃NO₃S.

Hazard: A poison.

dipropylene glycol. (2,2'-dihydroxydopropyl ether).

CAS: 110-98-5.

Properties: Colorless, slightly viscous liquid. D 1.0252 (20/20C), bp 233C, vap press 0.01 mm Hg (20C), flash p 280F (137.7C) (OC), bulk d 8.5 lb/gal (20C), coefficient of expansion 0.00073 K⁻¹ (20C), viscosity 1.07 cP (20C). Soluble in toluene and water. Combustible.

Grade: Technical.

Use: Polyester and alkyd resins, reinforced plastics, plasticizers, solvent.

dipropylene glycol dibenzoate. (Benzoflex; 3,3'-oxydyl-1-propanol dibenzoate).

CAS: 94-51-9. C₂₀H₂₂O₅.

Properties: Light-colored liquid. D 1.1271 (20/20C), bulk d 9.4 lb/gal (20C), bp 250C (10 mm Hg), mp 200C, viscosity 227 cP (20C). Insoluble in water. Combustible.

Use: Plasticizer.

dipropylene glycol dimethyl ether.

CAS: 111109-77-4. mf: C₈H₁₈O₃.

Hazard: A reproductive hazard.

dipropylene glycol dipelargonate.

[CH₃(CH₂)₇COOCH(CH₃)CH₂]₂O. A synthetic lubricant.

dipropylene glycol monomethyl ether.

(dipropylene glycol methyl ether).

CAS: 34590-94-8. CH₃OC₃H₆OC₃H₆OH.

Properties: Colorless liquid. D 0.950 (25/4C), bp 189C, 74.5C (10 mm Hg), fp -80C, viscosity 3.5 cP (25C), refr index 1.419 (25C), flash p 185F (85C) (OC). Completely miscible with water, VM&P naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene, and petroleum ether. Combustible.

Hazard: Toxic. Absorbed by skin. TLV: 100 ppm.

Use: Solvent, hydraulic brake fluids.

dipropylene glycol monosalicylate. (dipropylene glycol monoester; salicylic acid dipropylene glycol monoester).

C₃H₆(COOC₆H₄OH)OC₃H₆OH.

Properties: Light-colored oil; fragrant odor. D 1.16 (40C), refr index approximately 1.52. Soluble in alcohol, insoluble in water.

Use: UV light—screening agents, protective coatings, plasticizers.

dipropylentriamine. See 3,3'-iminobispropylamine.

dipropyl ketone. (butyrene; 4-heptanone).

CAS: 123-19-3. (CH₃CH₂CH₂)₂CO.

Properties: Stable, colorless liquid; pleasant odor. Bp 143.7C, fp -32.1C, d 0.8162 (20/20C), bulk d 6.79 lb/gal (20C), refr index 1.4068 (20C), surface tension 25.2 dynes/cm (25C) viscosity 0.0074 cP (20C), vap press 5.2 mm Hg (20C), flash p 120F (40C) (CC). Insoluble in water; miscible with many organic solvents.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by inhalation, skin irritant. TLV: 50 ppm.

Use: Solvent for nitrocellulose, raw and blown oils, resins, and polymers; lacquers; flavoring.

dipropylmethane. See *n*-heptane.

dipropyloxostannane.

CAS: 7664-98-4. mf: C₆H₁₄OSn.

Properties: Polymeric powder.

Hazard: A poison by ingestion. An eye and severe skin irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dipropyl phthalate. C₆H₄(COOC₃H₇)₂.

Properties: Colorless liquid. D 1.071 (25C), refr index 1.494 (25C), bp 129–132C (1 mm Hg). Solubility in water 0.015% by weight. Combustible.

Use: Plasticizer.

di-*n*-propyltin bismethanesulfonate.

CAS: 73927-87-4. mf: C₃H₂₀O₆S₂Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

dipropyltin dichloride. See dichlorodipropylstannane.

diprotic acid. An acid having two dissociable protons, for example, H_2SO_4 or oxalic acid.

“Dipterex” [Bayer]. TM for trichlorfon.

α, α' -dipyridyl. (2,2'-bipyridine).

CAS: 366-18-7. $(C_5H_4N)_2$.

Properties: White crystals. Mp 69–70C, bp 272–273C. Slightly soluble in water; soluble in alcohol, ether, benzene, chloroform, petroleum ether.

Grade: Reagent.

Use: Reagent for iron determination.

2,2-dipyridylamine. $(C_5H_4N)_2NH$.

Properties: Solid. Fp 92.3C (min), bp 222C (50 mm Hg). Very slightly soluble in water. Combustible.

Derivation: From 2-aminopyridine.

Use: Intermediate.

dipyridylethyl sulfide. $[C_5H_4N(CH_2)_2]_2S$.

Properties: Liquid. D 1.113 (25C), refr index 1.5841 (20C), mp 1.5C. Soluble in water and common organic solvents. Combustible.

Grade: Technical (95% purity).

Use: Synthesis of pharmaceuticals, dyestuffs, rubber chemicals, flotation agents, insecticides, fungicides, plasticizers, textile assistants, herbicides, oil additives, rust preventives, and pickling inhibitors.

2,2'-dipyridyl ketone hydrazone.

CAS: 2215-33-0. mf: $C_{11}H_{10}N_4$.

Hazard: Moderately toxic by ingestion and skin contact. A mild eye irritant.

diquat. (6,7-dihydrodipyrido(1,2-a:2',1'-c)pyrazidinium salt; 1,1'-ethylene-2,2'-dipyridinium dibromide).

CAS: 2768-72-9. $(C_5H_4NCH_2)_2Br_2$.

Properties: Yellow crystals. Mp 335C. Soluble in water.

Hazard: Toxic by ingestion. TLV: total dust 0.5 mg/m³; respirable dust 0.1 mg/m³.

Use: Herbicide and plant growth regulator, sugarcane flowering suppressant.

direct bordeaux. See C.I. direct red 13, disodium salt.

direct black 32. See C.I. direct black 32, trisodium salt.

direct brown 2. See C.I. direct brown 2.

direct dye. See dye, direct.

directed evolution. A laboratory process used on isolated molecules or microbes to cause mutations and identify subsequent adaptations to novel environments.

directed mutagenesis. Alteration of DNA at a specific site and its reinsertion into an organism to study any effects of the change.

directed sequencing. Successively sequencing DNA from adjacent stretches of chromosome.

direct scarlet. See C.I. direct red 23.

dirosorcinol. (tetrahydroxydiphenyl).

$(OH)_2C_6H_3C_6H_3(OH)_2$.

Properties: White to slightly yellowish, crystalline powder. Mp 310C. Slightly soluble in cold water.

Derivation: By fusing resorcinol and phenol with caustic soda.

Use: Organic synthesis.

dirosorcinolphthalein. See fluorescein.

disaccharide. A carbohydrate consisting of two covalently joined monosaccharide units. Sucrose, for example, is composed of glucose and fructose.

N, N' -disalicylidene-1,2-diaminopropane.

(N, N' -disalicylidene)propylenediamine; disalicylaminopropane; disalicylalpropylenediimine). $HOC_6H_4CH:NCH_2CH(CH_3)N:CHC_6H_4OH$.

Properties: (80% active compound) Liquid. D 1.08 (15.5/15.5C), bulk d 9.0 lb/gal, pour p 0F (–17.7C), flash p approximately 70F (21C) (TOC), viscosity 25 cs (37.7C), insoluble in water; miscible with benzene and xylene.

Hazard: Flammable, dangerous fire risk.

Use: Metal deactivator in motor fuels.

“Discoloy” [Westinghouse]. TM for an austenitic iron-base alloy containing nickel, chromium, and relatively small proportions of molybdenum, titanium, silicon, and manganese. This alloy is precipitation-hardened and was developed primarily to meet the need for improved gas-turbine disks, one of the most critical components of jet engines.

discharging agent. A substance capable of destroying a dye or mordant present within the fibers of a fabric. There are various methods of utilizing this property so that it is possible to produce a colorless figure upon a colored ground, or a colored figure upon a different-colored ground. Some examples are titanous sulfate, sodium hydrosulfide, zinc formaldehyde sulfoxylate.

See stripping (2).

Dische reaction. The reaction between the Dische reagent (diphenylamine, acetic acid, and sulfuric acid) and 2-deoxypentoses, resulting in the development of a characteristic blue color.

disease-associated genes. Alleles carrying particular DNA sequences associated with the presence of disease.

disilanyl. See silane.

disiloxane. See siloxane.

disinfectant. A substance used on inanimate objects that destroy harmful microorganisms or inhibit their activity. Disinfectants are either complete or incomplete. Complete disinfectants destroy spores as well as vegetative forms of microorganisms; incomplete disinfectants destroy vegetative forms of the organism, but do not injure spores. Some representative disinfectants are (1) mercury compounds (mercuric chloride, phenylmercuric borate); (2) halogens and halogen compounds (chlorine, iodine, fluorine, bromine, calcium and sodium hypochlorite); (3) phenols, including cresol from coal tar, *o*-phenylphenol; (4) synthetic detergents (anionic, such as sodium alkylbenzene sulfonates, and cationic, such as quaternary ammonium compounds); (5) alcohols of low molecular weight, except methanol; (6) natural products (pine oil); (7) gases (sulfur dioxide, formaldehyde, ethylene oxide). Heat and electromagnetic waves are used as disinfectants. A number of compounds (mercurous and mercuric chlorides, copper sulfate and carbonate, and a mixture of zinc oxide and zinc hydroxide) have been employed as seed disinfectants. Effectiveness of disinfectants is rated by the phenol coefficient. See antiseptic.

disk. (disc). A small thin circular section or platelet of a material, especially of a biological specimen. *Disk* is the spelling preferred by scientists.

dislocation. Any variation from perfect order and symmetry in a crystalline lattice. In some cases the imperfection is due to missing atoms, resulting in "holes" or vacancies in the lattice, or one or more atoms of another element may be present, effecting important changes in the conductivity, hardness, and other properties of the crystals. Disordered arrangement of the planes of atoms (dislocations) may also occur.
See impurity; semiconductor; hole.

disodium acetarsenate. (aricyl).
 $\text{NaOOCCH}_2\text{As}(\text{OH})\text{O}(\text{ONa})\cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water.

Derivation: By reacting sodium arsenite with sodium monochloracetate.

disodium bisethylphenyltriaminotriazine stilbenedisulfonate.

CAS: 24565-13-7. mf: $\text{C}_{36}\text{H}_{34}\text{N}_{12}\text{O}_6\text{S}_2\cdot 2\text{Na}$.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion.

2,7-disodiumdibromo-4-hydroxymercurifluorescein. See merbromin.

disodium dibutyl-*o*-phenylphenol-disulfonate.

Properties: Light-brown paste. Soluble in alcohol, acetone, dibutyl tartrate, ethylene glycol.

Use: Wetting, penetrating, and spreading agent used in kier boiling; scouring and dyeing textiles; industrial cleaners; deodorant preparations; insecticidal formulations; metal cleaning; stabilizer and wetting agent for latex used to treat cord or other fabrics.

disodium dihydrogen pyrophosphate. See sodium pyrophosphate, acid.

disodium 1,2-dihydroxybenzene-3,5-disulfonate.

(4,5-dihydroxy-*m*-benzenedisulfonic acid disodium salt, sodium catechol disulfonate). $\text{C}_6\text{H}_2(\text{OH})_2(\text{SO}_3\text{Na})_2$.

Properties: Nonhygroscopic crystals. Freely soluble in water. Produces water-soluble colored compounds with metal salts.

Use: Colorimetric reagent for iron, manganese, titanium, molybdenum.

disodium $\text{S}_2\text{S}'$ -(2-dimethylamino-1,3-propanediyl)bis(thiosulfate).

CAS: 52207-48-4. mf: $\text{C}_5\text{H}_{11}\text{NO}_6\text{S}_4\cdot 2\text{Na}$.

Hazard: A poison by ingestion.

disodium diphosphate. See sodium pyrophosphate, acid.

disodium EDTA. (ethylenediaminetetraacetic acid disodium salt.)

CAS: 139-33-3. $\text{C}_{10}\text{H}_{14}\text{N}_2\text{Na}_2\text{O}_8\cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. Freely soluble in water. Bulk density 6.5 lb/gal; pH (5% solution) between 4 and 6.

Grade: USP, FCC.

Use: Food preservative, chelating and sequestering agent.

disodium endothal. See endothal.

disodium ethylenebisdithiocarbamate.

See nabam.

disodium guanylate. See sodium guanylate.

disodium hydrogen phosphate. See sodium phosphate, dibasic.

disodium inosinate. See sodium inosinate.

disodium methylarsonate. (DMA; disodium methanearsonate; methanearsonic acid disodium salt.)

CAS: 144-21-8. $\text{CH}_3\text{AsO}(\text{ONa})_2$, sometimes with $6\text{H}_2\text{O}$.

Properties: Colorless, crystalline solid. Hygroscopic. Mp >355°C (hexahydrate mp 132–139°C). Soluble in water and methanol.

Derivation: Reaction of methyl chloride with sodium arsenate.

Grade: 55–65% powder concentration; 31.5% blend.

Hazard: Toxic by ingestion and inhalation.

Use: Pharmaceuticals, herbicide (crabgrass killer).

disodium orthophosphate. See sodium phosphate, dibasic.

disodiumphenyl phosphate. $C_6H_5Na_2PO_4$.

Properties: White powder. Soluble in water; insoluble in acetone and ether.

Use: Reagent for milk pasteurization.

disodium phosphate. See sodium phosphate, dibasic.

disodium pyrophosphate. See sodium pyrophosphate, acid.

disodium tartrate. See sodium tartrate.

dispersal. The scattering of organisms of a species, often following a major reproductive event. Spores and larvae are commonly dispersed into the environment. Pollen or gametes may also be dispersed, but in this case the intent is to target another individual so that reproduction may occur.

disperse dye. See dye, disperse.

disperse phase. See phase (2); colloid chemistry.

dispersing agent. A surface-active agent added to a suspending medium to promote uniform and maximum separation of extremely fine solid particles, often of colloidal size. True dispersing agents are polymeric electrolytes (condensed sodium silicates, polyphosphates, lignin derivatives); in non-aqueous media sterols, lecithin and fatty acids are effective.

Use: Wet-grinding of pigments and sulfur; preparation of ceramic glazes, oil-well drilling muds, insecticidal mixtures, carbon black in rubber, and water-insoluble dyes.

See emulsion; detergent.

dispersion. (1) A two-phase system where one phase consists of finely divided particles (often in the colloidal size range) distributed throughout a bulk substance, the particles being the disperse or internal phase, and the bulk substance the continuous or external phase. Under natural conditions, the distribution is seldom uniform; but under controlled conditions, the uniformity can be increased by addition of wetting or dispersing agents (surfactants) such as a fatty acid. The various possible systems are: gas-liquid (foam), solid-gas (aerosol), gas-solid (foamed plastic), liquid-gas (fog), liquid-liquid (emulsions), solid-liquid (paint), and solid-solid

(carbon black in rubber). Some types, such as milk and rubber latex, are stabilized by a protective colloid that prevents agglomeration of the dispersed particles by an adherent coating. Solid-in-liquid colloidal dispersions (loosely called solutions) can be precipitated by adding electrolytes that neutralize the electrical charges on the particles. Larger particles will gradually coalesce and either rise to the top or settle out, depending upon their specific gravity. See suspension; colloid chemistry. (2) In the field of optics, dispersion denotes the retardation of a light ray, usually resulting in a change of direction as it passes into or out of a substance, to an extent depending on the frequency. Dispersion is a critically important property of optical glass.

See refraction.

“Dispersite” [Uniroyl]. TM for water dispersions of natural, synthetic, and reclaimed rubbers and resins.

Use: Adhesives for textiles, paper, shoes, leather, tapes; coatings for metal, paper, fabrics, carpets; protective (strippable) for saturating paper, felt, book covers, tape, jute pads; for dipping tire cords. Can be applied by spraying, spreading, impregnation, saturation.

“Disperson” [Crompton & Knowles]. TM for wettable grades of zinc, calcium, and other metallic stearates.

Use: Where easy dispersion in water is desired.

“Disperson OS” [ICI]. TM for an oil-soluble emulsifying agent composed of an 8% solution of a polyethenoxy compound in isopropanol. Designed especially for dispersion of oil spills in seawater. Claimed to be biodegradable and to have low toxicity for fish and other marine organisms. Amount needed said to be from 20 to 25% of the oil volume.

displacement. Chemical change in which one element enters a compound in place of another, the latter being set free.

displacement series. See activity series.

disposal, waste. See waste control; chemical waste; radioactive waste.

disproportionation. A chemical reaction in which a single compound serves as both oxidizing and reducing agent and is thereby converted into a more oxidized and a more reduced derivative. Thus, a hypochlorite upon appropriate heating yields a chlorate and a chloride, and an ethyl radical formed as an intermediate is converted into ethane and ethylene.

See transalkylation.

dissociation. The process by which a chemical combination breaks up into simpler constituents as a result of either (1) added energy, as in the case of

gaseous molecules dissociated by heat, or (2) the effect of a solvent on a dissolved polar compound (electrolytic dissociation), e.g., water on hydrogen chloride. It may occur in the gaseous, solid, or liquid state, or in solution. All electrolytes dissociate to a greater or less extent in polar solvents. The degree of dissociation can be used to determine the equilibrium constant for dissociation, an important factor in ascertaining the extent of a chemical process.

See ionization.

dissociation constant. An equilibrium constant for the dissociation of one species into two. Examples would be the dissociation of a complex of two or more biomolecules into its components, for instance, dissociation of a substrate from an enzyme, described as a K_d ; an acid dissociating into its conjugate base and a proton, described as a K_a ; the dissociation of water into protons and hydroxide ions, described as a K_w ; or a base dissociating into its conjugate acid and a hydroxide ion, described as a K_b .

dissolution. Molecular dispersion of a solid in a liquid.

dissolved oxygen (DO). One of the most important indicators of the condition of a water supply for biological, chemical, and sanitary investigations. Adequate dissolved oxygen is necessary for the life of fish and other aquatic organisms, and is an indicator of corrosivity of water, photosynthetic activity, septicity, etc.

See biochemical oxygen demand.

dissymmetry. Lack of symmetry.

distearylamine. (dioctadecylamine).

$(C_{18}H_{37})_2NH$.

Properties: Solid. D 0.85, mp 69C. Almost insoluble in water.

Use: Intermediate.

2,6-distearyl-*p*-cresol. (2,6-dioctadecyl-*p*-cresol). $(C_{18}H_{37})_2CH_3C_6H_2OH$.

Properties: A viscous, pale-yellow liquid. Refr index 1.4825–1.4855 (25C). Soluble in most nonpolar solvents. Combustible.

Use: Antioxidant, heat stabilizer for polypropylene.

distearyldimethylammonium chloride.

See "Arosurf TA100" [*Crompton & Knowles*].

distearyl ether. (dioctadecyl ether).

$(C_{19}H_{37})_2O$.

Properties: Solid. Mp 58–60C, bp (decomposes).

Grade: 95% (min) purity.

Use: Electrical insulators, water repellents, lubricants in plastic molding and processing, antistatic agent, intermediate.

distearyl sulfide. (dioctadecyl sulfide; distearyl thioether). $(C_{18}H_{37})_2S$.

Properties: Solid. Mp 68–69C, bp (decomposes), d 0.8148 (70/4C).

Grade: 95% (min) purity.

Use: Organic synthesis (formation of sulfonium compounds).

distearyl thiodipropionate. (*e,e'*-dioctadecyl thiodipropionate; thiodipropionic acid distearyl ester). $(C_{18}H_{37}OOCCH_2CH_2)_2S$.

Properties: White flakes. Mp 58–62C. Insoluble in water; very soluble in benzene and olefin polymers. Resistant to heat and hydrolysis.

Use: Antioxidant, plasticizer, softening agent.

distearyl thioether. See distearyl sulfide.

distillate. Any product of distillation, especially of petroleum.

distillation. A separation process in which a liquid is converted to vapor and the vapor then condensed to a liquid. The latter is referred to as the distillate, while the liquid material being vaporized is the charge or distilland. Distillation is thus a combination of evaporation, or vaporization, and condensation. A simple example is the condensation of steam from a tea kettle on a cold surface. The usual purpose of distillation is purification or separation of the components of a mixture. This is possible because the composition of the vapor is usually different from that of the liquid mixture from which it is obtained. Alcohol has been so purified for generations to separate it from water, fusel oil, and aldehydes produced in the fermentation process. Gasoline, kerosene, fuel oil, and lubricating oil are produced from petroleum by distillation. It is the key operation in removing salt from seawater.

Use: Chemical analysis, in laboratory research, and for manufacture of many chemical products.

See destructive distillation; batch distillation; extractive distillation; rectification; dephlegmation; flash distillation; continuous distillation; simple distillation; reflux; fractional distillation; azeotropic distillation; vacuum distillation; molecular distillation; hydrodistillation.

disulfide bridge. A covalent cross link between two polypeptide chains formed by a cystine residue (two Cys residues oxidized together).

disulfiram. See tetraethylthiuram disulfide.

3,5-disulfobenzoic acid. $C_6H_3(HSO_3)_2COOH$.

Properties: White powder. Soluble in water.

Grade: CP.

Use: Intermediate for detergents, dyes, and pharmaceuticals.

disulfoton. (Di-Syston; *O,O*-diethyl *S*-[2-(ethylthio)ethyl]phosphorodithioate).

CAS: 298-04-4. $(C_2H_5O)_2P(S)SCH_2CH_2SCH_2CH_3$.

Properties: Pure compound: yellow liquid; technical compound: brown liquid. Bp 108C (0.01 mm Hg), d 1.144 (20C). Insoluble in water.

Hazard: Toxic by ingestion and inhalation, cholinesterase inhibitor, absorbed by skin, use may be restricted. TLV: 0.1 mg/m³.

Use: Systemic insecticide, acaricide.

disulfur decafluoride. See sulfur pentachloride.

disulfuryl chloride. See pyrosulfuryl chloride.

“Di-Syston” [Bayer]. TM for disulfoton. See disulfoton.

diterpenoid. Compound of four 2-methylbutane units, arranged according to the isoprene rule, with additional functionality such as ethylenic unsaturation and carboxyl, phenol, and alcohol groups.

ditetradecylamine. See dimyristylamine.

ditetradecyl ether. See dimyristyl ether.

ditetradecyl sulfide. See dimyristyl sulfide.

“Dithane” [Rohm & Haas]. TM for agricultural fungicides based on salts of ethylene bisdithiocarbamate. Supplied in zinc, manganese, and sodium forms as wettable powder or liquid concentration.

1,4-dithiacycloheptyliden-6-iminyl *n*-methyl-carbamate.

CAS: 24031-96-7. mf: $C_7H_{12}N_2O_2S_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

dithiadenoxide.

CAS: 153049-45-7. mf: $C_{17}H_{19}NOS_2 \cdot C_4H_4O_4$.

Hazard: Moderately toxic by ingestion.

dithiadenoxid hydrogen maleate. See dithiadenoxide.

1,4-dithiane. (diethylene disulfide).

Properties: White crystals. Bp 115.6C (60 mm Hg), mp 108C. Volatile in steam. Soluble in alcohol and ether; slightly soluble in water.

Derivation: Interaction of dichloroethyl sulfide with sodium or potassium sulfide.

Use: Organic synthesis.

dithiane methiodide. $C_4H_8S_2 \cdot CH_3I$.

Properties: Crystals. Mp 174C. Soluble in hot water; slightly soluble in alcohol; insoluble in ether.

Derivation: Interaction of dichloroethyl sulfide and methyl iodide.

dithianone. $C_{14}H_{14}N_2O_2S_2$.

Properties: Brownish solid. Mp 220C. Insoluble in water; soluble in acetone, chloroform, dioxane.

Hazard: Toxic by ingestion.

Use: Fungicide.

(((1,4-dithian-2-ylideneamino)oxy) carbonyl)methylaminothio) methylcarbamic acid, (1-methylethylidene)di-4,1-phenylene ester.

CAS: 87767-48-4. mf: $C_{31}H_{38}N_6O_8S_6$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

β - β' -dithiobisalanine. See cystine.

2,2'-dithiobis(benzothiazole). (benzothiazolyl disulfide; benzothiazyl disulfide; 2-mercapto-benzothiazyl disulfide; MBTS).

CAS: 120-78-5. $(C_6H_4SCN)_2S_2$.

Properties: Pale-yellow, free-flowing; odorless powder. D 1.54, mp 168C. Insoluble in water; sparingly soluble in organic solvents.

Use: Primary accelerator in natural and nitrile rubber and SBR, plasticizer and vulcanization retarder in neoprene type G, cure modifier in neoprene type W, oxidation cure activator in butyl. For extruded and molded goods, tires and tubes, wire and cable, sponge.

2,4-dithiobiuret. $C_4H_5N_3S_2$.

Properties: Colorless crystals. Bulk d 1.52, decomposes 181C. Partially soluble in boiling water, acetone, and “Cellosolve.”

Derivation: Reaction of dicyandiamide and hydrogen sulfide.

Hazard: Toxic by ingestion and inhalation, causes respiratory paralysis.

Use: Intermediate in manufacture of insecticides, synthetic resins; plasticizer, rubber accelerator.

dithiocarbamic acid. (aminodithioformic acid). NH_2CS_2H .

Properties: Colorless needles. Soluble in alcohol.

Use: The metal salts of the acid are important as strong (ultra) rubber accelerators, as are the thiuram disulfide derivatives. Seed disinfectant.

See thiuram; selenium diethyldithiocarbamate; zinc dibutyldithiocarbamate; zinc diethyldithiocarbamate; ziram.

2,2'-dithiodibenzoic acid. $(C_6H_4COOH)_2S_2$.

Properties: Tan to gray powder. Mp 280C (min).

Use: Intermediate for pharmaceuticals.

4,4'-dithiodimorpholine.

CAS: 103-34-4. $C_4H_8ONSSNOC_4H_8$.

Properties: Gray to tan powder. Mp 122C min, d 1.36 (25C).

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Rubber accelerator, fungicide.

1,2-dithioglycerol. See 2,3-dimercaptopropanol.

1,3-dithiolane-2,4-dione, 5,5-dimethyl-, 2-(dimethylhydrazone), 4-(*o*-((methyl-ethyl(trichloromethyl)thio)amino)carbonyl)oxime).

CAS: 71108-14-0. mf: $C_{10}H_{15}Cl_3N_4O_2S_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1,3-dithiolan-4-one, 5,5-dimethyl-2-(1,1-(dimethylethyl)imino)-, *o*-((methylamino)carbonyl) oxime.

CAS: 71108-08-2. mf: $C_{11}H_{19}N_3O_2S_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***o*-(1,3-dithiolan-2-yl)phenyl dimethylcarbamate.**

CAS: 21709-44-4. mf: $C_{12}H_{15}NO_3S_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

6,8-dithiooctanoic acid. See *dl*- α -lipoic acid.

dithiooxamide. (rubeanic acid).

$SC(NH_2)C(NH_2)_2S$.

Properties: Stable, orange-red powder. Decomposes at 140C. Insoluble in water; soluble in acetone and chloroform. Forms highly colored stable complexes with many metal ions; can form a series of *N,N'*-derivatives.

Use: Chemical intermediate.

dithiothreitol. (Cleland's reagent).

Properties: Solid. Mp 42–43.5C, 99% pure.

Available forms: 1-, 5-, 25-g quantities.

Use: Reducing agent for proteins and enzymes, biochemical research.

dithymol diiodide. See thymol iodide.

1,4-di-*p*-toluidinoanthraquinone. (FD&C

Green No. 6). $C_{14}H_6O_2(NHC_6H_4CH_3)_2$.

Properties: Solid. Mp 213C.

Use: Dye, approved for restricted use in drugs and cosmetics.

di-*o*-tolylcarbodiimide.

$(CH_3)_6C_6H_4N:C:NC_6H_4(CH_3)_2$.

Properties: Yellow to red-brown liquid; faint acrid odor. D 1.063 (25/4C), bp 140C (0.9 mm Hg), refr index 1.6248 (20C). Soluble in organic solvents

such as chloroform, carbon tetrachloride, benzene, and dioxane. Combustible.

Hazard: Toxic by inhalation and ingestion, irritant to skin and eyes.

Use: Surface coatings, textile processing, stabilizers of polyesters and urethanes, scavenger compounds for materials sensitive to active hydrogen.

***N,N*-di-*o*-tolylethylenediamine.**

$CH_3C_6H_4NHCH_2CH_2NHC_6H_4CH_3$.

Properties: Light-brown to purple granular solid. D 1.13, softens at approximately 57C. Insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline.

Use: Antioxidant for light-colored rubber goods.

di-*o*-tolylguanidine. (DOTG Accelerator).

CAS: 97-39-2. $(CH_3C_6H_4NH)_2CNH$.

Properties: White powder. D 1.10, mp 179C. Non-hygroscopic; very slightly soluble in water; soluble in warm alcohol, from which it crystallizes on cooling.

Derivation: Desulfurization of di-*o*-tolylthiourea with a lead compound in the presence of ammonia.

Hazard: Toxic by ingestion.

Use: Basic rubber accelerator.

2,7-di-*p*-tolyl naphthylenediamine.

$C_{10}H_6(NHC_6H_4CH_3)_2$.

Properties: Fine needles. Mp 237C. Sparingly soluble in alcohol; insoluble in water.

Derivation: By heating 2,7-dihydroxynaphthalene with *p*-toluidine and *p*-toluidine hydrochloride.

1,3-di-*p*-tolylphenylenediamine.

$C_6H_4(NHC_6H_4CH_3)_2$.

Properties: Long needles. Mp 137C. Soluble in alcohol and ether; insoluble in water.

Derivation: By heating resorcinol and *p*-toluidine in presence of zinc chloride.

di-*o*-tolylthiourea. (DOTT). $SC(NHC_6H_4CH_3)_2$.

Properties: Colorless, crystalline leaflets; pungent odor. Mp 144–148C. Not hygroscopic; soluble in alcohol, ether, and benzene; insoluble in water.

Derivation: By the interaction of *o*-toluidine and carbon disulfide.

Hazard: Toxic by ingestion.

Use: Metal-pickling inhibitor.

ditridecyl phthalate. (DTDP; Jayflex).

CAS: 119-06-2. $C_6H_4(COOC_{13}H_{27})_2$.

Use: Plasticizer.

ditridecyl thiodipropionate. (3,3'-tetramethylnonyl thiodipropionate; thiodipropionic acid ditridecyl ester). $(C_{13}H_{27}OOCCH_2CH_2)_2S$.

Properties: Colorless liquid. D 0.932 (25C). Insoluble in water; soluble in most organic solvents. Combustible.

Use: Stabilizer, plasticizer, and softening agent for plastics; lubricant additive.

diuretic. A drug that promotes water elimination from the body via kidney function.

diuron. (3-(3,4-dichlorophenyl)-1,1-dimethylurea).

CAS: 330-54-1. $C_6H_3Cl_2NHCON(CH_3)_2$.

Properties: White, crystalline solid. Mp 159C, vap press 2×10^{-7} mm Hg (30C). Very low solubility in hydrocarbon solvents; approximately 42 ppm at 25C in distilled water. Stable toward oxidation and moisture; decomposes at 180C.

Hazard: Toxic. TLV: 10 mg/m³.

Use: Preemergence herbicide, sugarcane flowering suppressant.

divalent carbon. See carbene.

divanadyl tetrachloride. See vanadyl chloride.

divinylacetylene. $H_2C:CHC:CCH:CH_2$. Trimer of acetylene formed by passing it into a hydrochloric acid solution containing a metallic catalyst.

Use: Intermediate in manufacture of neoprene.

divinylbenzene. (DVB; vinylstyrene).

CAS: 1321-74-0. $C_6H_5(CH:CH_2)_2$. Exists as *o*-, *m*- and *p*-isomers. The commercial form contains the three isomeric forms together with ethylvinylbenzene and diethylbenzene.

Properties: (Pure *m*-isomer) Water-white liquid, easily polymerized. Bp 199.5C, fp -66.90C, d 0.9289 (20C), viscosity 1.09 cP (20C), refr index 1.5772 (20C), flash p 165F (73.9C). (Divinylbenzene 55%) Pale-straw-colored liquid. Fp -87C, bp 195C, d 0.918 (25/25C). Insoluble in water; soluble in methanol and ether. Combustible.

Grade: 50–60%, 20–25%.

Hazard: Velocity of polymerization involves an explosion risk. If uninhibited, store at <90F (32.3C). Toxic by inhalation. TLV: 10 ppm.

Use: Polymerization monomer for special synthetic rubbers, drying oils, ion-exchange resins, casting resins, and polyesters. *Note:* Should contain inhibitor when stored or shipped.

divinyl ether. Legal label name for vinyl ether.

divinyl oxide. See vinyl ether.

3,9-divinylspirobi-*m*-dioxane. (3,9-divinyl-2,4,8,10-tetraoxaspirodecane).

$[CH_2:CHCH(OCH_2)_2]_2C$. Bicyclic.

Properties: Liquid. Mp 42C, 120C (2 mm Hg), d 1.251 (20/20C), flash p 290F (143C) (COC). Slightly soluble in water. Combustible.

Use: Intermediate and monomer.

divinyl sulfide. $(CH_2:CH)_2S$.

Properties: Mobile liquid; unpleasant odor. Polymerizes readily. D 0.9174 (15C), bp 85–86C. Combustible.

Derivation: Interaction of dichlorodiethyl sulfide and an alcoholic solution of potassium hydroxide.

Grade: Technical.

divinyl sulfone. $CH_2:CHSO_2CH:CH_2$.

Properties: Liquid. D 1.1788 (20/20C), bp 234C, fp -26C, soluble in water, flash p 255F (124C). Combustible.

Use: Monomer used in manufacture of polymers with diols, urea, and malonic esters; shrinkage control agent (textiles).

divinyln tin dichloride.

CAS: 7532-85-6. mf: $C_4H_6Cl_2Sn$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation. A severe eye irritant.

dixanthogen.

CAS: 502-55-6. $(C_2H_5OC\equiv S)_2S_2$.

Properties: Yellow crystals; strong odor. Mp 30C. Insoluble in water; soluble in benzene and ether.

Use: Herbicide, insecticide, parasiticide.

di-*o*-xenyphenyl phosphate.

$(C_6H_4C_6H_4O)_2(C_6H_5O)PO$.

Properties: Liquid. D 1.20 (60C), refr index 1.603–5 (60C), boiling range 285–330C (5 mm Hg), flash p 250F (121C). Insoluble in water. Combustible.

Use: Plasticizer.

di-*p*-xylylene. $(-CH_2C_6H_4CH_2-)_2$.

Properties: Stable, white crystals. Mp 280C.

Derivation: Pyrolysis of *p*-xylene at 398C in presence of steam. An organic quench (benzene or toluene) gives the dimer in yields of 10–15%.

Use: Parylene resins.

dixylylethane. (DXE). $[C_6H_5(CH_2)_2]_2HCCH_3$.

Properties: Colorless liquid. Bp 315C, pour p -34C, flash p 323F (162C), d 0.97.

Use: Dielectric fluid, heat-transfer medium, solvent, chemical intermediate.

DKP. Abbreviation for dipotassium phosphate. See potassium phosphate, dibasic.

DL (DL). A prefix indicating that a compound contains equal parts of D and L stereoisomers. Small capitals are often used to indicate the right- and left-handed structure of such molecules; they do not indicate rotation.

See *dl*; racemic substance.

dl. (dl). A prefix denoting a crystal that rotates the plane of polarized light equally to both left and right, resulting in optical inactivity. The symbol \bar{n} is preferably used.

"DLC" [Natrochem]. TM for dry liquid concentrate. Designates any of hundreds of oils and resins which have been partitioned that inert carrier

- to yield a free-flowing powder, 65% to 75% active powder.
Use: Activators, plasticizers, polymers, waxes, resins, tackifiers, processing aids.
- DM.** See diphenylamine chloroarsine.
- D2M.** Diethylene glycol dimethyl ether.
Use: Anhydrous reaction medium for organometallic syntheses.
- DMA.** Abbreviation for dimethylamine or disodium methyl arsonate.
- DMAC.** Abbreviation for dimethyl acetamide.
- DMPMA.** Abbreviation of dimethylaminopropylmethacryl amide.
- DMB.** Abbreviation for dimethoxybenzene.
See hydroquinone dimethyl ether.
- DMC.** (1) Abbreviation for dichlorophenylmethylcarbinol.
See di(*p*-chlorophenyl)ethanol. (2) Abbreviation for β -dimethylaminoethyl chloride hydrochloride.
- DMDT.** Abbreviation for dimethoxydiphenyltrichloroethane.
See methoxychlor.
- DMF.** Abbreviation for dimethyl formamide.
- DMH.** Abbreviation for dimethylhydantoin.
- DMHF.** Abbreviation for dimethylhydantoinformaldehyde.
See methyloldimethylhydantoin.
- DMN.** See *N*-nitrosodimethylamine.
- DMNA.** See *N*-nitrosodimethylamine.
- “DMP” [Rohm & Haas].** TM for dimethylaminomethyl-substituted phenols.
Use: Chemical intermediate, curing agents for epoxy resins, antioxidants.
- DMPA.** See *O*-(2,4-dichlorophenyl)-*O*-methyl isopropylphosphoramidothioate, dimethylol propionic acid.
- DMPC.** Abbreviation for 1-dimethylamino-3-propyl chloride.
- DMSO.** Abbreviation for dimethyl sulfoxide.
- DMT.** Abbreviation for dimethyl terephthalate.
- DMU.** Abbreviation for dimethylurea and dimethylolurea.
- DNA.** Abbreviation for deoxyribonucleic acid.
- DNA bank.** A service that stores DNA extracted from blood samples or other human tissue.
- DNA chimera.** A DNA containing genetic information derived from two different DNA molecules.
- DNA cloning.** The production of large numbers of identical DNA molecules or cells from a single ancestral DNA molecule, nucleus or cell.
- DNA library.** A random collection of cloned DNA fragments designed to include all or most of the genome of a given organism; also called a genomic library.
- DNA ligase.** An enzyme that creates a phosphodiester bond between the 3' end of one DNA segment and the 5' end of another.
- DNA polymerase.** An enzyme that catalyzes template-dependent synthesis of DNA from its dNTP precursors.
- DNA probe.** See probe.
- DNA repair genes.** Genes encoding proteins that correct errors in DNA sequencing.
- DNA replicase system.** The entire complex of enzymes and specialized proteins required in biological DNA replication.
- DNA replication.** The use of existing DNA as a template for the synthesis of new DNA strands. In humans and other eukaryotes, replication occurs in the cell nucleus.
- DNase.** Deoxyribonuclease, a class of enzymes that digest DNA. The most common is DNase I, an endonuclease that digests both single and double-stranded DNA.
- DNA sequence.** The relative order of base pairs, whether in a DNA fragment, gene, chromosome, or an entire genome.
See base sequence analysis.
- DNA supercoiling.** The coiling of DNA upon itself into a more condensed structure.
- DNA transposition.** The movement of a gene or set of genes from one site in the genome to another.
- DNBP.** Abbreviation for dinitro-*o*-*sec*-butylphenol.
- DNC.** Abbreviation for dinitrocresol.

DNFB. See 2,4-dinitrofluorobenzene.

DNOC. Abbreviation for 4,6-dinitro-*o*-cresol.

DNOCHP. Abbreviation for dinitro-*o*-cyclohexylphenol.

DNODA. Abbreviation for di(*n*-octyl,*n*-decyl) adipate.

DNODP. Abbreviation for di(*n*-octyl,*n*-decyl) phthalate.

DNP. Abbreviation for dinonyl phthalate.

DNPC. See 2,6-dinitro-*p*-cresol.

DNPD. Abbreviation for *N,N'*-di- β -naphthyl-*p*-phenylenediamine.

DNPT. Abbreviation for dinitrosopentamethylenetetramine.

DNT. Abbreviation for dinitrotoluene.

DO. Abbreviation for dissolved oxygen.

DOA. Abbreviation for dioctyl adipate. See di(2-ethylhexyl) adipate.

DOC. Abbreviation for dichromate oxygen consumed. See oxygen consumed.

***n*-docosane.** C₂₂H₄₆.
Properties: Solid. Mp 45.7C, bp 230C (15 mm Hg), d 0.778 (45/5C), refr index 1.4400 (45C). Combustible.

Grade: 95% (min) purity.

Use: Organic synthesis, calibration, temperature-sensing devices.

docosanoic acid. See behenic acid.

1-docosanol. See behenyl alcohol.

***cis*-13-docosenoic acid.** See erucic acid.

doctor knife. A metal straightedge (or equivalent) that detaches adhering product from a rotating drum or roll, or removes excess coating from a web. No cutting is involved.

Use: To scrape dried films, such as soap flakes, from drum dryers; to remove ink from printing rolls; clean residual paper stock from rolls and to provide a crimped paper for toweling, etc.; and to remove soft or sticky rubber and adhesive compositions from mixing rolls. An interesting application is the so-called air doctor (air knife); it is actually a stream of air delivered by a turbine blower through a tube with a discharge slot. Located at the take-off end of a

paper-coating machine, it efficiently levels off the coating suspension across the full width of the web.

doctor treatment. A method of improving or "sweetening" the odor of gasoline, petroleum solvents, or kerosene. A doctor solution of sodium plumbite, Na₂PbO₂, is made by dissolving litharge in sodium hydroxide solution; the feed to be sweetened is passed through the doctor solution. The action of the sodium plumbite and the lead sulfide formed from it, in conjunction with free sulfur (either naturally present or added), converts the malodorous mercaptans to the pleasanter disulfides.

dodecacarbonium chloride. C₂₃H₄₁ClN₂O.
Properties: Crystalline solid; acidic taste. Mp 145C. Insoluble in benzene and acetone; soluble in water and alcohol.

Hazard: Toxic by ingestion.

Use: Biocide, disinfectant.

dodecahydrosqualane. See squalane.

dodecamethylpentasiloxane. C₁₂H₃₆O₄S₅.
Properties: Inert, colorless liquid. Fp about -75C, bp 230C, refr index 1.40. Soluble in benzene and low-molecular weight hydrocarbons. Little change in viscosity with temperature.

Use: Silicone fluids, antifoam agent in lubricating oils.

dodecanal. See lauryl aldehyde.

***n*-dodecane.** (dihexyl).
CAS: 112-40-3. CH₃(CH₂)₁₀CH₃.

Properties: Colorless liquid. D 0.749 (20/4C), fp -10C, bp 213C, refr index 1.4221 (20C), flash p 160F (71.1C), autoign temp 400F. Soluble in alcohol, acetone, ether; insoluble in water. Combustible.

Grade: 95%, 99%, 99.7 mole %.

Use: Solvent, organic synthesis, distillation chaser, jet fuel research.

1,12-dodecanedioic acid.

HOCC₁₀H₂₀COOH. A 12-carbon, straight-chain, saturated aliphatic dibasic acid.

Properties: White, crystalline powder. Mp 130-132C. Soluble in hot toluene, alcohols, hot acetic acid; slightly soluble in hot water.

Use: Intermediate for plasticizers, lubricants, adhesives, polyesters, etc.

dodecanoic acid. See lauric acid.

***n*-dodecanol.** See lauryl alcohol.

trans-2-dodecen-1-al. mf: C₁₂H₂₂O.

Properties: Slightly yellow liquid; fatty, citruslike odor. D: 0.839-0.049, refr index: 1.462. Sol in alc, fixed oils; insol in water.

Use: Food additive.

dodecene. $C_{12}H_{24}$. Many possible isomers. See 1-dodecene; tetrapropylene; sodium dodecylbenzenesulfonate.

1-dodecene. (α -dodecylene; tetrapropylene). CAS: 6842-15-5. $H_2C:CH(CH_2)_9CH_3$. **Properties:** Colorless liquid. D 0.7600 (20/4C), fp $-33.6C$, bp 213C, refr index 1.4327 (20C). Soluble in alcohol, acetone, ether, petroleum, coal tar solvents; insoluble in water. Combustible. **Hazard:** Irritant and narcotic in high concentration. **Use:** Flavors, perfumes, medicine, oils, dyes, resins.

(e)-9-dodecenol acetate. CAS: 35148-19-7. mf: $C_{14}H_{26}O_2$. **Hazard:** Low toxicity by ingestion and skin contact. **Source:** Natural product.

dodecenylsuccinic acid. $HOOCCH(C_{12}H_{23})CH_2COOH$. **Properties:** Extremely viscous liquid. Practically insoluble in water; miscible with oil. Combustible. **Use:** Synthesis, corrosion inhibitor in oils, water-proofing.

dodecenylsuccinic anhydride. (DDS). CAS: 25377-73-5.

$C_{12}H_{23}CHCOOOCCH_2$. The normal and at least two branched-chain dodecenyls are used commercially. The following properties are those of a branched-chain compound.

Properties: Light-yellow, clear, viscous oil. Bp 180–182C (5 mm Hg), d 1.002 (25C), flash p 352F (177C) (COC), viscosity 400 cP (20C), 15.5 cP (70C). Combustible. **Use:** Alkyd, epoxy and other resins; anticorrosive agents; plasticizers; wetting agents for bituminous compounds.

dodecyl acetate. (acetate C-12; lauryl acetate). CAS: 112-66-3. $C_{12}H_{25}OOCCH_3$. **Properties:** Colorless liquid; fruity odor. D 0.860–0.862, refr index 1.430–1.433, bp 150.5–151.5C. Soluble in three volumes of 80% alcohol. Combustible. **Use:** Perfumery, flavoring.

n-dodecyl alcohol. See lauryl alcohol.

dodecyl aldehyde. See lauryl aldehyde.

dodecylaniline. $C_{12}H_{25}C_6H_4NH_2$ (probably the *p*-isomer). **Properties:** Colorless liquid. D 0.907–0.912 (25/25C), bp 340–350C. Oil-soluble aromatic amine; insoluble in water; soluble in most organic solvents. Combustible. **Hazard:** See aniline. **Use:** Intermediate.

dodecylbenzene. (detergent alkylate). $C_{12}H_{25}C_6H_5$. A commercial blend of isomeric, predominantly monoalkyl benzenes. The side chains are saturated, averaging 12 carbon atoms. Flash p 285F (140C). Combustible. **Derivation:** Alkylation of benzene with isomeric dodecenes, obtained usually by polymerization of propylene. **Hazard:** Toxic by ingestion. **Use:** Detergents of ABS or LAS type. Linear (normal) dodecylbenzene is called sodium dodecylbenzenesulfonate. See tetrapropylene; sodium dodecylbenzenesulfonate.

dodecylbenzenesulfonic acid. (DDBSA). See sodium dodecylbenzenesulfonate.

dodecylbenzenesulfonic acid triethanolamine salt. See triethanolamine dodecylbenzene sulfonate.

dodecylbenzyl mercaptan. $C_{12}H_{25}C_6H_4CH_2SH$. Offered as branched-chain isomers. **Properties:** Light-yellow oil; unpleasant odor. Bp approximately 150C (0.5 mm Hg). Soluble in acetone, benzene, and heptane; insoluble in water and alcohol. Combustible. **Hazard:** Irritant.

Use: Polymerization modifier, intermediate, metal-cleaning and polishing compounds. See -thiol.

n-dodecyl bromide. See lauryl bromide.

6-dodecyl-1,2-dihydro-2,2,4-trimethylquinoline. $C_{12}H_{25}C_9H_3N(CH_3)_3$. **Properties:** Dark viscous liquid. D 0.93 (45C). Combustible. **Use:** Rubber antioxidant (flex-cracking).

dodecylmethyl(2-phenoxyethyl)ammonium bromide. See domiphen bromide.

n-dodecylguanidine acetate. See dodine.

n-dodecyl mercaptan. (DDM). $C_{12}H_{25}SH$. Many isomers of dodecyl mercaptan are possible, and a variety of these occur in the technical material known as *tert*-dodecyl mercaptan, or lauryl mercaptan, or simply dodecyl mercaptan. See lauryl mercaptan. **Properties:** (*n*-isomer) Colorless liquid. Bp 143C, refr index 1.4589, flash p 262F (127C). Soluble in ether and alcohol; insoluble in water. Combustible. See -thiol.

4-dodecyloxy-2-hydroxybenzophenone. $C_{12}H_{25}OC_6H_3(OH)C(O)C_6H_5$. **Properties:** Pale-yellow flakes. Setting point 43C. Soluble in polar and nonpolar organic solvents. **Use:** UV light inhibitor in plastics.

dodecylphenol.

CAS: 27193-86-8. $C_{12}H_{25}C_6H_4OH$. A mix of isomers.

Properties: Straw-colored liquid; phenolic odor. D 0.94 (20/20C), flash p 325F (162.7C), boiling range 310–335C. Soluble in water. Combustible.

Hazard: See phenol.

Use: Solvent, intermediate for surface-active agents, oil additives, resins, fungicides, bactericides, dyes, pharmaceuticals, adhesives, rubber chemicals.

dodecyltrichlorosilane.

CAS: 4484-72-4. $C_{12}H_{25}SiCl_3$.

Properties: Colorless to yellow liquid. Bp 288C, d 1.026 (25/25C), refr index 1.4521 (25C). Readily hydrolyzed with liberation of hydrogen chloride.

Derivation: By Grignard reaction of silicon tetrachloride and dodecylmagnesium chloride.

Hazard: Strong irritant to tissue.

Use: Intermediate for silicones.

dodecyltrimethylammonium chloride.

$C_{12}H_{25}N(CH_3)_3Cl$.

Properties: White liquid. Surface tension 0.1% in water, 33 dynes/cm (25C). Soluble in water and alcohol.

Use: Germicides, fungicides, textile fiber softeners, cationic emulsifiers, flotation reagents, mildew proofing.

dodine. (*N*-dodecylguanidine acetate).

CAS: 2439-10-3.

$C_{12}H_{25}NHC(:NH)NH_2 \cdot CH_3COOH$.

Properties: Crystals. Mp 136C. Soluble in hot water and alcohol.

Hazard: Strong irritant to eyes and skin at >50% concentration.

Use: Fungicide.

DOE. Abbreviation for the U.S. Department of Energy.

Doebner-Miller reaction (Beyer method for quinolines). Synthesis of quinolines from primary aromatic amines and α,β -unsaturated carbonyl compounds in acid catalysis. The carbonyl compounds may be prepared in situ from two molecules of aldehyde or an aldehyde and methyl ketone. The latter is known as the Beyer method.

Doebner reaction. Formation of substituted cinchoninic acids from aromatic amines on heating with aldehydes and pyruvic acid.

Doering-LaFlamme allene synthesis.

Treatment of an olefin with bromoform in the presence of an alkoxide and reaction of the 1,1-dibromocyclopropane with an active metal to produce an allene in which a carbon atom is inserted between the carbon atoms of the original olefinic double bond.

DOF. See di(2-ethylhexyl) fumarate.

 β -dolabrin.

CAS: 4570-11-0.

Properties: A minor component of *Thujopsis dolabrata* SIEB. et ZUCC. var. *hondai* MAKINO mf: $C_{10}H_{12}O_2$.

Hazard: A poison.

Dollo's law. The rule that any substantial evolutionary change is virtually irreversible because genetic changes are not likely to be reversed in an order exactly opposite to the order in which they originally developed.

dolomite. $CaMg(CO_3)_2$. A carbonate of calcium and magnesium.

Properties: Color gray, pink, white; vitreous luster. D 2.85, Mohs hardness 3.5–4; good cleavage in three directions. Similar to calcite but less soluble in acids (reacts with acid when powdered or with hot acid). Noncombustible.

Use: Refractory for furnaces; manufacture of magnesium compounds and magnesium metals; as building material; in fertilizers; stock feeds; papermaking; ceramics; mineral wool; removal of sulfur dioxide from stack gases.

dolphin oil. See porpoise oil.

DOM. A hallucinogenic drug.

Use: Restricted by FDA.

See di(2-ethylhexyl) maleate.

domain. A distinct structural unit of a polypeptide. Domains may have separate functions and some are known to fold as independent, compact units, such as the Fc and Fab regions of an antibody molecule.

dominant. An allele that is almost always expressed, even if only one copy is present. See gene; genome.

domiphen bromide. (dodecyl dimethyl[2-phenoxyethyl]-ammonium bromide).

$C_{12}H_{25}OC_2H_4N(C_2H_5)_2(CH_3)_2Br$. A quaternary ammonium salt.

Properties: Crystals. Mp 112C. Soluble in water and organic solvents.

Use: Medicine (antiinfective).

Donnan hydrolysis. When a neutral salt in water exchanges its cation for hydrogen ions from the water to make the latter alkaline.

donor. An atom that furnishes a pair of electrons to form a covalent bond or linkage with another atom, called the acceptor.

See bond, chemical; Lewis electron theory.

DOP. Abbreviation for dioctyl phthalate.
See di(2-ethylhexyl) phthalate.

L-dopa. See L-dihydroxyphenylalanine.

dope. (1) Sizing formulation consisting of solutions of nitrocellulose, cellulose acetate, or other cellulose derivations applied to crepe yard to set the twist and assist creping, and to leather to form a high-gloss finish. (2) A combustible, such as wood pulp, starch, sulfur, etc., used in "straight" dynamites. (3) A trace impurity introduced into ultrapure crystals to obtain desired physical properties, especially electrical properties. Examples: erbium oxide doped with thulium for use as laser crystals; germanium or silicon doped with boron or arsenic for use as semiconductors.

Doppler effect. A shift toward longer or shorter wavelengths for waves reaching an observer when the source of the waves is moving away from or toward the observer.

dormancy. A period of suspended growth and metabolic activity. Many plants, seeds, spores, and some invertebrates become dormant during unfavorable conditions.

dormant oil. (refined mineral oil).

Properties: Viscosity 90–150 s (Saybolt 100F). Unsulfonable residue of 50–70%.

Use: As insecticide.

dormant spray. Agricultural insecticidal spray applied during winter or early spring when plant is dormant.

dosimetry, radiation Measurement of the amount of radiation delivered to the body of an individual. The permissible dose is the quantity of radiation that may be received by an individual over a given period with no detectable harmful effects. For X- or γ -ray exposure the permissible dose is 0.3 roentgen/week, measured in air. All workers with radioactive materials are expected to wear some device for detecting incident radiation. A dosimeter based on fiber optics has been developed for possible application in radiation therapy.

See rad; rem.

DOT. Abbreviation for Department of Transportation, the agency responsible for the shipping regulations for hazardous products in the U.S.

dot blot. A technique for measuring the amount of one specific DNA or RNA in a complex mixture. The samples are spotted onto a hybridization membrane (such as nitrocellulose or activated nylon, etc.), fixed and hybridized with a radioactive probe. The extent of labeling (as determined by autoradiography and densitometry) is proportional to the con-

centration of the target molecule in the sample. Standards provide a means of calibrating the results.

DOTC. See di-*n*-octyltindichloride.

DOTG. Abbreviation for di-*o*-tolylguanidine.

dotriacontane. (dicetyl). $\text{CH}_3(\text{CH}_2)_{30}\text{CH}_3$

Properties: Crystals. D 0.823, bp 310C, mp 70C.

Use: Research.

DOTT. Abbreviation for di-*o*-tolylthiourea.

double bond. See unsaturation.

double decomposition. (double displacement, double replacement, metathesis). Reaction of two compounds to form two new compounds.

double displacement. See double decomposition.

double helix. The natural coiled conformation of two complementary, antiparallel DNA chains by the formation of A-T and G-C base pairs.

double layer, electric. See electric double layer.

double membrane. In mitochondria and plastids, there is a two-layered membrane which surrounds the organelle. This is believed to be the result of endosymbiosis, with the outer membrane coming from the eukaryotic cell, and the inner membrane belonging to the original prokaryote, which was "swallowed".

double replacement. See double decomposition.

double salt. A hydrated compound resulting from crystallization of a mixture of ions in aqueous solution. Common examples are the alums, made by crystallizing from solution either potassium or ammonium sulfate and aluminum sulfate; Rochelle salt (potassium sodium tartrate), made from a water solution of potassium acid tartrate treated with sodium carbonate; and Mohr's salt (ferrous ammonium sulfate), crystallized from mixed solutions of ferrous sulfate and ammonium sulfate.

See nickel ammonium sulfate.

doublet. A quantum state of a system with a spin of 1/2.

"Doverphos" [Ashland]. TM for tris(nonylphenyl)phosphite.
CAS: 58968-53-9.

Available forms: Liquid.

Use: In rubber, vinyl stabilizers, and various polymers as an antioxidant.

- "Dowanol" [Dow].** TM for a series of glycol monoethers.
Use: Solvents, intermediates for plasticizers, bactericidal agents, and fixatives for soap and perfumes.
- "Dowclene" [Dow].** TM for a series of solvents for specialized cleaning. A stabilized emulsion of caustic soda, a detergent, and a sequestering agent. EC: A colorless liquid, fp -56.6, bp 77-122C, d 1.381. WR: Inhibited 1,1,1-trichloroethane.
- "Dow Corning" [Dow Corning].** TM for a wide range of silicone and polysiloxane products including emulsions, lubricants, greases, mold-release agents, laminating polymers, electrical varnishes, and heat-resistant coatings.
- "Dowetch" [Dow].** TM for magnesium photoengraving sheet, plate, and extruded tube. Also applied to chemicals used in the one-step engraving process.
- "Dowex" [Dow].** TM for a series of synthetic ion-exchange resins made from styrene-divinylbenzene copolymers having a large number of ionizable or functional groups attached to this hydrocarbon matrix. These functional groups determine the chemical behavior and types of ion-exchange resin. The strong-acid cation resins are capable of exchanging cations, for example, sodium for calcium and magnesium, as in softening water. The strong-base anion resins are capable of exchanging anions.
- "Dowfax 9N" [Dow].** TM for a series of nonylphenolethylene oxide adducts.
Use: Surfactants; textiles, pulp and paper, leather, latex paint.
- "Dowflake" [Dow].** TM for calcium chloride, 77-80%, in a special flake form.
- "Dowfrost" [Dow].** TM for a heat-transfer medium consisting of inhibited propylene glycol.
Use: Immersion freezing of poultry and other foods.
- "Dowfume" [Dow].** TM for a series of proprietary products used as fumigants and pesticides.
- "Dowlex" [Dow].** TM for a hybrid polyethylene of both low and high density, i.e., it has both linear and branched molecular structure. It can be used for both containers and bags. Forms available are film, injection molding, and extrusion.
- "Dowmetal" [Dow].** TM for magnesium alloys containing more than 85% magnesium.
- downcomer.** A pipe or flue that conveys gases, vapors, or condensate downward in blast furnaces, distillation towers, refineries, etc.
- downstream.** See upstream/downstream.
- "Dowtherm" [Dow].** TM for a group of liquid heat-transfer media.
- DOZ.** Abbreviation for dioctyl azelate.
 See di(2-ethylhexyl) azelate.
- DP.** Abbreviation for degree of polymerization.
- DKA.** Abbreviation for diphenylamine, also for diphenolic acid.
- DPG.** Abbreviation for diphenylguanidine.
- DPH.** Abbreviation for 1,6-diphenylhexatriene.
- DPIP.** See diphenyl isophthalate.
- DPN.** Abbreviation for diphosphopyridine dinucleotide.
 See nicotinamide adenine dinucleotide phosphate.
- DPO.** Abbreviation for 2,5-diphenyloxazole.
- DPDD.** Abbreviation for *N,N'*-diphenyl-*p*-phenylenediamine.
- Dragendorff's reagent.** (Kraut's reagent; potassium iodobismuthate).
Use: Testing alkaloids.
- Dragonic acid.** See anisic acid.
- dragon's blood.**
Properties: Deep-red, amorphous lumps. Mp 120C. Soluble in alcohol, ether, and volatile and fixed oils; insoluble in water.
Chief constituents: dracoalban, dracoresene, dracanine, and esters.
Derivation: The resin from the surface of the fruit of several species of *Daemonorops*; habitat is Indonesia and Borneo.
Use: Pigment for coloring paints, polishes, lacquers, etc.; photoengraving, to protect zinc plates from acid.
- draft sequence.** The sequence generated by the HGP as of June 2000 that, while incomplete, offers a virtual road map to an estimated 95% of all human genes. Draft sequence data are mostly in the form of 10,000 base pair-sized fragments whose approximate chromosomal locations are known.
 See sequencing; finished DNA sequence; working draft DNA sequence.
- dram.** Unit of weight used in pharmacy, equivalent to 0.125 ounce, 60 grains, or 3.888 grams.
- Dramamine.** See dimenhydrinate.
- "Drapex" [Crompton & Knowles].**
 CAS: 8013-07-8. TM for an epoxidized soybean-oil vinyl plasticizer.

Use: For food packaging.

draw. In metalworking technology, to gradually reduce the diameter of a metal rod or plastic cylinder by pulling it through perforations of successively diminishing size in a series of plates. Wire and various specialty filaments are made in this way; they may be either cold-drawn (without preheating) or hot-drawn (heated to softening point). Dies made of low-grade diamonds are often used for precision work. An analogous method is used in sheet-metal forming.

drazoxolon. (3-methyl-4-(*o*-chlorophenylhydrazono)-5-isoxazolone).

CAS: 5707-69-7. $C_{10}H_8ClN_3O_2$.

Properties: Yellowish crystals. Mp 167C. Insoluble in water, acids, and straight-chain hydrocarbons; partially soluble in chloroform, alkalies, ketones, and aromatic solvents.

Hazard: Toxic by ingestion.

Use: Antifungal agent.

“Dresinate” [Aqualon]. TM for liquid, paste, and powder forms of sodium and potassium soaps of rosins and modified rosins used as emulsifiers, detergents, and dispersants in soluble oils, cleaning compounds, and other compositions.

drevogenin a.

CAS: 10163-83-4. mf: $C_{28}H_{42}O_7$.

Hazard: A poison.

Source: Natural product.

“Drewmulse” [Drew]. TM for a series of glycerol and glycol esters, and sorbitan and polyoxyethylene sorbitan esters of fatty acids.

Use: Emulsifiers and opacifiers.

“Drewplast” [Stepan]. TM for glyceryl and polyglyceryl fatty acid esters.

Use: Slip additives for PVC and polyolefin resin films, antistatic and antifogging agent for clear plastic wraps, and as internal lubricants.

“Dricoid” [Kelco]. TM for xanthan gum blends made by galactomannan interaction.

drier. A substance used to accelerate the drying of paints, varnishes, printing inks, and the like by catalyzing the oxidation of drying oils or synthetic resin varnishes such as alkyds. The usual driers are salts of metals with a valence of two or greater, and unsaturated organic acids. The approximate order of effectiveness of the more common metals is cobalt, magnesium, cerium, lead, chromium, iron, nickel, uranium, and zinc. These are usually prepared as the linoleates, naphthenates, and resinates of the metals. Paste driers are commonly the metal salts (acetates, borates, or oxalates) dispersed in a dry oil.

See soap (2).

Note: The spelling *dryer* refers to equipment used for drying (of paper, textiles, food products, etc.).

“Drierite” [Drierite]. TM for a special form of anhydrous calcium sulfate having a highly porous granular structure and a high affinity for water. Absorbs water vapor both by hydration and by capillary action.

Grade: Regular, indicating (turns blue to red in use), “Du-Cal” (for drying air and gases).

Use: Drying of solids, liquids, gases.

drilling fluid. (drilling mud). A suspension of barytes and bentonite or attapulgite clay in either water or a petroleum oil. When circulated through oil-well drilling pipes, it acts as a coolant and lubricant and keeps the hole free from bore cuttings. To be effective, it must have a specific gravity of at least 2.0 and should be thixotropic, with appreciable gel strength. Lignosulfonates are used as thinners in the water-based type. Oil-based muds require thickening additives such as blown asphalt and metallic soaps of tall oil and rosin acids.

“Drinox” [Morton]. TM for a series of insecticides. H-34: A liquid containing 24.5% heptachlor. PX: A planter-box seed treatment containing 25% heptachlor.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Seed treatment.

“Driocel” [Engelhard]. TM for a solid, granular desiccant for drying process liquids and gases. Manufactured from a selected grade of natural bauxite, reduced to the required particle size, and thermally activated to its maximum absorbing activity. Mesh grades 4/8, 4/10, 8/14.

“Dri-Pax” [Wyeth-Ayerst]. TM for a group of silica-gel products used in packaging pharmaceuticals and similar products. Extends shelf life and deodorizes products having unpleasant odors.

dross. See slag.

“Drucomine” 9650 [Drew]. TM for a cationic fatty amino amide.

Use: Softener and finisher.

drug. (1) A substance that acts on the central nervous system, e.g., a narcotic, hallucinogen, barbiturate, or psychotropic drug; (2) A substance that kills or inactivates disease-causing infectious organisms; (3) A substance that affects the activity of a specific bodily organ or function; (4) According to the FDA, a drug is a substance “intended for use in the diagnosis, cure, mitigation, treatment or prevention of disease, or to affect the structure or function of the body.” Under this definition, high-potency preparations of vitamins A and D are classified as

drugs, though other vitamins are not; antiperspirants and suntan lotions are also considered to be drugs. The Drug Enforcement Administration is the federal agency responsible for supervision and control of the manufacture and use of drugs, especially those in class (1). The term *ethical drug* is equivalent to *prescription drug* i.e., a drug sold only on a physician's prescription. See pharmaceutical; see Appendix II for history of the industry.

“Drupene” [Drew]. TM for nonionic ethoxylated fatty alcohols, available as liquid or paste. **Use:** Detergents and penetrants.

“Drustate” [Drew]. TM for a series of cationic fatty amino amide condensates, alkyl sulfates. **Use:** Antistatic agents.

dry cell. (Leclanche cell). A primary battery having a zinc anode, a carbon (graphite) cathode surrounded by manganese dioxide, and a paste containing ammonium chloride as electrolyte. Such batteries are not reversible and therefore have a limited operating life. Their chief use is in flashlights and similar devices requiring low voltage. See battery.

dry chemical. A mixture of inorganic substances containing sodium bicarbonate (or, frequently, potassium bicarbonate) with small percentages of added ingredients to render it free-flowing and water repellent. **Use:** Fire extinguisher on fires in electric equipment, oils, greases, gasoline, paints, and flammable gases.

dry deposition. Deposition of materials from the atmosphere without the aid of rain or snow, e.g., particulates in the range of 2.5 microns as well as pollutant gases (SO₂, NO₂). See acid precipitation.

dryer. Any of numerous types of equipment used in the chemical industries to remove water from a product during processing. Space does not permit description of even a few of the great variety and multiplicity of choices available. The major types include the following:

belt	fluid-bed	screw
centrifugal	freeze	spray
convection	pan	tubular
conveyor	rotary drum	tunnel
flash	rotary tray	truck tray
	rotary vacuum	vibrating

See drying.

dry ice. See carbon dioxide.

drying. (1) Polymerization of the glycerides of unsaturated vegetable oils induced by exposure to air or oxygen. See drying oil; drier.

(2) Removal of 90–95% of the water from a material, usually by exposure to heat. Industrial drying is performed by both continuous and batch methods. The type of equipment and the temperatures used depend on the physical state of the material, i.e., whether liquid (solution or slurry), semiliquid (paste), solid units, or sheet. *Continuous drying:* The rotating-drum dryer is used for flaked or powdered products (soap flakes); a heated metal drum revolves slowly in contact with a solution of the material, the dry product being removed with a doctor knife. In paper manufacturing, drying is performed by a battery of staggered, steam-heated, revolving drums located at the dry end of the fourdrinier machine, the paper passing around the drums at high speed; the moisture content is thus reduced from 60% to about 5%. In spray drying, milk, egg white, and other liquid food products are passed through an atomizing device into a stream of hot air. In tunnel drying, the product travels on a conveyor belt through a heated chamber of considerable length. *Batch drying:* Steam-jacketed pans are used if the material is in paste or slurry form, or in removable trays placed in an oven, if in solid units (fruits, vegetables, meats, etc.). The revolving-tube dryer, used for granular solids and coarse powders, is a long, horizontal cylinder in which a current of warm air runs counter to the movement of the material. Freeze-drying is a specialized technique utilizing high vacuum and low temperatures. See dehydration; evaporation; freeze-drying.

drying oil. An organic liquid that, when applied as a thin film, readily absorbs oxygen from the air and polymerizes to form a relatively tough, elastic film. The oxidation is catalyzed by such metals as cobalt and manganese. Drying oils are usually natural products such as linseed, tung, perilla, soybean, fish, and dehydrated castor oils, but are also prepared by combination of natural oils or their fatty acids with various synthetic resins. The drying ability is due to the presence of unsaturated fatty acids, especially linoleic and linolenic, usually in the form of glycerides. The degree of unsaturation of an oil, and hence its drying ability, is expressed by its iodine number. The drying oils have the greatest capacity for iodine, and the nondrying oils the least. See drier.

“Dryspersion” [Kenrich]. TM for dry dispersion of rubber compounding chemicals in powder form. Deagglomerated and treated with nonstaining oil.

Use: Rubber compounding.

DSC. See differential scanning calorimetry.

DSMA. (disodium methanearsonate).

CAS: 144-21-8.

Use: Herbicide.

DSP. Abbreviation for disodium phosphate.
See sodium phosphate dibasic.

D-stoff See phosgene.

DTA. See differential thermal analysis.

DTBP. Abbreviation for di-*tert*-butyl peroxide.

DTBT. See bis(trifluoroacetoxy)dibutyltin.

DTDP. Abbreviation for dtridecyl phthalate.

dubnium. Db. A fermium element. Atomic number 105. Very short half-life.

“Duclean” [Du Pont]. TM for acids containing pickling inhibitors.

Use: Pickling iron and steel. No. 1: sulfuric acid, 60 degrees Bé, d 1.706, fp -10.8C. No. 2: hydrochloric acid technical, d 1.142, fp 40C.

Hazard: Corrosive liquids.

Duff reaction. The *ortho*-formylation of phenols or *para*-formylation of aromatic amines with hexamethylenetetramine in the presence of an acidic catalyst.

Duhring’s rule. Relates the vapor pressure of similar substances at different temperatures. A straight or nearly straight line results if the temperature at which a liquid exerts a particular pressure is plotted on a graph against the temperature at which some similar reference liquid exerts the same vapor pressure. Water is most frequently used as a reference liquid since its vapor pressure at various temperatures is well known.

dulcin. (4-ethoxyphenylurea).

CAS: 150-69-6. $\text{H}_2\text{NOCNHC}_6\text{H}_4\text{OC}_2\text{H}_5$. This substance should not be confused with dulcitol.

Properties: White, needle-like crystals or powder; taste approximately 200 times as sweet as sugar. Mp 173–174C. Soluble in alcohol and ether; moderately soluble in hot water.

Derivation: From *p*-aminophenol.

Use: Artificial sweetening agent, prohibited by FDA for use in foods.

dulcitol. (dulcite; dulcose). $\text{C}_6\text{H}_8(\text{OH})_6$. A sugar.

Properties: White crystalline powder; slightly sweet taste. D 1.466, mp 188.5C. Soluble in hot water; slightly soluble in cold water; very slightly soluble in alcohol.

Derivation: By hydrogenation of lactose; occurs naturally in *Melampyrum nemorosum*.

Grade: Technical, reagent.

Use: Bacteriology, medicine.

Dulong and Petit’s law. The atomic heat capacity (atomic weight times specific heat) of elementary substances is a constant whose average

value at room temperature is 6.2 cal/g K. A few elements, notably boron, carbon, and silicon, obey the law only at high temperatures.

Dumas method. Condensation of nitrogenous organic compounds with copper oxide in a stream of carbon dioxide, collection of the elementary nitrogen over aqueous potassium hydroxide, and volumetric estimation in an azotometer. Any nitrogen oxides formed are reduced by passage over a red-hot copper spiral.

dumortierite. $8\text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2 \cdot \text{B}_2\text{O}_3 \cdot \text{H}_2\text{O}$ (perhaps). A natural basic aluminum silicate, bright smalt-blue to greenish-blue in color, vitreous luster, d 3.26–3.36, Mohs hardness 7.

Occurrence: U.S. (New York, Arizona, Nevada), France, Norway.

Use: Spark-plug porcelain, special refractories.

“Duo 1 Cleaner” [General Graphics].

TM for a cleaning liquid.

Use: Cleaning compound for printing presses.

“Duon” [Phillips]. TM for engineered non-woven fabric.

Use: Automotive, consumer, home furnishings, and industrial applications.

“Duo-Sol” process. A proprietary process for refining lubricating oils by extraction with a solvent consisting of liquid propane and a cresol base.

“Duponol” [Du Pont]. TM for a series of surface-active agents based on lauryl sulfate. These have detergent, emulsifying, dispersing, and wetting properties and are used in the textile, paper, leather, cosmetic, and electroplating industries; in dental and medical preparations, and in agricultural products.

“Duracool” [Nalco]. TM for metalworking coolants and corrosion preventatives.

Use: In the machining industry.

“Duradene” [Firestone]. TM for a stereoregular copolymer of butadiene and styrene with exceptional purity, soluble in aromatics and aliphatics.

Use: Rubber products having superior abrasion resistance, good wet-skin resistance, flex-cracking resistance, and good resilience. Automotive tire treads, belt conveyors, shoe soles, and resilient products.

duralumin. A high-strength aluminum alloy, containing 4% copper, 0.5% magnesium, 0.25–1.0% manganese, and low percentages of iron and silicon. Resistant to corrosion by acids and seawater.

Use: Aircraft parts, railroad cars, boats, machinery.

“Duranickel” 301 [Inco]. TM for an alloy of 94% nickel and 4.5% aluminum.

“Duraphos” [FMC]. TM for a complex sodium-calcium-aluminum polyphosphate containing 67% phosphate.

Use: Slow-dissolving glassy phosphate.

“Duraplex” [Rohm & Haas]. TM for drying and nondrying oil-modified alkyd resins derived from phthalic anhydride, polyhydric alcohols, and vegetable oils. Air drying, baking, and nondrying grades, in solvent solution or viscous 100% resins. Produce tough, glossy, light-colored coatings with excellent durability.

Use: Primers, lacquers, and enamels; metal decorating; automotive coatings; furniture finishes; architectural enamels; inks.

“Durazone 37” [Uniroyal]. TM for 2,4,6-tris-(*N*-1,4-dimethylpentyl-*p*-phenylenediamino)-1,3,5-triazine.

Use: A nonstaining and nondiscoloring antiozonant for static and dynamic applications used in natural and synthetic rubbers.

“Durcupan” [Fluka]. TM for embedding medium for electron microscopy including water soluble and “Araldite” embedding agents.

durene. (*sym*-1,2,4,5-tetramethylbenzene).
C₆H₂(CH₃)₄.

Properties: Colorless crystals; camphorlike odor. D 0.838, mp 77C, bp 196–197C, flash p 165F (74C) (COC). Soluble in alcohol, ether, and benzene; insoluble in water; sublimes and is volatile with steam. Combustible.

Derivation: By heating *o*-xylene and methyl chloride in presence of aluminum chloride. Occurs in coal tar.

Use: Organic synthesis, plasticizers, polymers, fibers.

“Durethan” [Bayer]. TM for injection molding and extrusion-grade thermoplastic polyamide resins.

Use: For automotive components, electric components, and furniture

“Durez” [Occidental]. TM for synthetic resins, plastics, molding compositions, phenolformaldehyde resins, furfuryl alcohol resins, polyester resins, and polyurethane resins.

Use: Industrial chemicals; curing agents, rubber accelerators, plasticizers, and binders.

“Durfax EOM” [PPG]. (ethoxylated glyceryl monostearate). TM for emulsifier and dough conditioner.

Use: In bakery applications and in personal care products.

“Durite” [Borden]. TM for a series of phenol-formaldehyde resins used in the manufacture of grinding wheels, brake linings, clutch facings, lamp-base cements.

“Durobrite” [Du Pont]. TM for zinc cyanide plating brightening agents; amber liquids.

Durometer hardness. See hardness.

“Duron Microwax” [Astor]. TM for microcrystalline wax additive.

Available forms: Prills, slab, or pellets.

Use: In nonskid floor polish, mold release, hot melt, coatings, printing ink, corrosion protection, and metal-cutting fluids.

“Dursban” [Dow]. (chlorpyrifos).

CAS: 2921-88-2. TM for insecticides containing *O,O*-diethyl-*O*-3,5,6-trichloro-2-pyridyl phosphorothioate. C₉H₁₁Cl₃NO₃PS.

Hazard: Toxic. Use may be restricted. TLV: 0.2 mg/m³; toxic by skin absorption.

Use: Control of chinch bugs in Gulf Coast states, tick control on cattle and sheep in Australia.

“Dustac” [Georgia Pacific]. TM for lignin.

Available forms: Liquid and dry grades.

Use: As a dust suppressant, binder, emulsifier, viscosity reducer, sequestering agent, dispersant, and flotation aid.

“Dust-Ban” [Nalco]. TM for chemical program.

Use: In suppression of mining and road dust.

dust, industrial. Finely divided solid particles that may have damaging effects on personnel by inhalation, or that constitute a fire hazard. They are air suspensions of particles 10 microns or less in diameter, though sizes up to 50 microns may be present. Such dusts include (1) metallic particles of all types, some being more harmful than others; (2) silica, mica, talc, quartz, graphite, clays, calcium carbonate, asbestos; (3) organic materials such as chemicals, pesticides, flour or other cereals, cellulose, coal, etc. The size range of mineral dust most damaging to the lungs is between 0.5 and 2 microns. Silicosis is caused by chronic exposure to uncombined silica (quartz, cristobalite) in mines and quarries. Bag houses, dust collectors, or electrostatic precipitators can be used for dust control.

Hazard: Dust suspensions in enclosed industrial areas are a serious fire hazard regardless of the chemical nature of the dust; an explosion may be initiated by static sparks or any open flame. Threshold Limit

Values (TLV) for industrial dusts are given by the ACGIH.

See Threshold Limit Value; American Conference of Governmental Industrial Hygienists.

dusting agent. A powdery solid used as an adherent and mold-release agent in the plastics and rubber industries. Typical materials in general use are talc (soapstone), mica, slate, flour, and clay. Graphite and mica have a flat, crystalline structure which causes them to act as lubricants, and thus are especially effective in preventing sheets or slabs of hot solid mix from sticking together when stacked. See antiblock agent.

Dutch oil. See ethylene dichloride.

Dutch process. Process for making white lead. See lead carbonate, basic.

“Dutrex” [Shell]. TM for a series of aromatic hydrocarbon concentrates derived from petroleum. **Properties:** Colors ranging from light amber to black; odor slight to none; very low volatilities. Viscosity 3–10,000 cP at 210F, d approximately 1.0, **Hazard:** Flammable.

Use: Rubber processing and extending oils, plasticizer extenders for polyvinyl chloride, resin solvents, tackifier for nitrile-butadiene rubber.

Dutt-Wormall reaction. Preparation of diazoaminosulfonates by reaction of diazonium salts with aryl- or alkylsulfonamides followed by alkaline hydrolysis to the corresponding sulfinic acid of the sulfonamide and the azide.

Du Vigneaud, Vincent (1901–1978). An American biochemist who won the Nobel Prize for chemistry in 1955. His work involved the study of the metabolism of biologically significant sulfur compounds which led to the finding of transmethylation in mammalian metabolism. He isolated and proved the structure of the vitamin biotin, and synthesized penicillin, oxytocin, and the vasopressin hormone of the posterior pituitary. His education was at Rochester, Yale, St. Louis, and George Washington Universities.

DVB. Abbreviation for divinylbenzene.

DXE. See dixylylethane.

Dy. Symbol for dysprosium.

dyclonine hydrochloride. (4'-butoxy-3-piperidinopropiophenone hydrochloride). $C_{18}H_{27}NO_2 \cdot HCl$.

Properties: Crystals. Mp 175–176C. Soluble in water, alcohol, acetone, phenol.

Grade: ND.

Use: Medicine (topical anesthetic).

“Dycril” [Du Pont]. TM for a photosensitive plastic bonded to steel, aluminum, or “Cronar” base supports. Exposure to a UV light source renders exposed areas insoluble to a subsequent mild alkaline washout solution, so that a relief image of the exposed pattern remains. The depth of image is dependent on the thickness of the photosensitive plastic layer. There are eight types available.

Use: Printing plates.

“Dycron” [Dynamit Nobel].

CAS: 1344-28-1. TM for aluminum oxide.

dye, azo. See azo dye.

dye, azoic. See azoic dye.

dye, certified. See food color; FD&C color.

dye, direct. A water-soluble dye taken up directly by fibers from an aqueous solution containing an electrolyte, presumably due to selective adsorption. Usually applied to cellulosic fibers. Dyeing assistants such as sodium chloride or sodium sulfate are used to obtain a high concentration of dye on the fibers.

See dye, synthetic.

dye, disperse. A dye in any of three clearly defined chemical classes: (1) nitroarylamine; (2) azo; and (3) anthraquinone; almost all contain amino or substituted amino groups but no solubilizing sulfonic acid groups. They are water-insoluble dyes introduced as a dispersion or colloidal suspension in water and are absorbed by the fiber, after which they may remain untreated or be after-treated (diazoitized) to produce the final color. Their use is primarily for cellulose acetate, nylon, polyester, and other synthetic fibers, and for thermoplastics.

dye, fiber-reactive. A synthetic dye containing reactive groups capable of forming covalent linkages with certain portions of the molecules of natural or synthetic fibers, e.g., covalently bound azo dye on cellulose. Such dyes were not produced until 1953, when cholortriazinyl dyes were introduced. Since then, hundreds of fiber-reactive dyes for cellulose have been patented.

dyeing assistant. Any material added to a dye bath to promote or control dyeing. The action of assistants differs with the classes of dyes, but in most cases they aid in level deposition of the dye by either delaying its absorption, increasing its solubility, or assisting the dye solution to penetrate the material. Examples: sodium sulfate decahydrate, pine oils, alkylaryl sulfonates.

dye intermediate. See azo-dye intermediate.

dye, metal. An organic dye suitable for use with a metal such as aluminum or steel. Alizarin Cyanin

RR, Alizarin Green sulfur, Nigrosine 2Y, and Naphthalene Blue RS are used for this purpose.

dye, natural. An organic colorant obtained from an animal or plant source. Few of these are now in major use. Among the best-known are madder, cochineal, logwood, and indigo. The distinction between natural dyes and natural pigments is often arbitrary.
See colorant; pigment.

dye retarding agent. An additive to dye baths to prevent, by decreasing absorption of the dyes, the rapid exhaustion of the bath. Examples: sodium lauryl sulfate, sulfonated oils.

dye, solvent. Any of several organosoluble dyes used in plastics, printing inks, cosmetics, etc., as well as for polyester and other synthetic fibers. They are chemically related to disperse dyes. The solvents used are such chlorinated hydrocarbons as 1,1,1-trichloroethane, trichloroethylene, and perchloroethylene. Use of solvent dyes avoids the necessity of fine-grinding and gives ideal dispersion. (The term *solvent dye* is somewhat misleading, as it would apply equally well to dyes that are soluble in water.)

dye stuffs Synonym for dyes, the chemicals used in dyeing that impart color.
See dye entries.

dye, synthetic. An organic colorant derived from coal tar- and petroleum-based intermediates and applied by a variety of methods to impart bright, permanent colors to textile fibers. Organic dyes were first synthesized by Perkin in England (1856) and were later developed by Hofmann in Germany. Some, called *fugitive*, are unstable to sunlight, heat, and acids or bases; others, called *fast*, are not. Direct (or substantive) dyes can be used effectively without "assistants"; indirect dyes require either chemical reduction (vat type) or a third substance (mordant), usually a metal salt or tannic acid, to bind the dye to the fiber. A noteworthy development is the fiber-reactive group, wherein the dye reacts chemically with cellulose. Dyes may be either acidic or basic, and their effectiveness on a given fiber depends on this factor. Some types are soluble in water; others are not, but can be made so by specific chemical treatment. The central problem is the affinity of a dye for a fiber, and this involves both the chemical nature and the physical state of the dye, i.e., whether acidic or basic and whether colloidal, molecular, or ionic. Neither colloidal particles nor dissociated ions are accepted by a fiber; the dye must be in molecular dispersion to be effective. Further details will be found in the following entries: acetate dye, anthraquinone dye, acid dye, azo dye, alizarin, aniline, fiber-reactive dye, eosin, intermediate, resist, stilbene dye, sulfide dye. The chemical classes of coloring matters and their arrangement according to chemical structures have been designated numeri-

cally in the *Colour Index*, a British publication. See colorant; pigment.

dye, vat. See vat dye.

"Dyflor" [Dynamit Nobel]. TM for polyvinylidene fluoride.

Use: For a barrier layer material to prevent fuel permeation.

dyfonate. (fonofos).

CAS: 944-22-9. $C_6H_5SPS(C_2H_5O)_2$.

Hazard: Cholinesterase inhibitor. TLV: 0.1 mg/m³, toxic by skin absorption.

Use: Soil insecticide.

"Dylox" [Bayer]. TM for trichlorfon.

"Dylux" [Du Pont]. TM for a photosensitive paper free from silver compounds and coated with organic dyes that are activated by UV radiation. Gives good continuous tones and high resolution. Used in lithography, photoproofing, and information-handling systems. Permits instantaneous, direct recording without processing.

"Dynacerin 660" [Huls America]. TM for a liquid wax ester similar to jojoba oil.

"Dynacoll" [Huls America]. TM for a polyester for reactive hot melts.

"Dynacool" [Nalco]. TM for cooling-water dispersants.

Properties: Liquid.

Use: For prevention of fouling, scale, and microbiological deposits.

dynad. Group of atoms in which every atom is combined with neighboring atoms by forces stronger than those that join the atom to atoms belonging to other groups.

"Dynaflex" [Pecora]. TM for flexible polyurethane security sealant.

"Dynaflock" [Huls America].

CAS: 11138-49-1. TM for sodium aluminate.

dynamite. An industrial explosive detonated by blasting caps. The principal explosive ingredient is nitroglycerin (straight dynamite) or especially sensitized ammonium nitrate (ammonia gelatin dynamite) dispersed in carbonaceous materials. Diethylene glycol dinitrate, which is also explosive, is often added as a freezing point depressant. A dope such as wood pulp and an anticid such as calcium carbonate are also essential.

Hazard: Moderately sensitive to shock or heat, dynamite is a rather serious explosion hazard, also may ignite or explode as a result of contact with powerful oxidizing agents. *Note:* Use of dynamite is decreas-

ing; it may be entirely replaced by safer and more efficient explosives.
See explosive, high.

“**Dynapol**” [*Degussa*]. TM for hot-melt adhesives.

Use: Bonding or laminating of fabrics, films, foils, or leather.

“**Dynasan**” [*Degussa*]. TM for fatty acid esters.

See “Witepsol.”

dyphylline. [7-(2,3-dihydroxypropyl)theophylline; hyphylline].

CAS: 479-18-5. $C_{10}H_{14}N_4O_4$.

Properties: Crystals; bitter taste. Mp 158C. Soluble in water, alcohol, and chloroform.

Use: Medicine.

dynpnone. (phenyl β -methylstyryl ketone; 1,3-diphenyl-2-butene-1-one).

CAS: 1322-90-3. $C_6H_5COCHC(CH_3)C_6H_5$.

Properties: Stable, light-colored liquid; mild, fruity odor. Bp 340C, d 1.093 (20/20C), fp (sets to a glass approximately -30C), flash p 350F (176C). Insoluble in water. Combustible.

Use: Softening agent, plasticizer, and perfume base. High absorption of UV light, low water solubility, low evaporation rate, and good solvent action make it useful in light-stable coatings and sunscreen preparations.

dysprosia. See dysprosium oxide.

dysprosium. Dy. Rare-earth or lanthanide element having atomic number 66; aw 162.50; valence of 3; six stable isotopes.

Properties: Noncorroding metal. Does not react with moist air to form hydroxide. Mp 1407C, bp 2330C, d 8.54. Reacts slowly with water and halogen gases; soluble in dilute acids. High cross section for thermal neutrons.

Derivation: Reduction of the fluoride with calcium.
Available forms: High-purity lumps, ingots, sponge, powder.

Use: Measurement of neutron flux, reactor fuels, fluorescence activator in phosphors.
See rare earth.

dysprosium nitrate. $Dy(NO_3)_3 \cdot 5H_2O$.

Properties: Yellow crystals. Mp 88.6C (in its water of crystallization). Soluble in water.

Derivation: Treatment of oxides, carbonates, or hydroxide with nitric acid.

Grade: Up to 99.9% pure.

Hazard: Strong oxidizing agent, may ignite organic materials.

dysprosium oxide. (dysprosia). Dy_2O_3 .

Properties: White powder. Much more magnetic than ferric oxide; slightly hygroscopic, absorbing moisture and carbon dioxide from the air. D 7.81 (27/4C), mp 2340C. Soluble in acids and alcohol.

Derivation: Ignition of hydroxides and oxyacids (carbonates, oxalates, sulfates, etc.).

Use: With nickel, in cermets used as nuclear reactor control rods that do not require watercooling.

dysprosium salts. Salts available commercially are the chloride $DyCl_3 \cdot xH_2O$, fluoride $DyF_3 \cdot 2H_2O$, arsenide, antimonide, and phosphide.

Use: The last three are used as high-purity binary semiconductors.

dysprosium sulfate. $Dy_2(SO_4)_3 \cdot 8H_2O$.

Properties: Brilliant-yellow crystals. Stable at 110C and completely dehydrated at 360C. Soluble in water.

Derivation: Dissolving the hydroxide, carbonate, or oxide in dilute sulfuric acid.

Use: Atomic-weight determination.

dystetic mixture. A mix of two or more substances that has the highest possible melting point of all mixtures of these substances.

“**Dytek**” [*Du Pont*]. (2-methylpentamethylene diamine).

CAS: 15520-10-2. TM for corrosive urethanes, epoxies, polyamide fibers, films, resins, corrosion inhibitors, wet-strength resins.

“**Dytol**” [*Rohm & Haas*]. TM for aliphatic primary alcohols derived from natural fats and oils (C_{10} to C_{18}).

Use: Additives for cosmetic creams, polymerization regulators for elastomers and plastics, detergents and viscosity-index improvers for lubricating oils, finishing and softening agents for textiles, preparation of quaternary ammonium compounds, surfactants, water evaporation control, and antifoam.

E

- EADC.** Abbreviation for ethylaluminum dichloride.
- EAK.** Abbreviation for ethyl amyl ketone.
- earth.** (1) Any siliceous or claylike compound or mixture, e.g., fuller's earth, diatomaceous earth. (2) A natural metallic oxide, sometimes used as a pigment, e.g., red and yellow iron oxide, ocher, or umber. (3) An oxide of any of a series of chemically related metals that are difficult to separate from their oxides or other combined forms, specifically, rare earths, alkaline earths.
See specific entry.
- earth wax.** General name for ozocerite, ceresin, and montan waxes.
See wax.
- EASC.** Abbreviation for ethylaluminum sesquichloride.
- "Easibrom" [Nalco].** TM for microbiological control.
Use: For cooling and water systems.
- "Easperol" [Henkel].** TM for sulfated fatty alcohol-vegetable-oil mixtures.
Use: Replacement additives for sulfated sperm-oil types in production of leather.
- "Eastar" [Eastman].** TM for PETG copolyester useful in a variety of processes and applications because of its toughness, clarity, and good melt strength.
Use: For blister packaging and thermoformed containers for refrigerated/frozen foods, candies, and sundries.
- East India.** A type of fossil or semirecent resin similar to dammar. Varieties are batu, black, and pale.
Use: In spirit and oleoresinous varnishes.
- "Eastobond" [Eastman].** TM for a series of hot-melt adhesives used in the packaging industry for bonding paper, board, film, foil, and glassine.
- "Eastone" [Eastman].** TM for disperse dye-stuffs for use with acetate and nylon fibers.
- "Eastotac" [Eastman].** TM for hydrogenated C₅ aliphatic hydrocarbon tackifying resins.
Derivation: Produced from petroleum feedstock by polymerization followed by hydrogenation.
- "Easy Glide" [Swix].** TM for ski wax.
Use: For no-wax skis for better performance and to avoid icing.
- "Ebecryl 605a" [Cytec].**
CAS: 84593-14-6.
Hazard: A mild skin irritant.
Use: Industrial coating for wood, plastics, paper, and electronics including parquet and safety glass interlayers.
- ebonite.** See rubber, hard.
- ebullator.** A solid substance or surface used to prevent superheating of liquids above their boiling point.
- ebullioscope.** (ebulliscope). An instrument to determine concentration by means of boiling points of liquids.
- ebulliscope.** See ebullioscope.
- ecabet sodium.**
CAS: 86408-72-2. mf: C₂₀H₂₇O₃S•Na.
Hazard: Moderately toxic by ingestion.
- "Ecdel" [Eastman].** TM for an elastomer which imparts excellent low-temperature resistance that significantly reduces product loss due to flex cracking and shattering during cold weather distribution.
Use: Applications where low extraction of plasticizers from the product, flex crack resistance, and utility in harsh environments are required.
- echinomycin.**
CAS: 512-64-1. C₅₁H₆₄N₁₂O₁₂S₂.
Properties: Colorless crystals. Slightly hygroscopic, mp 218C. Soluble in fats, chloroform, dioxane; insoluble in water.
Use: Medicine (antibiotic).
- ECM.** See extracellular matrix.
- ecology.** The study of the interactions between plant and animal organisms and their environment; the latter is conceived to include everything that is not an intrinsic part of the organism and thus includes both living and nonliving components. Though primarily a branch of biology, ecology does involve chemistry in respect to plant and animal nutrients, metabolism, photosynthesis, etc., especially interferences that may occur in connection with these. Thus, insecticides, chemical-waste disposal, air and water pollution, oil spills, and radioac-

tive contaminants have direct bearing on the ecology of a given area.

See environmental chemistry.

economic poison. See pesticide.

economics, chemical. See chemical economics.

economizer. A device that acts like a heat exchanger whereby the heat produced by an operation is used to warm incoming air or water. It is widely used in the paper industry, in boilers, and in chemical processing. Heat recovery up to 30% is possible.

ecosystem. The organisms of an ecologic community together with the physical environment that they occupy.

“Ecozyme” [Swan]. TM for a xylanase-based enzyme that reduces chemical bleaching agents up to 25% with enhanced pulp quality.

Use: Reduces chlorinated effluent discharge levels in pulp mills.

ECTEOA-cellulose. (epichlorohydrin triethanolamine cellulose). A dry, powdered cellulose derivative containing tertiary amine groups.

Use: As an anion exchanger in chromatography. It is less basic than DEAE-cellulose and serves to separate viruses, nucleic acids, and nucleoproteins.

EDAP. See EDC (reagent).

EDB. Abbreviation for ethylene dibromide.

EDC (reagent).

CAS: 25952-53-8. mf: $C_8H_{17}N_3 \bullet ClH$.

Use: An antibiotic.

Hazard: A poison.

Edeleanu process. A solvent extraction process using liquid sulfur dioxide for the removal of undesirable aromatics from heavy lubrication oils.

edestin. A protein having a molecular weight of 310,000, obtained from hempseed. Closely similar proteins occur in seeds of pumpkin, squash, etc.

edetate. See ethylenediaminetetraacetic acid (note).

edible oil. As commonly used, the term refers to any fatty oil obtained from the flesh or seeds of plants that is used primarily in foodstuffs (margarine, salad dressing, shortening, etc.). Among these are olive, safflower, cottonseed, coconut, peanut, soybean, and corn oils, some of which may be hydrogenated to solid form. They vary in degree of unsaturation, ranging from 78% for safflower to about 10% for coconut. Castor oil, though technically edible, is not usually considered in this classifica-

tion, nor are medicinal oils derived from animal sources (cod liver, mineral oil, etc.).

Edman degradation. Sequential degradation of peptides beginning at the *N*-terminal residue based on the reaction of phenylisocyanate with the α -amino group of the terminal amino acid of the peptide chain.

EDTA. Abbreviation for ethylenediaminetetraacetic acid.

EDTAN. Abbreviation for ethylene diamine tetraacetoneitrile.

EDTA Na_4 Abbreviation for ethylene diamine tetraacetic acid tetrasodium salt.

See tetrasodium EDTA.

effect. An evaporation-condensation unit. See evaporation.

effective charge. The value of charge that, multiplied by the actual distance between two atoms of a heteropolar, diatomic molecule, gives the actual dipole moment.

effervescence. The rapid escape of gas from a liquid or a mixture.

efflorescence. Loss of combined water molecules by a hydrate when exposed to air, resulting in partial decomposition indicated by presence of a powdery coating on the material. This commonly occurs with washing soda ($Na_2CO_3 \bullet 10H_2O$), which loses almost all its water constituent spontaneously.

effluent. Any gas or liquid emerging from a pipe or similar outlet; usually refers to waste products from chemical or industrial plants, as stack gases or liquid mix.

egg. (1) A large gamete without flagellae that is fertilized by a sperm cell. An egg cell is also called an ovum. (2) A complex multicellular structure in which an animal embryo develops.

egg oil. Fatty oil obtained from egg yolk by extraction with ethylene dichloride; insoluble in water, but readily forms emulsions on strong agitation. **Use:** Ointments, cosmetic creams.

egg yolk.

Properties: Yellow, semisolid mass. D 0.95, mp 22C. High cholesterol content.

Grade: Technical, edible.

Use: Baking, dairy products, mayonnaise, pharmaceuticals, soap, perfumery.

See albumin, egg.

EHEC. Abbreviation for ethyl hydroxyethyl cellulose.

Ehrlich, Paul. (1854–1915). A native of Silesia, Ehrlich is considered the founder of the science of chemotherapy, or the treatment of diseases by chemical agents. He did fundamental work on immunity, which earned him the Nobel Prize in medicine in 1908, and also developed the famous nearsphenamine (salvarsan or 606) treatment for syphilis (1910), which was not improved upon until the discovery of penicillin.

Ehrlich-Sachs reaction. Formation of anils by the base-catalyzed condensation of compounds containing active methylene groups with aromatic nitroso compounds.

eicosamethyl nonasiloxane. $C_{20}H_{60}O_8Si_9$,
Properties: Inert liquid. Bp 173C (5 mm Hg), d 0.918. Soluble in benzene and light hydrocarbons; slightly soluble in alcohol.
Use: Silicone fluids, foam suppressor in lubricating oils.

eicosane. $C_{20}H_{42}$. Most technical eicosane is a mixture of predominantly straight-chain hydrocarbons averaging 20 carbon atoms to the molecule.
Properties: (pure *n*-eicosane): White, crystalline solid. Fp 36.7C, bp 205C (15 mm Hg), flash p 212F (100C), refr index 1.4348 (20C), d 0.778 (at melting point). Insoluble in water; soluble in ether. Can be readily chlorinated. Combustible.
Grade: Pure normal (99+%), technical.
Use: Cosmetic, lubricants, plasticizers.

eicosanoic acid. See arachidic acid.

eicosanoid. Any of a number of biochemically active compounds resulting from enzymic oxidation of arachidonic acid, e.g., prostaglandins, thromboxanes, prostacyclin, and leukotrienes. As a group, they compose what is known as the arachidonic acid cascade. They have many pharmacological and medical possibilities.
 See prostaglandin; arachidonic acid.

1-eicosanol. See arachidyl alcohol.

5,8,11,14-eicostetraenoic acid. See arachidonic acid.

eigenenergy. Quantity of energy corresponding to a time-invariant atomic state.

eigenfunction. Wave function corresponding to a state with a definite value of some quantity.

Eigen, Manfred. (1927–). A German physicist who won the Nobel Prize for chemistry in 1967. His research concerned the rate of hydrogen-ion formation through disassociation of water. He also was concerned with enzyme control. He received his degree at the University of Gottingen.

Einhorn-Brunner reaction. Formation of substituted 1,2,4-triazoles by condensation of hydrazines or semicarbazides with diacylamines in the presence of acid catalysts.

einstein. The energy acquired by a gram-molecular weight of a substance when each molecule absorbs a quantum of excitation energy.

einsteinium. Es. A synthetic radioactive element with atomic number 99 and aw 253, discovered in the debris from the 1952 hydrogen-bomb explosion. Einsteinium has since been prepared in a cyclotron by bombarding uranium with accelerated nitrogen ions, in a nuclear reactor by irradiating plutonium or californium with neutrons, and by other nuclear reactions. The element is named for Albert Einstein. It has chemical properties similar to those of the rare-earth metal holmium. Isotopes are known with mass numbers ranging from 246 to 253. Einsteinium has valence of 2, and the lowest heat of vaporization of any divalent element.
 See actinide series.

eka-. Prefix referring to element in next-lower position in the same group in the periodic system.

ekahafnium. One of the last-discovered transuranic elements; atomic number 104. It has two α -emitting isotopes (257 and 259) and possibly a third (258). The former, made by bombardment of californium-249 with carbon-12 nuclei, has a half-life of five seconds and decays into nobelium-253. The 259 isotope, made by merging a carbon-13 nucleus with californium-249, has a half-life of three sec and decays to nobelium-255.

“EkonoI” [Carborundum]. TM for an engineering plastic composed of poly-*p*-oxybenzoate. Resistant to temperatures above 600C, self-lubricating surface.
Use: In pumps handling corrosive liquids, protective coating for titanium skins on supersonic transports, disk brakes, etc.

“ELA” [Du Pont]. Brand name for elastomer lubricating agent, a mixture of phosphate esters. Light-amber liquid.
Use: Unvulcanized rubbers.

elaboration. A term used in biochemistry to describe chemical transformations within an organism resulting in formation of specific types of substances; for example, plants elaborate proteins and fats, and poisonous snakes elaborate their venom. It also refers to formation of metabolic end products such as purines and uric acid.

elaidic acid. (*trans*-9-octadecenoic acid). $CH_3[CH_2]_7HC:CH[CH_2]_7COOH$. The *trans* form of an unsaturated fatty acid of which the *cis* form is oleic acid.

Properties: White solid. D 0.8505 (79/4C), mp 43.7C, bp 288C (100 mm Hg), 234C (15 mm Hg), refr index 1.4358 (79C). Insoluble in water; soluble in alcohol, ether, benzene, and chloroform. Combustible.

Derivation: Synthesized from oleic acid by elaidinization.

Grade: Purified, 99+%.

Use: Medical research, reference standard in chromatography.

elaidinization. Originally the reaction by which oleic acid is converted into elaidic acid, but now used in a more general sense to indicate the conversion of any unsaturated fatty acid or related compound from the geometric *cis* to the corresponding *trans* form. Nitrous acid and selenium compounds are commonly used as catalysts for this reaction. The resulting *trans* acids are more stable to oxidation.

elargin.

CAS: 2169-75-7. mf: $\text{C}_{23}\text{H}_{27}\text{NO} \cdot \text{C}_6\text{H}_8\text{O}_7$.

Hazard: A poison by ingestion.

elasticity. The ability of a material to recover its original shape partially or completely after the deforming force has been removed. The small amount of deformation that is not recovered is called permanent set or permanent elongation. Among common materials, glass and some metals are virtually 100% elastic, whereas vulcanized rubber and other elastomeric substances are in the range of 90% elastic after extension to rupture. So-called perfect elasticity is a property of atoms that show no energy loss on collision.

See modulus of elasticity; stress; strain; plasticity.

elastic modulus. See modulus of elasticity.

elastin. A scleroprotein that occurs in connective tissue.

Properties: Yellow, fibrous mass. Insoluble in water, dilute acids, alkalis, salt solutions, and alcohol. Is partially digested by pepsin solution and wholly by trypsin.

“ElastoFlo” [Dow]. TM for ethylene-propylene rubber polymer.

Properties: A free-flowing granular solid.

Use: For automotive hose, tubing and extrusions, roofing membranes and gaskets.

“Elastoguard” [Milliken]. TM for an antimicrobial, anti-fatigue solution.

elastomer. As originally defined by Fisher (1940), this term referred to synthetic thermosetting

high polymers having properties similar to those of vulcanized natural rubber, namely, the ability to be stretched to at least twice their original length and to retract very rapidly to approximately their original length when released. Among the better-known elastomers introduced since the 1930s are styrene-butadiene copolymer, polychloroprene (neoprene), nitrile rubber, butyl rubber, polysulfide rubber (“Thiokol”), *cis*-1,4-polyisoprene, ethylene-propylene terpolymers (EPDM rubber), silicone rubber, and polyurethane rubber. These can be cross-linked with sulfur, peroxides, or similar agents. The term was later extended to include un-cross-linked polyolefins that are thermoplastic; these are generally known as TPO rubbers. Their extension and retraction properties are notably different from those of thermosetting elastomers, but they are well adapted to such specific uses as wire and cable coating, automobile bumpers, vibration dampers, and specialized mechanical products.

Elbs persulfate oxidation. Hydroxylation of phenols to *p*-diphenols by potassium persulfate in alkaline solution.

Elbs reaction. Formation of anthracenes by intramolecular condensation of diaryl ketones containing a methyl or methylene substituent adjacent to the carbonyl group.

elcatonin. See carbocalcitonin.

electric double layer. A diffuse aggregation of positive and negative electric charges surrounding a suspended colloidal particle which aids in maintaining its stability. According to the Gouy-Freundlich theory, advanced about 1920, a close-packed array of charges is attached to the surface of the particle while a diffuse layer of charges of opposite sign extends into the liquid. The particle is electrically neutral. There is an electrokinetic potential gradient across the double layer that is called the zeta potential. The diagram is an approximation of this phenomenon. Modifications of this theory have been introduced in recent years, notably by Derjaguin and Landau and by Verwey and Overbeek (DLVO theory). See zeta potential.

electric furnace. See furnace.

electric steel. Steel made in an electric furnace.

electric vehicle propulsion. See storage battery.

electride. An experimental compound composed of an alkali-metal cation and an electron in which the electron functions as a chemical element (e.g., a halogen) in salt formation. Several such compounds have been made in the U.S. and abroad. The phenomenon is reported to be one that challenges accepted concepts of compound formation.

electrochemical equivalent. The number of grams of an element or group of elements liberated by the passage of one coulomb of electricity (one ampere for one sec).

“Electrocarb” [*Electro Abrasives*]. TM for silicon carbide.
CAS: 409-21-2.

Properties: High thermal conductivity, abrasion resistant, high hardness (2550 knoop). Electrical conductor.

Grade: Grit sizes 8–1600 mesh.

Use: Wear resistant filler, thermal conductor in compounds, high temperature paints, ceramics, refractories. As a polishing and lapping abrasive.

electrochemical gradient. The sum of the gradients of concentration and of electric charge of an ion across a membrane. Used as the driving force for processes, such as oxidative phosphorylation and photophosphorylation.

electrochemical potential. The energy required to maintain a separation of charge and of concentration across a membrane.

Electrochemical Society. (ECS). Established in 1902, this society was organized to promote the advancement of the science of electrochemistry and related fields. It comprises 11 divisions, each devoted to a special branch of electrochemistry, e.g., corrosion, batteries, rare metals, electrodeposition, etc. It publishes a journal and sponsors books relating to its major interests. Its office is at 65 South Main Street, Pennington, New Jersey 08534-2839.
Website: <http://www.electrochem.org>.

electrochemistry. That branch of chemistry concerned primarily with the relationship between electrical forces and chemical reactions. This relationship is fundamental and farreaching, as the structure of matter is based on electrical effects. Electrochemistry is directly involved in chemical bonding, ionization, electrolysis (e.g., production of aluminum), metallurgy, battery science, fuel cells, and corrosion—in short, in any situation in which a chemical change is caused by or associated with

electrical phenomena. It has certain applications in biochemistry (in nerve reactions and the electric organs of fish) as well as in organic chemistry. Michael Faraday (1791–1867) is generally regarded as the founder of electrochemistry.

electrocoating. A process of applying primer paint to household appliances, automobiles, etc., in which the metal piece to be coated becomes the anode in a tank of water-based paint. The coating deposited on the metal is uniform regardless of the shape of the article. Large-scale use of electrocoating is on automobile bodies.
See electrostatic coating.

electroconductive polymer. See polymer, electroconductive.

electrocratic. Descriptive of a liquid colloidal dispersion of insoluble solid particles whose stability is maintained by either positive or negative charges on the particles. As the like charges are mutually repellent, they offset the attraction of gravity and prevent the particles from sinking or coalescing. A colloidal gold suspension is a well-known example. Electrocratic dispersions can be readily precipitated by addition of an oppositely charged electrolyte, as in the purification of water with Al^{3+} ions from aluminum sulfate.

“Electrocure.” TM for a process for hardening or curing paint films on plastics by use of low-voltage electron beams. Paints so treated cure in four sec or less at room temperature; the finishes produced are said to be superior in resistance to abrasion and chemicals. The process can also be applied to other substrates such as wood, glass, metals, etc.

electrode. Either of two substances having different electromotive activity that enables an electric current to flow in the presence of an electrolyte. Electrodes are sometimes called plates or terminals. Commercial electrodes are made of a number of materials which vary widely in electrical conductivity, i.e., lead, lead dioxide, zinc, aluminum, copper, iron, manganese dioxide, nickel, cadmium, mercury, titanium, and graphite; research electrodes may be calomel (mercurous chloride), platinum, glass, or hydrogen. Electrodes are essential components of both batteries and electrolytic cells; in batteries the negative plate is the anode and the positive plate the cathode, whereas in electrolytic cells the reverse is the case.

Use: Electrodes are also used in welding devices.
See anode; cathode; battery; electrolytic cell.

electrode, glass. A thin, glass membrane that when immersed in a suitable liquid medium develops a measurable electrical potential that can be readily related to the activity of ionic species present in the solution. By appropriate manipulation of the glass composition, careful pretreatment of the glass

surface, and reproducible experimental conditions, electrodes can be devised that not only yield information about the concentration of ions in solution but also have the ability to discriminate in the sense of a selective response between a number of different ions of similar chemical characteristics. Because of their ability to give both qualitative and quantitative information about ions in solution, glass electrodes are widely used for purposes of chemical measurement, especially in electrochemical research.

electrode, hydrogen. A platinum surface coated with platinum black immersed in a solution and bathed with a stream of pure hydrogen gas. The potential developed depends on the equilibrium between the hydrogen gas and the hydrogen ions in solution.

Use: Standard reference electrode.

electrodeposition. The precipitation of a material at an electrode as the result of the passage of an electric current through a solution or suspension of the material, for example, alkaline-earth carbonates, rubber from latex, paint films on metal. A technique for electrodepositing refractory carbide coatings on metal has been reported. The electrode is in the shape of the desired article. An important advantage of electrodeposition is its ability to coat complex shapes having small and irregular cavities with exact thickness control.

See electrophoresis.

electrodialysis. A form of dialysis in which an electric current aids the separation of substances that ionize in solution. Seawater can be desalted by this method on a large scale by placing it in the center chamber of a three-compartment container having two semipermeable membranes and a positive electrode in one end chamber, and a negative electrode in the other. The ions migrate to their respective electrodes under a difference of potential, leaving the water saltfree.

See dialysis; desalination; demineralization.

electroforming. An electrolytic plating process for manufacturing metal parts. A mold of the object to be reproduced is made in a soft metal or in wax (by impression). The mold surface is made conducting by coating with graphite. Some suitable metal is then deposited electrolytically on the mold surface. This mold is then (in most cases) a negative of the object to be produced. Other industrial applications are phonograph records, plastic tile, ducting, tubing, etc.

electrogenic. Contributing to the generation of an electrical potential across a membrane.

electroless coating. A protective coating of copper, cobalt, nickel, gold, or palladium deposited

in a bath without application of an electric current, i.e., by chemical reduction.

electroluminescence. Luminescence generated in crystals by electric fields or currents in the absence of bombardment or other means of excitation. It is a solid-state phenomenon involving p- and n-type semiconductors, and is observed in many crystalline substances, especially silicon carbide, zinc sulfide, and gallium arsenide, as well as in silicon, germanium, and diamond.
See phosphor.

electrolysis. Decomposition of water and other inorganic compounds in aqueous solution by means of an electric current, the extent being proportional to the quantity of electricity passing through the solution. The positive and negative ions formed are carried by the current to the oppositely charged electrodes, where they are collected (if wanted) or released (if unwanted). Metallic ions deposited on the electrode form a coating. A simple electrolysis is the separation of water into oxygen and hydrogen; this is one method of producing hydrogen. Somewhat more complicated is electrolysis of brine to chlorine and sodium hydroxide; this is carried out in electrolytic cells of the diaphragm or mercury type, with water taking part in the reaction. In electroplating, metal salts dissociate into their constituent ions, the positively charged metal ions coating the cathode. There are a number of variations of this process (electrodeposition, electrocoating, electroforming).
See electrolytic cell; ionization.

electrolyte. A substance that will provide ionic conductivity when dissolved in water or when in contact with it; such compounds may be either solid or liquid. Familiar types are sulfuric acid and sodium chloride, which ionize in solution. One solid electrolyte, used originally in fuel cells, is a polymer of perfluorinated sulfonic acid used as the core of a water electrolysis cell for production of hydrogen and oxygen. When saturated with water it has high conductivity. Another solid type is a ceramic mixture of sodium, aluminum, lithium, and magnesium used as a separating medium in the liquid-sodium-sulfur (β) battery under continuing development. The most common application of electrolytes is in electroplating of metals in which dissolved (ionized) metal salts are the electrolytes.

See electrolysis; electroplating.

electrolyte acid. Legal label name for battery acid.

electrolytic cell. An electrochemical device in which electrolysis occurs when an electric current is passed through it. Ionizable compounds dissociate in the aqueous solution with which the electrodes are in contact. Such cells are of two types: (1) the diaphragm cell, which has two compartments separated by a porous membrane; and (2) the mercury cell, in

which mercury is the cathode. The anodes of both types have long been made of graphite; because this decomposes rapidly as electrolysis progresses, they are being replaced with dimensionally stable types consisting of titanium coated with oxides of ruthenium and other rare metals, which are also much more efficient. In electrolysis of sodium chloride, the current causes chloride ion to migrate to the anode, where it is collected as chlorine gas; sodium hydroxide and hydrogen are also formed, the hydrogen being discharged. The overall cell reaction is: $2\text{NaCl} + 2\text{H}_2\text{O} \rightarrow \text{H}_2 + \text{Cl}_2 + 2\text{NaOH}$. This principle is applied in the electroplating of metals, electrodeposition of colloids, and similar processes.

See diaphragm cell; mercury cell; electroplating.

electromagnetic separation. Separation of isotopes, especially those of uranium, by first accelerating them by means of an electrostatic field and then passing them through a magnetic field. The effect of this is to cause all the particles to take a curved path; the heavier ones, having higher kinetic energy, describe a wider arc than the lighter ones. Thus, two isotopes of closely similar masses can be separated and collected.

See mass spectrometry; magnetic separation.

electromagnetic spectrum. See radiation.

electrometallurgy. Application of the principles and techniques of electrochemistry to the production of such metals as aluminum and titanium.

electromotive series. See activity series.

electron. Discovered by J. J. Thompson in 1896, the electron is a fundamental particle of matter that can exist either as a constituent of an atom or in the free state. It has a negative electric charge (4.8×10^{-10} esu) and a mass $1/1837$ that of a proton, equivalent to 9.1×10^{-28} gram. The number of electrons in an atom of any element is the same as the number of protons in the nucleus, i.e., the atomic number. Thus, the range is from one electron in hydrogen to 103 in lawrencium. As the negative charge of the electrons equals the positive charge of the protons, all atoms are electrically neutral. Electrons are arranged in from one to seven shells around the nucleus; the maximum number of electrons in each shell is strictly limited by the laws of physics. The tendency of electrons to form complete outer shells accounts for the valence of an element, and they play an essential part in chemical bonding. The outer shells are not always filled: sodium has two electrons in the first shell, eight in the second, and only one in the third. A single electron in the outer shell may be attracted into an incomplete shell of another element, leaving the original atom with a net positive charge. Each atom then is called an ion. Valence electrons are those that can be captured by or shared with another atom. Electrons can be removed from the atoms of metals and some other elements by heat, light, elec-

tric energy, or bombardment with high-energy particles (see radiation, ionizing). In such cases, they are totally free from the atomic orbit and their energy can be utilized by means of a conductor (electricity) or a vacuum tube or semiconductor. Current is generated by detaching the electrons of a metallic conductor (silver, copper) by means of an electric or magnetic field; the electrons then flow along the conductor to a positively charged terminal. The science of electronics was made possible by the ability of a heated metal cathode to emit a continuous stream of electrons in a vacuum tube. Free electrons, called β particles, are spontaneously emitted by decaying radioactive nuclei; they have comparatively low energy but can be accelerated to velocities approaching that of light. The basic nature of the electron has been the subject of much research of the highest order of mathematical rigor. In simplest terms, the electron has the properties of both a particle and a wave, i.e., a standing wave is associated with an electron moving in its orbit. The energy state of any electron in an atom is described by four quantum numbers.

See shell; atom; orbital theory; Lewis electron theory.

electron acceptor. A substance that receives electrons in a redox reaction.

electron-beam welding. See welding.

electron carrier. A protein or other chemical species, such as a cytochrome or coenzyme Q, that can reversibly gain and lose electrons. They function in the transfer of electrons from organic nutrients to oxygen or some other terminal acceptor as in the case of anaerobes.

electron donor. A substance that donates electrons in a redox reaction.

electronegativity. All atoms (except those of helium) that have fewer than eight electrons in their highest principal quantum level have low-energy orbital vacancies capable of accommodating electrons from outside the atom. The existence of these vacancies is evidence that within these regions the nuclear charge can exert a significant attraction for such electrons, even though as a whole the atom is electrically neutral. This attraction is called "electronegativity." To the extent that the initially neutral atom may be able to acquire electrons from outside, it will acquire also their negative charge. The word "electronegativity" means "tendency to become negatively charged." The concept of electronegativity is an extremely useful one in chemistry, since the attractive force exerted by the nuclei of atoms that have vacancies in their outer shells makes possible the formation of both covalent and ionic bonds and is thus a fundamental factor in the formation of chemical compounds. The most highly electronegative elements are the halogens, sulfur, and oxygen. See bond, chemical.

electron microscope. A microscope in which the source of illumination is a stream of electrons emanating from a tungsten cathode in a high vacuum and accelerated by a strong electric impulse (300 kv). The electrons are focused by a series of magnetic fields that function as lenses in the same way as glass affects waves of visible light, i.e., the electron stream curves as it passes through the magnetic field. Such lenses were developed in Germany by Busch, Knoll, and Tuska in the 1930s, and were adapted to microscopy by Zworykin and Hillier at the RCA Laboratories in the early 1940s, when the first commercial instruments were produced. The electron microscope is characterized by extremely high resolving power due to the ultrashort wavelength of electronic radiation—a small fraction of an angstrom unit (Å). Resolution of 2 Å is possible, which permits determination of the structure of macromolecules (DNA) and even observation of large atoms (uranium). Instruments of the scanning transmission type with a resolving power of 0.05 Å were developed at the University of Chicago. Two kinds of electron microscopies are in general use: the transmission type, in which the electrons penetrate the specimen, and the scanning type introduced in 1970, in which the electrons, condensed to a fine beam, repeatedly traverse the surface of the specimen, producing a three-dimensional contour effect by means of secondary electrons emanating from the specimen itself. Pictures of astonishing accuracy have been obtained, especially of surface structures, a matter of great importance in the study of catalysis and other critical phenomena in both industry and the biological sciences. A unique combination of these techniques is the scanning transmission electron microscope (STEM), by means of which colored motion pictures of uranium atoms on a thin-film carbon substrate have been obtained. See optical microscope; resolving power; ultramicroscope; field-ion microscope.

electron octet. Group of eight valence electrons. The most stable configuration of the outermost, or valency, electron shell of the atom.

electron paramagnetic resonance. (EPR). A method of spectroscopic analysis similar to nuclear magnetic resonance except that microwave radiation is employed instead of radio frequencies. It is used for studying free radicals, crystalline centers, transition elements, and structures involving unpaired electrons.

electrophile. An electron-deficient group with a strong tendency to accept electrons from an electron-rich group (nucleophile). See nucleophile; Lewis acid.

electroporation. A process using high-voltage current to make cell membranes permeable to allow the introduction of new DNA.

Use: In recombinant DNA technology. See transfection.

electron transport chain. See acceptor control.

electron-volt. (eV). An extremely small unit used in measuring the energy of electrons and other atomic constituents. It is the energy developed by an electron in falling through a potential difference of one V, equivalent to 1.6×10^{-19} J. The rupture of a carbon-to-carbon bond has been calculated to yield approximately 5 eV.

electrophoresis. Migration of suspended or colloidal particles in a liquid such as rubber latex due to the effect of a potential difference across immersed electrodes. The migration is toward electrodes of charge opposite to that of the particles. Most solids, being negatively charged, migrate to the anode, the exception being basic dyes, hydroxide solutions, and colloids that have adsorbed positive ions, all of which are positively charged and migrate to the cathode. Migrating particles lose their charge at the electrode and generally agglomerate around it. Clay suspensions can be filtered by means of forced-flow electrophoresis. Electrophoresis is important in the study of proteins because the molecules of such materials act like colloidal particles and their charge is positive or negative according to whether the surrounding solution is acidic or basic. Thus, the acidity of the solution can be used to control the direction in which a protein moves upon electrophoresis. It has been found that electrophoresis can be carried out more efficiently under zero-gravity conditions in outer space than on earth.

Use: Experimentally to separate mixtures of electrically charged species such as proteins or nucleic acids. See electrodeposition.

electroplating. The deposition of a thin layer or coating of metal (e.g., chromium, nickel, copper, silver, etc.) on an object by passing an electric current through an aqueous solution of a salt containing ions of the element being deposited, for example, Cu^{+2} . The material being plated (usually a metal but often a plastic) constitutes the cathode. The anode is often composed of the metal being deposited; ideally it dissolves as the process proceeds. The thin layer deposited is sometimes composed of two or more metals, in which case it is an alloy. The solution or plating bath contains dissolved salts of all the metals being deposited. Electrolytic cells are used for this process. The anode must be an electrical conductor, but may or may not be of the same chemical composition as the material being deposited, and may or may not dissolve during the process. The purpose of electroplating is usually protection of the base metal from corrosion. Silver is electroplated on copper for economy reasons; plastics may be electroplated for decorative effects.

See electrophoresis; protective coating; "electroless" coating; throwing power; current density.

electropolishing. A nonmechanical method of polishing metal surfaces that is actually the reverse of electroplating. This is achieved by making the object to be polished the anode in an electrolytic circuit, the cathode usually being carbon. The electrolytes used are phosphoric, hydrofluoric, nitric, and sulfuric acids (sometimes called polishing acids).

electrostatic bond. Alternative name for an ionic bond.

See bond, chemical.

electrostatic coating. A metal-painting technique in which electrostatically charged pigment particles are sprayed onto a substrate metal, followed by baking. The electric charge attracts the particles to the metal and holds them in place until heat treatment is applied. Maintenance of the charge is thus essential; factors affecting this are relative humidity (the lower the better) and the chemical nature of the pigment, e.g., phthalocyanine blue retains the charge much longer than titanium dioxide.

electrostatic precipitator. See Cottrell, Frederick G.

electrovalent bond. Alternative name for an ionic bond.

See bond, chemical; ionic bond.

electrowinning. The technique of extracting a metal from its soluble salt by an electrolytic cell. It is used in recovery of zinc, cobalt, chromium, and manganese, and has been applied to copper when in the form of a silicate ore. For any specific metal, the salt in solution is subjected to electrolysis and is electrodeposited on a cathode made of the metal being extracted.

element. One of the 112 presently known kinds of substances that compose all matter at and above the atomic level. According to a theory that has gained acceptance, the lightest elements were formed in less than half an hour from a primordial complex called ylem, a mixture of neutrons and electromagnetic radiation. The smallest unit of any element is the atom. All the atoms of a given element are identical in nuclear charge and number of electrons and protons, but they may differ in mass, e.g., hydrogen has mass numbers of 1, 2, and 3, called hydrogen, deuterium, and tritium, respectively. These are the isotopes of hydrogen; most elements have isotopic forms that are due to the presence of one or more extra neutrons in the nucleus. The atomic number of an element indicates its position in the periodic table and represents the number of protons present, which is the same as the number of electrons. All elements

heavier than lead are unstable and radioactive. About 90% of the earth's crust is made up of elements with even numbers of protons and neutrons. No stable elements heavier than nitrogen have an odd number of both protons and neutrons. Elements of even atomic number normally have several isotopes, while those of odd atomic number never have more than two stable isotopes. All elements beyond uranium (transuranic) were nonexistent in 1940. They are artificially created by bombardment of other elements with neutrons or other heavy particles. Research on new elements is actively carried on at many laboratories including the Lawrence Livermore Laboratories, which reported discovery of element 106 in 1974. Creation of element 109 was announced in 1982, and of element 112 in 1996. A single atom of element 109 was made by West German physicists by bombarding ^{209}Bi with ^{58}Fe nuclei. Controversy continues on the naming of elements 104 through 109. Many more (possibly up to 150) are theoretically possible according to Dr. G. T. Seaborg.

See periodic table; isotope; radioactivity; abundance.

Note: For origin of elements, see nucleogenesis.

elemi. A soft, balsam like resin obtained from a tree in the Philippines, soluble in coal tar hydrocarbons, but not in petroleum solvents, alcohols, and ketones.

Use: Plasticizer, adhesion of lacquers to metals, cements and adhesives, wax compositions, printing inks, textile and paper coatings, perfumery, waterproofing, engraving.

elimination reaction. A chemical reaction involving elimination of a portion of a reactant compound, resulting in a second compound. Many reactions eliminate water.

"Elimin-Ox" [Nalco]. TM for chemicals for scavenging oxygen.

Use: In water systems.

elongation factors. Specific proteins required in the elongation of polypeptide chains by ribosomes, or DNA strands by replisomes.

Eltékoff reaction. Production of highly branched hydrocarbons by methylation of olefins with methyl chloride, or methyl iodide in the presence of lead oxide, or calcium oxide at high temperatures.

eluant. The liquid used to separate or extract one material from another.

See chromatography.

eluate. The solution that results from the elution process.

See chromatography.

elutriation. A process of washing, decantation, and settling that separates a suspension of a finely divided solid into parts according to their weight. It is especially useful for very fine particles below the usual screen sizes, and is used for pigments, clay dressing, and ore flotation.

“Elvace” [Reichhold]. TM for a series of vinyl acetate ethylene emulsions.

“Elvacite” [Du Pont]. (butyl methacrylate resins). TM for polymer products.
Use: Resistance to UV weathering and degrading; as base for lacquers, paints, coatings, and inks.

“Elvanol” [Du Pont]. TM for various grades of polyvinyl alcohol.

“EMA” resins [Solutia]. TM for ethylene-maleic anhydride copolymers. Water-soluble resins that serve as dispersing agents in cold-water detergents, thickeners, binders, stabilizers, and emulsifiers.

embosser. See fiber roll.

embrittlement. Hardening of a metal (especially steel) or of an ABS resin, resulting in loss of strength and impairment of other physical properties. In metals, the primary cause is exposure to hydrogen, though other factors such as corrosion also are involved. In copolymer plastics, such as ABS resins, embrittlement is due to formation of a vitreous matrix as well as to oxidation of the butadiene particles in the matrix. Embrittlement due to thermal shock occurs in pressurized-water reactors. This may result in rupture of reactor walls and is a constant source of trouble in reactors of this type.

embryo. Once a zygote begins to undergo cellular divisions, it becomes an embryo.

embryonic stem (ES) cells. An embryonic cell that can replicate indefinitely, transform into other types of cells, and serve as a continuous source of new cells.

Emde degradation. Modification of the Hofmann degradation method for reductive cleavage of the carbon-nitrogen bond by treatment of an alcoholic or aqueous solution of a quaternary ammonium halide with sodium amalgam. Also used as a catalytic method with palladium and platinum catalysts. The method succeeds with ring compounds not degraded by the Hofmann procedure.

emedastine difumarate.
 CAS: 87233-62-3. mf: $C_{17}H_{26}N_2O \cdot 2C_4H_4O_4$.
Hazard: A poison by ingestion.

emerald green. A pigment consisting of copper acetoarsenite.

Hazard: Toxic by ingestion.

emeralds, synthetic. Artificial crystals produced by a high-pressure, high-temperature process from beryllium aluminum silicate containing a small amount of chromium.
Use: Lasers, masers, semiconductors.

emery. See corundum; abrasive.

emetine. (cephaline methyl ether; 6',7',10,11-tetramethoxyemetan).
 CAS: 483-18-1. $C_{29}H_{40}O_4N_2$. An alkaloid from ipecac.

Properties: White powder; very bitter taste. Mp 74C. Darkens on exposure to light. Soluble in alcohol and ether, slightly soluble in water.

Derivation: By extraction from root of *Cephalis ipecacuanha* (ipecac) or synthetically.

Hazard: Toxic by ingestion.

Use: Medicine (antiamebic).

emission spectroscopy. Study of the composition of substances and identification of elements by observation of the wavelengths of radiation they emit as they return to a normal state after excitation by an external energy source. When atoms or molecules are excited by energy input from an arc, spark, or flame, they respond in a characteristic manner; their identity and composition are signaled by the wavelengths of incident light they emit. The spectra of elements are in the form of lines of distinctive color, such as the yellow sodium D line of sodium; those of molecules are groups of lines called bands. The number of lines present in an emission spectrum depends on the number and position of the outermost electrons and the degree of excitation of the atoms. The first application of emission spectra was identification of sodium in the solar spectrum (1814).

See spectroscopy.

emivirine.
 CAS: 149950-60-7. mf: $C_{17}H_{22}N_2O_3$.
Hazard: Moderately toxic by ingestion.

emmenagogue. A drug used to induce menstruation.

Emmert reaction. Formation of 2-pyridyldialkylcarbinols by condensation of ketones with pyridine or its homologs in the presence of aluminum or magnesium amalgam.

emodin. (frangula emodin; frangulic acid; 1,3,8-trihydroxy-6-methylanthraquinone).
 CAS: 518-82-1. $C_{14}H_4O_2(OH)_3CH_3$.

Occurrence: Either free, or combined with a sugar in a glucoside, in rhubarb, cascara sagrada, and other plants. A synthetic product is also available.

Properties: Orange crystals. Mp 256C. Soluble in alcohol, insoluble in water.

Use: Medicine (cathartic).

emoren.

CAS: 13930-31-9. mf: $C_{28}H_{41}N_3O_3 \cdot xClH$.

Hazard: Moderately toxic by ingestion.

empirical formula. See formula, chemical.

EMTS. Abbreviation for ethylmercury-*p*-toluene sulfonanilide.

“Emulmetik” [Lucas Meyer]. TM for hydrogenated lecithin.

emulsifier. A surface-active agent. See emulsion.

emulsifying oil. See soluble oil.

“Emulsilac-S” [ACH]. (sodium stearoyl lactylate) TM for emulsifier, dough conditioner-strengthener, and whipping agent.

Use: For baked goods, puddings, dips, cheese substitutes, sauces, whipped toppings, and fillings.

emulsion. (synaptase; amygdalase; β -glucosidase). An enzyme catalyzing the production of glucose from β -glucosides.

Properties: White powder; odorless; tasteless. Capable of hydrolyzing glucosides such as amygdalin to glucose and the other component substances. Soluble in water; insoluble in ether and alcohol.

Source: Sweet almonds.

Derivation: By extracting an emulsion of almonds with ether, filtering the clear solution, and precipitating the emulsion with alcohol.

emulsion. A stable mixture of two or more immiscible liquids held in suspension by small percentages of substances called emulsifiers. These are of two types: (1) Proteins or carbohydrate polymers which act by coating the surfaces of the dispersed fat or oil particles, thus preventing them from coalescing; these are sometimes called protective colloids. (2) Long-chain alcohols and fatty acids, which are able to reduce the surface tension at the interface of the suspended particles because of the solubility properties of their molecules. Soaps behave in this manner; they exert cleaning action by emulsifying the oily components of soils. All such substances, both natural and synthetic, are known collectively as detergents. Polymerization reactions are often carried out in emulsion form; a wide variety of food and industrial products are emulsions of one kind or another, e.g., floor and glass waxes, drugs, paints, shortenings, textile and leather dressings, etc. All emulsions consist of a continuous phase and a disperse phase: in an oil-in-water (o/w) emulsion, such as milk, water is the continuous phase and butterfat (oil) the disperse phase; in a water-in-oil (w/o) emulsion, such as butter, free fat (from crushed fat globules) is the continuous phase and unbroken fat glob-

ules plus water droplets are the disperse phase. See colloid; protective; phase (2); detergent; surface-active agent; wetting agent.

emulsion breaker. See demulsification.

emulsion paint. See paint emulsion.

emulsion polymerization. Polymerization reaction carried out with the reactants in emulsified form. Performed at normal pressure and -20 to $+60C$. Many copolymers (synthetic rubbers) are made in this way.

“Emulsiphos” [Solutia]. TM for sodium phosphate.

CAS: 7601-54-9.

Grade: Powders.

Use: Food-grade phosphate emulsifying agent used in processed cheese and cheese food.

“Emulvis” [Hall]. TM for polyoxyethylene stearate.

Use: Viscosity builder and solubility retarder for cosmetics, soaps, and shampoos.

en. Abbreviation for ethylenediamine, used in formulas for coordination compounds, e.g., the cobalt complex $Co[en]_3(NO_3)_3$.

See dien; *pn*; *py*.

enamel. (1) A type of paint consisting of an intimate dispersion of pigments in a varnish or resin vehicle. The vehicle may be an oil-resin mix or entirely synthetic resin. Those containing drying oils are converted to films by oxidation; those composed wholly of synthetic resins may be converted by either heat or oxidation, or both.

See baking finish.

(2) Porcelain enamel.

enamine. A group of amino olefins; the name refers especially to unsaturated tertiary amines of the general formula

where R is any alkyl group. Though of little use as end products, enamines are valuable intermediates for many organic syntheses.

enanthaldehyde. See heptanal.

enanthic acid. See *n*-heptanoic acid.

enanthyl alcohol. See heptyl alcohol.

enantiomer. (enantiomorph). One of a pair of optical isomers containing one or more asymmetric carbon atoms C^* whose molecular configurations have left- and right-hand (chiral) forms. These

forms are conventionally designated dextro (D) and levo (L) because they compare to each other structurally as do the right and left hands when the carbon atoms are lined up vertically. This is apparent in the enantiomorphous forms of glyceraldehyde; the two structures are mirror images of each other and cannot be made to coincide:

Several pairs of enantiomers are possible, depending on the number of asymmetric carbon atoms in the molecule. Compounds in which an asymmetric carbon is present display optical rotation.

See asymmetry; optical isomer; optical rotation.

enantiomorph. See enantiomer.

encapsulation. The process in which a material or an assembly of small, discrete units is coated with or imbedded in a molten film, sheath, or foam, usually of an elastomer. A foam-forming plastic may be used to fill the spaces between various electrical or electronic components so that they are imbedded in and supported by the foam. Plastics and other materials used for this purpose are often called potting compounds. A specialized use of this technique is in growing crystals for semiconductors, in which a coating of liquid boric oxide is the encapsulating agent. Use of a glassy silicate coating to encapsulate nuclear waste for permanent disposal is under investigation.

See microencapsulation.

3' end. The end of a nucleic acid that lacks a nucleotide bound at the 3' position of the terminal residue.

endergonic reaction. A chemical reaction that consumes energy (that is, for which DG is positive). This is a nonspontaneous process.

"Endic" anhydride [Velsicol]. TM for *endo-cis*-bicyclo(2.2.1)-5-heptene-2,3-dicarboxylic anhydride. (C₉H₈O₃).

Properties: White crystals. Mp 163C. Soluble in aromatic hydrocarbons, acetone, ethanol.

Use: Elastomers, plasticizers, fire retardant chemicals, resins, and epoxy curing systems.

endo-. A prefix used in chemical names to indicate an inner position, specifically (1) in a ring rather than a side chain or (2) attached as a bridge within a ring.

See *exo-*.

endocrine glands. Groups of cells specialized to synthesize hormones and secrete them into the blood to regulate other types of cells. The pancreas, for example,

endocytosis. The uptake of extracellular material by its inclusion within a vesicle (endosome) formed by an invagination of the plasma membrane.

endoergic. See Endothermic.

endomycin. An antifungal antibiotic complex produced by streptomycetes.

endonuclease. An enzyme that digests nucleic acids starting in the middle of the strand (as opposed to an exonuclease, which must start at an end). Examples include the restriction enzymes, DNase I and RNase A.

See restriction enzyme.

endoplasmic reticulum. An extensive system of double membranes in the cytoplasm of eukaryotic cells. The two major types are smooth and rough endoplasmic reticulum. Functions in calcium storage as well as in protein and lipid synthesis.

"Endor" [Du Pont]. TM for a rubber peptizing agent containing activated zinc salt of pentachlorothiophenol. (C₆Cl₅)₂Zn and 80% inert filler.

Properties: Grayish-green powder. D 2.39.

endorphin. Any of a group of polypeptides formed in the brain tissue and pituitary gland of higher animals that are thought to control the transfer of signals at nerve junctions, thus ensuring that behavior patterns in the individual remain normal. Imbalance or malfunction of these polypeptides has been reported to be a factor in irrational and violent actions and other emotional disorders, as well as in epilepsy and memory processes. This belongs to a developing field of medicinal chemistry called neuropharmacology.

β-endorphin.

CAS: 60617-12-1.

Hazard: A reproductive hazard.

endosmosis. The passing of a fluid inward through a porous partition toward another fluid of different character.

See exosmosis; Perrin rule.

endosulfan. (6,7,8,9,10,10-hexachloro-1,5,5a,6,9,9a-hexahydro-6,9-methano-2,4,3-benzodioxathiepin-3-oxide).

CAS: 115-29-7. C₆H₆Cl₆O₃S.

Properties: (commercial product): Brown crystals. Mp 70–100C (pure: mp 106C). Mixture of two isomers. Mp 108–109C and 206–208C.

Hazard: Toxic by ingestion, inhalation, and skin absorption; use may be restricted. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide.

endosymbiosis. When one organism takes up permanent residence within another, so that the two

become a single functional organism. Mitochondria and plastids are believed to have resulted from endosymbiosis.

endothall. (7-oxalobicyclo-[2.2.1]-heptane-2,3-dicarboxylic acid disodium salt).

CAS: 145-73-3. $C_8H_8Na_2O_5$.

Hazard: Strong irritant to eyes and skin.

Use: Defoliant, herbicide.

endothermic. A process or change that takes place with absorption of heat and requires high temperature for initiation and maintenance. An example is production of carbon monoxide and hydrogen by passing steam over hot coke.

endothion. [*S*-(5-methoxy-4-oxo-4*H*-pyran-2-yl)-methyl] *O,O*-dimethylphosphorothioate).

CAS: 2778-04-3.

$(CH_3O)_2P(O)SCH_2C:CHC(O)C(OCH_3):CHO$.

Properties: Crystals. Mp 90–91°C. Very soluble in water; soluble in chloroform and ethanol.

Hazard: Toxic by ingestion, cholinesterase inhibitor; use may be restricted.

Use: Insecticide.

end point. (1) In chemical analysis, the point during a titration at which a marked color change is observed, indicating that no more titrating solution is to be added.

See indicator. (2) The highest temperature reached during an assay distillation of hydrocarbon liquids, indicating the overall volatility of the liquid (ASTM).

end-product inhibition. Inhibition of an allosteric enzyme at the beginning of a metabolic sequence by the end product of the sequence.

endrin. (1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-*endo,endo*-5,8-dimethanonaphthalene).

CAS: 72-20-8. $C_{12}H_8OCl_6$. A stereoisomer of dieldrin which is the *endo, exo* isomer.

Properties: White, crystalline powder. Mp approximately 200°C (rearranges above this point). Insoluble in water and methanol; moderately soluble in other common organic solvents; compatible with nonacidic fertilizers, herbicides, fungicides, and insecticides.

Hazard: Toxic by inhalation and skin absorption, a carcinogen, use may be restricted. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide.

See aldrin.

-ene. (1) Suffix denoting open-chain unsaturated hydrocarbons having one double bond, as in propene. (2) Suffix denoting an aromatic cyclic hydrocarbon, as in benzene.

enercology. A coined word defined as the balanced relationship between energy and ecology. A foundation devoted to practical applications of this relationship has been established at Alma College, Michigan.

Ene reaction. Addition of an olefin with an allylic hydrogen (ene) to a compound with a double bond (enophile), involving the allylic shift of one double bond, transfer of the allylic hydrogen to the enophile, and bonding between the two unsaturated termini.

energy. The fundamental active entity in the universe, defined as the capacity for doing work. Two famous equations relate energy to mass as either $E = mc^2$ (Einstein) or $E = h\nu$ (Planck). These equations show that energy cannot be completely divorced from mass, as the two are to some extent interconvertible. The law of conservation of energy, simply stated, is that the sum total of energy in the universe is constant; therefore, energy cannot be either created or destroyed, but only converted from one form to another. Radiant energy (light) comprises the electromagnetic spectrum; all wavelengths of light are composed of photons or packets of energy traveling at the speed of light. Theoretically, they have no mass except that associated with their speed. Protons, electrons, and neutrons are forms of highly condensed energy that possess determinable mass but move at lower speeds. Energy is directly related to chemical phenomena in the formation and decomposition of compounds, in the many important reactions that occur in electrochemistry, and in the release of energy in nuclear fission and fusion. Free energy is a thermodynamic function; in chemical reactions, it is a measure of the extent to which a substance can react. Kinetic energy (the energy of motion) is most clearly exhibited in gases, in which molecules have much greater freedom of motion than in liquids and solids.

See radiation; matter; thermodynamics; free energy.

Note: "One of the most difficult challenges we face is to find ways to ensure that all peoples of the world share more equitably the vast human benefits that energy can bring. The foundation of worldwide energy policy must be based on energy conservation and the development of additional sources through a judicious application of science and technology." (Glenn T. Seaborg, ACS meeting, April 1976).

energy, activation. The minimum energy which a molecule must acquire before it can be regarded as being activated. The difference between the energy of an activated molecule and the mean energy of all the molecules.

energy balance. (1) Energy required to carry on an operation or to maintain the desired operating conditions. (2) Calculation of energy required to balance a reaction.

energy band. Energy spectrum of valence electrons in a polyatomic material.

energy charge. The fractional degree to which the ATP/ADP/AMP system is filled with high-energy phosphate groups.

energy converter. Any element or compound having the ability to convert the radiant energy of sunlight into electrical, thermal, or chemical energy. Prominent among them are silicon, selenium, and tellurium, as well as the chlorophyll of plants in photosynthesis.
See solar cell; magnetohydrodynamics.

energy coupling. The transfer of energy from one process to another. For example, the coupling of ATP hydrolysis with glucose phosphorylation.

energy gap. Forbidden part of energy spectrum of valence electrons.

energy level. See quantum state.

energy sources. Nonrenewable energy sources are materials of geologic origin, i.e., petroleum, natural gas, coal, shale oil, and uranium, which cannot be replaced once their supply is exhausted. Renewable sources, on the other hand, are those that can be replenished on a predictable time basis and are known collectively as biomass; these include such cellulosic products as wood, bagasse, agricultural waste, and residue from the forest products industries (shavings, bark, sawdust, etc.), which yield the same heating value per dry ton as one barrel of crude oil. Several of these sources have been in use for some years as on-site fuels in the sugarcane, plywood, and paper pulp industries. Another instance is methane obtained from animal manures (biogas), which is being developed on a large scale in the west and southwest. Interest in the mass cultivation of algae and hydrocarbon-producing plants such as guayule and copaiba for fuel has been reported. There are also a number of mechanical energy sources whose development involves engineering rather than chemistry, namely, solar radiation, wind, water flow, tides, and thermal gradients in ocean water. Several of these are already in limited operation, but in most cases their development will be slow and costly. Hydroelectric power has long been an accomplished fact, though it accounts for only about 1% of electrical needs. Solar energy is being actively researched, but is unlikely to be a factor of consequence for at least another decade. The following entries discuss the chemical sources of energy more specifically:

battery	hydrocarbon (note)
biogas	hydrogen
biomass	methane
breeder	natural gas
carbohydrate	nuclear energy

cellulose	ocean thermal energy
coal	oil sands
conversion	peat
copaiba	petroleum
ethyl alcohol (note)	plutonium
fission	radiation
fuel cell	shale oil
fuel oil	solar cell
fusion	solar energy
gasification	solar pond
gasohol	storage (4)
gasoline	thermoelectricity
geothermal energy	uranium
guayule	wood

“Energy Smart” [Advanced Ingredients].

TM for a nutritive carbo sweetener made from fruit juice and dextrin.

Use: Nutritive sweetener that is stable at room temperatures.

energy storage. See storage (4).

enfleurage. Extraction of odoriferous components of flowers by means of fats or mixtures of fat and tallow, the process being carried out at room temperature to avoid decomposition of the desired perfumes. The latter are separated from the fat by washing with alcohol.
See essential oil; perfume.

enflurane. (2-chloro-1,1,2-trifluoroethyl difluoromethyl ether).

CAS: 13838-16-9. $C_3H_2ClF_5O$.

Properties: Clear, colorless liquid; mild, sweet odor. Mw 184.50, D 1.5167 (25C), bp 56.5C, vap press 174.5 mm Hg (20C). Soluble in organic solvents; slightly soluble in water.

Hazard: Volatile with anesthetic properties, but nonflammable. TLV: 75 ppm; not classifiable as a human carcinogen.

Use: Clinical anesthetic.

engineering material. A metal, alloy, plastic, or ceramic used in the fabrication of machinery and its components, structural shapes, chemical process equipment, castings, tools, instruments, drums, tanks, piping, ductwork, and auxiliary items (excluded are materials used chiefly as protective coatings or as components of alloys). Engineering materials are characterized by hardness, strength, machinability, dimensional stability, nonflammability, and resistance to corrosion, most acids, solvents, and heat. The more important of these are listed below; for specific uses, see individual entries.

<i>Metals and alloys</i>	<i>Plastics</i>
aluminum	ABS resin
beryllium	acetal resin
brass	acrylic resin
bronze	fluorocarbon polymer

<i>Metals and alloys</i>	<i>Plastics</i>
cast iron	nylon
copper	phenolformaldehyde resin
lead	polybutylene terephthalate
magnesium	polycarbonate
steel	polyethylene
tantalum	polyphenylene oxide
titanium	polypropylene
zinc	polystyrene
zirconium	polyvinyl chloride
various trademarked alloys	reinforced plastics (FRP)
	ureaformaldehyde resin

Ceramics
glass
porcelain

“Enhance” [*Evans Vanodine*]. TM for an ultra high solid floor polish.

enhanced oil recovery. Any of several methods for increasing the productivity of oil wells (after pumping is no longer effective) by emulsifying as much as possible of the oil trapped in the rock structure. Techniques that have been researched and used to some extent involve the pumping into the formations of pressurized carbon dioxide, water, steam, detergent solutions, brine, and a mixture of various high polymers, guar gum, xanthan biopolymer, bauxite, or sand. Considerable success has been achieved, but such methods have proved to be both slow and inefficient.

See chemical flooding; hydraulic fracturing.

enhancer. (1) A food additive that brings out the taste of a food product without contributing any taste of its own. Sodium glutamate is the most widely used substance of this class; its effective concentration is in parts per thousand.

(2) a nucleotide sequence to which transcription factor(s) bind, and which increases the transcription of a gene. It is NOT part of a promoter; the basic difference being that an enhancer can be moved around anywhere in the general vicinity of the gene (within several thousand nucleotides on either side or even within an intron), and it will still function. It can even be clipped out and spliced back in backwards, and will still operate. A promoter, on the other hand, is position- and orientation-dependent. Some enhancers are “conditional” in that they enhance transcription only under certain conditions.

See potentiator.

enocianina. See grape skin extract.

enol. A chemical grouping containing both a double bond (ene) and a hydroxyl group (OH), forming an intermediate and reversible product. Enols are characteristic of racemic compounds.

enolase. An enzyme active in glycolysis that catalyzes the conversion of 2-phosphoglyceric acid to the phosphorylated enol of pyruvic acid.

enology. (oenology). The art and science of wine making.

“Enovid” [*Searle*]. TM for norethynodrel with mestranol. Oral contraceptive approved by FDA.

enprostil.

CAS: 73121-56-9. mf: C₂₃H₂₈O₆.

Hazard: Moderately toxic by ingestion.

enrichment. (1) In food technology, the addition to a foodstuff of various nutrient substances during manufacture to increase the dietary value of the food, e.g., addition to wheat flour of vitamins B₁, B₂, niacin, and iron. In this way, the food is brought up to a specific nutritional standard. (2) Increase in the abundance of certain isotopes of an element by any of several methods: (a) By a chemical reaction accompanied by irradiation from a laser beam; enrichment of boron, chlorine, and sulfur isotopes has been achieved in this way in a number of research laboratories. Uranium enrichment is also possible, either by adding previously prepared ²³⁵U to natural uranium or by the laser technique. (b) Uranium can also be enriched by gas centrifugation and gaseous diffusion. The latter is the usual procedure. (3) Addition of oxygen to air to increase its combustion-supporting ability.

enrobe. To coat candy centers, fruits, nuts, etc., with a liquid confection such as chocolate or sugar solution by mechanical dipping.

ensilage. A feed for livestock prepared by long storage of corn husks, stalks, etc., in an air-tight vertical cylindrical structure (silo) in which the material undergoes anaerobic fermentation. It is a component of biomass.

enterokinase. An enzyme found in the small intestine which converts trypsinogen into trypsin.

enterotoxin b, staphylococcal.

CAS: 11100-45-1.

Hazard: A poison.

Source: Natural product.

enthalpy. The increase in heat content of a substance or system that accompanies its change from one state to another under constant pressure. The internal energy plus the product of the volume and pressure of a working substance.

entrainer. An additive for liquid mixtures difficult to separate by ordinary distillation. The entrainer usually forms an azeotrope with one of the compounds of the mixture and thereby aids in the

separation of such a compound from the remainder of the mixture.

entrainment. The presence of minute drops of water or other liquid in the vapor produced by evaporation or distillation; also small bubbles of air or other gas in a liquid as a result of turbulence induced by agitation. Entrained water or gas is often undesirable, and care needs to be taken to eliminate or prevent it; in certain cases it is beneficial. See venturi; entrainer.

entropy (*S*). Thermodynamic concept referring to heat content. If, during a reversible change at temperature *T*, an amount *dQ* of heat enters the substance, its entropy is augmented by:

$$dS = \frac{dQ}{T}$$

environmental chemistry. That aspect of chemistry concerned with air and water pollution, pesticides, and chemical and radioactive waste disposal. A random selection of specific areas of research includes lead and other toxic chemicals in the air, effects of increased burning of coal, biological modification of wastes, detoxification methods, pesticide content of fish, environmental analytical and monitoring techniques, utilization of biomass, drinking water quality, organic contaminants in lakes and rivers, and effect of deforestation on carbon dioxide and oxygen content of air.

Environmental Protection Agency. (EPA). A federal agency established in 1970. Under the Toxic Substances Control Act of 1976, it is required to ensure the safe manufacture, use, and transportation of hazardous chemicals. It includes an Office of Hazardous Materials Control which administers Congressional legislation pertaining to this field. The EPA may require manufacturers to conduct tests on materials or products that adversely affect the environment or public health and safety. One of the most important aspects of its activities is the establishment and supervision of automotive emission standards. It is also concerned with pesticides, fungicides, and other potentially detrimental materials, as well as industrial waste disposal. It operates in close conjunction with the U.S. Department of Agriculture and the Food and Drug Administration. The construction of new plants for manufacturing products must conform to EPA standards, especially as regards effluents that contribute to water pollution. The headquarters are located at 1200 Pennsylvania Avenue, N.W., Washington, DC 20460 Website: <http://www.epa.gov>.

See toxic substances; environmental chemistry.

enzyme. Any of a unique class of proteins that catalyze a broad spectrum of biochemical reactions. Enzymes are formed in living cells; they are comprised one or more polypeptide chains with molecu-

lar weight from 10,000 to a million or more. An important characteristic of enzymes is their specificity, i.e., a given enzyme can catalyze one particular reaction and no others. Six types are recognized, which catalyze the following reactions: (1) redox (oxidoreductases), (2) transfer of specific radicals or groups (transferases), (3) hydrolysis (proteolytic), (4) removal from or addition to the substrate of specific chemical groups (lyases), (5) isomerization (isomerases), (6) combination or binding together of substrate units (ligases). The names of enzymes invariably terminate in either *-ase* or *-in*. The following partial list indicates some of the more important functions performed by enzymes; among these are the ability to cleave the peptide bonds of proteins (hydrolysis) with simultaneous formation of water; and to decompose sugars and starches to ethyl alcohol and carbon dioxide (fermentation). Enzymes are essential to many biochemical processes, especially in the food, beverage, and pharmaceutical industries.

amylase	starch hydrolysis
carboxylase	decomposes pyruvic acid
cellulase	converts cellulose to glucose
cholinesterase	inactivates acetylcholine
chymotrypsin	hydrolysis of proteins
invertase	converts sucrose to glucose and fructose
lipase	hydrolysis of fats
maltase	converts maltose to glucose
pepsin	hydrolysis of proteins
protease	hydrolysis of peptide linkages
rennin	hydrolysis of proteins
ribonuclease	decomposes RNA
trypsin	splits proteins to amino acids
urease	decomposes urea to NH ₄ and CO ₂ .
zymase	converts sugars to alcohol and CO ₂ (fermentation)

Recent research in biomimetic chemistry has succeeded in creating synthetic enzymes that imitate the behavior of natural enzymes, e.g., chymotrypsin, and are almost as effective. See catalyst; biomimetic chemistry; fermentation; hydrolysis.

eolotropic. See aeolotropic.

eosin. (bromeosin; CI 45380; tetrabromofluorescein).

CAS: 15086-94-9. C₂₀H₈Br₄O₅.

Properties: Red, crystalline powder. Soluble in alcohol and acetic acid; insoluble in water. The potassium and sodium salts are soluble in water.

Derivation: Bromination of fluorescein.

Use: Dyeing silk, cotton, and wool; red writing ink; cosmetic products; biological stain; coloring motor fuel.

EP. (1) Abbreviation for extreme pressure as applied to lubricants. (2) Abbreviation for ethylene-propylene.

EPA. Abbreviation for Environmental Protection Agency.

“EPAL” [Albemarle]. TM for linear primary alcohols.

EPC black. Abbreviation for easy-processing channel black.
See carbon black.

EPDM. Abbreviation for a terpolymer elastomer made from ethylene-propylene diene monomer.
See ethylene-propylene terpolymer.

ephedrine. (1-phenyl-2-methylaminopropanol).
CAS: 299-42-3. $C_6H_5CH(OH)CH(NHCH_3)CH_3$.
Optically active (levorotatory) form.

Properties: White to colorless granules, pieces, or crystals; unctuous to touch. Mp 33–40C, bp 255C (decomposes). Hygroscopic, gradually decomposes on exposure to light. Soluble in water, alcohol, ether, chloroform, and oils.

Derivation: Isolation from stems or leaves of *Ephedra*, especially Ma huang (China and India).

Grade: Technical, NF.

Hazard: Toxic by ingestion.

Use: Medicine (bronchodilator).

See racephedrine.

epi. (1) A prefix denoting a bridge or intramolecular connection, e.g., epoxide. (2) An abbreviation for epichlorohydrin.

“EPI” [Epi-Products]. TM for a cleaning agent.

Use: For cleaning thermoplastic processing equipment.

(+)-epibatidine dihydrochloride.

CAS: 162885-01-0. mf: $C_{11}H_{15}ClN_2 \cdot 2ClH$.

Hazard: A poison.

Use: Agricultural chemical.

epichlorohydrin. (chloropropylene oxide).

CAS: 106-89-8. An epoxide.

Properties: Highly volatile, unstable liquid; chloroform-like odor. D 1.1761 (20/20C); bp 115.2C; bulk d 9.78 lb/gal; vap press 12.5 mm Hg (20C); fp –25C; viscosity 1.12 cP (20C) refr index 1.4358 (25C);

flash p 93F (33.9C) (TOC). Miscible with most organic solvents; slightly soluble in water.

Derivation: By removing hydrogen chloride from dichlorohydrin.

Hazard: Toxic by inhalation, ingestion, and skin absorption; strong irritant, a carcinogen. Flammable, moderate fire risk. TLV: 0.5 ppm; animal carcinogen.

Use: Major raw material for epoxy and phenoxy resins, manufacture of glycerol, curing propylene-based rubbers, solvent for cellulose esters and ethers, high-wet-strength resins for paper industry.

epichlorohydrin-bis(3-aminopropyl)methylamine copolymer.

CAS: 41941-50-8. mf: $(C_7H_{19}N_3 \cdot C_3H_5ClO)_x$

Hazard: Low toxicity by ingestion.

epichlorohydrin-dimethylamine copolymer.

See dimethylamine-epichlorohydrin copolymer.

epichlorohydrin triethanolamine cellulose.

See ECTEOLA-cellulose.

epigallocatechin 3-gallate.

CAS: 989-51-5. mf: $C_{22}H_{18}O_{11}$.

Hazard: Moderately toxic by ingestion.

epimer. An isomer that differs from the compound with which it is being compared only in the relative positions of an attached hydrogen and hydroxyl. The isomerism may be represented as –HCOH– and –HOCH–. It is common in sugars. See diastereoisomer.

epimerases. Enzymes that catalyze the reversible interconversion of two epimers.

epimers. Two stereoisomers differing in configuration at one asymmetric center in a compound having two or more asymmetric centers.

epinephrine. (1-methylaminoethanolcatechol; “Adrenalin”).

CAS: 51-43-4.

A hormone of the adrenal glands.

Properties: (*l*-Form) Light-brown or nearly white, crystalline powder; odorless. Affected by light. Mp 211–212C, specific rotation –50 to –53.5 (25C). Sparingly soluble in water; insoluble in alcohol, chloroform, ether, acetone, oils; readily soluble in aqueous solutions of mineral acids, sodium hydroxide, and potassium hydroxide.

Derivation: From the adrenal glands of sheep and cattle or synthetically from pyrocatechol.

Grade: USP.

Use: Medicine (vasoconstrictor).

“Epiphen” [Borden]. TM for an epoxy resin in liquid form. “Epiphen” ER-823 is used in adhesives for rubber, steel, aluminum, or glass. Catalyst is supplied for specific end uses.

3-episarmentogenin.

CAS: 465-12-3. mf: C₂₃H₃₄O₅.

Hazard: A poison.

Source: Natural product.

epistasis. One gene interferes with or prevents the expression of another gene located at a different locus.

epitaxy. An oriented crystalline growth between two crystalline solid surfaces of different chemical composition in which the surface of one crystal offers suitable positions for deposition of a second crystal. This behavior is characteristic of some types of high polymers.

“EPI-TDPA” [Epi-Products]. TM for plastic film products.

Use: For films that will will degrade in landfills, photo degrade and biodegrade.

epithelial cell. Any cell that forms part of the outer covering of an organism or organ.

epitope. A portion of an antigenic macromolecule recognized and bound by a specific antibody.

EPN. (*o*-ethyl-*o,p*-nitrophenyl phenylphosphorothioate).

CAS: 2104-64-5. C₆H₅P(C₂H₅O)(S)OC₆H₄NO₂.

Properties: Light-yellow crystals. Mp 36C, d 1.5978 (30C). Insoluble in water; soluble in most organic solvents. Decomposes in alkaline solutions.

Grade: Wetttable powders and dusts.

Hazard: A cholinesterase inhibitor, absorbed by skin, use may be restricted. TLV: 0.1 mg/m³ (skin); not classifiable as a human carcinogen.

Use: Cotton insect pest control, acaricide.

epolamine. See 1-pyrrolidineethanol.

“Eponol” Resins. TM for high molecular weight linear copolymers of bisphenol A and epichlorohydrin; produce outstanding surface coatings by solvent evaporation alone.

“Epon” resins [Shell]. TM for a series of condensation products of epichlorohydrin and bisphenol-A having excellent adhesion, strength, chemical resistance, and electrical properties when formulated into protective coatings, adhesives, and structural plastics.

“Epotuf” [Reichhold]. TM for epoxy resins, epoxy hardeners, and epoxy esters used as coating vehicles.

epoxidation. Reaction in which olefinic unsaturation is converted to a cyclic, three-membered ether by active oxygen agents.

epoxide. An organic compound containing a reactive group resulting from the union of an oxygen atom with two other atoms (usually carbon) that are joined in some other way as indicated:

This group, commonly called “epoxy,” characterizes the epoxy resins. Epichlorohydrin and ethylene oxide are well-known epoxides. The compounds are also used in certain types of cellulose derivatives and fluorocarbons.

epoxidized linseed oil. See “Drapex” [Crompton & Knowles].

epoxidized soybean oil.

Properties: Iodine number maximum of 6, oxirane oxygen minimum of 6.0 percent.

Use: Food additive.

1,2-epoxybutane. See 1,2-butylene oxide.

3,4-epoxycyclohexane carbonitrile.

O(C₆H₉)CN.

Properties: Liquid. D 1.0929 (20/20C), bp 244.5C, fp -33C. Soluble in water.

Hazard: Toxic by skin absorption, ingestion, and inhalation.

Use: Intermediate, stabilizer.

epoxyethane. See ethylene oxide.

2,3-epoxy-2-ethylhexanol.

$\begin{array}{c} \text{---} \\ \text{C}_3\text{H}_7\text{CHOC}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH} \end{array}$

Properties: Liquid. D 0.9517 (20/20C), bp (decomposes), fp -65C. Slightly soluble in water. Combustible.

Hazard: Skin irritant.

Use: Stabilizer, intermediate.

epoxyheptachlor. (HCE; heptachlor epoxide).

CAS: 1024-57-3. C₁₀H₅Cl₇O.

Hazard: Confirmed carcinogen and poison by ingestion. TLV: 0.05 mg/m³; animal carcinogen.

11,13-(epoxymethano)-13h-cyclopenta(a)phenanthrene, pregn-4-ene-3,20-deriv.

CAS: 6251-69-0. mf: C₂₁H₂₈O₅.

Hazard: A reproductive hazard.

Use: Hormone.

epoxy novolak. Epoxy resin made by the reaction of epichlorohydrin with a novolak resin (phenol-formaldehyde; see novolak). These have a repeating epoxide structure that offers better resistance to high temperatures than the epichlorohydrin—bisphenol A type, and are especially useful as adhesives.

2,3-epoxy-1-propanol. See glycidol.

epoxy resin. A thermosetting resin based on the reactivity of the epoxide group. One type is made from epichlorohydrin and bisphenol A. Aliphatic polyols such as glycerol may be used instead of the aromatic bisphenol A. Molecules of this type have glycidyl ether structures,

in the terminal positions, have many hydroxyl groups, and cure readily with amines.

Another type is made from polyolefins oxidized with peracetic acid. These have more epoxide groups, within the molecule as well as in terminal positions, and can be cured with anhydrides, but require high temperatures. Many modifications of both types are made commercially. Halogenated bisphenols can be used to add flame-retardant properties. See epoxy novolak.

The reactive epoxies form a tight, cross-linked polymer network and are characterized by toughness, good adhesion, corrosive-chemical resistance, and good dielectric properties.

Most epoxy resins are the two-part type which harden when blended. A one-component liquid type for filament winding and a pelletized type for injection molding are available under the TM "Arnox."

Hazard: Strong skin irritant in uncured state.

Use: Surface coatings, as on household appliances and gas storage vessels; adhesive for composites and for metals, glass, and ceramics; casting metal-forming tools and dies; encapsulation of electrical parts; filament-wound pipe and pressure vessels; floor surfacing and wall panels; neutron-shielding materials; cements and mortars; nonskid road surfacing; rigid foams; oil wells (to solidify sandy formations); matrix for stained-glass windows; low-temperature mortars.

(3- α)-12,13-epoxytrichothec-9-ene-3,4,15-triol 15-acetate.

CAS: 2623-22-5. mf: $C_{17}H_{24}O_6$.

Hazard: A poison by ingestion. A mild skin irritant.

Source: Natural product.

EPR. Abbreviation for ethylene propylene rubber, also for electron paramagnetic resonance.

epsilon acid. (1-naphthylamine-3,8-disulfonic acid). $C_{10}H_5(NH_2)(SO_3H)_2$.

Properties: White, crystalline scales. Soluble in hot water.

Derivation: Naphthalene-1,5- and 1,6-sulfonic acids are nitrated and reduced, giving 1-naphthylamine-3,8- and 4,8-disulfonic acids. Separation is effected by crystallizing out the acid sodium salts of 1-naphthylamine-3,8-disulfonic acid.

Use: Azo-dye intermediate.

Epsom salts. See magnesium sulfate.

EPT. Abbreviation for ethylene-propylene terpolymer.

"Eptac No.1" [Du Pont]. TM for zinc dimethylthiocarbamate, an ultraaccelerator for rubber.

EPTC. (*S*-ethyl di-*N,N*-propylthiocarbamate).

CAS: 759-94-4. $C_5H_5SC(O)N(C_3H_7)_2$.

Available forms: Liquid and granular formulations.

Use: A preemergence herbicide.

eq. Abbreviation for gram equivalent weight, i.e., the equivalent weight in grams. Recommended as an international unit.

"Equanil." [Wyeth-Ayerst] Proprietary name for meprobamate.

Use: Sedative.

equation of state. The mathematical formula that expresses the relationships between pressure, volume, and temperature of a substance in any state of aggregation.

equilibrium. (1) Chemical equilibrium is a condition in which a reaction and its opposite or reverse reaction occur at the same rate, resulting in a constant concentration of reactants; for example, ammonia synthesis is at equilibrium when ammonia molecules form and decomposes at equal velocities ($N_2 + 3H_2 \rightleftharpoons 2NH_3$).

(2) Physical equilibrium is exhibited when two or more phases of a system are changing at the same rate so that the net change in the system is zero. An example is the liquid-to-vapor-vapor-to-liquid interchange in an enclosed system, which reaches equilibrium when the number of molecules leaving the liquid is equal to the number entering it.

equilibrium constant. A number that relates the concentrations of starting materials and products of a reversible chemical reaction to one another. For example, for a chemical reaction represented by the equation $aAB + bCD \rightleftharpoons cAD + dBC$ the equilibrium constant would be $K = \frac{[(AD)^c(BD)^d]}{[(AB)^a(CD)^b]}$ where a , b , c , and d are the numbers of molecules of AB, CD, AD, and BC that occur in the balanced equation, and (AD), (BC), (AB), and (CD) are the molecular concentrations of AD, BC, AB, and CD in any mixture that is at equilibrium. At any one temperature, K is usually at least approximately constant, regardless of the relative quantities of the several substances, so that when K is known it is

often possible to predict the concentrations of the products when those of the starting materials are known. The constant changes markedly with temperature. The constant can often be calculated from the relations of thermodynamics if the free energy for the chemical reaction is known, or by measuring all concentrations in one or more carefully conducted experiments.

equilibrium diagram. (constitutional diagram). (1) A simplified boiling-point diagram, showing for a liquid mixture the composition of the vapor in equilibrium with the liquid. (2) A chart showing the relation between a solution and the solids that may be crystallized from it. (3) A diagram showing the limits of composition and temperature in which the various phases or constituents of an alloy are stable.

equipartition, law of. Every particle, heavy or light, gaseous or liquid, and independent of its chemical nature or form, always possesses the same mean energy of translation at a given temperature.

equipotential energy. The energy existing at a constant potential throughout a system.

equivalent electrons. Electrons of equal azimuthal quantum numbers and principal quantum numbers. They have identical orbital properties but may have a difference in sign of their orbital moments.

equivalent weight. (combining weight). The weight of an element that combines chemically with 8 g of oxygen or its equivalent. Since 8 g of oxygen combines with 1.008 g of hydrogen, the latter is considered equivalent to 8 g of oxygen. When 8 g is selected for the combining weight of oxygen, no element has a combining-weight value greater than one. The equivalent weight of an acid is the weight that contains one atomic weight of acidic hydrogen, i.e., hydrogen that reacts during neutralization of acid with base. The equivalent weight of a base or hydroxide is the weight that will react with an equivalent weight of acid. Equivalent weights of other substances are defined in a similar manner.

Er. Symbol for erbium.

ER. See endoplasmic reticulum.

ERAD. Endoplasmic reticulum-associated degradation (of protein). Incorrectly formed proteins are destroyed in the ER instead of being secreted.

erbia. See erbium oxide.

erbium. Er. Element with atomic number 68, aw 167.26, valence of 3; one of the rare-earth elements of the yttrium subgroup. See rare earth.

Properties: Soft, malleable solid with metallic luster. Salts are pink to red. D 9.16 (15C), mp 1522C, bp approximately 2500C, high electrical resistivity. Insoluble in water; soluble in acids.

Derivation: Reduction of the fluoride with calcium, electrolysis of the fused chloride.

Source: Rare-earth minerals.

Available forms: Lumps, ingots of high purity, sponge, powder.

Hazard: Flammable in finely divided form.

Use: Nuclear controls, special alloys, room-temperature laser.

erbium nitrate. $\text{Er}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Large, reddish crystals. Loses $4\text{H}_2\text{O}$ at 130C. Soluble in water, alcohol, ether, and acetone.

Derivation: Treatment of oxides, carbonates, or hydroxides with nitric acid.

Grade: 99%.

Hazard: May explode if shocked or heated.

erbium oxalate. $\text{Er}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Reddish, microcrystalline powder. Decomposes at 575C, d 2.64. Soluble in water and dilute acids.

Hazard: Corrosive.

Use: Oxalates of the rare-earth metals are used to separate the latter from common metals.

erbium oxide. (erbia). Er_2O_3 .

Properties: Pink powder that readily absorbs moisture and carbon dioxide from the atmosphere. D 8.64, specific heat 0.065, infusible. Insoluble in water; slightly soluble in mineral acids.

Derivation: By heating the oxalate or other oxy-acid salts.

Grade: 98–99%.

Use: Phosphor activator, infrared-absorbing glass. See rare earth.

erbium sulfate. $\text{Er}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Pink, monoclinic crystals. D 3.68, dehydrated at 400C. Soluble in water.

Derivation: Dissolving hydroxides, carbonates, or oxides in dilute sulfuric acid.

Grade: 99.9%.

Use: To determine atomic weight of a rare-earth element.

ERE. (estrogen response element). A binding site in a promoter to which the activated estrogen receptor can bind. The estrogen receptor is essentially a transcription factor which is activated only in the presence of estrogens. The activated receptor will bind to an ERE, and transcription of the adjacent gene will be altered. See also "Response element".

erbon. (generic name for 2-(2,4,5-trichlorophenoxy)ethyl-2,2-dichloropropionate). CAS: 136-25-4. $(\text{Cl})_3\text{C}_6\text{H}_2\text{OC}_2\text{H}_4\text{OC}(\text{O})\text{C}(\text{Cl})_2\text{CH}_3$. **Properties:** Solid. Mp 49–50C (technical), bp 161C

(0.5 mm Hg). Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by inhalation and ingestion, strong irritant to eyes and skin.

Use: Herbicide.

erepsin. A mixture of peptidase enzymes formerly thought to be a single enzyme that catalyzes the hydrolysis of peptides in the small intestine.

ergamine. See histamine.

ergocalciferol. (calciferol; vitamin D₂).
CAS: 50-14-6. C₂₈H₄₄O.

Properties: White, odorless crystals. Affected by air and light. Mp 115–118°C, specific rotation +103 to +106 degrees. Insoluble in water; soluble in alcohol, chloroform, ether, and fatty oils.

Derivation: From ergosterol by irradiation with UV light.

Grade: USP, FCC, as vitamin D₂.

Use: Nutrition, dietary supplement.

ergocornine, dihydro-. See 9,10-dihydroergocornine.

ergosterol. (provitamin D₂). C₂₈H₄₃OH. A plant sterol widely distributed in nature.

Properties: Colorless crystals. Mp 166°C (with 1.5 H₂O), bp 250°C (0.01 mm Hg), d 1.04, specific rotation -135 (in chloroform). Insoluble in water; soluble in alcohol, benzene, ether.

Derivation: Synthesized by yeast from simple sugars, obtained from fungus ergot.

Hazard: Due to its ability to catalyze calcium deposi-

tion in the bony structure (thus preventing rickets), overdosage of vitamin D may be harmful.

Use: Antirachitic vitamin; when irradiated with UV light, it has vitamin D activity; source of estradiol.

ergot. (secale cornutum; rye ergot). A fungus growth, *Claviceps purpurea*, on rye.

Occurrence: Europe, cultivated in Spain and Russia.

Grade: Spanish, Russian.

Hazard: Toxic by ingestion.

Use: Source of many alkaloids, medicine (vasoconstrictor).

ergotamine.

CAS: 113-15-5. Alkaloid present in rye ergot.

Properties: Mw 581.73.

ergovaline mesylate. See ergovaline monomethanesulfonate.

ergovaline monomethanesulfonate.

CAS: 3398-46-7. mf: C₂₉H₃₅N₅O₅•CH₄O₃S.

Hazard: A reproductive hazard.

erionite.

CAS: 66733-21-9. mf: Al₂O₁₈Si₇•¹/₂Ca•7H₂O•¹/₂Na.

Hazard: Confirmed human carcinogen.

Source: Natural product.

“Erionyl” [Novartis]. TM for a group of condensation products of aromatic sulfonic acids used as fixative/reserving agents in dyeing nylon and nylon-cellulosic blends.

Erlenmeyer flask. A useful type of laboratory glassware, it is an open container whose dimensions are, for example, about 8 inches tall with a relatively narrow neck section about 1.5 inches in diameter and 2 inches long, below which the contour becomes cone shaped. The bottom is flat. It was named after its inventor, a German chemist.

Use: Numerous experiments involving liquids, especially titrations and extractive testing.

Erlenmeyer-Plochl azlactone and amino acid synthesis.

Formation of azlactones by intramolecular condensation of acylglycines in the presence of acetic anhydride. The reaction of azlactones with carbonyl compounds followed by hydrolysis to the unsaturated α-acylamino acid and by reduction yields the amino acid; drastic hydrolysis gives the α-oxo acid.

Ernst, Richard R. (1933–). A native of Switzerland who won the Nobel Prize in chemistry in 1991 for important methodological developments in NMR spectroscopy. He invented Fourier-transform NMR (FT-NMR), which multiplied sensitivity 10 to 100 times compared to dispersive instruments. He also devised two-dimensional NMR techniques, increasing resolution and enabling structure determi-

nations of biologically important macromolecules. Ernst received his Ph.D from the Federal Technical Institute (ETH) in Zurich, Switzerland.

erucamide. (erucylamide). $C_{27}H_{41}CONH_2$.

Properties: Solid. D 0.888, mp 75–80C, iodine value 70–80. Soluble in isopropanol; slightly soluble in alcohol and acetone. Combustible.

Use: Foam stabilizer, solvent for waxes and resins, emulsions, antiblock agent for polyethylene. See "Crodamide" [*Croda*].

erucic acid. (*cis*-13-docosenoic acid).

$C_{22}H_{40}O_2$. A C_{22} (solid) fatty acid with one double bond; a homolog of oleic acid with four more carbons.

Properties: Mp 33–34C, bp 264C (15 mm Hg), iodine value 75. Combustible.

Derivation: Fats and oils from mustard seed, rapeseed, and crambe seed.

Use: Preparation of dibasic acids and other chemicals, polyethylene-film additive, water-resistant nylon.

"Erucical H-102" [Lambent]. TM for a high erucic acid rapeseed oil referred to as HEAR oil. **Use:** For lubricity in metal working fluids, as a base oil in hydraulic fluid applications.

erucyl alcohol. $C_{22}H_{43}OH$. A C_{22} (solid) fatty alcohol having one double bond.

Properties: White, soft solid; almost odorless. D 0.8486, cloud point 27.2C, boiling range 334–376C, iodine value 83, flash p 395F (201C). Soluble in alcohol and most organic solvents. Combustible.

Derivation: Sodium reduction of erucic acid.

Use: Lubricants, surfactants, petrochemicals, plastics, textiles, rubber.

erythorbic acid. (*d*-erythroascorbic acid; isoascorbic acid). $C_6H_8O_6$.

Properties: Shiny, granular crystals. Decomposes 164–169C. Soluble in water, alcohol, pyridine; moderately soluble in acetone; slightly soluble in glycerol.

Grade: FCC.

Use: Antioxidant (industrial and food), especially in brewing industry, reducing agent in photography.

erythorbic acid sodium salt.

CAS: 6381-77-7. mf: $C_6H_7O_6 \bullet Na$.

Hazard: Low toxicity by ingestion. A mild eye irritant.

erythrite. (1) Synonym for erythritol.

(2) Cobalt bloom. $Co_3(As)_2 \bullet 8H_2O$. A natural hydrated cobalt arsenate.

Properties: Crimson, peach, red, pink, or pearl gray. Contains 37.5% cobalt oxide. D 2.91–2.95, Mohs hardness 1.5–2.5, mp (decomposes). Soluble in hydrochloric acid.

Occurrence: U.S. (California, Colorado, Idaho, Nevada), Ontario.

Hazard: Toxic by ingestion and inhalation.

Use: Coloring glass and ceramics.

erythritol. (tetrahydroxybutane).

CAS: 149-32-6. $CH_2OHCH_2OCH_2OCH_2OH$. A tetrahydric alcohol found in *Protococcus vulgaris* and other lichens of *Rocella* species. Can be made synthetically.

Properties: White, sweet crystals. Mp 121–122C, bp 329–331C, d 1.45. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Use: Manufacture of erythrityl tetranitrate.

erythritol anhydride. (butadiene dioxide).

CAS: 564-00-1. $C_4H_6O_2$.

Properties: Colorless liquid. Bp 138C, fp –18C, d 1.11. Hydrolyzed to erythritol when dissolved in water.

Hazard: Quite toxic.

Use: Cross-linking agent, biocide, bacteriostat.

erythrityl tetranitrate. (erythrol tetranitrate).

$CH_2ONO_2(CHONO)_2CH_2ONO_2$.

Properties: Crystals. Mp 61C. Soluble in alcohol, ether, and glycerol; insoluble in water.

Derivation: By nitration of erythritol.

Hazard: Severe explosion risk when shocked or heated.

Use: Medicine (diluted with lactose in nonexplosive tablets).

erythroascorbic acid. See erythorbic acid.

erythrocyte. A red blood cell, containing hemoglobin, the iron-carrying protein of the blood. See leucocyte.

erythrogenic acid. See isanic acid.

erythromycin.

CAS: 114-07-8. $C_{37}H_{67}NO_{13}$. An antibiotic produced by growth of *Streptomyces erythreus* Waksman. It is effective against infections caused by Gram-positive bacteria, including some β -hemolytic streptococci, pneumococci, and staphylococci.

Properties: White or slightly yellow crystalline powder; odorless; bitter. Mp 133–138C. Freely soluble in alcohol, chloroform, and ether; very slightly soluble in water; slightly hygroscopic; pH (saturated solution) 8–10.5; pH <4 is destructive. Alcoholic solution is levorotatory.

Grade: USP.

Use: Medicine (antibiotic); various salts are available.

Note: The erythromycin molecule was synthesized by the Harvard chemist Robert Woodward. The synthesis was almost completed at the time of his death in 1979, and was finished by his associates in 1981. It is an extremely complex structure containing a lactone ring of 14 members with 10 asymmetric centers; it also has two specialized sugar molecules, L-cladinose and D-desosamine. The reported molecular configuration is:

erythromycin thiocyanate.

Properties: White or almost white powder.

Use: Food additive; drug (veterinary).

erythrosine. (Sodium or potassium salt of iodeosin; CI 45430; FD&C Red No.3).

CAS: 16423-68-0. $C_{20}H_{14}N_2O_5$.

Properties: Brown powder, forms cherry-red solution in water. Soluble in alcohol.

Use: Biological stain, certified food color.

Es. See einsteinium.

ESCA. Electron spectroscopy for chemical analysis.

eschka mixture. Consists of two parts magnesium oxide and one part anhydrous sodium carbonate.

Use: As a fusion mixture for determining sulfur in coal.

Eschweiler-Clarke reaction. Reductive methylation of primary or secondary amines with formaldehyde and formic acid (special form of the Leuckart-Wallach reaction).

ESD. Electron-stimulated desorption.

eserine. See physostigmine.

-esis. Suffix denoting state, condition, or process.

esmolol. See methyl 4-(2-hydroxy-3-((1.

esparto. The leaves of a desert plant (*Stipa tenacissima* and *Lygeum spartum*) of the Mediterranean area. Relatively high content of cellulose and α -cellulose make it usable for high-quality paper for in-

taglio color printing. A wax derived from this plant is used as a substitute for carnauba, especially in carbon paper.

ESR. See spin resonance.

essential. (1) Containing the characteristic odor or flavor, (i.e., the essence) of the original flower or fruit: an essential oil, usually obtained by steam distillation of the flowers or leaves or cold-pressing of the skin. (2) As applied to certain amino acids, fatty acids, and vitamins, this term is used by biochemists to mean that the compound in question is a necessary nutritional factor that is not synthesized within the body of the animal and thus must be obtained from external sources. Eight amino acids are classified as essential on this basis. See amino acid.

essential amino acids. Amino acids that cannot be synthesized by humans (or other vertebrates) and must be obtained from the diet.

essential fatty acids. The group of polyunsaturated fatty acids produced by plants, but not humans, and thus required in the human diet: linoleic, linolenic and arachidonic acids.

essential oil. A volatile oil derived from the leaves, stem, flower, or twigs of plants, and usually carrying the odor or flavor of the plant. Chemically, they are often principally terpenes (hydrocarbons), but many other types also occur. Essential oils (except for those containing esters) are unsaponifiable. Some are nearly pure single compounds, as oil of wintergreen, which is methyl salicylate. Others are mixtures, as turpentine oil (pinene, dipentene) and oil of bitter almond (benzaldehyde, hydrocyanic acid). Some contain resins in solution and are called oleoresins or balsams.

Properties: Pungent taste and odor; usually nearly colorless when fresh but becoming darker and thick on exposure to the air. Optically active, d 0.850–1.100. Soluble in alcohol, carbon disulfide, carbon tetrachloride, chloroform, petroleum ether, and fatty oils; insoluble in water except for individual constituents of some oils which may be partially water-soluble, resulting in a loss of these constituents during steam distillation.

Derivation: (1) By steam distillation; (2) by pressing (fruit rinds); (3) by solvent extraction; (4) by maceration of the flowers and leaves in fat and treating the fat with a solvent; (5) by enfleurage.

Use: Perfumery, flavors, thinning precious-metal preparations used in decorating ceramic ware.

See terpeness oil. Further information can be obtained from the Essential Oil Association of U.S.

Note: Many essential oils are now made synthetically for a wide variety of fragrances and flavoring agents. Use of these synthetics is increasing because of a shortage of natural products.

EST. See expressed sequence tag.

ester. An organic compound corresponding in structure to a salt in inorganic chemistry. Esters are considered as derived from acids by the exchange of the replaceable hydrogen of the latter for an organic radical. The usual reaction is that of an acid (organic or inorganic) with an alcohol or other organic compound rich in OH groups. Esters of acetic acid are called acetates, and esters of carbonic acid carbonates.

See fatty ester.

esterase-lipase.

Properties: Derived from *Mucor miehei*.

Use: Food additive.

ester gum. Hard, semisynthetic resin produced by esterification of natural resins (especially rosin) with polyhydric alcohols (principally glycerol but also pentaerythritol). Flash p 375F (190C). Combustible.

Grade: By color, also as gum rosin or wood rosin.

Use: Paints, varnishes, and cellulosic lacquers.

esterification. The process of producing an ester by reaction of an alcohol with an acid.

ester interchange. (transesterification; interification). The reaction between an ester and another compound with exchange of alkoxy or acyl groups to form a different ester.

ester number. (1) The number of milligrams of alkali necessary for saponification of the glyceryl esters in a fat or oil. (2) The difference between acid number and saponification number.

“Esteron” [Dow]. TM for a series of weed- and brush-control products; they are formulated esters of 2,4-D and 2,4,5-T.

estradiol.

CAS: 50-28-2. $C_{18}H_{24}O_2$. A female sex hormone. It occurs in two isomeric forms, α and β . β -estradiol has the greatest physiological activity of any naturally occurring estrogen. The α form is relatively inactive. Commonly used preparations are the benzoate, dipropionate, and valerate, as well as ethinylestradiol.

Properties: (β -form) White or slightly yellow, small crystals or crystalline powder; odorless. Mp 173–179C, stable in air. Almost insoluble in water;

soluble in alcohol, acetone, dioxane, and solutions of alkali hydroxides; sparingly soluble in vegetable oils.

Derivation: Isolated from human and mare pregnancy urine, commercial synthesis from cholesterol or ergosterol.

Grade: NF (β -form).

Hazard: A carcinogen (OSHA).

Use: Medicine (estrogenic hormone).

estradiol monopotassium.

Use: Food additive; drug (veterinary).

estragole. (chavicol methyl ether; methyl chavicol).

CAS: 140-67-0. $C_6H_4(C_3H_5)(OCH_3)$.

Properties: Colorless liquid; anise odor. D 0.965–0.975 (20/4C), 1.5230 (17.5C), bp 216C. Soluble in alcohol and chloroform.

Occurrence: In tarragon oil, basil oils, anise bark oil, and others.

Use: Perfumes, flavors.

4,9,11,-estratrien-17 β -ol-3-one. See trenbolone.

estriol.

CAS: 50-27-1. $C_{18}H_{26}O_3$.

Properties: White, odorless, microcrystalline powder. Mp 282C. Exhibits reddish fluorescence under filtered UV light. Undergoes phase change at 270–275C. Practically insoluble in water; soluble in alcohol, dioxane, and oils.

Derivation: Isolation from pregnant human urine, isolated from human placenta, organic synthesis.

Hazard: A carcinogen (OSHA).

Use: Medicine (estrogenic hormone).

estrogen. A general term for female sex hormones. They are responsible for the development of the female secondary sex characteristics, such as the deposition of fat and the development of the breasts. The naturally occurring estrogens, such as estradiol, estrone, and estriol, are steroids. Estrogens are produced by the ovary and, to a lesser degree, by the adrenal cortex and testis. Some synthetic nonsteroid compounds such as diethylstilbestrol and hexestrol have estrogenic activity.

Hazard: Carcinogenic, damaging side effects (thromboembolism).

Use: Medicine, biochemical research, oral contraceptives.

See antifertility agent.

estrogen response element. See ERE.

estrone.

CAS: 53-16-7. $C_{18}H_{22}O_2$. A steroid with some estrogenic activity.

Properties: Small, white crystals or white, crystalline powder; odorless. Mp 258–262C, stable in air. Insoluble in water; soluble in alcohol, acetone, dioxane, and solutions of fixed alkali hydroxides.

Derivation: Isolated from pregnant human urine, synthesis from ergosterol.

Hazard: A carcinogen (OSHA).

estrone 17-methoxime.

CAS: 3342-64-1. mf: $C_{19}H_{25}NO_2$.

Hazard: A reproductive hazard.

Et. Informal abbreviation for ethyl. Example: EtOH, ethyl alcohol.

estamycin.

CAS: 299-20-7. mf: $C_{14}H_{12}N_8O_{11}$.

Hazard: Moderately toxic by ingestion.

Etard reaction. Oxidation of an arylmethyl group to an aldehyde by means of chromyl chloride.

“**Ethacure**” [*Albemarle*]. TM for curing agents for thermosetting plastics.

“**Ethafoam**” [*Dow*]. TM for a lightweight, low-density polyethylene foam.

ethanal. See acetaldehyde.

ethanamide. See acetamide.

ethane. (dimethyl; methylmethane).

CAS: 74-84-0. C_2H_6 .

Properties: Colorless gas; odorless. Bp $-88.63C$, fp $-183.23C$ (triple point), d of liquid 0.446 (0C), d of vapor (air = 1) 1.04 (0C), critical temp 32.1C, critical press (absolute) 718 psi, specific heat at constant press 0.897, specific heat at constant vol 0.325, ratio of specific heats (cp/cv) 1.224, heat of combustion approximately 22,300 Btu/lb or 1800 Btu/cu ft, flash p $-211F$ ($-135C$), autoign temp 959F (515C). Insoluble in water; soluble in alcohol. Relatively inactive chemically.

Derivation: Fractionation of natural gas.

Grade: 95%, 99%, research, 99.98%.

Hazard: Severe fire risk if exposed to sparks or open flame. Flammable limits in air 3–12%. An asphyxiant gas.

Use: Petrochemicals (source of ethylene, halogenated ethanes), refrigerant, fuel.

***n,n'*-(1,2-ethanedioxysulfinyl)bis(s-methyl-*n*-methylcarbamoyloxythioacetimidate).**

CAS: 81861-89-4. mf: $C_{12}H_{22}N_4O_8S_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

ethanedioyl chloride. See oxalyl chloride.

1,2-ethanedithiol. (dithioethyleneglycol; ethylenedimercaptan).

CAS: 540-63-6. $HSCH_2CH_2SH$.

Properties: Liquid. Mw 94.20, bp 144–146C, d 1.123. Soluble in alcohol and alkalis.

Hazard: Vapors cause severe headache and nausea.

Use: Metal-complexing agent. Reverses the inhibition by α -keto aldehydes on mitosis in *E. coli*.

***n,n'*-(1,2-ethanedithiosulfinyl)bis(2,3-dihydro-2,2-dimethylbenzofuranyl-7) methylcarbamate.**

CAS: 81861-95-2. mf: $C_{26}H_{32}N_2O_8S_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***n,n'*-(1,2-ethanedithiosulfinyl)bis(s-methyl-*n*-methylcarbamoyloxythioacetimidate).**

CAS: 81861-94-1. mf: $C_{12}H_{22}N_4O_6S_6$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1,1'-(1,2-ethanediyl)bis(1-methylhydrazine).

CAS: 20247-50-1. mf: $C_4H_{14}N_4$.

Hazard: Moderately toxic by ingestion and inhalation.

1,1'-(1,2-ethanediylbis(oxy))bis(2,3,4,5,6-pentabromobenzene).

CAS: 61262-53-1. mf: $C_{14}H_4Br_{10}O_2$.

Hazard: Moderately toxic by inhalation and skin contact. Low toxicity by ingestion.

ethane hydrate. See gas hydrate.

ethanethiol. (ethyl sulfhydrate; ethyl mercaptan).

CAS: 75-08-1. C_2H_5SH .

Properties: Colorless liquid, has one of the most penetrating and persistent odors known (skunk). D 0.83907 (20/4C), bp 36C, fp $-121C$, refr index 1.4305 (20C), flammable limits in air 2.8–18.2% by volume, flash p approximately 80F (26.6C) (CC), autoign temp 570F (298C). Slightly soluble in water; soluble in alcohol, ether, petroleum naphtha.

Derivation: By saturating potassium hydroxide solution with hydrogen sulfide, mixing with calcium ethylsulfate solution, and distilling in a water bath.

Hazard: Toxic by ingestion and inhalation. Flammable, dangerous fire risk. TLV: 0.5 ppm.

Use: LPG odorant, adhesive, stabilizer, chemical intermediate.

Note: Tomato juice is reported to deodorize materials contaminated with this compound.

ethanethiolic acid. See thioacetic acid.

ethanoic acid. See acetic acid.

ethanol. See ethyl alcohol.

ethanolamine. (MEA; monoethanolamine; colamine; 2-aminoethanol; 2-hydroxyethylamine).
CAS: 141-43-5. HOCH₂CH₂NH₂.

Properties: Colorless; ammoniacal odor. D 1.0179 (20/20C), bp 170.5C, mp 10.5C, vap press 0.48 mm Hg (20C), flash p 200F (93.3C) (OC), bulk d 8.5 lb/gal (20C). Hygroscopic, viscous liquid. Strong base. Miscible with water, methanol, acetone. Combustible.

Derivation: Reaction of ethylene oxide and ammonia gives a mix of mono-, di-, and triethanolamines.

Grade: Technical, NF.

Hazard: Skin irritant. TLV: 3 ppm; STEL 6 ppm.

Use: Scrubbing acid gases (H₂S, CO₂), especially in synthesis of ammonia, from gas streams; nonionic detergents used in dry cleaning, wool treatment, emulsion paints, polishes, agricultural sprays; chemical intermediates, pharmaceuticals, corrosion inhibitor, rubber accelerator.

ethanol formamide. HOCH₂NHOCH₂.

Properties: Somewhat viscous liquid. Bp 143C (2.5 mm Hg), fp approximately -72C, d 1.170 (25/4C), flash p 347F (175C). Miscible with water, alcohol, and glycerol. Compatible with polyvinyl alcohol, many cellulosic and natural resins. Combustible.

ethanol hydrazine. See β-hydroxyethylhydrazine.

ethanolurea. NH₂CONHCH₂CH₂OH.

Properties: Liquid. Solidification point 71–74C. Formaldehyde condensation products are permanently thermoplastic and water soluble. As increasing amounts of simple urea are mixed with ethanolurea, the condensation products gradually change from pliable film-forming resins into the brittle types. Thus, almost any degree of water solubility and flexibility may be obtained in the final resin. The modified resins formed with ethanolurea are compatible with polyvinyl alcohol, methyl cellulose, cooked starch, and other water-dispersible materials.

ethanone, 1-(5,6,7,8-tetrahydro-3,5,5,6,8,8-hexamethyl-2-naphthalenyl)-.

CAS: 21145-77-7. mf: C₁₈H₂₆O.

Hazard: A poison by ingestion. Low toxicity by skin contact.

“Ethanox” [Albemarle]. TM for hindered phenolic antioxidants.

ethaphos.

CAS: 38527-91-2. mf: C₁₁H₁₅Cl₂O₃PS.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

ethaverine. (1-[(3,4-diethoxyphenyl)methyl]-6,7-diethoxyisoquinoline; isoquinoline).

CAS: 486-47-5. C₂₄H₂₉NO₄.

Properties: Crystals. Mw 395.48 (99–101C). Insoluble in water; very soluble in hot alcohol; slightly soluble in ether and chloroform.

Use: Antispasmodic drug.

“Ethazcate” [Uniroyal]. TM for zinc diethyl-dithiocarbamate.

See zinc diethyldithiocarbamate.

ethchlorvynol. (1-chloro-3-ethyl-1-penten-4-yn-3-ol; β-chlorovinylethylethynylcarbinol).

CAS: 113-18-8. HC≡CCOH(C₂H₅)CH=CHCl.

Properties: Colorless to yellow liquid; pungent aromatic odor. Darkens on exposure to light and air. D 1.068–1.071, refr index 1.4765–1.4800 (25C), bp 173–181C. Immiscible with water; miscible with most organic solvents.

Grade: NF.

Hazard: Abuse may cause addiction.

Use: Medicine (sedative).

ethene. See ethylene.

ethenol. See vinyl alcohol.

ethenylbenzene tribromo deriv. homopolymer.

CAS: 57137-10-7. mf: (C₈H₅Br₃)_x

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion. A mild eye irritant.

Use: Fragrance chemical.

ethenyl 2-propenoate.

CAS: 2177-18-6. mf: C₅H₆O₂.

Hazard: A poison by ingestion. Low toxicity by inhalation. A severe skin and eye irritant.

ethephon. See 2-chloroethylphosphonic acid.

ether. A class of organic compounds in which an oxygen atom is interposed between two carbon atoms (organic groups) in the molecular structure, giving the generic formula ROR. They may be derived from alcohols by elimination of water, but the major method is catalytic hydration of olefins. Only the lowest member of the series, methyl ether, is gaseous; most are liquid, and the highest members are solid (cellulose ethers). The term *ether* is often used synonymously with *ethyl ether* and is the legal label name for it.

Hazard: The lower molecular weight ethers are dangerous fire and explosion hazards; when containing peroxides they can detonate on heating.

Use: See ethyl ether; polymer, water-soluble; ethylene oxide; propylene oxide; diethylene glycol; ethylcellulose; polyether.

Note: An illogical and archaic use of the term *ether*

survives in such names as petroleum ether.
See crown ether.

ethereal. Descriptive of a liquid characterized by high volatility, often a mixture of ethyl ether and an essential oil.

ethical drug. A prescription drug.
See drug.

ethinylestradiol. (ethinylestradiol; 19-nor-17- α -pregna-1,3,5(1)-trien-20-yne-3,17-diol).
CAS: 57-63-6. $C_{20}H_{24}O_2$.

Properties: Fine, white to creamy white crystalline powder; odorless. Sensitive to light. Mp 142–146C. May also exist in a polymorphic modification with mp 180–186C. Soluble in acetone, alcohol, chloroform, dioxane, ether, and vegetable oils; practically insoluble in water; soluble in solutions of sodium hydroxide or potassium hydroxide; slightly dextrorotatory in dioxane solution.

Derivation: Preparation from estrone.

Grade: USP.

Use: Medicine (estrogenic hormone).

ethion. (generic name for *O,O,O',O'*-tetraethyl-*S,S'*-methylenediphosphorodithioate).
CAS: 563-12-2. $[(C_2H_5O)_2P(S)S]_2CH_2$.

Properties: Liquid. D 1.220 (20C), fp –13C. Slightly soluble in water; soluble in acetone, xylene, chloroform, and methylated naphthalene.

Hazard: Cholinesterase inhibitor, use may be restricted. TLV: 0.4 mg/m³.

Use: Insecticide and miticide.

ethisterone. (preneninolone; anhydrohydroxyprogesterone; ethynyltestosterone).
CAS: 434-03-7. $C_{21}H_{28}O_2$.

Properties: White or slightly yellow crystals or crystalline powder; odorless. Stable in air. Affected by light. Mp 267–275 (decomposes). Almost insoluble in water; slightly soluble in alcohol, chloroform, ether, and vegetable oils.

Derivation: From progesterone and other steroids.

Grade: NF.

Use: Medicine (estrogenic hormone).

“Ethocel” [Dow]. TM for ethylcellulose resins are able to withstand shock and maintain toughness over a temperature range of +93 to –40C. Available in transparent, translucent, and opaque colors. Insoluble in water, soluble in most organic solvents.
Use: Household articles, automotive parts, tools for aircraft industry.

ethodin. (6,9-diamino-2-ethoxyacridine lactate monohydrate).
CAS: 1837-57-6. $C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$.

Properties: Pale-yellow crystals. Darkens at 200C, mp 235C. Slowly soluble in 15 parts water; soluble in 9 parts boiling water; soluble in 110 parts alcohol

(22C). Solutions are yellow, fluorescent, and stable to boiling.

Purity: 97% (dry basis).

Use: Bactericide, surgical antiseptic, preparation of pure γ -globulin.

ethofumesate. (2-ethoxy-2,3-dihydro-3,3-dimethyl-5-benzofuranol methanesulfonate).
CAS: 26225-79-6. $C_{13}H_{18}O_3S$.

Properties: Whitish crystals. Mp 71C. Does not hydrolyze with water at neutral pH.

Use: Herbicide, silvicide.

ethoheptazine. (ethyl heptazine; 1-methyl-4-carbethoxy-4-phenylhexamethyleneimine).
 $C_{16}H_{23}NO_2$.

Properties: Liquid. D 1.038 (26/4C), bp 133–134C (1.0 mm Hg), refr index 1.5210 (26C).

Use: Medicine (analgesic).

ethohexadiol. USP name for 2-ethylhexanediol-1,3.

“ETHONIC” [Albemarle]. TM for ethoxylated alcohol surfactants.

“ETHONIC 11” [Albemarle]. TM for ethoxylated alcohols.

Use: As wetting agents and emulsifiers in detergents, personal care, textiles, and paper.

ethopabate.

CAS: 59-06-3. mf: $C_{12}H_{15}NO_4$.

Properties: Odorless white to pink crystals from MeOH (aq). Mp: 148–149°. Sol in methanol, ethanol, acetone, acetonitrile, isopropanol, *p*-dioxane, ethyl acetate, and methylene chloride.

Use: Drug (veterinary); food additive.

ethoxazene. See *p*-ethoxychrysoidine.

***p*-ethoxyacetanilide.** See acetophenetidin.

4-ethoxyamphetamine hydrochloride.

CAS: 135014-87-8. mf: $C_{11}H_{17}NO \cdot ClH$.

Hazard: A reproductive hazard.

ethoxycarbonyl isothiocyanate. (ethyl isothiocyanateformate). $C_2H_5O_2CNCS$.

Properties: Moisture-sensitive solid. Mw 131.15, bp 56C (18 mm Hg), d 1.112.

Hazard: Lachrymator.

Use: Versatile reagent for organic synthesis.

***o*-(4-(1-(((ethoxycarbonyl)oxy)imino)ethyl)phenyl) *o,o*-diethyl phosphorothioate.**

CAS: 22936-34-1. mf: $C_{15}H_{23}NO_6PS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***p*-ethoxychrysoidine.**

CAS: 94-10-0. mf: $C_{14}H_{16}N_4O$.

Hazard: A poison.

2-ethoxy-3,4-dihydro-2H-pyran.

Properties: Liquid. D 0.970 (20/20C), bp 143C, fp -100C, flash p 111F (OC). Sets to glass below this temperature. Very slightly soluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Stabilizer, intermediate.

6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline. (ethoxyquin).

CAS: 91-53-2. $\text{C}_{14}\text{H}_{19}\text{NO}$.

Properties: Yellow liquid. Bp 125C (2 mm Hg), mp approximately 0C, refr index 1.569–1.572 (25C), d 1.029–1.031 (25C). Discolors and stains badly.

Hazard: Toxic by ingestion.

Use: Insecticide, antioxidant, flex-cracking inhibitor, postharvest preservation of apples (scald inhibitor).

ethoxydimethylsilane. (dimethylethoxysilane).

CAS: 14857-34-2. $\text{C}_4\text{H}_{12}\text{OSi}$.

Hazard: An inhalation hazard. TLV: TWA 0.5 ppm; STEL: 1.5 ppm.

2-ethoxyethanol. See ethylene glycol monoethyl ether.

2-ethoxyethyl acetate. See ethylene glycol monoethyl ether acetate.

n-(2-ethoxyethyl)-4,5-dihydro-3-(phenylamino)-2h-benz(g)indazole-2-acetamide.

CAS: 301644-19-9. mf: $\text{C}_{23}\text{H}_{26}\text{N}_4\text{O}_2$.

Hazard: A poison by ingestion.

2-ethoxyethyl-*p*-methoxycinnamate.

Properties: Slightly yellow, viscous liquid; practically odorless. D 1.1000–1.1035 (25/25C), refr index 1.5650–1.5675 (20C), flash p >212F (>100C) (TCC). Miscible with alcohol and isopropyl alcohol; almost insoluble in water. Combustible.

Use: UV absorber in suntan preparations.

3-ethoxy-4-hydroxybenzaldehyde. See ethyl vanillin.

1-ethoxy-2-hydroxy-4-propenylbenzene.

See propenyl guaethol.

2-[1-(ethoxyimino)butyl]-5-[2-(ethylthio)propyl]-3-hydroxy-2-cyclohexene-1-one.

Use: Food additive; herbicide.

“Ethoxylan” [Henkel]. TM for additive lanolin.

Available forms: Paste, waxy solid.

Use: Emollient conditioner; lubricant emulsifier for creams, lotions, makeup, lip products, and nail and suntan products.

ethoxylated glyceryl monostearate. See “Durfax EOM” [PPG].

ethoxylated mono- and diglycerides.

Properties: Mix of stearate, palmitate, and lesser amounts of myristate partial esters of glycerin condensed with approx. 20 moles of ethylene oxide per mole of α -monoglyceride reaction mixtures. (FCC III) Pale, sltly yellow, oily liquid; mildly bitter taste. Sol in water, alc, xylene; sltly sol in mineral oil, vegetable oil.

Use: Food additive.

4-ethoxy-3-methoxybenzaldehyde.

Properties: White to light-brown crystals; slight vanillin odor. Mp 62–64C. Combustible.

Use: Intermediate.

4-ethoxy-3-methoxyphenylacetic acid.

Properties: An off-white powder. Mp 119–122C.

Use: Intermediate.

1-ethoxy-2-methoxy-4-propenylbenzene.

See isoeugenyl ethyl ether.

2-ethoxy-4-methyl-2,3-dihydro-4h-pyran.

CAS: 10138-44-0. mf: $\text{C}_8\text{H}_{14}\text{O}_2$.

Hazard: Moderately toxic by ingestion. mild skin and eye irritant.

ethoxymethylenemalononitrile.

Properties: Colorless liquid. Bp 160C, mp 64C, flash p 311F (155C). Combustible.

Use: Chemical intermediate.

4-ethoxyphenol. See hydroquinone monoethyl ether.

r-(-)-5-(2-((2-(2-ethoxyphenoxy)ethyl)amino)propyl)-2-methoxybenzenesulfonamide hydrochloride.

CAS: 106463-17-6. mf: $\text{C}_{20}\text{H}_{28}\text{N}_2\text{O}_5\text{S}\cdot\text{ClH}$.

Hazard: Moderately toxic by ingestion.

2-(*m*-ethoxyphenyl)imidazo(2,1-*a*)isoquinoline.

CAS: 61001-14-7. mf: $\text{C}_{19}\text{H}_{16}\text{N}_2\text{O}$.

Hazard: A reproductive hazard.

ethoxyquin. Coined name for 6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline.

ethoxytriglycol.CAS: 112-50-5. $C_9H_{16}O(C_2H_4O)_3H$.**Properties:** Colorless liquid. D 1.0208 (20/20C), bulk d 8.5 lb/gal (20C), bp 255.4C, vap press <0.01 (20C), fp -18.7C, viscosity 7.80 cP (20C). Completely soluble in water. Flash p 275F (135C) (CC). Combustible.**Use:** Chemical intermediate.**ethy abietate.** $C_{19}H_{29}COOC_2H_5$.**Properties:** Amber-colored, viscous liquid; hardens upon oxidation. Bp 350C, flash p 352F (177C), mp 45C, refr index 1.4980, d 1.02. Soluble in ether and most varnish solvents, insoluble in water. Combustible.**Derivation:** (1) By heating together ethyl chloride and an alcoholic solution of rosin and caustic soda.

(2) By reacting ethyl iodide with silver abietate.

Hazard: Irritant.**Use:** Varnishes, lacquers, and coating compositions.***n*-ethylacetamide.** $CH_3CONHC_2H_5$.**Properties:** Colorless liquid; faint odor. D 0.920 (20/20C), boiling range 206–208.5C, flash p 230F (110C). Combustible.**ethyl acetamidocynoacetate.** (acetamido-cynoacetic ester; ethyl-*n*-acetyl- α -cyanogly-cine). $NCCH(NHCOCH_3)COOC_2H_5$.**Properties:** Solid. Mp 129C.**Use:** Synthesis of amino acids and related compounds.***n*-ethylacetanilide.** (ethylphenylacetamide). $C_6H_5NC_2H_5COCH_3$.**Properties:** White, crystalline solid; faint odor. D 0.994, bp 258C, flash p 126F (52.2C), mp 54C. Soluble in most organic solvents; insoluble in water. Combustible.**Grade:** Technical.**Hazard:** Toxic by ingestion, moderate fire risk.**Use:** Substitute for camphor in nitrocellulose.**ethyl acetate.** (acetic ether; acetic ester; vinegar naphtha).CAS: 141-78-6. $CH_3COOC_2H_5$.**Properties:** Colorless, fragrant liquid. Bp 77C, vap press 73 mm Hg (20C), fp -83.6C, bulk density 0.8945 g/ml (25C), flash p 24F (-4.4C), autoign temp 800F (426C). Soluble in chloroform, alcohol, and ether; slightly soluble in water.**Derivation:** By heating acetic acid and ethyl alcohol in the presence of sulfuric acid and distilling.**Grade:** Commercial 85–88%, 95–98%, 99%, NF (99%), FCC.**Hazard:** Toxic by inhalation and skin absorption; irritant to eyes and skin. Flammable, dangerous fire and explosion risk, flammable limits in air 2.2–9%. TLV: 400 ppm; not classifiable as a human carcinogen.**Use:** General solvent in coatings and plastics, organic

synthesis, smokeless powders, pharmaceuticals, synthetic fruit essences.

ethyl-*o*-acetate. $CH_3C(OC_2H_5)_3$.**Properties:** Colorless liquid. Bp 144–148C, refr index 1.395 (25C). Insoluble in water; soluble in alcohol and ether, flash p 131F (55C). Combustible.**Hazard:** Moderate fire risk.**Use:** Intermediate.**ethyl acetate, anhydrous.** ethyl acetate, grade 99%.**ethyl acetic acid.** See butyric acid.**ethyl acetoacetate.** (diacetic ester; acetoacetic ester). $CH_3COCH_2COOC_2H_5$ (keto form), $CH_3C(OH):CHCOOC_2H_5$ (enol form). This compound is a tautomer at room temperature consisting of about 93% keto form and 7% enol form.**Properties:** Colorless liquid; fruity odor. D 1.0250 (20/4C), fp (enol) -80C; (keto) -39C, bp 180–181C, bulk d 8.5 lb/gal, vap press 0.8 mm Hg (20C), flash p 185F (85C) (COC), coefficient of expansion 0.00101/C. Soluble in water and common organic solvents. Combustible.**Derivation:** Action of metallic sodium on ethyl acetate with subsequent distillation.**Grade:** Technical, 98%.**Hazard:** Toxic by ingestion and inhalation; irritant to skin and eyes.**Use:** Organic synthesis; antipyrine, lacquers, dopes, plastics; manufacture of dyes, pharmaceuticals anti-malarials, vitamin B; flavoring.**ethyl acetone.** See methyl propyl ketone.**ethyl-*n*-acetyl- α -cyanoglycine.** See ethyl acetamidocynoacetate.**ethylacetylene.** (1-butyne).CAS: 107-00-6. $C_2H_5C\equiv CH$.**Properties:** Available as liquefied gas. Bp 8.3C, d 0.669 (0/0C), fp -130C, flash p <20F (-6.6C) (TOC), sv 7.2 cu ft/lb (21.2C). Insoluble in water.**Hazard:** Flammable, dangerous fire risk.**Use:** Specialty fuel, chemical intermediate. **α -ethylacrolein.**CAS: 922-63-4. mf: C_5H_8O .**Hazard:** Moderately toxic by inhalation.**ethyl acrylate.**CAS: 140-88-5. $CH_2=CHCOOC_2H_5$.**Properties:** Colorless liquid. Bp 99.4C, fp -72.0C, d 0.9230 (20/20C), refr index 1.4037 (25C), bulk d 7.6 lb/gal (20C), flash p 60F (15.5C) (OC). Soluble in alcohol and ether. Readily polymerized.**Derivation:** (1) Ethylene cyanohydrin, ethyl alcohol, and dilute sulfuric acid; (2) Oxo reaction of acetylene, carbon monoxide, and ethyl alcohol in the presence of nickel or cobalt catalyst.

Grade: Technical (inhibited, usually with hydroquinone or its monomethyl ether), pure uninhibited.

Hazard: Toxic by ingestion, inhalation, skin absorption; irritant to skin and eyes. Flammable, dangerous fire and explosion hazard. TLV: 5 ppm; STEL 15 ppm; suspected human carcinogen.

Use: Monomer for acrylic resins.

See acrylate; acrylic resin.

α -ethylacrylaldehyde. See α -ethylacrolein.

ethyl alcohol. (alcohol; grain alcohol; ethanol; EtOH).

CAS: 64-17-5. C_2H_5OH .

Properties: (Pure 100% absolute alcohol, dehydrated) Colorless, limpid, volatile liquid; ethereal vinous odor; pungent taste. Bp 78.3C, fp -117.3C, refr index 1.3651 (15C), surface tension 22.3 dynes/cm (20C), viscosity 0.0141 cP (20C), vap press 43 mm Hg (20C), specific heat 0.618 cal/g K (23C), flash p 55F (12.7C), d 0.816 (15.56C), bp 78C, fp -114C, autoign temp 793F (422C). Miscible with water, methanol, ether, chloroform, and acetone. (95% alcohol)

Derivation: (1) From ethylene by direct catalytic hydration or with ethyl sulfate as intermediate; (2) fermentation of biomass, especially agricultural wastes; (3) enzymatic hydrolysis of cellulose. See cellulase.

Grade: USP (95% by volume), absolute, pure, completely denatured, specially denatured, industrial, various proofs (one-half the proof number is the percentage of alcohol by volume).

Hazard: Classified as a depressant drug. Though it is rapidly oxidized in the body and is therefore noncumulative, ingestion of even moderate amounts causes lowering of inhibitions, often succeeded by dizziness, headache, or nausea. Larger intake causes loss of motor nerve control, shallow respiration, and in extreme cases unconsciousness and even death. Degree of intoxication is determined by concentration of alcohol in the brain. Of primary importance is the fact that intake of moderate amounts together with barbiturates or similar drugs is extremely dangerous and may even be fatal. Flammable, dangerous fire risk; flammable limits in air 3.3–19%. TLV: 1000 ppm; not classifiable as a human carcinogen.

Use: Solvent for resins, fats, fatty acids, oils, hydrocarbons; extraction medium; manufacture of acetaldehyde, acetic acid, ethylene, butadiene, 2-ethyl hexanol, dyes, pharmaceuticals, elastomers, detergents, cleaning preparations, surface coatings, cosmetics, explosives, antifreeze, beverages, antiseptics, gasohol, yeast-growth medium; octane booster in gasoline.

See alcohol, denatured; alcohol, industrial; biomass. *Note:* Ethanol from fermentation of biomass and hydrolysis of cellulose is a significant alternate energy source, especially as an automotive fuel. Its use in gasoline will continue to increase.

ethyl α -allylacetoacetate.

$CH_2COCH(CH_2CH:CH_2)COOC_2H_5$.

Properties: Water-white liquid. D 0.989 (20C), bulk d 8.24 lb/gal (20C). Combustible.

Use: Intermediate for pharmaceuticals, perfumes, fungicides, insecticides, fine chemicals.

ethylaluminum dichloride. (EADC).

$C_2H_5AlCl_2$.

Properties: Clear, yellow, pyrophoric liquid. Bp (extrapolated) 194C, fp 32C, d 1.222, bulk d 10.28 lb/gal (25C).

Derivation: Reaction of aluminum chloride with ethylaluminum sesquichloride.

Hazard: Ignites on contact with air, dangerous fire risk, reacts violently with water. Skin irritant.

Use: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

ethylaluminum sesquichloride. (EASC).

$(C_2H_5)_3Al_2Cl_3$.

Properties: Clear, yellow, pyrophoric liquid. Bp 204C, fp -50C, d 1.08.

Derivation: Reaction of ethyl chloride and aluminum.

Grade: Commercial.

Hazard: Ignites on contact with air, dangerous fire risk, reacts violently with water.

Use: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

ethylamine. (monoethylamine; aminoethane).

CAS: 75-04-7. $CH_3CH_2NH_2$.

Properties: Colorless, volatile liquid (or gas). Ammonia odor, strong alkaline reaction, bp 16.6C, fp -81.2C, d 0.689 (liquid 15/15C), bulk d 5.7 lb/gal (20C), flash p approximately 0F (-17.7C) (OC), autoign temp 723F (383C). Miscible with water, alcohol, and ether.

Derivation: From ethyl chloride and alcoholic ammonia under heat and pressure.

Grade: Technical (anhydrous and 70% aqueous solution), pure 98.5% min.

Hazard: Strong irritant. Flammable, dangerous fire risk, flammable limits in air 3.5–14%. TLV: 5 ppm; 15 ppm STEL.

Use: Dye intermediate, solvent extraction, petroleum refining, stabilizer for rubber latex, detergents, organic synthesis.

ethylamine hydrobromide. $C_2H_5NH_2 \cdot HBr$.

Properties: White, almost odorless granules. Mp 158–161C. Very soluble in water.

Use: Intermediate (where liquid ethylamine or liquid hydrobromic acid cannot be used).

ethyl-*o*-aminobenzoate. See ethyl anthranilate.

ethyl-*p*-aminobenzoate hydrochloride.

(anesthetol; benzocaine; procaine hydrochloride)

ride).

CAS: 51-05-8. $C_6H_5NH_2CO_2C_2H_5 \cdot HCl$.

Properties: White, crystalline; odorless; tasteless powder. Stable in air. Mp 88–92C. Soluble in dilute acids; less soluble in chloroform, ether, and alcohol; very slightly soluble in water.

Derivation: Ethylation of *p*-nitrobenzoic acid followed by reduction.

Grade: Technical, pure, NF (as benzocaine).

Hazard: Toxic by ingestion.

Use: Medicine (local anesthetic), suntan preparations.

ethylaminoethanol. See *N*-ethylethanolamine.

Mixed ethylaminoethanols; may also contain diethylaminoethanol.

2-ethylamino-4-isopropylamino-6-methylthio-*s*-triazine.

$C_2H_5HNC_3N_3(SCH_3)NHCH(CH_3)_2$.

Properties: White, crystalline powder. Mp 84–85C. Slightly soluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion.

Use: Weed-killing agent in pineapple and sugarcane.

ethyl-1-(*p*-aminophenyl)-4-phenylisonipecotate. See anileridine.

ethyl amyl ketone. (EAK; 5-methyl-3-heptanone).

CAS: 541-85-5. $CH_3CH_2CO(CH_2)_4CH_3$.

Properties: Colorless liquid; pungent odor. Bp 157C, bulk d 83 lb/gal, d 0.819–0.824, refr index 1.416, flash p 138F (58C). Insoluble in water; soluble in four volumes of 60% alcohol. Combustible.

Hazard: Narcotic in high concentration. Moderate fire risk. TLV: 25 ppm.

Use: Perfumery, solvent for nitrocellulose and vinyl resins.

***n*-ethylaniline.**

CAS: 103-69-5. $C_8H_9NHC_2H_5$.

Properties: Colorless liquid, becoming brown on exposure to light. Soluble in alcohol; insoluble in water. D 0.9631, fp –63.5C, bp 206C, refr index 1.5559 (20C), flash p 185F (85C) (OC). Combustible.

Derivation: By heating aniline and ethyl alcohol in the presence of sulfuric acid, with subsequent distillation.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Organic synthesis.

***o*-ethylaniline.**

CAS: 578-54-1. $C_8H_9(NH_2)C_2H_5$.

Properties: Brown liquid. Fp –44C, d 0.982 (20C), bp 214C, flash p 185F (85C) (OC). Soluble in alcohol and toluene; insoluble in water. Combustible.

Use: Intermediate for pharmaceuticals, dyestuffs, pesticides, and other products.

ethyl anthranilate. (ethyl-*o*-aminobenzoate).

CAS: 87-25-2. $C_6H_5(NH_2)COOCH_2CH_3$.

Properties: Colorless liquid; fruity odor. D 1.117, refr index 1.564, bp 260C. Soluble in alcohol and propylene glycol. Combustible.

Grade: Technical, FCC.

Use: Perfumery and flavors, similar to methyl anthranilate.

2-ethylanthraquinone. $C_{14}H_8O_2C_2H_5$.

Properties: Buff to light-yellow paste. Mp 108C.

Use: Synthesis, especially of hydrogen peroxide.

“Ethyl” Antiknock Compounds

[Albemarle]. TM for a series of fuel additives containing various percentages of tetraethyl lead, ethylene dibromide, ethylene dichloride, dye, kerosene, and antioxidant. All are used to improve the octane rating of motor fuels.

ethylarsenious oxide. C_2H_5AsO .

Properties: Colorless oil; garliclike, nauseating odor. D 1.802 (11C); bp 158C (10 mm Hg). Oxidizes in air and forms colorless crystals. Soluble in acetone, benzene, ether.

Hazard: Highly toxic.

Use: Organic synthesis.

2-ethylaziridine. See ethylethyleneimine.

ethyl *p*-benzamidobenzoate.

CAS: 736-40-3. mf: $C_{16}H_{15}NO_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

ethylbenzene. (phenylethane).

CAS: 100-41-4. $C_6H_5C_2H_5$.

Properties: Colorless liquid; aromatic odor. Vapor heavier than air, bp 136.187C, refr index 1.49594 (20C), d 0.867 (20C), fp –95C, bulk d 7.21 lb/gal (25C), flash p 59F (15C), autoign temp 810F (432C), specific heat 0.41 cal/gal/K, viscosity 0.64 cP (25C). Soluble in alcohol, benzene, carbon tetrachloride, and ether; almost insoluble in water.

Derivation: (1) By heating benzene and ethylene in the presence of aluminum chloride, with subsequent distillation; (2) by fractionation directly from the mixed xylene stream in petroleum refining.

Grade: Technical, pure, research.

Hazard: Toxic by ingestion, inhalation, and skin absorption; irritant to skin and eyes. Flammable, dangerous fire risk. TLV: 100 ppm; STEL 125 ppm.

Use: Intermediate in production of styrene, solvent.

***n*-ethylbenzenesulfonamide.**

CAS: 5339-67-3. mf: $C_8H_{11}NO_2S$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4-ethylbenzenesulfonic acid. (*p*-ethylbenzenesulfonic acid). $C_8H_8SO_3$.

Properties: Solid. Mw 186.23, d 1.229, fp >110C.

Hazard: Corrosive.

ethyl benzoate.

CAS: 93-89-0. $C_6H_5CO_2C_2H_5$.

Properties: Colorless aromatic liquid. D 1.043–1.046, fp –32.7C, bp 212.9C, refr index 1.505, flash p 200F (93C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By heating ethanol and benzoic acid in the presence of sulfuric acid.

Grade: Technical, FCC.

Use: Flavoring, perfumery, solvent mixture, lacquers, solvent for many cellulose derivatives and natural and synthetic resins.

ethyl benzoylacetate.

CAS: 94-02-0. $C_6H_5COCH_2COOC_2H_5$.

Properties: Light-yellow oil. Bp 265C (decomposes), d 1.111–1.117 (20C), flash p 275F (135C). Soluble in most organic solvents; insoluble in water. Combustible.

Derivation: Reaction of ethyl acetate and ethyl benzoate with metallic sodium.

Method of purification: Vacuum distillation.

Grade: 95% pure.

Use: Dye and pharmaceutical intermediate.

ethyl-*o*-benzoyl benzoate.

$C_6H_5COC_6H_4COOC_2H_5$.

Properties: Yellowish-white solid; odorless. Mp 56–58C; bp 325C. Insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzene. Combustible.

Use: Plasticizer for nitrocellulose and synthetic resins.

1-ethylbenzyl alcohol. (1-phenyl-1-propanol; ethylphenylcarbinol).

CAS: 93-54-9. C_8H_9OH .

Properties: Oily liquid. Bp 220C, d 0.99, refr index 1.51. Soluble in ethanol and methanol alcohols, benzene, and toluene.

Derivation: Benzaldehyde or phenyl ethyl ketone.

Use: Heat-transfer fluid.

ethylbenzylaniline. $C_6H_5N(C_2H_5)CH_2C_6H_5$.

Properties: Light-yellow liquid. D 1.034, bp 286C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By heating ethylaniline, benzyl chloride, and aqueous caustic soda, with subsequent distillation.

Hazard: Toxic by ingestion and inhalation.

Use: Dyestuffs, organic synthesis.

ethylbenzyl chloride. (1-chloromethylethylbenzene). $ClCH_2C_6H_4C_2H_5$. Consists of 70% *p*- and 30% *o*-ethylbenzyl chloride.

Properties: Colorless liquid. D 1.0460–1.0475 (25/25C), refr index 1.5290–1.5305 (25C). Soluble in alcohols; insoluble in water.

Hazard: Irritant to eyes, a lachrymator.

Use: Intermediate.

ethyl biscoumacetate. (ethyl bis(4-hydroxycoumarinyl)acetate).

CAS: 548-00-5. $C_{22}H_{16}O_8$. A synthetic derivative of bishydroxycoumarin.

Properties: White, crystalline solid; odorless; bitter taste. Mp 177–182C. Another form melts at 154–157C. Soluble in acetone and benzene; slightly soluble in alcohol and ether; insoluble in water.

Grade: NF.

Use: Medicine (anticoagulant).

ethyl borate. Legal label name for triethyl borate.

ethyl bromide. (bromoethane).

CAS: 74-96-4. C_2H_5Br .

Properties: Colorless liquid. D 1.431 (20/4C), bp 38.4C, bulk d 12–12.1 lb/gal, vap press 386 mm Hg (20C), autoign temp 952F (511C), fp –119C, flash p approximately 80F (26C). Soluble in alcohol and ether; sparingly soluble in water.

Derivation: From ethanol or ethylene and hydrobromic acid. One process uses γ -radiation to initiate the combination.

Grade: Technical (98%).

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 5 ppm; animal carcinogen. Flammable, dangerous fire hazard, explosion limits in air 6–11%.

Use: Organic synthesis, medicine (anesthetic), refrigerant, solvent, grain and fruit fumigant.

ethyl bromoacetate.

CAS: 105-36-2. $CH_3BrCOOC_2H_5$.

Properties: Clear, colorless liquid. Partially decomposed by water. D 1.53 (4C), bp 168C, fp –13.8C; vap d 5.8. Soluble in alcohol, benzene, ether; insoluble in water.

Derivation: Interaction of bromine and acetic acid in the presence of red phosphorus.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant.

ethylbromopyruvate. $BrCH_2COCO_2C_2H_5$.

Properties: Light-yellow liquid. Mw 195.02, bp 90–100C (10 mm Hg), d 1.554, fp 98C.

Hazard: Severe poison, lachrymator, irritant.

Use: Pharmaceutical intermediate.

2-ethylbutadiene.

CAS: 3404-63-5. mf: C_6H_{10} .

Hazard: A poison.

ethyl butanoate. See ethyl butyrate.

2-ethylbutanol. See 2-ethylbutyl alcohol.

2-ethyl-1-butene. (*uns*-diethylethylene).

Properties: Colorless liquid. D 0.6894 (20/4C), bp 64.95C, refr index 1.3969 (20C). Soluble in alcohol, acetone, ether, and benzene; insoluble in water. Combustible.

Grade: 95% pure.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

3-(2-ethylbutoxy)propionic acid.

Properties: Water-white liquid. D 0.9600 (20/20C), bp 200C (100 mm Hg), vap press <0.1 mm Hg (20C), fp (glass at approximately -90C), flash p 280F (137C). Insoluble in water. Combustible.

Use: Preparation of metallic salts for paint driers and gelling agents.

2-ethylbutyl acetate.

Properties: Colorless liquid; mild odor. D 0.875-0.881 (20/20C), boiling range 155-164C, purity not less than 90% ethylbutyl acetate, bulk d 7.33 lb/gal (20C), flash p 130F (54.4C) (OC).

Hazard: Moderate fire risk.

Use: Solvent for nitrocellulose lacquers, flavoring.

2-ethylbutyl alcohol. (2-ethylbutanol; pseudo-hexyl alcohol).

Properties: Colorless liquid. Bp 148.9C, fp -114C, d 0.8328 (20/20C), bulk d 6.93 lb/gal (20C), refr index 1.4229 (20C), flash p 137F (58.3C) (ASTM OC), vap press 0.9 mm Hg (20C). Stable; miscible with most organic solvents; slightly soluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Solvent for oils, resins, waxes, dyes; diluent; synthesis of perfumes, drugs; flavoring.

***n*-ethylbutylamine.**

Properties: Water-white liquid. Bp 108C, fp -78C, d 0.7401 (20/20C), refr index 1.407 (20C), flash p 65F (18.3C). Partly soluble in water.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion.

Use: Intermediate.

ethylbutyl carbonate. $\text{C}_7\text{H}_{14}\text{O}_3$

Properties: Colorless liquid. D 0.92-0.93 (20C), bp 135-175C, flash p 122F (50C) (CC). Combustible.

Hazard: Moderate fire risk.

Use: Solvent for many natural and synthetic resins, in mixtures for nitrocellulose

ethyl-*n*-butyl ether. (*n*-butyl ethyl ether).

Properties: Liquid. D 0.7528 (20C), fp -103C, bp 92.2C, flash p 40F (4.4C), vap press 43 mm Hg (20C). Slightly soluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Extraction solvent, inert reaction medium.

ethyl butyl ketone. (3-heptanone).

Properties: Clear liquid. D 0.8191 (20/20C), fp -39C, boiling range 142.8-147.8C, 95% purity, bulk d 6.8 lb/gal, flash p 115F (46C) (OC). Insoluble in water; soluble in alcohol. Combustible.

Hazard: Moderate fire risk. TLV: 50 ppm.

Use: Solvent mix for air-dried and baked finishes, for polyvinyl and nitrocellulose resins.

2-ethyl-2-butylpropanediol-1,3. (2-butyl-2-ethylpropanediol-1,3).

Properties: White crystals or liquid. D 0.931 (50/20C), bp 178C (50 mm Hg), fp 41.4C. Solubility in water 0.8% by wt (20C), flash p 280F (137C). Combustible.

Use: Synthesis of lubricants, emulsifying agents, insect repellents, plastics.

2-ethylbutyl silicate.

Properties: Colorless liquid. Bp 164C (1 mm Hg).

Derivation: Reaction of silicon tetrachloride with 2-ethylbutanol.

Use: Hydraulic fluid, heat-transfer liquid.

2-ethylbutyraldehyde. (diethylacetaldehyde).

Properties: Colorless liquid. D 0.8164 (20/20C), bp 116.8C, vap press 13.7 mm Hg (20C), flash p 70F (21.1C) (OC), bulk d 6.8 lb/gal (20C), fp -89C. Insoluble in water.

Grade: Technical.

Hazard: Irritant to eyes and skin. Flammable, dangerous fire risk.

Use: Organic synthesis, pharmaceuticals, rubber accelerators, synthetic resins.

ethyl butyrate. (ethyl butanoate).

Properties: Colorless liquid; pineapple-like odor. D 0.8788, fp -93.3C, bp 120.6C, refr index 1.400 (20C), flash p 78F (25.5C) (CC), autoign temp 865F (462C). Soluble in alcohol and ether; almost insoluble in water and glycerol.

Derivation: Ethyl alcohol and butyric acid heated in the presence of sulfuric acid, with subsequent distillation.

Grade: Technical, FCC.

Hazard: Irritant to eyes and mucous membranes, narcotic in high concentration. Flammable, dangerous fire risk.

Use: Flavoring extracts, perfumery, solvent mixture for cellulose esters and ethers.

2-ethylbutyric acid. (diethylacetic acid).

CAS: 88-09-5. $(C_2H_5)_2CHCOOH$.

Properties: Water-white liquid, resembles butyric acid in most properties except that its odor is less pronounced and its water solubility limited. D 0.9225 (20/20C), bp 190C, vap press 0.08 mm Hg (20C), flash p 210F (98C), bulk d 7.7 lb/gal, fp -15C. Combustible.

Use: Ester formation; intermediate for drugs, dye-stuffs, chemicals; flavoring.

ethyl caffeate. (ethyl-3,4-dihydroxycinnamate). $C_6H_3(OH)_2CH:CHCOOC_2H_5$.

Properties: Yellow to tan crystals; characteristic aromatic odor. Insoluble in water; very soluble in alcohol.

Grade: CP.

Use: Food antioxidant.

ethyl caprate. (ethyl decanoate).

CAS: 110-38-3. $C_9H_{19}COOC_2H_5$.

Properties: Colorless liquid; fragrant odor. D 0.862, bp 243C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By heating capric acid, absolute alcohol, and sulfuric acid, with subsequent distillation.

Use: Organic synthesis, flavoring agent.

ethyl caproate. (ethyl hexoate; ethyl hexanoate).

CAS: 123-66-0. $C_5H_{11}COOC_2H_5$.

Properties: Colorless to yellowish liquid; pleasant odor. D 0.873, bp 167. Soluble in alcohol and ether; insoluble in water and glycerol. Combustible.

Derivation: Heating absolute alcohol and *n*-caproic acid in the presence of sulfuric acid, with subsequent distillation.

Grade: Technical, FCC.

Use: Organic synthesis, artificial fruit essences.

2-ethylcaproic acid sodium salt. See sodium 2-ethylhexanoate.

ethyl caprylate. (ethyl octoate; ethyl octanoate).

CAS: 106-32-1. $CH_3(CH_2)_6COOC_2H_5$.

Properties: Colorless liquid; pineapple odor. D 0.865-0.869 (25C), fp -48C, bp 207-209C. Soluble in alcohol and ether; insoluble in water and glycerol. Combustible.

Derivation: Heating caprylic acid, alcohol, and sulfuric acid, with subsequent distillation.

Grade: Technical, FCC.

Use: Flavoring, fruit essences.

ethyl carbamate. See urethane.

ethyl carbazate.

CAS: 4114-31-2. $H_2NNHCO_2C_2H_5$.

Properties: Off-white crystals. Mw 104.11, mp 44-47C, bp 108-110C (22 mm Hg), fp 86C.

Hazard: Irritant.

Use: Synthetic intermediate.

N-ethylcarbazole. (9-ethylcarbazole).

$(C_6H_4)_2NC_2H_5$ (tricyclic).

Properties: Leaflets. Mp 69-70C, bp 175C (5 mm Hg). Soluble in ether and hot alcohol.

Derivation: Action of ethyl chloride on the potassium salt of carbazole.

Use: Intermediate for dyes, pharmaceuticals; agricultural chemicals.

ethylcarbitol acrylate.

CAS: 7328-17-8.

Properties: Liquid.

Hazard: Moderately toxic. A severe skin irritant.

ethyl carbonate. See diethyl carbonate.

ethylcellulose. An ethyl ether of cellulose.

Properties: White, granular thermoplastic solid, lowest density of the commercial cellulose plastics; properties vary with extent to which hydroxyl radicals of cellulose have been replaced by ethoxy groups. Standard commercial product has 47-48% ethoxy content, d 1.07-1.18, refr index 1.47, high dielectric strength, softening point 100-130C. Soluble in most organic liquids; compatible with resins, waxes, oils, and plasticizers; inert to alkalis and dilute acids; insoluble in water and glycerol. Combustible.

Derivation: From alkali cellulose and ethyl chloride or sulfate; from cellulose and ethanol in the presence of dehydrating agents.

Grade: Technical, NF, FCC.

Use: Hot-melt adhesives and coatings for cables, paper, textiles, etc.; extrusion-wire insulation; protective coatings; pigment-grinding bases; toughening agent for plastics; printing inks; molding powders; proximity fuses; vitamin preparations; casing for rocket propellants; food and feed additive.

ethyl centralite. See *sym*-diethyldiphenylurea.

Ethylch [Albemarle]. TM for antiknock fuel additive, tetraethyl lead.

ethyl chloride. (chloroethane).

CAS: 75-00-3. C_2H_5Cl .

Properties: Gas at room temperature; when compressed, a colorless volatile liquid; etherlike odor; burning taste. D 0.9214, fp -140.85C, bp 12.5C, critical point 187.2C (52 atm, d 0.33), vap press 1000 mm Hg (20C), flash p -58F (-50C) (CC) autoign temp 966F (518C). Stable and noncorrosive when dry, but will hydrolyze in the presence of water or alkalis. Miscible with most of the commonly used solvents; slightly soluble in water.

Derivation: (1) From ethylene and hydrogen chlo-

ride; (2) by passing hydrogen chloride into a solution of zinc chloride and ethanol.

Grade: Technical, USP.

Hazard: Highly flammable, severe fire and explosion risk; flammable limits in air 3.8–15.4%. Irritant to eyes. TLV: 1000 ppm.

Use: Manufacture of tetraethyl lead and ethylcellulose; anesthetic; organic synthesis; alkylating agent; refrigeration; analytical reagent; solvent for phosphorus, sulfur, fats, oils, resins, and waxes; insecticides.

ethyl chloroacetal. $\text{ClCH}_2\text{CH}(\text{OC}_2\text{H}_5)_2$.

Properties: Water-white liquid; pleasant odor. D 1.022 (20C), boiling range 54–61C (20 mm Hg), 149–153C, fp –32C, flash p 117F (47.2C), refr index 1.418 (20C). Soluble in alcohol and ethyl ether; insoluble in water. Combustible.

Hazard: Moderate fire risk.

ethyl chloroacetate.

CAS: 105-39-5. $\text{CCH}_2\text{ClCO}_2\text{C}_2\text{H}_5$.

Properties: Water-white, mobile liquid; pungent fruity odor. Decomposed by hot water and alkalis. D 1.1585 (20C), bp 144.2C, vap d 4.23–4.46, flash p 131F (55C), refr index 1.4227 (20C). Soluble in alcohol, benzene, and ether; insoluble in water. Combustible.

Derivation: (1) Action of chloroacetyl chloride on alcohol; (2) by treating chloroacetic acid with alcohol and sulfuric acid.

Hazard: Strong irritant to eyes.

Use: Solvent, organic synthesis, military poison, vat dyestuffs.

ethyl chlorobenzoxazoline-2-thione-3-carboxylate.

CAS: 33388-24-8. mf: $\text{C}_{10}\text{H}_8\text{ClNO}_3\text{S}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

ethyl chlorocarbonate. (ethyl chloroformate).

CAS: 541-41-3. $\text{ClCOOC}_2\text{H}_5$.

Properties: Water-white liquid; irritating odor. D 1.135–1.139 (20/20C), bp 93–95C, refr index 1.3974 (20C), flash p 61F (16.1C) (CC). Decomposes in water and alcohol; soluble in benzene, chloroform, and ether.

Derivation: Reaction of carbon monoxide with gaseous chlorine, producing phosgene (COCl_2), which is then treated with anhydrous ethanol, giving ethyl chlorocarbonate and splitting off hydrogen chloride.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Strong irritant to eyes and skin.

Use: Organic synthesis, intermediate in making diethyl carbonate, flotation agents, polymers, isocyanates.

ethyl chloroformate. See ethyl chlorocarbonate.

ethyl 4-chloro-2-oxo-3(2h)-benzothiazoleacetate.

CAS: 25059-80-7. mf: $\text{C}_{11}\text{H}_{10}\text{ClNO}_3\text{S}$.

Hazard: Moderately toxic by ingestion and skin contact.

Use: Agricultural chemical.

o-ethyl s-4-chlorophenyl ethylphosphonodithioate.

CAS: 2984-64-7. mf: $\text{C}_{10}\text{H}_{14}\text{ClOPS}_2$.

Hazard: A poison by skin contact. Moderately toxic by ingestion and inhalation.

Use: Agricultural chemical.

ethyl chlorosulfonate. $\text{C}_2\text{H}_5\text{OCISO}_2$.

Properties: Colorless, oily liquid; pungent odor. D 1.379 (0C); bp 153C; vap d 5 (air = 1.29); volatility 18,000 mg/m³ (20C). Fumes in moist air. Decomposed by water. Attacks lead and tin but copper only mildly; iron and steel not affected. Soluble in chloroform and ether; insoluble in water.

Derivation: (1) Action of fuming sulfuric acid on ethylchloroformate; (2) interaction of ethylene and chlorosulfonic acid.

Grade: Technical.

Hazard: Strong irritant to eyes and skin, evolves phosgene when heated.

Use: Organic synthesis, military poison.

3-ethylcinchoninic acid ethyl ester.

CAS: 21233-74-9. mf: $\text{C}_{14}\text{H}_{15}\text{NO}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

ethyl cinnamate. (ethyl phenylacrylate; cinnamyl ether). $\text{C}_6\text{H}_5\text{CH}:\text{CHCOOC}_2\text{H}_5$.

Properties: Limpid, oily liquid; strawberry-like odor. D 1.045–1.048, refr index 1.560 (20C), congealing point 7C (min), bp 271C. Soluble in alcohol and ether. Insoluble in water. Combustible.

Derivation: Heating ethyl alcohol and cinnamic acid in the presence of sulfuric acid.

Use: Perfumery, flavoring extracts.

ethyl citrate. See triethyl citrate.

ethyl crotonate.

CAS: 623-70-1. $\text{CH}_3\text{CH}:\text{CHCOOC}_2\text{H}_5$.

Properties: Water-white solid or liquid; characteristic, pungent, persistent odor. D 0.9207 (20/20C), mp (solid) 45C, bp (solid) 209C, (liquid) 139C, flash p 36F (2.2C), refr index 1.4242 (20C), bulk d 7.65 lb/gal (20C). Soluble in alcohol and ether, insoluble in water.

Hazard: Flammable, dangerous fire risk. Strong irritant.

Use: Solvent and softening agent, lacquers, organic synthesis.

ethyl cyanide. (propionitrile; propanenitrile).

CAS: 107-12-0. $\text{C}_2\text{H}_5\text{CN}$.

Properties: Mobile, colorless liquid; ethereal odor.

D 0.7829 (20/20C), refr index 1.3664 (20C), bp 97.4C, fp -92.9C, flash p 61F (16.1C) (OC). Soluble in alcohol and water.

Derivation: Heating barium ethyl sulfate and KCN with subsequent distillation.

Hazard: Toxic by ingestion and inhalation. TLV: 5 mg(CN)/m³. Flammable, dangerous fire risk.

Use: Solvent, dielectric fluid, intermediate.

ethyl cyanoacetate. (malonic ethyl ester nitrile).

CAS: 105-56-6. CNCH₂COOC₂H₅.

Properties: Colorless liquid. Bp 206-208C, fp -22.5C, refr index 1.41751 (20C). Soluble in alcohol and ether; soluble in alkaline solutions. Flash p 230F (110C). Combustible.

Derivation: Esterification of cyanoacetic acid with ethanol; reaction of an alkali cyanide and chloroacetic ethyl ester.

Method of purification: Vacuum distillation.

Grade: Reagent, technical.

Hazard: Toxic by ingestion and inhalation.

Use: Organic synthesis, pharmaceuticals, dyes.

ethyl cyanoacrylate. (ethyl α -cyanoacrylate; ethyl 2-cyanoacrylate; ethyl 2-cyano-2-propenoate).

CAS: 7085-85-0. C₆H₇NO₂.

Hazard: An inhalation hazard.

Use: An adhesive.

ethyl α -cyanoacrylate. See ethyl cyanoacrylate.

5-ethyl-5-cycloheptenylbarbituric acid.

See heptabarbital.

ethylcyclohexane. C₈H₁₆.

Properties: Colorless liquid. D 0.787, bp 131.8C, refr index 1.4330 (20C), flash p 95F (35C), autoign temp 504F (262C).

Hazard: Flammable, moderate fire risk; flammable limits in air 0.9-6.6%.

Use: Organic synthesis.

N-ethylcyclohexylamine.

CAS: 5459-93-8. C₆H₁₁NHC₂H₅.

Properties: Liquid. Mw 127.23, bp 165C, d 0.844, fp 43C.

Hazard: Corrosive and toxic.

Use: Intermediate in production of herbicides and pharmaceuticals.

ethyl 2-cyclohexylpropionate.

CAS: 2511-00-4. mf: C₁₁H₂₀O₂.

Hazard: Low toxicity by inhalation.

ethylcyclopentane. C₇H₁₂.

Properties: Colorless liquid. D 0.766, bp 103.5C, refr index 1.4198 (20C), autoign temp 504F (262C).

Hazard: Flammable, moderate fire risk; flammable limits in air 1.1-6.7%.

ethyl cyclopentanone-2-carboxylate. See 2-carbethoxycyclopentanone.

ethyl 2-cyano-2-propenoate. See ethyl cyanoacrylate.

ethyl decanoate. See ethyl caprate.

ethyl diazoacetate.

CAS: 623-73-4. N₂CHCO₂C₂H₅.

Properties: Liquid. Mw 114.10, mp 22C, bp 140-141 (720 mm Hg), d 1.085.

Available forms: Research quantities.

Hazard: Flammable liquid that explodes when heated.

ethyl 2,3-dibromopropanoate.

CAS: 3674-13-3. mf: C₃H₅Br₂O₂.

Hazard: A poison by ingestion and skin contact. A severe skin and eye irritant.

ethyldichloroarsine. (dichloroethylarsine).

CAS: 598-14-1. C₂H₅AsCl₂.

Properties: Colorless, mobile liquid; becomes yellowish under the action of light and air. Fruitlike odor (high dilution). Decomposed by water. Attacks brass but not iron (dry). D 1.742 (14C), bp 156C (decomposes), fp -65C, coefficient of thermal expansion 0.0011, vap d 6 (air = 1.29), volatility 20,000 mg/m³ (20C), vap press 2.29 mm Hg (21.5C). Soluble in alcohol, benzene, ether, and water.

Derivation: Chlorination of ethyl arsenious oxide.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant.

Use: Military poison.

ethyl-4,4'-dichlorobenzilate. See "Chlorobenzilate."

ethyl dichlorophenoxyacetate. See 2,4-D.

ethyldichlorosilane.

CAS: 1789-58-8. C₂H₅SiHCl₂.

Properties: Colorless liquid. Bp 75.5C, d 1.088 (25/25C), flash p 30F (-1.1C) (COC). Readily hydrolyzed by moisture, with the liberation of hydrogen and hydrogen chloride.

Derivation: By Grignard reaction of trichlorosilane and ethylmagnesium chloride.

Hazard: Flammable, dangerous fire risk. Strong irritant to eyes and skin.

Use: Intermediate for silicones.

ethyldiethanolamine. C₂H₅N(CH₂CH₂OH)₂.

Properties: Water-white liquid; amine odor. D 1.015 (20C), boiling range 246-252C, flash p 255F (123C). Combustible.

Use: Solvent, detergents.

ethyl-2-(diethoxyphosphinyl)-3-oxobutanoate.

CAS: 3730-54-9. mf: C₁₀H₁₉O₆P.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

ethyl 3-((diethylphosphinothioyl)oxy)-2-butenolate.

CAS: 73263-81-7. mf: $C_{10}H_{19}O_5PS$.

Hazard: A poison by ingestion.

ethyl diglyme. See diethylene glycol diethyl ether.

20-ethyl-6- β ,8-dihydroxy-1- α -methoxy-4-methylheteritan-14-one.

CAS: 3328-84-5. mf: $C_{22}H_{33}NO_5$.

Hazard: A poison.

Source: Natural product.

ethyldimethylmethane. See isopentane.

ethyldimethyl-9-octadecenylammonium bromide.

$C_{22}H_{46}NBr$. Cationic surfactant and algicide, soluble in propylene glycol and isopropyl alcohol.

n-ethyl-1,2-dimethylpropylamine.

CAS: 2738-06-9. mf: $C_7H_{17}N$.

Hazard: Low toxicity by ingestion. A severe skin and moderate eye irritant.

ethyldiphenyltin acetate.

CAS: 77405-29-9. mf: $C_{16}H_{18}O_2Sn$.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/ m^3 . STEL 0.2 mg/ m^3 (skin). Not classifiable as a human carcinogen

ethyldipropylmethane. See 4-ethylheptane.

S-ethyl di-N,N-propylthiocarbamate. See EPTC.

ethyl diselenide.

CAS: 628-39-7. mf: $C_4H_{10}Se_2$.

Hazard: A poison by ingestion and skin contact.

Low toxicity by inhalation. A moderate eye irritant.

ethyl enanthate. (ethyl heptanoate; cognac oil). $CH_3(CH_2)_5COOC_2H_5$.

Properties: Clear, colorless oil; fruity odor and taste. D 0.87; bp 187C. Soluble in alcohol, chloroform, and ether; insoluble in water. Combustible.

Derivation: By heating enanthic acid and ethanol in the presence of sulfuric acid and subsequent recovery by distillation.

Grade: Technical.

Use: Artificial cognac flavor, flavor for liquors and fruity-type soft drinks.

ethylene. (bicarburetted hydrogen; ethene).

CAS: 74-85-1. $H_2C:CH_2$.

Properties: Colorless gas; sweet odor and taste. Fp $-169C$, bp $-103.9C$, flash p $-213F$ ($-135C$), d (liquid) 0.610 (0C), vap d 0.975 (air = 1.29), critical

temp 9.5C, autoign temp 1009F (543C), critical press (absolute) 744 psi. Purity not less than 96% ethylene by gas volume, not more than 0.5% acetylene, not more than 4% methane and ethane. Sp vol 13.4 cu ft/lb (15.6C). Slightly soluble in water, alcohol, and ethyl ether.

Derivation: (1) Thermal cracking of hydrocarbon gases (800–900C), (2) dehydration of ethanol, (3) from synthesis gas with Ru as catalyst.

Grade: Technical (95% min), 99.5% min, 99.9 mole %.

Hazard: Highly flammable, dangerous fire and explosion risk; explosive limits in air 3–36% by volume. TLV: Simple asphyxiant; Not Classifiable as a Human Carcinogen.

Use: Manufacture of polyethylene, polypropylene, ethylene oxide, ethylene dichloride, ethylene glycols, aluminum alkyls, vinyl chloride, vinyl acetate, ethyl chloride, ethylene chlorohydrin, acetaldehyde, ethyl alcohol, polystyrene, styrene, polyvinyl chloride, SBR, polyester resins, trichloroethylene, etc.; as a refrigerant, in welding and cutting of metals, an anesthetic, and in orchard sprays to accelerate fruit ripening.

ethylene azelate.

CAS: 4471-27-6. mf: $C_{11}H_{18}O_4$.

Hazard: Low toxicity by ingestion and skin contact. A mild skin and eye irritant.

ethylene bis(iminodiacetic acid). See ethylenediaminetetraacetic acid.

ethylene bis(oxyethylenenitrilo)tetraacetic acid. See ethylene glycol-bis(β -aminoethyl ether)-N,N-tetraacetic acid.

ethylene bis(pentabromophenoxide). See 1,1'-(1,2-ethanediylobis(oxy))bis(2,3,4,5,6-pentabromobenzene).

ethylene bis(tetrabromophthalimide).

CAS: 32588-76-4. mf: $C_{18}H_4Br_8N_2O_4$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact. A mild eye irritant.

ethylene bromide. See ethylene dibromide.

ethylene bromohydrin. (glycol bromohydrin; 2-bromoethyl alcohol).

CAS: 540-51-2. $BrCH_2CH_2OH$.

Properties: Hygroscopic liquid. D 1.7629 (20C), bp 149–150C (750 mm Hg), refr index 1.4915 (20C). Soluble in most organic solvents; completely miscible with water. Aqueous solutions have a sweet, burning taste. Hydrolysis of aqueous solutions is accelerated by heat, acids, and alkalies. Combustible.

Derivation: Action of hydrogen bromide on ethylene oxide.

Hazard: Irritant to eyes and mucous membranes.

Use: Organic synthesis.

ethylene carbonate. (glycol carbonate; dioxolone-2).

CAS: 96-49-1. $(-\text{CH}_2\text{O})_2\text{CO}$.

Properties: Colorless, solid or liquid; odorless. Mp 36.4C, bp 248C, d 1.3218 (39/4C), refr index 1.4158 (50C), flash p 290F (143C) (OC). Miscible (40%) with water, alcohol, ethyl acetate, benzene, and chloroform; soluble in ether, *n*-butanol, and carbon tetrachloride. Combustible.

Derivation: Interaction of ethylene glycol and phosphene.

Use: Solvent for many polymers and resins, plasticizer, intermediate for pharmaceuticals, rubber chemicals, textile finishing agents, hydroxyethylation reactions.

ethylene chloride. See ethylene dichloride.

ethylene chlorohydrin. (2-chloroethyl alcohol; glycol chlorohydrin).

CAS: 107-07-3. $\text{ClCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; faint ethereal odor. D 1.2045 (20/20C), bp 128.7C, refr index 1.4419 (20C), vap press 4.9 mm Hg (20C), flash p 140F (60C) (OC), bulk d 10.0 lb/gal (20C), coefficient of expansion 0.00089 (20C), fp -62.6C , viscosity 0.0343 cP (20C), autoign temp 797F (425C). Soluble in most organic liquids and completely miscible with water. Combustible.

Derivation: Action of hypochlorous acid on ethylene.

Grade: Anhydrous, 38%.

Hazard: Deadly via ingestion, inhalation, and skin absorption; strong irritant, penetrates ordinary rubber gloves and protective clothing. Moderate fire hazard. TLV: ceiling 1 ppm; not classifiable as a human carcinogen.

Use: Solvent for cellulose acetate, ethylcellulose; introduction of hydroxyethyl group in organic synthesis; to activate sprouting of dormant potatoes; manufacture of ethylene oxide and ethylene glycol; insecticides.

ethylene chlorothioarsenate(III).

CAS: 3741-32-0. mf: $\text{C}_2\text{H}_4\text{AsClS}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

ethylene cyanide. (ethylene dicyanide; succinonitrile).

CAS: 110-61-2. $\text{C}_2\text{H}_4(\text{CN})_2$.

Properties: Colorless, waxy solid. Mp 57–57.5C; bp 265.7C; flash p 270F (132C). Soluble in alcohol, water, and chloroform. Combustible.

Derivation: Interaction of ethylene dibromide and potassium cyanide in the presence of alcohol.

Hazard: TLV: 5 mg(CN)/m³.

ethylene cyanohydrin. (β -hydroxypropionitrile).

CAS: 109-78-4. $\text{HOCH}_2\text{CH}_2\text{CN}$.

Properties: Straw-colored liquid. Fp -46C , bp

227–228C (decomposes) d 1.0404 (25/4C), vap press 0.08 mm Hg (25C), 20 mm Hg (117C). Miscible with water, acetone, methyl ethyl ketone, ethanol, chloroform, and diethyl ether; insoluble in benzene, carbon tetrachloride, and naphtha. Combustible.

Derivation: Ethylene oxide and hydrogen cyanide.

Hazard: Toxic by ingestion.

Use: Solvent for certain cellulose esters and inorganic salts; organic intermediate for acrylates.

ethylenediamine. (1,2-diaminoethane).

CAS: 107-15-3. $\text{NH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Colorless, alkaline liquid; ammonia odor. D 0.8995 (20/20C), bulk d 7.50 lb/gal (20C), bp 116–117C, vap press 10.7 mm Hg (20C), mp 8.5C, viscosity 0.0154 cP (25C), flash p 93F (33.9C) (CC), refr index 1.4540 (26C), pH of 25% solution 11.9 (25C). Strong base, soluble in water and alcohol; slightly soluble in ether; insoluble in benzene. Readily absorbs carbon dioxide from air.

Derivation: Catalytic reaction of ethylene glycol or ethylene dichloride and ammonia (nickel or copper catalysts are used).

Method of purification: Redistillation.

Grade: Technical, USP 97%, solutions of various strengths.

Hazard: Toxic by inhalation and skin absorption, strong irritant to skin and eyes. Flammable, moderate fire risk. TLV: 10 ppm; not classifiable as a human carcinogen.

Use: Fungicide, manufacture of chelating agents (EDTA), dimethylolethylene-urea resins, chemical intermediate, solvent, emulsifying agent, textile lubricants, antifreeze inhibitor.

ethylenediamine carbamate. See "Diak."

ethylenediamine dihydroiodide.

$(-\text{CH}_2\text{NH}_2)_2 \cdot 2\text{HI}$.

Use: Feed additive.

ethylenediamine-di-*o*-hydroxyphenylacetic acid. $[-\text{CH}_2\text{NHCH}(\text{COOH})\text{C}_6\text{H}_4\text{OH}]_2$. A phenolic analog of ethylenediaminetetraacetic acid.

Properties: Mp 218C (decomposes). Insoluble in water and most organic solvents; soluble in sulfuric acid; also forms water-soluble alkali-metal and ammonium salts.

Use: Chelating iron in mildly alkaline solutions.

ethylenediamine tartrate.

Use: To make piezoelectric crystals for control of electric frequencies, etc., as in television.

ethylenediaminetetraacetic acid. (EDTA; ethylenebisiminodiacetic acid; ethylenedinitrilotetraacetic acid).

CAS: 60-00-4. $(\text{HOOCCH}_2)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2$. An organic chelating agent.

Properties: Colorless crystals. Decomposes at 240C. Slightly soluble in water; insoluble in common organic solvents; neutralized by alkali metal hydroxides to form a series of water-soluble salts containing from one to four alkali metal cations.

Derivation: (a) Addition of sodium cyanide and formaldehyde to a basic solution of ethylenediamine (forms the tetrasodium salt); (b) heating tetrahydroxyethylethylenediamine with sodium hydroxide or potassium hydroxide with cadmium oxide catalyst.

Use: Detergents; liquid soaps; shampoos; agricultural chemical sprays; metal cleaning and plating; metal chelating agent; treatment of chlorosis; decontamination of radioactive surfaces; metal deactivator in vegetable oils, oil emulsions, pharmaceutical products, etc.; anticoagulant of blood; eluting agent in ion exchange; to remove insoluble deposits of calcium and magnesium soaps; in textiles to improve dyeing, scouring, and detergent operations; antioxidant; clarification of liquids; analytical chemistry, spectrophotometric titration; aid in reducing blood cholesterol; in medicine to treat lead poisoning and calcinosis; food additive (preservative).

Note: A number of salts of EDTA are available with uses identical or similar to the acid. The USP salts are called edetates (calcium disodium, disodium edetates); others are usually abbreviated to EDTA (tetrasodium, trisodium EDTA). Other salts, known chiefly under trademark names, are the sodium ferric, dihydrogen ferrous and a range of disodium salts with magnesium, divalent cobalt, manganese, copper, zinc, and nickel.

ethylenediaminetetraacetoneitrile. (ED-TAN). $[-\text{CH}_2\text{NCH}_2\text{CN}_2]_n$.

Properties: White, crystalline solid. Melting range 126–132C, bulk d 48.4 lb/cu ft. Slightly soluble in water; soluble in acetone.

Hazard: Toxic by ingestion and inhalation.

Use: Chelating agent and intermediate.

ethylene dibromide. (EDB; 1,2-dibromoethane; ethylene bromide).

CAS: 106-93-4. $\text{BrCH}_2\text{CH}_2\text{Br}$.

Properties: Colorless, liquid; sweetish odor. D 2.17–2.18 (20C), bulk d 18.1 lb/gal, bp 131C, vap press 17.4 mm Hg (30C), fp 9C, refr index 1.5337 (25C), flash p none. Emulsifiable; miscible with most solvents and thinners; slightly soluble in water. Nonflammable.

Derivation: Action of bromine on ethylene.

Hazard: TLV: animal carcinogen. Toxic by inhala-

tion, ingestion, and skin absorption; strong irritant to eyes and skin.

Use: Scavenger for lead in gasoline, grain fumigant, general solvent, waterproofing preparations, organic synthesis, fumigant for tree crops.

Note: May poison platinum catalysts.

ethylene dichloride. (*sym*-dichloroethane; 1,2-dichloroethane; ethylene chloride; Dutch oil).

CAS: 107-06-2. $\text{ClCH}_2\text{CH}_2\text{Cl}$.

Properties: Colorless, oily liquid; chloroform-like odor; sweet taste. Bp 83.5C, fp –35.5C, d 1.2554 (20/4C) (10.4 lb/gal), refr index 1.444, flash p 56F (13.3C). Stable to water, alkalies, acids, or active chemicals; resistant to oxidation, will not corrode metals. Miscible with most common solvents; slightly soluble in water.

Derivation: Action of chlorine on ethylene, with subsequent distillation with metallic catalyst; also by reaction of acetylene and hydrochloric acid.

Grade: Technical, spectrophotometric.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant to eyes and skin; a carcinogen. Flammable, dangerous fire risk, explosive limits in air 6–16%. TLV: 10 ppm; not classifiable as a human carcinogen.

Use: Production of vinyl chloride, trichloroethylene, vinylidene chloride, and trichloroethane; lead scavenger in antiknock gasoline; paint, varnish, and finish removers; metal degreasing; soaps and scouring compounds; wetting and penetrating agents; organic synthesis; ore flotation; solvent, fumigant.

ethylene dicyanide. See ethylene cyanide.

3,3'-(ethylenediiminodimethylene)bis(5,5-diphenylhydantoin).

CAS: 21322-39-4. mf: $\text{C}_{34}\text{H}_{32}\text{N}_6\text{O}_4$.

Hazard: A poison.

ethylenedinitrilotetraacetic acid. See ethylenediaminetetraacetic acid.

ethylenedinitrilotetra-2-propanol. See *N,N,N',N'*-tetrakis(2-hydroxypropyl)ethylenediamine.

ethylenediphenyldiamine. See *N,N*-diphenylethylenediamine.

1,1'-ethylene-2,2'-dipyridinium dibromide. See diquat.

ethylenedithiocyanate.

CAS: 629-17-4. mf: $\text{C}_4\text{H}_4\text{N}_2\text{S}_2$.

Hazard: A poison by ingestion and skin contact.

ethylene glycol. (ethylene alcohol; glycol; 1,2-ethanediol).

CAS: 107-21-1. $\text{CH}_2\text{OHCH}_2\text{OH}$. The simplest glycol.

Properties: Clear, colorless, syrupy liquid; odorless; sweet taste. D 1.1155 (20C), bp 197.2C, fp -13.5C, bulk d 9.31 lb/gal (15/15C), refr index 1.430 (25C), flash p 240.8F (116C), autoign temp 775F (412C). Hygroscopic, lowers fp of water, relatively nonvolatile. Soluble in water, alcohol, and acetone. Combustible.

Derivation: (1) Air oxidation of ethylene followed by hydration of the ethylene oxide formed; (2) acetoxylation; (3) from carbon monoxide and hydrogen (synthesis gas) from coal gasification; (4) Oxirane process.

Grade: Technical.

Hazard: TLV: (vapor) ceiling 50 ppm. Toxic by ingestion and inhalation. Lethal dose reported to be 100 cc.

Use: Coolant and antifreeze; asphalt-emulsion paints; heat-transfer agent; low-pressure laminates, brake fluids; glycol diacetate; polyester fibers and films; low-freezing dynamite; solvent; extractant for various purposes; solvent mixture for cellulose esters and ethers, especially cellophane; cosmetics (up to 5%); lacquers; alkyl resins; printing inks; wood stains; adhesives; leather dyeing; textile processing; tobacco; ingredient of deicing fluid for airport runways; humectant; ballpoint pen inks; foam stabilizer.

ethylene glycol-bis(β -aminoethyl ether)-*N,N*-tetraacetic acid. (ethylene bis(oxyethylenitrilo)tetraacetic acid). $[-CH_2OC_2H_4N(CH_2COOH)_2]_4$.

Properties: Crystals. Mp 241C (decomposes). Soluble in water.

Use: Chelating agent.

ethylene glycol bis(chloromethyl)ether.

See bis-1,2-(chloromethoxy)ethane.

ethylene glycol bis(mercaptopropionate).

See glycol dimercaptopropionate.

ethylene glycol bithioglycolate. See glycol dimercaptoacetate.

ethylene glycol diacetate. (glycol diacetate). CAS: 111-55-7. $CH_3COOCH_2CH_2OOCCH_3$.

Properties: Colorless liquid; faint odor. D 1.1063 (20/20C), bp 190.5C, vap press 0.3 mm Hg (20C), flash p 205F (96C) (OC), bulk d 9.2 lb/gal (20C), fp -31C, refr index 1.415 (20C). Soluble in alcohol, ether, benzene; slightly soluble in water (10%). Combustible.

Derivation: (a) Ethylene glycol and acetic acid; (b) ethylene dichloride and sodium acetate.

Use: Solvent for cellulose esters and ethers, resins, lacquers, printing inks; perfume fixative; nondiscoloring plasticizer for ethyl and benzyl cellulose.

ethylene glycol dibutyl ether.

CAS: 112-48-1. $C_4H_9OC_2H_4OC_4H_9$.

Properties: Almost colorless liquid; slight odor. D

0.8374 (20/20C), bulk d 7.0 lb/gal (20C), bp 203.1C, vap press 0.09 mm Hg (20C), fp -69.1C, flash p 185F (85C). Slightly soluble in water. Combustible.

Use: High-boiling inert solvent; specialized solvent and extraction applications.

ethylene glycol dibutyrate. (glycol dibutyrate). $(-CH_2OCOC_3H_7)_2$.

Properties: Colorless liquid. D 1.024 (OC), refr index 1.424 (25C), bp 240C, fp <-80C. Solubility in water 0.050% by weight. Combustible.

Use: Plasticizer.

ethylene glycol diethyl ether. (ethyl glyme). $C_2H_5OCH_2CH_2OC_2H_5$.

Properties: Colorless liquid; slight odor. Stable, d 0.8417 (20/20C), bp 121.4C, vap press 9.4 mm Hg (20C), flash p 95F (35C), bulk d 7 lb/gal (20C), fp -74C. Immiscible with water.

Grade: Technical.

Hazard: Flammable, moderate fire risk.

Use: Organic synthesis (reaction medium), solvent and diluent for detergents.

ethylene glycol diformate. (glycol diformate). $HCOOCH_2CH_2OOCH$.

Properties: Water-white liquid. D 1.2277 (20/20C), bulk d 10.2 lb/gal (20C), bp 177.1C, flash p 200F (93C), vap press 0.5 mm Hg (20C), fp -10C; hydrolyzes slowly, liberating formic acid. Soluble in water, alcohol and ether. Combustible.

Hazard: Toxic by ingestion.

Use: Embalming fluids.

ethylene glycol dimethyl ether. (GDME; glycol dimethyl ether; 1,2-dimethoxyethane; monoglyme). $CH_3OCH_2CH_2OCH_3$.

Properties: Water-white liquid; mild odor. D 0.8683 (20C), bp 85.2C, fp -69C, refr index 1.3792 (20C), flash p 104F (40C). Soluble in water and hydrocarbons, pH 8.2.

Hazard: Moderate fire risk.

Use: Solvent.

ethylene glycol dinitrate.

CAS: 628-96-6. A freezing-point depressant for nitroglycerine.

Use: Low-freezing dynamites.

Hazard: Toxic by skin absorption. TLV: 0.05 ppm.

ethylene glycol dipropionate. (glycol propionate; glycol dipropionate). $(-CH_2OCOC_2H_5)_2$.

Properties: Liquid. D 1.054 (15C), refr index 1.419 (25C), bp 211C, fp <-80C. Soluble in water 0.16% by weight. Combustible.

Use: Plasticizer.

ethylene glycol distearate. See "MAPEG" [PPG].

ethylene glycol monoacetate. (glycol monoacetate).

CAS: 542-59-6. $\text{HOCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; almost odorless. Bp 181–182C, d 1.108, flash p 215F (101C). Soluble in water, alcohol, ether, benzene, and toluene. Combustible.

Derivation: (a) Heating ethylene glycol with acetic acid (glacial) or acetic anhydride; (b) passing ethylene oxide into hot acetic acid containing sodium acetate or sulfuric acid.

Use: Solvent for nitrocellulose, cellulose acetate, camphor.

ethylene glycol monobenzyl ether. (benzyl "Cellosolve"). $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_2\text{H}_4\text{OH}$.

Properties: Water-white liquid; faint roselylike odor. D 1.070 (20/20C), bp 255.9C, vap press 0.02 mm Hg (20C), flash p 265F (129C), bulk d 8.9 lb/gal (20C), autoign temp 665F (351C). Combustible.

Hazard: Toxic by ingestion.

Use: Solvent for cellulose acetate, dyes, inks, resins, perfume fixative; organic synthesis (selective hydroxyethylating agent); coating compositions for leather, paper, and cloth; lacquers.

ethylene glycol monobutyl ether. (2-butoxyethanol; butyl "Cellosolve").

CAS: 111-76-2. $\text{HOCH}_2\text{CH}_2\text{OC}_4\text{H}_9$.

Properties: Colorless liquid; mild odor. Bp 171.2C, d 0.9019 (20/20C), bulk d 7.51 lb/gal (20C), refr index 1.4190 (25C), vap press 0.76 mm Hg (20C), flash p 142F (61C), autoign temp 472F (244C). High dilution ratio with petroleum hydrocarbons. Soluble in alcohol and water. Combustible.

Grade: Technical.

Hazard: A toxic material. TLV: 25 ppm.

Use: Solvent for nitrocellulose resins, spray lacquers, quick-drying lacquers, varnishes, enamels, dry-cleaning compounds, varnish removers, textile (preventing spotting in printing or dyeing); mutual solvent for "soluble" mineral oils to hold soap in solution and to improve the emulsifying properties.

ethylene glycol monobutyl ether acetate.

(butyl "Cellosolve" acetate).

$\text{C}_4\text{H}_9\text{OCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; fruity odor. Bp 192.3C, d 0.9424 (20/20C), fp -63.5C, flash p 190F (87.7C). Soluble in hydrocarbons and organic solvents; insoluble in water. Combustible.

Grade: Technical.

Use: High-boiling solvent for nitrocellulose lacquers, epoxy resins, multicolor lacquers; film-coalescing aid for polyvinyl acetate latex.

ethylene glycol monobutyl ether laurate.

(butoxyethyl laurate). $\text{C}_{11}\text{H}_{23}\text{COO}(\text{CH}_2)_2\text{OC}_4\text{H}_9$.

Properties: Liquid. D 0.985 (25C), fp -10 to -15C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monobutyl ether oleate.

(butoxyethyl oleate). $\text{C}_{17}\text{COOCH}_2\text{CH}_2\text{OC}_4\text{H}_9$.

Properties: Liquid. D 0.892 (25C), fp <-45C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monobutyl ether stearate.

(butoxyethyl stearate). $\text{C}_{17}\text{H}_{32}\text{COOC}_2\text{H}_4\text{OC}_4\text{H}_9$.

Properties: Colorless liquid. D 0.882 (20C), vap press <0.01 mm Hg (20C), bp 210–233C (4 mm Hg), mp 16.5C. Insoluble in water. Combustible.

Use: Plasticizer and solvent.

ethylene glycol mono-dicyclopentenyl ether.

CAS: 68586-17-4. mf: $\text{C}_{12}\text{H}_{18}\text{O}_2$.

Hazard: Moderately toxic by ingestion and skin contact. A severe eye and moderate skin irritant.

ethylene glycol monoethyl ether. (2-ethoxyethanol; "Cellosolve" solvent).

CAS: 110-80-5. $\text{HOCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; practically odorless. Bp 135.6C, d 0.9311 (20/20C), bulk d 7.74 lb/gal (20C), refr index 1.4060 (25C), flash p 120F (48.9C), pour point <100F (37.7C), autoign temp 460F (237C). Miscible with hydrocarbons and water. Combustible.

Grade: Technical.

Hazard: TLV: 5 ppm, toxic by skin absorption. Moderate fire risk.

Use: Solvent for nitrocellulose, natural and synthetic resins; mutual solvent for formulation of soluble oils; lacquers and lacquer thinners; dyeing and printing textiles; varnish removers; cleaning solutions; leather; antiicing additive for aviation fuels.

ethylene glycol monoethyl ether acetate.

("Cellosolve" acetate; 2-ethoxyethyl acetate).

CAS: 111-15-9. $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; pleasant esterlike odor. Bp 156.3C, d 0.9748 (20/20C), bulk d 8.1 lb/gal (20C), refr index 1.4030 (25C), viscosity 1.32 cP (20C), flash p 120F (48.9C), fp -61.7C, vap press 2 mm Hg (20C). Miscible with aromatic hydrocarbons; slightly miscible with water. Combustible.

Grade: Technical.

Hazard: Toxic by ingestion and skin absorption. TLV: 5 ppm, toxic by skin absorption.

Use: Solvent for nitrocellulose, oils, and resins; retards "blushing" in lacquers, varnish removers, wood stains, textiles, and leather.

ethylene glycol monoethyl ether laurate.

$\text{C}_{11}\text{H}_{23}\text{COO}(\text{CH}_2)_2\text{OC}_2\text{H}_5$.

Properties: Liquid. D 0.89 (25C), fp -7 to -11C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monoethyl ether

ricinoleate. $\text{C}_{17}\text{H}_{32}(\text{OH})\text{COO}(\text{CH}_2)_2\text{OC}_2\text{H}_5$.

Properties: Liquid. D 0.929 (25C), fp <-10C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monohexyl ether. (*n*-hexyl "Cellosolve"). $C_6H_{13}OCH_2CH_2OH$.

Properties: Water-white liquid. D 0.8887 (20/20C), bulk d 7.4 lb/gal (20C), bp 208.1C, vap press 0.05 mm Hg (20C), fp -50.1C, flash p 195F (90.5C). Combustible.

Use: High-boiling solvent.

ethylene glycol monomethyl ether. (2-methoxyethanol; methyl "Cellosolve").

CAS: 109-86-4. $CH_3OCH_2CH_2OH$.

Properties: Colorless liquid; mild agreeable odor; stable. Bp 124.5C, d 0.9663 (20/20C), bulk d 8.0 lb/gal (20C), refr index 1.4021 (20C), flash p 110F (43.3C), fp -85.1C, autoign temp 551F (288C). Miscible with hydrocarbons, alcohols, ketones, glycols, and water. Combustible.

Derivation: From ethylene oxide.

Grade: Technical.

Hazard: Toxic by ingestion and inhalation. Moderate fire risk. TLV: 5 ppm, toxic by skin absorption.

Use: Solvent for nitrocellulose, cellulose acetate, alcohol-soluble dyes, natural and synthetic resins, solvent mixtures, lacquers, enamels, varnishes, leather; perfume fixative; wood stains; sealing moisture-proof cellophane; jet fuel deicing additive.

ethylene glycol monomethyl ether acetate.

(methyl "Cellosolve" acetate).

CAS: 110-49-6. $CH_3COOCH_2CH_2OCH_3$.

Properties: Colorless liquid; pleasant odor. D 1.0067 (20/20C), bp 145C, vap press 2 mm Hg (20C), flash p 120F (48.9C), bulk d 8.4 lb/gal (20C), fp -65.1C. Stable, miscible with common organic solvents; soluble in water. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Moderate fire risk. TLV: 5 ppm, toxic by skin absorption.

Use: Solvent for nitrocellulose, cellulose acetate, various gums, resins, waxes, oils; textile printing; photographic film; lacquers; dopes.

ethylene glycol monomethyl ether acetyl ricinoleate.

$C_{17}H_{32}(OCOCH_3)COOCH_2CH_2OCH_3$.

Properties: Liquid. D 0.966, refr index 1.460, boiling range 220-260C, fp <-60C, flash p 425F (218C). Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monomethyl ether

ricinoleate. $C_{17}H_{32}(OH)COOCH_2CH_2OCH_3$.

Properties: Liquid. D 0.935 (25C), fp <-60C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monomethyl ether stearate.

$C_{17}H_{33}COOCH_2CH_2OCH_3$.

Properties: Liquid. D 0.890, mp 21C. Insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol mononitrate vinyl ether.

CAS: 53987-27-2. mf: $C_4H_7NO_4$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation.

ethylene glycol monoethyl ether.

$C_4H_9CHC_2H_5CH_2OCH_2CH_2OH$.

Properties: Colorless liquid; odorless. Bp 228.3C, d 0.8859, flash p 230F (110C), vap press 0.02 mm Hg (20C). Combustible.

Use: Solvent for cellulose esters, plasticizers.

ethylene glycol monophenyl ether. (2-

phenoxyethanol; phenyl "Cellosolve").

CAS: 122-99-6. $C_6H_5OCH_2CH_2OH$.

Properties: Colorless liquid; faint aromatic odor. Stable in presence of acids and alkalis, partially soluble in water. D 1.1094 (20/20C), bp 244.9C, fp 14C, vap press <0.01 mm Hg (20C), flash p 250F (121C), phenol 0.3% (max), bulk d 9.2 lb/gal. Combustible.

Grade: Technical.

Use: Solvent for cellulose acetate, dyes, inks, resins; perfume fixative; bactericidal agent; organic synthesis of plasticizers, germicides, pharmaceuticals; insect repellent.

ethylene glycol monoricinoleate.

$C_{17}H_{32}(OH)COO(CH_2)_2OH$.

Properties: Clear, moderately viscous, pale-yellow liquid; mild odor. Miscible with most organic solvents. D 0.965 (25/25C), saponification number 170, hydroxyl value 270, solidifies at -20C, insoluble in water. Combustible.

Derivation: Castor oil and ethylene glycol.

Grade: Technical.

Use: Plasticizer, greases, urethane polymers.

ethylene glycol monostearate. (glycol stearate).

CAS: 111-60-4. $C_{17}H_{33}COO(CH_2)_2OH$.

Properties: Yellow, waxy solid. Mp 57-60C; d 0.96 (25C). Soluble in alcohol, hot ether, and acetone; insoluble in water. Combustible.

ethylene glycol silicate. $(HOCH_2CH_2)_4SiO_4$.

Properties: Colorless liquid. Slowly hydrolyzed by acids; miscible with water.

Use: Nonvolatile bonding agent for pigments; weatherproofing paints for protecting concrete, stone, brick, and plastic surfaces.

ethylene hexene-1-copolymer. Product developed especially for use in blow-molded items.

Other possible uses are coatings for pipe, wire, and cables; sheeting; and monofilament.

ethylene hydrate. See gas hydrate.

ethyleneimine. (aziridine; ethylenimine).

CAS: 151-56-4.

Properties: Clear, colorless liquid; amine odor. Bp 57C, d 0.832 (20/4C), refr index 1.4123 (25C), fp -78C, flash p 12F (-11.1C), autoign temp 612F (322C). Miscible with water and most organic solvents.

Derivation: From ethylene dichloride and ammonia by use of an acid acceptor.

Hazard: Corrosive, absorbed by skin, causes tumors; exposure should be minimized; a carcinogen. Dangerous fire and explosion hazard, flammable limits in air 3.6–46%. TLV: 0.5 ppm, toxic by skin absorption; animal carcinogen.

Use: Intermediate and monomer for fuel-oil and lubricant refining, ion exchange, protective coatings, pharmaceuticals, adhesives, polymer stabilizers, surfactants. Alkyl-substituted forms, called alkyl aziranes, are used as intermediates and for microbial control; aziridinyl compounds are also used as polymers and intermediates.

ethylene-maleic anhydride copolymer.

CAS: 9006-26-2.

Properties: Fine, water-soluble powder available as both straight-chain and cross-linked polymers in a variety of molecular weights. May be in form of free acid, sodium, or amide-ammonium salts. Reacts readily with alcohols and amines.

Hazard: Low toxicity by ingestion and skin contact. A mild eye irritant.

Use: Oil-well drilling muds; stabilizers and thickeners in liquid detergents, cosmetics, paints; textile sizes; printing inks; suspending agents; ceramic binders.

ethylenenaphthalene. See acenaphthene.

ethylene oxide. (epoxyethane; oxirane).

CAS: 75-21-8.

Properties: Colorless gas at room temperature, liquid at approximately 12C. Fp -111.3C, bp 10.73C, d 0.8711 (20/20C), bulk d 7.25 lb/gal (20C), viscosity 0.32 cP (0C), flash p approximately 0F (-17.7C) (TOC), autoign temp 805F (429C). Soluble in organic solvents; miscible with water.

Derivation: (1) Oxidation of ethylene in air or oxygen with silver catalyst; (2) action of an alkali on ethylene chlorohydrin.

Grade: Technical, pure (99.7%).

Hazard: Irritant to eyes and skin. TLV: 1 ppm; suspected human carcinogen. Highly flammable, dan-

gerous fire and explosion risk, flammable limits in air 3–100%.

Use: Manufacture of ethylene glycol and higher glycols, surfactants, acrylonitrile, ethanalamines; petroleum demulsifier; fumigant; rocket propellant; industrial sterilant (e.g., medical plastic tubing); fungicide.

ethylene oxide and propylene oxide block polymer. See poloxamer 331.

ethylene oxide polymer.

Use: Food additive.

ethylene-propylene-diene monomer. See ethylene propylene terpolymer.

ethylene-propylene rubber. (EPR). An elastomer made by the stereospecific copolymerization of ethylene and propylene. Has no unsaturation; cannot be vulcanized with sulfur but can be cured with peroxides.

ethylene-propylene terpolymer. (EPT;

EPDM). An elastomer based on stereospecific linear terpolymers of ethylene, propylene, and small amounts of a nonconjugated diene, e.g., a cyclic or aliphatic diene (hexadiene, dicyclopentadiene, or ethylidene norbornene). The unsaturated part of the polymer molecule is pendant from the main chain, which is completely saturated. Can be vulcanized with sulfur.

Properties: (Vulcanizate) Light-cream to white; excellent resistance to ozone, to high and low temperatures (from -51 to +148C), and to acids and alkalis; good electrical resistance, susceptible to attack by oils; pelletized forms available.

Use: Automotive parts, gaskets, cable coating, mechanical rubber products, cover strips for tire sidewalls, tire tubes, safety bumpers, coated fabrics, footwear, wire and cable coating, thermoplastic resin modifier.

See "Nordel."

ethylene thiourea.

CAS: 96-45-7.

$\text{NHCH}_2\text{CH}_2\text{NHCS}$ (2-imidazolidinethione).

Properties: White to pale-green crystals; faint amine odor. Mp 199–204C. Slightly soluble in cold water; very soluble in hot water; slightly soluble at room temperature in methanol, ethanol, acetic acid, naphtha.

Use: Electroplating baths; intermediate for antioxidants, insecticides, fungicides, vulcanization accelerators, dyes, pharmaceuticals, synthetic resins.

ethylene urea. (2-imidazolidinone; dihydro-2(3)-imidazolone; 2-imidazolidone).

CAS: 120-93-4.

Properties: White, lumpy powder; odorless. Mp 125–128C. Soluble in water.

Derivation: From ethylenediamine and urea.

Use: Drip-dry textile products, ingredient of plasticizers and adhesives, insecticide.

ethylene-vinyl acetate copolymer. (EVA).

An elastomer used to improve adhesion properties of hot-melt and pressure-sensitive adhesives, as well as for conversion coatings and thermoplastics. See "Ulathene."

ethylenimine. See ethyleneimine.

N-ethylethanolamine. (ethylaminoethanol).

Properties: Colorless liquid; amine odor. D 0.914 (20C), boiling range 167–169C flash p 160F (71.1C) (OC). Soluble in water, alcohol and ether. Combustible.

Use: Solvent, intermediate.

ethyl ether. (ether; diethyl ether; sulfuric

ether; ethyl oxide; diethyl oxide).

CAS: 60-29-7. (C₂H₅)₂O.

Properties: Colorless, volatile, mobile liquid. Hygroscopic, aromatic odor, burning and sweet taste. Bp 34.5C, fp -116.2C, d 0.7147 (20/20C), surface tension 17.0 dynes/cm (20C), refr index 1.3526 (20C), viscosity 0.00233 cP (20C), vap press 442 mm Hg (20C), specific heat 0.5476 cal/g (30C), flash p -49F (-45C), autoign temp 356F (180C), latent heat of evaporation 83.96 cal/g at bp, electric conductivity 4×10^{-3} mho/cm (25C), bulk d 6 lb/gal (20C). Soluble in alcohol, chloroform, benzene, solvent naphtha, and oils; slightly soluble in water.

Derivation: By the action of sulfuric acid on ethanol or ethylene followed by distillation.

Method of purification: Rectification, dehydration, treatment with alkali and charcoal.

Grade: USP (for anesthesia), ACS Reagent, ACS Absolute, CP, concentrated, USP 1880, washed, motor, electronic.

Hazard: CNS depressant by inhalation and skin absorption. Very flammable, severe fire and explosion hazard when exposed to heat or flame. TLV: 400 ppm; STEL 500 ppm. Forms explosive peroxides. Explosive limits in air 1.85–48%.

Use: Organic synthesis; smokeless powder; industrial solvent (nitrocellulose, alkaloids, fats, waxes, etc.); analytical chemistry; anesthetic, extractant.

ethyl-3-ethoxypropionate.

Properties: Liquid. D 0.9496 (20C), bp 170.1C, vap press 0.9 mm Hg (20C), sets to glass at -100C, flash p 180F (82.2C) (OC). Slightly soluble in water. Combustible.

Use: Intermediate for vitamin B₁, other chemicals.

ethylethylene. See butene-1.

ethylethyleneimine. (2-ethylaziridine).

Properties: Water-white liquid. Bp 87–90C, d 0.812–0.816 (25/25C).

Use: Organic intermediate whose derivatives are used in the textile, paper, rubber, and pharmaceutical industries.

ethyl(5-ethylmercuri-3-(1,2,4-thiadiazolyl)thio)mercury(ii).

CAS: 73928-12-8. mf: C₆H₁₀Hg₂N₂S₂.

Hazard: A poison. TWA 0.01. STEL 0.03 mg/m³ (skin).

ethyl 3-ethyl-4-quinolinecarboxylate. See 3-ethylcinchoninic acid ethyl ester.

2-ethyl fenchol. mf: C₁₂H₂₂O.

Properties: Pale yellow liquid; camphor, earthy odor. D: 0.946–0.967, refr index: 1.470–1.491. Sol in alc, propylene glycol, fixed oils; insol in water.

Use: Food additive.

ethyl ferrocenoate. (ferrocenecarboxylic acid ethyl ester). (C₂H₄COOC₂H₅)₂Fe.

Properties: Orange, crystalline solid. Mp 63–64C.

Use: Intermediate.

"Ethylflo" [Albemarle]. TM for synthetic hydrocarbon fluids.

ethylfluoroformate. FCOOC₂H₅.

Properties: Liquid. D 1.11 (33C), bp 57C.

Derivation: Interaction of ethylchloroformate and a reactive fluoride.

Hazard: Strong irritant.

ethylfluorosulfonate. C₂H₅OFSO₂.

Properties: Liquid; ethereal odor.

Hazard: Strong irritant.

ethyl formate.

CAS: 109-94-4. HCOOC₂H₅.

Properties: Water-white, unstable liquid; pleasant aromatic odor. Flash p -4F (-20C) (CC); explosive limits in air 2.8–13.5%; autoign temp 851F (455C), d 0.9236 (20/20C); fp -80.5C, bp 54.3C, vap press 200 mm Hg (20.6C), 300 mm Hg (30.2C); wt/gal 7.61 lb (68F); refr index 1.35975 (20C). Miscible with benzene, ether, alcohol; slightly soluble in water; gradual decomposition in water.

Derivation: Heating ethanol with formic acid in the presence of sulfuric acid.

Grade: Technical, FCC.

Hazard: Narcotic and irritant to skin and eyes; use in foods restricted to 0.0015%. Highly flammable, dangerous fire and explosion risk. TLV: 100 ppm.

Use: Solvent for cellulose nitrate and acetate, acetone

substitute, fumigant, larvicide, synthetic flavors, organic synthesis.

ethyl-*o*-formate. $\text{CH}(\text{OC}_2\text{H}_5)_3$.

Properties: Colorless liquid. Bp 145.9C, fp <−18C, refr index 1.392 (20C), flash p 85F (29.4C). Slightly soluble in water; soluble in alcohol and ethers.

Hazard: Flammable, moderate fire risk.

Use: Intermediate.

ethyl-3-formylpropionate.

Properties: Liquid. D 1.0625 (20/20C), bp 190.9C, fp <−80C, bulk d 8.9 lb/gal, flash p 200F (93.3C). Somewhat soluble in water. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Solvent for lacquers, antibiotic extraction, acetic acid separation, coalescing acids for emulsion paints.

2-ethylfuran.

Properties: Liquid. Mw 96.13, bp 92–93C (768 mm Hg), d 0.912.

Grade: Food.

Hazard: Flammable liquid.

ethyl furoate. $\text{C}_4\text{H}_8\text{O}_4$

Properties: White leaflets or prisms. D 1.1174 (20.8/4C), mp 34C, bp 195C (706 mm Hg). Insoluble in water; soluble in alcohol and ether.

ethyl glycolate isocyanate. See ethyl isocyanatoacetate.

ethyl glyme. See ethylene glycol diethyl ether.

4-ethylheptane. (ethylpropylmethane).

Properties: Colorless liquid. D 0.730, bp 141.2C, refr index 1.4109 (20C). Combustible.

Grade: Technical.

Use: Organic synthesis.

ethyl heptanoate. See ethyl enanthate.

ethyl heptazine. See ethoheptazine.

2-ethylhexaldehyde. (butylethylacetaldehyde; octylaldehyde; 2-ethylhexanal).

Properties: Colorless high-boiling liquid; mild odor. Miscible with most organic solvents; slightly soluble in water. D 0.8205 (20C), bp 163.4C, vap press 1.8 mm Hg (20C), flash p 125F (51.6C) (OC), bulk d 6.8 lb/gal. Combustible.

Grade: Technical.

Hazard: Ignites in air.

Use: Organic synthesis, perfumes.

2,2'-(2-ethylhexamido)diethyl di(2-ethylhexoate). ("Flexol" 8N8).

Properties: Light-colored liquid. D 0.9564 (20/20C), bulk d 8.0 lb/gal (20C), bp 256C (5 mm Hg), flash p 420F (215C), vap press 0.60 mm Hg (200C), viscosity 139.2 cP (20C). Insoluble in water. Combustible.

Use: Plasticizer.

2-ethylhexanal. See 2-ethylhexaldehyde.

2-ethylhexanediol-1,3. (ethohexadiol; 2-ethyl-3-propyl-1,3-propanediol).

Properties: Colorless, slightly viscous, liquid; odorless. Hygroscopic. D 0.9422 (20/20C), bulk d 7.8 lb/gal (20C), bp 244C, vap press <0.01 mm Hg (20C), flash p 260F (126C), fp approximately −40C, refr index 1.4465–1.4515, viscosity 323 cP (20C). Soluble in alcohol and ether, partially soluble in water. Combustible.

Grade: USP (as ethohexadiol), industrial.

Use: Insect repellent, cosmetics, vehicle and solvent in printing inks, medicine, chelating agent for boric acid.

(r)-2-ethylhexanoic acid sodium salt.

Hazard: A reproductive hazard.

2-ethylhexanol. See 2-ethylhexyl alcohol.

((2-ethylhexanoyl)oxy)tributylstannane.

See tributyltin-2-ethylhexanoate.

2-ethylhexenal. See 2-ethyl-3-propylacrolein.

2-ethyl-1-hexene. $\text{CH}_3(\text{CH}_2)_3(\text{C}_2\text{H}_5)\text{C}=\text{CH}_2$.

Properties: Colorless liquid. D 0.7270 (20/4C), bp 120C, refr index 1.4157 (20C). Soluble in alcohol, acetone, ether, petroleum, coal tar solvents; insoluble in water. Combustible.

Grade: 95% min purity.

Hazard: Toxic by ingestion and inhalation.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

ethyl hexoate. See ethyl caproate.

2-ethylhexoic acid. (butylethylacetic acid).

Properties: Mild-odored liquid. D 0.9077 (20/20C), bulk d 7.6 lb/gal (20C), bp 226.9C, vap press 0.03 mm Hg (20C), fp −83C, viscosity 7.73 cP (20C),

acid number 370, flash p 260F (126C). Slightly soluble in water. Combustible.

Grade: 99%.

Use: Paint and varnish driers (metallic salts). Ethylhexoates of light metals are used to convert some mineral oils to greases. Its esters are used as plasticizers.

2-ethylhexyl. $\text{CH}_3(\text{CH}_2)_3\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2-$. An 8-carbon radical. Many of its compounds were formerly called *octyl*.

2-ethylhexyl acetate.

CAS: 103-09-3. $\text{CH}_3\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Water-white stable liquid. D 0.8733 (20C), bp 198.6C, fp -93C, vap press 0.4 mm Hg (20C), flash p 180F (82.2C), bulk d 7.3 lb/gal (20C). Very slightly soluble in water; miscible with alcohol. Combustible.

Grade: Technical (approximately 95%).

Use: Solvent for nitrocellulose, resins, lacquers, baking finishes.

2-ethylhexyl acrylate.

CAS: 103-11-7. $\text{CH}_2=\text{CHCOOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Liquid; pleasant odor. D 0.8869, bp 214-218C, vap press 0.1 mm Hg (20C), sets to glass at -90C, flash p 180F (82.2C) (OC). Insoluble in water. Combustible.

Use: Monomer for plastics, protective coatings, paper treatment, water-based paints.

2-ethylhexyl acrylate-hydroxyethyl acrylate-methyl acrylate polymer.

CAS: 50601-74-6. mf: $(\text{C}_{11}\text{H}_{20}\text{O}_2 \bullet \text{C}_8\text{H}_8\text{O}_3 \bullet \text{C}_4\text{H}_6\text{O}_2)_x$

Hazard: Low toxicity by ingestion and skin contact. A moderate eye irritant.

2-ethylhexyl alcohol. (2-ethylhexanol; octyl alcohol).

CAS: 104-76-7. $\text{CH}_3(\text{CH}_2)_3\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH}$.

Properties: Colorless liquid. D 0.83 (20C), bp 183.5C, fp -76C, vap press 0.36 (20C), refr index 1.4300 (20C), bulk d 6.9 lb/gal (20C), flash p 178F (81.1C). Miscible with most organic solvents, slightly soluble in water. Combustible.

Derivation: (a) Oxo process from propylene and synthesis gas; (b) aldolization of acetaldehyde or butyraldehyde, followed by hydrogenation; (c) from fermentation alcohol.

Grade: Technical.

Use: Plasticizer for PVC resins, defoaming agent, wetting agent; organic synthesis; solvent mix for nitrocellulose, paints, lacquers, baking finishes; penetrant for mercerizing cotton; textile finishing compounds; plasticizers; inks; rubber; paper; lubricants; photography; dry cleaning.

2-ethylhexylamine.

CAS: 104-75-6. $\text{C}_8\text{H}_{17}\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{NH}_2$.

Properties: Colorless liquid. D 0.7894 (20/20C), bulk d 6.56 lb/gal (20C), bp 169.2C, vap press 1.2

(20C), viscosity 1.11 cP (20C), flash p 140F (60C) (OC). Solubility in water 25.3% (20C). Combustible.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Use: Synthesis of detergents, rubber chemicals, oil additives, and insecticides.

n-2-ethylhexylaniline.

$\text{C}_6\text{H}_5\text{NHCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Light-yellow liquid; mild odor. D 0.9119 (20/20C), bp 194C (50 mm Hg), vap press <0.01 mm Hg (20C), fp (sets to a glass at approximately -70C), viscosity 7.4 cP (20C), flash p 325F (162C) (COC). Solubility in water <0.01% (20C). Combustible.

Hazard: Chronic exposure is toxic.

Use: Solvent, organic synthesis.

2-ethylhexyl bromide. $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{Br}$.

Properties: Water-white liquid. Bp 56-58C (6 mm Hg). Insoluble in water.

Use: Introduction of the 2-ethylhexyl group in organic synthesis; preparation of disinfectants, pharmaceuticals.

2-ethylhexyl chloride.

CAS: 123-04-6. $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. D 0.8833 (20C), bp 172.9C, refr index 1.4310, bulk d 7.33 lb/gal, flash p 140F (60C) (OC), fp -135C. Insoluble in water. Combustible.

Hazard: Moderate fire risk.

Use: Synthesis of cellulose derivatives, dyestuffs, pharmaceuticals, textile auxiliaries, insecticides, resins.

2-ethylhexyl cyanoacetate.

$\text{CNCH}_2\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Liquid. Bp 150C, refr index 1.4389 (20C). Insoluble in water; soluble in alcohol, benzene, and ether. Combustible.

Use: Organic intermediate.

2-ethylhexyl-2-cyano-3',3'-diphenyl acrylate.

See "Uvinul" [BASF].

2-ethylhexyl 2-cyano-3-phenylcinnamate.

See octocilene.

2-ethylhexyl (3-isocyanatomethylphenyl) carbamate.

CAS: 58240-57-6. mf: $\text{C}_{17}\text{H}_{24}\text{N}_2\text{O}_3$.

Hazard: A poison by ingestion and skin contact. A severe eye irritant.

2-ethylhexylisodecyl phthalate. $\text{C}_{26}\text{H}_{43}\text{O}_4$.

Properties: Colorless, high-boiling liquid. Good dielectric properties, refr index 1.478-1.488 (25C), d 0.969-0.977 (25/25C). Miscible with most common solvents, thinners, and oils. Combustible.

Use: Plasticizer.

2-ethylhexylmagnesium chloride.

$C_8H_{17}CH(C_2H_5)CH_2MgCl$. Grignard reagent available commercially in tetrahydrofuran solution.

2-ethylhexyloctylphenyl phosphite.

$(C_8H_{17}O)_2(C_8H_{17}C_6H_7C_6H_4O)P$.

Properties: Colorless to light-yellow liquid; characteristic odor. D 0.935–0.950 (20/4C), flash p 385F (196C). Insoluble in water. Combustible.

Use: Antioxidant, plasticizer, flame-retardant, lubricating-oil additive.

3,3'-(2-ethylhexyl) thiodipropionate. (dioctyl thiopropionate). $(C_8H_{17}OOCCH_2CH_2)_2S$.

Properties: Colorless liquid. D 0.952 (25C). Insoluble in water; soluble in most organic solvents. Combustible.

Use: Antioxidant, stabilizer, and lubricant.

ethyl(hydrogen *p*-mercaptobenzene-sulfonato)mercury sodium salt. See sodium thimerfonate.**ethyl-2-hydroxy-2,2-bis(4-chlorophenyl) acetate.** See "Chlorobenzilate."**ethyl-3-hydroxybutyrate.**

$CH_3CH(OH)CH_2CO_2C_2H_5$.

Properties: A solid. Mw 132.16, bp 170C, d 1.017, fp 64C.

Grade: Food.

ethyl hydroxyethyl cellulose. (EHEC). A cellulose ether.

Properties: White, granular solid. Soluble in mixtures of aliphatic hydrocarbons containing alcohol; soluble in water. Combustible.

Available forms: Extra low- and high-viscosity types.

Use: Stabilizer, thickener, binder, formation of film in silk-screen and gravure printing inks; protective coatings; aqueous, aqueous-organic, and organic solvent systems.

***n*-ethyl-*n*-(2-hydroxyethyl)-3-methyl-4-nitrosoaniline.**

CAS: 58066-96-9. mf: $C_{11}H_{16}N_2O_2$.

Hazard: A poison by ingestion.

ethyl- α -hydroxyisobutyrate. $(CH_3)_2COH-COOC_2H_5$.

Properties: Water-white liquid. D 0.978–0.986 (20C), bp 149–150C. Soluble in water, alcohol, and ether. Combustible.

Use: Solvent for nitrocellulose and cellulose acetate; solvent mixture for cellulose ethers, organic synthesis, pharmaceuticals.

4-ethyl-7-hydroxy-3-(*p*-methoxyphenyl) coumarin.

CAS: 5219-17-0. mf: $C_{18}H_{16}O_4$.

Hazard: A reproductive hazard.

ethyl 4-hydroxy-2-methyl-2*h*-1,2-benzothiazine-3-carboxylate 1,1-dioxide.

CAS: 24683-26-9. mf: $C_{12}H_{13}NO_5S$.

Hazard: Low toxicity by ingestion and inhalation.

2-ethyl-2-(hydroxymethyl)-1,3-propanediol triacetate.

CAS: 22208-25-9. mf: $C_{18}H_{26}O_9$.

Hazard: A poison by ingestion and skin contact.

3-((10-ethyl-11-(*p*-hydroxyphenyl)dibenz(b,f)oxepin-3-yl)oxy)-1,2-propanediol hydrate (4:1).

CAS: 85850-93-7. mf: $C_{25}H_{24}O_5 \cdot 1/4H_2O$.

Hazard: A reproductive hazard.

ethylidene chloride. (1,1-dichloroethane).

CAS: 75-34-3. CH_3CHCl_2 .

Properties: Colorless, neutral, mobile liquid; aromatic ethereal odor; saccharin taste. D 1.174 (17C), bp 57–59C, fp –98C, refr index 1.4166 (20C). Soluble in alcohol, ether, fixed and volatile oils; very sparingly soluble in water. Combustible.

Hazard: Toxic. TLV: 100 ppm; not classifiable as a human carcinogen.

Use: Extraction solvent, fumigant.

ethylidenediethyl ether. See acetal.**ethylidenedimethyl ether.** See dimethylacetal.**ethylidene fluoride.** See 1,1-difluoroethane.**5-ethylidene-2-norbornene.** (ENB).

CAS: 16219-75-3. A diene used as the third monomer in EPDM elastomers.

Hazard: Toxic. TLV: ceiling 5 ppm.

4,4',4''-ethylidynetrisphenol.

CAS: 27955-94-8. mf: $C_{20}H_{18}O_3$.

Hazard: Low toxicity by ingestion and skin contact. A mild eye irritant.

ethyl iodide. (iodoethane).

CAS: 75-03-6. C_2H_5I .

Properties: Colorless liquid, turning brown on exposure to light. D 1.90–1.93 (25/25C), fp –108C, bp 72C, refr index 1.5168 (15C). Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: By digesting red phosphorus with absolute ethanol, after which iodine is added and the mixture distilled.

Hazard: Toxic by inhalation and skin absorption, narcotic in high concentration.

Use: Medicine, organic synthesis.

ethyl iodoacetate. $CH_3ICOOC_2H_5$.

Properties: Dense, colorless liquid. Decomposed by light and air, also (very slowly) by alkaline solutions and water. D 1.8, bp 179C, vapor d 7.4, vap press 0.54 mm Hg (20C).

Derivation: Interaction of potassium iodide with ethyl bromo- or chloroacetate.

Hazard: Strong irritant to eyes and skin.

5-ethyl-5-isoamylbarbituric acid. See amobarbital.

ethylisobutrazine hydrochloride.

CAS: 3737-33-5. mf: $C_{20}H_{26}N_2S \cdot CH$.

Hazard: A poison.

ethylisobutylmethane. See 2-methylhexane.

ethyl isobutyrate.

CAS: 97-62-1. $(CH_3)_2CHCOOC_2H_5$.

Properties: Colorless, volatile liquid. D 0.870, bp 110–111C, fp –88C, refr index 1.3903 (20C). Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: Heating isobutyric acid and ethyl alcohol, with subsequent distillation.

Use: Organic synthesis, flavoring extracts.

ethyl isocyanate.

CAS: 109-90-0. C_2H_5NCO .

Properties: Liquid. D 0.898, bp 60C. Soluble in chlorinated and aromatic hydrocarbons.

Hazard: Strong irritant to tissue.

Use: Pharmaceutical and pesticide intermediate.

ethyl isocyanatoacetate.

CAS: 2949-22-6. mf: $C_5H_9NO_3$.

Hazard: Moderately toxic by ingestion and inhalation.

ethyl 4-isocyanobenzoate.

CAS: 1983-99-9. mf: $C_{10}H_9NO_2$.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

2-ethylisohexanol.

$(CH_3)_2CHCH_2CH(C_2H_5)CH_2OH$.

Properties: Liquid. D 0.825–8.035 (20/20C), boiling range 173–181.0C, refr index 1.4235 (20C), bulk d 6.89 lb/gal (20C), flash p 170F (76.6C) (COC). Combustible.

Use: Chemical intermediate.

ethyl isopropenyl ketone. See isopropenyl ethyl ketone.

ethyl isothiocyanate. See ethyl thiocarbimide.

ethyl 4-isothiocyanatobutanoate.

CAS: 17126-65-7. mf: $C_7H_{11}NO_2S$.

Hazard: A poison.

ethyl isovalerate. (ethyl valerate; ethyl 2-methylbutyrate).

CAS: 108-64-5. $(CH_3)_2CHCH_2COOC_2H_5$.

Properties: Colorless, oily liquid; fruity odor. Bp

135C, fp –99C, d 0.864 (20/20C), refr index 1.3950–1.3990 (20C). Slightly soluble in water; miscible with alcohol, ether, and benzene. Combustible.

Derivation: Heating sodium valerate and ethanol in the presence of sulfuric acid or hydrochloric acid, with subsequent distillation.

Grade: Technical, FCC.

Use: Essential oils, perfumery, artificial fruit essences, flavoring.

ethyl lactate.

CAS: 97-64-3. $CH_3CH_2COOC_2H_5$.

Properties: Colorless liquid; mild odor. D 1.020–1.036 (20/20C), bp 154C, flash p 115F (46.1C) (CC); bulk d 8.55 lb/gal (20C), autoign temp 752F (400C). Miscible with water, alcohols, ketones, esters, hydrocarbons, oil. Combustible.

Derivation: (a) By the esterification of lactic acid with ethanol; (b) by combining acetaldehyde with hydrogen cyanide to form acetaldehyde cyanohydrin, which is converted into ethyl lactate by treatment with ethanol and an inorganic acid.

Grade: Technical (96%).

Hazard: Moderate fire risk.

Use: Solvent for nitrocellulose, cellulose acetate, many cellulose ethers, resins; lacquers; paints; enamels; varnishes; stencil sheets; safety glass; flavoring.

ethyl levulinate. $CH_3CO(CH_2)_3COOC_2H_5$.

Properties: Colorless liquid. D 1.012, bp 205–206C, refr index 1.4229 (20C). Soluble in water; miscible with alcohol. Combustible.

Use: Solvent for cellulose acetate and starch ethers, flavoring.

ethylithium. (lithium ethyl).

Properties: Transparent crystals. Decomposed by water. The commercial product is a 2 M suspension of C_2H_5Li in benzene.

Hazard: Ignites in air, reacts with oxidizing materials.

Use: Grignard-type reactions.

ethylmagnesium bromide. C_2H_5MgBr .

Properties: Liquid. D 1.01.

Available forms: Dissolved in ether.

Hazard: Flammable, dangerous fire risk.

Use: Grignard-type reactions.

ethylmagnesium chloride. C_2H_5MgCl .

Available forms: Dissolved in ether (also offered commercially in tetrahydrofuran).

Properties: Liquid. D 0.85.

Hazard: Flammable, dangerous fire risk.

Use: Grignard-type reactions.

N-ethylmaleimide. (1-ethyl-1-H-pyrrole-2,5-dione).

CAS: 128-53-0. $C_6H_7NO_2$.

Properties: Crystals. Mw 125.13, mp 45C.

Hazard: Lachrymator when liquid, a strong irritant.
Use: Cancer research.

ethyl malonate. (malonic ester; diethyl malonate).

CAS: 105-53-3. $\text{CH}_2(\text{COOC}_2\text{H}_5)_2$.

Properties: Colorless liquid; sweet ester odor. Bp 198C, fp -50C , d 1.055 (25/25C), flash p 200F (93.3C). Insoluble in water; soluble in alcohol, ether, chloroform, and benzene. Combustible.

Derivation: By passing hydrogen chloride into cyanoacetic acid dissolved in absolute alcohol with subsequent distillation.

Use: Intermediate for barbiturates and certain pigments, flavoring.

ethylmemazine monohydrochloride. See ethylisobutrazine hydrochloride.

ethyl mercaptan. Legal label name for ethanethiol.

ethylmercuric acetate.

CAS: 109-62-6. $\text{C}_2\text{H}_5\text{HgOOCCH}_3$.

Properties: White, crystalline powder. Mp 178C. Slightly soluble in water; soluble in many organic solvents. May be steam distilled.

Hazard: Strong irritant; see mercury.

Use: Seed fungicide as dust or slurry with water. See mercury.

ethylmercuric chloride.

CAS: 107-27-7. $\text{C}_2\text{H}_5\text{HgCl}$.

Properties: Crystals. D 3.482, mp 193C, sublimes readily. Insoluble in water; slightly soluble in ether; soluble in hot alcohol.

Derivation: Reaction of zinc diethyl and mercuric chloride.

Hazard: Strong irritant.

Use: Fungicide for seed or bulb treatment, either alone or with other organic mercury compounds. See mercury.

ethylmercuric dicyandiamide.

CAS: 63869-03-4. mf: $\text{C}_4\text{H}_8\text{HgN}_4$.

Properties: IDLH 10 mg/m^3 (as Hg).

Hazard: A poison. TWA 0.01. STEL 0.03 mg/m^3 (skin).

ethylmercuric phosphate.

CAS: 2440-45-1. $(\text{C}_2\text{H}_5\text{HgO})_3\text{PO}$.

Properties: White powder; garlic like odor. Soluble in water.

Derivation: Reaction of ethylmercuric acetate with phosphoric acid.

Hazard: Strong irritant.

Use: Seed fungicide, timber preservative. See mercury.

ethylmercurithiosalicylic acid, sodium salt.

See thimerosal.

***n*-ethylmercuri-*p*-toluenesulfonanilide.**

CAS: 517-16-8. $\text{C}_{15}\text{H}_{17}\text{SO}_2\text{NHg}$.

Properties: Crystalline solid; strong, garlic like odor. Insoluble in water.

Hazard: Ingestion may be fatal.

Use: Agricultural chemical (grain smut control).

ethylmercury-2,3-dihydroxypropyl mercaptide.

$\text{C}_2\text{H}_5\text{HgSCH}_2\text{CH}_2\text{OCH}_2\text{OH}$. Organic mercurial.

Hazard: Very toxic; see mercury.

Use: Fungicidal dust, or in slurry treatment, for control of seed borne disease and to reduce losses from seed decay and damping off of wheat, oats, rye, etc. See mercury.

ethylmercury-*p*-toluenesulfonanilide.

(EMTS; "Ceresan" M).

$\text{C}_6\text{H}_5\text{N}(\text{HgC}_2\text{H}_5)\text{SO}_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Crystals; pungent odor. Mp 154–157C. Nearly insoluble in water; soluble in acetone and chloroform.

Hazard: Very toxic.

Use: Dust or slurry for control of seed-borne diseases of fungi by treatment of seeds or bulbs.

See mercury.

ethylmercury toluenesulfonate.

CAS: 2654-47-9. mf: $\text{C}_8\text{H}_{10}\text{HgO}_3\text{S}$.

Properties: IDLH 10 mg/m^3 (as Hg).

Hazard: A poison. TWA 0.1 $\text{mg}(\text{Hg})/\text{m}^3$ (skin).

ethyl methacrylate.

CAS: 97-63-2. $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid. Bp 119C, fp approximately -75C , d 0.911, refr index 1.4116 (25C), flash p 70F (21.1C) (OC). Insoluble in water; readily polymerized.

Derivation: Reaction of methacrylic acid or methyl methacrylate with ethanol.

Grade: Technical (inhibited).

Hazard: Flammable, dangerous fire and explosion hazard. An irritant.

Use: Polymers, chemical intermediates.

See acrylic resin.

***n*-(2-(5-ethyl-2-methoxyphenyl)ethyl) propionamide.**

CAS: 156482-87-0. mf: $\text{C}_{14}\text{H}_{21}\text{NO}_2$.

Hazard: Moderately toxic by ingestion.

***N*-ethyl-3-methylaniline.** See *n*-ethyl-*m*-toluidine.

***n*-ethyl-2(or 4)-methylbenzenesulfonamide.**

CAS: 8047-99-2. mf: $\text{C}_9\text{H}_{13}\text{NO}_2\text{S}$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A mild eye irritant.

ethyl-2-methylbutyrate. See ethyl isovalerate.

ethyl methyl cellulose. A water-soluble cellulose ether used for thickening, sizing, emulsifying, and dispersing.
See polymer, water-soluble.

***o*-ethyl-s-(3-methyl-4-chlorophenyl)ethyl phosphonodithioate.**

CAS: 1942-78-5. mf: $C_{11}H_{16}ClOPS_2$.

Hazard: A poison by ingestion and skin contact.

Use: Agricultural chemical.

***n*-ethyl-3,4-methylenedioxyamphetamine.**

CAS: 82801-81-8. mf: $C_{12}H_{17}NO_2$.

Hazard: Human systemic effects.

ethyl methyl ether.

CAS: 540-67-0. $C_2H_5OCH_3$.

Properties: Colorless liquid. D 0.725, bp 10.8C, flash p -35F (-37.2C), autoign temp 374F (190C). Soluble in water; miscible with alcohol and ether.

Hazard: Highly flammable, dangerous fire and explosion risk.

Use: Medicine (anesthetic).

ethyl (4-(1-methylethyl)phenyl)methyl 3-pyridinylcarbonimidodithioate.

CAS: 51308-73-7. mf: $C_{18}H_{22}N_2S_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2-ethyl-4-methylimidazole. $C_2H_3C_3N_2H_2CH_3$.

Properties: A supercooled amber liquid that if crystallized is a low-melting solid. Mp 45C, bp 154C (10 mm Hg).

Use: Curing epoxy-resin systems.

ethyl methyl ketone. See methyl ethyl ketone.

ethyl 3-methyl-4-(methylthio)phenyl(1-methylethyl) phosphoramidate. See fenamiphos.

ethyl methylphenylglycidate. (so-called aldehyde C-16; "strawberry aldehyde").

Properties: Colorless to yellowish liquid; strong odor suggestive of strawberry. D 1.104-1.123, refr index 1.509-1.511. Soluble in three volumes of 60% alcohol. Combustible.

Grade: Technical, FCC (as aldehyde C-16).

Use: Perfumery, flavors.

***o*-ethyl s-1-methylpropyl s-1,1-dimethylethyl phosphorodithioate.**

CAS: 86073-23-6. mf: $C_{10}H_{23}O_2PS_2$.

Hazard: A poison by ocular route.

2-ethyl-3-methylpyrazine.

CAS: 15707-23-0. mf: $C_7H_{10}N_2$.

Properties: Colorless to sltly yellow liquid; strong, raw potato odor. D: 0.980-0.999 @ 20°, refr index: 1.502. Sol in water, org solvs.

Hazard: Moderately toxic by ingestion.

Use: Food additive.

5-ethyl-2-methylpyridine. See 2-methyl-5-ethylpyridine.

***O*-ethyl-*O*-[4-(methylthio)phenyl] *S*-propyl phosphorodithioate.** See sulprofos.

7-ethyl-2-methyl-4-undecanol. (tetradecanol). $C_4H_9CH(C_2H_5)C_2H_4CH(OH)CH_2CH(CH_3)_2$.

Properties: Liquid. D 0.8355 (20/20C), bp 264C, flash p 285F (140C). Insoluble in water. Combustible.

Use: Intermediate for synthetic lubricants, defoamers, and surfactants.

ethylmorphine hydrochloride.

CAS: 125-30-4. $C_{19}H_{23}NO_3 \cdot HCl \cdot 2H_2O$.

Properties: White, crystalline powder; odorless. Mp approximately 123C (decomposes). Soluble in water and alcohol; slightly soluble in ether and chloroform.

Derivation: Action of hydrochloric acid on ethylmorphine, which is made by action of ethyl iodide on morphine in alkaline solution.

Grade: Technical, NF.

Hazard: Toxic by ingestion; habit-forming narcotic.

Use: Medicine (analgesic).

***N*-ethylmorpholine.**

CAS: 100-74-3.

Properties: Colorless liquid; ammoniacal odor. D 0.916 (20/20C), fp -63C, bp 138C, bulk d 7.6 lb/gal (20C), flash p 90F (32.3C) (OC). Miscible with water.

Grade: Technical.

Hazard: Irritant to skin and eyes, absorbed by skin. Flammable, moderate fire risk. TLV: 5 ppm, toxic by skin absorption.

Use: Intermediate for dyestuffs, pharmaceuticals; rubber accelerators and emulsifying agents; solvent for dyes, resins, oils; catalyst in making polyurethane foams.

ethyl mustard oil. See ethyl thiocarbimide.

ethyl myristate. (ethyl tetradecanoate).

$\text{CH}_3(\text{CH}_2)_{12}\text{COOC}_2\text{H}_5$.

Properties: Liquid. D 0.856, mp 12C, bp 295C. Insoluble in water, soluble in alcohol; slightly soluble in ether. Combustible.

Use: Flavoring.

***n*-ethyl- α -naphthylamine.** (*n*-ethyl-1-naphthylamine). $C_{10}H_7NCH_2H_5$.

Properties: Colorless liquid. Refr index 1.6475, bp 305C. Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Intermediate.

ethyl nitrate.

CAS: 625-58-1. $C_2H_5NO_3$.

Properties: Colorless liquid; pleasant odor; sweet taste. D 1.116, fp -112C, bp 87.6C, vapor three times heavier than air, flash p 50F (10C) (CC), lower explosive limit 3.8%. Soluble in alcohol and ether; insoluble in water.

Derivation: By heating alcohol, urea nitrate, and nitric acid, with subsequent distillation.

Hazard: Flammable, dangerous, fire and explosion risk.

Use: Organic synthesis, drugs, perfumes, dyes, rocket propellant.

ethyl nitrite.

CAS: 109-95-5. $C_2H_5NO_2$.

Properties: Yellowish volatile liquid. D 0.90, bp 16.4C, flash p -31F (-35C), decomposes spontaneously at 194F (90C), explosive limits in air 3-50%. Soluble in alcohol and ether; decomposes in water. Narcotic in high concentration.

Hazard: Highly flammable, dangerous, explodes!!

Use: Organic reactions, synthetic flavoring.

ethyl 2-(*m*-nitrobenzylidene)acetoacetate.

CAS: 39562-16-8. mf: $C_{13}H_{13}NO_5$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

ethyl 2-nitrophenyl sulfide.

CAS: 3058-46-6. mf: $C_8H_9NO_2S$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and moderate irritant.

ethyl nonanoate. See ethyl pelargonate.

ethyl octanoate. See ethyl caprylate.

ethyl octoate. See ethyl caprylate.

ethyl oenanthate. See ethyl enanthate.

ethyl oleate. $C_{17}H_{33}COOC_2H_5$.

Properties: Light-colored, yellowish, oily liquid. Bulk d 7.27 lb/gal (20C), refr index 1.45189 (20C), bp 205C, fp approximately -32C, d 0.867, flash p 348F (175C). Insoluble in water, soluble in alcohol and ether; solubility of water in ethyl oleate 1.0 cc/100 cc (20C). Combustible.

Use: Solvent, plasticizer, lubricant, water-resisting agent, flavoring.

ethyl orthopropionate. $CH_3CH_2C(OC_2H_5)_3$.

Properties: Colorless liquid. Bp 155-160C, refr index 1.401 (20C), flash p 140F (60C). Insoluble in water; soluble in alcohol and ether. Combustible.

Hazard: Moderate fire risk.

Use: Intermediate.

ethyl oxalate. (diethyl oxalate).

CAS: 95-92-1. $(COOC_2H_5)_2$.

Properties: Colorless, unstable, oily, aromatic liquid. D 1.09 (20/20C), bp 186C, fp -40.6C, bulk d approximately 8.96 lb/gal (20C), flash p 168F (75.5C) (CC). Miscible with alcohol, ether, ethyl acetate, and other common organic solvents; slightly soluble in water and gradually decomposed by it. Combustible.

Derivation: By standard esterification procedure using ethanol and oxalic acid. The final purification calls for unusual technique and equipment. The last traces of water are most difficult to remove, and this is accomplished by a special step in the rectification.

Hazard: Toxic by ingestion, strong irritant to skin and mucous membranes.

Use: Solvent for cellulose esters and ethers, many natural and synthetic resins; radio-tube cathode fixing lacquers; dye intermediate; pharmaceuticals, perfume preparations; organic synthesis.

ethyl-2-oxocyclopentanecarboxylate. See 2-carbethoxycyclopentanone.

ethyl oxyhydrate.

Properties: Colorless liquid; sharp rum-like odor. Miscible in alc, glycerin, propylene glycol.

Use: Food additive.

ethyl pabate. See ethopabate.

ethylparaben. (ethyl-*p*-hydroxybenzoate).

CAS: 120-47-8. $C_9H_{10}O_3$.

Properties: Colorless crystals. Mp 115C, decomposes at 297C. Soluble in alcohol and ether; almost insoluble in water.

Derivation: Esterification of *p*-hydroxybenzoic acid.

Use: Pharmaceutical preservative. See "Parabens."

ethyl parathion. See parathion.

ethyl PCT. See *O,O*-diethyl phosphorochlorodithioate.

ethyl pelargonate. (ethyl nonanoate; wine ether). $CH_3(CH_2)_7COOC_2H_5$.

Properties: Colorless liquid; fruity odor. Refr index 1.4220 (20C), d 0.866 (18/4C), bp approximately 220C, fp -44C. Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Technical, FCC.

Use: Flavoring alcoholic beverages; perfumes; chemical intermediate.

3-ethylpentane. (triethylmethane). $(C_2H_5)_3CH$.

Properties: Colorless liquid. Bp 93.5C, fp -118.6C, d 0.69818 (20C), refr index 1.3934 (20C). Soluble in alcohol; insoluble in water. Combustible.

Grade: Technical.

Use: Organic synthesis.

m-ethylphenol. (3-ethylphenol). $\text{HOC}_6\text{H}_4\text{C}_2\text{H}_5$.

Properties: Colorless liquid. Fp -4C , bp 214C , d 1.001. Very slightly soluble in water; miscible with alcohol and ether. Combustible.

Hazard: Toxic material.

See phenol.

p-ethylphenol. (4-ethylphenol). $\text{HOC}_6\text{H}_4\text{C}_2\text{H}_5$.

Properties: Colorless needles. Mp 46C , bp 219C , flash p 219F . Soluble in alcohol or ether; slightly soluble in water. Combustible.

Hazard: Toxic material.

See phenol.

3-(2-ethylphenoxy)-1-((1s)-1,2,3,4-tetrahydronaphth-1-ylamino)-(2s)-2-propanol oxalate.

CAS: 174689-39-5. mf: $\text{C}_{21}\text{H}_{27}\text{NO}_2 \bullet \text{C}_2\text{H}_2\text{O}_4$.

Hazard: A poison.

ethylphenylacetamide. See *n*-ethylacetanilide.

ethyl phenylacetate.

CAS: 101-97-3. $\text{C}_6\text{H}_5\text{CH}_2\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid; honeylike odor. D 1.027–1.032, refr index 1.498, bp 226C . Soluble in 8 parts of 60% alcohol; insoluble in water. Combustible.

Grade: Technical, FCC.

Use: Perfumery; flavors; intermediate, especially for phenobarbital; herbicide.

ethyl phenylacrylate. See ethyl cinnamate.

5-ethyl-5-phenylbarbituric acid. See phenobarbital.

ethyl phenylcarbamate. (phenylurethane; ethyl phenylurethane). $\text{C}_6\text{H}_5\text{NHCOOC}_2\text{H}_5$.

Properties: White, crystalline solid; aromatic odor; clovelike taste. Mp 51C . Soluble in alcohol, ether, and boiling water; insoluble in cold water.

Derivation: Action of ethanol on phenyl isocyanate.

ethylphenyldichlorosilane. $\text{C}_2\text{H}_5(\text{C}_6\text{H}_5)\text{SiCl}_2$.

Properties: Colorless liquid that fumes strongly in moist air.

Hazard: Toxic by inhalation and ingestion, strong irritant to eyes and skin.

N,N-ethylphenylethanolamine.

$\text{C}_6\text{H}_5\text{NC}_2\text{H}_5\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Liquid. D 1.04 (20/20C), bp 268C (740 mm Hg), bulk d 8.7 lb/gal. Combustible.

Use: Organic synthesis, dyestuffs.

2-ethyl-2-phenylglutarimide. (glutethimide).

$\text{C}_{13}\text{H}_{15}\text{NO}_2$.

Properties: White, crystalline powder. Melting range $85\text{--}87\text{C}$. Saturated solution is slightly acid. Freely soluble in acetone, ethyl acetate, and chloroform; soluble in ethanol and methanol; practically insoluble in water.

Grade: NF (as glutethimide).

Hazard: Manufacture and use controlled by law.

Use: Medicine (sedative).

ethyl phenyl ketone. See propiophenone.

4-ethyl-*n*-(phenylmethylene)benzenamine *n*-oxide.

CAS: 42790-35-2. mf: $\text{C}_{15}\text{H}_{15}\text{NO}$.

Hazard: Moderately toxic by ingestion and skin contact. A mild eye irritant.

α -(5-ethyl-1-phenyl-1h-pyrazol-4-yl)-1-piperidinebutanol.

CAS: 296269-54-0. mf: $\text{C}_{20}\text{H}_{29}\text{N}_3\text{O}$.

Hazard: A poison by ingestion.

ethyl phenylurethane. See ethyl phenylcarbamate.

ethylphosphoric acid. $\text{C}_2\text{H}_5\text{H}_2\text{PO}_4$.

Properties: Pale-straw-colored liquid. D 1.33 (25C). Can be neutralized with alkalis or amines to give water-soluble salts. Combustible.

Grade: Purity: 97%, remainder being orthophosphoric acid and ethanol.

Hazard: An irritant.

Use: Catalyst, rust remover, soldering flux, intermediate.

ethyl phthalate. See diethyl phthalate.

ethyl phthalyl ethyl glycolate.

$\text{C}_6\text{H}_5\text{OCOC}_2\text{H}_4\text{COOCH}_2\text{COOC}_2\text{H}_5$.

Properties: Liquid with slight odor. D 1.180 (25C), refr index 1.498 (25C), bp 190C (5 mm Hg). Solubility in water 0.018% by weight; miscible with most organic solvents. Combustible.

Use: Plasticizer; food additive.

5-ethyl-2-picoline. See 2-methyl-5-ethylpyridine.

2-ethylpiperidine.

Properties: Liquid. Mw 113.20, bp 143C , d 0.850.

Hazard: Flammable; irritant.

1-ethyl-1-propanol. See 3-pentanol.

ethyl propiolate. $\text{HC}\equiv\text{CCO}_2\text{C}_2\text{H}_5$.

Properties: Liquid. Mw 98.10, bp 120C , d 0.968.

Hazard: Flammable; lachrymator.

ethyl propionate.

CAS: 105-37-3. $\text{C}_2\text{H}_5\text{COOC}_2\text{H}_5$.

Properties: Water-white liquid; pineapple odor. D 0.888 (25C), bp 99C , fp -73C , flash p 54F (12.2C)

(CC), autoign temp 890F (476C), refr index 1.3844 (20C). Soluble in alcohol and ether; solubility in water 2.5% 15C.

Derivation: Treating ethanol with propionic acid.

Grade: Commercial 85–90% ester content, FCC.

Hazard: Flammable, dangerous fire risk.

Use: Solvent for cellulose ethers and esters, various natural and synthetic resins; flavoring agent; fruit syrups; cutting agent for pyroxylin.

ethylpropionyl. See diethyl ketone.

2-ethyl-3-propylacrolein. (2-ethylhexenal).

CAS: 645-62-5. $C_7H_{12}O$; $C(C_2H_5)CHO$.

Properties: Yellow liquid; powerful odor. D 0.8518 (20/20C), bp 175.0C, vap press 10 mm Hg (20C), flash p 155F (68.3) (OC), bulk d 7.1 lb/gal (20C), viscosity 0.113 cP (20C). Combustible.

Hazard: Toxic by inhalation and ingestion; strong irritant.

Use: Insecticide, organic synthesis (intermediate), warning agents, and leak detectors.

α -ethyl- β -propylacrylanilide.

$C_6H_5NHCOC(C_2H_5)_2CH(CH_2)_2CH_3$.

Use: Rubber accelerator.

2-ethyl-3-propylacrylic acid.

$C_7H_{12}O_2$; $CH_2=C(C_2H_5)COOH$.

Properties: Liquid. D 0.9484 (20C), fp $-7.8C$, bp 232.1C, vap press <0.1 mm Hg (20C), flash p 330F (165C). Insoluble in water. Combustible.

Use: Pharmaceuticals, resins and plastics, lubricants.

ethyl propyl ketone. See 3-hexanone.

ethyl propyl phosphorothioate.

CAS: 20195-06-6. mf: $C_7H_{17}O_3PS$.

Hazard: A poison.

3-ethyl-3-propyl-1,3-propanediol. See 2-ethylhexanediol-1,3.

2-(5-ethyl-2-pyridyl)ethyl acrylate.

$CH_2=CHCOOC_2H_5C_5H_4NC_2H_5$.

Properties: Liquid. D 1.0458 (20C), bp 181C (50 mm Hg), fp $-75C$. Very slightly soluble in water. Combustible.

Use: Manufacture of plastics and fibers, adhesives, textile finishes and sizes.

ethyl pyrophosphate. See tepp.

ethyl salicylate.

CAS: 118-61-6. $C_9H_{10}O_3$; $(OH)COOC_2H_5$.

Properties: Colorless liquid; faint odor of methyl salicylate. D 1.127–1.130, refr index 1.523, bp 231–234C. Soluble in ether and alcohol; slightly soluble in water. Combustible.

Use: Perfumery, flavors.

ethyl silicate. (tetraethyl orthosilicate).

CAS: 78-10-4. $(C_2H_5)_4SiO_4$.

Properties: Colorless liquid; faint odor. D 0.9356 (20/20C), bp 168.1C, mp 110C (sublimes), vap press 1.0 mm Hg (20C), flash p 125F (51.6C) (OC), bulk d 7.8 lb/gal (20C), fp $-77C$, viscosity 0.0179 cP (20C). Miscible with alcohol; hydrolyzed to an adhesive form of silica. Combustible.

Grade: 29% silicon, 40% silicon.

Hazard: Moderate fire risk. Strong irritant to eyes, nose, throat. TLV: 10 ppm.

Use: Weatherproof and acid-proof mortar and cements, refractory bricks, other molded objects, heat-resistant paints, chemical-resistant paints, protective coatings for industrial buildings and castings, lacquers, bonding agent, intermediate.

ethyl silicate, condensed. Light-yellow liquid with mild odor consisting of 85% by weight tetraethyl orthosilicate and 15% polyethoxysiloxanes.

Properties: Yields high-purity, refractory silica on hydrolysis or ignition.

Hazard: Toxic.

Use: Intermediate for siloxane compounds; for precision casting of high-melting alloys; pigment binder for paints; surface hardener for sandstones.

See ethyl silicate.

ethyl sodium oxalacetate.

$C_2H_3O_4Na$; $CHCOOC_2H_5$.

Properties: Light-yellow powder, 92% pure.

Derivation: Reaction of pure ethyl acetate and diethyl oxalate with metallic sodium.

Use: Dyes, synthesis.

ethyl sulfate. See diethyl sulfate.

ethyl sulfhydrate. See ethanethiol.

ethyl sulfide. (diethyl sulfide).

CAS: 352-93-2. $(C_2H_5)_2S$.

Properties: Colorless, oily liquid; garliclike odor. D 0.837, fp $-102C$, bp 92–93C, refr index 1.4423 (20C). Soluble in alcohol and ether, slightly soluble in water. Combustible.

Derivation: Heating sodium ethyl sulfate and potassium sulfide, with subsequent distillation.

Use: Organic synthesis, solvent for mineral salts, electroplating baths.

ethylsulfonylethyl alcohol. (2-(ethylsulfonyl)ethanol). $CH_3CH_2SO_2CH_2CH_2OH$.

Properties: Colorless crystals. Mp 45C, bp 153C (2.5 mm Hg). Soluble in water and common organic solvents; hygroscopic.

Derivation: Reaction of 2-ethylthioethanol with hydrogen peroxide.

Use: Solvent and organic intermediate, antistatic agent, humectant.

ethylsulfuric acid. (acid ethylsulfate).

Properties: Colorless, oily liquid. D 1.316; bp 280C (decomposes). Soluble in water, alcohol, and ether. Combustible.

Derivation: Action of sulfuric acid on ethanol.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin.

Use: Precipitant for casein, organic synthesis.

4-ethyl-1,4-thiazane. $C_4H_8NSC_2H_5$.

Properties: Colorless, mobile liquid. D 0.9929 (15C); bp 184C (763 mm Hg). Soluble in water. Combustible.

Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.

3-(ethylthio)butyraldehyde.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation. An eye irritant.

ethyl thiocarbimide. (ethyl mustard oil; ethyl isothiocyanate). C_2H_5NCS .

Properties: Colorless liquid; pungent odor. D 1.004 (15/4C), fp -5.9C, bp 131-132C. Soluble in alcohol; insoluble in water.

Hazard: Toxic by inhalation; strong irritant to skin and mucous membranes.

Use: Military poison gas.

ethyl thioethanol. $C_2H_5SC_2H_4OH$.

Properties: Pale-straw-colored liquid. D 1.015-1.025 (20/20C), distillation range 180-184C, refr index 1.486 (20C). Combustible.

Grade: 95% min.

Use: Organic intermediate (pesticides, plasticizers, etc.).

ethylthiopyrophosphate. See sulfotep.**(ethylthio)trioctylstannane.**

Hazard: Moderately toxic. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

ethyltin trichloride.

Properties: Colorless liquid. Mp: -10°, bp: 196-198°.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

m-ethyltoluene.

Hazard: Moderately toxic. Low toxicity by inhalation.

n-ethyl-p-toluenesulfonamide.

Properties: Colorless crystals. Mp 64C, flash p 260F (126C). Soluble in alcohol. Combustible.

Grade: A mixture of the *o*- and *p*-isomers is available commercially.

Use: Plasticizer.

ethyl-p-toluenesulfonate.

Properties: Unstable solid. Mp 33C, bp 221.3C, d 1.17, flash p 316F (157C). Soluble in many organic solvents; insoluble in water. Combustible.

Use: Plasticizer for cellulose acetate, ethylating agent.

N-ethyl-m-toluidine. (*N*-ethyl-3-methylamine).

Properties: Light-amber liquid. Refr index 1.5451 (20C), bp 221C. Combustible.

Use: Chemical intermediate.

N-ethyl-o-toluidine. $CH_3C_6H_4NHC_2H_5$.

Properties: Colorless to yellowish oil. D 0.9534; bp 214C. Soluble in alcohol, ether, and hydrochloric acid; insoluble in water. Combustible.

Derivation: Heating ethanol with *o*-toluidine and hydrochloric acid.

ethyl triacetyl gallate. $C_2H_5OOCOC_2H_5(OOCCH_3)_3$.

Properties: Colorless crystals or white crystalline powder; insipid taste; odorless. Mp 134-136C. Soluble in warm alcohol and acetone; slightly soluble in ether and alcohol; insoluble in water.

ethyl-3,5,6-tri-*o*-benzyl-*d*-glucufuranoside.

Hazard: Low toxicity by ingestion.

ethyltrichlorosilane.

Properties: Colorless liquid. Bp 99.5C, d 1.236 (25/25C), refr index 1.4257 (25C), flash p 72F (22.2C) (OC). Soluble in benzene, ether, heptane, perchloroethylene; readily hydrolyzed with liberation of hydrogen chloride.

Derivation: By reaction of ethylene and trichlorosilane in the presence of a peroxide catalyst.

Hazard: Flammable, dangerous fire risk, may form explosive mixture with air. A strong irritant.

Use: Intermediate for silicones.

“Ethyl Tuex” [Uniroyal]. TM for tetramethylthiuran disulfide.

ethyl urethane. See urethane.

ethyl valerate. See ethyl isovalerate.

ethyl vanillate. $(CH_3O)HOC_6H_3COOC_2H_5$.

Properties: Solid. Mp 44C, bp 291-293C. Insoluble in water; soluble in alcohol and ether.

Use: Food preservative, medicine, sunburn preventive.

ethyl vanillin. (3-ethoxy-4-hydroxybenzaldehyde).

CAS: 121-32-4. $\text{OHC}_6\text{H}_3(\text{OC}_2\text{H}_5)\text{CHO}$.

Properties: Fine, white crystals; intense odor of vanillin. Affected by light, mp 76.5C. Soluble in alcohol, chloroform, and ether; slightly soluble in water. Combustible.

Grade: NF, FCC.

Use: Flavors, to replace or fortify vanillin.

ethyl vinyl ether. See vinyl ethyl ether.

ethyl vinyl ether polymer.

CAS: 25104-37-4.

Hazard: Moderately toxic.

ethylxanthic acid. See xanthic acid.

ethylzinc. See diethylzinc.

ethyne. See acetylene.

ethynylation. Condensation of acetylene with a reagent such as an aldehyde to yield an acetylenic derivative. The best example is the union of formaldehyde and acetylene to produce butynediol.

ethynylenebis(carbonyloxy)bis(triphenylstannane). See

bis(triphenyltin)acetylenedicarboxylate.

1-ethynylcyclohexanol.

CAS: 78-27-3. $\text{HC}\equiv\text{CC}_6\text{H}_{10}\text{OH}$.

Properties: Colorless, low-melting solid; sweet odor. Mp 30–31C, bp 180C, d 0.967 (20/20C). Slightly soluble in water; soluble in most organic solvents.

Use: Stabilization of chlorinated organic compounds, intermediate, corrosion inhibitor for mineral acids, medicine (sedative).

ethynylestradiol. See ethynylestradiol.

ethythrins. Ethyl analog of allethrin.

Use: Insecticide with applications similar to allethrin. See barthrin; cyclethrin; furethrin.

ETU. See ethylene thiourea.

Eu. Symbol for europium.

eucalyptol. (cineol; cajeputol).

CAS: 470-82-6. $\text{C}_{10}\text{H}_{18}\text{O}$.

Properties: Colorless essential oil; a terpene ether having a camphorlike odor and pungent, cooling, spicy taste. D 0.921–0.923 (25C); bp 174–177C; congealing point not less than about 0C, refr index 1.4550–1.4600 (20C). Slightly soluble in water;

miscible with alcohol, chloroform, ether, glacial acetic acid, and fixed or volatile oils. Combustible.

Derivation: By fractionally distilling eucalyptus oil followed by freezing. The oil is imported from Spain, Portugal, and Australia.

Grade: Technical, NF.

Use: Pharmaceuticals (cough syrups, expectorants), flavoring, perfumery.

euchromatin. Chromatin, which is in an uncondensed form, is more accessible and contains the majority of actively expressed genes. See also heterochromatin.

eucriptite. A lithium silicate mineral (LiAlSiO_4) containing up to 4.8% lithia.

Use: Glass manufacture; source of lithium.

eugenic acid. See eugenol.

eugenics. The study of improving a species by artificial selection; usually refers to the selective breeding of humans.

eugenol. (4-allyl-2-methoxyphenol; caryophyllenic acid; eugenic acid).

CAS: 97-53-0. $\text{C}_3\text{H}_5\text{C}_6\text{H}_3(\text{OH})\text{OCH}_3$.

Properties: Colorless or yellowish liquid, oily; becomes brown in air; spicy odor and taste. D 1.064–1.070, bp 253.5C, fp –9C, refr index 1.5400–1.5420 (20C), optically inactive. Soluble in alcohol, chloroform, ether, and volatile oils; very slightly soluble in water. Combustible.

Derivation: By extraction of clove oil with aqueous potash, liberation with acid, and rectification in a stream of carbon dioxide.

Grade: Technical, USP, FCC.

Use: Perfumes, essential oils, medicine (analgesic), production of isoeugenol for the manufacture of vanillin, flavoring.

eugenyl methyl ether. See methyl eugenol.

eukaryote. A unicellular or multicellular organism with cells having a membrane-bounded nucleus. All possess, in addition, multiple chromosomes and internal organelles.

“Eureka” [Du Pont]. TM for a soldering flux crystalline composition based on zinc chloride and ammonium chloride.

europia. See europium oxide.

europium. Eu. Atomic number 63, one of the lanthanide or rare-earth elements of the cerium subgroup, aw 151.96, valences of 2, 3; two stable isotopes.

Properties: Steel-gray metal, difficult to prepare, quite soft and malleable (DPH = 20). Mp 826C, bp approximately 1489C, d 5.24, oxidizes rapidly in air. May burn spontaneously. Most reactive of the

rare-earth metals. Liberates hydrogen from water. Reduces metallic oxides.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Source: Rare-earth minerals.

Grade: High purity (ingots, lumps).

Hazard: Highly reactive, may ignite spontaneously in powder form.

Use: Neutron absorber in nuclear control, color-TV phosphors to activate yttrium, phosphors in postage-stamp glues to permit electronic recognition of first-class mail.

europium chloride.

CAS: 10025-76-0. $\text{EuCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow needles. D 4.89 (20C), mp 850C. Soluble in water.

Derivation: Obtained by treating the oxide with hydrochloric acid.

europium fluoride. $\text{EuF}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Crystals. Mp 1390C, bp 2280C. Insoluble in water and dilute acids.

europium nitrate. $\text{Eu}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Colorless to pale-pink crystals, mp 85C (sealed tube), soluble in water, obtained by treating the oxide with nitric acid.

europium oxalate. $\text{Eu}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

White powder, insoluble in water, slightly soluble in acids.

Grade: 25–50% and 99.8% Eu salt. Impure grade may be colored.

europium oxide. (europia). Eu_2O_3 .

Properties: Pale-rose powder. D 7.42. Insoluble in water; soluble in acids to give the corresponding salt.

Derivation: Calcination of the oxalate, solvent extraction, or liquid ion-exchange processes.

Grade: 25–50%, 99.9%.

Use: Nuclear-reactor control rods, especially in red- and infrared-sensitive phosphors.

europium sulfate. $\text{Eu}_2(\text{SO}_4)_3$, anhydrous and $8\text{H}_2\text{O}$.

Properties: Colorless to pale-pink crystals. D (anhydrous) 4.99 (20C). Hydrate loses $8\text{H}_2\text{O}$ at 375C; slightly soluble in water.

“Eurovanillan” [Borregaard]. TM for aromatic ethyl vanillin.

Use: An aroma additive.

eutactic. Characterized by precise molecular order, like that of a perfect crystal, the interior of a protein molecule, or a machine-phase system; contrasted to the disorder of bulk materials, solution environments, or biological structures on a cellular scale.

eutectic. The lowest melting point of an alloy or solution of two or more substances (usually metals) that is obtainable by varying the proportion of the components. Eutectic alloys have definite and minimum melting points in contrast to other combinations of the same metals.
See alloy, fusible.

eutectic point. Melting point of eutectic mixture. The lowest temperature at which the eutectic mixture can exist in liquid phase.

eutrophication. The unintentional enrichment or “fertilization” of either fresh or saltwater by chemical elements or compounds present in various types of industrial wastes. Phosphates and nitrogenous compounds in detergent and chemical-processing wastes are particularly effective eutrophying agents. They supply nutrients to algae, which proliferate so abundantly that a large proportion die for lack of light; their decomposition products deplete the water of its dissolved oxygen and thus cause the death of fish and other marine life. One process for removing phosphates involves addition of a metal-ion source to waste effluents so as to insolubilize dissolved phosphates, after which the particles are agglomerated by anionic polymers.
See algae; nitrilotriacetic acid.

eutropic series. Series of substances in which the physical properties and crystal form show regularity in their variation.

eV. Abbreviation for electron-volt.

EVA. Abbreviation for ethylene–vinyl acetate copolymer.

evaporation. The change of a substance from the solid or liquid phase to the gaseous or vapor phase. In some cases (e.g., ice, snow, dry ice), the substances do not go through a liquid phase; the phenomenon is called sublimation. The rate of evaporation of liquids varies with their chemical nature and the temperature; in general, organic liquids (benzene, gasoline) evaporate at lower temperatures and higher rates than water. The thermal energy required to vaporize a given volume of a liquid is known as its latent heat of vaporization; it remains in the vapor (steam, in the case of water heated to its boiling point) and is released when the vapor condenses. For water, this latent-heat value is 540 cal/g. In chemical processing installations requiring a series of evaporations and condensations, the units are set up in series and the latent heat of vaporization from one unit is utilized to supply energy for the next. Such units are called “effects” in engineering parlance, as, e.g., a triple-effect evaporator.
See distillation.

evaporite. A mineral or rock formed by precipitation of crystals from evaporating water.

EVE. Abbreviation for ethyl vinyl ether.
See vinyl ether.

eve carbamate.

CAS: 204442-82-0. mf: $C_9H_4F_{13}NO_4$.

Hazard: Low toxicity by ingestion. A mild skin and moderate eye irritant.

“Everflex” [Grace]. TM for vinyl acetate polymer emulsions.

Use: Paints, paper coating, and acoustic tile coatings.

evolution. Emission of a gas as a result of a chemical reaction, as hydrogen from acids reacted with a metal or carbon dioxide from the action of an acid on a carbonate. In formulas it may be indicated by an upward vertical arrow.

evolutionarily conserved. See conserved sequence.

evolutionary rootprinting. One can infer which portions of a gene are important by comparing the sequence of that gene with its cognates from other species. A plot showing the regions of high conservation indicates the regions that are functional in all the test species.

exchange reaction. A chemical reaction in which atoms of the same element in two different molecules or in two different positions in the same molecule change places. Exchange reactions are usually studied with the aid of a tracer or tagged atom.

excimer. A transient excited dimer formed between a solute and a solvent molecule.

excipient. A natural, inert, and somewhat tacky material used in the pharmaceutical industry as a binder in tablets, etc. Commonly used materials are gum arabic, honey, and beet pulp.

excitation. Addition of energy to a system whereby it is transferred from its ground state to a state of higher energy.

excited state. A higher than normal energy level of the electrons of an atom, radical, or molecule, typically resulting from absorption of photons (quanta) from a radiation source (arc, flame, spark, etc.) in any wavelength of the electromagnetic spectrum. X-ray, UV, visible, infrared, microwave, and radio frequencies are used for excitation in various types of spectroscopy. When the energizing source is removed or discontinued, the atom or molecule returns to its normal or stable state either by emitting

the absorbed photons or by transferring the energy to other atoms or molecules. The emission by the atom or molecule yields line or band spectra characteristic of its structure, thus permitting identification. Photochemical reactions are induced by excited chemical entities, which are also responsible for the phenomena of luminescence (phosphorescence and fluorescence).

See spectroscopy; photochemistry; absorption (2).

exciton. An energetic entity induced in semiconductor crystals by incident radiation and occurring in the field area between a hole and its displaced electron. It is conceived as behaving like an uncharged particle having quantum-mechanical properties.

excluded volume. The presence of one molecule reduces the volume available for other molecules; resulting reductions in their entropy are termed excluded volume effects.

exell.

CAS: 104559-06-0.

Hazard: Moderately toxic by ingestion.

exemestane. See 6-methylenandrosta-1,4-diene-3,17-dione.

exergonic reaction. A chemical reaction that proceeds with the release of free energy (that is, for which ΔG is negative and the reaction spontaneous).

exhaust emission control. See air pollution.

Exkin 1,2,3. TM for a series of antiskinning agents of the volatile oxime type.

Use: Paints.

exo-. A prefix used in chemical names to indicate attachment to a side chain rather than to a ring. See *endo-*.

exocarbon. Cyclic compound in which all or most carbon atoms are in the form of carbonyl groups or their equivalents.

exocytosis. The fusion of an intracellular vesicle with the plasma membrane, releasing the vesicle contents to the extracellular space.

exoergic. See exothermic.

exogenous DNA. DNA originating outside an organism that has been introduced into the organism.

exon. Those portions of a genomic DNA sequence which will be represented in the final, mature mRNA. The term “exon” can also be used for the equivalent segments in the final RNA. Exons may include coding sequences, the 5' untranslated re-

gion, or the 3' untranslated region.
See: Intron.

exonuclease. An enzyme that digests nucleic acids starting at one end. An example is Exonuclease III, which digests only double-stranded DNA starting from the 3' end.

exosmosis. Osmosis in an outward direction.
See endosmosis.

exothermic. Describes a process or chemical reaction that is accompanied by evolution of heat, for example, combustion reactions.

exotic. A term applied to materials of various functional types that have extra power and that are often derived from unusual sources. Examples are rocket propellants derived from boron hydrides and certain special-purpose solvents.

expander. (1) A mixture of lampblack, barium sulfate, and an organic material usually derived from lignin that increases the capacity of storage batteries, presumably by coating the anode and thus preventing the deposit of lead sulfate on the underlying lead metal.

(2) A substance used in medicine as a substitute for blood plasma, e.g., dextran, gelatin, or polyvinylpyrrolidone.

expeller. See extractor; expression.

explosive, high. A chemical compound, usually containing nitrogen, that detonates as a result of shock or heat see detonation. Dynamite was the most widely used explosive for blasting and other industrial purposes until 1955, when it was largely replaced by prills-and-oil and slurry types. The former consists of 94% ammonium nitrate prills and 6% fuel oil (ANFO). Slurry blasting agents (SBA) are based on thickened or gelatinized ammonium nitrate slurries sensitized with TNT, other solid explosives, or aluminum. An unusual type of explosive is represented by acetylides of copper and silver, which are examples of commercially used explosives that contain neither oxygen nor nitrogen. High explosives vary greatly in their shock sensitivity; most sensitive are mercury fulminate and nitroglycerin, whereas TNT and ammonium nitrate are comparatively difficult to detonate, requiring the use of blasting caps or similar activating device.

explosive, initiating. An explosive composition used as a component of blasting caps, detonators, and primers. They are highly sensitive to flame, heat, impact, or friction. Examples are lead azide, silver acetylide, mercury fulminate, diazodinitrophenol, nitrosoguanidine, lead styphnate, and pentaerythritol tetranitrate.

explosive limits. The range of concentration of a flammable gas or vapor (% by volume in air) in which explosion can occur upon ignition in a confined area. Explosive limits for some common substances are

Substance	Lower (%)	Upper (%)
carbon disulfide	1	50
benzene	1.5	8
methane	5	15
butadiene	2	11.5
butane	1.9	8.5
propane	2.4	9.5
natural gas	3.8	17
hydrogen	4	75
acetylene	2.5	80

explosive, low. An explosive, such as black powder, that deflagrates rather than detonates.
See deflagration.

explosive, permissible. Explosives approved for use in coal mines. Usually they are modified dynamites.

exposure testing. Determination of the degradation of a material by exposing samples to an environment selected for its adverse effect. Materials most frequently tested are paints, metals and alloys, rubber, and plastics. An area frequently chosen is the coast of southern Florida, where the combination of high temperature, strong sunlight, salt air, and moisture is particularly severe, especially as regards metal corrosion. Burial of metals in acid soils for long periods and immersion of impregnated wood samples in seawater are other exposure-testing techniques.

See testing.

expressed sequence tag. (EST). A short strand of DNA that is a part of a cDNA molecule and can act as identifier of a gene. Used in locating and mapping genes.

See cDNA; sequence tagged site.

expression. (1) Removal of a liquid from a solid by hydraulic pressure, as in manufacture of vegetable oils from seeds, rinds, or meal cake. Worm devices similar to extrusion machines are also used for this purpose; they are called *expellers* or *extractors*. (2) To "express" a gene is to cause it to function. A gene which encodes a protein will, when expressed, be transcribed and translated to produce that protein. A gene which encodes an RNA rather than a protein (for example, a rRNA gene) will produce that RNA when expressed.

expression clone. This is a clone designed to produce a protein from the DNA insert. Since mammalian genes do not function in bacteria, to get bacterial expression from mammalian cDNA. It is

required to put its coding region (i.e. no introns) immediately adjacent to bacterial transcription/translation control sequences.

Ext. D&C. Product certified for external use only in drugs and cosmetics.

extender. A low-gravity material used in paint, ink, plastic, and rubber formulations chiefly to reduce cost per unit volume by increasing bulk. Extenders include diatomaceous earth, wood flock, mineral rubber, liquid asphalt, etc. Microscopic droplets of water fixed permanently in a plastic matrix are an efficient extender for polyester resins. In the food industry, the term refers to certain extruded proteins, especially those derived from soybeans, which are used in meat products to provide equivalent nutrient values at lower cost. Made from defatted soy flour, they are often called *textured proteins*.

See diluent (2); filler.

extinction. When all the members of a clade or taxon die, the group is said to be extinct.

extinguishing agent. See fire extinguishment.

extracellular matrix. (ECM). Region outside of metazoan cells which includes compounds attached to the plasma membrane, as well as dissolved substances attracted to the surface charge of the cells. The ECM functions both to keep animal cells adhered together as well as to buffer them from their environment.

extraction, solvent. See solvent extraction.

extractive distillation. A variety of distillation that always involves use of a fractionating column and is characterized by use of a purposely added substance that modifies the vaporization characteristics of the materials undergoing separation to make them easier to separate. The additive is often called a solvent and is usually chosen to be much less volatile than any of the substances being separated. It is added to the down flowing liquid-reflux stream near the top of the column and is removed from the still pot or reboiler at the base. The addition of furfural to mixtures of butadiene and butene hydrocarbons to separate the butadiene more easily is an example of extractive distillation.

extractive metallurgy. That portion of metallurgical science devoted to the technology of mining and processing of metals and their ores.

extractor. A machine designed for expression of the oil from seeds such as cottonseed, flaxseed, etc.,

or for extracting the juice from fruits. It is similar in principle to an extrusion machine having a tapering screw rotating in a cylindrical barrel; the oil or juice is delivered to a container while the residual pulp and fiber are extruded as waste material. Fruit is fed into the machine after being crushed and preheated. Juices can also be separated centrifugally. Machines of this type are also called *expellers*.

"Extrema" [Schumacher]. (trichloroethane). TM for a chlorine source.

Use: Thermal oxidation of silicon and furnace-tube cleaning.

extreme-pressure additive. (EP additive).

(1) Material added to cutting fluids to impart high film strength. They are mainly sulfur, chlorine, and occasionally phosphorus compounds. Actual conditions, amounts, etc. are proprietary. (2) Lubricating oil and grease additives that prevent metal-to-metal contact in highly loaded gears. Some react with the metal gears to form a protective coating. Saponified lead salts are often used.

"Extru Seal" [Pecora]. TM for a butyl glazing tape for construction.

extrusion. A fundamental processing operation in many industries in which a material is forced through a metal forming die, followed by cooling or chemical hardening. The material may be liquid (molten glass or a polymer dispersion); a viscous polymer, as in injection molding; a semisolid mass, such as a rubber or plastic mix; or a hot metal billet. High-viscosity materials are fed into a rotating screw of variable pitch that forces the materials through the die with considerable pressure; a ram is used for metals at temperatures from 537 to 1093C. Film is made by passing a low-viscosity mixture through a narrow slit. Molten glass and polymer suspensions are forced through a nozzle having a tiny orifice (spinnerette); the latter are hardened after extrusion by immersion in a bath of formaldehyde or similar agent. Food items (spaghetti, etc.) are also extruded. Extrusion involves rheological principles of some complexity, critical factors being viscosity, temperature, flow rate, and die design. See injection molding.

eyespot. Light-sensitive organelle found in many groups of protists, and in some metazoans.

"E-Z Mulse" [Florida Chemicals]. TM for an emulsifier.

Use: To combine *d*-limonene and water to make stable formulations; emulsifies solvents or oil with water.

"Ezn-Chek" [Ferro]. TM for heat stabilizers.

F

F. Symbol for fluorine; the molecular formula is F_2 .

F1. See filial generation.

F2. See filial generation.

FAB. Abbreviation of fast atom bombardment.

fabric. A textile structure composed of mechanically interlocked fibers or filaments. It may be randomly integrated (nonwoven) or closely oriented by warp and filler strands at right angles to each other (woven). While the word usually refers to wool, cotton, or synthetic fibers, fabrics can also be made of glass fiber and graphite.

fabrication. The molding, forming, machining, assembly, and finishing of metals, rubber, and plastics into end-use products. In the paper industry, the term *converting* is used in this sense.

“Fabrikoid” [Du Pont]. TM for pyroxylin-coated fabrics that are water-resistant and soap and water washable.

Use: Book binding, luggage.

“Fabrilit” [Du Pont]. TM for vinyl-coated fabrics and selected vinyl compounds without fabric backing.

Use: Pocketbooks, bags, upholstery, etc.

“Fabrisoil” [Phillips]. TM for engineered nonwoven fabric.

Use: Landfill daily cover.

face-centered cubic structure. An internal crystal structure, determined by X rays, in which the equivalent points are at the corners of the unit cell and at the centers of the six faces of a cube.

F acid. See Casella's acid.

facilitated diffusion. Diffusion of a molecule across a biological membrane via a protein transporter down a concentration gradient. Also called passive diffusion.

factice. (vulcanized oil). A soft, mealy material made by reaction of sulfur or sulfur chloride with a vegetable oil.

Use: Erasers, rubber goods (bath spray tubing, etc.) to give soft “hand.”

factor. A term used chiefly by biochemists to indicate any member of a biologically active com-

plex, especially if its exact chemical nature is unknown or if its function in cellular metabolism has not been elucidated. Several of the B-complex vitamins were originally referred to as factors until their identity had been established by research. There are a number of blood-coagulation factors.

See Rh factor.

facultative. See bacteria.

facultative cells. Cells that can live in the presence or absence of oxygen.

FAD. (flavin adenine dinucleotide). The coenzyme of some redox enzymes. It contains riboflavin.

Fahrenheit. The scale of temperature in which 212 degrees is the boiling point of water at 760 mm Hg and 32 degrees is the freezing point of water. The scale was invented by a German physicist, G. D. Fahrenheit (1686–1736), who introduced the use of mercury instead of alcohol in thermometers. The entry for centigrade contains a method of converting from Fahrenheit to centigrade. The entry for absolute temperature contains a method for converting Fahrenheit to absolute Rankine.

See centigrade.

falecalcitriol. See hexafluorocalcetriol.

fallout. Deposition on the earth of the radioactive particles resulting from a nuclear explosion, e.g., strontium-90.

“Falone” [Uniroyal]. TM for tris(2,4-dichlorophenoxyethyl) phosphite.

Properties: Viscous, amber liquid. D 1.434, mp 70–72C. Soluble in benzene, xylene and aromatic hydrocarbons; insoluble in water; available as an emulsifiable concentration and a granular solid.

Use: A preemergence herbicide.

famphur. (famophos; (generic name for *O,O*-dimethyl-*O*-[*p*-(dimethylsulfamoyl)phenyl]phosphorothioate).

CAS: 52-85-7. $(CH_3O)_2P(S)OC_6H_4SO_2N(CH_3)_2$.

Properties: Crystalline powder. Mp 55C. Very soluble in chloroform and carbon tetrachloride; slightly soluble in water.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Insecticide.

“Fanal” [BASF]. TM for phosphotungstic lakes. Characterized by brilliancy of shade and good fastness to light.

Use: Printing inks.

faraday. The quantity of electricity that can deposit (or dissolve) one gram-equivalent weight of a substance during electrolysis (approximately 96,500 coulombs).

Faraday, Michael. (1791–1867). A native of England, Faraday did more to advance the science of electrochemistry than any other scientist. A profound thinker and accurate experimentalist and observer, he was the first to propound correct ideas as to the nature of electrical phenomena, not only in chemistry but in other fields. His contributions to chemistry include the basic laws of electrolysis, electrochemical decomposition (the basis of corrosion of metals) of battery science, and electrometallurgy. His work in physics led to the invention of the dynamo. Faraday was in many respects the exemplar of a true scientist, combining meticulous effort and interpretive genius.

farnesol. (generic name for 3,7,11-trimethyl-2,6,10-dodecatrienol).

CAS: 4602-84-0. $C_{15}H_{26}OH$.

Properties: Colorless liquid; delicate floral odor. D 0.885 (15C), bp 145–146C (3 mm Hg). Soluble in three volumes of 70% alcohol. Combustible.

Derivation: Found in nature in many flowers and essential oils such as cassia, neroli, cananga, rose, balsams, ambrette seed.

Use: Perfumery, flavoring, insect hormone.

fast. (1) Descriptive of a dye or pigment whose color is not impaired by prolonged exposure to light, steam, high temperature, or other environmental conditions. Inorganic pigments are normally superior in this respect to organic dyes. (2) In nuclear technology, the term refers to neutrons moving at the speed at which they emerge from a ruptured nucleus as opposed to “slow” or thermal neutrons whose speed has been reduced by impinging on a neutral substance called a moderator. Fast neutrons are used in breeder reactors.

fast atom bombardment. (FAB). One of several techniques for ionizing solids from solutions. In FAB, a thin film of the dissolved solid to be analyzed is bombarded with fast atoms. These dislodge ions by impact; the ions are then analyzed by mass spectroscopy. Peptide ions with molecular weight of approximately 6000 have been produced and analyzed by this method.

fastogen super magneta r. See 2,9-dimethylquinacridone.

fat. A glyceryl ester of higher fatty acids such as stearic and palmitic. Such esters and their mixtures are solids at room temperature and exhibit crystalline structure. Lard and tallow are examples. There is no chemical difference between a fat and an oil,

the only distinction being that fats are solid at room temperature and oils are liquid. The term fat usually refers to triglycerides specifically, whereas lipid is all-inclusive.

See lipid.

fat dyes. Oil-soluble dyes for candles, wax, etc.

fatigue. Incremental weakening of a material as a result of repeated cycles of stresses that are far lower than its breaking load, ending in failure. For metals, to which the term usually refers, the number of low-stress cycles may be of the order of 10^7 . Failure is due to development of cumulative imperfections in the crystal structure, with consequent minute interior cracks. Gear failure is often caused by fatigue. It has been reported in experimental windmills for power generation in which steel blades have failed after a few hundred hours of operation due to centrifugal stress. In elastomeric materials, fatigue involves complete dissipation of their resilient energy by repeated cycles of low-order stresses.

fat liquoring agent. An oil-in-water emulsion usually made from raw oils such as neatsfoot, cod, etc., made soluble by dispersing agents such as sulfonated oils.

Use: Leather processing to replace natural oils removed from hides by tanning operations. See neatsfoot oil; emulsion.

fat splitting. See hydrolysis.

fatty acid. A carboxylic acid derived from or contained in an animal or vegetable fat or oil. All fatty acids are composed of a chain of alkyl groups containing from 4 to 22 carbon atoms (usually an even number) and characterized by a terminal carboxyl group $-COOH$. The generic formula for mentioned acetic is $CH_3(CH_2)_xCOOH$ (the carbon atom count includes the carboxyl group). Fatty acids may be saturated or unsaturated (olefinic), and solid, semisolid, or liquid. They are classed among the lipids, together with soap and waxes. **Saturated:** A fatty acid in which the carbon atoms of the alkyl chain are connected by single bonds. The most important of these are butyric (C_4), lauric (C_{12}), palmitic (C_{16}), and stearic (C_{18}). They have a variety of special uses (see specific entry). Stearic acid leads all other fatty acids in industrial use, primarily as a dispersing agent and accelerator activator in rubber products and soaps. **Unsaturated:** A fatty acid in which there are one or more double bonds between the carbon atoms in the alkyl chain. These acids are usually vegetable derived and consist of alkyl chains containing 18 or more carbon atoms with the characteristic end group $-COOH$. Most vegetable oils are mixtures of several fatty acids or their glycerides; the unsaturation accounts for the broad chemical utility of these substances, especially of drying oils. The most common unsaturated acids are oleic, linoleic, and linolenic (all C_{18}). Safflower oil is high in

linoleic acid, peanut oil contains 21% linoleic acid, olive oil is 38% oleic acid, palmitoleic acid is abundant in fish oils. Aromatic fatty acids are now available.

See phenylstearic acid.

Note: Linoleic, linolenic, and arachidonic acids are called essential fatty acids by biochemists because such acids are necessary nutrients that are not synthesized in the animal body.

Use: Special soaps, heavy-metal soap, lubricants, paints and lacquers (drying oils), candles, salad oil, shortening, synthetic detergents, cosmetics, emulsifiers.

fatty acid enol ester. A fatty acid reacted with enolic form of acetone for the purpose of increasing the chemical reactivity of the acid. Stearic acid (18-carbon) combined with acetone (3-carbon) gives isopropenyl stearate (21-carbon). This is effective in making the fatty stearoyl group available for synthesis of polymers, medicinals, and the like.

See fatty ester.

fatty acid pitch. A by-product residue from (1) soap stock and candle stock manufacture; (2) refining of vegetable oils; (3) refining of refuse greases; and (4) refining of wool grease.

Properties: Dark-brown to black. Properties analogous to complex hydrocarbons, contains fixed carbon (5–35%), soluble in naphtha and carbon disulfide.

Use: Manufacture of black paints and varnishes, tarred papers, printers' rolls, rubber filing agent, impregnating agent, electrical insulations, marine caulking, waterproofing, sealant.

fatty alcohol. A primary alcohol (from C_8 to C_{20}), usually straight chain. High molecular weight alcohols are produced synthetically by the Oxo and Ziegler processes. Those from C_8 to C_{11} are oily liquids; those greater than C_{11} are solids. Other methods of production are (1) reduction of vegetable seed oils and their fatty acids with sodium; (2) catalytic hydrogenation at elevated temperatures and pressures; and (3) hydrolysis of spermaceti and sperm oil by saponification and vacuum fractional distillation. The more important commercial saturated alcohols are octyl, decyl, lauryl, myristyl, cetyl, and stearyl. The commercially important unsaturated alcohols, such as oleyl, linoleyl, and linolenyl, are also normally included in this group. The odor tends to disappear as the chain length increases.

Use: Solvent for fats, waxes, gums, and resins; pharmaceutical salves and lotions; lubricating-oil additives; detergents and emulsifiers; textile antistatic and finishing agents; plasticizers; nonionic surfactants; cosmetics.

fatty amine. A normal aliphatic amine derived from fats and oils. May be saturated or unsaturated, and primary, secondary, or tertiary, but the alkyl groups are straight chain and have an even number

of carbons in each. The length varies from 8 to 22 carbon atoms.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides which are converted to nitriles and reduced to the amine.

Use: Organic bases, soaps, plasticizers, tire cords, fabric softeners, water-resistant asphalt, hair conditioners, cosmetics, medicinals.

fatty ester. A fatty acid with the active hydrogen replaced by the alkyl group of a monohydric alcohol. The esterification of a fatty acid, $RCOOH$, by an alcohol, $R'OH$, yields the fatty ester $RCOOR'$. The most common alcohol used is methanol, yielding the methyl ester $RCOOCH_3$. The methyl esters of fatty acids have higher vapor pressures than the corresponding acids and are distilled more easily.

fatty nitrile. (RCN). An organic cyanide derived from a fatty acid.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides, which are converted to nitriles.

Use: Intermediates for fatty amines, lubricating oil additives, plasticizers.

faujasite. $Na_2CaO \cdot Al_2O_3 \cdot 5SiO_2 \cdot 10H_2O$. A mineral.

Use: Zeolite; molecular sieve.

Favorskii-Babayan synthesis. Synthesis of acetylenic alcohols from ketones and terminal acetylenes in the presence of anhydrous alkali.

Favorskii rearrangement. Base-catalyzed rearrangement of α -haloketones to acids or esters. The rearrangement of α, α' -dibromocyclohexanones to 1-hydroxycyclopentanecarboxylic acids, followed by oxidation to the ketones, is known as the Wallach degradation.

FBR. Abbreviation for fast breeder reactor. See breeder.

FCC. (1) Abbreviation for Food Chemicals Codex, a publication giving specifications and test methods for chemicals used in foods. (2) Abbreviation for fluid-cracking catalyst as used in the petroleum refining industry. Examples are powdered silica alumina, in which alumina is impregnated with dry synthetic silica gel, and various natural clays impregnated with alumina.

FDA. Abbreviation for Food and Drug Administration.

FD&C color. A series of colorants permitted in food products, marking inks, etc., certified by the FDA. Among the more important are the following: Blue No. 1: disodium salt of 4-((4-(*N*-ethyl-*p*-sulfobenzylamino)-phenyl)-(2-sulfoniumphenyl)-methylene)-(1-(*N*-ethyl-*N*-*p*-sulfobenzyl)- $\Delta^{2,5}$ -cyclohex-

adienimine). Blue No. 2: disodium salt of 5,5'-indigotin disulfonic acid. Green No. 3: disodium salt of 4-((4-(*N*-ethyl-*p*-sulfobenzylamino)-phenyl)-(4-hydroxy-2-sulfonium phenyl)-methylene)-(1-(*N*-ethyl-*N*-*p*-sulfobenzyl))- $\Delta^{2,3}$ -cyclohexadienimine). Green No. 6: 1,4-di-*p*-toluidinoanthraquinone. Red No. 2: trisodium salt of 1-(4-sulfo-1-naphthylazo)-2-naphthol-3,6-disulfonic acid. Formerly the largest volume food color in commercial use. A carcinogen. Use prohibited by FDA. Red No. 40 is currently a permissible substitute. Red No. 3: disodium salt of 9-*o*-carboxyphenyl-6-hydroxy-2,4,5,7-tetraiodo-3-isoxanthone (erythrosin). Red No. 4: disodium salt of 2-(5-sulfo-2,4-xylylazo)-naphthyl-4-sulfonic acid. Use in foods prohibited by FDA. Violet No. 1: monosodium salt of 4-((*N*-ethyl-*p*-sulfobenzylamino)-phenyl)-(4(*N*-ethyl-*p*-sulfoniumbenzylamino)-phenyl)-methylene)-(N,N-dimethyl- $\Delta^{2,5}$ -cyclohexadienimine). Use prohibited by FDA in 1973 and by USDA in 1976. Yellow No. 5: trisodium salt of 3-carboxy-5-hydroxy-1-*p*-sulfophenyl-4-sulfophenylazopyrazole. Yellow No. 6: disodium salt of 1-*p*-sulfophenylazo-2-naphthol-6-sulfonic acid.

See food color; food additive.

Fe. Symbol for iron.

feathers. See keratin.

Federal Trade Commission. (FTC). The Federal Trade Commission enforces a variety of federal antitrust and consumer protection laws. The Commission seeks to ensure that the nation's markets function competitively, and are vigorous, efficient, and free of undue restrictions. The Commission also works to enhance the smooth operation of the marketplace by eliminating acts or practices that are unfair or deceptive. Its main office is located at 600 Pennsylvania Avenue, N.W., Washington, D.C. 20580. Website: <http://www.ftc.gov>.

feedback inhibition. Inhibition of an allosteric enzyme at the beginning of a metabolic sequence by the end product of the sequence.

feeder. An accessory equipment unit that provides controlled flow of materials of a wide range of particulate sizes to or from processing operations. Major types include the following: (1) Vibratory: an enclosed bowl or open trough, activated electromagnetically, that vibrates at a constant rate of 3600 oscillations a minute (electromechanical, hydraulic, and pneumatic types are also used). Capacities are up to 2000 lb/hr. The bowl type is applicable to large-size units of materials up to several inches in diameter (wood, plastics, ceramics, etc.). (2) Volumetric: an enclosed device that meters a particulate by volume; there are a number of types, including the rotary lock, the helix, and the roll. Bulk density, particle size, and moisture content of the material handled are important factors. (3) Gravimetric: a belt conveyor provided with a scale that continuous-

ly weighs the material passing over it. These are used in operations that are not suitable for volumetric feed.

feedstock. Gaseous or liquid petroleum-derived hydrocarbons or mixture of hydrocarbons from which gasoline, fuel oil, and petrochemicals are produced by thermal or catalytic cracking. It is also called charging stock. Feedstocks commonly used include ethane, propane, butane, butene, benzene, toluene, xylene, naphtha, and gas oils.

FEFO. See formaldehyde bis(2-fluoro-2,2-dinitroethyl) acetal.

Fehling's solution. A reagent used as a test for sugars, aldehydes, etc. It consists of two solutions, copper sulfate and alkaline tartrate, which are mixed just before use. Benedict's modification is a one-solution preparation. Additional details are available in the Book of Methods, Association of Official Analytical Chemists.

Feist-Benary synthesis. Formation of furans from α -halogeno ketones or ethers and 1,3-dicarbonyl compounds in the presence of pyridine. With ammonia as condensing agent, pyrrole derivatives are always formed as secondary products.

felbamate.

CAS: 25451-15-4. mf: $C_{11}H_{14}N_2O_4$.

Hazard: Low toxicity by ingestion. Human systemic effects.

feldspar. (potassium aluminosilicate). General name for a group of sodium, potassium, calcium, and barium aluminum silicates. Commercially, feldspar usually refers to the potassium feldspars with the formula $KAlSi_3O_8$, usually with a little sodium. Noncombustible.

Occurrence: North Carolina, Colorado, New Hampshire, South Dakota, California, Arizona, Wyoming, Virginia, Texas.

Grade: Usually based on silicon dioxide content, potassium-sodium ratio, iron content, and fineness of grinding.

Hazard: Toxic as fine-ground powder.

Use: Pottery, enamel, and ceramic ware; glass; soaps; abrasive; bond for abrasive wheels; cements and concretes; insulating compositions; fertilizer; poultry grit; tarred roofing materials.

felsic rock. A silicon-rich igneous rock that contains only a small percentage of iron and magnesium. Granite is the most abundant example. Felsic rocks dominate the crusts of continents.

felt. A compressed, porous, nonwoven fabric usually made of wool and used as a vibration damper and caulking agent. Its moisture-absorbing property is utilized in the drying section of fourdrinier machines.

FEMA. See Flavor Extract Manufacturers Association.

femto- Prefix meaning one-quadrillionth (10^{-15}). Laser pulses as short as 30 femtoseconds have been produced.

fenac. (2,3,6-trichlorophenylacetic acid).

CAS: 85-34-7.

Use: Herbicide.

fenamidone.

CAS: 161326-34-7. mf: $C_{17}H_{17}N_3OS$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation.

Use: Agricultural chemical.

fenamiphos. (ethyl-3-methyl-4-(methylthio)phenyl(1-methylethyl) phosphoramidate).

CAS: 22224-92-6. $C_{13}H_{22}NO_3PS$.

Properties: Tan, waxy solid. Mw 303.4, mp 49.2C (pure) 40C (tech). Soluble in organic solvents; slightly soluble in water.

Hazard: Toxic by inhalation and skin contact. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

Use: Nematocide and insecticide.

fenchone.

CAS: 1195-79-5. $C_{10}H_{16}O$.

Properties: Oil with camphorlike odor. D 0.9465 (19C), bp 193C. Soluble in ether; insoluble in water. Combustible.

Derivation: A ketone found (1) as dextrofenchone in oil of fennel; (2) as levofenchone in oil of thuja.

Use: Flavoring.

fenchyl alcohol. (fenchol; 2-fenchanol; 1-hydroxyfenchane).

CAS: 512-13-0. $C_{10}H_{18}O$.

Properties: Colorless, oily liquid (*d* and *l* forms) or solid (*dl* form). D approximately 0.96, bp 201C, mp 39C, refr index 1.473.

Derivation: Pine oil, fennel oil, also made synthetically.

Use: Solvent, organic intermediate, odorant, flavoring.

fenhexamid.

CAS: 126833-17-8. mf: $C_{14}H_{17}Cl_2NO_2$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

Use: Agricultural chemical.

fenitrothion. [*O,O*-diethyl-*O*-(3-methyl-4-nitrophenyl)phosphorothioate].

CAS: 122-14-5. $C_9H_{12}NO_3PS$.

Properties: Yellow, oily liquid. Bp 118C (0.05 mm Hg), d 1.322, refr index 1.552. Insoluble in water; soluble in most organic solvents except aliphatics.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Insecticide.

fenitrothion-malathion mixture.

CAS: 8067-98-9. mf: $C_{10}H_{19}O_6PS_2 \cdot C_9H_{12}NO_3PS$.

Hazard: Human systemic effects.

Fenn, John B. (1917–). An American born in New York City who won the Nobel Prize for chemistry in 2002 for his pioneering work concerning the development of methods for identification and structure analyses of biological macromolecules. Awarded an undergraduate degree from Berea College and Allied Schools, and a Ph.D. from Yale University. He was a long-time Professor at Princeton University.

fenoprop. See silvex.

“Fenox” [Regal]. TM for a flowable system fungicide.

Use: Controls disease caused by Oomycete class of fungi.

fenpropidine.

CAS: 67306-00-7. mf: $C_{19}H_{31}N$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

fenprostalene.

CAS: 69381-94-8. mf: $C_{23}H_{30}O_6$.

Use: Drug (veterinary); food additive.

fenpyrate.

CAS: 55512-33-9. mf: $C_{19}H_{23}ClN_2O_2S$.

Hazard: Moderately toxic by ingestion and skin contact.

Use: Agricultural chemical.

fenson. (*p*-chlorophenyl benzene sulfonate; murvesco).

CAS: 80-38-6. $ClC_6H_4OSO_2C_6H_5$.

Properties: Colorless crystals. Mp 61–62C. Soluble in organic solvents; insoluble in water.

Use: Acaricide.

fensulfothion. (*O,O*-diethyl-*O*-[*p*-(methylsulfinyl)phenyl]phosphorothioate).

CAS: 115-90-2. $C_{11}H_{15}O_4PS_2$.

Properties: Liquid. Bp 138C (0.01 mm Hg).

Hazard: Cholinesterase inhibitor. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide, especially for nematocide control.

fenthion. (generic name for *O,O*-diethyl-*O*-[4-(methylthio)-*m*-tolyl]phosphorothioate (generic)). CAS: 55-38-9. $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_3(\text{CH}_3)\text{SCH}_3$.

Properties: Brown liquid. Bp 105C (0.01 mm Hg). Insoluble in water; soluble in most organic solvents.

Hazard: Toxic by ingestion, inhalation, and skin absorption; use may be restricted, cholinesterase inhibitor. TLV: 0.2 mg/m³, toxic by skin absorption; not classifiable as a human carcinogen.

Use: Insecticide, acaricide.

fenticlor. (2,2'-thiobis(4-chlorophenol); novex). $\text{C}_{12}\text{H}_8\text{Cl}_2\text{O}_2\text{S}$.

Properties: Acicular crystals. Mp 170C. Soluble in alcohol, hot benzene, and sodium hydroxide solution.

Derivation: Chlorination of bis(2-hydroxyphenyl)sulfide.

Hazard: Toxic by ingestion.

Use: Fungicide.

Fenton reaction. Oxidation of α -hydroxy acids with hydrogen peroxide and ferrous salts (Fenton's reagent) to α -keto acids or of 1,2-glycols to hydroxy aldehydes.

Fenton's reagent. A solution of sulfuric acid and a ferrous salt.

Use: Oxidation of polyhydric alcohols.

fenuron. (generic name for 3-phenyl-1,1-dimethylurea).

CAS: 101-42-8. $\text{C}_6\text{H}_5\text{NHCON}(\text{CH}_3)_2$.

Properties: White, crystalline solid. Mp 127–129C. Almost insoluble in water (0.3% at 25C), sparingly soluble in hydrocarbon solvents, stable toward oxidation and moisture.

Use: Weed and brush killer.

fenvalerate. (cyano(3-phenoxyphenyl)methyl-4-chloro- α -(1-methylethyl)phenylacetate).

CAS: 51630-58-1.

Use: Insecticide.

fenylfosfin. See phenylphosphine.

FEP resin. Abbreviation for fluorinated ethylenepropylene resin.

ferbam. (generic name for ferric dimethyldithiocarbamate).

CAS: 14484-64-1. $[(\text{CH}_3)_2\text{NCSS}]_3\text{Fe}$.

Properties: Black or dark-colored, fluffy powder. Decomposes above 180C. Usually readily dispersible but very slightly soluble in water; pH of saturated solution 5.0.

Derivation: By addition of carbon disulfide to an alcoholic solution of dimethylamine and precipitation with a ferric salt.

Grade: 76% wettable powder, 87% technical powder.

Hazard: Irritant to eyes and mucous membranes.

TLV: 10 mg/m³; not classifiable as a human carcinogen.

Use: Fungicide.

"Fermate" [Du Pont]. (ferric diethyl dithiocarbamate). TM for a wettable powder containing 76% ferbam.

Use: Fruit fungicide.

fermentation. A chemical change induced by a living organism or enzyme, specifically bacteria or the microorganisms occurring in unicellular plants such as yeast, molds, or fungi. The reaction usually involves the decomposition of sugars and starches to ethanol and carbon dioxide, the acidulation of milk, or the oxidation of nitrogenous organic compounds. The basic reaction is catalyst $\text{C}_6\text{H}_{12}\text{O}_6 \rightarrow 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$. Enzymes are usually involved in such reactions; with yeast, the effective enzyme is zymase. Fermentation is essential in the preparation of breads and other food products and in the manufacture of beer, wine, and other alcoholic beverages, as well as of citric acid, gluconic acid, sodium gluconate, and synthetic biopolymers. Much of the industrial alcohol used in the U.S. is made by fermentation of blackstrap molasses, a by-product of sugar manufacture. Antibiotics are produced by various forms of microorganisms active in molds, especially bacteria and *actinomycetes*. The activated sludge process for sewage digestion is a form of fermentation. A continuous fermentation process for deriving edible protein from petroleum has been introduced. Fermentation is also used in making synthetic amino acids. Research in this field is being directed toward conversion of agricultural, urban, and animal wastes to fuels by fermentation processes.

See yeast; sewage sludge; antibiotics; bacteria; biotechnology.

fermentation alcohol. See ethanol.

Fermi, Enrico. (1901–1954). An Italian physicist who later became a U.S. citizen. He developed a statistical approach to fundamental problems of physical chemistry based on Pauli's exclusion principle. He discovered induced or artificial radioactivity resulting from neutron impingement, as well as slow or thermal neutrons. He was professor of physics at Columbia (1939) and awarded the Nobel Prize in physics in 1938. He was the first to achieve a controlled nuclear chain reaction, directed the construction of the first nuclear reactor at the University of Chicago (1942), and worked on the atomic bomb at Los Alamos. He also carried on fundamental research on subatomic particles using sophisticated statistical techniques. Element 100 (fermium) is named after him.

fermium. (Fm). Element 100, aw 254, valence of 3, half-life 3 h. A synthetic radioactive element with atomic number 100 discovered in 1952. Fermium has since been prepared in a nuclear reactor by

irradiating californium, plutonium, or einsteinium with neutrons in a cyclotron; by bombarding uranium with accelerated oxygen ions; and by other nuclear reactions. The element is named for Enrico Fermi. It has chemical properties similar to those of the rare earth erbium. Isotopes are known with mass numbers 254, 255, and 256.

Use: Tracer studies.
See actinide element.

Ferrario reaction. Formation of phenoxathiins by cyclization of diphenyl ethers with sulfur in the presence of aluminum chloride.

ferrate. See ferrite (2).

ferredoxin. An iron-containing protein thought to be involved in photosynthesis as an acceptor of energy-rich electrons from chlorophyll. It occurs in green plants and in bacteria that metabolize elemental hydrogen.

ferric acetate, basic. (iron acetate, basic).

$\text{Fe}(\text{C}_2\text{H}_3\text{O}_2)_2\text{OH}$.

Properties: Red powder. Soluble in alcohol and acids; insoluble in water. Combustible.

Derivation: Action of acetic acid on ferric hydroxide, with subsequent crystallization.

Use: Mordant in dyeing textiles, wood preservative, medicine.

ferric acetylacetonate.

$\text{Fe}[\text{OC}(\text{CH}_3)\text{CHC}(\text{O})\text{CH}_3]_3$.

Properties: Crystalline powder. Mp 179–182C. Slightly soluble in water; soluble in most organic solvents, resistant to hydrolysis, a chelating nonionizing compound. Combustible.

Use: Moderating and combustion catalyst, solid fuel catalyst, bonding agent, curing accelerator, intermediate.

ferric ammonium alum. See ferric ammonium sulfate.

ferric ammonium citrate. (iron ammonium citrate).

Properties: Thin, transparent, garnet-red scales or granules or a brownish-yellow powder; odorless (or slight ammonia odor); saline, mildly ferruginous taste. Deliquescent, affected by light. Soluble in water; insoluble in alcohol. Combustible.

Derivation: Addition of citric acid to ferric hydroxide, addition of ammonium hydroxide, followed by filtration.

Grade: Technical.

Use: Medicine, blueprint photography, feed additive.

ferric ammonium ferrocyanide.

CAS: 25869-00-5. mf: $\text{C}_6\text{FeN}_6\bullet\text{Fe}\bullet\text{H}_4\text{N}$.

Hazard: Low toxicity.

ferric ammonium oxalate. (iron ammonium oxalate; ammonioferric oxalate).

CAS: 14221-47-7. $(\text{NH}_4)_3\text{Fe}(\text{C}_2\text{O}_4)_3\bullet 3\text{H}_2\text{O}$.

Properties: Green crystals. Soluble in water and alcohol; sensitive to light.

Derivation: Interaction of ammonium binoxalate and ferric hydroxide.

Hazard: Irritant to skin and mucous membranes.
Use: Blueprint photography.

ferric ammonium sulfate. (iron ammonium sulfate; ferric ammonium alum; ammonio ferric sulfate). $\text{FeNH}_4(\text{SO}_4)_2\bullet 12\text{H}_2\text{O}$.

Properties: Lilac to violet, efflorescent crystals. D 1.71, mp 39–41C, bp loses $12\text{H}_2\text{O}$ at 230C. Soluble in water; insoluble in alcohol.

Derivation: By mixing solutions of ferric sulfate and ammonium sulfate followed by evaporation and crystallization.

Use: Medicine, analytical chemistry, textile dyeing (mordant).

ferric arsenate.

CAS: 10102-49-5. $\text{FeAsO}_4\bullet 2\text{H}_2\text{O}$.

Properties: Green or brown powder. D 3.18, decomposes on heating. Insoluble in water; soluble in dilute mineral acids. Nonflammable.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Insecticide.

ferric arsenite.

CAS: 63989-69-5. $2\text{FeAsO}_3\bullet\text{Fe}_2\text{O}_3\bullet 5\text{H}_2\text{O}$. A basic salt of variable composition.

Properties: Brownish-yellow powder. Soluble in acids; insoluble in water. Nonflammable.

Hazard: Toxic by ingestion and inhalation, strong irritant.

Use: Combined with ammonium citrate (ferric ammonium citrate) and used in medicine.

ferric bromide. (ferric tribromide; iron bromide).

CAS: 10031-26-2. FeBr_3 .

Properties: Dark-red, deliquescent crystals. Mp (sublimes). Soluble in water, alcohol, and ether.

Derivation: By the action of bromine on iron filings.
Use: Bromination catalyst.

ferric chloride, anhydrous. (ferric trichloride; ferric perchloride; iron chloride, iron trichloride, iron perchloride).

CAS: 7705-08-0. FeCl_3 .

Properties: Black-brown solid. D 2.898 (25C), mp 306C (partly decomposes), bp 319C. Soluble in water, alcohol, glycerol, methanol, and ether. Noncombustible.

Derivation: Action of chlorine on ferrous sulfate or chloride.

Grade: Anhydrous 96%; 42 degrees Bé solution, photographic and sewage grades.

Hazard: Toxic by ingestion, strong irritant to skin and tissue.

Use: Treatment of sewage and industrial wastes; etching agent for engraving, photography, and printed circuitry; condensation catalyst in Friedel-Crafts reactions; mordant; oxidizing, chlorinating, and condensing agent; disinfectant; pigment; feed additive; water purification.

ferric chromate. (iron chromate). $\text{Fe}_2(\text{CrO}_4)_3$.

Properties: Yellow powder. Soluble in acids (especially hydrochloric) insoluble in water and alcohol.

Derivation: By adding sodium chromate to a solution of a ferric salt.

Hazard: Carcinogenic. Toxic by ingestion and inhalation. Strong irritant. Moderate fire risk by reaction with reducing agents.

Use: Metallurgy, ceramics (color), paint pigment.

ferric citrate. (iron citrate).

CAS: 2338-05-8. $\text{FeC}_6\text{H}_5\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: Reddish-brown scales. Keep away from light. Soluble in water; insoluble in alcohol.

Derivation: By the action of citric acid on ferric hydroxide and crystallization.

Use: Medicine, blueprint paper.

ferric dichromate. (iron dichromate; ferric bichromate). $\text{Fe}_2(\text{Cr}_2\text{O}_7)_3$.

Properties: Reddish-brown granules. Soluble in water and acids.

Derivation: By heating aqueous chromic acid and moist ferric hydroxide.

Hazard: Toxic by inhalation and ingestion, strong irritant. Moderate fire risk by reaction with reducing agents.

Use: Preparation of pigments.

ferric dimethyldithiocarbamate. See ferbam.

ferric ferrocyanide. (iron ferrocyanide; Prussian blue). Blue pigment described under iron blue.

ferric fluoride. (iron fluoride).

CAS: 7783-50-8. FeF_3 .

Properties: Green crystals. D 3.52. Soluble in dilute hydrogen fluoride; insoluble in alcohol and ether.

Hazard: Strong irritant. TLV: 2.5 mg(F)/m³.

Use: Ceramics (porcelain, pottery), catalyst.

ferric fluoroborate.

Use: Rebuilding of worn iron parts, such as cylinders, stereotypes, and electrotypes; plating of solder iron tips.

ferric glycerophosphate. (iron glycerophosphate). $\text{Fe}_2[\text{C}_3\text{H}_5(\text{OH})_2\text{PO}_4]_3 \cdot x\text{H}_2\text{O}$.

Properties: Yellowish scales; odorless; nearly tasteless. Soluble in water; insoluble in alcohol.

Use: Pharmaceuticals.

ferrichrome. $\text{C}_{27}\text{H}_{42}\text{FeN}_9\text{O}_{12}$. A cyclic iron chelate compound.

Properties: Yellow needles. Soluble in water and methanol; slightly soluble in alcohol, acetone, and chloroform.

Derivation: Isolated from rust fungus in 1952, synthesized in 1969.

Use: Growth-promoting factor in medicine.

ferric hydroxide. (ferric hydrate; iron hydroxide; iron hydrate; iron oxide, hydrated; ferric oxide, hydrated). $\text{Fe}(\text{OH})_3$.

Properties: Brown flocculant precipitate that dries as the oxide. D 3.4–3.9, mp loses water at approximately 500C. Soluble in acids; insoluble in water, alcohol, and ether. Noncombustible.

Derivation: Addition of ferrous sulfate solution to ammonia solution.

Use: Water purification, manufacturing pigments, rubber pigment, catalyst.

ferric hypophosphite. (iron hypophosphite).

$\text{Fe}(\text{H}_2\text{PO}_2)_3$.

Properties: White or grayish-white powder; odorless; tasteless. Slightly soluble in water; more soluble in boiling water.

Hazard: Explosion may occur if triturated or heated with nitrates, chlorates, or other oxidizing agents.

ferric naphthenate.

Properties: A heavy-metal soap. Combustible.

Derivation: Fusion method by heating naphthenic acids with the metallic oxide.

Use: Conditioning and waterproofing agent, sludge preventive, fungicide, and paint drier.

See soap (2).

ferric nitrate. (iron nitrate).

CAS: 10421-48-4. $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Violet crystals. D 1.684, mp 47.2C, decomposes at 125C. Soluble in water and alcohol.

Derivation: Action of concentrated nitric acid on scrap iron or iron oxide and crystallization.

Hazard: Dangerous fire risk in contact with organic materials. Strong oxidant and irritant.

Use: Dyeing (mordant for buffs and blacks), tanning, analytical chemistry.

ferric octoate. See soap (2).

ferric oleate. (iron oleate). $\text{Fe}(\text{C}_{18}\text{H}_{33}\text{O}_2)_3$.

Properties: Brownish-red lumps. Soluble in alcohol, ether, and acids; insoluble in water. Combustible. See soap (2).

ferric oxalate. $\text{Fe}_2(\text{C}_2\text{O}_4)_3$.

Properties: Pale-yellow amorphous scales or powder; odorless. Decomposes on heating to 100C. Soluble in water and acids; insoluble in alkali. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Catalyst in making O₂, silvertone photographic printing papers.

ferric oxide. (ferric oxide, red; iron oxide; red iron trioxide; ferric trioxide).

CAS: 1309-37-1. Fe₂O₃.

Properties: Dense, dark-red powder or lumps. D 5.12–5.24, mp 1565C. Soluble in acids; insoluble in water.

Grade: Technical, 99.5% pure, electronic.

Use: Metallurgy, gas purification, paint and rubber pigment, component of thermite, polishing compounds, mordant, laboratory reagent, catalyst (*p*-hydrogen), feed additive, electronic pigments for TV, permanent magnets, memory cores for computers, magnetic tapes.

See iron oxide reds.

ferric perchloride. See ferric chloride.

ferric phosphate. (iron phosphate).

CAS: 10045-86-0. FePO₄•2H₂O.

Properties: Yellowish-white powder. D 2.87. Insoluble in water; soluble in acids.

Derivation: By adding a solution of sodium phosphate to a solution of ferric chloride. The product is filtered and then dried.

Use: Fertilizers, feed and food additive.

ferric pyrophosphate. (iron pyrophosphate).

CAS: 10058-44-3. Fe₂(P₂O₇)₃•xH₂O.

Properties: Yellowish-white powder. Insoluble in water; soluble in dilute acid. Contains 24% iron min, not to be confused with ferric pyrophosphate, soluble.

Use: Source of nutritional iron, catalyst, pigments, flame-retardant.

ferric pyrophosphate, soluble. A combination of ferric pyrophosphate and sodium citrate.

Properties: Apple-green crystals. Very soluble in water; insoluble in alcohol. Protect from light, 11% iron.

Use: Feed additive.

ferric resinate. (iron resinate).

Properties: Reddish-brown powder. Soluble in ligroin, carbon disulfide, ether, oil of turpentine; slightly soluble in alcohol; insoluble in water.

Use: Drier (paints, varnish).

See soap (2).

ferric sodium oxalate. (iron sodium oxalate). Na₂Fe(C₂O₄)₃•5.5H₂O.

Properties: Emerald-green crystals, decomposed by heat or light. D 1.973 (18C), decomposes at 300C, protect from light. Soluble in water and alcohol.

Derivation: By the interaction of sodium acid oxalate and ferric hydroxide.

Use: Photography, blueprinting.

ferric sodium pyrophosphate. See sodium ferric pyrophosphate.

ferric stearate. (iron stearate). Fe(C₁₈H₃₅O₂)₃.

Properties: Light-brown powder. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Interaction of solutions of ferric sulfate and sodium stearate.

Use: Varnish driers, photocopying.

See soap (2).

ferric sulfate. (iron sulfate; ferric trisulfate; iron tersulfate; iron persulfate).

CAS: 10028-22-5. (1) Fe₂(SO₄)₃, (2)

Fe₂(SO₄)₃•9H₂O.

Properties: Yellow crystals or grayish-white powder. D (1) 3.097, (2) 2.0–2.1, mp decomposes at 480C, (1) slightly soluble in water, (2) very soluble in water. Keep well closed and protected from light. Noncombustible.

Derivation: By adding sulfuric acid to ferric hydroxide.

Grade: Technical, CP, partly hydrated.

Use: Pigments, reagent, etching aluminum, disinfectant, textiles (dyeing and calico printing), flocculant in water and sewage purification, soil conditioner, polymerization catalyst, metal pickling, chelated iron products, intermediate.

ferric tallate. See soap (2).

ferric tannate. (iron tannate; iron gallotannate). Fe₂(C₁₄H₆O₈)(OH)₃.

Properties: Dark-brown or bluish-black powder. Variable composition. Soluble in alkalies and dilute acids; insoluble in water, alcohol, and ether. Combustible.

Derivation: Interaction of ferric acetate and tannic acid solutions.

Use: Medicine.

ferric tribromide. See ferric bromide.

ferric trichloride. See ferric chloride.

ferric trioxide. See ferric oxide.

ferric trisulfate. See ferric sulfate.

ferric vanadate. (iron metavanadate).

Fe(VO₃)₃.

Properties: Grayish-brown powder. Soluble in acids; insoluble in water and alcohol. Noncombustible.

Derivation: By adding a solution of a ferric salt to the liquor obtained by leaching vanadium ores with caustic-soda solution or by lixivating the slags obtained when vanadium ores are fused with soda ash, etc.

Grade: Technical.

Use: Metallurgy.

ferric versenate. See iron(III)-edta complex.

ferrite. (1) Iron in the body-centered cubic form; commonly occurs in steels, cast iron, and pig iron at approximately 910C. α and β iron are the common varieties of ferrite, and the name is also applied to Δ iron. (2) A compound, a multiple oxide, of ferric oxide with another oxide, as sodium ferrite, NaFeO_2 , but more commonly a multiple oxide crystal. Ferrites are made by dissolving hydrated ferric oxide in concentrated alkali solution; by fusing ferric oxide with alkali metal chloride, carbonate, or hydroxide; or by simply heating metal oxides with ferric oxide. Ceramic ferrites are made by press-forming powdered ingredients (with a binder) into a sheet, then sintering or firing.

Use: The oxide ferrites in rectifiers on memory and record tapes, for permanent magnets, semiconductors, insulating materials, dielectrics, high-frequency components, and various related uses in radio, television, radar, computers, and automatic control systems.

ferro-alloy. An alloy of iron with some element other than carbon used as a vehicle for introducing such an element into steel during its manufacture. The element may alloy with the steel by solution or as the carbide, neutralize the harmful impurities by combining with them, and separating from the steel as flux or slag before solidification.

ferroboron. A ferro-alloy used as a hardening agent in special steels. It also is an efficient deoxidizer. Boron steel is used in controlling the operating rate of nuclear reactors. Two grades are available, 10 and 17% boron.

“Ferrocarbo” [Carborundum]. TM for briquetted or granular silicon carbide.

Use: Cupola addition in the production of gray iron or as a ladle addition to steel. Decomposes into its component elements and acts as a powerful deoxidizer and graphitizer. Machinability and strength of the iron or steel are increased with no loss of hardness.

ferrocene. (dicyclopentadienyliron). $(\text{C}_5\text{H}_5)_2\text{Fe}$. A coordination compound of ferrous iron and two molecules of cyclopentadiene in which the organic portions have typically aromatic chemical properties. Its activity is intermediate between phenol and anisole. The first compound shown to have the “sandwich” structure found in certain types of metallocene molecules. Two structures of ferrocene are shown below:

Properties: Orange, crystalline solid; camphorlike odor. Mp 173–174C; resists pyrolysis at 400C. Insoluble in water; soluble in benzene, ether, and alcohol. Iron content 29.4–30.6%.

Derivation: From ferrous chloride and cyclopentadiene sodium.

Hazard: Moderate fire risk. Evolves toxic products on decomposition and heating.

Use: Additive to fuel oils to improve efficiency of combustion and eliminate smoke, antiknock agent, catalyst, coating for missiles and satellites, high-temperature lubricant, intermediate for high-temperature polymers, UV absorber.

See metallocene.

ferrocenecarboxylic acid ethyl ester. See ethyl ferrocenoate.

1,1'-ferrocenedicarboxylic acid diethyl ester. See 1,1'-diethyl ferrocenoate.

1,1'-ferrocenedicarboxylic acid dimethyl ester. See dimethyl ferrocenoate.

1,1'-ferrocenediyl dichlorosilane.

$(\text{C}_5\text{H}_5)_2\text{FeSiCl}_2$. An experimental ferrocene derivative that prevents oxidative deterioration of the surfaces of photoelectrodes with which it is in contact. It increases the stability of light-sensitive electrodes in energy-conversion reactions occurring in liquid media.

ferrocenoyl chloride. See chlorocarbonyl ferrocene.

ferrocenoyl dichloride. See 1,1'-dichlorocarbonyl ferrocene.

ferrocenylborane polymer.

Properties: Long-term heat resistance at 315C, short-term stability approximately 815C, good resistance to oxidation and hydrolysis, contains up to 30% iron directly combined.

Use: Specialty plastics, coatings, fibers; ablative material for space vehicles.

ferrocenyl methyl ketone. See acetylferrocene.

ferrocerium. A pyrophoric alloy of iron and misch metal.

ferrochromium. (ferrochrome). An alloy, composed principally of iron and chromium, used as a means of adding chromium to steels (low, medium, and high-carbon) and cast iron. Available in several classifications and grades, generally containing between 60 and 70% chromium, in crushed sizes and lumps up to 75 pounds that readily dissolve in molten steel.

ferroconcrete. See concrete.

ferroelectric. A crystalline material such as barium titanate, monobasic potassium phosphate, or potassium-sodium tartrate (Rochelle salts) that, over certain limited temperature ranges, has a natural or inherent deformation (polarization) of the electrical fields or electrons associated with the atoms and groups in the crystal lattice. This results in the development of positive and negative poles and a consequent "direction" of polarization, which can be reversed when the crystal is exposed to an external electric field. Ferroelectric crystals are internally strained and, as a consequence, show unusual piezoelectric and elastic properties.

Use: Capacitors, transducers, computer technology. See ceramic, ferroelectric.

ferroin chelation group. A functional group characteristic of heterocyclic ring nitrogen compounds:

Among such compounds are 2,2'-bipyridine; 1,10-phenanthroline; and the 2-pyridyl triazines. These provide a large number of terminal ($\equiv\text{C}-\text{H}$) groups in which the hydrogen can be replaced by many chemical groupings (carboxyl, hydroxyl, halogen, etc.). Thus, synthesis of an almost endless number of substituted ferroin reactants is possible. About 200 such chelation reagents have been synthesized. Ferroin chelation chemicals in general form complex undissociated cations with divalent metal ions, e.g., $[(\text{C}_{12}\text{H}_8\text{N}_2)_3\text{Fe}]^{2+}$.

ferromagnesite. An iron-bearing variety of magnesite.

Use: Refractory owing to its ability to bond under heat.

ferromagnetic oxide. See ferrite (2).

ferromanganese. An alloy consisting of manganese (approximately 48%), plus iron and carbon. **Available forms:** Standard, low-carbon, and medium-carbon grades in ground, crushed, and lump sizes ranging from 80 mesh to 75-lb lumps, suitable for ladle or furnace addition.

Use: Vehicle for adding manganese to steel. See nodules.

ferromolybdenum. An alloy, composed largely of iron and molybdenum, used as a means of adding

molybdenum to steel. Engineering steels rarely contain more than 1% molybdenum, stainless steels may contain 3%, and tool steels as much as 10%. Ferromolybdenum is available in several grades in which molybdenum ranges from 55 to 75% and the maximum carbon content is 1.10%, 0.60%, or 2.50%. It is generally added in the furnace since it does not oxidize under steelmaking conditions. Mp approximately 1630C. Available in crushed sizes up to one inch.

ferro niobium. An alloy of iron and niobium made by reducing the ore columbite with silicon. **Use:** Stainless steels and other alloys for welding rods.

ferrophosphorus. An alloy of iron and phosphorus used in the steel industry for adjustments of phosphorus content of special steels.

Grade: (1) 18% phosphorus, (2) 25% phosphorus. **Use:** In preventing thin sheets from sticking together when rolled and annealed in bundles.

ferrosilicon. An alloy of iron and silicon used to add silicon to steel and iron, d 5.4, insoluble in water. Small quantities of silicon deoxidize the iron, and larger amounts impart special properties.

Available forms: Six grades containing from 20 to 95% silicon. The 20% grade is made in a blast furnace, but grades of higher silicon content are made in electric furnaces.

Hazard: Ferrosilicon containing from 30 to 90% silicon is flammable and evolves gases in the presence of moisture.

Use: Pidgeon process for producing metallic magnesium.

ferrosoferric oxide. See iron oxide, black.

ferrotitanium. An alloy composed principally of iron and titanium, used to add titanium to steel. It is often made from titanium scrap. Three classifications are available: low, high, and medium carbon content. Furnished in various lump, crushed, and ground sizes.

ferrotungsten. An alloy of iron and tungsten used as a means of adding tungsten to steel. Contains 70 to 80% tungsten and no more than 0.6% carbon. Melting range 1648–2750C, dissolves readily in molten steel. Furnished in ground and crushed sizes up to one inch. See tungsten steels.

ferrous acetate. (iron acetate).

Properties: Greenish crystals when pure and unexposed to air; usually partly brown from action of air. Soluble in water and alcohol. Oxidizes to basic ferric acetate in air. Combustible.

Derivation: Action of acetic acid or pyroligneous acid on iron with subsequent crystallization.

Use: Textile dyeing, medicine, dyeing leather, wood preservative.

ferrous ammonium sulfate. (Mohr's salt; iron ammonium sulfate).
 $\text{Fe}(\text{SO}_4) \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Light-green crystals. Soluble in water; insoluble in alcohol. D 1.865, decomposes at 100–110C, deliquescent. Affected by light.

Derivation: By mixing solutions of ferrous sulfate and ammonium sulfate, followed by evaporation and subsequent crystallization.

Use: Analytical chemistry, metallurgy.

ferrous arsenate. (iron arsenate).
 CAS: 10102-50-8. $\text{Fe}(\text{AsO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Green, amorphous powder. Insoluble in water; soluble in acids.

Derivation: Interaction of solutions of sodium arsenate and ferrous sulfate.

Use: Insecticide.

ferrous ascorbate.

CAS: 14536-17-5.

Properties: Blue-violet solid.

Hazard: A nuisance dust.

Use: Food additive.

ferrous bromide. (iron bromide).

$\text{FeBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Green, crystalline powder; very deliquescent. D 4.636, mp 27C. Readily oxidized in moist air; soluble in water and alcohol.

Derivation: Action of bromine on iron filings.

Use: Polymerization catalyst.

ferrous carbonate.

CAS: 563-71-3. mf: CFeO_3 .

Properties: White solid; odorless; gray solid. Decomposes yielding CO_2 + FeO at 2°. Insol in H_2O ; sol acids to give CO_2 ; sol in H_2O saturated with CO_2 to give $\text{Fe}(\text{HCO}_3)_2$ which then oxidizes.

Hazard: A nuisance dust.

Use: Food additive.

ferrous chloride. (iron chloride; iron dichloride; iron protochloride).

CAS: 7758-94-3. (1) FeCl_2 , (2) $\text{FeCl}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Greenish-white crystals. D (1) 3.16 (25C), (2) 1.93, mp (1) 670–674C, deliquescent, readily oxidized. Soluble in alcohol and water.

Derivation: Action of hydrochloric acid on an excess of iron, with subsequent crystallization.

Use: Mordant in dyeing, metallurgy, pharmaceutical preparations, manufacture of ferric chloride, sewage treatment.

ferrous citrate.

CAS: 23383-11-1. mf: $\text{C}_6\text{H}_6\text{FeO}_7$.

Properties: White crystals or sltly colored powder.

Use: Food additive.

ferrous-2-ethylhexoate. A paint drier.

See soap (2).

ferrous fluoride. (iron fluoride). FeF_2 .

Properties: Green crystals. D 4.09. Soluble in acids; slightly soluble in water; insoluble in alcohol and ether.

Hazard: Strong irritant. TLV: 2.5 mg(F)/m³.

Use: Ceramics, catalyst.

ferrous fumarate.

CAS: 141-01-5. $\text{FeC}_4\text{H}_2\text{O}_4$. Anhydrous salt of a combination of ferrous iron and fumaric acid, stable, odorless, substantially tasteless. Reddish-brown, anhydrous powder, contains 33% iron by weight, does not melt at temperatures up to 280C, insoluble in alcohol, very slightly soluble in water. Combustible.

Grade: USP.

Use: Dietary supplement.

ferrous gluconate. (iron gluconate).

CAS: 299-29-6. $\text{Fe}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish-gray or pale-greenish-yellow fine powder or granules with slight odor, solution (1 in 20) is acid to litmus. Soluble in water and glycerol; insoluble in alcohol. Combustible.

Grade: Pharmaceutical, NF.

Use: Feed and food additive, vitamin tablets.

ferrous iodide. (iron iodide; iron protoiodide). $\text{FeI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Dark-violet to black hygroscopic leaflets. Soluble in water and alcohol. D 2.873, decomposes at 90–98C, mp (anhydrous) 177C, deliquescent, affected by light.

Derivation: By the action of iodine on iron filings.

Use: Manufacture of alkali metal iodides, pharmaceutical preparations, catalyst.

ferrous lactate. (iron lactate).

CAS: 5905-52-2. $\text{Fe}(\text{C}_3\text{H}_5\text{O}_3) \cdot 3\text{H}_2\text{O}$.

Properties: Greenish-white crystals; slight peculiar odor. Soluble in water; insoluble in alcohol. Deliquescent, affected by light. Combustible.

Derivation: By interaction of calcium lactate with ferrous sulfate or direct action of lactic acid on iron filings.

Use: Food additive and dietary supplement.

ferrous naphthenate. A soap based on mixed naphthenic acids. Available commercially as a liquid containing 6% iron.

See soap (2).

ferrous octoate. A paint drier.

See soap (2).

ferrous oxalate. (iron oxalate).

$\text{FeC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Pale-yellow, crystalline powder; odorless. Soluble in acids; insoluble in water. D

2.28, decomposes at 160C releasing carbon monoxide.

Derivation: By the interaction of solutions of ferrous sulfate and sodium oxalate.

Hazard: Toxic. Evolves carbon monoxide on heating.

Use: Photographic developer, pigment in glass, plastics, paints.

ferrous oxide. (iron monoxide).

CAS: 1345-25-1. FeO.

Properties: Black powder. D 5.7, mp 1420C. Insoluble in water; soluble in acid.

Derivation: Prepared from the oxalate by heating, but the product contains some ferric oxide.

Use: Catalyst, glass colorant, steel manufacture.

ferrous phosphate. $\text{Fe}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Bluish-gray powder. D 2.58. Soluble in inorganic acids; insoluble in water. Hygroscopic.

Use: Catalyst, ceramics.

ferrous phosphide. (iron phosphide). Fe_3P .

Properties: Bluish-gray powder. D 6.56, mp 1290C. Ferromagnetic. Insoluble in water.

Grade: 24–25% phosphorus.

Hazard: Evolves toxic and flammable products on exposure to moisture or acids.

Use: Iron and steel manufacture.

ferrous selenide. FeSe.

Properties: Black, shiny solid. D 6.8. Almost insoluble in water; soluble in hydrochloric acid, evolving selenium hydride.

Use: Semiconductor technology.

ferrous sulfate. (iron sulfate; iron vitriol; copperas; green vitriol; sal chalybis).

CAS: 7720-78-7. $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Greenish or yellow-brown crystals or granules; odorless. Soluble in water with saline taste; insoluble in alcohol. D 1.89, mp 64C, loses $7\text{H}_2\text{O}$ by 300C, pH 3.7 (10% solution), hygroscopic.

Derivation: (1) By-product from the pickling of steel and many chemical operations, (2) by action of dilute sulfuric acid and iron, (3) oxidation of pyrites in air followed by leaching and treatment with scrap iron.

Method of purification: Recrystallization.

Grade: Technical, anhydrous, CP, USP.

Hazard: Ingestion causes intestinal disorders.

Use: Iron oxide pigment; other iron salts; ferrites; water and sewage treatment; catalyst, especially for synthetic ammonia; fertilizer; feed additive; flour enrichment; reducing agent; herbicide; wood preservative; process engraving.

ferrous sulfide. (iron sulfide; iron protosulfide).

CAS: 1317-37-9. FeS .

Properties: Dark-brown or black metallic pieces,

sticks, or granules. D 4.75, mp 1195, bp (decomposes). Soluble in acids; insoluble in water.

Derivation: By fusing iron and sulfur.

Use: Generating hydrogen sulfide, ceramics, other sulfides, pigment.

See pyrite.

ferrovanadium.

CAS: 12604-58-9. An iron-vanadium alloy used to add vanadium to steel. Vanadium is used in engineering steels to the extent of 0.1–0.25% and in high-speed steels to the extent of 1–2.5% or higher. Melting range 1482–1521C. Furnished in a variety of lump, crushed, and ground sizes.

Derivation: By reduction of the vanadium oxide with aluminum or silicon in the presence of iron in an electric furnace.

Grade: Available containing from 50 to 80% vanadium.

Hazard: Moderate fire risk. TLV: (dust) 1 mg/m³; STEL 3 mg/m³.

ferrozirconium. Alloys used in the manufacture of steel. (1) 12–15% zirconium alloy. Approximate analysis: zirconium 12–15%, silicon 39–43%, iron 40–45%; application: steel of high silicon content. (2) 35–40% zirconium alloy. Approximate analysis: zirconium 35–40%, silicon 47–52%, iron 8–12%; application: steel of low silicon content.

ferrium. Latin name for iron, hence the symbol Fe.

fertile material. In nuclear technology, any substance not capable of fission but that can be converted into a fissionable material in a nuclear reactor. ²³⁸Uranium (converted to ²³⁹plutonium) and ²³²thorium (converted to ²³³uranium) are the most important fertile materials.

fertilizer. A substance or mixture that contains one or more of the primary plant nutrients and sometimes also secondary and/or trace nutrients. The primary nutrients are nitrogen (supplied as anhydrous ammonia or solutions containing nitrogen derived from ammonia, ammonium nitrate, or urea), phosphorus (as superphosphates derived from phosphate rock), and potassium (in the form of KCl from sylvite ore or natural brines). Secondary nutrients are calcium, magnesium, and sulfur. Trace elements (iron, copper, boron, manganese, zinc, and molybdenum) are also among the 12 elements considered essential for plant growth. Nitrogen solutions and anhydrous ammonia are used both in fertilizer manufacture and for direct application to the soil. Substantial amounts of both separate materials and mixtures are used in liquid form. Controlled-release fertilizers are those whose particles are coated with polymeric sulfur by a proprietary process. Their advantages include more uniform supply of nutrient, lower labor costs, and reduced leaching losses in

areas of irrigation and high rainfall.
See superphosphate; nutrient solution.

fertilization. The process by which an egg is made capable of generating offspring. It is often synonymous with syngamy.

festucine.

CAS: 25161-91-5. mf: $C_8H_{14}N_2O$.

Hazard: A poison.

Source: Natural product.

FFA. Abbreviation for free fatty acid.

Use: Describing specifications for fatty esters, glycerides, oils, etc.

FFPA. Abbreviation for "free from prussic acid."

FGAN. Fertilizer-grade ammonium nitrate.

Use: In blasting agents, as well as fertilizers, because its coating of kieselguhr and its prilled form, making it safer to handle than the usual grades.

fiber. A fundamental form of solid (usually crystalline) characterized by relatively high tenacity and an extremely high ratio of length to diameter (several hundred to one). Natural fibers are animal, e.g., wool and silk (proteins), vegetable, e.g., cotton (cellulose), and mineral (asbestos). Cotton fiber is called staple and rarely exceeds 2 inches in length.

Semisynthetic fibers include rayon and inorganic substances extruded in fibrous form, such as glass, boron, boron carbide, boron nitride, carbon, graphite, aluminum silicate, fused silica, and some metals (steel). Synthetic fibers are made from high polymers (polyamides, polyesters, acrylics, and polyolefins) by extruding from spinnerettes (nylon, "Orlon," etc.). Some are being used in specialty papers, though the primary use is in textile fabrics. See "Fiberfax."

Metal fibers are used in several ways: (1) As whiskers, which are single-crystal fibers up to 2 inches long having extremely high tensile strength; they are made from tungsten, cobalt, tantalum, and other metals and are used largely in composite structures for specialized functions. (2) As filaments, which are alloys drawn through diamond dies to diameters as small as 0.002 cm; steel for tire cord and antistatic devices has been developed for such applications. (3) In biconstituent structures composed of a metal and a polymeric material; for example, aluminum filament covered with cellulose acetate butyrate. Hollow fibers of cellulose acetate and nylon are used as membranes in the reverse osmosis method of water purification. See filament; denier; whiskers; glass fiber.

fiber, biconstituent. A composite fiber comprising a dispersion of fibrils of one synthetic material within, and parallel to, the axis of another; also a fiber made up of polymeric material and a metal or alloy filament.

fiberfill. A fiber designed specifically for use as a filling material in such products as pillows, comforters, quilted linings, and furniture battings, e.g., sisal, jute.

"Fiberfrax" [Carborundum]. TM for ceramic fiber made from alumina and silica. Available in bulk as blown, chopped and washed, long staple, paper, rope, roving, blocks.

Properties: Retains properties to 1260C and under some conditions used to 1648C, light weight, inert to most acids and unaffected by hydrogen atmosphere, resilient.

Use: High-temperature insulation of kilns and furnaces, packing expansion joints, heating elements, burner blocks; rolls for roller hearth furnaces and piping; fine filtration; insulating electrical wire and motors; insulating jet motors; sound deadening.

fiber gear. A driver gear made of a material of somewhat lower strength than the driven gear (cast iron); for example, a composite such as fiberglass-reinforced plastic or an engineering plastic (e.g., nylon). It is intended to fail under overload, thus protecting the driven master gear from destructive stress.

"Fiberglas" [Owens-Corning]. TM for a variety of products made of or with glass fibers or glass flakes, including insulating wools, mats and rovings, coarse fibers, acoustical products, yarns, electrical insulation, and reinforced plastics.

See glass fiber; reinforced plastic.

fiber glass. See glass fiber.

fiber, graphite. See graphite fiber.

fiber, optical. A fine-drawn silica (glass) fiber or filament of exceptionally high purity and specific optical properties (refractive index) that transmits laser light impulses almost instantaneously with high fidelity. Such fibers are made from quartz coated with germanium-doped silica by vapor deposition; 100 or more filaments are assembled into a cable that has extremely high data-carrying capacity. These are applicable not only to telephonic communication systems, for which they are now being used, but also to remote-sensing devices that permit analysis of samples at widely separated locations. Thus, one of the most important developing uses of optical fibers is in analytical instrumentation. Because, as they are nonelectrical and noncorrosive, optical fiber cables are safe to use in highly toxic or explosive environments, e.g., radioactive separations and hazardous waste analyses. The laser beam is coupled to the end of the cable (which may be up to 1000 m long) by a device called an optrode; the light traverses the cable and interacts with the sample, eliciting a signal that is reflected back through the same cable to a spectrometer. Fiber optics are also used in other forms of instrumentation, e.g.,

radiation dosimeters and high-temperature thermometers. In the latter case, the fibers are made from single crystals of alumina.

See glass, optical; laser; thermometer (5).

fiber-reactive dye. See dye, fiber-reactive.

fiber roll. A calender roll constructed of specially prepared papers or fabrics on a steel base. The fibrous material is cut into circular sheets with a hole at the center; these are stacked on a steel core and then compressed under high pressure, producing a dense, hard material with a smooth surface. As such, it is used in supercalenders for paper finishing. An intaglio design can be impressed on it by an engraved steel roll; this operation requires several days and is facilitated by application of water, soap, or other softener. So prepared, it is used in embossing calenders for applying decorative patterns on special paper or plastic products.

See supercalender.

fibrid. Generic name for a fibrous form of synthetic polymeric material used for example as a binder material in the manufacture of tetryl.

fibril. (1) Extremely fine fiber or cell-like mass formed during first stages of gel formation; (2) protein filament of hide fiber.

fibrin. An insoluble blood protein resulting from the hydrolysis of fibrinogen by the action of thrombin; it polymerizes to form blood clots. Recent research has found that it forms a protective coating on tumors that inhibits antigenic activity, thus protecting the tumor and neutralizing the immune system of the organism.

fibrinogen. A sterile fraction of normal human blood plasma, dried from the frozen state. In solution, it has the property of being converted into insoluble fibrin when thrombin is added. It is an essential factor in the blood-clotting mechanism.

Properties: White or grayish amorphous substance.

Grade: USP.

Use: Medicine (coagulant).

fibrinolysin. (plasmin). A proteolytic enzyme that dissolves fibrin and hastens the solution of clots that may form in the bloodstream. It is prepared by activating a fraction of normal human plasma with highly purified streptokinase.

fibroblast. A cell of connective tissue that secretes connective tissue proteins, such as collagen.

fibroin. The fibrous material in silk; a scleroprotein containing glycine and alanine; light-yellow, silk like mass; insoluble in water; soluble in concentrated alkalis and concentrated acids.

fibrolite. See sillimanite.

fibrous glass See glass fiber.

fibrous proteins. Water-insoluble proteins that serve in a protective or structural role. The ratio of length to width generally exceeds 10.

ficin. A proteolytic enzyme hydrolyzing casein, collagen, edestin, fibrin, liver, and other protein like material.

Properties: Buff to cream-colored powder; acrid odor. Very hygroscopic. Partially soluble in water; insoluble in organic solvents.

Source: Fig latex or sap, commercially prepared by filtering and drying the latex.

Use: Food industry, bating leather, tenderizing meat, shrink proofing wool, coagulation of milk, chill proofing beer, Rh-factor determination.

“Fi-Con” [Phillips]. TM for fiber additive.

Use: Concrete additive.

fictile. Descriptive of certain molecules that have no permanent structure but are constantly changing their shapes and arrangements. An example is the metal carbonyl $\text{Fe}_3(\text{CO})_{12}$, in which, according to Dr. F. Albert Cotton, originator of the term, “carbonyl groups readily move from one iron atom to another through the rapid formation and dissolution of carbonyl bridges between iron atoms.”

field-ion microscope. A type of microscope whose unique feature is that it has no lens system. Invented by Muller in 1951, it is capable of resolving metal atoms 2–3 Å in diameter. Its essential components are an evacuated glass chamber through which runs a wire carrying an electric impulse of 30,000 volts that establishes a field strength of 500 million volts/cm. A specimen of the metal to be observed, which is machined to an extremely fine tip and is positively charged, is connected to the wire. An inert gas such as helium or neon is then admitted. The positively charged tip of the specimen attracts electrons from the helium atoms, creating positive helium ions. These are strongly repelled by the metal atoms and stream to the negatively charged fluorescent screen, producing an image of the individual atoms of the metal. Magnifications of one million times or more have been obtained of atoms of indium, tungsten, and others.

See electron microscope.

Fieser, Louis F. (1899–1977). A distinguished American chemist, Fieser became professor of organic chemistry at Harvard in 1930 after teaching for several years at Bryn Mawr. He achieved the synthesis of vitamin K_1 and did fundamental research on cortisone, the chemistry of steroids, and aromatic carcinogens. His achievements as a chemist and educator are recognized throughout the world. Unique in his facility in laboratory demonstration and as a lecturer and author, he exemplified

that rare combination of a great teacher and a profound scholar.

filament. A continuous fiber usually made by extrusion from a spinnerette (nylon, rayon, glass, polyethylene). It also may be a drawn metal (tungsten, gold) or a metal carbide.

See fiber.

filament winding. The process of winding fibers under tension onto a prepared core. Before or during the winding operation, the assembly is impregnated with a thermosetting resin. Structures of considerable size and strength can be made in this way. The fibers used are chiefly glass, boron, or silicon carbide.

See filament.

filial generation. (F1; F2). Each generation of offspring in a breeding program, designated F1, F2, etc.

filler. (1) An inert mineral powder of rather high specific gravity (2.00–4.50) used in plastic products and rubber mix to provide a certain degree of stiffness and hardness and to decrease cost. Examples are calcium carbonate (whiting), barytes, blanc fixe, silicates, glass spheres and bubbles, slate flour, soft clays, etc. Fillers have neither reinforcing nor coloring properties, and the term should not be applied to materials that do, i.e., reinforcing agents or pigments. Fillers are similar to extenders and diluents in their cost-reducing function; exact lines of distinction between these terms are difficult, if not impossible, to draw. Use of fillers and extenders in plastics has increased in recent years due to shortages of basic materials.

(2) The cross or transverse thread in a fabric or other textile structure.

(3) A metal or alloy used in brazing and soldering to effect union of the metals being joined. See diluent; extender; reinforcing agent.

film. An extremely thin continuous sheet of a substance that may or may not be in contact with a substrate. There is no precise upper limit of thickness, but a reasonable assumption is 0.010 inch. The protective value of any film depends on its being 100% continuous, i.e., without holes or cracks, since it must form an efficient barrier to molecules of atmospheric water vapor, oxygen, etc. A long-chain fatty acid or alcohol on water produces a film whose thickness is the length of one molecule (approximately 200 Å). The fatty acid molecules are oriented with the radical end in the water. Such films are good evaporation barriers and have been successfully imposed on glass. Soap bubbles are elastic films about one micron thick and have considerable strength. Film-forming agents (drying oils) are essential in paints and lacquers. Oxide films formed automatically on the surface of aluminum protect it from corrosion. Thin metallic oxide films are widely

used in electronic and semiconducting devices. Electrodeposited metals (chromium, copper, nickel) are conventionally (and perhaps illogically) called coatings. The term film is also applied to sheets of cellophane, polyethylene, polyvinylidene chloride, etc., used for wrapping and packaging of food products, meats, and poultry (especially shrink films that are stretched before application). These function as a moisture vapor barrier. Plastic films are also used as slip surfaces in concrete structures such as airstrips, ice rinks, and highways. Photographic film is made from cellulose acetate.

filter. See filtration; leaf, filter; baghouse.

filter aid. See filter media; filtration.

filter alum. See aluminum sulfate.

filter medium. Almost any water-insoluble, porous material having a reasonable degree of rigidity can serve as a filter. Sand is used in simple large-scale water filtration, the voids between the grains providing the porosity. In industrial operations, cotton duck, woven wire cloth, nylon cloth, and glass cloth are used. For laboratory work, Whatman filter paper, diatomaceous earth, and closely packed glass fibers are standard materials. Plastics membranes containing more than a million pores per square inch are used in bacteriological filtration.

See filtration; screen.

filter sand. Sand used to separate sediment and suspended matter from water.

filtration. The operation of separating suspended solids from a liquid (or gas) by forcing the mixture through a porous barrier (see filter media). The construction and operation of the many kinds of industrial filtration equipment are too detailed to permit description. The most widely used types may be classified as follows: (1) gravity filters, used largely for water purification and consisting of thick beds of sand and gravel that retain the flocculated impurities as the water passes through; (2) pressure filters of plate-and-frame or shell-and-leaf construction that utilize filter cloths of coarse fabric as a separating medium; (3) vacuum or suction filters of the rotating drum or disk type, used on thick sludges and slurries; (4) edge filters; (5) clarification filters; (6) bag filters (dust collectors). Gel filtration is a chromatographic technique involving separation at the molecular level. For bacteriological filtration, membranes having more than a million pores per square inch are used, e.g., collodion or synthetic film. Some types of viruses will pass through such membranes and are thus known as filterable viruses.

See baghouse.

fine chemical. A chemical produced in comparatively small quantities and in a relatively pure state. Examples are pharmaceutical and biological

products, perfumes, photographic chemicals, and reagent chemicals. They are sold on the basis of specifications (on the basis of what they are, not what they do).

fines. The portion of a powder composed of particles that are smaller than a specified size (MPA definition, MPA Standard 9–50T).

fine structure. See ultrastructure.

fingerprinting. The characteristic two-dimensional pattern (on paper or gel) formed by the separation of a mixture of peptides resulting from partial hydrolysis of a protein; also known as peptide mapping.

finished DNA sequence. High-quality, low error, gap-free DNA sequence of the human genome. Achieving this ultimate 2003 HGP goal requires additional sequencing to close gaps, reduce ambiguities, and allow for only a single error every 10,000 bases—the agreed-upon standard for HGP finished sequence.

See sequencing; draft sequence.

finishing compounds. Materials that impart softness, flexibility, stiffness, color, water and fire resistance, etc.

Use: In the final or finishing stages of manufacture of a product, usually textiles and leather, to make them suitable for specific purposes.

Finkelstein reaction. Reaction of alkyl halides with sodium iodide in acetone.

“Firebrake ZB” [U. S. Borax]. (zinc borate). TM for a synergist with antimony compounds and alumina trihydrate.

Use: Flame and smoke suppressant.

fireclay. See refractory.

fire extinguishment. Fires are divided into 4 classes, each requiring special treatment. The essential point in extinguishing all types is exclusion of air from the fire by an effective means. Class A includes fires in combustible materials, such as wood, paper, and cloth, where the quenching and cooling effect of quantities of water or of solutions containing a high percentage of water is of primary importance. Fire extinguishers utilizing the pressure of carbon dioxide to throw a stream of water onto the fire are the most widely used for this class. In the soda-acid extinguisher, the carbon dioxide is generated within the cylinder at the time of use. In another type, carbon dioxide gas is stored in the cylinder under pressure and is released by opening a valve. Class B includes fires in flammable liquids where a blanketing or smothering effect is essential. Carbon dioxide gas, dry chemical, or foam are suitable. Water should not be used. Class C includes fires in electri-

cal equipment. The use of carbon dioxide gas or dry chemical extinguishers is recommended. Water should not be used. Class D fires are burning metals. A powder formulation such as “Met-L-X” powdered graphite or trimethoxyboroxine will extinguish a metal fire. Water should not be used. In general, for small fires, salt (sodium chloride) and sodium bicarbonate, either dry or in concentrated solution are effective. Carbon tetrachloride and methyl bromide should be avoided as extinguishing agents because of the toxicity of their decomposition products, for example, phosgene.

See foam, fire-extinguishing.

“Firefrax” [Carborundum]. TM for a group of refractory cements made from kaolin or fireclay base materials for applications where aluminum silicate cements are best suited.

Use: Laying and repairing fireclay and silica brickwork, bond for crushed firebrick or ganister for patching furnace linings and for making rammed-up or monolithic linings, patching materials for by-product coke ovens, and as a wash for small pouring ladles in nonferrous foundry.

fire point. The lowest temperature at which a liquid evolves vapors fast enough to support continuous combustion. It is usually close to the flash point.

See autoignition temperature.

fire-retarding agent. See flame-retarding agent.

fire sand. See furnace sand.

fir-needle oil. (fir oil). An essential oil obtained by the steam distillation of needles and twigs of several varieties of coniferous trees (*Abies*) native to both Canada and Siberia.

Use: Odorant in perfumery, flavoring agent.

fir needle oil, Canadian type.

Properties: Found in the needles and twigs of *Abies balsamea* L. Mill (Fam. *Pinaceae*). Colorless to faintly yellow liquid; pleasant odor. Sol in fixed oils, mineral oil; sltly sol in propylene glycol; insol in glycerin.

Use: Food additive.

first law of thermodynamics. Energy can be neither created nor destroyed, only converted to other forms.

Fischer, Emil. (1852–1919). A German organic chemist, recipient of the Nobel Prize in chemistry (1902) for his original research in the chemistry of purines and sugars. He was professor of Chemistry at the University of Berlin (1882), succeeding Hofmann. He synthesized fructose and glucose and elucidated their stereochemical configurations; he also established the nature of uric acid and its deriva-

tives. Additional work included enzyme chemistry, proteins, synthetic nitric acid, and ammonia production.

Fischer, Ernst Otto. (1918–). A German inorganic chemist who won the Nobel Prize for chemistry in 1973 with Wilkinson for their independent work on the chemistry of organometallic “sandwich compounds.” He was the contributor to many publications on organometallic chemistry. His education and work were primarily in Munich.

Fischer, Hans. (1881–1945). A German biochemist who studied under Emil Fischer. He was awarded the Nobel Prize in chemistry in 1930 for his synthesis of the blood pigment hemin. He also did important fundamental research on chlorophyll, the porphyrins, and carotene.

Fischer-Hepp rearrangement. Rearrangement of secondary aromatic nitrosamines to *p*-nitrosoarylamines.

Fischer indole synthesis. Formation of indoles on heating aryl hydrazones of aldehydes or ketones in the presence of catalysts such as zinc chloride, or other Lewis acids, or proton acids.

Fischer oxazole synthesis. Condensation of equimolar amounts of aldehyde cyanohydrins and aromatic aldehydes in dry ether in the presence of dry hydrochloric acid.

Fischer peptide synthesis. Formation of polypeptides by treatment of an α -chloro or α -bromo acyl chloride with an amino acid ester, hydrolysis to the acid, and conversion to a new acid chloride that is again condensed with a second amino acid ester, and so on. The terminal chloride is finally converted to an amino group with ammonia.

Fischer phenylhydrazine synthesis. Formation of arylhydrazines by reduction of diazo compounds with excess sodium sulfite and hydrolysis of the substituted hydrazine sulfonic acid salt with hydrochloric acid. The process is a standard industrial method for production of arylhydrazines.

Fischer phenylhydrazone and osazone reaction. Formation of phenylhydrazones and osazones by heating sugars with phenylhydrazine in dilute acid.

Fischer projection formulas. Formulas which, by convention, show bonds coming out of the plane drawn vertically, and bonds that project behind the plane drawn horizontally.

Fischer-Speier esterification method. Esterification of acids by refluxing with excess alcohol in the presence of hydrochloric acid or other acid catalysts.

Fischer’s reagent. A reagent used as a test for sugars.

Derivation: Three parts of sodium acetate and two parts of phenylhydrazine hydrochloride in 20 parts of water.

Note: Do not confuse with Karl Fischer reagent.

Fischer’s salt. See cobalt potassium nitrite.

Fischer-Tropsch process. Synthesis of liquid or gaseous hydrocarbons or their oxygenated derivatives from the carbon monoxide and hydrogen mixture (synthesis gas) obtained by passing steam over hot coal. The synthesis is carried out with metallic catalysts such as iron, cobalt, or nickel at high temperature and pressure. The process was developed in Germany in 1923 by F. Fischer and H. Tropsch and was used there for making synthetic fuels before and during World War II. It has never been used for this purpose in the U.S.; the only coal-to-gasoline conversion plant using this process is Sasol in South Africa, though the closely related Lurgi process is being used rather extensively in a number of locations. Easing of the petroleum crisis has tended to diminish conversion activity in the U.S.

Fischer-Tropsch synthesis. (Synthol process; Oxo synthesis). Synthesis of hydrocarbons, aliphatic alcohols, aldehydes, and ketones by the catalytic hydrogenation of carbon monoxide using enriched synthesis gas from passage of steam over heated coke. The ratio of products varies with conditions. The high-pressure Synthol process gives mainly oxygenated products and addition of olefins in the presence of cobalt catalyst (Oxo synthesis) produces aldehydes. Normal-pressure synthesis leads mainly to petroleum-like hydrocarbons.

fisetin. (3,7,3'-tetrahydroxyflavone). $C_{15}H_{10}O_6$. See flavanol.

FISH. (Florescent in situ hybridization). A technique for uniquely identifying whole chromosomes or parts of chromosomes using florescent tagged DNA.

Fisher’s solution. See physiological salt solution.

fish glue. An adhesive derived from the skins of commercial fish (chiefly cod). A ton of skins yields about 50 gal liquid glue. Bond strength on wood is approximately 2500 psi, pH approximately 6.5–7.2. Compatible with animal glues, some dextrans, some polyvinyl acetate emulsions, and rubber latex. Chief applications are in gummed tape, cartons, blueprint paper, and letterpress printing plates. Fish glue can be made light sensitive by adding ammonium bichromate and water insoluble by UV radiation, hence its usefulness in the photoengraving process. See adhesive.

fish-liver oil. An oil containing a high percentage of vitamin A. High-potency livers, as from cod, shark, and halibut, contain from 100,000 to 1,500,000 A units/g. The oil is extracted by cooking the livers under low-pressure steam and removing the oil, which floats on the condensate. Livers of low oil content are processed with a weak solution of sodium hydroxide or sodium carbonate, which extracts the oil in emulsified form.

Use: Medicine and dietary supplement.

See fish oil.

fish meal. A fishery by-product consisting essentially of processed scrap from the filleting operation or from whole fish. In the dry process, the waste from cod, halibut, and haddock heads is disintegrated and dried. The oil and proteins are largely retained. In the wet process, the whole fish (chiefly menhaden and pilchard) are used. These are steam-cooked and run through a screw press to remove the oil. The resulting meal is then dried and packed. Its chief use is now for animal feeds and as a raw material for fish protein concentrate.

Hazard: Flammable, strong tendency for spontaneous heating.

fish oil. A drying oil obtained chiefly from menhaden, pilchard, sardine, and herring. Extracted from the entire body of the fish by cooking and compressing. Should not be confused with fish-liver oil. It contains approximately 20% polyunsaturated fatty acids, which enables it to lower cholesterol content of the human diet. Chemically modified fish oil is used in soaps, detergents, protective coatings, and alkyd resins. The hydrogenated product is used as a base for margarines and shortenings and as an industrial dispersing agent.

Hazard: Subject to spontaneous heating.

fish protein concentrate. (FPC). A flour or pastelike product prepared from whole fish including bones and viscera, of a size and type not acceptable for sale as such. Both biological (enzymatic) and chemical (solvent extraction) methods are used to obtain the proteins.

fissile. Synonymous with fissionable.
See fission.

fissiochemistry. The process by which a chemical change or reaction is brought about by nuclear energy, for example, the production of anhydrous hydrazine from liquid ammonia in a nuclear reactor.

fission. The splitting of an atomic nucleus induced by bombardment with neutrons from an external source and propagated by the neutrons so released. When a fissionable (unstable) nucleus, such as ^{235}U or ^{239}Pu , is struck by a neutron in a critical area, the following events occur: (1) the nucleus disintegrates to form several other elements, called fission products or fragments, all of which are ra-

dioactive and have high kinetic energy; (2) the disrupted nucleus emits an average of 2.5 neutrons (^{235}U) or three neutrons (^{239}Pu), which in turn split other nuclei of the fissionable material in a chain reaction that is self-perpetuating; (3) it also emits the energy equivalent of the mass defect of the nucleus, usually approximately 200 MeV per nucleus, some of which is in the form of γ rays. A nuclear explosion will not occur until a critical mass of fissionable material is attained, that is, the smallest amount capable of sustaining a chain reaction. Similarly, a nuclear reactor will not produce power until the assembly achieves a critical activity. This occurs as follows: The neutrons introduced to the system are continually escaping—some are lost through the walls, some are captured by structural materials, and some are absorbed by the fissionable atoms themselves without fission taking place. When the neutrons entering the system are very slightly in excess of those lost to it, the assembly is said to be critical and measurable power generation takes place. The ratio is carefully controlled, the rate of energy production rising exponentially. Control rods made of cadmium absorb neutrons so readily that the reactor can function at precisely predetermined levels of activity. Nuclear fission is used for electric power generation and for making radioactive isotopes.
See nuclear reactor.

Fittig's synthesis. The preparation of aromatic hydrocarbons by condensation of aryl halides with alkyl halides in the presence of metallic sodium.

fix. (1) To cause an unreactive element, e.g., nitrogen to combine into a chemical compound, as in ammonia synthesis. (2) To hold a dye permanently on a fiber or fabric by chemical or mechanical action or a combination of both. (3) To retard the evaporation rate of the volatile components of essential oils, as in perfumes.
See nitrogen fixation.

fixation. See nitrogen fixation.

fixative. (1) See fixing agent, perfume; (2) a substance applied as a spray or solution to harden and preserve objects for microscopic examination, or to pencil and ink drawings to prevent blurring, e.g., a sodium silicate solution.

fixed oil. A nonvolatile, fatty oil characteristic of vegetables as opposed to the volatile essential oils of flowers.

fixing agent, chemical. (1) A substance that aids fixation of mordants on textiles by uniting chemically with them and holding them on the fiber until the dyes can react with them. (2) A substance that causes actual precipitation of mordant on the fiber by double decomposition.

fixing agent, mechanical. (1) A substance (e.g., albumin) capable of holding pigments permanently on textile fibers. (2) Certain gums and starches that hold dyes and other substances on textile fibers long enough to permit a desirable reaction to take place.

fixing agent, perfume. (fixative). A substance that prevents too rapid volatilization of the components of a perfume and tends to equalize their rates of volatilization. It thus increases the odor life of a perfume and keeps the odor unchanged. For many years, the chief fixatives were animal products (ambergris, civet, musk, castoreum), but these have been largely replaced by synthetics. See perfume.

flagellum. Hair-like structure attached to a cell, used for locomotion in many protists and prokaryotes. The prokaryotic flagellum differs from the eukaryotic flagellum in that the prokaryotic flagellum is a solid unit composed primarily of the protein flagellin, while the eukaryotic flagellum is composed of several protein strands bound by a membrane and does not contain flagelli

“Flagyl” Tablets [Searle]. TM for metronidazole.

Use: Drug.

flake lead. See lead carbonate, basic.

flame cracking. See ethylene (note).

flame photometry. See emission spectroscopy.

flame-retarding agent. A substance applied to or incorporated in a combustible material to reduce or eliminate its tendency to ignite when exposed to a low-energy flame such as a match or cigarette. There are three methods of application: (1) as a coating or surface finish (nondurable, readily removed); (2) in solution form to penetrate the fibers (semidurable, reasonably stable); and (3) as an integral part of the polymer structure of a synthetic fiber (durable, not removable). The latter method provides permanent protection because it not only makes the material self-extinguishing but cannot be leached out by laundering or dry cleaning. Substances commonly used in methods (1) and (2) include such inorganic salts as ammonium sulfamate, zinc borate, and antimony oxychloride; chlorinated organic compounds such as chlorendic anhydride; alumina trihydrate; and certain organic phosphates and phosphonates. Method (3) is exemplified by a polyester fiber, TM “Trevira 271,” composed of polyethylene terephthalate and an undisclosed flame-retardant chemically linked to the polymer molecule. A copolymer of styrene and phosphazene has also been researched. Certain types of fibers (polyamides and

aramids) are inherently flame-retardant, e.g., nylon, “Nomex,” “Kevlar.”

Use: Carpets, rugs, upholstery, plastics used in construction and miscellaneous wearing apparel.

flammability. The ease with which a material (gas, liquid, or solid) will ignite either spontaneously (pyrophoric) or from exposure to a high-temperature environment (autoignition) or a spark or open flame. It also involves the rate of spreading of a flame once it has started. The more readily ignition occurs, the more flammable the material; less easily ignited materials are said to be combustible, but the line of demarcation is often indefinite and depends on the state of subdivision of the material, as well as its chemical nature. The Flammable Fabrics Act establishes standards of flammability to which all textile manufacturers must conform.

See flammable material; combustible material.

flammable material. Any solid, liquid, vapor, or gas that will ignite easily and burn rapidly. Flammable solids are of several types: (1) dusts or fine powders (metals or organic substances such as cellulose, flour, etc.); (2) those that ignite spontaneously at low temperatures (white phosphorus); (3) those in which internal heat is built up by microbial or other degradation activity (fish meal, wet cellulosic materials); (4) films, fibers, and fabrics of low-ignition-point materials. Flammable liquids are defined by the National Fire Protection Association and the Department of Transportation (DOT) as those having a flash point (flash p) less than 100F (37.7C) (CC) and a vapor pressure of not more than 40 psi(a) at 100F. Flammable gases are ignited very easily; the flame and heat propagation rate is so great as to resemble an explosion, especially if the gas is confined. The most common flammable gases are hydrogen, carbon monoxide, acetylene, and other hydrocarbon gases. Oxygen, though essential for the occurrence of combustion, is not itself either flammable or combustible; neither are the halogen gases, sulfur dioxide, or nitrogen. Flammable gases are extremely dangerous fire hazards and require precisely regulated storage conditions.

Note: The terms *flammable*, *nonflammable*, and *combustible* are difficult to delimit. Since any material that will burn at any temperature is combustible by definition, it follows that this word covers all such materials, irrespective of their ease of ignition. Thus, the term *flammable* actually applies to a special group of combustible materials that ignite easily and burn rapidly. Some materials (usually gases) classified in shipping and safety regulations as nonflammable are actually noncombustible. The distinction between these terms should not be overlooked. For example, sodium chloride, carbon tetrachloride, and carbon dioxide are noncombustible; sugar, cellulose, and ammonia are combustible but nonflammable.

See combustible material.

flamprop-*m*-isopropyl.CAS: 63782-90-1. mf: C₁₉H₁₉ClFNO₃.**Hazard:** Moderately toxic by ingestion and skin contact.**Use:** Agricultural chemical.**flash.** The overflow of rubber or plastic at the parting line of a mold when subjected to full pressure. It is removed in the finishing operation.**flash distillation.** Distillation in which an appreciable proportion of a liquid is quickly converted to vapor in such a way that the final vapor is in equilibrium with the final liquid. This method is now widely used for desalination of seawater.**flash photolysis.** A method of investigating the mechanism of extremely rapid photochemical reactions involving the formation of free radicals (both inorganic and organic) by irradiating a given reaction mixture with a flash of high-intensity light, thus producing the short-lived radicals that activate photochemical reactions. These products are instantaneously analyzed spectroscopically, which permits identification of the radical species from the spectra obtained. The time lapses involved in this technique are approximately 1/100,000 second. It has also been applied to study of the exceedingly fast reactions occurring in flames and explosions.

See photochemistry; free radical; photolysis.

flash point. The temperature at which a liquid or volatile solid gives off vapor sufficient to form an ignitable mixture with the air near the surface of the liquid or within the test vessel (NFPA). For the purposes of the official shipping regulations, the flash point is determined by the Tagliabue open cup method (ASTM D1310-63), usually abbreviated TOC. (IATA also permits the Abel or Abel-Pensky closed cup tester.) Other methods used, generally for the higher flash points, are the Tag closed cup (Tagliabue closed cup, TCC) and Cleveland open cup (COC). The open cup method more nearly approximates actual conditions.

See flammable material.

flattening agent. A substance ground into minute particles of irregular shape and used in paints and varnishes to disperse incident light rays so that a dull or flat effect is produced. Standard flattening agents are heavy-metal soaps, finely divided silica, and diatomaceous earth.**flavanol.** (3-hydroxyflavone). A derivative of flavanone; yellow needles melting at 169°C, has violet fluorescence in concentrated sulfuric acid. It is a flavonoid pigment. Dyes cotton a bright yellow when mordanted with aluminum hydroxide. Other hydroxyflavones are chrysin, fisetin, and quercetin. Eleven different flavonols are known. Not identical to flavonol.**flavanone.** (2,3-dihydroflavone). A group of colorless derivatives of flavone distributed in higher plants either in free form or as glucosides. About 25 different types have been isolated. It comprises one of the major groups of flavonoids. Examples are hesperidin and naringin.**flavanthrene.** (indanthrene yellow; chloranthrene yellow). C₂₈H₁₂O₂N₂.**Properties:** Brownish-yellow needles. Soluble in dilute alkaline solutions.**Derivation:** Action of antimony pentachloride on β-aminoanthraquinone in boiling nitrobenzene.**Use:** Vat dye for textiles, etc.**flavianic acid.** See 2,4-dinitro-1-naphthol-7-sulfonic acid.**flavin.** (1) isoalloxazine. C₁₀H₆N₄O₂. The nucleus of various natural yellow pigments.

See riboflavin; flavin enzymes.

(2) tetrahydroxyflavanol. C₁₅H₁₀O₆•2H₂O.

A yellow dye derived from oak bark.

flavine. See acriflavine.**flavin enzyme.** (flavoprotein). An enzyme composed of protein linked to coenzymes that are mono- or dinucleotides containing riboflavin. Because of their distinctive color, they are also called yellow enzymes. The flavin enzymes function in tissue respiration as dehydrogenases, the hydrogen atoms being taken up by the riboflavin group.**flavin-linked dehydrogenases.** Dehydrogenases requiring one of the riboflavin coenzymes, either FMN or FAD.**flavin mononucleotide.** See riboflavin phosphate.**flavin nucleotides.** Nucleotide coenzymes containing riboflavin, either FMN or FAD.**flavone.** (2-phenylchromone). One of a group of flavonoid plant pigments existing as colorless needles, that are insoluble in water and melting at 100°C. It fluoresces violet in concentrated sulfuric acid. It can be synthesized. Treatment with alcoholic alkali yields flavanone. The flavones produce ivory and yellow colors in plants and flowers.

See flavonoid.

flavonoid. A group of aromatic, oxygen-containing, heterocyclic pigments widely distributed among higher plants. They constitute most of the yellow, red, and blue colors in flowers and fruits. Exceptions are the carotenoids. The flavonoids include the following subgroups: (1) catechins; (2) leucoanthocyanidins and flavanones; (3) flavanins, flavones, and anthocyanins; and (4) flavonols.

For details consult specific entries.

flavonol. (flavon-3-ol). A flavonoid plant pigment giving ivory and yellow colors to flowers. Not identical with flavanol.

flavoprotein. An enzyme containing a FMN or FAD as a tightly bound prosthetic group. See flavin enzyme.

flavor. (1) The simultaneous physiological and psychological response obtained from a substance in the mouth that includes the senses of taste (salty, sour, bitter, sweet), smell (fruity, pungent), and feel. The sense of feel as related to flavor encompasses only the effect of chemical action on the mouth membranes such as heat from pepper, coolness from peppermint, and the like (Institute of Food Technologists). No reliable correlation of taste with chemical structure has yet been possible. Flavor is a critical factor in the acceptability of foods, medicines, confectionery, and beverages. Flavors are used in insect and animal baits to induce ingestion of the bait, also to prevent rodent attack on organic materials, e.g., tributyl tin in cable covers. Substances that affect flavor often have a synergistic effect (for example, monosodium glutamate and certain nucleotides). Sodium chloride is classed as a seasoning agent.

See potentiator; enhancer.

(2) Any substance or mixture of substances that contributes a positive taste to a food product, such as vanillin, cacao, and fruit extracts among natural products, together with numerous synthetic compounds that imitate or duplicate these tastes. Undesirable or off flavors occur in milk, meat, and other food products as a result of improper preparation, oxidation, and incipient rancidity. There are over 1500 flavoring materials listed as food additives under provisions of the Food, Drug, and Cosmetics Act.

See odor.

Flavor Extract Manufacturers Association.

(FEMA). The FEMA makes recommendations to the FDA on safety aspects of flavoring materials. Membership is composed of firms engaged in the manufacture and sale of flavoring extracts. It is located at 1620 I Street, NW, Ste. 925, Washington DC 20006.

flax. Bast fibers, approximately 20 inches long, obtained from the stems of the linseed plant, *Linum usitatissimum*. Stronger and more durable than cotton. Combustible.

Use: Apparel fabrics (linens), thread, rope, twine, cigarette paper, duplicating papers.

flaxseed oil. See linseed oil.

flecainide.

CAS: 54143-55-4. mf: $C_{17}H_{20}F_6N_2O_3$.

Hazard: Human systemic effects.

"Flectol" [Solutia]. TM for polymerized 1,2-dihydro-2,2,4-trimethylquinoline.

Use: Rubber antioxidant to retard oxidation, deterioration, and normal aging in belts, tires, hoses, retread, rubber, and general mechanics.

Fleming, Sir Alexander. (1881–1955). A Scottish biochemist and bacteriologist who discovered (1928) the bactericidal properties of molds produced from the plant *Penicillium notatum*. A broad spectrum of antibiotics has been developed from this discovery.

See antibiotic.

"Flexamine G" [Uniroyal]. TM for a mixture of *N,N'*-diphenyl-*p*-phenylenediamine and a complex diarylamine-ketone reaction product.

Properties: Brownish-gray granules. D 1.20, melting range 75–90C. "Flexamine S" is soluble in acetone, benzene, and ethylene dichloride and insoluble in water and gasoline.

Use: Antioxidant used in tires, camelback, wire insulation, neoprene belting, and soles.

"Flexol" [Dow]. TM for a series of plasticizers and stabilizers including phthalates, adipates, polyalkylene glycol derivatives, polymeric epoxies, decanoates, octoates, hexoates, tri(2-ethylhexyl)phosphate, and dibutyltin dilaurate.

Use: Film and sheeting; flooring; coated fabrics; wire, cable and other extrusions; organosols; plastisols and plastigels; lacquers; and rubbers.

"Flexomer" [Dow]. TM for very low density, extremely flexible, olefin copolymers that bridge the gap between plastics and rubber.

Use: For hose and tubing, ice and frozen-food bags, food packaging and stretch wrap, and impact modifiers when blended with other polymers.

"Flexsil" [Ametek]. TM for for a high silica refractory cloth filter designed to extract dross, slag, refractory particles, and nonmetallic inclusions from molten metals. An important property is its chemically active surface.

Use: In-mold filtration of gray, malleable, or white, compacted graphite, and ductile cast irons, as well as nonferrous aluminum- and copper-based alloys.

"Flexzone" [Uniroyal]. TM for a series of antiozonants, antioxidants, and stabilizers based on *p*-phenylenediamine.

flint. A crystalline form of native silica or quartz.

Properties: Smoky-gray, brownish, blackish or dull yellowish in color; waxy to greasy luster. Mohs hardness 6.5–7, d 2.60–2.65. More easily soluble in hot caustic alkali than is crystallized quartz.

Occurrence: Europe, U.S.

Use: Abrasive; balls for ball mills; paint extender; filler for fertilizer, insecticides, rubber, plastics, and road asphalt; ceramics; chemical tower packing.

“**Flintflex**” [*Du Pont*]. TM for air- or force-dried organic coating system.

Use: Linings in interiors of containers that haul dry bulk loadings of edibles or chemicals. Complies with FDA regulations. Accepted by the Meat Inspection Division of the USDA for interiors of freight cars, motor trucks, and trailers and in federally inspected meat-processing plants.

flint glass. See glass, optical.

“**FLIT**”. [*Clarke Mosquito*]. Proprietary insecticide containing coal tar oil and refined petroleum.

floatation. Purification and/or classification of finely divided solids, e.g., clays, by passing them through an air blast. Do not confuse with *flotation*.

flocalcitriol. See hexafluorocalcitriol.

floculant. A substance that induces flocculation. Flocculants are used in water purification, liquid waste treatment, and other special applications. Inorganic flocculants are lime, alum, and ferric chloride; polyelectrolytes are examples of organic flocculants.

flocculation. The combination or aggregation of suspended colloidal particles in such a way that they form small clumps or tufts. The word is derived from this appearance. Carbon black displays a tendency to flocculate in rubber when improperly dispersed, and some clays have the same property. Oil-well drilling muds are made alkaline to prevent flocculation of their components. Flocculation can often be reversed by agitation, because the cohesive forces are relatively weak. This is not true of other forms of aggregation (coalescence and coagulation), which are irreversible.

See agglomeration; aggregation.

flocculation value. See coagulation value.

flock. A light powder, composed of ground wood or cotton fibers, used as an extender or filler in plastics, low-grade rubber, and flooring compositions.

“**Flo-Fre**” [*Oil-Dri*]. (bentonite).

CAS: 1302-78-9. TM for flowability aid for soybean meal and other feeds.

Use: Drying agent in fertilizer impregnations.

“**Flo-Gard**” [*PPG*]. TM for amorphous calcium polysilicate used as an anticaking agent for salt.

“**Flomet-Z**” [*Mallinckrodt*]. TM for a fine, white, grit-free powder containing 12.5–14.0% zinc oxide.

Use: Lubricant in powdered iron metallurgy.

flooding, chemical. See chemical flooding.

Flood reaction. Formation of trialkylsilyl halides from hexaalkyldisiloxanes using concentrated sulfuric acid in the presence of ammonium chloride or fluoride, or by treatment of the intermediate silane sulfates with hydrochloric acid in the presence of ammonium sulfate.

“**Floropryl**” [*Merck*]. TM for diisopropyl fluorophosphate.

Flory, Paul J. (1910–1986). An American chemist who won the Nobel Prize in 1974 for his work in polymer chemistry. He published extensive work on the physical chemistry of polymers and macromolecules. He held many medals and awards. Flory received his doctorate from Ohio State University in 1934. He was the C. J. Wood professor of chemistry at Stanford University.

flotation. A method of separating minerals from waste rock or solids of different kinds by agitating the pulverized mixture of solids with water, oil, and special chemicals that cause preferential wetting of solid particles of certain types by the oil, while other kinds are not wet. The unwetted particles are carried to the surface by the air bubbles and thus separated from the wetted particles. A frothing agent is also used to stabilize the bubbles in the form of a froth that can be easily separated from the body of the liquid (froth flotation). Do not confuse with floatation.

flow cytometry. Analysis of biological material by detection of the light-absorbing or fluorescing properties of cells or subcellular fractions (i.e., chromosomes) passing in a narrow stream through a laser beam. An absorbance or fluorescence profile of the sample is produced. Automated sorting devices, used to fractionate samples, sort successive droplets of the analyzed stream into different fractions depending on the fluorescence emitted by each droplet.

flow diagram. (flow sheet). A chart or line drawing used by chemical engineers to indicate successive steps in the production of a chemical, materials input and output, by-products, waste, and other relevant data.

flow karyotyping. Use of flow cytometry to analyze and/or separate chromosomes on the basis of their DNA content.

flowers. A fine powder usually resulting from sublimation of a substance, e.g., flowers of sulfur. The term is now obsolete.

flowers of Benjamin. See benzoic acid.

flox. A mixture of liquid fluorine (30%) and liquid oxygen (70%), designed for use as a space-vehicle propellant.

Hazard: Explosively flammable.

fluazifop-butyl.

CAS: 69806-50-4. mf: $C_{19}H_{20}F_3NO_4$.

Properties: Pale straw-colored, odorless liquid. Bp: 165°, mp: 13°, d: 1.21 @ 20°.

Hazard: Moderately toxic by ingestion.

Use: Food additive; herbicide; agricultural chemical.

fluazinam. See 3-chloro-*n*-(5-chloro-2,6-dinitro-4-trifluoromethylphenyl)-5.

fluorbazone-sodium.

CAS: 181274-17-9. mf: $C_{12}H_{10}F_3N_4O_6S \cdot Na$.

Hazard: Moderately toxic.

fluocythrinat. See (+)cyano(3-phenoxyphenyl)methyl(\bar{n})-1-(difluoromethoxy).

fluid. Any material or substance that changes shape or direction uniformly in response to an external force imposed on it. The term applies not only to liquids but also gases and finely divided solids. Fluids are broadly classified as Newtonian and non-Newtonian depending on their obedience to the laws of classical mechanics.

See liquid, Newtonian; rheology; fluidization; hydraulic fluid.

fluid bed. See fluidization.

fluidization. A technique in which a finely divided solid is caused to behave like a fluid by suspending it in a moving gas or liquid. The solids so treated are frequently catalysts, hence the term *fluid catalysis*. The fluidized catalyst, e.g., alumina-silica gel, is brought into intimate contact with the suspending liquid or gas mix, usually a petroleum fraction. Local overheating of the catalyst is greatly reduced, and portions of catalyst can be easily removed for regeneration without shutting down the unit. There are also noncatalytic applications of fluidization, e.g., reduction of iron ore. Important uses of the fluidized bed process are (1) cracking of petroleum fractions, (2) gasification of coal, (3) application of organic coatings to metals (fusion bond method), (4) coal combustion, in which sulfur-bearing coal (1.33-inch diameter) is fed into a fluidized bed of limestone. Combustion occurs at 1600F, at which temperature the limestone is reduced to lime, which reacts with the sulfur in the coal to form gypsum. This technique makes possible the use of high-sulfur coal without necessity of scrubbers. The bed material is approximately 5% coal and 95% limestone products.

fluid mosaic model. A model proposed by Singer and Nicholson, describing biological membranes as a fluid lipid bilayer with embedded pro-

teins that create a mosaic. Both protein and lipid components of the bilayer are able to move but exhibit both structural and functional asymmetry.

fluid, supercritical. See supercritical fluid.

fluoboric acid. (fluoroboric acid; hydrogen tetrafluoroborate).

CAS: 16872-11-0. HBF₄.

Properties: Colorless. Strongly acidic liquid. D approximately 1.84; bp 130C (decomposes). Miscible with water and alcohol.

Derivation: Action of boric and sulfuric acids on fluorspar.

Grade: Technical (approximately 48%), pure.

Hazard: Highly toxic, corrosive, irritant.

Use: Production of fluoborates, electrolytic brightening of aluminum, throwing power aid in electrolytic plating baths, esterification catalyst, metal cleaning, making stabilized diazo salt.

fluometuron. (*N*-(3-trifluoromethylphenyl)-*N',N'*dimethylurea).

CAS: 2164-17-2. $C_{10}H_{11}F_3N_2O$.

Properties: Crystalline solid. Mp 163C. Partially soluble in water; soluble in alcohol and acetone.

Derivation: Reaction of dimethylamine with 3-trifluoromethylphenyl isocyanate.

Hazard: Toxic by ingestion.

Use: Herbicide.

fluophosphate alkyl ester. See diisopropyl fluorophosphate.

fluor. See phosphor.

fluoranthene. (idryl).

CAS: 206-44-0. $C_{16}H_{10}$. A tetracyclic hydrocarbon.

Properties: Colored needles. Fp 107C, bp 250C (60 mm Hg). Insoluble in water; soluble in ether and benzene. Combustible.

Derivation: From coal tar.

fluorapatite. See apatite.

fluorbenside. $ClC_6H_4CH_2SC_6H_4F$. (generic name accepted for *p*-chlorobenzyl-*p*-fluorophenyl sulfide).

Properties: Crystals, mp 36C, insoluble in water, soluble in acetone and oils.

Use: Acaricide.

“Fluorel” [3M]. TM for a fully saturated fluorinated polymer containing more than 60% fluorine by weight.

Use: O-rings, gaskets, hoses, wire and fabric coatings, diaphragms, fuel cells, expellent bladders, sealants, insulation, containers.

fluorene. (α -diphenylenemethane).

CAS: 86-73-7.

Properties: Small, white, crystalline plates; fluorescent when impure. Mp 116C, bp 295C (decomposes). Soluble in alcohol, ether, benzene, and carbon disulfide; insoluble in water. Combustible.

Derivation: By reduction of diphenylene ketone with zinc, from coal tar.

Grade: Technical, 98% pure.

Use: Resinous products, dyestuffs.

9-fluorenone.

CAS: 486-25-9. $C_{13}H_{10}O$.

Properties: Solid. Mw 180.21, mp 82–85C, bp 342C.

Use: Intermediate.

fluorescein. (resorcinolphthalein; diresorcinolphthalein; CI 45350).

CAS: 2321-07-5. $C_{20}H_{12}O_5$

Properties: Orange-red, crystalline powder. Very dilute alkaline solutions exhibit intense greenish-yellow fluorescence by reflected light, while the solution is reddish-orange by transmitted light. Mp decomposes at 290C; soluble in dilute alkalies, boiling alcohol, ether, dilute acids, and glacial acetic acid; insoluble in water, benzene, chloroform. Combustible.

Derivation: By heating phthalic anhydride and resorcinol.

Grade: The sodium salt (uranine) and potassium salt are marketed.

Use: Dyeing seawater for spotting purposes, tracer to locate impurities in wells, dyeing silk and wool, diagnostic aid in ophthalmology, indicator and reagent for bromine.

See uranine.

fluorescence. A type of luminescence in which an atom or molecule emits visible radiation in passing from a higher to a lower electronic state. The term is restricted to phenomena in which the time interval between absorption and emission of energy is extremely short (10^{-8} to 10^{-3} second). This distinguishes fluorescence from phosphorescence, in which the time interval may extend to several hours. Fluorescent materials may be liquid or solid, organic or inorganic. Fluorescent crystals such as zinc or cadmium sulfide are used in lamp tubes, television screens, scintillation counters, and similar devices. Fluorescent dyes are used for labeling molecules in biochemical research.

See phosphorescence; phosphor; resonance (2).

fluorescent brightener 85. See C.I. fluorescent brightener 85.

fluorescent brightener 220. See C.I. fluorescent brightener 220.

fluoridation. Addition to public drinking water supplies of 1 ppm of a fluoride salt for the purpose of reducing the incidence of dental caries. The chemicals most commonly used for city fluoridation programs are fluosilicic acid, sodium silicofluoride, and sodium fluoride. The concentration used has been established to be far below the permissible level of toxicity of fluorine-containing compounds in the human body. The program was successfully tested for over 20 years on local populations and since then has been widely adopted in large cities in the U.S. The protection is especially effective for children, whose teeth are usually more susceptible to caries than those of adults. Fluorine is a bone-seeking element; tooth protection is due to the ability of fluoride ion to replace other ions in hydroxyapatite, the chief mineral component of bones and teeth. Fluorides are used in toothpastes and other dentifrices.

fluorinated ethylene-propylene resin.

(FEP resin). A copolymer of tetrafluoroethylene and hexafluoropropylene with properties similar to polytetrafluoroethylene resin. The repeating structure of the molecule is $[-CF_2-CF_2-CF_2CF(CF_3)-]_n$.

See "Teflon."

Properties: Similar to polytetrafluoroethylene but has a higher coefficient of friction.

Available forms: Extrusion and molding powder, aqueous dispersion, film, monofilament fiber, and nonsticking finish.

Use: Wire and cable insulation, pipe linings, lining for processing equipment. Fibers are used for filtration screening and mist separators.

fluorine.

CAS: 7782-41-4. F. Nonmetallic halogen element in group 17 of the periodic table. An 9, aw 18.99840, valence of 1, no other stable isotopes, the most electronegative element and most powerful oxidizing agent known.

Properties: Pale-yellow diatomic gas or liquid; pungent odor. Bp -188C, fp -219C, d (gas) 1.695 (air = 1.29), d (liquid) 1.108 (-188C), sp vol 10.2 cu ft/lb (21C). Reacts vigorously with most oxidizable substances at room temperature, frequently with ignition; forms fluorides with all elements except helium, neon, and argon.

Occurrence: Widely distributed to the extent of 0.03% of the earth's crust. The chief minerals are fluorapatite, cryolite, and fluorspar (Spain, Mexico, South Africa).

Derivation: Electrolysis of molten anhydrous hydrofluoric acid-potassium fluoride melts with special copper-bearing carbon anodes, steel cathodes and containers, and Monel screens.

Hazard: Powerful oxidizing agent; though nonflammable, it reacts violently with a wide range of

both organic and inorganic compounds and thus is a dangerous fire and explosion risk in contact with such materials. Toxic by inhalation, extremely strong irritant to tissue. TLV: 1 ppm; STEL 2 ppm. **Use:** Production of metallic and other fluorides; production of fluorocarbons, active constituent of fluoridating compounds used in drinking water, tooth-pastes, etc.

fluorine cyanide. See cyanogen fluoride.

fluorine nitrate.

CAS: 7789-26-6. FNO_3 .

Properties: Gas or liquid. Ignites in contact with alcohol, aniline, and ether.

Hazard: Strong oxidizing agent, liquid explodes on shock or friction.

Use: Rocket propellants.

fluoroacetic acid.

CAS: 144-49-0. CH_2FCOOH .

Properties: Colorless crystal. Mp 33C, bp 165C. Soluble in water and alcohol.

Hazard: Toxic by ingestion.

Use: Rodenticide.

fluoroacetophenone. (phenacyl fluoride;

phenyl fluoromethylketone). $\text{C}_6\text{H}_5\text{COCH}_2\text{F}$.

Properties: Brown liquid; pungent odor. Bp 98C (8 mm Hg).

Derivation: By Friedel-Crafts synthesis.

Hazard: Irritant. TLV: 2.5 mg(F)/m³.

p-fluoroaniline.

CAS: 371-40-4. $\text{FC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid. D 1.1524 (25C), bp 187.4C, fp -2C, refr index 1.5395 (20C).

Hazard: Toxic material.

Use: Intermediate (herbicides), preparation of p-fluorophenol.

See aniline.

fluorobenzene. (phenyl fluoride).

CAS: 462-06-6. $\text{C}_6\text{H}_5\text{F}$.

Properties: Colorless liquid; benzene odor. D 1.0252 (20C), refr index 1.4646 (25C), bp 84.9C, fp -40C. Insoluble in water, miscible with alcohol and ether.

Hazard: Flammable, dangerous fire risk. Irritant. TLV: 2.5 mg(F)/m³.

Use: Insecticide and larvicide intermediate, identification reagent for plastic or resin polymers.

1-(2-(4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl)ethyl)-3-phenyl-2-imidazolidinone.

CAS: 200398-40-9. mf: $\text{C}_{23}\text{H}_{25}\text{FN}_4\text{O}_2$.

Hazard: A poison by ingestion.

p-fluorobenzoic acid 2-phenylhydrazide.

CAS: 1496-02-2. mf: $\text{C}_{13}\text{H}_{11}\text{FN}_2\text{O}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

fluoroboric acid. Legal label name (Air) for fluoboric acid.

fluorocarbon. Any of a number of organic compounds analogous to hydrocarbons in which the hydrogen atoms have been replaced by fluorine. The term is loosely used to include fluorocarbons that contain chlorine; these should properly be called chlorofluorocarbons or fluorocarbon chloride, since they deplete the ozone layer of the upper atmosphere.

See chlorofluorocarbon.

Properties: Fluorocarbons are chemically inert, non-flammable, and stable to heat up to 260–315C. They are denser and more volatile than the corresponding hydrocarbons and have low refractive indices, low dielectric constants, low solubilities, low surface tensions, and viscosities comparable to hydrocarbons. Some are compressed gases and others are liquids.

Hazard: Nonflammable; reacts violently with reactive substances, e.g., barium, sodium, and potassium.

Use: Refrigerants, solvents, blowing agents, fire extinguishment, lubricants and hydraulic fluids, flotation and damping fluids, dielectric, plastics, electrical insulation, wax coatings for alkali cleaning tanks, air-conditioning. *Note:* Many of these compounds are designated by a number system preceded by the word *refrigerant*, *propellant*, *fluorocarbon* or by a TM (“Freon,” “Ucon,” “Genetron”).

They are cross-referenced in this book as follows:

11. See trichlorofluoromethane.
12. See dichlorodifluoromethane.
13. See chlorotrifluoromethane.
14. See tetrafluoromethane.
21. See dichlorofluoromethane.
22. See chlorofluoromethane.
23. See fluoroform.
113. See 1,1,2-trichloro-1,2,2-trifluoroethane.
114. See 1,2-dichloro-1,1,2,2-tetrafluoroethane.
115. See chloropentafluoroethane.
116. See hexafluoroethane.

fluorocarbon polymer. This term includes polytetrafluoroethylene, polymers of chlorotrifluoroethylene, fluorinated ethylene-propylene polymers, polyvinylidene fluoride, hexafluoropropylene, etc.

Properties: Thermoplastic; resistant to chemicals and oxidation; broad useful temperature range (up to 287C); high dielectric constant; resistant to moisture, weathering, ozone, and UV radiation. Their structure comprises a straight backbone of carbon atoms symmetrically surrounded by fluorine atoms. Noncombustible.

Available forms: Powders, dispersions, film, sheet, tubes, rods, tapes, and fibers.

Use: High-temperature wire and cable insulation, electrical equipment, drug and chemical equipment, coating of cooking utensils, piping gaskets, continu-

ous sheet, bonding industrial diamonds to metal (grinding wheels).
See fluoroelastomer.

fluorochemical. Organic compounds, not necessarily hydrocarbons, in which a large percentage of the hydrogen directly attached to carbon has been replaced by fluorine. The presence of two or more fluorine atoms on a carbon atom usually imparts stability and inertness to the compound, and fluorine usually increases the acidity of organic acids.

Derivation: (1) Electrolysis of solutions in hydrogen fluoride (Simons process); (2) replacement of chlorine or bromine by fluorine with hydrogen fluoride in the presence of a catalyst (antimony trifluoride or pentafluoride); (3) addition of hydrogen fluoride to olefins or acetylene.

Use: Dielectric and heat-transfer liquids, pump sealants, surfactants, metering devices, special solvents. See fluorocarbon; fluoroelastomer.

5-fluorocytosine. (flucytosine).

CAS: 2022-85-7. $C_4H_4FN_3O$.

Properties: Crystalline solid. Mw 129.09, mp 295C (decomposes), light sensitive.

fluorodichloromethane. See dichlorofluoromethane.

fluoroelastomer. Any elastomeric high polymer containing fluorine; they may be homopolymers or copolymers. Fluorocarbon polymers include a large group of fluoroelastomers, including a copolymer in which the molecular skeleton is a $-P=N-$ chain containing approximately equal numbers of tri- and heptafluoroethoxy side groups. Such polymers are amorphous, thermally stable, noncombustible. Generally resistant to attack by solvents and chemicals, have low glass transition temperature ($-77C$), and are generally resistant to attack by solvents and chemicals.

fluoroform. (trifluoromethane; propellant 23; refrigerant 23).

CAS: 75-46-7. CHF_3 .

Properties: Colorless gas. Bp $-84C$, mp $-160C$. Nonflammable.

Grade: 98% min purity.

Use: Refrigerant, intermediate in organic synthesis, direct coolant for infrared detector cells, blowing agent for urethane foams.

fluoroformyl fluoride. See carbonyl fluoride.

"Fluorographite" [Atofina]. TM for fluorinated graphite cathode material.

Use: Lithium anode batteries, lubricant chromatographic materials.

"Fluoroinert" [3M]. TM for a series of perfluorinated liquids used for cleaning electronic com-

ponents after testing, bp range 31–173C, high dielectric strength, colorless, nonflammable.

fluorol. See sodium fluoride.

"Fluorolubes" [Occidental]. TM for polymers of trifluorovinyl chloride ($-(CF_2-CFCl)-_x$ containing 49% fluorine and 31% chlorine. Products are light oils, heavy oils, and greaselike materials.

Use: Lubricant and sealant for plug cocks, valves, and vacuum pumps; impregnant for gaskets and packings; fluid for hydraulic equipment, heat exchange, and instrument damping.

fluoromethane. (methyl fluoride).

CAS: 593-53-3. CH_3F .

Properties: Colorless gas. Bp $-78.2C$, fp $-142C$, d 1.19 (air = 1.29). Soluble in alcohol and ether.

Hazard: Flammable. Narcotic in high concentrations. TLV: 2.5 mg(F)/m³.

fluorometholone. (9-fluoro-11,17-dihydroxy-6-methylpregna-1,4-diene-3,20-dione; fluormetholone). $C_{22}H_{33}FO_4$.

Properties: Crystalline solid. Mp 292–303C.

Use: A steroid, glucocorticoid, antiinflammatory.

3-(6-fluoro-2-naphthalenyl)-2,5-dihydro-1,2-dimethyl-1h-pyrrole, el-(2r,3r)-2,3-dihydroxybutanedioate (1:1).

CAS: 326800-76-4. mf: $C_{16}H_{16}FN \cdot C_4H_6O_6$.

Hazard: A poison.

3-(6-fluoro-2-naphthalenyl)-1,2-dimethyl (2r,3s)-rel-3-pyrrolidinol hydrochloride.

CAS: 302959-28-0. mf: $C_{16}H_{18}FNO \cdot ClH$.

Hazard: A poison.

fluoronitrofen.

CAS: 13738-63-1. mf: $C_{12}H_6Cl_2FNO_3$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

p-fluorophenol. (4-fluorophenol).

CAS: 371-41-5. FC_6H_4OH .

Properties: White, crystalline solid. D 1.1889 (56C), mp 48.2C (stable form), 28.5C (unstable form), bp 185.6C. Soluble in water.

Hazard: Irritant.

Use: Fungicide, intermediate for pharmaceuticals.

2-(4-fluorophenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-09-0. mf: $C_{17}H_{11}FN_2$.

Hazard: A reproductive hazard.

3-(4-fluorophenyl)-n-(4-propylcyclohexyl)-2-propenamide.

CAS: 315706-75-3. mf: $C_{18}H_{24}FNO$.

Hazard: A poison by ingestion.

8-fluoro-*n*-(2-(4-phenyl-2-thiazolyl)ethyl)-4-quinolinamine.CAS: 124533-50-2. mf: C₂₀H₁₆FN₃S.**Hazard:** Moderately toxic by ingestion.**fluorophosphoric acid, anhydrous.**CAS: 13537-32-1. H₂PO₃F.**Properties:** Colorless, viscous liquid. D 1.1818 (25C). Miscible with water.**Hazard:** Strong irritant to tissue.**Use:** Metal cleaners, electrolytic or chemical polishing agents, formation of protective coatings for metal surfaces, catalyst.

See difluorophosphoric acid; hexafluorophosphoric acid.

4-fluoro-*n*-(4-propylcyclohexyl)benzamide.CAS: 315706-67-3. mf: C₁₆H₂₂FNO.**Hazard:** A poison by ingestion.**6-fluoro-7-(1-pyrrolyl)-1-ethyl-1,4-dihydro-4-oxo-3-quinolinecarboxylic acid.**CAS: 91524-15-1. mf: C₁₆H₁₃FN₂O₃.**Hazard:** Low toxicity by ingestion.**fluorosilicic acid.** See fluosilicic acid.**fluorosulfonic acid.** See fluosulfonic acid.**fluorosulfuric acid.** See fluosulfonic acid.**fluorothane.** (ethyl fluoride). CH₃CH₂F.**Use:** Replaces ether in surgery.***n*-(2-fluoro-1,1,2,2-tetrachloroethylthio)-methanesulfoanilide.**CAS: 22729-75-5. mf: C₉H₈Cl₄FNO₂S₂.**Hazard:** Low toxicity by ingestion.**Use:** Agricultural chemical.**5-fluoro-3-(tetrahydro-2-furyl)uracil.**CAS: 63901-83-7. mf: C₈H₉FN₂O₃.**Hazard:** Moderately toxic by ingestion.**fluorothene.** See chlorotrifluoroethylene polymer.**8-fluoro-*n*-(2-(2-thienyl)ethyl)-4-quinolinamine.**CAS: 124533-68-2. mf: C₁₅H₁₃FN₂S.**Hazard:** Moderately toxic by ingestion.**fluorotrchloromethane.** See trichlorofluoromethane.**5-fluorouracil.** [5-fluoro-2,4(1H,3H)-pyrimidinone].CAS: 51-21-8. C₄H₃FN₂O₂.**Properties:** Crystalline solid. Mw 130.08, mp 282C (decomposes). Soluble in water or methanol-water mixtures.**Use:** Antineoplastic agent.**fluorspar.** (fluorite; florspar). CaF₂. Natural calcium fluoride; yellow, green, or purple crystals. Mohs hardness 4, d 3.2, mp 1350C.**Grade:** Metallurgical; ceramic and acid, containing more than 85 and 98% CaF₂, respectively.**Occurrence:** U.S., Canada, Europe, Mexico.**Use:** Principal source of fluorine and its compounds by way of hydrogen fluoride, flux in open-hearth steel furnaces and in metal smelting, in ceramics, for synthetic cryolite, in carbon electrodes, emery wheels, electric arc welders, certain cements, dentifrices, phosphors, paint pigment, catalyst in wood preservatives, optical equipment.**fluosilicate.** A salt of fluosilicic acid, H₂SiF₆.**fluosilicic acid.** (hydrofluosilicic acid; fluoro-silicic acid; hexafluorosilicic acid; hydrogen hexafluorosilicate; hydrosilicofluoric acid; hydrofluosilicic acid).CAS: 16961-83-4. H₂SiF₆.**Properties:** Aqueous solution: Colorless fuming liquid. Attacks glass and stoneware.**Derivation:** By-product of the action of sulfuric acid on phosphate rock containing fluorides and silica or silicates. The hydrogen fluoride acts on the silica to produce silicon tetrafluoride, SiF₄, which reacts with water to form fluosilicic acid, H₂SiF₆.**Grade:** Technical, CP.**Hazard:** Extremely corrosive by skin contact and inhalation.**Use:** Water fluoridation, ceramics (to increase hardness), disinfecting copper and brass vessels, hardening cement, etc., wood preservative and impregnating compounds, electroplating, manufacture of aluminum fluoride, synthetic cryolite and hydrogen fluoride, sterilizing bottling and brewing equipment (1–2% solution).**fluosulfonic acid.** (fluorosulfuric acid; fluorosulfonic acid).CAS: 7789-21-1. HSO₃F.**Properties:** Colorless, fuming liquid. D 1.745 (15C); fp –87C; bp 165C. Soluble in nitrobenzene. Reacts violently with water, does not attack glass.**Derivation:** Reaction of anhydrous hydrogen fluoride with sulfuric acid or sulfuric acid anhydride.**Hazard:** Extremely irritating to eyes and tissue.**Use:** Catalyst in organic synthesis, electropolishing, fluorinating agent.**flushed color.** A pigment dispersed in oil, varnish, etc., the transfer from the water phase to the oil phase having been effected without the usual drying and subsequent grinding of the dry pigment. It is claimed that flushed colors are ready for use without grinding.**fluvoxamine.**CAS: 54739-18-3. mf: C₁₅H₂₁F₃N₂O₂.**Hazard:** A poison.

fluvoxamine maleate.CAS: 61718-82-9. mf: $C_{15}H_{21}F_3N_3O_2 \cdot C_4H_4O_4$.**Hazard:** A poison by ingestion. Human systemic effects.

flux. (1) A substance that promotes the fusing of minerals or metals or prevents the formation of oxides. For example, in metal refining lime is added to the furnace charge to absorb mineral impurities in the metal. A slag is formed that floats on the bath and is run off. (2) A substance applied to metals that are to be united. On application of heat, it aids the flow of solder and prevents formation of oxides. (3) Any readily fusible glass or enamel used as a base or ground in ceramic processing. (4) The rate of flow or transfer of electricity, magnetism, water, heat, energy, etc., the term being used to denote the quantity that crosses a unit area of a given surface in a unit of time. (5) The intensity of neutron radiation, expressed as the number of neutrons passing through one square centimeter in one second. (6) A mixture of sodium nitrate and sodium nitrite; oxidizing agent used as a low explosive.

fluxing lime. See calcium oxide.

fly ash. The very fine ash produced by combustion of powdered coal with forced draft and often carried off with the flue gases. Special equipment is required for effective recovery, e.g., electrostatic precipitators. Fly ash is a mixture of alumina, silica, unburned carbon, and various metallic oxides. It is reported to have mutagenic properties after passing through stack precipitators. The alumina is recoverable by calssintering, which makes it a possible alternative source of aluminum.

Use: Cement additive for oil-well casings, absorbent for oil spills (silicone-coated), to replace lime in scrubbing sulfur dioxide from flue gas, as a filler in plastics, source of germanium (England), proposed as catalyst for coal liquefaction, removal of heavy metals from industrial wastewaters, separation of oil-sand tailings.

See calssintering.

Fm. Symbol for fermium.

FMN. Abbreviation for flavin mononucleotide. See riboflavin phosphate.

foam. A dispersion of a gas in a liquid or solid. The gas globules may be of any size, from colloidal to macroscopic, as in soap bubbles. Bakers' bread and sponge rubber are examples of solid foams. Typical liquid foams are those used in fire-fighting, shaving creams, etc. In such foams, the liquid must have sufficient cohesion to form an elastic film, e.g., soap, oil, protein, fatty acids, etc. Surfactant-induced foams have been developed to increase the efficiency of fuel cells. Foams made by mechanical incorporation of air are widely used in the food industry, e.g., whipped cream, egg white, ice cream,

etc. Useful foams for automobile seats, mattresses, and similar uses are made from natural and synthetic latexes, e.g., polystyrene, polyurethane. A glass foam is based on sodium silicate and rock wool, and vitreous ceramic foams are also available. Metals can be caused to foam. Concrete foams are also in general use. Foams designed for fire extinguishment are agglomerations of small bubbles of gas produced by two methods: (1) by chemical reaction between aluminum sulfate and sodium bicarbonate to generate carbon dioxide (chemical foams), and (2) by mixing or agitation of air with water containing the foaming ingredients (mechanical foams). The two types are equally efficient in fire-extinguishing ability. Besides the foaming ingredients, the foams contain stabilizing agents to assure permanence; there are many of these, for example, soaps, proteins, extract of licorice root, fatty acids, and sulfite liquors. The ingredients of chemical foams are assembled in two separate units, which generate the foam on blending. Fire foams are used primarily on fires in hydrocarbon liquids (class B fires). There are many special types tailored for specific uses. Some fire-protection systems for aircraft include an instant-generating foam for cabin interiors, using a 2.5% aqueous solution of alkyl sulfonate and rigid polyurethane foams for use in fuel tanks.

See fire extinguishment.

An unusually stable foam that remains intact much longer than fire-fighting foams has been developed at Sandia National Laboratories. It results from a synergistic action caused when a water-soluble polymer and a fatty alcohol are blended with a solvent and a surfactant. A possible agricultural use would be in insecticide application.

foam, metal. A cellular metallic structure, usually of aluminum or zinc alloys, made by incorporating titanium or zirconium hydride in the base metal. This subsequently evolves hydrogen to produce a uniform, foamlike material. Its density is approximately that of seawater so that it is weightless when submerged. The principal use of foamed metals is in absorption of shock impact without elastic rebound. Fiber-reinforced light-metal foams have potential application in reducing the weight of automobile bodies.

foam, plastic. A cellular plastic that may be either flexible or rigid. Flexible foams may be polyurethane, rubber latex, polyethylene, or vinyl polymers; rigid foams are chiefly polystyrene, polyurethane, epoxy, and polyvinyl chloride. The blowing agents used are sodium bicarbonate, halocarbons such as CCl_3F , and hydrazine. Flexible polystyrene foam is available in extruded sheets and also in the form of beads made by treating a polystyrene suspension with pentane; these expand from 30 to 50 times on heating and are used as automobile radiator sealants. Rigid foams are widely used for boat construction, filtration, fillers in packing cases, absorp-

tion of oil spills, and building insulation. The latter application involves a fire risk described below.

Hazard: The most widely used types of organic foam plastics (polystyrene, polyurethane, polyisocyanurate) are combustible; even when fire-retardant agents are incorporated, such foams will burn. The extent of burning or fire severity will vary with surface treatment, end-use location, recipe, and degree of protection. Thin coatings of fire-retardant paint, metal, or automatic sprinkler systems may not adequately protect against rapid fire spread. Organic foamed plastic surfaces should not be left exposed. Multiple adjacent surfaces such as walls and ceiling create a most severe hazard because of the chemical kinetics associated with radiative, conductive, and convective currents developed during a building fire. New methods of making such plastic foams as polyurethane that are reported to reduce their combustibility have been developed, for example, use of trichlorobutylene oxide instead of propylene oxide. Use of urea-formaldehyde foams for building insulation has been restricted in some areas due to potential toxic effect of the formaldehyde.

foab. Abbreviation for "freight on board," a designation used in shipping a material to indicate that freight charges are to be paid by the purchaser. This is in contrast to "freight prepaid and allowed," indicating that freight charges are paid by the manufacturer.

fog. A suspension of liquid droplets in air; an aerosol. The size of the droplets ranges from colloidal to macroscopic. "Synthetic" fogs can be produced on a laboratory scale by ultrasonic vibrations, and natural fogs can be precipitated by the same means. Mists or fogs composed of atomized particles of oil are used as military concealment screens and for insecticidal purposes in orchards and truck gardens.

See smog; chemical smoke; aerosol.

folacin. See folic acid.

folic acid. (pteroylglutamic acid; folacin; PGA). $C_{19}H_{19}N_7O_6$. Considered a member of the vitamin B complex. At least three substances with folic acid activity occur in nature, one of which, pteroylglutamic acid, is made synthetically.

Properties: Pteroylglutamic acid: Orange-yellow needles or platelets; tasteless; odorless. Slightly soluble in methanol and sparingly soluble in water; insoluble in acetone, ether, benzene; moderately soluble in dilute alkali hydroxide and carbonate solutions; stable in heat in neutral and alkaline solution; destroyed by heating with acid; inactivated by light.

Source: Green plant tissue, fresh fruit, liver, and yeast. Synthetic pteroylglutamic acid made by the reaction of 2,3-di-bromopropanol, 2,4,5-triamino-6-hydroxypyrimidine, and *p*-aminobenzoyl glutamic acid.

Grade: 10% feed grade, USP.

Use: Medicine, nutrition, food additive (maximum daily ingestion not to exceed 0.01 mg).

See folinic acid.

folinic acid. (5-formyl-5,6,7,8-tetrahydropteroyl-l-glutamic acid; citrovorum factor; leucovorin). $C_{20}H_{23}N_7O_7$. A member of the folic acid group of vitamins and a growth factor for the bacterium *Leuconostoc citrovorum*. Folinic acid is an important metabolite of folic acid and may be the active form in cellular metabolism. It is an effective hemopoietic factor. Ascorbic acid and vitamin B₁₂ are essential for the conversion of folic acid to folinic acid.

Properties: (*dl* form): Crystals. Decompose 240–250C. Sparingly soluble in water.

Derivation: (1) Prepared by catalytic reduction of folic acid, (2) produced microbially.

Use: Medicine, nutrition, biochemical research.

folpet. (phaltan; (*N*-(trichloromethylthio)-phthalimide)).

CAS: 133-07-3. $C_8H_4(CO)_2NSCCl_3$.

Properties: Light-colored powder. Insoluble in water, slightly soluble in organic solvents.

Use: Fungicide-bactericide for vinyls, paints, and enamels.

"Fomerez" [Crompton & Knowles]. TM for a series of polyester and polyether resins, stannous octoate catalysts, and coupling agents used in the manufacture of urethane foams.

fonofos. See dyfonate.

"Fonoline" [Crompton & Knowles]. TM for petrolatum of soft consistency and low melting point with color range of white to yellow and meeting USP or NF purity requirements for petrolatum.

fonophos. (ethylphosphonodithioic acid-*O*-ethyl-*S*-phenyl ester).

CAS: 944-22-9. $C_{10}H_{15}OPS_2$.

Properties: Yellow liquid. Insoluble in water; miscible with organic solvents.

Hazard: Cholinesterase inhibitor.

Use: Insecticide, soil fumigant.

food. Any substance or mixture that, when ingested by humans or animals, contributes to the maintenance of vital processes. With the exception of sodium chloride and water, all foods are derived from plants, either by direct consumption or by ingestion of animal tissue or such animal products as eggs, milk, etc., which are derived metabolically from vegetable sources. Basic foods are composed of proteins, fats (lipids), and carbohydrates, together with vitamins and minerals. Ancillary items that are associated with foods, though with little or no nutritive value, are collectively called food additives, e.g., flavorings, spices, preservatives, and colorants.

Many of these are also plant-derived, though some are now made synthetically.
See plant (1); nutrient.

food additive. (1) Intentional: The Food Protection Committee of the National Research Council states that a food additive is "a substance or mixture other than a basic foodstuff that is present in food as a result of any aspect of production, processing, storage, or packaging." (2) Unintentional: Substances that may become part of a food product as a result of chance contamination, such as insecticide residues, fertilizers, and the like. The permissible content of insecticide residues has been established by the FDA. The Food Additives Amendment to the Food, Drug, and Cosmetic Act empowers the FDA to disapprove or discontinue any food additive that it determines to be unsafe at the level of intended use, based on data supplied by the manufacturer.

Note: Unintentional additives should more logically be called contaminants.

Food and Drug Administration. (FDA).

The federal agency responsible for administering and enforcing the Food, Drug, and Cosmetic Act, including the Food Additives Amendment, which went into effect in March 1960 and has been extended and updated regularly. It has the authority to require proof of the efficacy and safety of drugs, foods, and pharmaceuticals; to conduct and evaluate screening tests; and to compel withdrawal from the market of any such product that it finds ineffective or hazardous. It establishes tolerances on food and animal feed additives of all types, including pesticides, as well as on cosmetic products, flammable fabrics, and packaging and labeling materials. It can also require specific statement on labels of the components or ingredients of a product, as well as precautionary warnings. Headquarters are located at 5600 Fishers Lane, Rockville MD 20857-0001. Website: <http://www.fda.gov>. See Environmental Protection Agency; food additive.

food chain. The sequence of nutritional steps in an ecosystem, with producers at the bottom and consumers at the top.

food color. (certified color). A colorant that may be either dye (soluble) or a lake (insoluble) permissible for use in foods, drugs, or cosmetics by the FDA. The dyes color by solution and the lakes by dispersion. All must satisfy strict regulations as to toxicity.
See FD&C colors.

food engineering. Application of engineering principles to the design of equipment for large-scale food processing, e.g., automatic harvesting devices, dryers of various types, crystallizers, ovens and heat exchangers, comminuting and mixing equipment, distillation units, packaging machines. Food engineering requires an understanding of thermodynam-

ics, conditions of state and equilibrium, rate processes, and transport phenomena. The unit operations of chemical engineering and basic physics and mechanics are also involved.

food starch, modified.

Properties: White powders; tasteless and odorless. Insol in water, alc, ether, chloroform.

Use: Food additive.

food technology. Practice of the techniques used in the preparation of foods for large-scale human use. Among others these include harvesting, postharvest treatment, all forms of cooking, tenderizing, preservation by chemicals, heating, dehydration, drying and freezing, distillation and solvent extraction, milling, refining, hydrogenation, emulsification, packaging materials and storage, labeling, and transportation. Other aspects of food technology are bacteriology, sanitation, quality control, and formulation of ingredients for a wide variety of end products. A recent development of importance is the growth of convenience and quick-service foods.

food web. The nutritional structure of an ecosystem in which more than one species occupies each level. Thus, there are usually several producer species and several consumer species in a food web.

footprinting. A technique for identifying the nucleic acid sequence bound either by a DNA- or by an RNA-binding protein. This sequence is protected from digestion by the protein.

foots. (soapstock). The mixture of soap, oil, and impurities that precipitates when natural fatty oils are refined by treatment with caustic soda or soda ash. Usually contains 30–50% free and combined fatty acids. A related meaning is the suspended solid matter in crude oils.

Use: Manufacture of relatively low-grade soaps, as a source of free fatty acids.

foots oil. The oil sweated out of slack wax. It takes its name from the fact that it goes to the bottom, or foot, of the pan when sweated.
See foots; slack; wax.

“Foray” [Ansul]. TM for a monoammonium phosphate-based formulation used to extinguish fires in flammable liquids (Class B fires) and in combustible materials such as wood and paper (Class A fires).

forensic chemistry. See legal chemistry.

forensics (DNA). The use of DNA for identification. Some examples of DNA use are to establish paternity in child support cases; establish the presence of a suspect at a crime scene; and identify accident victims.

forge. A furnace used for heating and softening a metal in preparation for hot working, e.g., wrought iron.

forging. Shaping a heated metal by means of repeated impact, thus improving its strength.

formal. See methylal.

formaldehyde. (oxymethylene; formic aldehyde; methanal).

CAS: 50-00-0. HCHO. A readily polymerizable gas. Formaldehyde is commercially offered as a 37–50% aqueous solution that may contain up to 15% methanol to inhibit polymerization. These commercial grades are called *formalin*. It is one of the few organic compounds known to exist in outer space.

Properties: (Gas) Strong, pungent odor. Vap d 1.067 (air = 1.000), vap d 0.815, (-20/4C), bp -19C, fp -118C, autoign temp 806F (430C), soluble in water and alcohol. (Aqueous 37% solution with 15% methanol) Bp 96C, flash p 122F (50C). (Methanol free) Bp 101C, flash p 185F (85C).

Derivation: Oxidation of synthetic methanol or low-boiling petroleum gases such as propane and butane. Silver, copper, or iron-molybdenum oxide are the most common catalysts.

Grade: Aqueous solutions: 37, 44, 50% inhibited (with varying percentages of methanol) or stabilized or unstabilized (methanol-free); also available in solution in *n*-butanol, ethanol, or urea; USP (37% aqueous solution containing methanol).

See paraformaldehyde.

Hazard: Moderate fire risk. Explosive limits in air 7–73%. Toxic by inhalation, strong irritant, a carcinogen. (Solution) Avoid breathing vapor and avoid skin contact. TLV: 1 ppm; suspected human carcinogen.

Use: Urea and melamine resins, polyacetal resins, phenolic resins, ethylene glycol, pentaerythritol, hexamethylenetetramine, fertilizer, disinfectant, biocide, embalming fluids, preservative, reducing agent as in recovery of gold and silver, corrosion inhibitor in oil wells, durable-press treatment of textile fabrics, industrial sterilant, treatment of grain smut, foam insulation, particle board, plywood, a versatile chemical intermediate.

formaldehyde aniline. (formaniline).
C₆H₅NCH₂.

Properties: Colorless to yellowish crystals. Initial mp 133C, bp 271C, d 1.14 (but these vary somewhat from sample to sample). Soluble in water, ether, and alcohol.

Derivation: Condensation of formaldehyde and aniline.

Hazard: Toxic by ingestion.

Use: Rubber accelerator, intermediate.

formaldehyde bis(2-fluoro-2,2-dinitroethyl) acetal.

CAS: 17003-79-1. mf: C₅H₆F₂N₄O₁₀.

Hazard: Moderately toxic by ingestion.

formaldehyde cyanohydrin. See glycolonitrile.

formaldehyde, polymer with (chloromethyl)oxirane and phenol.

CAS: 9003-36-5. mf: (C₆H₆O•C₃H₅ClO•CH₂O)_x

Hazard: Moderately toxic by ingestion and skin contact. A mild skin irritant.

formaldehyde, polymer with 4-nonylphenol and oxirane.

CAS: 30846-35-6. mf: (C₁₅H₂₄O•C₂H₄O•CH₂O)_x

Hazard: A mild eye irritant.

formaldehyde-*p*-toluidine. (methylene-*p*-toluidine). (CH₂C₆H₄NCH₂)_x.

Properties: White powder with grayish-yellow cast; aromatic odor. D 1.11. Soluble in acetone.

Derivation: Reaction between formaldehyde and *p*-toluidine.

Use: Rubber accelerator, dyes.

formalin. An aqueous 37–50% solution of formaldehyde that may contain 15% methyl alcohol. See formaldehyde.

formamide. (methanamide).

CAS: 75-12-7. HCONH₂.

Properties: Colorless, hygroscopic, oily liquid. D 1.146, bp 200–212C with partial decomposition beginning at approximately 180C, mp 2.5C, flash p 310F (154C). Soluble in water and alcohol. Combustible.

Derivation: Interaction of ethyl formate and ammonia, with subsequent distillation.

Hazard: Toxic material. TLV: 10 ppm, toxic by skin absorption.

Use: Solvent, softener, intermediate in organic synthesis.

formaniline. See formaldehyde aniline.

“Formcel” [Celanese]. TM for a series of water-free formaldehyde solutions in alcohols.

Use: Alcoholated urea and melamine resins, embalming fluids.

formetanate. (3-dimethylaminoethyleneiminophenyl-*N*-methylcarbamate hydrochloride).

CAS: 23422-53-9.

Properties: Water soluble.

Use: Acaricide for deciduous fruits.

“Formica” Brand Laminate [*Formica*].

TM for high-pressure laminated sheets of melamine and phenolic plastics for decorative applications such as surfacing, adhesives for bonding laminated plastic to other surfaces.

formic acid. (hydrogen carboxylic acid; methanoic acid).
CAS: 64-18-6. HCOOH.

Properties: Colorless, fuming liquid; penetrating odor. D 1.2201 (20/4C), mp 8.3C, bp 100.8C, flash p 156F (69C) (OC), bulk d 10.16 lb/gal (20C), refr index 1.3719 (20C), autoign temp 1114F (600C), strong reducing agent. Soluble in water, alcohol, and ether. Combustible.

Derivation: (1) By treatment of sodium formate and sodium acid formate with sulfuric acid at low temperatures and distilling in vacuo; (2) by acid hydrolysis of methyl formate; (3) as a by-product in the manufacture of acetaldehyde and formaldehyde.

Method of purification: Rectification.

Grade: Technical, 85%, 90%, CP, FCC.

Hazard: Corrosive to skin and tissue. TLV: 5 ppm; STEL 10 ppm.

Use: Dyeing and finishing of textile; leather treatment; chemicals (formates, oxalic acid, organic esters); manufacture of fumigants, insecticides, refrigerants; solvents for perfumes, lacquers; electroplating; brewing (antiseptic); silvering glass; cellulose formate; natural latex coagulant; ore flotation; vinyl resin plasticizers.

formic aldehyde. See formaldehyde.

formonitrile. See hydrocyanic acid.

“Formopon” [*Rohm & Haas*]. TM for sodium formaldehyde hydrosulfite. “Formopon” Extra is the basic zinc salt.

formothion. [S-(*N*-formyl-*N*-methylcarbamoyl-methyl)-dimethyl phosphorodithioate].

CAS: 2540-82-1. C₆H₁₂NO₄PS₂.

Properties: Yellow liquid. Fp 25C. Insoluble in water; miscible with common organic solvents.

Hazard: Cholinesterase inhibitor.

Use: Systemic insecticide.

“Form Release Gold” [*Unitex*]. TM for a general use premium type form release product.

Use: For steel, aluminum, plywood and composition forms.

“Formrez” [*Crompton & Knowles*]. Specialty oxylates or polyethers.

Use: In polyurethane foams, prepolymers, coatings, elastomers, adhesives, caulks, and sealants.

formula, chemical. A written representation using symbols of a chemical entity or relationship. There are several kinds of formulas: (1) Empirical. Expresses in simplest form the *relative* number and

the kind of atoms in a molecule of one or more compounds; it indicates composition only, not structure. Example: CH is the empirical formula for both acetylene and benzene. (2) Molecular. Shows the actual number and kind of atoms in a chemical entity (i.e., a molecule, group, or ion). Examples: H₂ (one molecule of hydrogen), 2H₂SO₄ (two molecules of sulfuric acid), CH₃ (a methyl group), Co(NH₃)₆²⁺ (an ion). (3) Structural. Indicates the location of the atoms, groups, or ions relative to one another in a molecule, as well as the number and location of chemical bonds. Examples:

Since all molecules are three-dimensional, they cannot properly be shown in the plane of the paper. This third dimensionality is sometimes indicated by extra-heavy lines or three-dimensional artwork (configurational formula) as in this representation of an ethanol molecule:

(4) Generic. Expresses a generalized type of organic compound in which the variables stand for the number of atoms or for the kind of radical in a homologous series. Examples:

C_nH_{2n+2} a paraffin C_nH_{2n} an olefin

ROR an ether ROH an alcohol

(R = a hydrocarbon radical)

(5) Electronic. A structural formula in which the bonds are replaced by dots indicating electron pairs, a single bond being equivalent to one pair of electrons shared by two atoms. Example: the electronic formula for methane is

formula, product. A list of the ingredients and their amounts or percentages required in an industrial product. Such formulas (or recipes) are mixtures, not compounds; they are generally used in such

industries as adhesives, food, paint, rubber, and plastics.

See formulation.

formulation. Selection of components of a product formula or mixture to provide optimum specific properties for the end use desired. Formulation by experienced technologists is essential for products intended to meet specifications or special service conditions.

formula weight. The sum of the atomic weights represented in a chemical formula. Thus, since the atomic weight of hydrogen is 1 and that of oxygen is 16, the formula weight of water (H₂O) is 18 (approximate atomic weights used).

2-formyl-3,4-dihydro-2H-pyran. See acrolein dimer.

formyl fluoride. HCOF.

Properties: Gas at normal temperature and pressure. Bp -26C, fp -142C. Decomposes slowly with formation of hydrogen fluoride and carbon monoxide. Soluble in water (decomposes).

Derivation: Interaction of benzoyl chloride and a formic acid solution of potassium fluoride.

Grade: Technical.

Hazard: Toxic by inhalation, strong irritant to tissue. TLV: 2.5 mg(F)/m³.

Use: Organic synthesis (acetylating agent).

2-formyl-2'-methyl-1,1'-(oxydimethylene)dipyridinium, dichloride oxime.

CAS: 70441-84-8. mf: C₁₄H₁₇N₃O₂•2Cl.

Hazard: A poison.

formyloxytribenzylstannane.

CAS: 17977-68-3. mf: C₂₃H₂₄O₂Sn.

Hazard: A poison by ingestion. A skin and eye irritant. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

1-formylpiperidine.

\square
C₅H₉NCH=O.

Properties: Colorless liquid. Liquid from -30 to 222C, aprotic, low volatility. Miscible with alcohols, esters, ketones, amines, amides, inorganic acids, organometallics; soluble in water and hexane.

Use: Solvent for polar and nonpolar compounds, as well as many high polymers; gas absorption; plastics modifiers.

See *N,N*-dimethylformamide.

3-formyltetrahydrofuran.

CAS: 79710-86-4. mf: C₅H₈O₂.

Hazard: A mild eye irritant.

Forster reaction. Formation of secondary amines by condensation of a primary amine with an

aldehyde, addition of alkyl halide to the Schiff base, and subsequent hydrolysis.

"FORTEX" [Baker Petrolite]. TM for an oxidized hydrocarbon wax.

"Forticel" [Celanese]. TM for a cellulosic thermoplastic for use in injection molding, extrusion, rotational casting, and blow molding.

Properties: Pellets (crystals, translucent, metallic, and opaque colors). D 1.20, highest use temperature 80C. Soluble in organic solvents; insoluble in mineral oils. Combustible.

Use: Pen and pencil barrels, telephone bases, eyeglass frames, tool handles, sheeting, steering wheels, etc.

fortification. In food technology, addition to a food ingredient or product of nutrients that are not normally present, for example, addition of vitamin D to milk or of vitamin C to cake fillings. Nutritionists apply this term to foods especially designed for schoolchildren and older persons.

See nutrification; enrichment.

"Fortiflex" [Celanese]. TM for a high-density polyethylene consisting mainly of long molecules with occasional short side branches. Thermoplastic.

Properties: Milk-white, translucent pellets (colors are also available). D 0.95; melt index 0.2-8; tensile strength 3100-3700 psi; highest use temperature 225F. Combustible.

See polyethylene.

"Fortisan" [Celanese]. TM for a cellulosic fiber manufactured by partial saponification of stretched cellulose acetate. A semisynthetic product, it resembles cellulose (cotton) in many respects. The high-tenacity product has a dry strength of 5-7 lb/denier (100,000-130,000 psi); wet strength is 85% of dry strength. It has relatively low elongation under stress, elastic recovery is approximately 70% after extension to break, immediate elastic recovery is 46%, delayed recovery is 30% at 5% strain. Young's modulus 1650; can be dyed in the same way as cotton. The monofilament can be produced to a fineness of one denier. D 1.50. Resists stretching both dry and wet. Combustible.

fortovase.

CAS: 149845-06-7. mf: C₃₈H₅₀N₆O₅•CH₄O₃S.

Hazard: Moderately toxic by ingestion.

"Fortrel" [Celanese]. TM for a polyester-type synthetic fiber.

"Fosfodril" [FMC]. TM for a glassy phosphate of high molecular weight (sodium hexametaphosphate).

Use: Thickener for drilling muds, water treatment in oil-well flooding operations.

fosfomycin.CAS: 23155-02-4. $C_3H_5O_2P$.**Properties:** Water-soluble crystals. Mp 95C.**Derivation:** Produced by *Streptomyces*, also made synthetically.**Use:** General antibiotic.

fossil. Any material that results from an animal or vegetable source in past geologic ages and has been buried (compressed) in the earth. Examples are fossil fuels (petroleum, natural gas, coal, lignite), fossil waxes (ozocerite, montan), fossil resins (amber), and fossil woods partially preserved (petrified) by the action of silica.

“Fosterite” [Westinghouse]. TM for a family of resins. Largest application is as solventless varnishes for electric insulation, also as a photoelastic resin and as a bond for impregnating and laminating asbestos sheets. Rods made of this plastic will carry a beam of light without the dispersion that occurs in air, making it possible to bend the beam.

foston. (*O,O*-diethyl-*S*-(*N*-isopropyl carbamoylmethyl) phosphorodithioate).

CAS: 2275-18-5. $(C_2H_5O)_2SPSCH_2SCH(CH_3)_2$.**Properties:** White, crystalline solid. Mp 24C. Soluble in most organic solvents.**Hazard:** Toxic by ingestion and skin absorption, cholinesterase inhibitor.**Use:** Fungicide, ovicide.

“Fotoceram” [Corning]. TM for a photosensitive, crystalline ceramic.

Use: Electronics and industrial arts.

“Foundrez” [Reichhold]. TM for a group of water-soluble phenol-formaldehyde and urea-formaldehyde resins for foundry applications.

foundry sand. (greensand; molding sand).

Sand containing zirconium, titanium, and other metals and mixed with suitable binders used in making molds for casting metals. The sand/binder mixture is either rammed into place around the mold or baked into a core at 204–260C (dry-sand molding). The binders used are resins of various types, casein, etc.

fourdrinier. The machine most widely used for papermaking, named for its English inventors who introduced it in the mid-19th century. It provides a wide range of papers from heavy board to light tissue and is of impressive size and complexity. Its unique feature is the traveling mesh belt onto which the slurry of fiber and water is run from the headbox. The wire was formerly a screen made of specially annealed bronze and brass in 55–85 mesh size range. This has largely been replaced by single and multi-layer woven polyester-forming fabrics, which are plastic screens woven with approximately 0.20 mm polyester monofilament. The plastic-forming fabric is longer lasting and more adaptable. The sheet is

formed on this wire almost instantly, most of the water draining through the interstices of the wire. After leaving the wire, the sheet (called the web) passes through the press section of the machine where a number of rollers express enough of the remaining water to enable the sheet to hold together. It then moves into the multiroller drying section. The dried sheet (4–6% moisture content) is then fed to a high-speed calender for compaction and finishing. The entire process is continuous and rapid, the machine often operating for several days without shutdown.

See calender; drying (2); paper; couch roll; dandy roll; supercalender.

Fourier-transform NMR. (FT-NMR).

A type of spectroscopy, developed by Ernst, which multiplies sensitivity 10 to 100 times compared to dispersive NMR instruments.

See spectroscopy.

“FP” Acids [Atofina]. TM for a series of fluorophosphoric acid.

FPC. (1) Abbreviation for fish protein concentrate. (2) Abbreviation for Federal Power Commission.

Fr. Symbol for francium.

fraction. Any portion of a mixture characterized by very similar properties. The most important fractions of petroleum are naphtha, gasoline, fuel oil, kerosene, and tarry or waxy residues. These are obtained by fractional distillation.

See separation.

fractional distillation. Distillation in which rectification is used to obtain product as nearly pure as possible. A part of the vapor is condensed and the resulting liquid contacted with more vapor, usually in a column with plates or packing. The term is also applied to any distillation in which the product is collected in a series of separate components of similar boiling range.

See reflux.

fractionation. In general, the separation or isolation of components of a mixture or a micromolecular complex. In distillation, this is done by means of a tower or column in which rising vapor and descending liquid are brought into contact (countercurrent flow). Macromolecular components (proteins and other high polymers) can be separated by a number of methods, including electrophoresis, gel filtration, chromatography, centrifugation, foam fractionation, and partition.

See reflux.

fracturing, hydraulic. See hydraulic fracturing.

fragile sites. A non-staining gap of variable width that usually involves both chromatids and is always at exactly the same point on a specific chromosome derived from an individual or kindred.

fragrance. An odorant used to impart a pleasant smell to lotions, toothpastes, cosmetics, etc.; balsamic and piney odors are typical.

fraissite. (benzyl iodide). $C_6H_5CH_2I$.

Use: A tear gas.

frame shift. A mutation caused by insertion or deletion of one or more paired nucleotides, changing the reading frame of codons and therefore the amino acids incorporated into proteins.

Franchimont reaction. Carboxylic acid dimerization to 1,2-dicarboxylic acids by treating α -bromocarboxylic acids with potassium cyanide followed by hydrolysis and decarboxylation.

francium. Fr. Element of atomic number 87, group IA of the periodic table system, aw 223, valence of 1; it appears to exist only as radioactive isotopes. One isotope is actinium K (^{223}Fr). Other isotopes have been made artificially: ^{223}Fr is the longest-lived isotope, having a half-life of 21 minutes, and is the only natural isotope. Francium is the heaviest of the alkali-metal family.

frankincense. (olibanum). A gum resin.

frankincense oil. See olibanum oil.

Frankland-Duppa reaction. Formation of α -hydroxycarboxylic esters by reaction of dialkyl oxalates with alkyl halides in the presence of zinc, or amalgamated zinc, and acid.

Frankland synthesis. Synthesis of zinc dialkyls from alkyl halides and zinc.

franklinite. (iron, manganese, zinc). $(\text{FeMn})_2\text{O}_4$. Black mineral resembling magnetite.

Frary metal. A lead-based bearing metal containing 97–98% lead alloyed with 1–2% each of barium and calcium; excellent for low-pressure bearings at moderate temperatures.

Frasch process. A process by which much of the world's sulfur is obtained. Developed about 1900 by Herman Frasch, the process involves melting sulfur underground by introducing superheated water through a pipe under pressure and forcing the molten sulfur to the surface by compressed air.

Fraunhofer lines. See spectroscopy.

free electron. Electron not attached to any one atom and not restricted by potential gradients.

free energy. (ΔG ; Gibbs free energy). An exact thermodynamic quantity used to predict the maximum work obtainable from the spontaneous transformation of a given system. It also provides a criterion for the spontaneity of a transformation or reaction and predicts the greatest extent to which the reaction can occur, i.e., its maximum yield. Transformation of a system can be brought about by either heat or mechanical work. Free energy is derived from the internal energy and entropy of a system in accordance with the laws of thermodynamics. See also enthalpy.

free radical. A molecular fragment having one or more unpaired electrons, usually short-lived and highly reactive. In formulas, a free radical is conventionally indicated by a dot, as in $\text{Cl}\cdot$ and $\cdot(\text{C}_2\text{H}_5)$. In spite of their transitory existence, they are capable of initiating many kinds of chemical reactions by means of a chain mechanism. Free radicals are formed only by the splitting of a molecular bond. A chain can result only if (1) radicals attack the substrate and (2) the radicals lost by this reaction are regenerated. Chain mechanisms for the thermal decomposition of many substances have been established. Free radicals are known to be formed by ionizing radiation and thus play a part in deleterious degradation effects that occur in irradiated tissue. They also act as initiators or intermediates in such basic phenomena as oxidation, combustion, photolysis, and polymerization. See carbonium ion.

free sulfur. Sulfur that is left chemically uncombined after vulcanization of a rubber compound. When this exceeds 1%, the upper limit of solubility of sulfur in rubber, blooming will occur. Most rubber products are vulcanized with as low a sulfur content as possible so that the free sulfur content of the product is seldom over 0.5%. See bloom; vulcanization.

freeze-drying. (lyophilization). A method of dehydration or of separating water from biological materials. The material is first frozen and then placed in a high vacuum so that the water (ice) vaporizes in the vacuum (sublimes) without melting and the nonwater components are left behind in an undamaged state.

Use: Blood plasma, certain antibiotics, vaccines, hormone preparations, food products such as coffee and vegetables. One technique prepares freeze-dried ceramic pellets from water solutions of metal salts.

"Freezene" [Crompton & Knowles]. TM for a series of refrigeration white mineral oils. **Use:** Low-temperature lubrication.

freezing point. See melting point.

"Freon" [Du Pont]. TM for a series of fluorocarbon products used in refrigeration and air-condi-

tioning equipment, as blowing agents, fire-extinguishing agents, and cleaning fluids and solvents.

Properties: Clear, water-white liquids; vapors have a mild, somewhat ethereal, odor and are not irritating; essentially stable and inert. Nonflammable, nonexplosive, noncorrosive.

See fluorocarbon. *Note:* Many types contain chlorine, as well as fluorine, and should be called chloro-fluorocarbons.

"Freon 22" [Du Pont]. See 1,1,1-chlorodifluoroethane.

"Freon 112" [Du Pont]. *sym*-Tetrachlorodifluoroethane.

"Freon C-51-12" [Du Pont]. See perfluorodimethylcyclobutane.

"Freon 225" [Du Pont]. See 3,3-dichloro-1,1,1,2,2-pentafluoropropane.

"Freon E" [Du Pont]. TM for a series of hydrogen endcapped tetrafluoroethylene epoxide polymers having a DP up to 10, boiling range 39–49 C, high dielectric constant.

Use: Coolants in electronic devices.

"Fresh Notes" [Florida Chemicals]. TM for flavor and fragrance fractions.

Use: A flavor and fragrance additive.

Freundlich isotherm. The relationship between the amount of a substance adsorbed and the concentration of the solute:

$$\frac{x}{m} = Kc^{1/n}$$

where x is the amount adsorbed, m the weight of adsorbent, c the concentration or pressure, and K and n constants.

Freund's acid. 1-Naphthylamine 3,6-disulfonic acid.

Freund synthesis. Formation of alicyclic hydrocarbons by the action of sodium (Freund) or zinc (Gustavson) on open-chain dihalo compounds; 1,3-dichloropropane derived from the chlorination of propane, obtained from natural gas, is cyclized in the Hass process by treating with zinc dust in aqueous alcohol in the presence of sodium iodide as catalyst.

friction. A soft and extremely tacky mixture of rubber and softener applied to a fabric by means of a three-roll calender. The differential speed of the calender rolls drives the material into the interstices of the fabric, forming a strongly adherent coating. Uncured friction on a light sheeting is used for electrical insulating or friction tape. Heavy-weave fabric coated with high-grade friction (rubber plus softener and curing agents) is used as piles in tire carcasses,

and other laminated products that are vulcanized.

See calender.

friction welding. See welding.

Friedel-Crafts reaction. A type of reaction involving anhydrous aluminum chloride and similar metallic halides as catalysts, discovered in 1877 by Charles Friedel, a French chemist (1832–1899), and James Mason Crafts, an American chemist (1830–1917), during joint research in France; it has been developed since then for many important industrial uses, exemplified by the condensation of ethyl chloride and benzene to form ethylbenzene and the manufacture of acetophenone from acetyl chloride and benzene. The name is now applied to a wide variety of acid-catalyzed organic reactions.

Use: Alkylation and acylation in general. Some examples are the production of high-octane gasoline, cumene, detergent alkylate, and various plastics and elastomers.

Friedlaender synthesis. Base-catalyzed condensation of 2-aminobenzaldehydes with ketones to form quinoline derivatives.

Fries rearrangement. Rearrangement of phenolic esters to *o*- and/or *p*-phenolic ketones on heating with aluminum chloride or other Lewis acid catalysts.

Fries rule. The most stable form of a polynuclear hydrocarbon is that in which the maximum number of rings has the benzenoid arrangement of three double bonds. A benzenoid electronic configuration is energetically favored and, therefore, particularly stable.

frit. A ground glass used in making glazes and enamels and also for making so-called frit seals. Finely powdered glass may be called a frit. The term is also used for finely ground inorganic minerals, mixed with fluxes and coloring agents that become a glass or enamel on heating.

Fritsch-Buttenberg-Wiechell rearrangement. The rearrangement of 1,1-dialkyl-2-haloethylenes to diaryl acetylenes with strong bases.

"FR-N" [B. F. Goodrich]. TM for a series of butadieneacrylonitrile elastomeric polymers and latexes.

Properties: Oil and solvent resistance combined with good flexibility and resistance to low temperatures, water absorption, and permanent set.

Use: Oil-resistant seals, shoe soles, gasoline hose, belt conveyors, plasticizers, paper saturation, adhesives, leather finishes, and carpet backing.

froth flotation. See flotation.

FRP. Abbreviation for glass fiber-reinforced plastic.

See reinforced plastic.

“FR-S” [B. F. Goodrich]. TM for general-purpose rubbers and latexes, composed of copolymers of butadiene and styrene.

Use: (Rubber): Tires, hose, belting, and packing; molded and extruded automotive and industrial products; soles and heels; hard rubber. (Latex): Adhesives, foamed rubber, textile and rug backing, paper coating and impregnation, modification of plastics to produce high-impact strength, asphalt additive.

fructose. (fruit sugar; D(-)-fructose; levulose).

$C_6H_{12}O_6$. A sugar occurring naturally in a large number of fruits and in honey. It is the sweetest of the common sugars.

Properties: White crystals. Mp 103–105C (decomposes); specific rotation –89 to –91 degrees. Soluble in water, alcohol, and ether. Combustible.

Derivation: Hydrolysis of inulin; hydrolysis of beet sugar followed by lime separation, from cornstarch by enzymic or microbial action.

Grade: Technical, NF, food, parenteral.

Use: Foodstuffs, medicine, preservative.

fructose-1,6-diphosphate. (FDP; fructosediphosphoric acid; Harden-Young ester).

$H_2PO_4(C_6H_{10}O_4)H_2PO_4$. Can be prepared from fructose and certain other sugars by the use of yeasts. It is known to take part in cell metabolism; an intermediate in carbohydrate metabolism. Usually handled in the form of its barium or calcium salts, white amorphous powders, soluble in ice water and dilute acid solutions, insoluble in hot water and alcohol.

Use: Organic synthesis, research in cell metabolism.

fruit acids. See α hydroxy acids.

frustule. The mineral “skeleton” of a diatom or other unicellular organism.

3-FT. See 5-fluoro-3-(tetrahydro-2-furyl)uracil.

FT black. Abbreviation for fine thermal black. See thermal black.

FTC. Abbreviation for Federal Trade Commission.

fuchsin. (basic fuchsin; magenta). A synthetic rosaniline dyestuff, a mixture of rosaniline and *p*-rosaniline hydrochlorides.

Properties: Dark-green powder or greenish crystals with a bronze luster; faint odor. Soluble in water and alcohol.

Grade: NF.

Use: Textiles and leather industries, red dye, pharmaceutical.

fuel. Any substance that evolves energy in a controlled chemical or nuclear reaction. The most common type of chemical reaction is combustion, the type of oxidation occurring with petroleum products, natural gas, coal, and wood; more-rapid oxidation takes place in rocket fuels (hydrogen, hydrogen peroxide, hydrazine) and approaches the rate of an explosion. The nuclear fuels used for power generation release their energy by fission of the atomic nucleus (uranium, plutonium, thorium).

See combustion; fission.

fuel cell. (1) An electrochemical device for continuously converting chemicals—a fuel and an oxidant—into direct-current electricity. It consists of two electronic-conductor electrodes separated by an ionic-conducting electrolyte with provision for the continuous movement of fuel, oxidant, and reaction product into and out of the cell. The fuel can be gaseous, liquid, or solid; the electrolyte liquid or solid; the oxidant gaseous or liquid. The electrodes are solid but may be porous and may contain a catalyst. Fuel cells differ from batteries in that electricity is produced from chemical fuels fed to them as needed, so that their operating life is theoretically unlimited. The cell products can be regenerated externally into fuel for return to the cell, e.g., carbon dioxide from the cell can be reacted with coal to form carbon monoxide for feed to the cell. Fuel is oxidized at the anode (negative electrode), giving electrons to an external circuit; the oxidant accepts electrons from the anode and is reduced at the cathode. Simultaneously with the electron transfer, an ionic current in the electrolyte completes the circuit. One type of electrolyte is a solid polymer of perfluorinated sulfonic acid. The fuels range from hydrogen, carbon monoxide, and carbonaceous materials to redox compounds, alkali metals, and biochemical materials. Fuel cells based on hydrogen and oxygen have a significant future as a primary energy source. Cells of this type are under development for use as a power source for electric automobiles, the hydrogen being derived from methanol. Large-scale development of fuel cells for on-site power generation for housing units is well advanced, and research has been completed for construction of a 26-megawatt cell capable of serving the needs of a small community.

(2) An aircraft fuel tank or container made of or lined with an oil-resistant synthetic rubber.

fuel element. A fabricated rod, form, or other shape that consists of or contains the fissionable fuel for a nuclear reactor. The term does not refer to a chemical element but rather to a device from which power is derived.

fuel oil. Any liquid petroleum product that is burned in a furnace for the generation of heat or used in an engine for the generation of power, except oils having a flash point of approximately 100F (37.7C) and oils burned in cotton or woolwick burners. The

oil may be a distilled fraction of petroleum, a residuum from refinery operations, a crude petroleum, or a blend of two or more of these. Because fuel oils are used with burners of various types and capacities, different grades are required. ASTM has developed specifications for six grades of fuel oil. No. 1 is a straight-run distillate, a little heavier than kerosene, used almost exclusively for domestic heating. No. 2 (diesel oil) is a straight-run or cracked distillate used as a general purpose domestic or commercial fuel in atomizing-type burners. No. 4 is made up of heavier straight-run or cracked distillates and is used in commercial or industrial burner installations not equipped with preheating facilities. The viscous residuum fuel oils, Nos. 5 and 6, sometimes referred to as bunker fuels, usually must be preheated before being burned. ASTM specifications list two grades of No. 5 oil, one of which is lighter and under some climatic conditions may be handled and burned without preheating. These fuels are used in furnaces and boilers of utility power plants, ships, locomotives, metallurgical operations, and industrial power plants.

Use: Domestic and industrial heating, power for heavy units (ships, trucks, trains), source of synthesis gas.

See diesel oil.

Fujimoto-Belleau reaction. Synthesis of cyclic α -substituted α,β -unsaturated ketones from enol lactones and Grignard reagents prepared from primary halides.

Fukui, Kenichi. (1918–1998). A Japanese professor who was corecipient of the Nobel Prize for chemistry along with Hoffmann in 1981. His work involved quantum mechanical studies of chemical reactivity. Fukui's entire career has been at Kyoto University.

fullerines. General name for closed spheroidal aromatic molecules with even numbers of carbons. See buckminsterfullerene.

fuller's earth. A porous colloidal aluminum silicate (clay) that has high natural adsorptive power. Gray to yellow color, noncombustible.

Occurrence: Florida, England, Canada.

Use: Decolorizing of oils and other liquids, oil-well drilling muds, insecticide carrier, floor-sweeping compounds, cosmetics, rubber filler, carrier for catalysts, filtering medium.

See bentonite; diatomite.

full gene sequence. The complete order of bases in a gene. This order determines which protein a gene will produce.

fulminates. Materials with carbon-nitrogen-oxygen groups.

Use: Sensitive explosives.

fumagillin.

CAS: 23110-15-8. $C_{27}H_{36}O_7$. An antibiotic substance produced by *Aspergillus fumigatus*.

Properties: Light-yellow crystals from dilute methanol. Mp 189–194C. Insoluble in water, dilute acids, saturated hydrocarbons; soluble in most other organic solvents.

Use: Medicine.

fumaric acid. (boletic acid; lichenic acid; allomaleic acid; *trans*-butenedioic acid).

CAS: 110-17-8. The *trans* isomer of maleic acid.

Properties: Colorless, odorless crystals; fruit acid taste. Stable in air, d 1.635, sublimes at 290C, mp 287C (sealed tube), soluble in water 0.63g/100 g (25C), soluble in alcohol 5.76 g/100 g (30C). Insoluble in chloroform and benzene. Combustible.

Derivation: (1) Isomerization of maleic acid, (2) catalytic oxidation of benzene.

Grade: Technical, crystals, FCC.

Use: Modifier for polyester, alkyd, and phenolic resins; paper-size resins; plasticizers; rosin esters and adducts; alkyd resin coatings; upgrading natural drying oils (especially tall oil) to improve drying characteristics; in foods as substitute for tartaric acid, as acidulant and flavoring agent (FDA approved); mordant; organic synthesis, printing inks.

fumaryl chloride.

CAS: 627-63-4. ClCOCH:CHCOCl .

Properties: Clear, straw-colored liquid. Bp 158–160C, 62–64C (13 mm Hg), d 1.408 (20C).

Hazard: Corrosive to eyes and skin.

Use: Chemical intermediate for pharmaceuticals, dyestuffs, and insecticides.

fume. The particulate, smokelike emanation from the surface of heated metals. Also the vapor evolved from concentrated acids (sulfuric, nitric), from evaporating solvents, or as a result of combustion or other decomposition reactions (exhaust fume). Many of these fumes are toxic.

fumigant. A toxic agent in vapor form that destroys rodents, insects, and infectious organisms; a type of pesticide. The most effective temperature for their use is approximately 70F. They are used chiefly in enclosed or limited areas (barns, greenhouses, ships' holds, and the like) and also are applied locally to soils, grains, fruits, and garments. Some commonly used fumigants are formaldehyde, sulfur dioxide and other sulfur compounds, hydrogen cyanide, methyl bromide, carbon tetrachloride, *p*-dichlorobenzene, and ethylene oxide. Care must be used when handling and applying fumigants be-

cause of their toxicity.
See repellent; pesticide.

fuming. A characteristic of some highly active liquids that evolve visible smokelike emanations on contact with air. Most familiar are the forms of nitric and sulfuric acids designated as fuming. These are not pure, concentrated acids; low percentages of nitrogen dioxide and water are present in fuming nitric acid, and fuming sulfuric acid contains sulfur trioxide. Hydrofluoric acid (a mixture of hydrogen fluoride and water) also fumes. Pure compounds in which fuming occurs are fluosilicic acid and hydrazine.

functional gene tests. Biochemical assays for a specific protein, indicating a specific gene is not merely present but active.

functional genomics. The study of genes, their resulting proteins, and the role played by the proteins in the body's biochemical processes.

fundamental particle. (elementary particle). One of the many constituents of atoms in either the normal or the excited state, i.e., protons, electrons, and neutrons, that are directly involved in chemical reactions. Other subatomic species are mesons, positrons, neutrinos, hyperons, etc. Photons are light quanta, i.e., "particles" of energy that have no rest mass.
See particle; photon.

fundamental research. (basic research). Scientific investigations undertaken primarily to increase knowledge of a given field on a long-range basis. It is free from the time factor usually present in applied research and is comparatively unlimited by economic restrictions. In general, it seeks basic causes for phenomena rather than immediate results. It has no predetermined goal or purpose. Nonetheless, tremendous achievements in chemistry and other sciences have resulted, and it will always remain the essential cornerstone of science. "Fundamental research is essentially a matter of inquiring into nature. The motivation for this activity is only imperfectly understood but it is primarily an intellectual pursuit. Unlike applied research, the reward being sought is attained through the ability to understand and explain natural phenomena. The interest centers on elucidating the laws of nature, not on manipulating or exploiting them" (Howard McMahan).

fungal protease enzyme. See acid fungal protease.

fungicide. Any substance that kills or inhibits the growth of fungi. Older types include a mixture of lime and sulfur, copper oxychloride, and Bordeaux mixture. Copper naphthenate has been used to impregnate textile fabrics such as tenting and military

clothing. Dithiocarbamate and quinone types were introduced about 1940. Mercury compounds are also effective but have been discontinued because of their toxicity to humans. Hypochlorite solutions are used in swimming pools and water-cooled heat exchangers. Some types of fungi that infect the human body are extremely hard to eradicate and require highly specific medical treatment.

fungizone intravenous.

CAS: 58501-21-6. mf: $C_{47}H_{73}NO_{17} \bullet C_{24}H_{40}O_4 \bullet Na$.

Hazard: A poison. Human systemic effects.

fungocin. See bacillus subtilis BPN.

fungus. Any of a plantlike group of organisms that does not produce chlorophyll; they derive their food either by decomposing organic matter from dead plants and animals or by parasitic attachment to living organisms, thus often causing infections and disease. Examples of fungi are molds, mildews, mushrooms, and the rusts and smuts that infect grain and other plants. They grow best in a moist environment at temperatures of about 25C, little or no light being required.
See mycotoxin.

Funk, Casimir. (1884–1948). Born in Poland and later becoming an American citizen, Funk in 1911 isolated a food factor, extracted from rice hulls, that he found to be a cure for a disease caused by malnutrition (beri-beri). Believing this to be an amine compound essential to life, he coined the name *vitamine*, from which the final *e* was later dropped. The various types and functions of vitamins were not differentiated until some years later as a result of the work of McCollum, Szent-Gyorgi, R. J. Williams, and others.

furacrylic acid. See furylacrylic acid.

"Furadan." (carbofuran; 2,3-dihydro-2,2-dimethyl-7-benzofuranylmethylcarbamate).
CAS: 1563-66-2. TM for a pesticide designed to combat corn rootworm and rice water weevil. Approved by USDA. Also effective on alfalfa, sugarcane, rice, peanuts, and potatoes.
Hazard: Toxic material. TLV: 0.1 mg/m³; not classifiable as a human carcinogen.

furamide. See furoamide.

furan. (furfuran; tetrol).
CAS: 110-00-9.

HC:CHCH:CHO . A heterocyclic compound. Its basic structure is

Properties: Colorless liquid turning brown on standing, this color change is retarded if a small amount of water is added. D 0.938 (20/4C), fp -86C, bp 31.4C, flash p <32F (0C) (TOC), refr index 1.4216 (20C). Insoluble in water; soluble in alcohol and ether.

Derivation: Dry distillation of furoic acid from furfural.

Hazard: Flammable, dangerous fire risk, flammable limits 2-24%, forms peroxides on exposure to air. Absorbed by skin.

Use: Organic synthesis, especially for pyrrole, tetrahydrofuran, thiophene.

See furan polymer.

furancarboxylic acid. See furoic acid.

2,5-furandione. See maleic anhydride.

2-furanmethanethiol.

Properties: Liquid. D 1.1319 (20/4C), bp 155C, refr index 1.5324 (20C). Insoluble in water.

Use: Ingredient for synthetic coffee compositions and fortifier for natural coffee blends and flavor adjunct. Also inhibits the corrosive power of nitric acid.

furanodiene.

CAS: 57566-47-9. mf: C₁₅H₂₀O.

Hazard: A poison by ingestion.

furanose. A simple sugar structurally analogous to the five-membered furan ring.

furan polymer. A plastic derived (1) from furfuryl alcohol or (2) from furfural or reaction products of furfural and a ketone. The materials are dark colored and resistant to solvents, most nonoxidizing acids, alkalis, and specific corrosives such as dinitrogen pentoxide.

Properties: Physical properties of a typical asbestos-reinforced furan polymer are d 1.7, tensile strength 5000 psi, flexural strength 7500 psi, impact strength 0.5 ft lb/in. notch, water absorption 0.2%, and coefficient of thermal expansion 3.0-10⁻⁵ in/in/F.

Use: Coating asphaltic pavements, foundry sand cores, shell molding and corrosion-resistant materials of construction. Since furfural is readily obtainable by heating pentosan-containing products such as corncobs with mineral acid, these resins are inexpensive and have great potential use where products with their characteristics are required.

3-((2-furanylmethylene)amino)-2-oxazolidone.

CAS: 6270-33-3. mf: C₈H₈N₂O₃.

Hazard: Moderately toxic by ingestion.

furazolidone. (N-(5-nitro-2-furfurylidene-3-amino)-2-oxazolidinone).

CAS: 67-45-8. C₈H₇N₃O₅.

Properties: Yellow powder; odorless. Mp 255C. Slightly soluble in polyethylene glycol; insoluble in water, alcohol, and peanut oil.

Derivation: Synthetically from furfural, hydroxyethylhydrazine, and diethyl carbonate.

Grade: NF.

Hazard: A carcinogen, use has been restricted. See nitrofurantoin.

furcellaran.

Properties: Seaweed gum (a natural phycocolloid) available as an odorless white powder, soluble in warm water. It forms gels at low concentrations. Reputed to be more stable to heat and acids than other vegetable gums. Available in the form of salts.

Derivation: From the seaweed *Furcellaria fastigiata*.

Use: Gelling-agent, viscosity-control agent, puddings, jams, toothpastes, bacterial cultural media, pharmaceuticals.

furethrin. (generic name for 3-furfuryl-2-methyl-4-oxo-2-cyclopenten-1-ylchrysanthemumate (generic)). C₂₁H₂₇O₄. A synthetic analog of allethrin substituting the 2-furfuryl for allyl in the side chain.

Properties: Yellow liquid. Bp 187-188C (0.4 mm Hg.) Insoluble in water; soluble in light oils.

Use: Insecticide, use like allethrin.

furfural. (ant oil, artificial; pyromucic aldehyde; furfuraldehyde; bran oil).

CAS: 98-01-1. C₄H₃OCHO.

Properties: Colorless liquid when very pure, becomes reddish-brown on exposure to light and air; odor somewhat similar to benzaldehyde. Forms condensation products with many types of compounds, phenol, amines, urea, etc. D 1.1598 (20/4C), fp -36.5C, bp 161.7C, heat of vaporization 107.5 cal, refr index 1.5260 (20C), flash p 140F (60C) (CC), autoign temp 392C (797F). Soluble in alcohol, ether, and benzene; 8.3% soluble in water at 20C. Combustible.

Derivation: From oat hulls, rice hulls, corncobs, bagasse, and other cellulosic waste materials by steam-acid digestion.

Grade: Technical, refined.

Hazard: Absorbed by skin; irritant to eyes, skin, and mucous membranes. TLV: 2 ppm, toxic by skin absorption; animal carcinogen.

Use: Solvent refining of lubricating oils, butadiene, rosin, and other organic materials; solvent for nitrocellulose, cellulose acetate, shoe dyes; intermediate

for tetrahydrofuran and furfuryl alcohol, phenolic and furan polymers; wetting agent in manufacture of abrasive wheels and brake linings; weed killer; fungicide; adipic acid and adiponitrile; road construction; production of lysine; refining of rare earths and metals; flavoring; analytical reagent.

furfuralacetic acid. See furylacrylic acid.

furfuraldehyde. See furfural.

furfuramide. See hydrofuramide.

furfuran. See furan.

furfuryl acetate. $C_4H_7OCH_2OOCCH_3$.

Properties: Colorless liquid turning brown on exposure to light and air; pungent odor. D 1.1175 (20/4C), bp 175–177C, refr index 1.4627. Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: By treatment of furfuryl alcohol with acetic anhydride.

Grade: Refined.

Use: Flavor.

furfuryl alcohol. (furyl carbinol).

CAS: 98-00-0. $C_4H_7OCH_2OH$.

Properties: Colorless, mobile liquid becoming brown to dark-red on exposure to light and air. It autopolymerizes with acid catalysts, often with explosive violence, to form a thermosetting resin that cures to an insoluble, infusible solid, highly resistant to chemical attack. D 1.1285 (20/4C), bp 170C, refr index 1.4850 (25C), flash p 167F (75C) (OC), auto-ign temp 915F (490C). Soluble in alcohol, chloroform, benzene, and water; insoluble in paraffin hydrocarbons. Combustible.

Derivation: Continuous vapor-phase hydrogenation of furfural.

Grade: Technical, refined.

Hazard: May react explosively with mineral acids and some organic acids. Toxic by inhalation and skin absorption. Approved for food products. TLV: 10 ppm; STEL 15 ppm, toxic by skin absorption.

Use: Wetting agent, furan polymers, corrosion-resistant sealants and cements, foundry cores, modified urea-formaldehyde polymers, penetrant, solvent for dyes and resins, flavoring. The polymer is used as a mortar for bonding acid-proof brick and chemical masonry.

See furan polymer.

α -furfuryl amine. $C_4H_7OCH_2NH_2$.

Properties: Colorless liquid. D 1.0550 (17C), bp 145C (757 mm Hg), refr index 1.4900 (17C), flash p

99F (37.2C) (OC). Soluble in water, alcohol, and ether.

Derivation: Furfural and ammonia.

Hazard: Flammable, moderate fire risk.

Use: Corrosion inhibitor, component of soldering flux, chemical intermediate.

6-furfurylaminopurine. See kinetin.

2-(2-furfuryl)furan.

CAS: 1197-40-6. mf: $C_9H_8O_2$.

Hazard: A poison by skin contact. Low toxicity by inhalation. A moderate eye irritant.

furfuryl mercaptan. See 2-furanmethanethiol.

furilazole.

CAS: 121776-33-8. mf: $C_{11}H_{13}Cl_2NO_3$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

Use: Agricultural chemical.

α -furildioxime. (di-2-furanylethanedione dioxime). $C_{10}H_8N_2O_4$.

Properties: Needlelike crystals. Mp 167C, mw 220.18. Very soluble in alcohol, ether; slightly soluble in benzene, petroleum ether.

Use: Reagent in alcohol solution for nickel, gives an orange-red compound.

furisyl.

CAS: 72239-53-3. mf: $C_{16}H_{20}N_6O_4$.

Hazard: A poison.

furnace. An enclosed chamber or structure lined with firebrick or similar refractory and containing a heat source (coal, coke, gas, or electric elements). It may have various designs depending on its function. Furnaces are used for steel production (open-hearth and basic oxygen types), for smelting iron and other ores (blast furnace) and for manufacture of furnace carbon black, etc. Electric furnaces are used for special types of steel, as well as for high-temperature reactions such as the manufacture of pyrolytic graphite, synthetic diamonds, silicon, silicon carbide, and salt cake. Temperatures obtained range up to 3000C. Laboratory electric furnaces are used for high-temperature experiments and product testing. See muffle furnace; reverberatory furnace; Mannheim furnace; kiln; forge; cupola.

furnace black. See carbon black.

furnace oil. Usually No. 1 fuel oil.
See fuel oil.

furnace sand. (fire sand). Sand used to line furnace bottoms or walls, particularly in open-hearth steel furnaces.

furnish. Term used by papermakers for the mixture containing the constituents of paper as supplied to the fourdrinier wire on which the sheet is formed.

furoamide. (pyromucamide; furamide).
 C_4H_5OCON .

Properties: Crystals. Sublimes partly at 100C, mp 142C.

Derivation: Treatment of furoyl chloride with ammonia.

furoic acid. (pyromucic acid; furancarboxylic acid).
CAS: 88-14-2.

$C_4H_5O_2COOH$ or $OCH:CHCH:CCOOH$.

Properties: Colorless crystals. Mp 133–134C, sublimes at 130C (50–60 mm Hg). Slightly soluble in cold water; very soluble in hot water, alcohol, and ether; insoluble in paraffin hydrocarbons. Combustible.

Derivation: Cannizzaro reaction from furfural, oxidation of furfural.

Method of purification: Sublimation, fractional crystals from hot water.

Grade: Technical.

Use: Preservative, bactericide, furoates for perfume and flavoring, fumigant, textile processing, chemical intermediate.

Furol viscosity. The efflux time in seconds (SFS) of 60 mL of sample flowing through a calibrated Furol orifice in a Saybolt viscometer under specified conditions. Furol viscosity is approximately 1/10 of Saybolt Universal viscosity and is used for fuel oil and residual materials of relatively high viscosity. Furol is derived from the words *fuel and road oils*.

furoyl chloride. C_4H_5OCOCl .

Properties: Colorless liquid. Powerful lachrymator. Decomposes in water, mp $-2C$, bp 176C. Soluble in ether. Combustible.

Derivation: Treatment of furoic acid with phosphorus pentachloride.

Hazard: Strong irritant to eyes and skin.

Use: Substitute for chloropicrin in disinfecting grain elevators.

furylacrylic acid. (furfural acetic acid; furacrylic acid). $C_4H_5OCH:CHCOOH$.

Properties: White powder. Mp 141C, bp 117C (8 mm Hg), 286C. Slightly soluble in cold water; easily soluble in hot water; soluble in alcohol, ether, and glacial acetic acid.

Derivation: From furfural.

Use: Derivatives used in perfumes.

furyl carbinol. See furfuryl alcohol.

2-furyl-1-nitroethene.

CAS: 699-18-3. mf: $C_6H_5NO_3$.

Hazard: A poison by ingestion. Moderately toxic by inhalation.

Use: Agricultural chemical.

furyltriazine.

CAS: 4685-18-1. mf: $C_7H_7N_3O$.

Hazard: Moderately toxic.

“Fusabond” [DuPont]. TM for resin used for coupling in mineral-filled polypropylene systems. Works best with long glass fiber systems. The resins act to bond the filler into the polymer matrix. Also improves surface wetting and dispersion of the filler. It enhances tensile and impact strength of the composite.

fuse. Of a solid, to melt, e.g., fused salt. An electric fuse acts as a circuit breaker by the melting of a thin strip of metal. The term has the connotation of uniting or joining, as in welding. The union of hydrogen nuclei to yield energy is called fusion.

fused ring. A ring having one or more of its sides in common with another ring, as shown:

fused salt. A salt (i.e., ionic compound) in the molten state. Halides and nitrates are the salts most commonly used. High temperatures (500–1000C for the alkali halides) are usually required. Most fused salts are liquids with viscosities, diffusion coefficients, thermal conductivities, and surface tensions in the same range as water. They conduct electricity exceptionally well.

Use: Production of sodium by electrolysis, heat transfer agents, reaction medium in chemical synthesis, heat-treatment of metals (from 350 to 2400F), solvents for the metals corresponding to their cations, nuclear power reactors.

See salt bath.

fused silica. See silica.

fusel oil. (amyl alcohol; fermentation; grain oil; potato oil). A volatile, oily mixture consisting largely of amyl alcohols. Isoamyl alcohol (isobutyl carbinol) and active amyl alcohol (2-methyl-1-butanol) are chief constituents. Ethyl, propyl, butyl, hexyl, and heptyl alcohols, as well as other alcohols, have been separated. Acids, esters, and aldehydes are also present. Normal primary amyl alcohol (1-pentanol) is not found in fusel oil. Combustible.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Use: Chemicals (amyl ether, amyl acetate, pure amyl alcohols, nitrous ether, various esters), explosives (gelatinizing agent), solvent for fats and oils, intermediate, pharmaceuticals, nitrocellulose plastics, synthetic rubber, varnishes, lacquers, solvent for resins and waxes, perfumery.

fusible alloy. See alloy, fusible.

fusion. (thermonuclear reaction). An endothermic nuclear reaction yielding large amounts of energy in which the nuclei of light atoms (chiefly the hydrogen isotopes D [deuterium] and T [tritium]) unite or fuse to form helium. Uncontrolled fusion was achieved some years ago in the hydrogen bomb, in which the initiating temperature was supplied by a fission reaction. Research efforts are now being devoted to developing a controlled and sustained fusion reaction that would utilize the deuterium and tritium in water. Several reactions are possible, but the most efficient is, for each fusion event, $D + T + e \rightarrow {}^4\text{He} + n + 17.5 \text{ MeV}$. An energy input (e) equivalent to at least 44 million degrees C is necessary. One approach utilizes powerful laser beams impinging on a mixture of deuterium and tritium in glass microspheres coated with "Teflon" and beryllium, which have an ablative effect. Fusion reactions have been

successfully attained by this method at the Lawrence Livermore Laboratory. The other approach is a magnetic fusion device called a tokamak, located in Princeton, N.J. The Joint European Torus (JET) is located in Cambridge, England. Fusion has two great advantages over fission as an energy source: (1) it utilizes water and readily available lithium as its raw materials instead of scarce and costly uranium; (2) it produces only tritium as a radioactive by-product. As indicated, the $D + T$ reaction yields ${}^4\text{He}$ nuclei, as well as 24 MeV neutrons, which carry off 80% of the energy.

See JET; tokamak.

fusion protein. Depending on the context, means one of two different things. Most commonly, it refers to the protein product of a gene created by the fusion of two distinct genes, or portions of genes. Less commonly it refers to one of a family of proteins that participate in membrane fusion.

futile cycle. A set of enzyme-catalyzed cyclic reactions that result only in the net release of thermal energy by the hydrolysis of ATP.

"Fybrene" [Crompton & Knowles]. TM for petrolatum, USP, of medium melting point and medium consistency.

Use: Paper industry.

G

γ. See gamma.

G. See guanine

g. (1) Abbreviation of gram, (2) acceleration due to gravity.

μg. Abbreviation of microgram.

“G-30” [Haynes]. TM for a high-strength, nickel-based alloy with outstanding corrosion resistance to strong oxidizing media, and excellent resistance to localized corrosion and stress corrosion cracking while maintaining ease of welding and fabrication.

Available forms: Sheet, plate, bars, rods, welding electrodes, and wire.

Use: Fabrication into all types of process equipment.

“G-942” [Du Pont]. TM for an aqueous solution of the partial sodium salt of a polymeric carboxylic acid.

Use: Tanning agent.

Ga. Symbol for gallium.

GABA. Abbreviation for γ -aminobutyric acid. See aminobutyric acid.

Gabriel-Colman rearrangement. Formation of isoquinoline derivatives by the action of sodium ethoxide on phthalimidoacetic esters.

Gabriel ethylenimine method. Formation of ethylenimines (aziridines) by elimination of hydrogen halides from aliphatic vicinal haloamines with alkali. The method can be extended to the preparation of five- and six-membered ring amines.

Gabriel synthesis. Conversion of alkyl halides to primary amines by treatment with potassium phthalimide and hydrolysis of the *N*-alkylphthalimides formed.

G acid. (2-naphthol-6,8-disulfonic acid).

Properties: White needles. Soluble in water.

Derivation: Sulfonation of β -naphthol.

See Schaeffer acid.

Use: Azo dye intermediate.

gadodiamide hydrate.

CAS: 122795-43-1. mf: $C_{16}H_{28}GdN_5O_9 \cdot xH_2O$.

Hazard: Low toxicity. A reproductive hazard.

gadolinium.

CAS: 7440-54-2. Gd. A rare-earth element of the lanthanide series, atomic number 64, group IIIB of the periodic table, aw 157.25, valence of 3; seven natural isotopes.

Properties: Lustrous metal. D 7.87, mp 1312C, bp 3000C; reacts slowly with water. Soluble in dilute acid; insoluble in water. Exhibits a high degree of magnetism, especially at low temperatures; salts are colorless; has highest neutron absorption cross-section of any known element; has superconductive properties, burns in air to form the oxide. Combustible.

Derivation: (1) Reduction of the fluoride with calcium, (2) electrolysis of the chloride with sodium chloride or potassium chloride in an iron pot that serves as an anode and graphite cathode.

Grade: Ingots, lumps, turnings, powder up to 99.9+% pure.

Use: Neutron shielding, garnets in microwave filters, phosphor activator, catalyst, scavenger for oxygen in titanium production.

gadolinium chloride. $GdCl_3 \cdot xH_2O$. Colorless crystals, soluble in water, purities up to 99.9%.

Use: Gadolinium sponge metal, by contact with a reducing metal vapor; source of gadolinium.

gadolinium fluoride. $GdF_3 \cdot 2H_2O$. Available up to 99.9% purity.

Properties: Semisolid mass.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Source of gadolinium.

gadolinium nitrate. $Gd(NO_3)_3 \cdot xH_2O$. Colorless crystals, soluble in water, decomposes at 110C, purities up to 99.9% gadolinium salt.

Hazard: Fire risk in contact with organic materials.

gadolinium oxalate. $Gd_2(C_2O_4)_3 \cdot 10H_2O$.

Properties: White powder. Insoluble in water; slightly soluble in acids; loses 6H₂O at 110C.

Available forms: Purities up to 99.9% gadolinium salt.

gadolinium oxide. Gd_2O_3 . Properties: White- to cream-colored powder, d 7.41, mp 2330C, insoluble in water, soluble in acids to form the corresponding salts, hygroscopic, absorbs carbon dioxide from the air, purities up to 99.8% gadolinium oxide.

Derivation: Calcination of gadolinium salts, liquid/liquid ion-exchange separation.

Use: Neutron shields; catalysts; dielectric ceramics; filament coatings; special glasses; TV phosphor activator; lasers, masers, and telecommunication; laboratory reagent.

gadolinium sulfate. $Gd_2(SO_4)_3 \cdot 8H_2O$.

Properties: Colorless crystals. D 3.01 (15C), purities up to 99.9% gadolinium salt. Slightly soluble in hot water; more soluble in coldwater.

Use: Cryogenic research; the selenide is used in thermoelectric generating devices.

gafamide coa. See coconut amine oil condensate.

“GAF” Carbonyl Iron Powders

[International Specialty]. TM for microscopic spheres of extremely pure iron. Produced in 11 carefully controlled grades ranging in particle size from 3 to 20 microns in diameter. The iron content of some types is as high as 99.5%.

Use: High-frequency cores for radio, telephone, television, short-wave transmitters, radar receivers, direction finders; alloying agents; catalysts; powder metallurgy; magnetic fluids.

Gal. Abbreviation for galactose.

d-galactosamine hydrochloride. (2-amino-2-dioxy-d-galactose).

CAS: 1772-03-8. $C_6H_{14}ClNO_5$.

Properties: Crystalline solid. Mw 215.64, mp 182–185C (decomposes).

Derivation: Amino sugar isolated from chondroitin sulfate.

galactose.

CAS: 59-23-4. $C_6H_{12}O_6$. A monosaccharide commonly occurring in milk sugar or lactose.

Properties: White crystals. Mp 165–168C. Soluble in hot water and pyridine; slightly soluble in glycerol.

Derivation: By acid hydrolysis of lactose.

Use: Organic synthesis, medicine (diagnostic aid).

α -galactosidase.

Properties: Derived from *Mortierella vinaceae* var. *raffinoseutilizer*.

Use: Food additive.

D(+)-galacturonic acid. $COOH(CH_2O)_4CHO$.

A major constituent of plant pectins. It exhibits mutarotation, having both an α and a β form.

Properties: The α form melts with decomposition at 159–160C. Soluble in water, slightly soluble in hot alcohol; insoluble in ether.

Derivation: Hydrolysis of pectins.

Use: Biochemical research.

galena. (galenite; lead glance).

CAS: 1314-87-0. PbS . Natural lead sulfide.

Properties: Lead gray in color, lead-gray streak,

metallic luster, good cubic cleavage. D 7.4–7.6, Mohs hardness 2.5. Soluble in strong nitric acid, in excess of hot hydrochloric acid.

Occurrence: Western U.S., Canada, Africa, South America.

Use: Chief ore of lead, frequently recovered for the silver it sometimes contains.

“Galex” [Natrochem]. TM for disproportioned gum rosin or wood rosin.

Properties: Stable. Softening point 64–72C, acid no. 150–170 degrees.

Use: Adhesives, extender in rubber formulations.

gallic acid. (3,4,5-trihydroxybenzoic acid).

CAS: 149-91-7. $C_6H_2(OH)_3CO_2H$.

Properties: Colorless or slightly yellow crystalline needles or prisms. D 1.694, mp 222–240C. Soluble in alcohol and glycerol; sparingly soluble in water and ether.

Derivation: Action of mold on solutions of tannin or by boiling the latter with strong acid or caustic soda.

Use: Photography, writing ink, dyeing, manufacture of pyrogallol, tanning agent and manufacture of tannins, paper manufacture, pharmaceuticals, engraving and lithography, analytical reagent.

gallium.

CAS: 7440-55-3. Ga. Metallic element of atomic number 31, group IIIA of the periodic table, aw 69.72, valences of 2, 3; two stable isotopes.

Properties: Silvery-white liquid at room temperature. Mp 29.7C, bp 2403C; may be undercooled to almost 0C without solidifying, d 5.9 (25C). More dense as a liquid than as a solid. Soluble in acid, alkali; slightly soluble in mercury. Reacts with most metals at high temperatures.

Grade: Up to 99.9999% purity.

Occurrence: Prepared commercially from zinc ores and bauxite.

Derivation: Extraction of gallium as gallium chloride by ethyl ether or isopropyl ether and subsequent electrodeposition from an alkaline gallium oxide solution.

Use: The metal has no significant commercial uses. Its compounds are used as semiconductors.

gallium antimonide. $GaSb$. Available in an electronic grade.

Use: Semiconducting devices.

gallium arsenide.

CAS: 1303-00-0. $GaAs$.

Properties: Crystals. Mp 1238C. Electroluminescent in infrared light.

Grade: Ingots, polycrystalline form in high-purity electronic grade, single crystals. Often alloyed with gallium phosphide or indium arsenide.

Hazard: Toxic metal.

Use: Semiconductor in light-emitting diodes for telephone dials, injection lasers, solar cells, magnetoresistance devices, thermistors, microwave generation.

See arsenic.

gallium oxides. The sesquioxide, Ga_2O_3 , and suboxide, Ga_2O , are known. Both are stable at ordinary temperatures.

See gallium sesquioxide.

gallium phosphide. GaP .

Properties: Pale-orange, transparent crystals or whiskers up to 2 cm long, made by vapor phase reaction at relatively low temperatures between phosphorus and gallium suboxide. These crystals are intermediate between normal semiconductors and insulators or phosphors. They operate over a temperature range of -55 to 500C . Gallium phosphide is electroluminescent in visible light.

Grade: Polycrystalline form in high-purity electronic grade, single crystals, whiskers.

Use: Semiconducting devices.

gallium sesquioxide. Ga_2O_3 .

Properties: (α form) White crystals. D 6.44, mp 1900C , changes to β form at 600C . (β form) white crystals. D 5.88. Both forms are insoluble in hot acid.

Grade: High-purity electronic.

Use: Spectroscopic analysis.

gallo cyanine. (CI 51030). $\text{C}_{15}\text{H}_{13}\text{ClN}_2\text{O}_5$.

Properties: Greenish solid. Insoluble in water; soluble in alcohol, glacial acetic acid, alkali carbonate, and concentrated hydrochloric acid.

Derivation: Reaction of gallic acid with nitrosodimethylaniline.

Use: Analytical reagent for lead, dye, and biological stain.

gallotannic acid. See tannic acid.

galls. (nutgalls). Excrescences on various kinds of oak trees resulting from the deposition of insect eggs.

Grade: The best grades (55–60% tannic acid) come from Iran, Syria, Turkey, and Tripoli.

Use: Source of gallic and gallotannic acids, leather tanning, writing inks, medicine, textile printing, pharmaceuticals.

“Galvan” [Cabot]. TM for battery and electrically conductive carbon black.

galvanizing. Coating of a ferrous metal by passing it through a bath of molten zinc or by electrodeposition of zinc. In the former process, the iron and zinc combine to form an intermetallic compound at the interface, the outer surface being relatively pure zinc, which crystallizes as it cools to form the characteristic spangle. The electrodeposition method gives a uniform surface that may be either dull or bright. Duration of corrosion protection is directly related to the thickness of the zinc coating.

See sacrificial protection.

“Galvoline” [Dow]. TM for a cored magnesium ribbon used as a continuous anode for the cathode protection of buried pipelines and other metal structures. Combustible.

“Galvomag” [Dow]. TM for magnesium alloy composition used in anodes in cathodic protection.

“Galvorod” [Dow]. TM for a cored magnesium rod used as an anode in the cathodic protection of water-heater tanks. Combustible.

gamete. A sex cell (egg or sperm) that carries half the normal complement of chromosomes and combines with another sex cell to produce a new individual possessing the normal complement.

gametes. Reproductive cells (sperm or egg) which are haploid.

gametocide. A substance that can control pollination of plants by selectively killing plant sex cells (gametes). Some suggested gametocides are maleic hydrazide and sodium- α , β -dichloroisobutyrate.

gametophyte. The haploid stage in the life cycle of an organism undergoing alternations of generations. The gametophyte is multicellular and mitotically produces gametes. In plants, the gametophyte nourishes the zygote and young sporophyte.

gamma. (γ). A prefix having meanings analogous to those of α , namely, to designate locations of substituents in a compound or a particular form or modification of an organic substance (γ -globulin) or a metal crystal. It also identifies the most intense form of short-wave radiation.

See gamma ray.

gamma-acid. See γ -acid.

gamma globulin. γ globulin.
See globulin.

gamma ray. (γ). Electromagnetic radiation of extremely short wavelength and intensely high energy. γ rays originate in the atomic nucleus; they usually accompany α and β emission, as in the decay of radium, and always accompany fission. γ rays are

extremely penetrating and are absorbed by dense materials like lead and depleted uranium.

Hazard: Exposure to γ radiation may be lethal. Complete protection is essential.

Use: To initiate chemical syntheses (ethyl bromide) and cross-linking of polyethylene and other polymers; biochemical research; food preservation; analytical chemistry.

See X ray; radiation.

gamma-ray spectroscopy. (γ -ray spectroscopy). An analytical technique involving the use of γ radiation, which is emitted from radioactive nuclei in discrete energies. The spectrum of energies and the relative intensities of the γ rays often characterize the radionuclide that emits them; these are determined by γ -ray spectroscopy. It is possible to identify quantitatively the elements present by their characteristic γ -ray spectra, as well as to determine radioactive decay rates.

“Ganex” [International Specialty]. TM for a series of modified polyvinylpyrrolidone-based products. Available in a wide range of physical forms, from liquid to waxy solid to granular solid. Used as emollients and lubricity additives, dispersing and suspending agents, pour-point depressants, sizing additives.

gangliefene.

CAS: 299-61-6. mf: $C_{20}H_{33}NO_5$.

Hazard: Moderately toxic.

gangliosides. Sphingolipids containing complex oligosaccharides as head groups.

gangue. The minerals and rock mined with a metallic ore but valueless in themselves or used only as a by-product. They are separated from the ore in the milling and extraction processes, often as slag. Common gangue materials are quartz, calcite, limonite, feldspar, pyrite, etc.

“Gantrez” AN [International Specialty].

TM for an interpolymer of methyl vinyl ether and maleic anhydride.

Properties: Soluble in water and many organic solvents. Compatible with a wide range of gums, resins, and plasticizers and with most metallic salts. Stable in acid and alkaline solutions. Available in a range of molecular weights.

Use: Ammonium nitrate slurry explosives, for its suspending action and cross-linking ability; rust-preventive films; antistatic and finishing agent in natural and synthetic textiles and glass fibers; adhesives and coatings; thickening agent and protective colloid; flocculant and foam stabilizer in papermaking; photoreproduction; pharmaceutical preparations; cosmetics; etc.

“Gantrez” M [International Specialty].

TM for polyvinyl methyl ether.

gardenia yellow.

CAS: 94238-00-3.

Hazard: Moderately toxic by ingestion.

Source: Natural product.

gardrin. See enprostil.

garlic oil.

CAS: 8000-78-0.

Hazard: Moderately toxic by ingestion.

Source: Natural product.

“Garlon” [Dow]. TM for herbicides containing water-soluble salts or oil-soluble esters of 3,5,6-trichloro-2-pyridyloxyacetic acid.

garnet, natural.

A group of silicate minerals.

Garnets in nature are usually composed of a mix of various garnet subspecies.

Use: Abrasive, blast cleaning of buildings.

garnet, synthetic.

Single-crystal garnets designed, by the introduction of bismuth, calcium, and vanadium, for microwave devices such as low-frequency ferrimagnetic resonators. Special yttrium, iron, and aluminum garnets are used in lasers and electronic devices.

garnierite. $(Ni, Mg)_6(OH)_6Si_4O_{14} \cdot H_2O$. A natural nickel-magnesium silicate, occurring as a natural alteration of magnesium silicate rocks. A nickel ore.

gas. (\uparrow). A state of matter characterized by very low density and viscosity (relative to liquids and solids), comparatively great expansion and contraction with changes in pressure and temperature, ability to diffuse readily into other gases, and ability to occupy with almost complete uniformity the whole of any container. Gases may be either elements (argon) or compounds (carbon dioxide); elemental gases may be monatomic (helium), diatomic (chlorine), or triatomic (ozone). All exist in the gaseous state at standard temperature and pressure but can be liquefied by pressure. The most abundant gases on earth are oxygen, hydrogen, nitrogen (diatomic), and carbon dioxide. Gases are used for fundamental research on the behavior of matter largely because the low concentration permits isolation of the phenomena far better than is possible in liquids or solids. A “perfect” or ideal gas closely conforms to the simple gas laws (Boyle’s law, Charles’ law) for expansion and contraction. *Note:* Use of the word *gas* for gasoline, natural gas, or the anesthetic nitrous oxide is acceptable only in informal communication.

See kinetic theory; compressed gas; noxious gas; noble gas; vapor.

gas, asphyxiant. See asphyxiant gas.

gas black. See carbon black.

gas chromatography. (GC; gas-liquid chromatography; GLC; vapor-phase chromatography; VPC). The process in which the components of a mix are separated from one another by volatilizing the sample into a carrier gas stream that is passing through and over a bed of packing consisting of a 20–200 mesh solid support. The surface of the latter is usually coated with a relatively nonvolatile liquid (the stationary phase). This gives rise to the term *gas-liquid chromatography*. If the liquid is not present, the process is *gas-solid chromatography*, which is also widely used for analysis. Different components move through the bed of packing at different rates and so appear separately, at the effluent end, where they are detected and measured by thermal conductivity changes, density differences, or ionization detectors. Gas chromatography is advantageous as a means of analysis of minute quantities of complex mixtures from industrial, biological, and chemical sources and is also of potential value in actually preparing moderate quantities of highly purified compounds otherwise difficult to separate from the mixture in which they occur.

gas, compressed. See compressed gas; liquefied petroleum gas.

gas constant (R). Pressure times volume divided by the temperature of one gram-molecule of any ideal gas in the general gas law.

$$R = \frac{P_0 V_0}{273C}$$

gas constant, molar. R in general gas law, $PV = nRT$, equal to 0.082060 L-atm mole⁻¹ degree⁻¹.

gaseous diffusion. See diffusion, gaseous.

gas hydrate. A clathrate compound formed by a gas (either noble or reactive) and water. The compounds are crystalline solids and are insoluble in water. They usually form (only at relatively low temperatures and high pressures) directly by contact of gas and liquid water. From 6 to 18 molecules of water may combine with each molecule of gas, depending on the nature of the gas. The best-known gas hydrates are those of ethane, ethylene, propane, and isobutane. Others include methane and 1-butene, most of the fluorocarbon refrigerant gases, nitrous oxide, acetylene, vinyl chloride, carbon dioxide, methyl and ethyl chloride, methyl and ethyl bromide, cyclopropane, hydrogen sulfide, methyl mercaptan, and sulfur dioxide. Interest in the gas hydrates originated mainly because of the nuisance of such compound formation in gas pipelines. In recent years, propane has been used successfully to precipitate water from salt solution (or seawater), thus yielding potable water.

gasification. Production of gaseous or liquid hydrocarbon fuels from coal (1) by direct addition of

hydrogen to form methane (hydrogasification); (2) by reacting steam with hot coal (800C) in the presence of air or oxygen to form carbon monoxide and hydrogen (synthesis gas), followed by a methanation reaction (Fischer-Tropsch method); (3) by underground aeration. In methods (1) and (2), the coal enters the reaction sequence in finely divided form; hydrocarbon gases, naphtha, and fuel oils of various grades can be produced by several modifications. In method (3), air is pumped down to previously ignited coal seams and the combustible products evolved are collected. Many variations of methods (1) and (2) have been researched in the U.S., but none is economically competitive with crude oil. Several have advanced to the pilot stage, and projections of cost, investment, and installation for large-scale operation have been made. Environmental and geographic considerations have also been investigated. The controlling factor for future development is the price of crude. All three methods mentioned are technically feasible. During World War II hydrocarbon fuels were produced from coal on a large scale in Germany by both hydrogasification and Fischer-Tropsch methods. Large-scale coal conversion has been successfully achieved by the Lurgi and Sasol methods; the latter, in South Africa, is a large-scale installation utilizing the Fischer-Tropsch technology. The Lurgi technique is in production at a number of locations. Catalytic gasification of peat for production of methanol is now utilized on a commercial scale; use of lignite and wood for this purpose is under development.

See Fischer-Tropsch process; synthesis gas.

gas, inert. See noble gas, inert.

gas laws. See Boyle's law; Charles' law; Gay-Lussac's law; ideal gas.

gas, liquefied petroleum. See liquefied petroleum gas.

gas liquid. See light hydrocarbon.

gas, natural. See natural gas.

gas, noble. See noble.

gasohol Gasoline blended with alcohol. Typically 10% methanol or ethanol is blended with the gasoline.

gas oil. A liquid petroleum distillate with viscosity and boiling range between those of kerosene and lubricating oil. Boiling range 232–426C, flash p 150F (65.5C), autoign temp 640F (337C). Combustible.

Use: Absorption oil, manufacture of ethylene.

gasoline.

CAS: 8006-61-9. A mixture of volatile hydrocarbons suitable for use in a spark-ignited internal-

combustion engine and having an octane number of at least 60. The major components are branched-chain paraffins, cycloparaffins, and aromatics. There are several methods of production: distillation or fractionation, which yields straight-run product of relatively low octane number, used primarily for blending; thermal and catalytic cracking; reforming; polymerization; isomerization; and dehydrocyclo-dimerization. All but the first are various means of converting hydrocarbon gases into motor fuels by modifications of chemical structure, usually involving catalysis. The present commercial source of gasoline is petroleum, but it may also be produced from shale oil and Athabasca tar sands, as well as by hydrogenation or gasification of coal.

anti-knock gasoline. A gasoline to which a low percentage of methyl-*tert*-butyl ether (MBTE) has been added to eliminate knocking and increase octane number. This compound has almost completely replaced tetraethyllead. Gasolines of octane number 100 or more are used chiefly as aviation fuel; those having a research octane number of approximately 90 are in general automotive use. See antiknock agent; octane number.

casingshead gasoline. See natural gasoline (below).

cracked gasoline. Gasolines produced by the catalytic decomposition of high-boiling components of petroleum. In general, such gasolines have much higher octane ratings (80–100) than that produced by fractional distillation. The difference is due to the prevalence of unsaturated, aromatic, and branched-chain hydrocarbons in the cracked gasoline. The actual properties vary widely with the nature of the starting material and the temperature, time, pressure, and catalyst used in cracking.

high-octane gasoline. A gasoline with an octane number of 90–100. See antiknock gasoline; octane number.

lead-free gasoline. An automotive fuel containing no more than 0.05 g lead per gallon, designed for use in engines equipped with catalytic converters.

natural gasoline. A gasoline obtained by recovering the butane, pentane, and hexane hydrocarbons present in small proportion in certain natural gases. Used in blending to produce a finished gasoline with adjusted volatility but low octane number. Do not confuse with natural gas.

polymer gasoline. A gasoline produced by polymerization of low molecular weight hydrocarbons such as ethylene, propene, and butenes. Used in small amounts for blending with other gasolines to improve their octane numbers.

pyrolysis gasoline. Gasoline produced by thermal cracking as a by-product of ethylene manufacture. It is used as a source of benzene by the hydrodealkylation process.

reformed gasoline. A high-octane gasoline obtained from low-octane gasoline by heating the vapors to a high temperature or by passing the vapors through a suitable catalyst.

straight-run gasoline. Gasoline produced from petroleum by distillation without use of cracking or

other chemical conversion processes. Its octane number is low.

white gasoline. An unleaded gasoline especially designed for use in motorboats; it is uncracked and strongly inhibited against oxidation to avoid gum formation and is usually not colored to distinguish it from other grades. It also serves as a fuel for camp lanterns and portable stoves.

Hazard: Highly flammable, dangerous fire and explosion risk. TLV: 300 ppm; STEL 500 ppm; animal carcinogen.

gas, perfect. See ideal gas.

Gastaldi synthesis. Formation of dicyanopyrazines by cyclization of two molecules of an aminocyanomethyl ketone, produced by treatment of an isonitrosomethyl ketone bisulfite compound with potassium cyanide, heating in hydrochloric acid, and oxidation.

gastric juice. A mixture of hydrochloric acid and pepsin secreted by glands in the stomach in response to a conditioned nerve reflex. Its pH is about 2.0. Its action in the metabolic breakdown of food components is essential to the digestive process, though carbohydrate decomposition is initiated by the saliva.

See digestion (1).

gastrin tetrapeptide amide.

CAS: 1947-37-1. mf: $C_{37}H_{42}N_6O_8S$.

Hazard: Moderately toxic by ingestion.

gate. The opening in an injection mold leading from the sprue or runner to the mold cavity; the term also refers to molded material removed from the aperture when the product is ejected.

Gattermann aldehyde synthesis. Preparation of aldehydes of phenols, phenol ethers, or heterocyclic compounds by treatment of the aromatic substrate with hydrogen cyanide and hydrochloric acid in the presence of Lewis acid catalysts.

Gattermann-Koch reaction. Formulation of benzene, alkylbenzenes, or polycyclic aromatic hydrocarbons with carbon monoxide and hydrochloric acid in the presence of aluminum chloride at high pressure. Addition of cuprous chloride allows the reaction to proceed at atmospheric pressure.

gauge. An instrument for measuring and indicating such process variables as pressure (hydraulic, steam, air), liquid level, thickness, vacuum, etc. The many types of gauges are activated by mechanical, ultrasonic, electronic, magnetic, and pneumatic means. Some operate on the principle of automatic control. In materials technology, the term *gauge* is often synonymous with thickness, especially in the metals, rubber, and plastics fields. Light gauge refers to thicknesses from about 0.005 to 0.05 inch,

and heavy gauge to thicknesses from about 0.05 to 0.150 inch.

See mil; meter (2).

Gay-Lussac, Joseph Louis. (1778–1850). A French chemist and physicist noted for the brilliance and accuracy of his reasoning and experimental work. He contributed greatly to the knowledge of gases in his discovery (1808) of the law of combining volumes and his independent discovery (1802) of the law of Charles, the relationship of temperature to the volume of gases. He graduated from and taught at the Ecole Polytechnique, becoming a full professor in 1810. His work in chemistry was extensive, resulting in the discovery of boron, which he named, with Louis-Jacques Thenard, and a variety of compounds such as boron trifluoride, chloric acid, and dithionic acid ($\text{H}_2\text{S}_2\text{O}_6$). He identified iodine as an element, named it, and studied its properties. He investigated the relationship of acids and bases and introduced many analytical techniques (such as the use of litmus as an indicator). Among his many contributions to industrial chemistry were improvements in the production of sulfuric acid. Much of the progress of chemistry in the early 19th century is associated with his career.

Gay-Lussac's law. A modification of Charles' law to state the following: At constant pressure the volume of a confined gas is proportional to its absolute temperature. The volumes of gases involved in a chemical change can always be represented by the ratio of small whole numbers.

GC. Abbreviation for gas chromatography.

GC-rich area. Many DNA sequences carry long stretches of repeated G and C, which often indicate a gene-rich region.

Gd. Symbol for gadolinium.

GDME. Abbreviation for glycol dimethyl ether. See ethylene glycol dimethyl ether.

GDNF. Abbreviation for glial cell line-derived neurotrophic factor.

GDP. Abbreviation for guanosine diphosphate. See guanosine phosphates.

GDUE. See 1h,3h,5h-oxazolo(3,4-c)oxazole-7a(7h)-methanol.

Ge. Symbol for germanium.

gel. A colloid in which the disperse phase has combined with the continuous phase to produce a viscous jellylike product. Only 2% gelatin in water forms a stiff gel. A gel is made by cooling a solution, whereupon certain kinds of solutes (gelatin) form submicroscopic crystalline particle groups that re-

tain much solvent in the interstices (so-called "brush-heap" structure). Gels are usually transparent but may become opalescent.

See pectin.

gelatin. A mixture of proteins obtained by hydrolysis of collagen by boiling skin, ligaments, tendons, etc. Its production differs from that of animal glue in that the raw materials are selected, cleaned, and treated with special care so that the product is cleaner and purer than glue. Type A gelatin is obtained from acid-treated raw materials, and type B from alkali-treated raw materials. Gelatin is strongly hydrophilic, absorbing up to 10 times its weight of water and forming reversible gels of high strength and viscosity. It can be chemically modified to make it insoluble in water for such special applications as microencapsulation of fish nutrients for fish culture.

Properties: Flakes or powder; odorless; tasteless. Soluble in warm water and glycerol; insoluble in organic solvents.

Grade: Edible, photographic, technical, USP.

Use: Photographic film; sizing; textile and paper adhesives; cements; capsules for medicinals; matches; light filters; clarifying agent; desserts, jellies, etc.; culture medium for bacteria; blood plasma volume expander; microencapsulation; printing inks; nutrient; protective colloid in ice cream.

gelatin dynamite. A high explosive that contains nitrocellulose in addition to nitroglycerin. The product is a gelatinized mass, less sensitive to shock and friction than straight dynamite.

gel electrophoresis. A procedure for separating a mixture of molecules through a stationary material (gel) in an electrical field.

gel filtration. A type of fractionation procedure in which molecules are separated from each other according to differences in size and shape; the action is similar to that of molecular sieves. Dextran gels (three-dimensional networks of polysaccharide chains) are usually used in this method known as gel-filtration chromatography. See fractionation; molecular sieve.

"Gelflex Blue" [ACC Silicones]. TM for a reusable moulding rubber.

"Gelgard" [Dow]. TM for a synthetic polymeric water-gelling material.
Use: Fire control.

gelled hydrogen. Liquid hydrogen thickened with silica powder.
Use: Rocket fuel.

gel paint. (thixotropic paint). A paint formulation that has a semisolid or gel consistency when undisturbed, but that flows readily under the brush or when stirred or shaken. After removal of the

stress, it becomes stiff again and has little tendency to spill, drip, or run. The thixotropic quality is obtained by the carefully controlled reaction of a relatively small proportion of a polyamide resin with an alkyd resin vehicle.

See thixotropy.

gel-permeation chromatography. (GPC).

The form of liquid chromatography that sorts polymer molecules in a gel-packed column according to their size in solution.

gelsemine.

CAS: 509-15-9. $C_{20}H_{22}N_2O_2$.

Hazard: A toxic plant alkaloid.

Use: Medicine, as a CNS stimulant.

gel shift assay. (gel mobility shift assay (GMSA); band shift assay (BSA); electrophoretic mobility shift assay (EMSA). A method by which one can determine whether a particular protein preparation contains factors which bind to a particular DNA fragment. When a radiolabeled DNA fragment is run on a gel, it shows a characteristic mobility. If it is first incubated with a cellular extract of proteins (or with purified protein), any protein-DNA complexes will migrate slower than the naked DNA—a shifted band.

“Gelva” [Solutia]. TM for a family of acrylic multipolymer products designed for high-performance, pressure-sensitive adhesive applications where skin adhesion, high temperature and/or difficult-to-adhere-to surface are involved. Provided for both solvent and water based grades.

Use: Medical, automotive, solar film, graphics, and specialty tape products.

gem-. Prefix. Abbreviation of geminate, meaning two identical groups attached to the same carbon atom.

gemicitabine.

CAS: 95058-81-4. mf: $C_9H_{11}F_2N_3O_4$.

Hazard: Human systemic effects

gene. A complex of nucleoproteins (chiefly DNA) that is the active transmitter of genetic information. Each of the body's 50,000 to 100,000 genes contains the code for a specific product, typically, a protein such as an enzyme.

Genes occur on the chromosomes of every living cell, where they are arranged in a linear order. Genetic mechanism is the same in all organisms, ranging from the lowest forms of life, both plant and animal, to humans. Every organism has a large number of different genes; there are over 10,000 in each cell of the human body. These control the intricate and well-balanced system of biochemical reactions in the cell. The first synthesis of a gene was reported in 1970. In 1976, it was announced that a synthetic gene was successfully introduced into a microorganism

in which it functioned in the same manner as would a normal gene. Because of the ability of DNA to store and transfer coded genetic instructions, genes determine the sequence of amino acids in specific polypeptides (see proteins), thus they prescribe the structure of the proteins synthesized. In viruses, the genes consist of ribonucleic acid (RNA). Mutation of genes is a change in the basic sequence of amino acids in DNA and may be induced by ionizing radiation. Mutations can occur in any living cell. See genetic code; radiation, ionizing; recombinant DNA; molecular biology.

gene amplification. Any process by which specific DNA sequences are replicated disproportionately larger than their representation in the parent molecules; during development, some genes become amplified in specific tissues.
See gene; oncogene.

gene chip technology. Development of cDNA microarrays from a large number of genes. Used to monitor and measure changes in gene expression for each gene represented on the chip.

gene deletion. The total loss or absence of a gene.

gene expression. The process by which a gene's coded information is translated into the structures present and operating in the cell (either proteins or RNAs).

gene families. Groups of closely related genes that make similar products.

gene library. See genomic library.

gene mapping. Determination of the relative positions of genes on a DNA molecule (chromosome or plasmid) and of the distance, in linkage units or physical units, between them.

gene pool. All the variations of genes in a species.
See allele; gene; polymorphism.

gene prediction. Predictions of possible genes made by a computer program based on how well a stretch of DNA sequence matches known gene sequences

gene product. The biochemical material, either RNA or protein, resulting from expression of a gene. The amount of gene product is used to measure how active a gene is; abnormal amounts can be correlated with disease-causing alleles.

gene testing. See genetic testing; genetic screening.

gene therapy. An experimental procedure aimed at replacing, manipulating, or supplementing nonfunctional or malfunctioning genes with healthy genes.

See gene; inherit; somatic cell gene therapy; germ line gene therapy.

gene transfer. Incorporation of new DNA into and organism's cells, usually by a vector such as a modified virus. Used in gene therapy.

See mutation; gene therapy; vector.

general acid-base catalysis. Catalysis involving a proton transfer from/to a molecule other than water. Compare to specific acid-base catalysis.

generic formula. See formula, chemical.

“Genesolv” [General Electric]. TM for ultrapure halogenated hydrocarbon solvents of the methane and ethane series.

Properties: High densities and low viscosities, combined residue (soluble plus insoluble matter) is less than 1 ppm.

Grade: Standard and electronic, Genesolv D, 200, and 2004.

Hazard: Nonflammable, nonexplosive, thermally stable, and relatively nonhydrolyzable.

Use: Removal of greases and oils from metal, plastic, elastomer, and paint or varnish surfaces. Used with all cleaning techniques on assembled motors and parts, electronic devices, precision components, motion-picture film, refrigeration systems, etc. Also used for isolation of viruses, for fire extinguishing, and as dielectric coolants.

gene-splicing. The enzymatic attachment of one exon to another.

See genetic engineering.

gene testing. Examining a sample of blood or other body fluid or tissue for biochemical, chromosomal, or genetic markers that indicate the presence or absence of genetic disease.

gene therapy. Treatment that alters genes (the basic units of heredity found in all cells in the body). In early studies of gene therapy for cancer, researchers are trying to improve the body's natural ability to fight the disease or to make the tumor more sensitive to other kinds of therapy.

genetic code. Information stored in the genes that program the linear sequence of amino acids within the protein polypeptide chain synthesized during cell development. The agencies involved are DNA (deoxyribonucleic acid) and RNA (ribonucleic acid). It is this information code (analogous to a computer language) that determines (1) the nature and type of an organism, i.e., its heredity, and (2) the kind of cell structure to be formed (muscle, bone,

organ, etc.).

See protein; amino acid; ribonuclease.

genetic counseling. Provides patients and their families with education and information about genetic-related conditions and helps them make informed decisions.

genetic discrimination. Prejudice against those who have or are likely to develop an inherited disorder.

genetic engineering. Transference of genetic material from the genes of one species to those of another by uniting a portion of the DNA of one organism with extranuclear sections of DNA from another organism (also called gene-splicing). Such recombinant molecules will replicate in the same way as in normal DNA behavior. This technique is being utilized in basic genetic research sponsored by the National Institutes of Health.

There have been a number of outstanding achievements in genetic engineering in which bacteria are made to form chains of amino acids programmed by nucleic acids supplied by the experimenters; (1) Production of human insulin from *E. coli* by implanting synthetic genes in the bacterium; commercial production of such synthetic insulin has been going on for some time, and the product has been approved by the FDA. (2) Formation and secretion by *E. coli* of the protein ovalbumin. (3) Synthesis of rat growth hormone in bacteria. (4) Synthesis of human growth hormone in bacteria; it will probably be developed on a commercial scale. (5) Production of a biologically active protein closely similar to interferon by exposing to the action of viruses bacteria that have been programmed to form it by introduction of the appropriate genetic code. (6) Creation of a wholly synthetic bacterium characterized by unusual ability to consume crude oil.

Various patents are pending on some of these techniques for commercial exploitation. The Supreme Court has ruled that these and other results of genetic engineering are patentable inventions. See biotechnology.

genetic engineering technology. See recombinant DNA technology.

genetic illness. Sickness, physical disability, or other disorder resulting from the inheritance of one or more deleterious alleles.

genetic information. The hereditary information contained in a sequence of nucleotide bases.

genetic linkage map. A chromosome map showing the relative positions of the known genes on the chromosomes of a given species.

genetic map. A diagram showing the position of specific genes along a chromosome relative to markers.

genetic marker A gene or other identifiable portion of DNA whose inheritance can be followed. See chromosome; DNA; gene; inherit.

genetic material. See genome

genetic mosaic. An organism in which different cells contain different genetic sequence. This can be the result of a mutation during development or fusion of embryos at an early developmental stage.

genetic polymorphism. Difference in DNA sequence among individuals, groups, or populations (e.g., genes for blue eyes versus brown eyes).

genetic predisposition. Susceptibility to a genetic disease. May or may not result in actual development of the disease.

genetics. The scientific study of heredity—how particular qualities or traits are transmitted from parents to offspring.

genetic screening. Testing groups of individuals to identify defective genes capable of causing hereditary conditions.

genetic testing. Analyzing an individual's genetic material to determine predisposition to a particular health condition or to confirm a diagnosis of genetic disease.

genetic variation. A phenotypic variance of a trait in a population attributed to genetic heterogeneity.

“Genetron” [General Electric]. TM for a group of fluorinated hydrocarbons of the methane and ethane series.

Properties: Low moisture content, noncorrosive, nonflammable, stable, low power requirement per unit of refrigeration, high dielectric strength.

Use: Refrigerant and foam expansion agent.

Geneva System. A system of nomenclature for organic compounds recommended in 1892. It is based on compounds derived from hydrocarbons as a starting point, the names corresponding to the longest straight carbon chain present. The position is indicated by numbers applied to the carbons of the straight chain, beginning with the end carbon nearest the substituent element or group. Normal compounds, in which the carbons are linked in a straight chain, are named ethane, propane, pentane, etc. Normal propane is

Branched compounds are so named to show the proper deviation, e.g., 2-methyl propane

is a derivation of propane, not of methane. Similarly, isopentane

is named 2-methylbutane. The four carbons in a straight line give the name *butane*, and the side group is attached to the second carbon. Another pentane has the structure

and was once called tetramethyl pentane. Under the Geneva System, it is named in terms of two methyl groups joined to carbon number two in a propane chain (e.g., 2,2-dimethyl propane). Some special recommendations of the Geneva System define the use of certain suffixes: open-chain hydrocarbons with one double bond end in *-ene*; those with two double bonds end in *-diene* (*alkenes* and *alkadienes* rather than *olefins* and *diolefins*). Triple-bonded compounds end in *-yne*. Alcohols are named by use of the hydrocarbon name with *-ol* as the characteristic suffix, i.e., methanol, ethanol, etc. In order to extend this plan to polyhydric alcohols, a syllable such as *di-*, *tri-*, or *tetra-* is inserted between the name of the parent hydrocarbon and the suffix *-ol*.

Sulfides, disulfides, sulfoxides, and sulfones are named like ethers, the *oxy* term being replaced with *thio-*, *dithio-*, *sulfinyl*, and *sulfonyl*. The acids are also named in accordance with the Geneva System.

See chemical nomenclature.

genin. The steroid portion linked to a sugar residue in certain glycosides. Important genins are found in the digitalis glycosides used as heart stimulants.

genome. The total DNA contained in each cell of an organism. Mammalian genomic DNA (including that of humans) contains 6x10⁹ base pairs of DNA per diploid cell. There are somewhere in the order of a hundred thousand genes, including coding regions, 5' and 3' untranslated regions, introns, 5' and 3' flanking DNA. Also present in the genome are structural segments, such as telomeric and centro-

meric DNAs and replication origins, and intergenic DNA.

genome maps. Charts that indicate the ordered arrangement of the genes or other DNA markers within the chromosomes.

genome project. Research and technology-development effort aimed at mapping and sequencing the genome of human beings and certain model organisms.

See Human Genome Initiative.

genomic blot. A type of Southern blot specifically used to analyze a mixture of DNA fragments derived from total genomic DNA. Because genomic DNA is very complicated, when it has been digested with restriction enzymes it produces a complex set of fragments ranging from tens of bp to tens of thousands of bp. However, any specific gene will be reproducibly found on only one or a few specific fragments. A million identical cells will produce a million identical restriction fragments for any given gene, so probing a genomic Southern with a gene-specific probe will produce a pattern of perhaps one or just a few bands.

genomic clone. A piece of DNA taken from the genome of a cell or animal, and spliced into a bacteriophage or other cloning vector. A genomic clone may contain coding regions, exons, introns, 5' flanking regions, 5' untranslated regions, 3' flanking regions, 3' untranslated regions, or it may contain none of these.

genomic library. A collection of clones made from a set of randomly generated overlapping DNA fragments representing the entire genome of an organism.

genomics. The study of genes and their function.

genomic sequence. See DNA.

genotype. The genetic constitution of an organism, as distinguished from its physical appearance (its phenotype).

gentamicin. (gentamycin).

CAS: 1403-66-3. $C_{21}H_{43}N_7O_7$.

Properties: Amorphous solid. Mp 102–108C. Freely soluble in water, pyridine, acid solutions; moderately soluble in methanol, ethanol, and acetone; practically insoluble in benzene and halogenated hydrocarbons.

Use: Antibacterial.

gentian violet. USP name for methyl violet.

gentisic acid. (2,5-dihydroxybenzoic acid).

CAS: 490-79-9. $C_6H_3(OH)_2COOH$.

Properties: Crystals. Mp 199–200C. Soluble in wa-

ter, alcohol, and ether; insoluble in carbon disulfide, chloroform, and benzene.

Use: Medicine, as sodium gentisate (analgesic).

geochemistry. The study of the chemical composition of the earth in terms of the physicochemical and geological processes and principles that produce and modify minerals and rocks. Of practical importance in discovering and establishing the limits of ore deposits, petroleum, tar sands, salt, sulfur, and other valuable resources.

geometric isomer. A type of stereoisomer in which a chemical group or atom occupies different spatial positions in relation to the double bonds. If the double bond is between two carbon atoms, the isomers are called *cis* and *trans*, as in crotonic acid, where the H and COOH reverse locations:

If the double bond is between a nitrogen and a carbon atom, the isomers are named *anti* and *syn*, as in benzaldoxime, where the OH group shifts locations.

This phenomenon also occurs in saturated ring compounds having three or more members in the ring, as well as in certain coordination compounds.

See stereochemistry.

“Geon” [B. F. Goodrich].

CAS: 9002-86-2. TM for polyvinyl chloride formulated for moldings, extrusions, binders, and coatings.

Use: For appliance applications, electronic parts, medical devices, construction applications, bottles, wiring, and cable.

geothermal energy. Superheated water and steam trapped in rock strata in areas characterized by volcanic activity or by intrusions of molten magma. Associated temperatures range from 150 to 300C. It escapes either from natural surface vents (geysers, fumaroles, hot springs) or from bore holes drilled through the strata. A contributing source of heat is the natural radioactivity of rocks in the earth's upper mantle. Power was produced in Italy from geothermal sources as long ago as 1913; since then geothermal power plants have been installed in Iceland, New Zealand, France, Hungary, Japan, Mexico, and El Salvador. Many nonelectrical uses have been developed for home heating and industrial purposes, especially in Iceland. The chief source of geothermal energy in the continental U.S. is the California-Nevada area. The geysers in central California have been generating electric power from steam in sub-

stantial amounts for some years. The same is true of Hawaii. Geological formations appropriate for geothermal heat are so few that this form of energy will always have limited potential.

geranial. See citral.

geranialdehyde. See citral.

geraniol. (*trans*-3,7-dimethyl-2,6-octadien-1-ol). $(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{C}(\text{CH}_3):\text{CHCH}_2\text{OH}$. A terpene alcohol.

Properties: Colorless to pale-yellow, liquid oil; pleasant geranium-like odor. D 0.870–0.890 (15C), fp –15C, bp 230C, refr index 1.4710–1.4780 (20C), optical rotation –2 to +2 degrees. Soluble in alcohol, ether, mineral oil, fixed oils; insoluble in water and glycerol. Combustible.

Derivation: From citronella oil (Java), citronellol-free grades from palmerosa oil, and (synthetically) from pinene. These are of higher quality.

Grade: Standard, soap, synthetic, FCC, EOA.

Use: Perfumery, constituent of synthetic fragrances and synthetic linalool.

geranyl acetate. (geraniol acetate).

CAS: 105-87-3. $\text{CH}_3\text{COOC}_{10}\text{H}_{17}$.

Properties: Clear, colorless liquid; odor of lavender. D 0.907–0.918 (15C), bp 242C, optical rotation –2 to +2 degrees, refr index 1.4580–1.4640 (20C). Soluble in alcohol and ether; insoluble in water and glycerol. Combustible.

Derivation: (1) Constituent of several essential oils. (2) By heating geraniol and sodium acetate with acetic anhydride.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

geranyl butyrate. (geraniol butyrate).

$\text{C}_3\text{H}_7\text{COOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; roselike odor. Bp 151C (18 mm Hg), d 0.9008 (17/4C). Insoluble in water and glycerol; soluble in alcohol, ether. Occurs in several essential oils. Combustible.

Grade: FCC.

Use: Perfumes and soaps, flavoring, synthetic attar of rose.

geranyl formate. (geraniol formate).

CAS: 105-86-2. $\text{HCOOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid. Bp 113 (15 mm Hg), d 0.927 (20/4C), roselike odor. Insoluble in alcohol and ether. Occurs in several essential oils. Combustible.

Grade: FCC.

Use: Perfumes and soaps, flavoring, synthetic neroli oil.

geranyl propionate. (geraniol propionate).

$\text{C}_2\text{H}_5\text{COOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; roselike odor. D 0.896–0.913 (25C), refr index 1.4570–1.4650

(20C). Soluble in most oils; insoluble in glycerol. Combustible.

Use: Perfumery, flavoring.

germacrone.

CAS: 6902-91-6. mf: $\text{C}_{15}\text{H}_{22}\text{O}$.

Hazard: A poison by ingestion.

“Germall” [Isp Europe]. TM for a broad spectrum highly effective preservative.

“Germall 115” [Sutton].

CAS: 39236-46-9. TM for imidazolidinyl urea.

Use: Preservative in cosmetics.

germane. A germanium hydride of the general formula $\text{Ge}_n\text{H}_{2n+2}$.

See germanium tetrahydride.

germanium. Ge. Nonmetallic element of atomic number 32, aw 72.59, valences of 2, 4; group IVa of the periodic table.

Properties: Grayish-white solid. A *p*-type semiconductor, conductivity depends largely on added impurities, d 5.323, mp 937.4C, bp 2830C, oxidizes readily at 600–700C, does not volatilize to approximately 1350C, Mohs hardness 6. Attacked by nitric acid and aqua regia; stable to water, acids, and alkalis in the absence of dissolved oxygen.

Derivation: Recovered from residues from refining of zinc and other sources, by heating in the presence of air and chlorine. It is also present in some coals and can be recovered from their ash.

Occurrence: Missouri, Kansas, Oklahoma.

Method of purification: The chloride is distilled and then hydrolyzed to the oxide, which is reduced by hydrogen to the metal. Zone melting is used for final purification. Single crystals are made by vaporization of germanium diiodide. The impurities in germanium are of controlling importance in its use in transistors. These are added to high-purity germanium in trace amounts during growth of single crystals.

Grade: Transistor, i.e., impurities 1 part in 10^{10} .

Available forms: Ingots, single crystals, pure or doped, powder.

Use: Solid-state electronic devices (transistors, diodes), semiconducting applications, brazing alloys, phosphors, gold and beryllium alloys, infrared-transmitting glass.

germanium dichloride. GeCl_2 . White powder, mp (decomposes), decomposes in water, soluble in germanium tetrachloride, insoluble in alcohol and chloroform.

germanium dioxide. (germanium oxide).

CAS: 1310-53-8. GeO_2 .

Properties: White powder, hexagonal, tetragonal, and amorphous.

Grade: Technical, semiconductor, 99.999% pure.

Use: Phosphors, transistors and diodes, infrared-transmitting glass.

germanium monoxide. GeO.

Properties: Black solid. Mp 710C (sublimes); insoluble in water; soluble in oxidizing agents. Available commercially 99.999% pure.

germanium potassium fluoride. (potassium germanium fluoride). K_2GeF_6 .

Properties: White crystals. Soluble in water (hot); insoluble in alcohol.

Grade: Technical.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

germanium telluride. GeTe.

Properties: An efficient semiconductor. Mp 725C.

germanium tetrachloride.

CAS: 10038-98-9. $GeCl_4$.

Properties: Colorless liquid. D 1.874 (25/25C), fp -49.5C (1 atm), bp 83.1C, refr index 1.464, decomposes in water. Insoluble in concentrated hydrochloric acid; soluble in carbon disulfide, chloroform, benzene, alcohol, and ether.

Derivation: Reaction of chlorine with elemental germanium.

germanium tetrahydride.

CAS: 7782-65-2. GeH_4 .

Properties: Colorless gas, d 3.43 g/L, fp -165C, bp -88C, decomposes at 350C, insoluble in water, soluble in liquid ammonia, slightly soluble in hot hydrochloric acid.

Hazard: Toxic material. TLV: 0.2 ppm.

germ cell. The reproductive cells, either egg or sperm cells. Germ cells are haploid and have only one set of chromosomes (23 in all), while all other cells have two copies (46 in all).

germicide. See bactericide.

germ line. The continuation of a set of genetic information from one generation to the next. See inherit.

germination. The process by which a seedling emerges and develops from a seed, or by which a sporeling emerges and develops from a spore.

germ-line cell. A class of animal cells formed early in embryogenesis that are set aside for reproductive function (give rise to gametes). All other cells are somatic cells.

germ line gene therapy. An experimental process of inserting genes into germ cells or fertilized eggs to cause a genetic change that can be passed on to offspring.

Use: To alleviate effects associated with a genetic

disease.

See genomics; somatic cell gene therapy.

germ line genetic mutation. See mutation.

getter. See scavenger.

ghatti gum. Exudation from the stem of *Anogeissus latifolia*.

Properties: Colorless to pale-yellow tears, rounded or vermiform. Almost tasteless and odorless, partially soluble in water. Can be solubilized by autoclaving.

Use: Thickener and protective colloid; emulsifier for oils, fats, waxes.

“Ghost Remover” [Ulano]. TM for an ink haze and stencil residue remover.

Use: Effective on most inks and emulsions.

Giauque, William F. (1895–1982). An American chemist who achieved distinction for his studies of the properties of matter at temperatures approaching absolute zero (-273C). This research established the science of cryogenics. Giauque received the Nobel Prize in chemistry in 1949. He was professor and research director at the University of California at Berkeley. One of his most significant contributions was the invention of a magnetic cooling device that made it possible to attain cryogenic temperatures. An important property of matter discovered as a result of his work is superconductivity. See cryogenics; superconductivity.

gibberellic acid.

CAS: 77-06-5. $C_{19}H_{22}O_6$. A plant-growth-promoting hormone. It is a tetracyclic dihydroxylactonic acid. It was synthesized in 1978.

Properties: Crystals. Mp 233–235C. Slightly soluble in water; soluble in methanol, ethanol, acetone; soluble in aqueous solutions of sodium bicarbonate and sodium acetate.

Use: Agriculture and horticulture, malting of barley with improved enzymatic characteristics.

gibberellin. A group of plant-growth regulators (hormones), isolated in 1938 and widely distributed in flowering plants that promotes elongation of shoots and coleoptiles. They differ from auxins in not stimulating the growth of roots and in various other properties. The presence of auxin appears to be necessary for gibberellins to function. All gibberellins have closely related structures, being weak acids with a ring system containing double bonds and eight asymmetric carbons.

See gibberellic acid; plant-growth regulator.

Gibbs-Duhem equation. (GDE). An exact thermodynamic relation that permits computation of the changes of chemical potential for one component of a uniform mixture over a range of compositions, provided the changes of potential for each of the other components have been measured over the same range.

Gibbs, Josiah Willard. (1839–1903). The father of modern thermodynamics. During his lifelong post as professor of mathematical physics at Yale, he stated the fundamental concepts embraced by the three laws of thermodynamics, especially the nature of entropy. A theorist rather than an experimenter, Gibbs was the first to expound with mathematical rigor the "relation between chemical, electrical, and thermal energy and capacity for work." It has been said that throughout his adult life Gibbs did nothing but think. The results established him as a great creative scientist.

See thermodynamics.

Gibb's free energy. See free energy.

Gibbs phase rule. See phase rule.

Gibbs phthalic anhydride process. Oxidation of naphthalene to phthalic anhydride with air at 360C over vanadium pentoxide and other catalysts.

giga- Prefix meaning 10⁹ units (symbol = G). 1 Gg = 1 gigagram = 10⁹ grams.

Gilbert, Walter. (1932–). An American molecular biochemist who won the Nobel Prize for chemistry in 1980 along with Berg and Sanger for their studies of the chemical structure of nucleic acid. Author of many papers on theoretical physics and molecular biology. He has been at Harvard since 1972.

gilsonite. An asphaltic material or solidified hydrocarbon found only in Utah and Colorado. One of the purest (9.9%) natural bitumens. Said to be the first solid hydrocarbon to be converted to gasoline.

Hazard: Irritant, skin sensitizer.

Use: Acid, alkali, and waterproof coatings; black varnishes, lacquers, baking enamels, and japans; wire-insulation compounds; linoleum and floor tile; paving; insulation; diluent in low-grade rubber compounds; possible source of gasoline, fuel oil, and

metallurgical coke.

See asphalt; bitumen.

gin. An alcoholic beverage made by distilling alcohol through a mixture of herbs and berries (juniper, coriander, etc.) and adjusting to 80–100 proof.

Properties: Flash p 90F (32.3C).

Hazard: Flammable, moderate fire risk. Slight irritant, intoxicant.

ginkgo biloba l., root extract.

CAS: 90045-36-6.

Hazard: Low toxicity by ingestion. Human systemic effects.

Source: Natural product.

ginsenoside.

CAS: 74749-74-9.

Hazard: A poison.

Source: Natural product.

Girard's reagent. (Girard's "P": carboxymethylpyridinium chloride hydrazide; acethydrazidepyridinium chloride). C₅H₅NCICH₂CONHNH₂. (Girard's "T": carboxymethyltrimethyl ammonium chloride hydrazide; trimethylacethydrazide ammonium chloride). (CH₃)₃NCICH₂CONHNH₂.

Properties: White to faintly pinkish crystals; little or no odor. Mp 190–200C. Soluble in water; insoluble in oils. T is hygroscopic.

Use: Separation of aldehydes and ketones from natural oily or fatty materials; extraction of hormones.

Girbotol absorption. (amine absorption). A process for the removal of hydrogen sulfide or carbon dioxide from a gaseous mixture. An organic amine (ethanolamine or diethanolamine, which are basic) is allowed to flow down a tortuous path through a tower where it is contacted by and absorbs (acidic) hydrogen sulfide or carbon dioxide from the gas to be purified as it moves up the tower. The amine, contaminated with these products, is then sent from the bottom of the tower to a steam stripper where it flows countercurrent to steam, which strips the hydrogen sulfide or carbon dioxide from it. The amine is then returned to the top of the tower. The process is widely used in the petroleum industry for purifying refinery and natural gases and for recovery of hydrogen sulfide for sulfur manufacture. Removal of carbon dioxide from gases is usually done with monoethanolamine.

glacial. A term applied to a number of acids, e.g., acetic and phosphoric, that have a freezing point slightly below room temperature when in a highly pure state. For example, glacial acetic acid is 99.8% pure and crystallizes at 16.6C.

"Glacier" [Solutia]. TM for a new class of metal-working fluids. It is biodegradable and non-toxic, and generates no oil mist while in use. Pro-

vides low maintenance, environmental compatibility, and worker safety in metal operations.

Use: Desirable when aggressive metal removal and extreme requirements are desired. For grinding, milling, and turning in automotive, aviation, tooling, and bearings.

glance. A mineralogical term meaning brilliant or lustrous; used to describe hard, brittle materials that exhibit a bright reflecting surface when fractured. Examples of such materials are hard asphalts (glance pitch) and ores of certain metals such as lead glance (galena).

Glaser coupling. Coupling of terminal acetylenes by shaking an aqueous solution of cuprous chloride–ammonium chloride and the alkyne in an atmosphere of air or oxygen.

glass. A ceramic material consisting of a uniformly dispersed mixture of silica (sand) (75%), soda ash (20%), and lime (5%), often combined with such metallic oxides as those of calcium, lead, lithium, cerium, etc., depending on the specific properties desired. The blend (or “melt”) is heated to fusion temperature (approximately 700–800C) and then gradually cooled (annealed) to a rigid, friable state, often referred to as vitreous. Technically, glass is an amorphous, undercooled liquid of extremely high viscosity that has all the appearances of a solid. It has almost 100% elastic recovery.

See glass, optical.

Properties: (Soda-lime glass.) Lowest electrical conductivity of any common material (below 10^{-6} mho/cm). Low thermal conductivity. High tensile and structural strength. Relatively impermeable to gases. Inert to all chemicals except hydrofluoric, fluosilicic, and phosphoric acids and hot, strong alkaline solutions. Continuous highest-use temperature about 121C but may be higher, depending on composition. Good thermal insulator in fibrous form. Molten glass is extrudable into extremely fine filaments. Glass is almost opaque to UV radiation; in the absence of added colorant it transmits 95–98% of light to which it is exposed. Noncombustible.

Occurrence: Natural glass is rare but exists in the form of obsidian in areas of volcanic activity and meteor strikes. Excellent sand for glassmaking occurs in Virginia (James River), Pennsylvania, Massachusetts, New Jersey, West Virginia, Illinois, and Maryland; also in southern Germany and the Czech Republic.

Available forms: Plate, sheet, fiber, filament, fabric, rods, tubing, pipe, powder, beads, flakes, hollow spheres.

See sodium silicate.

Use: Windows, structural building blocks, chemical reaction equipment, pumps and piping, vacuum tubes, lightbulbs, glass fibers, yarns and fabrics, containers, optical equipment. Minute glass spheres with partial vacuum interior and treated exterior are available for compounding with resins for use in

deep-sea floats, potting compounds, and other composites.

glass, borosilicate. See glass, heat-resistant.

glass ceramic. A devitrified or crystallized form of glass whose properties can be made to vary over a wide range.

Properties: Rupture modulus up to 50,000 psi, d 2.5, thermal shock resistance 900C, highest continuous-use temperature 700C. Glass ceramics lie between borosilicate glasses and fused silica in high-temperature capability.

Derivation: A standard glass formula to which a nucleating agent, such as titania, has been added, is melted, rolled into sheet, and cooled. It is then heated to a temperature at which nucleation occurs, causing formation of crystals.

Use: Range and stove tops, laboratory bench tops, architectural panels, restaurant heating and warming equipment, telescope mirrors.

See nucleation; “Pyroceram”; “Cer-vit.”

“Glasslad 6C” [United Chemical]. TM for a chlorine terminated polydi methylsiloxane telomer.

Use: To form a siliconized surface.

glass electrode. See electrode, glass.

glass enamel. A finely ground flux, basically lead borosilicate, intimately blended with colored ceramic pigments. Different grades give characteristics of acid resistance, alkali resistance, sulfide resistance, or low lead release to meet requirements for various uses. Firing range 540–760C.

Use: For fired-on labels and decorations on glassware, tumblers, milk bottles, beverage bottles, glass containers, illuminating ware, architectural glass, and signs.

See porcelain enamel.

glass fiber. (fibrous glass; fiberglass). Generic name for a manufactured fiber in which the fiber-forming substance is glass (Federal Trade Commission). Noncombustible.

Properties: Tensile strength 15 g/denier, elongation 3–4%, d 2.54, no moisture regain, loses strength at >315C, softens at approximately 815C.

See glass.

Derivation: Molten glass is extruded at high speed through extremely small orifices.

Hazard: A suspected carcinogen. TLV: 10 mg/m³ (dust).

Use: Thermal, acoustic, and electrical insulation (coarse fibers in bats or sheets); decorative and utility fabrics such as drapes, curtains, table linen, carpet backing, tenting, etc.; tire cord as belt between tread and carcass; filter medium; reinforced plastics; light transmission for communication signals; reinforcement of cement products for construction use.

See fiber, optical.

glass, heat-resistant. (1) A soda-lime glass containing approximately 5% boric oxide, which lowers the viscosity of the silica without increasing its thermal expansion. Such glasses (known as borosilicates) have a very low expansion coefficient and high softening point (about 593C). Tensile strength is approximately 10,000 psi. Continuous-use temperature 482C. Transmits UV light in higher wavelengths and is used in sunlight lamps and similar equipment for this reason.

See "Pyrex."

Note: Use of borosilicate glass as a storage-disposal medium for high-level radioactive wastes has been under research for some time. Tentative conclusions based on high-temperature and high-pressure autoclave tests indicate that this method would be suitable for geologic storage of such wastes.

See radioactive waste.

(2) A pure silica glass trademarked "Vycor" that softens at about 1482C.

See silica, fused.

glassine. A thin, transparent, and very flexible paper obtained by excessive beating of the pulp. It may contain an admixture of urea formaldehyde to improve strength.

Use: Packaging, dust covers for books; general household purposes.

glassmaker's soap. Term for manganese dioxide (MnO_2).

glass, metallic. Metal alloys having an amorphous atomic structure similar to that of silica glass; achieved by cooling of the molten alloy so rapidly that no crystalline structure is formed. Such alloys are said to be harder than their crystalline counterparts and are more resistant to corrosion. Those containing iron have unusual ferromagnetic properties that make them suitable for use as transformer coils.

See "Metglas."

glass, optical. Glasses intended for vision correcting and such applications as lenses for cameras, microscopes, and other instruments; must be of extremely high quality and uniformity to meet requirements for refractive index and light dispersion. Optical glass may be either crown (lime) or flint (lead). Lead oxide is a major ingredient of flint glass, imparting high refractive index and dispersion, as well as surface brilliance. Flint glasses are also used in vacuum tubes and electrical equipment. Many special ingredients are used in both crown and flint glasses for specific refractivity and dispersion properties.

glass, photochromic. A glass that changes color on exposure to light and returns to original color when the light has been removed. One type is a silicate glass containing dispersed crystals of colloidal silver halide that is precipitated within the melt

during cooling. Alkali borosilicates are the most suitable types of glasses for this purpose.

Use: Variable-tint prescription lenses that darken in sunlight and return to original clearness indoors (85% light transmission when clear, 45% in sunlight).

glass, photosensitive. A glass containing a small amount of a photosensitive substance such as a gold, silver, or copper compound. When UV light is passed through a photographic negative onto the surface of this glass, a latent image formed within the glass is converted to a visible image made up of tiny metal particles when the glass is heated. In a special type of photosensitive glass (photosensitive opal), the metal particles of the photographic image within the glass serve as nuclei for the growth of nonmetallic crystals; crystalline growth is confined to the area of the image. These crystalline areas are dissolved much more rapidly than the adjacent glass by hydrogen fluoride. Thus, the glass can be formed into intricate shapes without the use of mechanical tools.

glass, plate. Plate glass has the same composition as window glass (soda-lime silica), differing from it only in method of manufacture. These differences are primarily (1) the longer time of annealing (3 or 4 days), which eliminates the distortion and strain effects of rapid cooling; and (2) intensive grinding and polishing, which removes local imperfections and produces a bright, highly reflecting finish.

glass, ruby. A deep-red glass made by incorporating colloidal gold into the silicate mixture. It is used chiefly in the decorative arts.

glass, safety. See safety glass.

glass transition temperature. (T_g). The temperature at which an amorphous material (such as glass or a high polymer) changes from a brittle vitreous state to a plastic state. Many high polymers, such as acrylics, and their derivatives have this transition point, which is related to the number of carbon atoms in the ester group. The T_g depends on its composition and extent of annealing.

glass, water. See sodium silicate.

Glauber's salt. See sodium sulfate decahydrate.

glauconite. $K_2(Mg, Fe)_2Al_6(Si_4O_{10})_3(OH)_{12}$. A natural silicate of potassium, aluminum, iron, and magnesium found in greensands and other sedimentary rocks.

Properties: Green in color, earthy luster. D 2.3.

Occurrence: New Jersey, Virginia.

Use: Water softener, foundry molds, fertilizer.

allo-glaucotoxinigenin.CAS: 14155-65-8. mf: $C_{23}H_{32}O_6$.**Hazard:** A poison.**Source:** Natural product.

glaze. A mixture similar to porcelain enamel, applied to a ceramic substrate. It may refer to (1) a vitreous coating on pottery or enamelware; (2) the mixed dry powders of the batch to be used for the coating; or (3) a water suspension of these materials (wet glaze). Glazes must be low in sodium and are usually mixtures of silicates and flint, lead compounds, boric acid, calcium carbonate, etc. See frit; porcelain enamel.

glaze stain. Finely ground calcined oxide of cobalt, copper, iron, and manganese.

Use: Coloring ceramic glazes.

GLC. Abbreviation for gas-liquid chromatography.

See gas chromatography.

gliadin. A prolamin occurring in gluten, the protein of wheat, rye, and other grains. Wheat gliadin has the following composition: 52.7% carbon, 17.7% nitrogen, 21.7% oxygen, 6.9% hydrogen, 1.0% sulfur. It is composed of 18 amino acids, 40% being glutamic acid. Insoluble in water, soluble in 70–90% alcohol, soluble in dilute acid and in alkali.

Use: Chemical synthesis of spinal anesthetics, pharmaceutical preparations.**gliftor.**CAS: 8065-71-2. mf: $C_3H_6ClFO \cdot C_3H_6F_2O$.**Hazard:** A poison by ingestion, inhalation, and skin contact. An eye irritant.**gliquidone.**CAS: 33342-05-1. mf: $C_{27}H_{33}N_3O_6S$.**Hazard:** Low toxicity by ingestion. A reproductive hazard.

“Globar” [Carborundum]. TM for silicon carbide heating elements and resistors and accessories.

Properties: Elements have a working temperature up to 1510C, which can be extended to 1648C for short periods; low coefficient of expansion; structure not affected by rapid heating and quick cooling; resistance remains practically constant above 482C.

Use: Electric resistors and heating elements, terminals, and other accessories for electric heating elements, electric heating appliances, electric furnaces.

globular proteins. Soluble proteins with a globular (somewhat rounded) shape. Their axial to diameter ratio is less than 10:1, and usually closer to 1:1.

globulin. (1) Any of a group of proteins synthesized by the body when invaded by infective organ-

isms. They are coagulated by heat; insoluble in water; soluble in dilute solutions of salts, strong acids, and strong alkalis. Enzymes and acids cause hydrolysis to amino acids as the only products. Examples are immune serum or γ -globulins in blood and myosin in muscle. The blood globulins are used in immunizing against specific diseases and in medical research. The γ -globulin molecule is reported to consist of 19,996 atoms associated in 1320 amino acid units.

(2) A protein occurring naturally in wheat and other cereal grains. See immunochemistry.

γ -globulin. See immune endoglobulin.

GLP. (good laboratory practices). Refers to the body of regulations that govern the collection of laboratory data. As two examples, data collected must be traceable to the exact person who collected the data, and computer files must have their name changed if the file contents change.

Glu. Abbreviation for glutamic acid.

glucagon. (hyperglycemic-glycogenolytic factor; HG-factor; HGF). Produced by the α cells of the islands of Langerhans and also by the gastric mucosa. It is opposite in effect to insulin. It appears to be a straight-chain polypeptide with a molecular weight of approximately 3500. Small amounts have been detected in commercial insulin preparations.

Grade: USP.**Use:** Medicine, biochemical research.

“Glucam E-10” [Dow]. TM for humectant from corn.

Use: To reduce overall irritancy from other ingredients in hair- and skin-care preparations.

“Glucam E-20” [Dow]. TM for humectant from corn.

Use: For a highly active, mild skin moisturizer that reduces water loss from cream and lotion formulations.

“Glucam P-20” [Dow]. TM for a fragrance fixative.

glucase. See maltase.

glucinium. Former name for the element beryllium, named because the salts of beryllium are sweet tasting.

glucocorticoid response element. See GRE.

glucogenic amino acids. Amino acids with carbon chains that can be metabolically converted into glucose via gluconeogenesis. Contrast with ketogenic amino acids.

gluconeogenesis. The biosynthesis of a carbohydrate from simpler, noncarbohydrate precursors such as alanine or pyruvate.

gluconic acid. (glyconic acid; glyconic acid).

CAS: 299-27-4. $\text{CH}_2\text{OH}(\text{CH}_2\text{O})_4\text{COOH}$.

Properties: Pure product is crystalline; light-brown color. Mp 131C, d 1.24. Commercial grade is 50% aqueous solution. Insoluble in organic solvents.

Derivation: Bacterial, chemical, or electrochemical oxidation of glucose. It is the chief acid in honey.

Grade: Technical, 50% solution.

Use: Pharmaceutical and food products, cleaning and pickling metals, sequestrant, cleansers for bottle washing, paint strippers, alkaline derusters, catalyst in textile printing (ammonium salt).

glucono- Δ -lactone. (D-gluconic acid, Δ -lactone).

CAS: 90-80-2. $\text{CH}_2\text{OHCH}(\text{CH}_2\text{O})_3\text{C}(\text{O})\text{O}$.

Properties: White crystals. Mp 155C, bp (decomposes). Readily soluble in water; slightly soluble in alcohol.

Derivation: Oxidation of glucose.

See gluconic acid.

8- β -D-glucopyranosyl-apigenin.

CAS: 3681-93-4. mf: $\text{C}_{21}\text{H}_{20}\text{O}_{10}$.

Hazard: A poison.

D(+)-glucosamine.

$\text{CH}_2\text{OH}(\text{CH}_2\text{O})_3\text{CHNH}_2\text{CHO}$.

Properties: (β form.) Colorless needles. Mp 110C (decomposes). Very soluble in water; slightly soluble in methanol and ethanol; insoluble in ether and chloroform.

Use: Biochemical research.

glucose. (dextrose; grape sugar; corn sugar).

CAS: 50-99-7.

Properties: Colorless crystals or white granular powder; odorless; sweet taste. D 1.544, mp 146C. Soluble in water; slightly soluble in alcohol. It has the D (right-handed) configuration and is dextrorotatory. Combustible.

Occurrence: Formed in plants by photosynthesis, also in the blood.

Derivation: Hydrolysis of cornstarch with acids or enzymes, hydrolysis of cellulosic wastes.

Grade: Technical, USP, anhydrous, hydrated.

Use: Confectionery, infant foods, medicine, brewing

and wine making, intermediate, caramel coloring, baking and canning, source of methane by anaerobic fermentation, source of certain amino acids (e.g., lysine) by fermentation.

See glucose syrup; invert sugar.

glucose isomerase enzyme preparations, insoluble.

Use: Food additive.

glucose oxidase. An enzyme commercially available under various trademarks; catalyzes oxidation of glucose to gluconic acid. Water-soluble amorphous powder. Removes excess oxygen from canned foods, beer, etc., and from stored food.

Use: Food preservative, analytical reagent for glucose, stabilizer for vitamins C and B₁₂.

glucose syrup. (corn syrup). A mixture of D-glucose, maltose, and maltodextrins made by hydrolysis of cornstarch by the action of acids or enzymes. The degree of conversion of the starch varies with consequent effect on the dextrose equivalent (DE) or reducing power of the syrup.

Use: Food industry as a sweetener (high DE), thickener, or bodying agent (low DE) in soft drinks. See glucose.

α -glucosidase. See maltase.

β -glucosidase. See emulsion.

glucoside. See glycoside.

“Glucquat 100” [Dow]. TM for humectant from corn.

Use: For conditioning, plasticizing, and foam retention.

D(+)-glucuronic acid. $\text{COOH}(\text{CH}_2\text{O})_4\text{CHO}$. A widely distributed substance in both plants and animals, usually occurs as part of a larger molecule as in various gums or combined with phenols or alcohols.

Properties: Needle-like crystals. Exhibits mutarotation; the β form has mp 165C. Soluble in water and alcohol.

Derivation: From gum acacia.

Use: Biochemical research, medicine.

D-glucuronolactone.

CAS: 32449-92-6. $\text{C}_8\text{H}_8\text{O}_6$. The γ -lactone of glucuronic acid. Found in plant gums and animal connective tissues.

Properties: Colorless or white powder; odorless. D 1.76 (30/4C), mp 172–178C. Soluble in water.

Derivation: From glucuronic acid or by synthesis.

Use: Growth factor, medicine, pharmaceutical intermediate.

glue. A colloidal suspension of various proteinaceous materials in water. Most familiar are those derived by boiling animal hides, tendons, or bones,

which are high in collagen. Chief sources are slaughterhouse wastes and fish scraps. Other animal-derived glues are made from casein (milk) and blood. The most important vegetable glue is made from soybean protein. Combustible in solid form. See adhesive; fish glue; collagen; gelatin.

Glueglis. TM for a composition containing chiefly glue and glycerol used in printing-press rollers. Has soft, rubbery consistency but is easily decomposed by heat.

glufosinate.

CAS: 53369-07-6. mf: $C_5H_{12}NO_4P$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

gluside. See saccharin.

glutamic acid. (α -aminoglutaric acid; 2-aminopentanedioic acid).

CAS: 56-86-0. $COOH(CH_2)_2CH(NH_2)COOH$. A nonessential amino acid. The naturally occurring form is L(+)-glutamic acid.

Properties: DL-glutamic acid (synthetic racemic mix): crystals. Mp 224–227C (decomposes). Slightly soluble in ether, alcohol, and petroleum ether. D 1.4601 (20/4C). Moderately soluble in water L(-)-glutamic acid. Mp 247–249C (decomposes), d 1.538 (20/4C) L(+)-glutamic acid: crystals. Sublimes at 200C, decomposes at 247–249C. Slightly soluble in ether, acetone, cold glacial acetic acid; insoluble in alcohol. D 1.538 (20/4C), specific rotation +37 to +38.9 degrees (25C). Available commercially.

Derivation: Hydrolysis of vegetable protein (e.g., beet sugar waste, wheat gluten), organic synthesis based on acrylonitrile. It comprises 40% of the gliadin in wheat gluten.

Grade: FCC (L-form).

Use: Medicine, biochemical research, salt substitute, flavor enhancer (L-form only).

See sodium glutamate.

glutamine. (2-amino-4-carbamoylbutanoic acid).

CAS: 56-85-9. $H_2NC(O)(CH_2)_2CH(NH_2)COOH$. A nonessential amino acid. Both the L- and DL-forms are available.

Properties: White, crystalline powder. Soluble in water; insoluble in most organic solvents. Should be kept dry and refrigerated. Mp (L-form) 184–185C (decomposes) (DL-form) 176C. Its presence in wheat gluten contributes to the elastic properties of flour by hydrogen bonding and disulfide cross-linking.

Derivation: Action of enzymes on gluten, from beet roots, constituent of many proteins.

Use: Medicine, culture media, biochemical research, feed additive.

7-n-((2-((2-(glutamylamino)ethyl)dithio)ethyl)mitomycin c.

CAS: 118359-59-4. mf: $C_{24}H_{34}N_6O_8S_2$.

Hazard: A poison.

γ -glutamylcysteinylglycine. See glutathion.

glutaraldehyde.

CAS: 111-30-8. $OCH(CH_2)_3CHO$.

Properties: Liquid. D 0.72, bp 188C (decomposes), fp -14C, vap press 17 mm Hg (20C). Soluble in water and alcohol. No flash point. Nonflammable.

Grade: 99%, 50% biological solution, 25% solution.

Hazard: Irritant. TLV: ceiling 0.2 ppm.

Use: Intermediate; fixative for tissues; cross-linking protein and polyhydroxy materials, tanning of soft leathers.

glutaric acid. (*n*-pyrotartaric acid; pentanedioic acid).

CAS: 110-94-1. $HOOC(CH_2)_3COOH$.

Properties: Colorless crystals. Mp 97C; refr index 1.419 (106C). Soluble in water, alcohol, ether, benzene, and chloroform.

Derivation: From cyclopentanone.

Use: Organic synthesis, biochemical research.

glutaric anhydride. (pentanedioic acid anhydride). $H_2C(CH_2CO)_2O$.

Properties: Solid. Mp 56.5C, bp 303C. Soluble in benzene and toluene; soluble in water on complete hydrolysis.

Hazard: Irritant.

Use: Plasticizers, resin, lubricant, adhesive synthesis, dyes, and pharmaceuticals.

glutaronitrile. (trimethylenedicyanide; pentanedinitrile).

CAS: 544-13-8. $NC(CH_2)_3CN$.

Properties: Colorless to straw-colored, viscous liquid. Bp 286C, d 0.989. Soluble in water and alcohol; insoluble in ether and carbon disulfide. Combustible.

Use: Chemical intermediate.

glutathione. (γ -glutamylcysteinylglycine).

CAS: 70-18-8. $C_{10}H_{17}O_6N_3S$. A universal component of the living cell. Contains glutamic acid, cysteine, and glycine. These are chemically bound but can be separated by hydrolysis.

Properties: White, crystalline powder; odorless; mild, sour taste. Mp 190–192C. Soluble in water and dilute alcohol.

Use: Nutritional and metabolic research.

gluten. A mixture of many proteins in which gliadin, glutenin, globulin, and albumin predominate; it occurs in highest percentage in wheat (Manitoba wheat contains approximately 12%) and also to some extent in other cereal grains, usually associated with starch. It comprises 18 amino acids. Gluten is insoluble in water and hydrophilic. Its specific adaptability to bread making is due to its elastic, cohesive nature that enables it to retain the bubbles of carbon dioxide evolved by leavening agents; this

also imparts to doughs their characteristic dilatant properties. This behavior is due to disulfide cross-links and hydrogen bonding between the proteins or their constituent amino acids.

Use: Special breakfast foods and other cereals and foods, cattle food, adhesives, production of certain amino acids.

glutenin. One of the proteins present in wheat flour in substantial percentage. It is composed of 18 amino acids.

Gluten Intolerance Group. (GIG). A non profit group that provides support to persons with gluten intolerances, including Celiac Disease, Dermatitis Herpetiformis and other gluten sensitivities. Its mailing address is 15110 10th Ave., SW, Seattle, WA 98166. Website: <http://www.gluten.net>

gluten sensitive enteropathy. (GSE).
See: celiac disease.

glutethimide. See 2-ethyl-2-phenylglutaramide.

Gly. Abbreviation for glycine.

glycan. A general term for a polymer of monosaccharide units joined by glycosidic bonds, may or may not have other components, e.g. peptidoglycan.

glycarbylamide. (4,5-imidazoledeicarboxamide). $C_3H_2N_2(CONH_2)_2$.

Properties: White powder. Melts above 360C. Insoluble in water.

Use: A coccidiostat for chickens.

glyceraldehyde. (glyceric aldehyde).

CAS: 56-82-6. $HOCH_2CH_2OCHO$. Isomeric with dihydroxyacetone. It is produced by the oxidation of sugars in the body. As the simplest aldose, the conformation of D- and L-glyceraldehydes has been designated the reference standard for D- and L-carbohydrates and derivatives.

In these isomers, the central carbon atom (C*) is asymmetric.

Properties: (DL-glyceraldehyde.) Tasteless crystals from alcohol-ether mixture. Mp 145C. Insoluble in benzene, petroleum ether, pentane.

Grade: 40% aqueous solution.

Use: Biochemical research; intermediate; nutrition; preparation of polyesters, adhesives; cellulose modifier; leather tanning.

glyceride. An ester of glycerol and fatty acids in which one or more of the hydroxyl groups of the

glycerol have been replaced by acid radicals. The latter may be identical or different so that the glyceride may contain up to three different acid groups. Glycerides can be made synthetically. The most common are based on fatty acids that occur naturally in oils and fats.

See monoglyceride; triglyceride.

glycerin. See glycerol.

glycerin carbonate. (hydroxymethylethylene carbonate).

Properties: Pale-yellow hygroscopic liquid; odorless. Boiling range 125–130C (0.1–0.2 mm Hg), fp supercools to a glass, d 1.4000 (20/4C), refr index 1.4580 (20C), flash p 415F (212C). Miscible with water, alcohol, ether; soluble in ethylene dichloride; insoluble in carbon tetrachloride, benzene, and aliphatic hydrocarbons. Combustible.

Grade: Technical.

Use: Solvent, intermediate.

glycerin 1-isopropyl ether.

CAS: 17226-43-6. mf: $C_6H_{14}O_3$.

Hazard: Low toxicity by ingestion and inhalation. A mild skin and eye irritant.

glycerol. (glycerin; glycylic alcohol; 1,2,3-propanetriol).

CAS: 56-81-5.

A trihydric (polyhydric) alcohol.

Properties: Clear, colorless, syrupy liquid; odorless; sweet taste; hygroscopic. D anhydrous 1.2653, USP greater than 1.249 (25/25C), dynamite 1.2620, mp 18C, bp 290C, flash p 320F (160C), autoign temp 739F (392C). Soluble in water and alcohol (aqueous solutions are neutral); insoluble in ether, benzene, and chloroform and in fixed and volatile oils. Combustible.

Derivation: (1) By-product of soap manufacture; (2) from propylene and chlorine to form allyl chloride, which is converted to the dichlorohydrin with hypochlorous acid; this is then saponified to glycerol with caustic solution; (3) isomerization of propylene oxide to allyl alcohol, which is reacted with peracetic acid, (the resulting glycidol is hydrolyzed to glycerol); (4) hydrogenation of carbohydrates with nickel catalyst; (5) from acrolein and hydrogen peroxide.

Method of purification: Redistillation, ion-exchange techniques.

Grade: USP, CP (pharmaceutical and commercial, where highest grade is required), saponification soap lye, crude yellow distilled (for commercial purposes where color and extreme purity are not

factors), high gravity or dynamite (dehydrated to 99.8–99.9% purity), natural, synthetic, FCC.

Hazard: TLV: (vapor) 10 mg/m³.

Use: Adhesive resins, dynamite, ester gums, pharmaceuticals, perfumery, plasticizer for regenerated cellulose, cosmetics, foodstuffs, conditioning tobacco, liquors, solvent, printer's ink rolls, polyurethane polyols, emulsifying agent, rubber stamp and copying inks, binder for cements and mixes, special soaps, lubricant and softener, bacteriostat, penetrant, hydraulic fluid, humectant, fermentation nutrients, antifreeze mixtures.

glycerol boriborate.

Properties: Pale-yellow liquid obtained by heating glycerol, sodium borate, and boric acid; composition varies, soluble in cold water, absolute alcohol, other alcohols, glycerol.

Use: Adhesive, binder, fabric softener, fire-retardant on fabrics.

glycerol dichlorohydrin. See α -dichlorohydrin.

glycerol-1,3-distearate. (glyceryl-1,3-distearate). C₃₉H₇₆O₅.

Properties: Solid. Mp 29.1. Very slightly soluble in cold alcohol and ether; soluble in hot organic solvents.

glycerol ester of partially dimerized rosin.

Properties: Hard, pale amber-colored resin. Sol in acetone, benzene; insol in water.

Use: Food additive.

glycerol ester of partially hydrogenated wood rosin.

Properties: Medium hard, pale amber resin. Sol in acetone, benzene; insol in water, alc.

Use: Food additive.

glycerol ester of polymerized rosin.

Properties: Hard, pale amber resin. Sol in acetone, benzene; insol in water, alc.

Use: Food additive.

glycerol ester of tall oil rosin.

Properties: Pale amber resin. Sol in acetone, benzene; insol in water.

Use: Food additive.

glycerol ester of wood rosin.

Properties: Hard, pale amber resin. Sol in acetone, benzene; insol in water.

Use: Food additive.

glycerol-lacto oleate.

Use: Food additive.

glycerol-lacto palmitate.

Use: Food additive.

glycerol-lacto stearate.

Use: Food additive.

glycerol monolaurate. (glyceryl monolaurate). C₁₁H₂₃COOCH₂CH₂OCH₂OH.

Properties: Cream-colored paste; faint odor. Mp 23–27C, d 0.98, FFA <2.5%, iodine value 5–8, pH 8.0–8.6 (25C) (5% aqueous dispersion). Dispersible in water; soluble in methanol and ethanol, toluene, naphtha, mineral oil, cottonseed oil, ethyl acetate. Combustible.

See monoglyceride.

Grade: Edible, technical.

Use: Emulsifying and dispersing agent for food products, oils, waxes, and solvents; antifoaming agent; dry-cleaning soap base.

glycerol monooleate.

CAS: 25496-72-4.

Properties: Clear amber or pale yellow liquid. Insol in water.

Use: Food additive.

See "Aldo MO" [Ashland].

glycerol monooleate. (glyceryl monooleate).

C₁₇H₃₃COOCH₂CH₂OCH₂OH.

Properties: Yellow oil or soft solid. D 0.95, mp 14–19C depending on purity, iodine value 65–80. Insoluble in water; somewhat soluble in alcohol and most organic solvents. Combustible.

See monoglyceride.

Grade: Edible, technical.

Use: Foods, pharmaceuticals, and cosmetics; rust-preventive oils; textile finishing; vinyl light stabilizers; odorless base paints, flavoring.

glycerol monoricinoleate. (glyceryl monoricinoleate).

C₆H₁₃CH₂OC₁₀H₁₈COOCH₂CH₂OCH₂OH.

Properties: Yellow liquid. D 1.10, mp <-5C, iodine value 65–70. Dispersible in water; soluble in most organic solvents. Combustible.

See monoglyceride.

Use: Nondrying emulsifying agent; solvent; plasticizer; in polishes; in cosmetics; in textile, paper, and leather processing; low-temperature lubricant. Stabilizes latex paints against breakdown due to repeated freeze-thaws.

glycerol monostearate. (GMS; glyceryl monostearate; monostearin).

(C₁₇H₃₅)COOCH₂CH₂OCH₂OH.

Properties: Pure white or cream-colored, waxlike solid; faint odor; fatty agreeable taste. Affected by light, mp 58–59C (capillary tube), d 0.97, FFA <5%, iodine value 3–4, dispersible in hot water, soluble (hot) in alcohol, oils, and hydrocarbons. Combustible.

See monoglyceride.

Grade: Edible, cosmetic, NF.

Use: Thickening and emulsifying agent for margarine, shortenings, and other food products; flavor-

ing; emulsifying agent for oils, waxes, and solvents; protective coating for hygroscopic powders; cosmetics; pharmaceuticals; opacifier; detackifier; resin lubricant.
See "Atnul" [ACH].

glycerol phthalate. See glyceryl phthalate.

glycerol tributyrate. See glyceryl tributyrate.

glycerol tripropionate. See glyceryl tripropionate.

glycerol tristearate. See stearin; "Neustrene 064" [ACH].

glycerophospholipid. An amphipathic lipid with a glycerol backbone. A (usually saturated) fatty acid is esterified to C-1 and a (usually unsaturated) fatty acid is esterified to C-2 of glycerol. A polar alcohol is attached through a phosphodiester linkage to C-3.

glycerophosphoric acid. $C_3H_5(OH)_2H_2PO_4$.
Properties: Colorless liquid; odorless. D 1.60; fp $-25^\circ C$. Soluble in water and alcohol. Combustible.
Derivation: Interaction of glycerol and phosphoric acid.
Use: Manufacture of glycerophosphates.

glyceryl abietate. An ester gum.
Use: Additive in citrus-flavored beverages.

glycerylaminophenacine.
CAS: 3820-67-5. mf: $C_{19}H_{17}ClN_2O_4$.
Hazard: Moderately toxic by ingestion. Human systemic effects.

glyceryl behenate.
Properties: Off white powder. Tasteless.
Use: Food additive.

glyceryl α -chlorohydrin. See chlorohydrin.

glyceryl diacetate. See diacetin.

glyceryl-1,3-distearate. See glycerol-1,3-distearate.

glyceryl ditolyl ether. See dicresyl glyceryl ether.

glyceryl monoacetate. See acetin.

glyceryl monolaurate. See glycerol monolaurate.

glyceryl monooleate. See glycerol monooleate.

glyceryl monoricinoleate. See glycerol monoricinoleate.

glyceryl monostearate. See glycerol monostearate.

glyceryl monothioglycolate.
CAS: 30618-84-9. mf: $C_5H_{10}O_4S$.
Hazard: A mild skin and eye irritant.

glyceryl phthalate. (glycerol phthalate).
Properties: Water-white, solid resin. D 1.29, saponification value 605–615, acid value 300–315, softening point approximately $67^\circ C$. Insoluble in water; soluble (hot) in methanol and ethanol, acetone, ethyl acetate; partly soluble in toluene, naphtha.
Grade: Technical.
Use: Varnishes, lacquers, etc.
See alkyd resin.

glyceryl ricinoleate. See glyceryl triricinoleate.

glyceryl triacetate. See triacetin.

glyceryl tri-(12-acetoxystearate). (castor oil, acetylated and hydrogenated).
CAS: 139-43-5. $C_3H_5(OOCC_{17}H_{34}OCOCH_3)_3$.
Properties: Clear, pale-yellow, oily liquid; mild odor. D 0.955 (25/25C), saponification value 298, iodine value 3, solidifies at $4^\circ C$. Soluble in most organic solvents; insoluble in water. Combustible.
Derivation: Hydrogenation of acetylated castor oil.
Grade: Technical.
Use: Plasticizer for nitrocellulose, ethylcellulose, and polyvinyl chloride; lubricants; protective coatings; food additive.

glyceryl tri-(12-acetylricinoleate). (castor oil, acetylated). $C_3H_5(OOCC_{17}H_{32}OCOCH_3)_3$.
Properties: Clear, pale-yellow, oily liquid; mild odor. D 0.967 (25/25C), saponification value 300, iodine value 76, solidifies at $-40^\circ C$. Soluble in most organic liquids; insoluble in water. Combustible.
Grade: Technical.
Derivation: Acetylation of castor oil.
Use: Plasticizer for nitrocellulose, ethylcellulose, and polyvinyl chloride; lubricants; protective coatings.

glyceryl tributyrate. (tributylin; butylin; glycerol tributyrate). $C_3H_5(OCOC_3H_7)_3$.
Properties: Colorless, oily liquid. D 1.035 (20C), refr index 1.4359 (20C), bp $315^\circ C$, soluble in water 0.010%. Soluble in alcohol and ether. Combustible.
Grade: Technical, FCC.
Use: Plasticizer, flavoring.

glyceryl tri(12-hydroxystearate). (castor oil, hydrogenated). $C_3H_5(OOCC_{17}H_{34}OH)_3$. Glycerol triricinoleate in which hydrogen has saturated the ricinoleic groups.

Properties: Hard, brittle, waxlike solid; yellowish to milky-white in color. Mp 86–88C, d 0.899 (100/25C).

Use: Lubricants, heavy-metal soaps, waxes, plasticizers, cosmetics, chemical intermediate. The lithium compound is used in high-temperature greases.

glyceryl trinitrate. See nitroglycerin.

glyceryl trioleate. See olein.

glyceryl tripalmitate. See tripalmitin.

glyceryl tripropionate. (glycerol tripropionate; tripropionin). $C_3H_5(OCOC_7H_5)_3$.

Properties: Solid. D 1.078 (20C), refr index 1.431 (20C), bp 177–182C (20 mm Hg), fp <50C. Solubility in water 0.313% of weight; soluble in alcohol.

Use: Plasticizer.

glyceryl triricinoleate. (glyceryl ricinoleate). $C_3H_5(OOCC_{17}H_{32}OH)_3$. The triglyceride of ricinoleic acid. It constitutes approximately 80% of castor oil.

Properties: Light-amber, oily liquid.

Use: Emulsifying agent.

glyceryl tristearate. See stearin.

glycidol. (2,3-epoxy-1-propanol).
CAS: 556-52-5.

An epoxide.

Properties: Colorless liquid. Bp 162C, d 1.12. Soluble in water, alcohol, and ether. Combustible.

Derivation: Treatment of monochlorohydrin with bases; reaction product of allyl alcohol and perbenzoic acid.

Hazard: Toxic material. TLV: 2 ppm; animal carcinogen.

Use: Stabilizer for natural oils, demulsifier, dye-leveling agent, stabilizer for vinyl polymers.

γ -glycidoxypropyltrimethoxysilane.

Properties: Liquid. D 1.070 (25C), bp approximately 120C (2 mm Hg), refr index 1.4280 (25C). Soluble in acetone, benzene, ether; reacts with water.

Derivation: Addition of hypochlorite to allyl alcohol and reaction with soda lime.

Use: Coupling agent for glass- and mineral-filled plastics.

glycidyl acrylate.

CAS: 106-90-1.

Properties: Liquid. D 1.1074 (20/20C), bp 57C (2

mm Hg) with polymerization, fp –41.5C, flash p 141F (60.5C) (TOC). Insoluble in water. Combustible.

Hazard: Irritant to skin and eyes.
See acrylate.

glycidyl ether.

$\begin{array}{c} \text{O} \\ \diagup \quad \diagdown \\ \text{OCH}_2\text{C HOCH}_2 \end{array}$. Appears as the terminal group of epoxy resin structures resulting from reaction of epichlorohydrin and bisphenol A with alkaline catalyst. Also reacts with novolac resins.

Properties: Combustible liquid.

glycidyl isocyanurate. (1,3,5-triglycidyl-s-triazinetriene; TGT).

CAS: 2451-62-9. $C_{12}H_{15}N_3O_6$.

Properties: Mw 297.30.

Hazard: TLV: 0.05 mg/m³.

glycine. (1) (aminoacetic acid).

CAS: 56-40-6. $\text{NH}_2\text{CH}_2\text{COOH}$. A nonessential amino acid.

Properties: White, sweet, crystals; odorless. Mp 232–236C with decomposition, d 1.1607. Combines with hydrochloric acid to form the hydrochloride; soluble in water; insoluble in alcohol and ether.

Derivation: Action of ammonia on chloroacetic acid; occurs in many proteins and is especially abundant in silk fibroin, gelatin, and sugarcane.

Grade: Technical, NF, FCC.

Hazard: Use in fats restricted to 0.01%.

Use: Organic synthesis, nutrient, biochemical research, buffering agent, chicken-feed additive, reduces bitter taste of saccharin, retards rancidity in animal and vegetable fats.

(2) The extreme dilution of methylacetophenone gives a perfume resembling the odor of the climbing plant glycine (*Wisteria sinensis*), native to China and cultivated elsewhere. The name is also given to bouquets made from violet, lilac, and jasmin ottos.

(3) *p*-Hydroxyphenylglycine. A photographic developer.

glycocholic acid. (cholyglycine). $C_{26}H_{43}NO_6$.

The sodium salt occurs in bile, where it is formed by the combination of glycine with cholic acid. It aids in the digestion and absorption of fats.

Properties: Crystallizes from water with 1.5 moles H_2O , becomes anhydrous at 100C, anhydrous form decomposes at 165C. Practically insoluble in water. The sodium salt is soluble in water and alcohol.

Derivation: Precipitation from bile.

Use: Biochemical research, food emulsifying agent (up to 0.1%).

glycocoll. See glycine (1).

glycocoll-*p*-phenetidine hydrochloride.

See phenocoll hydrochloride.

glycogen. (animal starch; liver starch).

CAS: 9005-79-2. (C₆H₁₀O₅). A glucose polysaccharide, the storage carbohydrate of the animal organism, found especially in the liver and rested muscle.

Properties: White powder; sweet taste. Forms a dextrorotatory colloidal solution; insoluble in alcohol; soluble in water.

Derivation: Isolated from liver by treatment with 30% sodium hydroxide solution.

Use: Biochemical research.

glycogenic acid. See gluconic acid.

glycol. A general term for dihydric alcohols that are physically and chemically similar to glycerol. See ethylene glycol.

glycol bromohydrin. See ethylene bromohydrin.

glycol carbonate. See ethylene carbonate.

glycol chlorohydrin. See ethylene chlorohydrin.

glycol diacetate. See ethylene glycol diacetate.

glycol dibutyrate. See ethylene glycol dibutyrate.

glycol diformate. See ethylene glycol diformate.

glycol dimercaptoacetate. (ethylene glycol bithioglycolate).
HSCH₂COOCH₂CH₂OOCCH₂SH.

Properties: Liquid. D 1.313, bp 137–139C (2 mm Hg), refr index 1.519 (25C). Insoluble in water; soluble in alcohol, acetone, and benzene. Combustible.

Use: Crosslinking agent for rubbers, accelerator in curing epoxy resins.

glycol dimercaptopropionate. [ethylene glycol bi-(mercaptopropionate)].
(HSCH₂CH₂COOCH₂)₂.

Properties: Liquid. D 1.219 (25C), bp 175–195C, refr index 1.5150 (25C). Insoluble in water and hexane; soluble in alcohol, acetone, and benzene. Combustible.

Use: Crosslinking agent for polymers, especially epoxy resins; chemical intermediate.

glycol dimethyl ether. See ethylene glycol dimethyl ether.

glycol dipropionate. See ethylene glycol dipropionate.

glycolic acid. See hydroxyacetic acid.

glycolic aldehyde.

CAS: 141-46-8. mf: C₂H₄O₃.

Hazard: Moderately toxic by ingestion.

glycolipid. A lipid containing a small amount of carbohydrate.

glycol monoacetate. See ethylene glycol monoacetate.

glycolonitrile. (glyconitrile; formaldehyde cyanohydrin). HOCH₂CN.

Properties: Mobile oil; colorless; odorless. Supplied commercially as a 70% aqueous solution stabilized with phosphoric acid. Bp 183C (slight decomposition), mp does not solidify when cooled to –72C, d 1.1039 (19C), refr index 1.4090 (25C), electrolytic dissociation constant K = 0.843 × 10⁻⁵ (25C).

Derivation: Formaldehyde and hydrogen cyanide.
Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Solvent and organic intermediate.

(glycolyloxy)tributylstannane.

CAS: 5847-48-3. mf: C₁₄H₃₀O₃Sn.

Hazard: A poison. Moderately toxic by ingestion. Tributyl tin compounds are extremely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

glycol propionate. See ethylene glycol dipropionate.

glycol stearate. See ethylene glycol monostearate.

glycolysis. Enzymatic (anaerobic) decomposition of sugars, starches, and other carbohydrates with release of energy, a type of reaction occurring in yeast fermentation and in certain metabolic processes. Lactic acid is one of the products formed.

“Glycomul” [Lonza]. TM for PEG, glyceryl, sorbitan, polysorbate esters, and fatty acid esters. See “Pegospersse Aldo.”

glyconic acid. See gluconic acid.

glyconitrile. See glycolonitrile.

glycoprotease.

CAS: 120720-15-2.

Hazard: A poison.

Source: Natural product.

glycoprotein. A composite molecule made up of a carbohydrate group and a simple protein. An example is the taste-modifying sweetener occurring in so-called “miracle fruit.”

glycosaminoglycan. A molecule composed of alternating monosaccharide units. One is either

GlcNAc or GalNAc, the other is a usually glucuronic acid. Formerly called mucopolysaccharide.

glycoside. One of a group of organic compounds, of abundant occurrence in plants that can be resolved by hydrolysis into sugars and other organic substances known as aglycones. Specifically glycosides are acetals derived from a combination of various hydroxy compounds with various sugars. They are designated individually as glucosides, mannosides, galactosides, etc. Glycosides were formerly called glucosides, but the latter term now refers to any glycoside having glucose as its sugar constituent.

glycosidic bonds. Bonds between a sugar and another molecule (typically an alcohol, purine, pyrimidine, or a second sugar). Divided into N-glycosidic or O-glycosidic linkages, depending on the point of attachment.

“Glycosperse” [Lonza]. TM for PEG, glyceryl, sorbitan, polysorbate esters, and fatty acid esters. See “Pegospere Aldo.”

glycothiourea. See 2-thiohydantoin.

glycoylurea. See hydantoin.

glycol alcohol. See glycerol.

glycyrrhizin. A glycoside of the triterpene group; the active principle of licorice root from which it is extracted. It has an intensely sweet taste; and is used as a humectant in tobacco and a flavoring in confectionery and pharmaceutical products. The ammoniated derivative, which is 50 times as sweet as sucrose, is used as a foaming agent in root beer and mouthwashes; as a sweetener in chocolate, cocoa, and chewing gum; and as a taste-masking agent in pharmaceuticals such as aspirin. Its ability to exert strong synergistic action with sucrose makes it useful in low-calorie foods (from 30 to 100 ppm is effective).
See sweetener, nonnutritive.

glyme. Trivial name for a series of glycol ethers used as aprotic solvents. The group includes monoglyme (bp 85C), ethyl glyme (bp 121C), diglyme (bp 162C), ethyl diglyme (bp 190C), triglyme (bp 216C), butyl diglyme (bp 256C), and tetraglyme (bp 276C). Each is separately listed and referred to its conventional name.

glydoin. (generic name for 2-heptadecyl-2-imidazoline acetate; 2-heptadecylglyoxalidine acetate).

CAS: 556-22-9. $C_{17}H_{33}C_3H_5N_2 \bullet CH_3COOH$.

Properties: Light-orange crystals. Mp 62C, d 1.03. Insoluble in water.

Derivation: Ethylenediamine and stearic acid.

Use: Fungicide (fruits and vegetables).

glyoxal.

CAS: 107-22-2. OHCCHO.

Properties: Yellow crystals or light-yellow liquid; mild odor. Mp 15C, bp 51C, d 1.14 (20/20C), bulk d 10.0 lb/gal (20C), vapor has a green color and burns with a violet flame, refr index 1.3826 (20C). Polymerizes on standing or in presence of a trace of water. An aqueous solution contains monomolecular glyoxal and reacts weakly to acid. Undergoes many addition and condensation reactions with amines, amides, aldehydes and hydroxyl-containing materials. Glyoxal VP resists discoloration.

Derivation: Oxidation of acetaldehyde.

Grade: 40% solution; pure, solid; VP.

Hazard: Mixture of vapor and air may explode.

Use: Permanent-press fabrics; dimensional stabilization of rayon and other fibers. Insolubilizing agent for compounds containing polyhydroxyl groups (polyvinyl alcohol, starch, and cellulosic materials); insolubilizing of proteins (casein, gelatin, and animal glue); embalming fluids; leather tanning; paper coatings with hydroxyethylcellulose; reducing agent in dyeing textiles.

glyoxaline. See imidazole.

glyoxaline-5-alanine monohydrochloride.

See histidine monohydrochloride.

glyoxylate cycle. A variant of the citric acid cycle present in bacteria and some plant cells which is used for the net conversion of lipid into carbohydrate.

glyoxyldiureide. See allantoin.

glyoxysome. A specialized peroxisome containing the enzymes of the glyoxylate cycle. Particularly prevalent and important in germinating seeds.

glyphosate. (N-(phosphonomethyl)glycine).

CAS: 1071-83-6.

Use: Herbicide.

glyphosine. $C_4H_{11}NO_8P_2$. A ripening agent for sugarcane.

“G-M-F” [Uniroyal]. HONC₆H₄NOH TM for p-quinonedioxime. A rubber accelerator.

GMP. Abbreviation for guanosine monophosphate.

See guanosine phosphates; guanylic acid; sodium guanylate.

GMS. Abbreviation for glycerol monostearate.

Gogte synthesis. Formation of α-pyrone derivatives by rearrangement of acyl-substituted glutamic anhydrides.

gold.

CAS: 7440-57-5. Au. Metallic element of atomic number 79, Group IB of the periodic table, aw 196.9665, valences of 1, 3; no stable isotopes.

Properties: Yellow, ductile metal; relatively soft. D 19.3, mp 1063C, bp 2800C. Does not corrode in air but is tarnished by sulfur. Chemically nonreactive; attacked by chlorine and cyanide solutions in the presence of oxygen. Soluble in aqua regia. Insoluble in acids. Excellent reflector of infrared and heat; electrical resistivity (0C) 2.06 microhm-cm; extremely high light reflectivity.

Occurrence: South Africa, the former U.S.S.R., northwest Canada, U.S. (South Dakota, Nevada, Utah, Alaska, California), Australia. Oceans are estimated to contain 70 million tons in solution, with 10 billion additional tons on the ocean floor. There is no present economical method of exploiting these resources.

Derivation: Ore is treated with cyanide solution, and the dissolved gold cyanate is recovered by precipitation with zinc dust or aluminum or by hydrolysis. Placer methods are also used.

Available forms: Ingots; sheet; wire; tubing; powder; leaf; alloys with copper or other metals, the gold content being expressed in carats (the number of parts of gold in 24 parts of alloy). Single crystals and aqueous colloidal suspensions. Leaf may be made in near-colloidal thickness; one troy ounce covers 68 sq ft at 0.0001 inch thickness.

Use: Infrared reflectors; electrical contact alloys; brazing alloys; polarographic electrodes; spinnerettes; laboratory ware; decorative arts (ceramics); in electronics for bonding transistors and diodes to wires, for metallizing ceramic and mica capacitors, and for printed circuits; space vehicle instruments; dental alloys; jewelry. Colloidal dispersions are used in coloring glass, as nucleating agent in photo-sensitive glasses, and for specialized medical treatments; gold leaf is used in surgery. Further details can be obtained from Gold Information Center, Box 934, Madison Sq. Station, New York, NY 10159.

¹⁹⁸gold. Radioactive gold of mass number 198.

Properties: Half-life, 2.7 days.

Derivation: Neutron irradiation of the element.

Available forms: Gold metal, colloidal gold. The NF solution is colloidal ¹⁹⁸Au.

Hazard: Toxic from β- and γ radiation.

Use: Internal radiation therapy, to detect leaks in bacterial filters, to locate solidification boundary in continuously cast aluminum, to determine metallic silver in photographic materials.

See radio-gold; gold sodium thiosulfate.

gold, artificial. See stannic sulfide.

gold bromide. (aurous bromide). AuBr.

Properties: Yellowish-gray mass. Decomposes at approximately 165C. Insoluble in water.

Grade: Technical.

See gold tribromide.

gold bronze. See aluminum bronze.

gold chloride. See gold trichloride.

gold-cobalt alloys. See cobalt-gold alloys.

gold cyanide. (auric cyanide; cyanoauric acid). Au(CN)₃•3H₂O or HAu(CN)₄•3H₂O.

Properties: Colorless, hygroscopic crystals. Mp 50C (decomposes). Very soluble in water; soluble in alcohol and ether.

Hazard: Toxic material. TLV: 5 mg(CN)/m³.

Use: Electrolyte in the electroplating industry.

gold, filled. A thin gold alloy bonded to a base metal, also called clad stock.

Use: Inexpensive jewelry.

gold hydroxide. (auric hydroxide). Au(OH)₃.

Properties: Brown powder. Sensitive to light, keep in amber bottle. Probably a hydrated gold oxide (Au₂O₃) and loses water easily. Soluble in hydrochloric acid, solutions of sodium cyanide, and alkali hydroxides; insoluble in water.

Use: Gilding liquids, decorating porcelain, gold plating.

gold, liquid bright. See "Liquid Bright Gold."

gold oxide. (auric oxide; auric trioxide; gold trioxide). Au₂O₃.

Properties: Brownish-black powder, decomposed by heat. Keep in dark bottle. Soluble in hydrochloric acid; insoluble in water.

Use: Gold plating.

gold potassium chloride. See potassium gold chloride.

gold potassium cyanide. See potassium gold cyanide.

gold salts. See sodium gold chloride.

Goldschmidt, Hans. See thermite.

Goldschmidt law. The structure of a crystal is determined by the ratio of the numbers, sizes, and properties of polarization of its atoms or ions.

Goldschmidt process. Formation of sodium formate by absorption of carbon monoxide in caustic soda at increased pressures and temperatures around 200C. At temperatures above 400C, alkali formate liberates hydrogen and yields alkali oxalate.

gold-silicon alloy. (silicon-gold alloy).

Formed in amorphous foils 10 microns thick by cooling molten gold and silicon almost instantaneously by spreading on a moving wheel. The atoms are "frozen" before crystals can form.

Use: Electronics.

gold sodium chloride. See sodium gold chloride.

gold sodium cyanide. See sodium gold cyanide.

gold sodium thiomalate.

CAS: 12244-57-4. $\text{NaOOCCH(SAu)CH}_2\text{COO-Na}\cdot\text{H}_2\text{O}$.

Properties: White to yellowish-white powder; odorless; metallic taste. Affected by light. Very soluble in water; practically insoluble in alcohol and ether; aqueous solutions are colorless to paleyellow; pH (5% solution) 5.8–6.5.

Derivation: Reaction of sodium thiomalate with a gold halide.

Grade: USP.

Use: Medicine (antirheumatic).

gold solder. A solder usually composed of gold, silver, copper, zinc, or brass.

Use: Principally by jewelers.

gold tin purple. (purple of Cassius; gold stannate; aurous stannate; gold-tin precipitate; CI 77482).

Properties: Brown powder. Insoluble in water; soluble in ammonia.

Derivation: By the reaction of a neutral solution of gold trichloride with stannous and stannic chlorides, yielding a mixture of colloidal gold and tin oxide in varying proportions.

Grade: Technical.

Use: Manufacture of ruby glass, coloring enamels and porcelain.

gold tribromide. (auric bromide; gold bromide). AuBr_3 .

Properties: Brownish-black powder. Mp 160C with decomposition. Soluble in water and alcohol.

Use: Analysis (testing for alkaloids, spermatic fluid), medicine.

gold trichloride. (1) (auric chloride; gold chloride).

CAS: 13453-07-1. AuCl_3 .

(2) $\text{AuCl}_3\cdot 2\text{H}_2\text{O}$.

(3) (chlorauric acid; chloroauric acid; gold trichloride, acid). $\text{AuCl}_2\cdot\text{HCl}\cdot 4\text{H}_2\text{O}$ or $\text{HAuCl}_4\cdot 4\text{H}_2\text{O}$.

Properties: Yellow to red crystals, decomposed by heat. Soluble in water, alcohol, and ether.

Derivation: Action of aqua regia on gold.

Grade: Technical, CP, usually as chlorauric acid.

Use: (3): Photography, gold plating, special inks, medicine, ceramics (enamels, gilding and painting porcelain), glass (gilding, ruby glass), manufacture of finely divided gold and purple of Cassius.

gold trioxide. See gold oxide.

gold, white. A jeweler's alloy consisting of approximately 58% gold, 17% nickel, 7% zinc, and 17% copper.

Golgi apparatus. Eukaryotic organelle that package cell products, such as enzymes and hormones, and coordinate their transport to the outside of the cell.

Golgi complex. A complex and dynamic membranous organelle of eukaryotic cells. Golgi bodies function in the posttranslational modification (glycosylation) and secretion of proteins or insertion into membranes. Composed of *cis*, medial and *trans* compartments, as well as a less well defined "transgolgi network."

Gomberg-Bachmann reaction. Formation of diaryl compounds from aryl diazonium salts and aromatic compounds in the presence of alkali.

Gomberg free radical reaction. Formation of free radicals by abstraction of the halogen from triarylmethyl halides with metals.

Gooch. See crucible.

good laboratory practices. See GLP.

Goodyear, Charles. (1800–1860). Born in Woburn, MA. Goodyear was the first to realize the potentialities of natural rubber. Frustrated by its lack of stability to temperature and other weaknesses in the uncured state, he experimented with additives such as magnesium and sulfur. The discovery of vulcanization was not accidental, as is often stated, but the result of intelligent trials and correct evaluation of their results. Though Goodyear's patents were contested by Hancock in England, he well merits the credit for making rubber usable in countless ways and helping to make the automobile possible.

See vulcanization.

Gordon Research Conferences. See American Association for Advancement of Science.

"Gorilla Glue" [Gorilla Glue]. TM for liquid glue.

Use: To bond and repair interior and exterior wood, stone, metal ceramic, foam board, and fiberglass.

"Gorilla Tape" [Gorilla Glue]. TM for tape.

Use: Bonds to brush stucco, wood and more—a double thick adhesive.

gossypure. (7,11-hexadecadien-1-ol acetate).

CAS: 50933-33-0. $\text{C}_{18}\text{H}_{32}\text{O}_2$.

Properties: A yellow liquid. Mw 280.46, bp 130–132C. Soluble in most organic solvents.

Hazard: Extremely flammable.

Use: Sex attractant for pink bollworm.

gossypol.

CAS: 303-45-7. $C_{30}H_{30}O_8$. A natural polyphenol.

Properties: Yellow, crystalline pigment having three modifications. Insoluble in water; soluble in alcohol.

Occurrence: Cottonseed kernels.

Hazard: Toxic by ingestion but is inactivated by heat, 0.04% max allowed in foods.

Use: Stabilizer for vinyl polymers, has possibilities as a biodegradable insecticide and male contraceptive, actively investigated in China.

Gould-Jacobs reaction. Synthesis of 4-hydroxyquinolines from anilines and diethyl ethoxymalonate via cyclization of the intermediate anilino-methylenemalonate followed by hydrolysis and decarboxylation.

GPC. See gel permeation chromatography.

GPCR. G-protein coupled receptor. Usually a serpentine receptor.

GPF black. Abbreviation for general purpose furnace black.

See carbon black.

gracilin.

CAS: 23522-05-6. mf: $C_{15}H_{20}O_3$.

Hazard: A reproductive hazard.

grade. Any of a number of purity standards for chemicals and chemical products established by various specifications. Some of these grades are as follows:

ACS (American Chemical Society specifications) reagent (analytical reagent quality)

CP (chemically pure)

USP (conforms to U.S. Pharmacopeia specifications)

NF (conforms to National Formulary specifications)

FCC (Food Chemicals Codex specifications)

Other common grade designations are chemical, commercial, feed, food, injectable, nitration, purified, radio, research, semiconductor, spectro, technical (industrial chemicals).

graduate. A cylindrical glass container with etched volumetric gradations usually ranging from 5 to 100 or more milliliters.

Use: Measuring liquids in chemical and biological laboratories.

Graebe-Ullmann synthesis. Formation of carbazoles by the action of nitrous acid on 2-amino-diphenylamines, followed by decomposition of the resulting benzotriazoles.

graft copolymer. Polymer having branches of varying length made up of different monomeric units on a common truck chain.

grafting. A deposition technique whereby organic polymers can be bonded to a wide variety of other materials, both organic and inorganic, in the form of fibers, films, chips, particles, or other shapes. Grafting occurs at specific catalyst sites on the host materials, which must have some capacity for ion exchange, metathesis, or complex formation. Ionizable groups may be added artificially. One proprietary application is polymerization of acrylonitrile with wood pulp fibers to make synthetic soil blocks; the polymer imparts high water-holding capacity to the pulp. Plant nutrient materials are added and the mixture pressed into blocks to be used for starting seedlings.

graft polymer. A copolymer molecule comprised of a main backbone chain to which side chains containing different atomic constituents are attached at various points. The main chain may be either a homopolymer or a copolymer. This process may be applied to the union of cellulosic molecules (cotton, rayon) with synthetic polymers (except polyesters, acrylics, and polypropylene) to form modified fibers having improved flame-resistance, dimensional stability, resilience, and bacterial resistance. An intermediate called cellulose thiocarbonate is formed in this proprietary process.

See polyorganosilicate graft polymer.

Graham's salt. See sodium metaphosphate.

Graham, Thomas. (1805–1869). Born in Scotland, Graham is famous for his basic studies in diffusion that led to the development of colloid chemistry. He was the first to observe a marked difference in the rate of passage of certain types of substances through a parchment membrane. Those that readily crystallize, like sugar, pass rapidly through the membrane, but gelatinous types are "slow in the extreme." Graham designated the latter, which comprise albumin, starch, gums, etc., as colloids and their solutions as colloidal solutions. The former, which he called crystalloids, form "true" or molecularly dispersed solutions.

See colloid chemistry.

grain. (1) The smallest unit of mass in the avoirdupois system; 1 grain = 0.0648 gram; one ounce contains 437.5 grains

(2) Any cereal plant, such as wheat, corn, barley, etc.

- (3) Crystalline particles of metals.
 (4) The dehaired side of a skin or hide.

grain alcohol. See ethanol.

grain oil. See fusel oil.

gram. (g). One one-thousandth kilogram. It is the mass of one milliliter (approximately 1 cubic centimeter) of water at 4C. One pound contains 453.5 grams.

gram atomic weight. The atomic weight of an element in grams; e.g., the gram atomic weight of oxygen is 15.994 grams. See mole.

gramicidin. An antibiotic produced by the metabolic processes of the bacteria *Bacillus brevis*. It is a polypeptide that is active against most Gram-positive pathogenic bacteria. It is one of the two antibiotic components of tyrothricin but has been isolated and used alone.

Properties: White, crystalline platelets. Mp 229–230C. Soluble in lower alcohols, acetic acid, and pyridine; moderately soluble in dry acetone and dioxane; almost insoluble in water, ether, and hydrocarbons. Depresses surface tension, forms a fairly stable colloidal emulsion in distilled water.

Derivation: From tyrothricin by extraction with a mixture of equal volumes of acetone and ether, followed by concentration in vacuo and dissolving in hot acetone.

Grade: NF.

Use: Medicine (antibacterial).

gramine. [3-(dimethylaminomethyl)indole].

CAS: 87-52-5. $C_{11}H_{14}N_2$.

Properties: Shiny, flat needles. Mw 174.24, mp 138–139C. Soluble in alcohol, ether, chloroform; slightly soluble in cold acetone; practically insoluble in petroleum ether, water.

gram molecular weight. The molecular weight of a compound in grams, e.g., the gram molecular weight of carbon dioxide is 44.01 grams. See mole.

Gram-positive, -negative. A characteristic property of bacteria in reacting to a staining method developed by Gram around 1880. The bacteria are stained with crystalline violet, treated with Gram's solution, and again stained with safranin. If the dye is retained the bacteria are called Gram-positive, and vice versa. See bacteria.

grana. Stacks of thylakoids in chloroplasts.

granule. A piece of gravel of small size (between two and four mm).

grape color extract.

Use: Food additive.

grapefruit oil. See citrus peel oil.

grape skin extract.

Properties: Red to purple powder or liquid concentrate.

Use: Food additive.

grape sugar. See glucose.

graphite. (black lead; plumbago).

CAS: 7440-44-0. The crystalline allotropic form of carbon.

Occurrence: Naturally in Madagascar, Ceylon, Mexico, Korea, Austria, the former U.S.S.R., and China. Also produced synthetically by heating petroleum coke to approximately 3000C in an electric resistance furnace. Approximately 70% used in U.S. is synthetic.

Properties: Relatively soft, greasy feel; steel-gray to black color with a metallic sheen. D 2.0–2.25 depending on origin. Apparent d of artificial graphite 1.5–1.8. High electrical and thermal conductivity, specific heat 0.17 at room temperature, 0.48 at 1500C, tensile strength 400–2000 psi, compressive strength usually approximately 2000–8000 psi. Coefficient of friction 0.1 microns. Resistant to oxidation and thermal shock. Sublimes at 3650C.

Grade: Powdered, flake, crystals, rods, plates, fibers.

Hazard: (Powder, natural) Fire risk. TLV: 2 mg/m³, respirable dust.

Use: Crucibles, retorts, foundry facings, molds, lubricants, paints and coatings, boiler compounds, powder glazing, electrotyping, monochromator in x-ray diffraction analysis, fluorinated graphite polymers with fluorine-to-carbon ratios of 0.1–1.25, electrodes, bricks, chemical equipment, motor and generator brushes, seal rings, rocket nozzles, moderator in nuclear reactors, cathodes in electrolytic cells, pencils, fibers, self-lubricating bearings, intercalation compounds.

See carbon; graphite fiber; carbon, industrial.

graphite fiber. High-tensile fibers or whiskers made from (1) rayon, (2) polyacrylonitrile, or (3) petroleum pitch.

Properties: (1) Amorphous structure, oxidizes readily, requiring silicon carbide coating. Resistant to acids and bases, including hydrogen fluoride; tensile strength 50,000–150,000 psi, elastic modulus 4–9 million psi, temperature limit in oxidizing atm 500C, self-lubricating, resistant to electricity, lightweight. (2) Polycrystalline structure, tensile strength up to 350,000 psi, elastic modulus up to 70 million psi, smooth surface, lightweight. (3) Properties similar to (2).

Derivation: (1) Heating rayon in air at 1400–1700C. (2) Heating polyacrylonitrile in air at 220C (20 h) to oxygenate, then in hydrogen to 1000C (24 h) to carbonize, finally in argon at 2500C (2 h). (3) Heating pitch materials (petroleum residues, asphalt, etc.) to carbonization temperature.

Available forms: Filament, yarn, fabric, whiskers. Fibers may be 7–8 microns in diameter.

Use: Heating pads (combined with glass fiber), protection clothing, polyester and epoxy composites for jet engine components, spacecraft, compressor blades, airframe structure, electrodes for spark-hardening metals, flame-proof textile products, engineering thermoplastics.

See fiber; whiskers; composite; carbon, industrial.

graphite, pyrolytic. (pyrographite). A dense, nonporous graphite stronger and more resistant to heat and corrosion than ordinary graphite, intended for rocket nozzles, missiles in general, and nuclear reactors; exhibits tensile strengths 5–10 times higher than commercial graphite and maintains its strength above 3300C. It is ultrapure, impermeable to all fluids, and an anisotropic thermal and electrical conductor.

graphitic oxide. (GO). $C_7O_2(H)_2$.

Properties: Light-yellow flakes or plates that deposit in layers to form a membrane, usually supported on a cellulose ester.

Derivation: Slow oxidation of graphite with potassium nitrate in nitric and sulfuric acids.

Use: Reverse-osmosis membrane for desalination of seawater.

GRAS. Abbreviation for “generally recognized as safe,” applied to food additives approved by the FDA.

gravel. Sediment particles larger than sand (larger than two mm).

gravimetric analysis. A type of quantitative analysis involving precipitation of a compound that can be weighed and analyzed after drying. It is also used in determining specific gravity.

grayanol A.

CAS: 52557-31-0. mf: $C_{20}H_{32}O_6$.

Hazard: A poison.

Source: Natural product.

grayanol B.

CAS: 52611-78-6. mf: $C_{20}H_{32}O_6$.

Hazard: A poison.

Source: Natural product.

grayanotoxin II.

CAS: 4678-44-8. mf: $C_{20}H_{32}O_5$.

Hazard: A poison.

grayanotoxin III.

CAS: 4678-45-9. mf: $C_{20}H_{34}O_6$.

Hazard: A poison.

Source: Natural product.

grayanotoxin III 6,14-diacetate.

CAS: 30460-34-5. mf: $C_{24}H_{38}O_8$.

Hazard: A poison.

Source: Natural product.

grayanotoxin VI.

CAS: 30460-36-7. mf: $C_{20}H_{32}O_5$.

Hazard: A poison.

GRE. (glucocorticoid response element). The glucocorticoid receptor is essentially a transA binding site in a promoter to which the activated glucocorticoid receptor can bind to a transcription factor which is activated only in the presence of glucocorticoids. The activated receptor will bind to a GRE, and transcription of the adjacent gene will be altered. See response element.

Greek letters. See alpha; beta; gamma.

green.

Use: In the process industries in a number of senses in addition to that of a dye or pigment. For example, it often is applied to any material that is uncured or untreated, e.g., leather, rubber, cement, etc.

See green liquor; greensand; greensalt; green soap; Paris green.

green cross. (superpalite).

See trichloromethyl chloroformate.

greenhouse effect. Gradual rise in average global temperature due to absorption of infrared radiation by increasing amounts of carbon dioxide in the air, which retards dissipation of heat from the earth's surface. This phenomenon, which has been well documented, is ascribed to the burning of fossil fuels, especially coal, aided by aerosols and other contaminants. Definitive studies by NRC (1979) and NASA (1981) project a substantial increase in average temperature during the next century, perhaps as much as 3–4C. The increase of 1C reported to have occurred from 1900–1950 indicates that this has been going on for the last 100 years or more, coinciding with the industrial revolution. Since the

CO₂ concentration tends to be greatest at the poles (perhaps due to the absence of vegetation), it is probable that the ice caps there will deteriorate, with a concomitant rise in sea levels throughout the world. Other deleterious effects are also predicted, e.g., droughts in North America and central Asia caused by basic changes in rainfall distribution. As combustion of organic fuels is the underlying cause of this situation, reduction in their use is desirable wherever possible, combined with accelerated development of energy sources that do not produce carbon dioxide.

Greenland spar. See cryolite, natural.

green liquor. See liquor (b).

greenockite. CdS. A native cadmium sulfide containing 77.7% cadmium. Ore of cadmium.

greensalt. A wood preservative containing chromated copper arsenate.

Hazard: Highly toxic.

greensand. See foundry sand.

green soap. A liquid soap made with potassium hydroxide and a vegetable oil (except coconut and palm kernel oil).
See soap.

greenstone.

Available forms: Mineral granules, various screen gradings and colors.

Use: In roofing materials where outdoor weathering resistance is required, as a filler for asbestos shingles, tennis court surfaces.

green-verditer. A paint pigment consisting of the hydroxycarbonate of copper.
See copper carbonate; malachite.

grex. See denier.

Griess diazo reaction. Formation of aromatic diazonium salts from primary aromatic amines and nitrous acid or other nitrosating agents.

Grignard degradation. Stepwise dehalogenation of a polyhalo compound through its Grignard reagent, which on treatment with water yields a product containing one fewer halogen atom.

Grignard reaction. Addition of organomagnesium compounds (Grignard reagents) to carbonyl groups or other unsaturated groups to give alcohols or ketones.

Grignard reagent. An important class of reagents used in synthetic organic chemistry, made by union of metallic magnesium with an organic chloride, bromide, or iodide, usually in the presence of

an ether and in the complete absence of water. General formula RMgX, where R is an alkyl, aryl, or other organic group and X a halogen. The value of the reagents lies in their ease of reaction with water, carbon dioxide, alcohols, aldehydes, ketones, amines, etc. to produce a great variety of organic compounds, usually with good yields. Examples are ethyl magnesium chloride (C₂H₅MgCl), methyl magnesium bromide (CH₃MgBr), etc.

Hazard: Because the heat of decomposition of Grignard reagents with water is great and the ether in which they are dissolved is highly volatile and flammable, they must be handled with extreme care. Some, especially the solution of MeMgBr in ethyl ether, may ignite spontaneously on contact with water or even damp floors; nearly all will ignite on a wet rag or similar material. Since all Grignard reagents react rapidly with both water and oxygen, contact must be avoided. Ordinary materials of construction are satisfactory for use with Grignard reagents.

Grignard, Victor. (1871–1935). A French chemist who worked with Sabatier to win the Nobel Prize in 1912. He authored "Theses sur les combinaisons organomagnésiennes mixtes et leurs applications a des synthèses." As a student of Beribier, he went from Lyons to Besancon to Nancy, France. He discovered organomagnesium compounds that are used for organic synthesis by the Grignard reaction.

"Grilbond" [EMS-Grilon]. TM for solutions for bonding coating and sealing components in auto production.

"Grilonit" [EMS-Grilon]. TM for solutions for bonding coating and sealing components in auto production.

grinding media. Balls ranging in diameter from 1/4 to 2 inches (in special cases even larger) made of porcelain, flint, bronze-alumina or alloy steels of various compositions. These perform an efficient size-reduction action on solid materials that are softer than the balls themselves. Steel rods are also used. See ball mill; rod mill.

"Grinsted" [Danisco]. TM for locust bean gum.

Available forms: Powder.

Use: A gelling, thickening, stabilizing agent for ice cream, cream cheese, sauces, and desserts.

griseofulvin. C₁₇H₁₇ClO₆.

Properties: White to creamy white, odorless powder. Insoluble in water; slightly soluble in alcohol, benzene, acetone, and chloroform.

Derivation: By growth of *Penicillium griseofulvum* or synthetically.

Grade: USP.

Use: Medicine (antifungal), feed additive.

grizzly. A coarse size-grading device used for ores, coal, and mineral aggregate. It consists of a grid of parallel steel bars separated by a distance determined by the size separation desired. It is set at an angle of approximately 45 degrees so that lumps that are too large to pass through it can roll down the bars while the smaller sizes fall into a container beneath.

Grob fragmentation reaction. Carbon-carbon bond cleavage involving a system of four atoms.

grog. Crushed refractory materials added to ceramic mixes to reduce lamination in plastic clays and also to reduce shrinkage on drying. Materials crushed for this purpose are pottery, firebrick, quartz, quartzite, burned ware, saggars.

ground-nut oil. See peanut oil.

ground state. Condition in which the orbital electrons of an atom are in their lowest energy state.

groundwood. A type of wood pulp produced by direct friction of a rotating stone on the end of a log. In the paper trade this is called mechanical pulp.

Use: Newsprint and other low-grade papers.

See pulp, paper.

group. (1) One of the major classes or divisions into which elements are arranged in the periodic table (vertical columns). The classification is made according to the properties of the elements, those whose properties are similar occupying one group. Groups I through VII are divided into subgroups (A and B), but group VIII, which contains the noble gases, is not so divided.

See periodic table.

Note: Though often loosely so used, the word group should not be applied to a number of elements of similar properties that are not actual groups in the periodic table; the proper term for these is series, e.g., lanthanide series, rare-earth series, etc.

(2) A combination of two or more closely associated elements that tend to remain together in reactions, usually behaving chemically as if they were individual entities, i.e., in respect to valence, ionization, and related properties. Among the more familiar are OH (hydroxyl), COOH (carboxyl), CO₃ (carbonate), NH₄ (ammonium), SO₄ (sulfate), CH₃ and homologs (methyl, etc.), SH (sulfhydryl), and CO (carbonyl). When a group acquires an electric charge it is called a radical.

(3) Any combination of elements that has a specific functional property, for example, a chromophore group in dyes.

group transfer potential. A measure of the ability of a compound to donate an activated group (such as a phosphate group). Computed and expressed from the standard free energy of hydrolysis.

growth. (1) In biochemistry, the continuous process of cell division and reproduction characteristic of all living organisms. The basic phenomenon is considered to be osmosis, by which nutrients are transferred through cell walls and tissue structures; it is thus essential to the metabolic functioning of the organism. (2) In crystallography, the process of crystalline formation and development by nucleation and accretion. Crystals of many kinds are artificially produced for a variety of uses (e.g., lasers) by vapor condensation, electrodeposition, or rapid cooling of a saturated solution.

growth hormone. See somatotrophic hormone.

growth regulator. See plant growth regulator.

Grubbs, Robert H. (1942–). An American born in Calvert City, Kentucky who won the Nobel Prize for chemistry in 2005 for his pioneering work concerning the development of the metathesis method in organic synthesis. Grubbs was awarded a B.S. and M.S. in chemistry from the University of Florida, and obtained his Ph.D. at Columbia University. He is the Victor and Elizabeth Atkins Professor of Chemistry at the California Institute of Technology and is a member of the National Academy of Sciences.

Grundmann aldehyde synthesis. Transformation of an acid into an aldehyde of the same chain length by conversion of the acid chloride via the diazo ketone to the acetoxy ketone, reduction with aluminum isopropoxide and hydrolysis to the glycol, and cleavage with lead tetraacetate.

G salt. The sodium or potassium salt of 2-naphthol-6,8-disulfonic acid (G acid).

Use: Dye intermediate.

GTP. Abbreviation for guanosine triphosphate. See guanosine phosphates.

guaiaic. (guaiaic gum; guaiaic resin). A resin from certain Mexican and West Indian trees, especially *Guaiaecum santum* and *G. officinale*.

Properties: Brownish lumps. Mp 85°C. Insoluble in water; soluble in alcohol, ether, acetone, chloroform, and caustic soda.

Use: Flavoring agent in foods; medicine (diagnostic aid for blood or hemoglobin).

guaiaicol. (methylcatechol; pyrocatechol methyl ether; pyrocatechol methyl ester; *o*-methoxyphenol; *o*-hydroxyanisole).
CAS: 90-05-1. $\text{OHC}_6\text{H}_4\text{OCH}_3$.

Properties: Faintly yellowish, limpid, oily liquid or yellow crystals; aromatic odor. D 1.1395, mp 27.9C, bp 205C, flash p 180F (82.2C) (OC). Constitutes 60–90% of beechwood creosote. Soluble in alcohol, ether, chloroform, and glacial acetic acid; moderately soluble in water. Combustible.

Derivation: (1) By extracting beechwood creosote with alcoholic potash, washing with ether, crystallizing the potash compound from alcohol, and decomposing it with dilute sulfuric acid. (2) Also from *o*-anisidine by diazotization and subsequent action of dilute sulfuric acid.

Hazard: Toxic by ingestion and skin absorption.
Use: Synthetic flavors, medicine (expectorant).

guaiaicwood oil.

Properties: Yellow to amber semisolid mass; floral odor. D 0.965–0.975, optical rotation –6 to –7 degrees. Soluble in alcohol, ether, and chloroform; insoluble in water.

Derivation: Steam distillation of guaiaicwood (Paraguay). Chief constituent: Guaiol.

Use: Perfume fixative and modifier, soap odorant, fragrances, production of guaiaicwood acetate.

guaiol. $\text{C}_{15}\text{H}_{26}\text{O}$. A bicyclic sesquiterpene alcohol found in guaiaic wood oil.

Properties: Crystalline solid. Mp 91C. Insoluble in water; soluble in alcohol.

guanethidine sulfate. ([2-(hexahydro-1(2H)-azocinyl)ethyl]guanidine sulfate).

CAS: 60-02-6. $(\text{C}_{10}\text{H}_{22}\text{N}_4)_2 \cdot \text{H}_2\text{SO}_4$.

Properties: White crystalline powder; strong odor. Very soluble in water; slightly soluble in alcohol; practically insoluble in chloroform.

Grade: USP.

Use: Medicine (antihypertensive agent).

guanidine. (carbamide; iminourea).

CAS: 113-00-8. $\text{HN}=\text{C}(\text{NH}_2)_2$.

Properties: Colorless crystals. Mp 50C, decomposes at 160C. Soluble in water and alcohol. Combustible.

Derivation: (1) By heating calcium cyanamide with ammonium iodide. (2) By treating urea with ammonia under pressure.

Use: Organic synthesis.

guanidine-aminovaleric acid. See arginine.

guanidine carbonate.

$(\text{H}_2\text{NCNHNH}_2)_2 \cdot \text{H}_2\text{CO}_3$.

Properties: White granules. Decomposes without melting at 197–199C, d 1.25. Soluble in water; slightly soluble in alcohol and acetone. Combustible.

Derivation: From dicyandiamide.

Grade: Technical, over 95% pure.

Hazard: Toxic by ingestion.

Use: As a strong organic alkali, organic intermediate, soap and cosmetic products.

guanidine hydrochloride. $\text{HNC}(\text{NH}_2)_2 \cdot \text{HCl}$.

Properties: White powder. Mp approximately 183C. Soluble in water and alcohol, pH (aqueous solution) 6.2 for 10% solution.

Grade: 88% and 95% pure.

Hazard: Toxic by ingestion, evolves hydrogen chloride fumes on heating.

guanidine nitrate. $\text{H}_2\text{NC}(\text{NH})\text{NH}_2 \cdot \text{HNO}_3$.

Properties: White granules. Melting range 206–212C. Soluble in water and alcohol; slightly soluble in acetone.

Derivation: From cyanamide or dicyandiamide.

Grade: Technical, greater than 95% pure.

Hazard: Strong oxidant, may ignite organic materials on contact, may explode by shock or heat.

Use: Manufacture of explosives, disinfectants, photographic chemicals.

guanidine thiocyanate.

CAS: 593-84-0. $\text{H}_2\text{NC}(\text{=NH})\text{NH}_2 \cdot \text{HSCN}$.

Properties: Solid. Mw 118.16, mp 114–119C. Contains 2% hydrochloric acid.

Hazard: Irritant.

Use: Potent protein denaturant used in isolation of intact DNA, RNA.

guanine. (G; 2-amino-6-oxypurine).

CAS: 73-40-5. $\text{C}_5\text{H}_5\text{N}_5\text{O}$. A purine constituent of ribonucleic acid and deoxyribonucleic acid. Usual sources are guano, sugar beets, yeast, clover seed, and fish scales.

Properties: Colorless, rhombic crystals. Mp 360C (decomposes). Insoluble in water; sparingly soluble in alcohol and ether; freely soluble in ammonium hydroxide, alkali hydroxides, and dilute acids. Available as hydrochloride or hemisulfate.

Derivation: Isolation following hydrolysis of nucleic acids (usually from yeast), organic synthesis.

Use: Biochemical research, cosmetics.

See: Base pair; pearl essence; nucleotide.

guano. Excrement of sea birds found chiefly on islands off the coasts of Peru, Chile. Contains 10% nitrogen, 6% phosphorus, 2% potassium. Formerly the main source of nitrates.

guanosine. (guanine riboside).

CAS: 118-00-3. $\text{C}_{10}\text{H}_{13}\text{N}_5\text{O}_3$. The nucleoside containing guanine and D-ribose.

Properties: White, crystalline powder; odorless; mild saline taste. Mp 237–240C (decomposes).

Very slightly soluble in cold water; soluble in boiling water, dilute mineral acids, hot acetic acid, and dilute bases; insoluble in alcohol, ether, chloroform, and benzene.

Derivation: Found in pancreas, clover, coffee plant, and pollen of pines; prepared from yeast nucleic acid.

Use: Biochemical research.

guanosine monophosphate. See guanylic acid.

guanosine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated are the monophosphate (GMP), the diphosphate (GDP), and the triphosphate (GTP).

guanosine phosphoric acid. See guanylic acid.

guanylic acid. (GMP; guanosine monophosphate; guanosine phosphoric acid). CAS: (3') 117-68-0; (5') 85-32-5. $C_{10}H_{14}N_5O_6P$. The monophosphoric ester of guanine, i.e., the nucleotide containing guanine, D-ribose, and phosphoric acid. The phosphate may be esterified to either the 2, 3, or 5 carbon of ribose, yielding guanosine-2'-phosphate, guanosine-3'-phosphate, and guanosine-5'-phosphate, respectively. It is important in growth processes of the body.

Derivation: (Commercial product): Isolation from nucleic acid of yeast or pancreas; also made synthetically.

Use: Biochemical research, flavor potentiator (disodium salt).

guanyl nitrosaminoguanylidene hydrazine.
A high explosive.

guanyl nitrosaminoguanyl tetrazene. See tetrazene.

guanylurea sulfate. (carbamylguanidine sulfate). $(C_2H_6ON_4)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White powder, greater than 97% pure. Soluble in water and alcohol.

Derivation: From cyanamide or dicyandiamide.

Use: Analytical reagent for nickel, manufacture of dyes, organic synthesis.

“Guardkote” [Shell]. TM for fast-setting two-component liquid systems based on “Epon” resins and designed specifically for highway resurfacing and repair. They are used in combination with sharp aggregates to waterproof and deslick Portland cement or bituminous concrete pavements.

Guareschi-Thorpe condensation. Synthesis of pyridine derivatives by condensation of cyanoacetic ester with acetoacetic ester in the presence of ammonia. In a second type of synthesis, a mixture of

cyanoacetic ester and a ketone is treated with alcoholic ammonia.

guar gum. (guar flour).

CAS: 9000-30-0. A water-soluble plant mucilage obtained from the ground endosperms of *Cyanopsis tetragonoloba*, cultivated in India and Pakistan as livestock feed, as well as in southwestern U.S. The water-soluble portion of the flour (85%) is called guaran and consists of 35% galactose, 63% mannose, probably combined in a polysaccharide, and 5–7% protein.

Properties: Yellowish-white free-flowing powder. Completely soluble in hot or cold water. Practically insoluble in oils, greases, hydrocarbons, ketones, esters. Water solutions are tasteless, odorless, non-toxic. Has 5–8 times the thickening power of starch. Reduces the friction drag of water on metals.

Grade: Industrial, technical, FCC.

Use: Paper coating, cosmetics, pharmaceuticals, binder in tablet mixtures, interior coating of firehose nozzles, fracturing aid in oil wells, textiles, printing, polishing, thickener and emulsifier in food products (e.g., cheese spreads, ice cream, and frozen desserts).

guayule. A rubberlike hydrocarbon, almost identical with *cis*-polyisoprene, obtained from a shrub that is a member of the *Compositae* family. It is grown extensively in Mexico and the southwestern U.S. It contains approximately 15% rubber hydrocarbon in the form of latex in cells in the roots and stem. Conventional practice involves crushing and parboiling the entire plant; this coagulates the latex, which is removed by milling. An improved process utilizes steam from 200–240C for 6 min instead of milling. Resins, which comprise 10–15% of the plant, are then removed with acetone followed by treatment with hexane to extract the hydrocarbon. This method can increase the yield of hydrocarbon by up to 50%. The yield is 1 lb rubber/6 lb committed shrub.

Guerbet reaction. Condensation of alcohols at high temperature and pressure in the presence of sodium alkoxide or copper by a dehydrogenation, aldol condensation, and hydrogenation sequence.

Guignet’s green. A chrome-green pigment made by fusing potassium chromate and boric acid.

Gulberg and Waage law. See Mass action law.

gum arabic. See arabic, gum.

gum benzoin. See benzoin resin.

gum camphor. See camphor.

gum, gasoline. A viscous oxidation product occurring after long standing in gasoline that is not stabilized with an antioxidant.

gum, natural. A carbohydrate high polymer that is insoluble in alcohol and other organic solvents, but generally soluble or dispersible in water. Natural gums are hydrophilic polysaccharides composed of monosaccharide units joined by glycosidic bonds. They occur as exudations from various trees and shrubs in tropical areas or as phycocolloids (algae) and differ from natural resins in both chemical composition and solubility properties. Some contain acidic components, and others are neutral. **Use:** Protective colloids and emulsifying agents in food products and pharmaceuticals, as sizing for textiles, and in electrolytic deposition of metals. See arabic; tragacanth; guar; karaya.

Note: The terminology of natural gums and resins is inconsistent and often confusing. The word *gum*, often used as an adjective, seems to acquire a different meaning from the noun. For example, the resinous products obtained from pine pitch (produced by the parenchyma cells of softwoods) are conventionally called *gum turpentine*, and *gum rosin*. There are also such *gum resins* as *gum benzoin*, gum camphor, and others. The so-called ester gum is a semisynthetic reaction product of rosin and a polyhydric alcohol. All these are actually resinous products having properties quite different from those of natural gums. Furthermore, resins are complex *mixtures*, whereas gums are *compounds* that can be represented by a formula. Still further complicating the matter is the common application of the word *gum*, to such plant latices as chicle and natural rubber, which are different from both carbohydrate gums and resins. It is probable that the confusion originated in the casual use of *gum* to refer to any soft, sticky product derived from trees. In view of this situation, any specific definition of these terms is likely to be controversial.

See resin; natural; polymer, water soluble.

gum rosin. See rosin; gum, natural (note).

gum sugar. See arabinose.

gum, synthetic. See ester gum.

gum tragacanth. See tragacanth gum.

gum turpentine. See turpentine; gum, natural (note).

guncotton. See nitrocellulose.

gun metal. An alloy of copper with 10% tin.

gunpowder. See black powder.

“Guthion” [Bayer]. TM for *O,O*-dimethyl-*S*-4-oxo-1,2,3-benzotriazin-3(4*H*)-ylmethyl phospho-

rodithioate.

See azinphos methyl.

Hazard: A cholinesterase inhibitor.

Gutknecht pyrazine synthesis. Cyclization of α -amino ketones produced by reduction of isonitroso ketones; the dihydropyrazines formed are dehydrogenated with Hg_2O or $CuSO_4$, or sometimes with atmospheric oxygen.

gutta percha. (*trans*-polyisoprene). A geometric isomer of natural rubber obtained from trees native to Malaya. It is stiff, hard, and inelastic when cold; softens at 60C to moldable condition and melts at 100C, insoluble in water, essentially soluble in carbon disulfide, petroleum ether, and chloroform. It can be vulcanized with sulfur.

Use: Formerly used widely for golf-ball covers, its present uses are in dentistry, surgical accessories, and as an insulating medium in electrical devices.

Gutzeit test. A test for arsenic. Zinc and dilute sulfuric acid are added to the substance, which is then covered with a filter paper moistened with mercuric chloride solution. A yellow spot forms on the paper if arsenic is in the sample.

See Bettendorf's reagent.

gyandromorph. Organisms that have both male and female cells and, therefore, express both male and female characteristics.

gyocardia oil. See chaulmoogra oil.

Glyp. See Glyptal.

Glyptal. (Glyp). Synthetic resin made by heating phthalic anhydride and glycerin together.

Use: Shellac, lacquers, paints, or varnishes.

gylplore. (generic name for *cis*-9-octadecen-1,12-diol-12-acetate). It is a synthetic product used as a sex attractant for the male gypsy moth. The natural product, found in female moths, is said to be *d*-10-acetoxy-1-hydroxy-*cis*-7-hexadecene.

gypsum (calcium(II) sulfate dihydrate (1:1:2)). CAS: 10101-41-4. $CaSO_4 \cdot 2H_2O$. A mineral that consists of calcium sulfate with water molecules attached, or the rock that consists primarily of this mineral.

Hazard: TLV: (nuisance particulate) 10 mg/m³ of total dust (when toxic impurities are not present, e.g., quartz <1%).

See calcium sulfate.

gypsum cement. (plaster of Paris; Keene's cement; Parian cement; Martin's cement; Mack's cement). A group of cements that consist essentially of calcium sulfate and are produced by the partial dehydroxylation of gypsum to the hemihydrate $CaSO_4 \cdot 1/2H_2O$. They usually contain additions

of various sorts. For example, Keene's cement contains alum or aluminum sulfate; Mack's cement contains sodium or potassium sulfate; Martin's cement contains potassium carbonate; and Parian cement contains borax.

gyratory crusher. A machine for large-scale size reduction of rocks, ore, or mineral aggregate. Essentially, it comprises a vertical cone-shaped crushing head or mantle that moves in a shell shaped like an inverted cone that is open at the top where the feed enters. The space between the mantle and the shell decreases gradually, being smallest at the bot-

tom where the crushed material is discharged. The lower third of the mantle and shell have concave surfaces to minimize packing of the crushed product. The crushing head functions by executing a gyratory or circular motion, i.e., a rolling action in which the upper portion describes a circle while the lower portion is almost stationary. From 300–500 gyrations per minute are possible. The mechanism is activated by a shaft attached to the crushing head, the bottom of which rests in a gear-driven eccentric. Heavy-duty gyratories have feed openings up to 72 inches; fine-reduction sizes are as small as 12 inches.

H

H. Symbol for hydrogen, the molecular formula is H_2 .

h. See Planck's constant.

Haber, Fritz. (1868–1934). Born in Breslau, Germany, Haber's great contribution to chemistry, for which he was awarded the Nobel Prize in 1918, was his development (with Bosch) of a workable method for synthesizing ammonia by the water-gas reaction from hot coke, air, and steam; the gas mixture obtained includes nitrogen from the air, as well as hydrogen from the steam. It was the first successful attempt to "fix" atmospheric nitrogen in an industrial process. This discovery was developed to production scale in approximately 1912; it enabled Germany to manufacture an independent supply of explosives for World War I.

habit. The type of geometric structure that a given crystalline material invariably forms, e.g., cubic, orthorhombic, monoclinic, tetragonal, hexagonal, etc. Each of these types has several subclasses. Thus, crystals may have the form of thin sheets or plates, cubes, rhomboids, and even more complicated geometric structures. For example, the crystalline habit of mica is monoclinic, with formation of extremely thin sheets.
See crystal.

H acid. (1-amino-8-naphthol-3,6-disulfonic acid).

Properties: Gray powder. Soluble in water, alcohol, and ether.

Derivation: Fusion of 1-naphthylamine-3,6,8-trisulfonic acid (Koch acid) with 30% sodium hydroxide solution at 180C.

Use: Azo dye intermediate.

haemo-. Prefix indicating relationship to blood.

hafnia. See hafnium oxide.

hafnium.

CAS: 7440-58-6. Hf. Metallic element of atomic number 72, Group IVB of the periodic table, aw 178.49, valences of 2, 3, 4; 6 stable isotopes.

Properties: Generally similar to zirconium. Gray crystals. D 13.1, mp approximately 2150C, bp above

5400C, high thermal neutron cross section (115 barns). Good corrosive resistance and high strength. See zirconium.

Occurrence: Zirconium ores.

Derivation: Extremely difficult to separate from zirconium. Most important methods are: (1) solvent extraction of the thiocyanates by hexone, (2) solvent extraction of the nitrates by tributyl phosphate, (3) fractional crystallization of the double fluorides.

Available forms: Powder, rods, single crystals.

Hazard: Toxic by inhalation; compounds are also toxic. Powder form is explosive in air, either dry or wet, with less than 25% water. TLV: 0.5 mg/m³.

Use: Control rods in water-cooled nuclear reactors; lightbulb filaments, electrodes, special glasses, getter in vacuum tubes.

hafnium boride. HfB₂. Crystalline solid, mp 3100C.

Use: Refractory material.

hafnium carbide. HfC.

Properties: High thermal neutron absorption cross section. Very high mp 3890C (7030F). Most refractory binary substance known.

Use: Control rods in nuclear reactors.

hafnium disulfide. HfS₂. Available in a particle size of 40 microns as a solid lubricant. The diselenide and ditelluride are also available.

hafnium nitride. HfN. Yellow-brown crystals, mp 3305C, the most refractory of known metal nitrides.

hafnium oxide. (hafnia). HfO₂.

Properties: White solid. D 9.68 (20C), mp 2812C, bp approximately 5400C. Insoluble in water.

Use: Refractory metal oxide.

Hahn, Otto. (1879–1968). A German physical chemist who won the Nobel Prize for chemistry in 1944 for atom splitting and the principle of the chain reaction. Well-known for work on nuclear fission he discovered protactinium and transuranium elements with atomic numbers 94, 95, and 96. After receiving his doctorate at the University of Munich, he worked in Canada before returning to Europe.

hair. See keratin.

halazone. (*p*-*N,N*-dichlorosulfamylbenzoic acid; *p*-sulfondichloraminobenzoic acid).

CAS: 80-13-7. HOOC-C₆H₄-SO₂-NCl₂.

Properties: White crystalline powder; strong chlorine odor. Mp 195C with decomposition. Affected

by light. Soluble in glacial acetic acid, benzene; slightly soluble in water, chloroform; insoluble in petroleum ether.

Grade: NF.

Use: Water disinfectant.

half-life. The time required for an unstable element or nuclide to lose one-half of its radioactive intensity in the form of α , β , and γ radiation. It is a constant for each radioactive element or nuclide. Half-lives vary from fractions of a second for some artificially produced radioactive elements to millions of years. The half-life of ^{235}U is 7.1×10^8 years; that of ^{239}Pu is 24,360 years.

halibut liver oil. (haliver oil).

Properties: Pale-yellow to dark-red liquid; fishy odor and taste. D 0.920–0.930, saponification number 160–180, iodine number 120–136, refr index about 1.47. Soluble in alcohol, ether, chloroform, and carbon disulfide; insoluble in water.

Derivation: By expressing and boiling halibut livers.

Grade: Crude, refined.

Use: Source of vitamins A and D, leather dressing.

halides. Binary compounds of the halogens.

halite. The mineral that consists of sodium chloride (NaCl), popularly known as rock salt, or the rock that consists primarily of this mineral.

Hall, Charles Martin. (1863–1914). A native of Ohio, Hall invented a method of reducing aluminum oxide in molten cryolite by electrochemical means. This discovery made possible the large-scale production of metallic aluminum and resulted in formation of the Aluminum Company of America. The process requires high electric power input. Hall is generally considered the founder of the aluminum industry.

See Hall process.

“Hallco” [Hall]. TM for specialty esters based on acetic, lauric, and sebacic acids.

“Hallcomid” [Hall]. TM for a series of *N,N'*-dimethyl amides and esters of fatty acids.

“Hallcote” [Hall]. TM for clay containing anti-blocking coatings (slab dips) used in rubber processing.

Haller-Bauer reaction. Cleavage of nonenolizable ketones with sodium amide, most often applied to ketones ArCOCR_3 to yield trisubstituted acetic acids.

halloysite. $\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A clay used in refractories and as a catalyst support.

Hall process. The electrolytic recovery of aluminum from bauxite or, more specifically, from the

alumina extracted from it (see Bayer process). A typical cell for this process consists of a rectangular steel shell lined with insulating brick and block carbon. The cell holds a molten cryolite-alumina electrolyte, commonly called the “bath.” The carbon bottom is covered by a pad of molten aluminum and serves as the cathode. The anodes are prebacked carbon blocks suspended in the electrolyte. The cathodic current is collected from the carbon bottom by embedded steel bars that protrude through the shell to connect with the cathode bus. During electrolysis, aluminum is deposited on the metal pad, and the oxygen, liberated at the anode, reacts with the carbon to form carbon dioxide, some of which is reduced to carbon monoxide by secondary reactions. At 24–48-h intervals, aluminum is tapped from the cell by a siphon. The process requires large amounts of electric power (from 4–5% of total U.S. production). Disposition of the toxic fluoride waste is a problem.

See Toth process.

hallucinogen. Any of a number of drugs acting on the central nervous system in such a way as to cause mental disturbance, imaginary experiences, coma, and even death. Many of these are narcotics and/or alkaloids; some are derived from plants, and others are made synthetically. They differ in degree of addiction and hallucinatory effect. Their sale and possession (other than by physicians) is illegal in the U.S. The most common hallucinogens are cannabis (marijuana, hashish), lysergic acid (LSD), amphetamine, and numerous morphine derivatives.

halocarbon. A compound containing carbon, one or more halogens, and sometimes hydrogen. The lower members of the various homologous series are used as refrigerants, propellant gases, fire-extinguishing agents, and blowing agents for urethane foams. When polymerized, they yield plastics characterized by extreme chemical resistance, high electrical resistivity, and good heat resistance. See fluorocarbon.

halocarbon 112a. See 1,1,2-tetrachloro-2,2-difluoroethane.

halofuginone hydrobromide.

mf: $\text{C}_{16}\text{H}_{18}\text{Br}_2\text{ClN}_3\text{O}_3$.

Properties: Crystals.

Use: Drug (veterinary); food additive.

halogen. One of the electronegative elements of group VII A of the periodic table (fluorine, chlorine, bromine, iodine, astatine, listed in order of their activity, fluorine being the most active of all chemical elements).

halogenation. Incorporation of one of the halogen elements, usually chlorine or bromine, into a chemical compound. Thus benzene (C_6H_6) is treated with chlorine to form chlorobenzene ($\text{C}_6\text{H}_5\text{Cl}$), and

ethylene (C₂H₄) is treated with bromine to form ethylene dibromide (C₂H₄Br₂). Compounds of chlorine and bromine are sometimes used as the source of the halogen, e.g., phosphorus pentachloride.

“Halon” [Great Lakes]. TM for tetrafluoroethylene polymer.

Properties: Inertness to almost all chemicals, resistance to high and low temperatures, zero moisture absorption, high impact strength, excellent dielectric properties, nonstick surface with low coefficient of friction, self-extinguishing (ASTM D-635).

Grade: Varies with particle size as 600-, 300-, 20-micron average size.

See polytetrafluoroethylene; fluorocarbon polymer.

“Halon 1211” [Great Lakes]. (bromochlorodifluoromethane).

CAS: 353-59-3. TM for a compressed gas.

Use: Fire-extinguisher compound.

Halon 1301. See trifluorobromomethane.

halosafen. See 5-(2-chloro-6-fluoro-4-(trifluoromethyl)phenoxy)-n.

halothane. (2-bromo-2-chloro-1,1,1-trifluoroethane).

CAS: 151-67-7. CF₃CHBrCl.

Properties: Colorless, volatile liquid; sweetish odor. D 1.872–1.877 (20/4C), bp 50.2C, 20C (243 mm Hg). Light sensitive. May be stabilized with 0.01% thymol. Slightly soluble in water; miscible with many organic solvents.

Grade: USP.

Hazard: TLV: 50 ppm; not classifiable as a human carcinogen.

Use: Medicine (anesthetic).

Halowax 1051. See octachloronaphthalene.

Hamilton, Alice. (1869–1970). The first American physician to devote her life to the practice of industrial medicine. In studying the lead industries in Illinois, she discovered and ameliorated lead poisoning among bathtub enamellers in Chicago. She wrote about phossy jaw, which occurred among American matchmakers who used white or yellow phosphorus. She studied the effects of carbon monoxide among steelworkers, the toxicity of nitroglycerin among munitions makers during World War I, the symptoms of hatters exposed to mercury in Danbury, Connecticut, and the “dead fingers” syndrome of workers utilizing the early jackhammers. She also described the toxic effects to the blood-forming cells from benzol, and the neurologic and psychological responses of workers in the viscose rayon industry. In 1919, Dr. Hamilton was appointed assistant professor of industrial medicine at Harvard Medical School. The first woman on the Harvard faculty, she gave occupational medicine respectability as an academic pursuit.

Hamiltonian function. An expression of the sum of potential and kinetic energy in a system in terms of Cartesian coordinates and momenta.

hammer mill. A crushing or shredding device consisting of four or more rectangular metal hammers or sledges mounted on a rotating shaft, the hammers being free to swing on a pin. As the shaft rotates, the hammers impact the material introduced from above, crushing it against a stationary breaker plate. The fragments are carried downward and sorted by a grid located beneath the shaft; those too large to pass through it are returned for another cycle. A complete mill is made up of several such units working on a single shaft, with suitable housing. Products such as coal, limestone, and other mineral aggregates, as well as wood, sugarcane, and similar materials, can be effectively disintegrated with equipment of this type.

Hammick reaction. Decarboxylation of α-picolinic or related acids in the presence of carbonyl compounds accompanied by the formation of a new carbon-carbon bond.

Hammond-Leffler postulate. States that the structure of the transition state more closely resembles the product or the starting material, depending on which is higher in enthalpy.

“Hampamide” [Grace]. TM for mixtures of mono-, di-, and triamides of nitrailotriacetic acid in solution of dry salt form.

“Hamp-ene” [Grace]. TM for chemical compositions comprising amino acid or carbohydrate chelating or sequestering agents or compositions containing such sequestering agents.

Available forms: Bulk and package.

“Hamp-Ex” [Grace]. TM for chemical compositions comprising amino acid or carbohydrate chelating or sequestering agents or compositions containing such sequestering agents.

Available forms: Bulk and package form.

“Hampirex” [Grace]. TM for chelated micro-nutrients.

“Hamp-Iron” [Grace]. TM for iron chelates for agricultural purposes.

“Hamp-OI” [Grace]. TM for chemical compositions comprising amino acid or carbohydrate chelating or sequestering agents or compositions containing such sequestering agents.

Available forms: Bulk and package form.

“Hamposyl” [Grace]. TM for chemically modified fatty acids.

“Hampshire” [Grace]. TM for chemical products, namely, amino acids, chelating agents, metal chelates, surfactants, sequestering agents, and resins.

“Hamp-Tex” [Grace]. TM for chelating agent for textile applications.

hand. (handle). A term used chiefly in the textile industry to describe a fabric in a qualitative manner, as determined by the sensory perception of its feeling. It is also used to some extent in the leather industry. Such pragmatic physical-perception tests are of great practical value, although the properties being ascertained are often not objectively definable.

See texture.

handedness. See asymmetry; enantiomer; chiral.

“Hansa” [BASF]. TM for a group of yellow to orange, insoluble azo pigments based on toluidine and β -naphthol. Have good light fastness in deep shades but tend to fade in pastels. Notably poor resistance to bleeding, good weather resistance, and relatively unaffected by acids and alkalis. Used chiefly in emulsion paints, toy enamels, and other applications.

Hantach pyrrole synthesis. Formation of pyrrole derivatives from α -chloromethyl ketone, β -keto esters, and ammonia or amines.

Hantzsch pyridine synthesis. Synthesis of alkylpyridines by condensation of two moles of a β -dicarbonyl compound with one mole of an aldehyde in the presence of ammonia. The resulting dihydropyridine is dehydrogenated with an oxidizing agent.

Hanus reagent. Reagent consisting of 20% iodine monobromide in glacial acetic acid.

Use: Determination of iodine values.

haploid. A single set of chromosomes (half the full set of genetic material), present in the egg and sperm cells of animals and in the egg and pollen cells of plants. Human beings have 23 chromosomes in their reproductive cells.

See: Diploid.

haploid-diploid life cycle. Occurs when a multicellular diploid phase, or sporophyte, alternates with a multicellular haploid phase, or gametophyte. Only plants and certain algae possess this kind of life cycle, which is also called “alternation of generations”.

haploid life cycle. Occurs when the only multicellular stage in an organism’s life cycle is haploid.

haplotype. A way of denoting the collective genotype of a number of closely linked loci on a chromosome.

haptoglobin. A serum protein which binds free hemoglobin for transport to the liver for destruction.

“Harborlite” [World Minerals]. TM for perlite minerals and mineral substances.

Use: Filtration for industry, agriculture, horticulture, and forestry applications.

hard. A nontechnical word, used by chemists, that has a variety of meanings. It describes the following:

(1) Water in which calcium carbonate or calcium sulfate is present.

See water, hard.

(2) An acid having high positive oxidation and whose valence electrons are not readily excited.

See acid.

(3) Extremely short-wave radiation, e.g., hard X rays.

(4) The resistance of a pesticide or detergent to biodegradation.

(5) Rubber cured with 30% or more of sulfur. See rubber, hard.

(6) Wood from deciduous trees. See hardwood; hardness.

Harden, Sir Arthur. (1865–1940). An English chemist who won the Nobel Prize in chemistry in 1929 along with Hans von-Euler-Chelpin. He discovered fermentation enzymes and demonstrated the structure of zymase. His fermentation work proved how inorganic phosphates speeded the process. Born in England, he received his doctorate in Germany.

hardness. The resistance of a material to deformation of an indenter of specific size and shape under a known load. This definition applies to all types of hardness scales except the Mohs scale, which is based on the concept of scratch hardness and is used chiefly for minerals. The most generally used hardness scales are Brinell (for cast iron), Rockwell (for sheet metal and heat-treated steel), diamond pyramid, Knoop, and scleroscope (for metals). Durometer hardness is used for materials such as rubber and plastics.

hardwood. In papermaking terminology, the wood from deciduous trees (maple, oak, birch), regardless of whether it is actually hard or soft.

Use: Components of paper pulp, but in much lower volume than softwoods.

Hardy-Weinberg Law. The concept that both gene frequencies and genotype frequencies will remain constant from generation to generation in an infinitely large, interbreeding population in which mating is at random and there is no selection, migration or mutation.

“**Hard Water/Acid Tolerant Synthetic Lube**” [*Ace*]. TM for a conveyor lubricant.

Hargreaves process. The manufacture of sodium sulfate (salt cake) from sodium chloride and sulfur dioxide. A mixture of sulfur dioxide and air is passed over briquettes of sodium chloride in a countercurrent manner to produce sodium sulfate and hydrogen chloride. This process accounts for only a small amount of the salt cake produced in the U.S.

Harries ozonide reaction. Treatment of olefins with ozone as a method of cleaving olefinic linkages. On hydrolysis or catalytic hydrogenation, the initially formed ozonide yields two molecules of carbonyl compounds.

“**Hartex**” [*Firestone*]. TM for natural rubber latex.

Use: Dipped goods and adhesives.

hartshorn. See ammonium carbonate.

hartshorn oil. See bone oil.

HAS. Abbreviation for hydroxylamine acid sulfate.

hashish. Extract of cannabis (marijuana), more concentrated and thus more powerful than the base drug.
See cannabis.

Hass chlorination rules. A series of rules pertaining to the chlorination of saturated hydrocarbons.

Hassel, Odd. (1897–1981). A Norwegian chemist who won the Nobel Prize for chemistry in 1969 with Barton. A great deal of his work was concerned with using X ray and electron differentiation methods of crystal and molecular structures. He also researched stereochemistry and conformational analysis. His education and teaching career were in his homeland.

hassium. Hs. A transfermium element. Atomic number 108. Very short half-life.

Hass vapor-phase nitrogen. Production of nitroparaffins by vapor phase reaction of aliphatic hydrocarbons with gaseous nitric acid at 420C; a series of thirteen rules governing these reactions.

“**Hastelloy**” [*Haynes*]. TM for a family of high-strength, nickel-based alloys with a high resistance to uniform corrosion, outstanding resistance to localized attack, and excellent stress corrosion cracking resistance while maintaining ease of welding and fabrication.

Available forms: Sheet, plate, bars, rods, welding electrodes, and wire.

Use: Fabrication into all types of process equipment.

Hauptman, Herbert A. (1917–). An American biophysicist who won the Nobel Prize for chemistry in 1985 along with Karle. Work involved developing equations that allow determination of phase information from X ray crystallography intensity patterns. The use of computers permitted use of the equations to determine the conformation of thousands of chemicals. Hauptman was director of research and vice president of the Medical Foundation of Buffalo and a professor of biophysics in Buffalo at the State University of New York.

“**Haveg**” [*Ametek*]. TM for a series of molding compounds fabricated into corrosive-resistant chemical process equipment. Composites of various synthetic polymers with silicate fillers.

Use: Tanks, towers, scrubbers, agitators, piping, etc. in the handling of sulfuric, hydrochloric, and phosphoric acids and chlorinated solvents. Also used as ablative products to protect metal surfaces from heat of launching missiles.

“**Havelast**” [*Ametek*]. TM for an elastomeric binder or impregnant for various reinforcing materials such as “Siltemp,” as fabric or rovings, asbestos, glass, or graphite.

Use: Rocket and missile industry when resiliency is desired.

Haworth methylation. Formation of methylated methyl glycosides from monosaccharides with dimethyl sulfate and 30% sodium hydroxide. The glycosidic methyl group is hydrolyzed with acid to yield the free methylated sugar.

Haworth perspective formulas. A method for representing cyclic chemical structures (sugars) in order to define the configuration around each chiral center.

Haworth phenanthrene synthesis. Acylation of aromatic compounds with aliphatic dibasic acid anhydrides to β -aroylpropionic acids, reduction of the carbonyl group according to Clemmensen or Wolff-Kishner procedures, cyclization of the γ -arylbutyric acid with 85% sulfuric acid, and conversion of the cyclic ketone to polycyclic hydroaromatic and subsequently to aromatic compounds.

Haworth, Sir Walter N. (1883–1950). An English chemist who received the Nobel Prize in chemistry in 1937 along with Paul Karrer. He recommended the name *ascorbic acid* and synthesized vitamin C. He accomplished much work on carbohydrate structure and developed a substitute for blood plasma using carbohydrates. During World War II, he developed gaseous diffusion separation on uranium isotopes. He received his Ph.D. in Manchester.

Hayashi rearrangement. Rearrangement of α -benzoylbenzoic acids in the presence of sulfuric acid or phosphorus pentoxide.

“Haynes” [Haynes]. TM for a series of high-temperature nickel and cobalt-based alloys designed to resist high-temperature corrosion processes up to 2200° F. Engineered to provide high temperature strength, resistance to creep, oxidation and sulfidation resistance while maintaining ease of welding and fabrication.

Available forms: Sheet, plate, bars, rods, welding electrodes, and wire.

Use: Fabrication into all types of process equipment.

“Haystellite” [Cabot]. TM for tungsten carbide products, principally in the form of hard-surfacing rods for protecting parts from severe abrasion.

hazardous material. Any material or substance that in normal use can be damaging to the health and well-being of humans. Such materials cover a broad range of types that may be classified as follows: (1) Toxic agents (see poison; toxicity) including drugs, chemicals, and natural or synthetic products that in normal use are in any way harmful, ranging from poisons to skin irritants and allergens. When improperly used, all materials can be hazardous to humans.

(2) Corrosive chemicals such as sodium hydroxide or sulfuric acid that destroy or otherwise damage the skin and mucous membranes on external contact or inhalation.

(3) Flammable materials including (a) organic solvents, (b) finely divided metals or powders, (c) some classes of fibers, textiles, or plastics, and (d) chemicals that either evolve or absorb oxygen during storage, thus constituting a fire risk in contact with organic materials.

(4) Explosives and strong oxidizers such as peroxides and nitrates.

(5) Materials in which dangerous heat buildup occurs on storage, either by oxidation or microbiological action. Examples are fish meal, wet cellulosics, and other organic waste materials.

(6) Radioactive chemicals that emit ionizing radiation. Packaging, labeling, and shipping of hazardous materials by rail, highway, water, and air are regulated in the U.S. by the Department of Transportation (DOT). In general, its regulations for air shipment follow those of the International Air Transport Association (IATA), though there are numerous points of difference.

An authoritative guide to the safety labeling of hazardous materials and products is issued by the American National Standards Institute. See toxicity; flammable material; label.

hazardous waste. See chemical waste; radioactive waste.

Hb. Abbreviation for hemoglobin.

HCCH. Abbreviation for hexachlorocyclohexane.

HCE. See epoxyheptachlor.

HCG. Abbreviation for human chorionic gonadotropin.

“HCR” [Dow]. TM applied to ion-exchange resin used in water-treating and chemical process applications; strong acid cation-exchange resin, 8% divinylbenzene cross-linked.

HDPE. Abbreviation for high-density polyethylene.

He. Symbol for helium.

HEA. Abbreviation for 2-hydroxyethyl acrylate.

head box. A large container, holding the prepared slurry of paper pulp and additives, located at the head of the fourdrinier machine; the slurry is fed continuously from slots in the bottom of the box to the wire on which the sheet is formed.

head space. A term used in the canning industry to refer to the space intentionally left between the top of the filled liquid and the cover of the can to allow for expansion of the contents during heat processing.

“Healthya Water” [Kao]. TM for first sport drink approved as a food for specific health use.

heat. A form of energy associated with and proportional to molecular motion. It can be transferred from one body to another by radiation, conduction, or convection; unlike latent heat, sensible heat is accompanied by a change in temperature.

—*of combustion:* The heat evolved when a definite quantity of a substance is completely oxidized (burned).

—*of crystallization:* The heat evolved or absorbed when a crystal forms from a saturated solution of a substance;

—*of dilution:* The heat evolved per mole of solute when a solution is diluted from one specific concentration to another.

—*of formation:* The heat evolved or absorbed when a compound is formed in its standard state from elements in their standard states at a specified temperature and pressure.

—*of fusion:* The heat required to convert a substance from the solid to the liquid state with no temperature change (also called latent heat of fusion or melting).

—*of hydration:* The heat associated with the hydration or solvation of ions in solution; also the heat evolved or absorbed when a hydrate of a compound is formed.

—*of reaction*: The heat evolved or absorbed when a chemical reaction occurs in which the final state of the system is brought to the same temperature and pressure as that of the initial state of the reacting system.

—*of solution*: The heat evolved or absorbed when a substance is dissolved in a solvent.

—*of sublimation*: The heat required to convert a unit mass of a substance from the solid to the vapor state (sublimation) at a specified temperature and pressure without the appearance of the liquid state.

—*of transition*: The heat evolved or absorbed when a unit mass of a given substance is converted from one crystalline form to another.

—*of vaporization*: The heat required to convert a substance from the liquid to the gaseous state with no temperature change (also called latent heat of vaporization).

heat exchanger. A vessel in which an outgoing hot liquid or vapor transfers a large part of its heat to an incoming cool liquid; in the case of vapors, the latent heat of condensation is thus utilized to heat the entering liquid. The shell-and-tube type is widely used; here the hot liquid or vapor is contained in the shell while the cool liquid passes through the tubes, which are usually arranged in coils for maximum contact with the heat source. Heat exchangers are used in many chemical operations, e.g., evaporation and pulp manufacture, as well as to produce steam from the heat developed in nuclear reactors for power generation.

See evaporation; heat transfer.

heat transfer. Transmission of thermal energy from one location to another by means of a temperature gradient existing between the two locations. It may take place by conduction, convection, or radiation. Heat transfer is involved in many types of industrial operations, including distillation, evaporation, canning of foods, baking, curing, etc. In some cases, a heat exchanger is utilized. Fluids of high heat capacity are widely used to remove unwanted heat or to transfer it from one place to another within a system; examples are air, water, ethylene glycol. See coolant.

heavy. A nontechnical word used in a number of scientific senses: (1) referring to atomic weight (heavy water, heavy metal); (2) referring to production volume (heavy chemical); (3) referring to physical weight (heavy spar); (4) referring to thickness (heavy-gauge wire); (5) referring to distillation range (heavy oil).

heavy chemicals. A chemical produced in tonnage quantities, often in a relatively impure state. Examples are sodium chloride, sulfuric acid, soda ash, salt cake, sodium hydroxide, etc. See basic chemicals; fine chemical.

heavy hydrogen. See deuterium; tritium.

heavy metal. A metal of atomic weight greater than sodium (23) that forms soaps on reaction with fatty acids, e.g., aluminum, lead, cobalt. See soap (2).

heavy oil. An oil distilled from coal tar between 230C and 330C, the exact range not at all definite. See coal tar.

heavy oxygen. See oxygen-18.

heavy spar. See barite.

heavy water. (deuterium oxide; DOD; tritium oxide; TOT). Water composed of two atoms of deuterium and one atom of oxygen; or one or two atoms of tritium and one of oxygen. In lower states of purity, the proportion of heavy water molecules decreases. Deuterium oxide is present to the extent of approximately one part in 6500 of ordinary water. Deuterium oxide freezes at 3.8C, boils at 101.4C, and has density of 1.1056 at (25C).

Derivation: There are several methods of separating or concentrating DOD: (1) fractional distillation, (2) Girdler-Spevack process, (3) hydrogen-sulfide exchange process, (4) electrolysis, (5) cryogenic methane distillation.

Available forms: DOD 99.75% pure, in up to 5000 g lots.

Use: Moderator in some types of nuclear reactors. Tritium (hydrogen of atomic weight 3) combines with oxygen to give another variety of heavy water, TOT, i.e., tritium oxide.

See tritium.

HEBP. See 2-hydroxyethyl dibutyl phosphate.

hecto-. (h). Prefix meaning 10^2 units, e.g., 1 hg = 1 hectogram = 100 grams.

hectorite. (hector clay). $\text{Na}_{0.67}(\text{Mg},\text{Li})_6\text{Si}_8\text{O}_{20}(\text{OH},\text{F})_4$. One of the montmorillonite group of minerals that are principal constituents of bentonite.

Hazard: Respiratory irritant.

Use: Chill-proofing of beer.

hedeoma oil. See pennyroyal oil.

hedonal. (methylpropylcarbinolurethane). CAS: 120-36-5. $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{OCONH}_2$. **Properties:** White, crystalline powder; faint aromatic odor and taste. Fusing p 76C, bp 215C. Soluble in alcohol, ether, organic solvents; sparingly soluble in cold water; more soluble in hot water.

Use: Medicine (sedative).

α -hederine.

CAS: 27013-91-8. mf: $\text{C}_{41}\text{H}_{66}\text{O}_{12}$.

Hazard: Low toxicity by ingestion.

HEDTA. See hydroxyethylethylenediaminetriacetic acid.

HEED. Abbreviation for high-energy electron diffraction.

Heeger, Alan J. (1923–). Awarded Nobel Prize in chemistry in 2000 jointly with Alan G. MacDiarmid and Hideki Shirakawa for the discovery and development of conductive polymers. He performs his research at Texas Instruments, Dallas, Texas.

Hehner number. The percentage of weight of water-insoluble fatty acids in oils and fats.

Heisenberg, Werner P. (1901–1976). A native of Germany, Heisenberg received his doctorate from the University of Munich in 1923, after which he was closely associated for several years with Niels Bohr in Copenhagen. He was awarded the Nobel Prize in physics in 1932 for his brilliant work in quantum mechanics. In 1946, he became director of the Max Planck Institute. His notable contributions to theoretical physics, best known of which was the uncertainty principle, imparted new impetus to nuclear physics and made possible a better understanding of atomic structure and chemical bonding. See uncertainty principle.

helenine. A nucleoprotein derived from the mold *Penicillium funiculosum*.
Use: An antiviral drug.

Helferich method. Glycosidation of an acetylated sugar by heating with a phenol in the presence of zinc chloride or *p*-toluenesulfonic acid as catalyst.

Helianthine B. See methyl orange.

helicase. An enzyme that catalyzes the unwinding of strands in a DNA molecule before replication.

“Helindon” [BASF]. TM for vat dyestuffs used for dyeing wool.

“Heliogen” [BASF]. TM for phthalocyanine dyestuffs.
Use: Paint, lacquers, printing inks, wallpaper, coated paper, rubber, and plastics.

“Helisorb” [Norquay]. TM for UV stabilizer.
Properties: Free-flowing nonhazardous powder.
Use: An effective UV stabilizer for UVA and UVB protection in low concentrations for cosmetics and plastics.

“He-Li-Ox” 500 Series [Mallinckrodt].
TM for a series of PVC heat stabilizers for extruding, injection molding, calendaring, and blow mold-

ing. All ingredients conform to FDA requirements for food packaging.

“Heliozone” [Du Pont]. TM for a blend of waxy material.
Use: Retards sun-checking and cracking of rubbers.

helium.

CAS: 7440-59-7. He. Noble element of atomic number 2, first element in the noble gas group of the periodic table, aw 4.00260, valence of 0. Helium nuclei are alpha particles. Most important isotope is helium-3.

Properties: Colorless, noncombustible gas; odorless and tasteless. Liquefies at 4.2K to form helium I; at 2.2K there is a transition (λ) point at which helium II is formed. See note below.

Properties: Bp -268.9C (1 atm), fp -272.2C (25 atm) lowest of any substance, bulk d 0.1785 g/L (0C). Very slightly soluble in water; insoluble in alcohol; rate of diffusion through solids is three times that of air; an asphyxiant gas.

See noble gas.

Occurrence: Texas, Oklahoma, Kansas, New Mexico, Arizona, Canada. Originally discovered in the sun's atmosphere (1868) and confirmed in the atmosphere of Jupiter.

Derivation: From natural gas, by liquefaction of all other components, followed by purification over activated charcoal.

Grade: USP, technical, 99.995% pure.

Use: To pressurize rocket fuels, welding, inert atmosphere (growing germanium and silicon crystals), inflation of weather and research balloons, heat-transfer medium, leak detection, chromatography, cryogenic research, magnetohydrodynamics, luminous signs, geological dating, aerodynamic research, lasers, diving and space-vehicle breathing equipment. Possible future uses include coolant for nuclear fusion power plants and in superconducting electric systems.

Note: Liquid helium has unique thermodynamic properties too complex to be adequately described here. Liquid He I has refr index 1.026, d 0.125, and is called a “quantum fluid” because it exhibits atomic properties on a macroscopic scale. Its bp is near absolute zero and viscosity is 25 micropoises (water = 10,000). He II, formed on cooling He I below its transition point, has the unusual property of superfluidity, extremely high thermal conductivity, and viscosity approaching zero.
See superconductivity.

helix-loop-helix. A protein structural motif characteristic of certain DNA-binding proteins.

hellebrigenin 3-acetate.

CAS: 4064-09-9. mf: $\text{C}_{26}\text{H}_{34}\text{O}_7$.

Hazard: A poison.

Source: Natural product.

Hell-Volhard-Zelinsky reaction. α -Halogenation of carboxylic acids with halogen and phosphorus, presumably involving the enol form of the intermediate acyl halide.

17- α -helveticoside.

CAS: 6869-17-6. mf: $C_{29}H_{42}O_9$.

Hazard: A poison.

Source: Natural product.

hem-. Prefix indicating relationship to blood.

HEMA. See hydroxyethyl methacrylate.

hema-. Prefix indicating relationship to blood.

hematein.

CAS: 475-25-2. $C_{16}H_{12}O_6$. A tetracyclic compound. An oxidation product of hematoxylin, the coloring principle of logwood. Not to be confused with hematin.

Properties: Dark-purple solid. Mp 200+C. Almost insoluble in water, slightly soluble in alcohol and ether; soluble in dilute sodium hydroxide, giving a bright-red color; soluble in ammonia with brownish-violet color.

Derivation: By adding ammonia to logwood extract and exposing to air.

Use: Indicator, biological stain.

hematin. $C_{34}H_{32}N_4O_4FeOH$. The hydroxide of heme. Not to be confused with hematein.

Properties: Blue to brown-black powder. Decomposes at 200C without melting. Soluble in alkalis, hot alcohol, or ammonia; slightly soluble in hot pyridine; insoluble in water, ether, and chloroform.

Derivation: By dissolving hemin in dilute potassium hydroxide, precipitating with acetic acid, and recrystallizing from pyridine.

Use: Biochemical research.

hematite, red. (red iron ore; bloodstone; iron oxide).

CAS: 1317-60-8. Fe_2O_3 with impurities.

Properties: Brilliant black to blackish-red or brick-red mineral with brown to cherry-red streak and metallic to dull luster. D 4.9–5.3, Mohs hardness 6. Noncombustible.

Hazard: A carcinogen (OSHA).

Use: The most important ore of iron. Also certain varieties are used as paint pigments and for rouge. See iron oxide reds; ferric oxide.

hemato-. Prefix indicating relationship to blood.

hematoporphyrin.

CAS: 14459-29-1. $C_{34}H_{38}O_6N_4$. Deep-red crystals; soluble in alcohol, sparingly soluble in ether; insoluble in water.

Derivation: Obtained from hemin or hematin by the action of strong acids.

Hazard: Toxic. Reported to be preferentially ab-

sorbed by cancerous tissues, making them fluoresce under UV light.

Use: Medicine (antidepressant).

hematoxylin.

CAS: 517-28-2. $C_{16}H_{14}O_6 \bullet 3H_2O$.

Properties: Slightly yellow crystals, turning red in light. Mp 100–120C. Soluble in hot water and alcohol, in glycerol, and in alkali hydroxides.

Hazard: May be carcinogenic.

Use: Colorant in inks, biological stains.

heme. (hem). $C_{34}H_{32}FeN_4O_4$. The nonprotein portion of hemoglobin and myoglobin, consisting of reduced (ferrous) iron bound to protoporphyrin. See porphyrin hemin.

Use: Medical and biochemical research.

hemel. (generic name for hexamethylmelamine; HMM). $C_3N_3[N(CH_3)_2]_3$ (cyclic).

Properties: Solid. Insoluble in water; soluble in acetone.

Use: Chemosterilant for insects.

hemellitic acid. (2,3-xylic acid).

$C_6H_3(CH_3)_2COOH$.

Properties: Mp 144C.

hemi-. Prefix meaning half.

hemicellulose. Cellulose having a degree of polymerization of 150 or less. A collective term for α and γ cellulose. It is that portion of holocellulose that is soluble in mild caustic solution. The pure form is obtained from corn grain hulls. It is not an important component of cellulosic products and is of chiefly theoretical interest. Hemicellulose obtained by treating a mixture of hard and softwoods with steam has been used as an animal feed supplement.

hemicholinium.

CAS: 16478-59-4. mf: $C_{24}H_{34}N_2O_4$.

Hazard: A poison by ingestion.

hemiketal. Organic compound formed by the reaction of one molecule of ketone ($RR'CO$) with one molecule of alcohol ($R''CO$). Hemiketals are the rings of ketose sugars.

See ketals.

hemimellitene. (1,2,3-trimethylbenzene).

$C_6H_3(CH_3)_3$.

Properties: Liquid. D 0.8944 (20/4C), fp –25.5C, bp 176C. Insoluble in water; soluble in alcohol. Occurs in some petroleum.

Hazard: Combustible. TLV: 25 ppm.

Use: Raw material for chemical synthesis.

hemin. (Teichmann's crystals; the chloride of heme). $C_{34}H_{32}N_4O_4FeCl$.

Properties: Crystals that are brown by transmitted light and steel blue by reflected light. Sinters at 240C. Freely soluble in ammonia water; soluble in strong organic bases; insoluble in carbonate solutions, dilute acid solutions; insoluble but stable in water.

Derivation: By heating hemoglobin with acetic acid and sodium chloride.

Use: Identification of blood stains, biochemical research, complexing agent. See chelate.

hemizygous. Having only one copy of a particular gene. For example, in humans, males are hemizygous for genes found on the Y chromosome.

hemo-. (haemo-, hem-, hema-, hemato-). Prefix indicating relationship to blood.

hemoglobin. (Hb). The respiratory protein of the red blood cells, it transfers oxygen from the lungs to the tissues and carbon dioxide from the tissues to the lungs. Its affinity for carbon monoxide is greater than 200 times that for oxygen. Hemoglobin is a conjugated protein of molecular weight 65,000, consisting of approximately 94% globin (protein portion) and 6% heme. Each molecule can combine with one molecule of oxygen to form oxyhemoglobin (HbO₂). The iron (in the heme portion) must be in the reduced (ferrous) state to enable the hemoglobin to combine with oxygen. Oxyhemoglobin is available commercially as a brownish-red powder or crystals, soluble in water.

Use: Medicine, usually called hemoglobin.

hemp. Soft, white fibers 3–6 ft long. It is coarser than flax but stronger, more glossy, and more durable than cotton. Obtained from the stems of *Cannabis sativa*.

Source: Central Asia, Italy, the former U.S.S.R., India, U.S.

Hazard: Combustible. May ignite spontaneously when wet.

Use: Blended with cotton or flax in toweling and heavy fabrics, twine, cordage, packing.

See cannabis.

hempa. (generic name for hexamethylphosphoric triamide; hexamethylphosphoramide; HMPA; hexametapal).

CAS: 680-31-9. [N(CH₃)₂]₃PO.

Properties: Water-white liquid; mild amine odor. Bp 230–232C (739.4 mm Hg), d 1.021 (15.5/15.5C). Soluble in water and polar and nonpolar solvents.

Hazard: TLV: animal carcinogen. Toxic by skin contact. Combustible.

Use: UV inhibitor in polyvinyl chloride, chemosterilant for insects, promoting stereospecific reactions, specialty solvent.

hempseed oil.

Properties: A drying oil similar in properties and uses to linseed. Edible, iodine value approximately 160, d 0.923, refr index 1.470–1.472. Contains approximately 10% saturated fatty acids (palmitic and stearic), unsaturated acids present are linoleic, linolenic, and oleic. Saponification value 190–193.

Source: Produced chiefly in the former U.S.S.R., southern Europe, Japan, Chile, little in U.S.

Hazard: Combustible.

henda- compounds. See unde-.

Henderson-Hasselbalch equation. An equation relating the pH, the pKa, and the ratio of the concentrations of the proton-acceptor (A-) and proton-donor (HA) species in a solution.

n-heneicosanoic acid. CH₃(CH₂)₁₉COOH. A saturated fatty acid not normally found in natural fats or waxes.

Properties: White, crystalline solid. Mp 74.3C. Synthetic product available for organic synthesis, 99% purity.

Hazard: Combustible.

(z)-6-1-heneicosen-11-one.

CAS: 54844-65-4. mf: C₂₁H₄₀O.

Hazard: Low toxicity by ingestion and skin contact.

Source: Natural product.

henequen.

Properties: Hard, strong, reddish fibers obtained from the leaves of *Agave fourcroydes*. It is similar to sisal but coarser and stiffer.

Available forms: Denier ranges from 300 to 500.

Source: Mexico, Cuba.

Hazard: Combustible.

Use: Binder twine, cordage.

Henkel reaction. Industrial-scale thermal rearrangement or disproportionation of alkaline salts of aromatic acids to symmetrical diacids in the presence of cadmium or other metallic salts.

henna. A coloring principle obtained from dried leaves of certain tropical plants (North Africa, India).

Use: Commercial hair-dyeing preparations to give a yellow-red color; medicine as an antifungal agent.

“**Hennig Purifier**” [PPG]. TM for a preparation having a soda-ash base and other materials. Produced as walnut-sized briquettes. Packed in 100-lb paper bags.

Use: Ladle addition to produce cleaner steel by aiding in removal of dissolved oxides and silicates and fluxing nonmetallic inclusions to slag.

Henry reaction. Formation of nitroalcohols by an aldol-type condensation of nitroparaffins with aldehydes in the presence of base (Henry) or by the condensation of sodium salts of acinitroparaffins with the sodium bisulfite addition products of aldehydes in the presence of a trace of alkali or weak acid (Kamlet). Widely used in sugar chemistry.

Henry’s law. When a liquid and a gas are in contact, the mass of the gas that dissolves in a given quantity of liquid is proportional to the pressure of the gas above the liquid. Thus, if air is kept in contact with water at standard atmospheric pressure, each kg of water dissolves 0.017 g oxygen at 20C; if this pressure is halved (by doing the experiment at high altitude where the pressure is only 0.5 atm), the water dissolves only 0.0085 g oxygen. The law holds true only for equilibrium conditions, i.e., when enough time has elapsed so that the quantity of gas dissolved is no longer changing.

hentriacontane. $C_{31}H_{64}$ or $CH_3(CH_2)_{29}CH_3$.
Properties: Crystals. D 0.781 (68C), bp 302C (15 mm Hg), mp 68C.
Hazard: Combustible.

HEOD. See dieldrin.

heparin.
 CAS: 9005-49-6. A complex organic acid (mucopolysaccharide) present in mammalian tissues; a strong inhibitor of blood coagulation; a dextrorotatory polysaccharide built up from hexosamine and hexuronic acid units containing sulfuric acid ester groups. Precise chemical formula and structure uncertain; a formula of $(C_{12}H_{16}NS_2Na_3)_{20}$ and molecular weight of 12,000 have been suggested for sodium heparinate.

Properties: White or pale-colored amorphous powder; nearly odorless; hygroscopic. Soluble in water; insoluble in alcohol, benzene, acetone, chloroform, and ether; pH in 1% solution between 5.0 and 7.5.

Derivation: Animal livers or lungs.

Grade: USP.

Hazard: May cause internal bleeding.

Use: Medicine (anticoagulant), biochemical research, rodenticides.

hepasythyl.
 CAS: 5634-42-4. mf: $C_{19}H_{26}O_4 \bullet C_4H_{11}NO_2$.
Hazard: Moderately toxic by ingestion.

hepatocyte. The major cell type of liver tissue, which is parenchymal tissue. Liver also contains fixed macrophages called Kupfer cells and other cells.

hepatoxane. See hepasynthyl.

“**Hepsera Tabs**” [Lapgap]. TM for tablets.
Use: For antiviral treatment of chronic hepatitis B.

heptabarbital. (5-[1-cyclohepten-1-yl]-5-ethylbarbituric acid; 5-ethyl-5-cycloheptenylbarbituric acid).

CAS: 509-86-4. $C_{13}H_{18}N_2O_3$.

Properties: White, crystalline powder; odorless; slightly bitter taste. Mp 174C. Very sparingly soluble in water; slightly soluble in alcohol; soluble in alkaline solutions. Forms water-soluble sodium, magnesium, and calcium salts.

Use: Medicine (sedative).

See barbiturate.

heptachlor. (generic name for 1, 4, 5, 6, 7, 8, 8-heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene. Generic).

CAS: 76-44-8. $C_{10}H_6Cl_7$.

Properties: White to light-tan, waxy solid. Mp 95–96C, d 1.57–1.59. Insoluble in water; soluble in xylene and alcohol.

Hazard: Toxic by ingestion, inhalation, and skin absorption; use has been restricted and discontinued except for termite control. TLV: 0.5 mg/m³; animal carcinogen.

Use: Insecticide.

heptachlorepoide. $C_{10}H_9Cl_7O$. A degradation product of heptachlor that also acts as an insecticide. See epoxyheptachlor.

heptachlorotetrahydromethanoindene.
 See heptachlor.

n-heptacosane. $CH_3(CH_2)_{25}CH_3$.
Properties: Crystals. D 0.804, bp 270C (15 mm Hg), mp 59.5C. Soluble in alcohol; insoluble in water.
Hazard: Combustible.

n-heptadecane. $C_{17}H_{36}$ or $CH_3(CH_2)_{15}CH_3$.
Properties: Leaflets, soluble in alcohol. D 0.778, bp 303C, mp 22.5C. Insoluble in water.
Hazard: Combustible.

n-heptadecanoic acid. (margaric acid).
 CAS: 506-12-7. $CH_3(CH_2)_{15}COOH$. A saturated fatty acid not normally found in natural fats or waxes.
Properties: Colorless crystals. Mp 61C, d 0.8355 (90.6/4C), bp 363.8C, 230.7C (16 mm Hg), refr index 1.4324 (70C). Soluble in alcohol and ether; insoluble in water.

Available forms: 99% pure synthetic product.

Use: Organic synthesis.

heptadecanol. Any saturated C₁₇ alcohol.

Hazard: Combustible.

See *n*-heptadecanol; 3,9-diethyl-6-tridecanol.

***n*-heptadecanol.** C₁₇H₃₅OH.

Properties: Colorless liquid. D 0.8475 (20/20C), bp 308.5C, vap press <0.01 mm Hg (20C), flash p 310F (154C), bulk d 7.1 lb/gal (20C). Slightly soluble in water.

Grade: Technical.

Hazard: Combustible.

Use: Organic synthesis, plasticizer, intermediates, perfume fixatives, soaps and cosmetics, manufacture of wetting agents and detergents.

2-(8-heptadecenyl)-2-imidazoline-1-ethanol.

See amine 220.

2-heptadecylglyoxalidine. (2-heptadecylimidazoline). C₂₀H₄₀N₂ or C₁₇H₃₅C₃H₃N₂.

Properties: Waxy solid. Mp 85C, bp 200C (2 mm Hg). Slightly soluble in water; soluble in alcohol, benzene; hydrolyzes on standing to form *N*-2-aminoethyl stearamide.

Derivation: By reacting stearic acid with ethylene diamine.

Hazard: Combustible.

Use: Fungicide.

2-heptadecylglyoxalidine acetate. See glyodin.

2-heptadecylimidazoline. See 2-heptadecylglyoxalidine.

2-heptadecyl-2-imidazoline acetate. See glyodin.

heptafluorobutyric acid. (perfluorobutyric acid). C₃F₇COOH.

Properties: Colorless, hygroscopic liquid with sharp odor. Bp 120C (735 mm Hg), fp -17.5C, d 1.641 (25C), refr index 1.290 (25C), surface tension 15.8 dynes/cm (30C). Miscible with water, acetone, ether, and petroleum ether; soluble in benzene and carbon tetrachloride; insoluble in carbon disulfide and mineral oil.

Derivation: By electrolysis of a solution of butyric acid in hydrogen fluoride.

Hazard: Irritant to tissue.

Use: Intermediate, surfactant, acidulant.

γ-heptalactone.

CAS: 105-21-5. mf: C₇H₁₂O₂.

Properties: Colorless, sltly oily liquid; coconut, sweet, malty, caramel odor. D: 0.997-1.004 @ 20°, refr index: 1.439-1.445. Misc in alc, fixed oils; very sltly sol in water.

Hazard: A skin irritant.

Use: Food additive.

heptaldehyde. See heptanal.

heptalin acetate. See methylcyclohexanol acetate.

heptamethylene. See cycloheptane.

heptamethylnonane. C₁₆H₃₄. Isomer of cetane (hexadecane). In 1964 it replaced α-methylnaphthalene as ignition standard for diesel fuels.

Properties: Ignition value 15 on cetane-α-methylnaphthalene scale.

Hazard: Flammable, moderate fire risk.

heptanal. (heptaldehyde; enanthaldehyde; aldehyde C-7).

CAS: 111-71-7. C₆H₁₃CHO.

Properties: Oily, colorless liquid; penetrating, fruity odor; hygroscopic. D 0.814-0.819, refr index 1.42, mp 43C, bp 153C. Soluble in three volumes of 60% alcohol, slightly soluble in water. Soluble in ether.

Derivation: Castor oil, from decomposition of the ricinoleic acid glyceride.

Hazard: Combustible.

Use: Manufacture of 1-heptanol, organic synthesis, perfumery, pharmaceuticals, flavoring.

***n*-heptane.** (dipropylmethane).

CAS: 142-82-5. CH₃(CH₂)₅CH₃.

Properties: Volatile, colorless liquid. Fp -90.595C, bp 98.428C, refr index 1.38764 (20C), d 0.68368 (20C), flash p 25F (-3.89C) (CC). Soluble in alcohol, ether, chloroform; insoluble in water; distillation range 93.3-98.9C; vap press 2.0 psi (a)(37.7C) (max). Color Saybolt +30 (min), maximum sulfur content 0.01 wt %, corrosive passes ASTM D 130-30 test, autoign temp 433F (222C).

Derivation: Fractional distillation of petroleum, purified by rectification.

Grade: Commercial, 99%, spectro, ASTM reference fuel, research, 99.92 mole %.

Hazard: Toxic by inhalation. Flammable, dangerous fire risk. TLV: TWA 400 ppm; STEL 500 ppm.

Use: Standard for octane-rating determinations (pure normal heptane has zero octane number), anesthetic, solvent, organic synthesis, preparation of laboratory reagents.

See octane number.

1,7-heptanedicarboxylic acid. See azelaic acid.

1,7-heptanedioic acid. See pimelic acid.

***n*-heptanoic acid.** (enanthic acid; *n*-heptylic acid; heptoic acid).

CAS: 111-14-8. CH₃(CH₂)₅COOH.

Properties: Clear, oily liquid; unpleasant odor. D 0.9181 (20/4C), fp 8C, bp 221.9C, refr index 1.4229. Soluble in alcohol and ether, insoluble in water.

Derivation: By oxidizing heptanal with potassium permanganate in dilute sulfuric acid.

Hazard: Combustible.

Use: Organic synthesis, production of special lubricants for aircraft and brake fluids.

1-heptanol. See heptyl alcohol.

2-heptanol. See methyl amyl carbinol.

3-heptanol.

CAS: 589-82-2. $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{C}_4\text{H}_9$.

Properties: Liquid. D 0.8224 (20C), fp -70C , bp 156.2C , flash p 140F (60C) (CC). Slightly soluble in water.

Hazard: Toxic by ingestion. Moderate fire risk.

Use: Flotation frother, solvent and diluent in organic coatings, intermediates.

2-heptanone. See methyl-*n*-amyl ketone.

3-heptanone. See ethyl butyl ketone.

4-heptanone. See dipropyl ketone.

heptanoyl chloride. $\text{CH}_3(\text{CH}_2)_5\text{COCl}$.

Properties: Solid. Mw 148.63, bp 173C , d 0.960, fp 58C .

Hazard: Corrosive and a lachrymator.

1-heptene. (1-heptylene). $\text{CH}_3(\text{CH}_2)_4\text{CH}=\text{CH}_2$.

Properties: Colorless liquid. D 0.6968 (20/4C), bp 93.3C , fp -10C , flash p 32F (0C), refr index 1.3994 (20C). Soluble in alcohol, acetone, ether, petroleum and coal tar solvents; insoluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

2-heptene. (2-heptylene).

$\text{CH}_3(\text{CH}_2)_3\text{CH}=\text{CHCH}_3$ (*cis* and *trans* isomers).

Properties: Colorless liquid. D (*cis*) 0.708, (*trans*) 0.704, (commercial) 0.7010–0.7050 (20/4C), bp (*trans*) 98C , (*cis*) 98.5C , (commercial) $97\text{--}99\text{C}$, refr index 1.406 (20C); flash p (commercial) 28F (-2.2C). Soluble in alcohol, acetone, ether, petroleum, and coal tar solvents; insoluble in water.

Hazard: Flammable, dangerous fire risk.

Use: Suggested as plant growth-retardant.

3-heptene. (3-heptylene). $\text{C}_3\text{H}_7\text{CH}=\text{CHC}_2\text{H}_5$.

Properties: (Mixed *cis* and *trans* isomers) Colorless liquid. Bp 95C , d 0.705 (15.5/15.5C), refr index 1.405 (20C), flash p 21F (-6.1C).

Hazard: Flammable, dangerous fire risk.

Use: Suggested as plant-growth retardant.

6-heptenoic acid, 7-(2-cyclopropyl-4-(4-fluorophenyl)-3-quinolinyl)-3,5-dihydroxy-, calcium salt (2:1), (3r,5s,6e)-. See NK 104 (acid).

heptoic acid. See heptanoic acid.

1-heptyl acetate.

CAS: 112-06-1. $\text{C}_7\text{H}_{15}\text{OOCCH}_3$. Liquid with fruity odor.

Use: Artificial fruit essences.

heptyl alcohol. (1-heptanol; enanthyl alcohol).

CAS: 111-70-6. $\text{C}_7\text{H}_{15}\text{OH}$.

Properties: Colorless, fragrant liquid. Fp -34.6C , bp 175C , d 0.824 (20/4C), refr index 1.4233 (20C), flash p 170F (76.6C). Slightly soluble in water; miscible with alcohol and ether.

Derivation: From heptaldehyde by reduction.

Hazard: Combustible.

Use: Organic intermediate, solvent, cosmetic formulations.

heptylamine. $\text{C}_7\text{H}_{15}\text{NH}_2$.

Properties: Colorless liquid. D 0.777 (20/4C), fp -23C , bp 155C , flash p 140F (60C) (OC). Slightly soluble in water; soluble in alcohol and ether.

Hazard: Combustible.

heptyl formate. $\text{HCOOC}_7\text{H}_{15}$.

Properties: Colorless liquid; fruity odor. Bp 176.7C , d 0.894 (0C).

Hazard: Combustible.

Use: Artificial fruit essences.

heptyl heptoate. $\text{C}_7\text{H}_5\text{OOCOC}_7\text{H}_{13}$.

Properties: Colorless liquid; fruity odor. D 0.865 (19C), bp $273\text{--}274\text{C}$ (754 mm Hg).

Hazard: Combustible.

Use: Artificial fruit essences.

***n*-heptyl *p*-hydroxybenzoate.** See heptylparaben.

***n*-heptylic acid.** See heptanoic acid.

heptyl (4-(1-methylethyl)phenyl)methyl 3-pyridinylcarbonimidodithioate.

CAS: 51308-74-8. mf: $\text{C}_{23}\text{H}_{32}\text{N}_2\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

heptylparaben. mf: $\text{C}_{14}\text{H}_{20}\text{O}_3$.

Properties: Small colorless crystals or white crystalline powder; odorless, burning taste. Mp: $48\text{--}51^\circ$. Sol in alc, ether; very sltly sol in water.

Use: Food additive.

heptyl pelargonate. $\text{C}_7\text{H}_{15}\text{OOCOC}_8\text{H}_{17}$.

Properties: Liquid with pleasant odor. D 0.866 (15.5/15.5C), bp 300C , refr index 1.4360.

Hazard: Combustible.

Use: Flavors and perfumes.

α -heptyl-3,4,5-trimethoxyphenethylamine.

CAS: 67293-51-0. mf: $\text{C}_{18}\text{H}_{31}\text{NO}_3$.

Hazard: A poison.

herbicide. (weed killer). A pesticide, either organic or inorganic, used to destroy unwanted vegetation, especially various types of weeds, grasses, and woody plants. Until 1924 inorganics such as sodium chlorate, sodium chloride, ammonium sulfamate, arsenic, and boron compounds were used. At that time the more specific organics were introduced, typified by 2,4-dichlorophenoxyacetic acid (2,4-D). Herbicides may be of two major types: (1) selective, such as 2,4-D, 2,4,5-T, phenols, carbamates and urea derivatives, permitting elimination of weeds without injury to the crop, and (2) nonselective, comprising soil sterilants (sodium compounds) and silvicides (ammonium sulfamate). The latter kill woody plants and trees. Some types act as overstimulating growth hormones. Many herbicides are highly toxic and should be handled and applied with care; use of chlorinated types may be restricted. See defoliant.

herbifert.

CAS: 39324-65-7. mf: $C_9H_{17}N_5S \cdot C_8H_{14}ClN_5$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. SO_2 , and Cl $_2$.

“Herclor” [Aqualon]. TM for a group of specialty elastomers based on epichlorohydrin, claimed to have unique service performance properties. **Use:** Automotive and aircraft parts, wire and cable coating, seals and gaskets, packings, hose, belting, and coated fabrics. “Herclor H” is a homopolymer, and “Herclor C” a copolymer with ethylene oxide; both have high resistance to ozone, heat, solvents, and chemical attack.

“Hercoflex” [Aqualon]. TM for a series of plasticizers. 600 High-boiling ester of pentaerythritol and a saturated aliphatic acid. 707 High molecular weight polyol ester. 707A High molecular weight polyol ester.

Use: High-temperature vinyl electrical insulation. 900 High molecular weight polyester.

Use: Plasticizer for polyvinyl acetate.

“Hercolube” [Aqualon]. TM for synthetic lubricant base stocks. J15 Saturated aliphatic ester of pentaerythritol for plasticizing vinylidene chloride.

Derivation: Derived from pentaerythritol esters of saturated fatty acids.

“Hercolyn” D [Aqualon]. TM for a pale, viscous liquid; the hydrogenated methyl ester of rosin.

Use: Plasticizing resin.

hercules trap. Water-measuring liquid trap used in aquametry when the material collected is heavier than water.

“Herculoid” [Aqualon]. TM for nitrocellulose containing 10.9–11.2% nitrogen.

Hazard: See nitrocellulose.

Use: Pyroxylin plastics.

“Herculon” [Aqualon]. TM for polypropylene olefin fibers. Available in bulked continuous and continuous multifilament yarns, staple, and uncut tow.

Use: Apparel, home furnishings, and industrial applications.

hereditary cancer. Cancer that occurs due to the inheritance of an altered gene within a family. See sporadic cancer.

hereditary mutation. A gene change in the body's reproductive cells (egg or sperm) that becomes incorporated in the DNA of every cell in the body; also called germline mutation.

heroin. See diacetylmorphine.

herring oil. See fish oil.

Herschbach, Dudley R. (1932–). Awarded the Nobel Prize in chemistry in 1986 for work reporting that the energies of reactions of crossed molecular beams of isolated alkali metal atoms and alkyl halide molecules appeared mostly as vibrational excited states of products. This method of studying all types of chemical reactions led to a more detailed knowledge of reaction processes. Doctorate awarded from Harvard in 1958.

Hershko, Avram. (1937–). Born in Karcag, Hungary, Hershko won the Nobel Prize for chemistry in 2004 for his pioneering work concerning the discovery of ubiquitin-mediated protein degradation. He received his M.D. in 1965 and his Ph.D in 1969 from the Hadassah Faculty of Medicine of the Hebrew University of Jerusalem. He is currently a Distinguished Professor at the Rappaport Family Institute for Research in Medical Sciences at the Technion (Israel Institute of Technology) in Haifa and Adjunct Professor of Pathology at New York University. In 2000 he received the Albert Lasker Award for Basic Medical Research.

Herzberg, Gerhard. (1904–1999). A German-born physicist who won the Nobel Prize for chemistry in 1971 for his work on the composition of molecules. His research involved the spectroscopy of atoms and molecules and their excitation behavior. He became a Canadian citizen and was the director of the Division of Pure Physics of the National Research Council of Canada.

Herzig-Meyer determination of N-alkyl groups. N-alkylamines are refluxed with hydriodic acid and the quaternary alkyl ammonium iodides are pyrolyzed to split off alkyl iodide, which is determined gravimetrically by conversion to silver iodide or titrated as iodate.

Herz reaction; Herz compounds. Formation of *o*-aminothiophenols by heating aromatic

amines with excess sulfur monochloride. The first products formed are thiazothionium halides known as Herz compounds. If the position next to the amino group is unoccupied, chloride is substituted at this position during the reaction.

hesperidin.

CAS: 520-26-3. $C_{28}H_{34}O_{15}$. A natural bioflavonoid of the flavanone group.

Properties: Fine needles. Mp 258–262C. Soluble in dilute alkalis and pyridine.

Derivation: Extraction from citrus fruit peel.

Use: Synthetic sweetener research.

Hess's law.

The heat evolved or absorbed in a chemical process is the same whether the process takes place in one or in several steps; also known as the law of constant heat summation.

hetastarch.

A starch derivative containing 90% amylopectin.

Use: Blood plasma volume expander.

heteratisine.

See 20-ethyl-6- β ,8-dihydroxy-1- α -methoxy-4.

heteratisine 6-benzoate.

CAS: 99759-48-5. mf: $C_{29}H_{37}NO_6$.

Hazard: A poison.

Source: Natural product.

heteroaromatic.

See heterocyclic.

heteroazeotrope.

Azeotropic mixture having more than one liquid phase in equilibrium with the vapor phase at the boiling points.

heterochromatin.

Chromatin which is in a condensed, less accessible state and thus frequently transcriptionally silent. However, some DNA is constitutive heterochromatin (e.g. the second X chromosome is inactivated to a Barr body for dosage compensation) whereas other DNA is facultative heterochromatin. An example might be genes required under time of stress only, or during a stage of the cell cycle.

heterocyclic.

Designating a closed-ring structure, usually of either 5 or 6 members, in which one or more of the atoms in the ring is an element other than carbon, e.g., sulfur, nitrogen, etc. Examples are pyridine, pyrrole, furan, thiophene, and purine.

thiophene

pyridine

heteroduplex DNA.

Duplex DNA containing complementary strands derived from two different

DNA molecules with similar or partially identical sequences. Sometimes from two unmanipulated species, at other times a gene has been modified and reintroduced.

heterogeneity.

The production of identical or similar phenotypes by different genetic mechanisms.

heterogeneous.

(Latin "different kinds"). Any mixture or solution comprised of two or more substances regardless of whether they are uniformly dispersed. Common examples are such diverse materials as air (a mixture of 20% oxygen and 80% nitrogen), milk, marble, paint, gasoline, blood and mayonnaise. In all such cases, the mixtures can be separated mechanically into their components. "Homogenized" milk is as heterogeneous as regular milk and the term is, strictly speaking, a misnomer. See homogeneous; mixture.

heterogeneous catalysis.

See catalysis, heterogeneous.

heteromolybdates.

(heteropolymolybdates). A large group of complex molybdenum salts and acids in which the anion contains oxygen atoms and from 2 to 18 hexavalent molybdenum atoms, as well as one or more other metal or nonmetal atoms (phosphorus, arsenic, iron, and tellurium). The latter are referred to as hetero atoms, and any of approximately 35 elements may be present in this manner. Example: $Na_3PMo_{12}O_{40}$, sodium phospho-12-molybdate. The molecular weights of these compounds range up to 3000. The acids and most of the salts are very soluble in water, and the acids and some salts are soluble in organic solvents.

Use: Phosphomolybdates and phosphotungstates are used as precipitants for basic dyes to form lakes and toners. The phospho- and silicomolybdate groups are of key importance in the functioning of certain enzymes. There are many uses in analytical chemistry.

heterophos.

CAS: 40626-35-5. mf: $C_{11}H_{17}O_3PS$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

heteropolysaccharide.

A polysaccharide containing two or more types of sugars.

heterotroph.

An organism that requires complex nutrient molecules, such as glucose, as an energy source.

heterotropic enzyme.

An allosteric enzyme requiring a molecule other than its substrate as a modulator.

heterozygosity.

The presence of different alleles at one or more loci on homologous chromosomes.

heterozygote. See heterozygosity.

HETP. (1) Abbreviation for hexaethyl tetraphosphate; (2) abbreviation for height equivalent to a theoretical plate.
See theoretical plate.

“Hetron” [Ashland]. TM for an unsaturated polyester resin.

Use: Corrosion and chemical resistance, fire-retardant, castings, marine gel coats, laminating, and molding.

Heumann-Pfleger indigo synthesis. Cyclization of phenylglycine to indoxyl followed by oxidation by air or oxidizing agents, such as ferric chloride, to yield indigo.

heuristic. See computational chemistry.

Hevesy, Georg de. (1885–1966). A Hungarian chemist who won the Nobel Prize in chemistry in 1943. He discovered the element hafnium in 1923. One of his interesting projects involved the calculation of the percentages of chemical elements in the universe. He also was involved in research using radioactive lead and phosphorus traces. His work included the separation of isotopes by physical means. His Ph.D. was granted at Freiburg in 1908.

hexa-. Prefix signifying six.

hexabromobenzene.

CAS: 87-82-1. mf: C₆Br₆.

Hazard: A poison.

hexabromoethane. C₂Br₆.

Properties: Yellowish-white, rhombic needles. Slightly soluble in water and alcohol. Mp 149C (decomposes with separation of bromine).

Derivation: Action of bromine on diiodoacetylene.

Use: Organic synthesis.

1,2,3,4,6,7-hexabromonaphthalene.

CAS: 75625-24-0. mf: C₁₀H₂Br₆.

Hazard: A poison by ingestion.

1,1,1,3,3,3-hexabutyldistanthiane.

CAS: 4808-30-4. mf: C₂₄H₅₄SSn₂.

Properties: Colorless oil. Bp: 208° (decomp).

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexacalcium phytate. See calcium phytate.

hexachloroacetone. (hexachloro-2-propanone).

CAS: 116-16-5. Cl₃CCOCCl₃.

Properties: Yellow liquid. Bp 204C, fp -3C, d 1.744 (12/12C). Slightly soluble in water; soluble in acetone.

Hazard: Toxic by ingestion and inhalation, strong irritant. Combustible. Evolves phosgene when heated.

Use: Desiccant, herbicide.

hexachlorobenzene. (perchlorobenzene).

CAS: 118-74-1. C₆Cl₆.

Properties: White needles. D 2.04, mp 229C, bp 326C, flash p 468F (242C). Soluble in benzene and boiling alcohol; insoluble in water.

Hazard: TLV: 0.002 (skin); Animal Carcinogen. Toxic by ingestion. Combustible.

Use: Organic synthesis, fungicide for seeds, wood preservative.

2,2',4,4',6,6'-hexachlorobiphenyl.

CAS: 33979-03-2. mf: C₁₂H₄Cl₆.

Hazard: A poison.

2,3',4,4',5',6-hexachlorobiphenyl.

CAS: 59291-65-5. mf: C₁₂H₄Cl₆.

Hazard: A poison.

hexachlorobutadiene.

CAS: 87-68-3. Cl₂C:CCICCl:CCl₂.

Properties: Clear, colorless liquid; mild odor. Freezing range -19 to -22C, boiling range 210–220C, refr index 1.552 (20C), flash p none, d 1.675 (15.5/15.5C), bulk d 13.97 lb/gal (15.5C), purity 98% (min). Vap press 22 mm Hg (100C), 500 mm Hg (200C). Viscosity (37.7C) 2.447 cP, 1.479 centistokes; (98.9C) 1.131 cP, 0.724 centistokes. Insoluble in water, compatible with numerous resins, soluble in alcohol and ether. Nonflammable.

Hazard: Toxic by ingestion and inhalation, a suspected carcinogen. TLV: TWA 0.02 ppm; animal carcinogen.

Use: Solvent for elastomers, heat-transfer liquid, transformer and hydraulic fluid, wash liquor for removing C₄ and higher hydrocarbons.

1,2,3,4,5,6-hexachlorocyclohexane. (BHC;

HCC; HCH; TBH; benzene hexachloride).

CAS: 608-73-1. C₆H₆Cl₆. A systemic insecticide. The γ isomer is known as lindane.

Properties: White or yellowish powder or flakes; musty odor. Melting point vary with isomeric composition. D 1.87, vap press approximately 0.5 mm Hg (60C). Stable toward moderate heat but decomposed by alkaline substances. Mp of the pure isomers are (α -*trans*) 157–158C, (β -*cis*) 297C (sublimes), (γ) 112.5C, (Δ) 138–139C, (ϵ) 217–219C. Insoluble in water; soluble in 100% alcohol, chloroform, and ether.

Derivation: Chlorination of benzene in actinic light.

Method of purification: Fractional crystallization.

The technical grade may run 10–15% γ isomer but can be brought up to 99% (lindane).

Grade: Technical (mixture of isomers), 25% γ isomer, and 99% γ isomer (lindane).

Hazard: Toxic by ingestion and inhalation, absorbed by skin, strong irritant to skin and eyes. CNS depress-

sant. Use may be restricted. TLV: (lindane) 0.5 mg/m³.

Use: Component of insecticides; toxic to flies, cockroaches, aphids, grasshoppers, wire worms, and boll weevils.

hexachlorocyclopentadiene. (perchlorocyclopentadiene).

CAS: 77-47-4. C₅Cl₆.

Properties: Pale-yellow liquid; pungent odor. Bp 239C, fp 9.6C, d 1.717 (15/15C), bulk d 14.30 lb/gal (15.5C), refr index 1.563 (25C), flash p none. Nonflammable.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.01 ppm; not classifiable as a human carcinogen.

Use: Intermediate for resins, dyes, pesticides, fungicides, pharmaceuticals.

2,3,4,4,5,5-hexachloro-2-cyclopenten-1-one.

CAS: 2514-52-5. mf: C₅Cl₆O.

Hazard: A poison by ingestion. Moderately toxic by inhalation.

2,2',4,4',5,5'-hexachlorodiphenyl ether.

CAS: 71859-30-8. mf: C₁₂H₄Cl₆O.

Hazard: A reproductive hazard.

2,2',4,4',5,6'-hexachlorodiphenyl ether.

CAS: 106220-81-9. mf: C₁₂H₄Cl₆O.

Hazard: A reproductive hazard.

hexachlorodiphenyl oxide. (chlorinated diphenyl oxide).

CAS: 31242-93-0. C₁₂H₄Cl₆O.

Properties: Light-yellow, very viscous liquid. Bp 230–260C (8 mm Hg), d 1.60 (20/20C), bulk d 13.12 lb/gal (25C), refr index 1.621 (25C), flash p none. Soluble in methanol, ether; very slightly soluble in water. Nonflammable.

Hazard: Toxic by ingestion. TLV: 0.5 mg/m³.

Use: Solvent, intermediate.

1,1,1,4,4,4-hexachloro-1,4-disilabutane.

See bis(trichlorosilyl)ethane.

hexachloroendomethylene tetrahydrophthalic acid. See chlorendic acid.

hexachloroendomethylene tetrahydrophthalic anhydride. See chlorendic anhydride.

hexachloroethane. (perchloroethane; carbon trichloride; carbon hexachloride).

CAS: 67-72-1. Cl₃CCCl₃.

Properties: Colorless crystals: camphorlike odor. D 2.091, mp 185C, bp sublimates at 185C. Soluble in alcohol and ether; insoluble in water.

Hazard: Toxic by ingestion and inhalation, strong

irritant, absorbed by skin. TLV: 1 ppm; suspected human carcinogen.

Use: Organic synthesis, retarding agent in fermentation, camphor substitute in nitrocellulose, pyrotechnics and smoke devices, solvent, explosives.

hexachloromethylcarbonate. (triphosgene). (OCCl₃)₂CO.

Properties: White crystals; odor similar to that of phosgene. D approximately 2, bp 205–206C (partial decomposition), mp 78–79C. Decomposed by hot water and alkali hydroxides. Only slowly aceted upon by cold water. Soluble in alcohol, benzene, ether.

Derivation: Chlorination of dimethyl carbonate exposed to direct sunlight.

Hazard: Strong irritant to eyes and skin.

Use: Lachrymator.

hexachloromethyl ether. O(CCl₃)₂.

Properties: Liquid; phosgenelike odor. D 1.538 (18C), bp 98C (partial decomposition).

Derivation: Chlorination of dichloromethyl ether.

Hazard: Strong irritant to eyes and skin.

hexachloronaphthalene.

CAS: 1335-87-1. C₁₀H₂Cl₆.

Properties: White solid.

Hazard: Toxic by inhalation, strong irritant, absorbed by skin. TLV: 0.2 mg/m³.

1,2,3,4,6,7-hexachloronaphthalene.

CAS: 103426-96-6. mf: C₁₀H₂Cl₆.

Hazard: A reproductive hazard.

1,2,3,5,6,7-hexachloronaphthalene.

CAS: 103426-97-7. mf: C₁₀H₂Br₆.

Hazard: A poison by ingestion.

hexachlorophene. (2,2'-methylene-bis-(3,4,6-trichlorophenol); bis-(3,5,6-trichloro-2-hydroxyphenyl)methane).

CAS: 70-30-4. (C₆HCl₃OH)₂CH₂.

Properties: White, free-flowing powder; odorless. Mp 161–167C. Soluble in acetone, alcohol, ether, chloroform; insoluble in water.

Derivation: Condensation of 3,4,5-trichlorophenol with formaldehyde in the presence of sulfuric acid.

Hazard: FDA prohibits use unless prescribed by a physician.

Use: Topical antiinfective (restricted), germicidal soaps, veterinary medicine.

hexachloro-2-propane. See hexachloroacetone.

hexachloropropylene. (hexachloropropene; perchloropropylene). CCl₂CCl:CCl₂.

Properties: Water-white liquid. Bp 210C. Insoluble in water; miscible with alcohol, ether, chlorinated compounds.

Use: Solvent, plasticizer, hydraulic fluid.

hexacontane. $C_{60}H_{122}$. High molecular weight hydrocarbon.

Properties: Waxy solid. Mp 101C.

Hazard: Combustible.

hexacosanoic acid. See cerotic acid.

n-hexadecane. (cetane). $C_{16}H_{34}$.

Properties: Colorless liquid. D 0.77335 (20/4C), flash p 200F (93C), bp 286.5C, mp 18.14C, refr index 1.43435 (20C). Soluble in alcohol, acetone, ether; insoluble in water, autoign temp 401F (205C).

Grade: Technical, ASTM.

Hazard: Combustible.

Use: Solvent, organic intermediate, ignition standard for diesel fuels.

See cetane number.

hexadecanoic acid. See palmitic acid.

1-hexadecanol. See cetyl alcohol.

hexadecanoyl chloride. See palmitoyl chloride.

(z)-7-hexadecenal.

CAS: 56797-40-1. mf: $C_{16}H_{30}O$.

Hazard: Low toxicity by ingestion.

Source: Natural product.

(z)-9-hexadecenal.

CAS: 56219-04-6. mf: $C_{16}H_{30}O$.

Hazard: Low toxicity by ingestion.

Source: Natural product.

1-hexadecene. (cetene; α -hexadecylene).

$CH_3(CH_2)_{13}CH=CH_2$.

Properties: Colorless liquid. Mp 4C, bp 274C, flash p 200F (93C), d 0.784 (15/4C), refr index 1.441 (20C). Insoluble in water; soluble in alcohol, ether, petroleum, and coal tar solvents.

Derivation: Treatment of cetyl alcohol with phosphorus pentoxide.

Grade: 95% purity.

Hazard: Combustible.

Use: Organic synthesis.

cis-9-hexadecenoic acid. See palmitoleic acid.

(z)-11-hexadecenol.

CAS: 56683-54-6. mf: $C_{16}H_{32}O$.

Hazard: Low toxicity by ingestion.

Source: Natural product.

(z)-7-hexadecen-1-ol acetate.

CAS: 23192-42-9. mf: $C_{18}H_{34}O_2$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation.

Use: Agricultural chemical.

6-hexadecenolide. See ambrettolide.

hexadecyl mercaptan. See cetyl mercaptan.

tert-hexadecyl mercaptan. $C_{16}H_{33}SH$.

Properties: Colorless liquid; unpleasant odor. Boiling range 121–149C (5 mm Hg), d 0.874 (60/60F), refr index 1.474 (20C), flash p 265F (129.4C).

Hazard: Combustible.

Use: Polymer modification.

See thiol.

hexadecyltrichlorosilane.

CAS: 5894-60-0. $C_{16}H_{33}SiCl_3$.

Properties: Colorless to yellow liquid. Bp 269C, d 0.996 (25/25C), refr index 1.4568 (25C), flash p 295F (146C).

Derivation: By Grignard reaction of silicon tetrachloride and hexadecylmagnesium chloride.

Grade: Technical.

Hazard: Strong irritant. Combustible. Evolves hydrogen chloride in the presence of moisture.

Use: Intermediate for silicones.

hexadecyltrimethylammonium bromide.

See cetyl trimethylammonium bromide.

hexadecyltrimethylammonium chloride.

CAS: 112-02-7. mf: $C_{19}H_{42}N\cdot Cl$.

Hazard: A poison by ingestion and skin contact.

1,4-hexadiene.

CAS: 42296-74-2. $H_2C=CHCH_2CH=CH_2$.

Properties: Colorless liquid. D 0.6996 (20/4C), bp 64C (745 mm Hg), refr index 1.4162 (20C), flash p -6F (-21.1C). Insoluble in water.

Derivation: Reaction between ethylene and butadiene with a special catalyst.

Hazard: Highly flammable, explosive limits in air 2–6.1%.

Use: As third monomer in EPDM synthetic elastomers.

2,4-hexadienedial, (e,e)-.

CAS: 18409-46-6. mf: $C_6H_6O_2$.

Hazard: A poison.

2,4-hexadienoic acid. See sorbic acid.

1,5-hexadiyne. See dipropargyl.

hexa-2-ethylbutoxydisiloxane.

$[(CH_3CH_2(C_2H_5)CH_2CH_2O)_2Si]_2O$.

Properties: Colorless oil. Bp 195C (0.2 mm Hg).

Derivation: Reaction of silicon tetrachloride, 2-ethylbutanol, and water.

Hazard: Combustible.

Use: Aircraft hydraulic fluid.

hexaethyldistannoxane.

CAS: 1112-63-6. mf: $C_{12}H_{30}OSn_2$.

Properties: Air-sensitive liquid. D: 1.377 @ 20°, bp: 272°.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexaethylidistanthiane.

CAS: 994-50-3. mf: C₁₂H₃₀SSn₂.

Properties: A liquid. D: 1.431 @ 20°, bp: 187–188° @ 20 mm.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexaethyl tetraphosphate. (HETP).

CAS: 757-58-4. A mixture of ethyl phosphates and ethyl pyrophosphates (TEPP).

Properties: Yellow liquid. D 1.26–1.28 (25/4C), fp –90C, refr index 1.427, decomposes at high temperatures. Soluble or miscible with water and many organic solvents except kerosene; hydrolyzes in low concentration; hygroscopic.

Hazard: Toxic by ingestion, inhalation, and skin absorption; cholinesterase inhibitor.

Use: Contact insecticide.

Note: Hexaethyl tetraphosphate and compressed gas mixture not accepted by air or by passenger rail. For details consult regulations.

hexafluoroacetone.

CAS: 684-16-2. CF₃COCF₃.

Properties: Colorless, hygroscopic, highly reactive gas. Bp –27C, fp –122C, liquid density 1.33 (25C), minimum purity 95%.

Hazard: Toxic by inhalation and skin absorption. Reacts vigorously with water and other substances, releasing considerable heat. Nonflammable. TLV: 0.1 ppm.

Use: Intermediate in organic synthesis.

hexafluoroacetone bisphenol a.

CAS: 1478-61-1. mf: C₁₅H₁₀F₆O₂.

Hazard: Moderately toxic by ingestion.

hexafluorobenzene. C₆F₆.

Properties: Liquid. Bp 80.26C, mp 5.2C, d 1.613.

Hazard: Toxic by inhalation. Combustible.

Use: Chemical intermediate, solvent in NMR spectroscopy.

hexafluorocalcitriol.

CAS: 83805-11-2. mf: C₂₇H₃₈F₆O₃.

Hazard: A poison by ingestion.

hexafluorodiphenylolpropane. See hexafluoroacetone bisphenol a.

hexafluoroethane. (fluorocarbon 116).

CAS: 76-16-4. CF₃CH₃.

Properties: A gas. Bp –78.2C, d 1.59. Insoluble in water; slightly soluble in alcohol. One of the most stable of all organic compounds.

Grade: 99.6% pure.

Use: Dielectric and coolant, aerosol propellant, refrigerant.

2-(1,1,2,3,3,3-hexafluoro-2-(heptafluoropropoxy)propoxy)-2,3,3,3-tetrafluoropropanoic acid.

CAS: 13252-14-7. mf: C₉HF₁₇O₄.

Hazard: Moderately toxic by inhalation and skin contact. A moderate eye irritant.

hexafluorophosphoric acid.

CAS: 16940-81-1. HPF₆.

Properties: (65% solution) Colorless, fuming liquid. D 1.81, mp 31C (6H₂O). Stable in neutral and alkaline solutions.

Hazard: Strong irritant to tissue.

Use: Metal cleaners, electrolytic or chemical polishing agents for the formation of protective coatings for metal surfaces, and as a catalyst.

1,1,1,2,3,3-hexafluoropropane.

CAS: 431-63-0. mf: C₃H₂F₆.

Hazard: Low toxicity by inhalation. A reproductive hazard.

1,1,1,3,3,3-hexafluoropropane.

CAS: 690-39-1. mf: C₃H₂F₆.

Hazard: Moderately toxic by inhalation route.

hexafluoropropylene. (perfluoropropene).

CF₃CF=CF₂.

Properties: Gas. Fp –156C, bp –29C, d 1.583 (–40/4C).

hexafluoropropylene epoxide. (HFPO).

CF₂CF₂CF₂O.

Derivation: Oxidation of hexafluoropropylene with alkaline hydrogen peroxide at approximately –30C.

Use: Monomer for HFPO polymers that are heat resistant to 410C. Noncombustible.

See “Freon E”; “Krytox.”

hexafluorosilicic acid. See fluosilicic acid.

hexaglycerol. See trimethylolpropane, polyglycerol.

hexahydric alcohol. See mannitol, sorbitol, and dulcitol.

hexahydroaniline. See cyclohexylamine.

hexahydrobenzene. See cyclohexane.

hexahydrobenzoic acid. (cyclohexanecarboxylic acid [a naphthenic acid]). C₆H₁₁COOH.

Properties: Colorless monoclinic prisms. Mp 31C, bp 233C, d 1.048 (15/4C), refr index 1.4561 (33.8C). Slightly soluble in water; soluble in alcohol and ether.

Use: Paint and varnish driers, dry-cleaning soaps, lubricating oils, stabilizer for rubber.

hexahydrocresol. See methylcyclohexanol.

hexahydro-4,7-methanoindandimethanol.
See tricyclodecanedimethanol.

hexahydromethylphenol. See methylcyclohexanol.

hexahydrophenol. See cyclohexanol.

hexahydrophthalic anhydride. (1,2-cyclohexandicarboxylic anhydride). $C_6H_{10}(CO)_2O$.

Properties: Clear, colorless, viscous liquid that becomes a glassy solid at 35–36C. Bp 158C (17 mm Hg), d 1.19 (40C). Miscible with benzene, toluene, acetone, carbon tetrachloride, chloroform, ethanol, and ethyl acetate; slightly soluble in petroleum ether.

Hazard: Toxic by inhalation, strong irritant to eyes and skin.

Use: Intermediate for alkyds, plasticizers, insect repellents, and rust inhibitors; hardener in epoxy resins.

hexahydropyridine. See piperidine.

hexahydrotoluene. See methylcyclohexane.

hexahydro-1,3,5-trinitro-sym-triazine. See cyclonite.

hexahydroxycyclohexane. See inositol.

hexahydroxylene. See dimethylcyclohexane.

hexaisobutyliditin.

CAS: 3750-18-3. mf: $C_{24}H_{54}Sn_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

hexakis(methoxymethyl)melamine.

$NC(NR)NC(NR)NC(NR)$ where R = $(CH_2OCH_3)_2$.

Use: Crosslinking agent for alkyds, epoxies, cellulose, and vinyls.

n-hexaldehyde. (caproic aldehyde).

CAS: 66-25-1. $CH_3(CH_2)_4CHO$.

Properties: Colorless liquid; sharp aldehyde odor. D 0.8156 (20/20C), bp 128.6C, vap press 10.5 mm Hg (20C), flash p 90F (32.2C) (OC), bulk d 6.9 wt/gal (20C), fp -56.3C. Immiscible with water.

Grade: Technical.

Hazard: Flammable, moderate fire risk.

Use: Organic synthesis of plasticizers, rubber chemicals, dyes, synthetic resins, insecticides.

“Hexalin” [Du Pont]. TM for cyclohexanol (usually shipped with 2.25% methanol as anti-freeze).

Hazard: Toxic by ingestion.

hexametapol. See hempa.

hexamethonium chloride. (hexamethylene-bis(trimethylammonium) chloride).

CAS: 60-25-3. $(CH_3)_3NCl(CH_2)_6NCl(CH_3)_3$.

Properties: White, crystalline, hygroscopic powder; faint odor. Mp 289–292C (decomposes). Very soluble in water; soluble in alcohol, methanol, and n-propanol; insoluble in chloroform and ether. Available commercially as unhydrated form or as dihydrate.

Use: Medicine (antihypertensive).

hexamethylbenzene. $C_{12}H_{18}$ or $C_6(CH_3)_6$.

Properties: Colorless plates. Bp 265C, mp 165.5C. Soluble in alcohol; insoluble in water.

Hazard: Combustible.

hexamethylcyclotrisilazane.

CAS: 1009-93-4. mf: $C_6H_{21}N_3Si_3$.

Hazard: Moderately toxic by ingestion.

hexamethyldiaminoisopropanol diiodide.

See propiodal.

hexamethyldisilazane. (HMDS).

CAS: 999-97-3. $(CH_3)_3SiNHSi(CH_3)_3$.

Properties: Liquid. D 0.77 (25C), refr index 1.4057 (25C), bp 125C, flash p 77F (25C). Soluble in acetone, benzene, ethyl ether, heptane, perchloroethylene; reactive with methanol and water.

Grade: 99% min.

Hazard: Flammable, moderate fire risk.

Use: Chemical intermediate, chromatographic packings.

hexamethyldistannane. See hexamethylditin.

hexamethylditin.

CAS: 661-69-8. mf: $C_6H_{18}Sn_2$.

Properties: Crystals from pet ether. Mp: 28°, bp: 182°.

Hazard: A poison by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

Use: Agricultural chemical.

hexamethylene. See cyclohexane.

hexamethylenediamine. (1,6-diaminohexane; 1,6-hexanediamine).

CAS: 124-09-4. $H_2N(CH_2)_6NH_2$.

Properties: Colorless leaflets. Mp 39–42C, bp 205C. Soluble in water; slightly soluble in alcohol and benzene.

Derivation: (1) Reaction of adipic acid and ammonia (catalytic vapor phase) to yield adiponitrile, followed by liquid-phase catalytic hydrogenation. (2) Chlorination of butadiene followed by reaction with sodium cyanide (cuprous chloride catalyst) to 1,4-dicyanobutylene and hydrogenation.

Hazard: Toxic by ingestion, strong irritant to tissue. TLV: 0.5 ppm. Combustible.

Use: Formation of high polymers, e.g., nylon 66.

hexamethylenediamine carbamate. See "Diak."

hexamethylene diisocyanate.

CAS: 822-06-0. $\text{OCN}(\text{CH}_2)_6\text{NCO}$.

Properties: Liquid. D 1.04 (25/15.5C), flash p 284F (140C).

Hazard: TLV: 0.005 ppm. Combustible.

Use: Chemical intermediate.

hexamethylene glycol. (1,6-hexanediol).

CAS: 629-11-8. $\text{CH}_2\text{OH}(\text{CH}_2)_4\text{CH}_2\text{OH}$.

Properties: Crystalline needles. Mp 42C, bp 210C, refr index 1.457, d 0.953 (50C), flash p 130C (266F).

Derivation: Reduction of adipic acid ester with copper chromite catalyst.

Hazard: Toxic by ingestion.

Use: Solvent, intermediate for high polymers (nylon, polyesters), coupling agent, coil coating.

hexamethyleneimine.

CAS: 111-49-9. $\text{C}_6\text{H}_{12}\text{NH}$ (cyclic).

Properties: Clear, colorless liquid; ammonia-like odor. Bp 138C, fp -37C, d 0.8799 (20/4C).

Hazard: Toxic by ingestion, strong irritant to tissue.

Use: Intermediate for pharmaceutical, agricultural, and rubber chemicals.

hexamethylenetetramine. (methenamine;

HMTA; aminoform; hexamine, erroneously "Hexamethyleneamine").

CAS: 100-97-0. $(\text{CH}_2)_6\text{N}_4$. A heterocyclic fused ring structure.

Properties: White, crystalline powder or colorless lustrous crystals; practically odorless. D 1.27 (25C); soluble in water, alcohol, and chloroform; insoluble in ether; sublimes approximately 200C; partly decomposes.

Derivation: Action of ammonia on formaldehyde.

Grade: Technical, NF (as methenamine).

Hazard: Skin irritant. Flammable, dangerous fire risk.

Use: Curing of phenolformaldehyde and resorcinol-formaldehyde resins, rubber-to-textile adhesives, protein modifier, organic synthesis, pharmaceuticals, ingredient of highly explosive cyclonite, fuel tablets, rubber accelerator, fungicide, corrosion inhibitor, shrink-proofing textiles, antibacterial.

hexamethylmelamine. See hemel.

hexamethylparosaniline chloride. See methyl violet.

hexamethylphosphoramidate. See hempa.

hexamethylphosphoric triamide. See hempa.

hexamethyltetracosahexaene. See squalene.

hexamethyltetracosane. See squalane.

hexamine. See hexamethylenetetramine.

hexanaphthene. See cyclohexane.

n-hexane.

CAS: 110-54-3. $\text{CH}_3(\text{CH}_2)_4\text{CH}_3$.

Properties: Colorless, volatile liquid; faint odor. D 0.65937 (20/4), bp 68.742C, fp -95C, refr index 1.37486 (20C), flash p -9F (-22.7C), autoign temp 500F (260C). Soluble in alcohol, acetone, and ether; insoluble in water.

Derivation: By fractional distillation from petroleum (molecular sieve process).

Grade: 85%, 95%, 99%, spectro, research, and nano-grade.

Hazard: Flammable, dangerous fire risk. TLV: 50 ppm.

Use: Solvent, especially for vegetable oils; low-temperature thermometers; calibrations; polymerization reaction medium; paint diluent; alcohol denaturant.

2-hexanecarboxylic acid.

CAS: 4536-23-6. mf: $\text{C}_7\text{H}_{14}\text{O}_2$.

Hazard: A reproductive hazard.

hexanedioic acid. See adipic acid.

1,6-hexanediol. See hexamethylene glycol.

hexanedione-2,5. See acetonyl acetone.

1,2,6-hexanetriol.

CAS: 106-69-4.

$\text{HOCH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Water-white liquid. D 1.1063, sets to glass at approximately -20C (fp under controlled conditions 32.8C), bp (178C) 5 mm Hg, flash p 380F (193C). Miscible with water.

Hazard: Combustible.

Use: Alkyd and polyester resin intermediate, softener, moistening agent, and solvent.

hexanitrodiphenylamine. (hexil; hexyl; hexite; dipicrylamine). $(\text{NO}_2)_3\text{C}_6\text{H}_2\text{NHC}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Yellow solid. Mp 238-244C, decomposes violently at higher temperatures. Insoluble in water and alcohol; soluble in alkalis and warm acetic or nitric acid.

Derivation: Nitration of diphenylamine, also from dinitrochlorobenzene.

Hazard: Explodes on shock or exposure to heat, dangerous.

Use: Booster explosive, analysis for potassium.

hexanitrodiphenyl sulfide. (dipicryl sulfide). $[(\text{NO}_2)_3\text{C}_6\text{H}_2]_2\text{S}$.

Properties: Golden-yellow leaflets. Mp 234C. Sparingly soluble in alcohol and ether; more soluble in glacial acetic acid and acetone.

Derivation: Interaction of picryl chloride and sodium thiosulfate in alcohol solution in the presence of magnesium carbonate.

Hazard: Explodes on shock or exposure to heat; dangerous.

Use: High explosive.

hexanitromannite. See mannitol hexanitrate.

hexaoctyldistannoxane. See 1,1,1,3,3,3-hexaoctyldistannoxane.

1,1,1,3,3,3-hexaoctyldistannoxane.

CAS: 2787-93-1. mf: $\text{C}_{48}\text{H}_{102}\text{OSn}_2$.

Hazard: Moderately toxic. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexaoctyldistannthiane.

CAS: 13413-18-8. mf: $\text{C}_{48}\text{H}_{102}\text{SSn}_2$.

Hazard: Moderately toxic. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexanoic acid. Legal label name for caproic acid.

1-hexanol. See hexyl alcohol.

2-hexanone. See methyl-*n*-butyl ketone.

3-hexanone. (ethyl propyl ketone).

CAS: 589-38-8. $\text{C}_6\text{H}_{12}\text{O}$ (CH₂)₂CH₃.

Properties: Colorless liquid. Bp 124C, d 0.813 (22C), flash p 95F (35C) (OC).

Hazard: Toxic by ingestion and inhalation, strong irritant. Flammable, moderate fire risk.

Use: Solvent.

***n*-(*n*-hexanoyl)aniline.**

CAS: 621-15-8. mf: $\text{C}_{17}\text{H}_{17}\text{NO}$.

Hazard: Moderately toxic by ingestion.

hexanoyl chloride. $\text{CH}_3(\text{CH}_2)_4\text{COCl}$.

Properties: Colorless liquid. Bp 151–153C, refr index 1.4867 (20C). Decomposed by water and alcohol; soluble in ether and chloroform.

Hazard: Combustible.

Use: Chemical intermediate.

hexaphenyldisilane. $[(\text{C}_6\text{H}_5)_2\text{Si}]_2$.

Properties: White powder, mp 352C.

Derivation: Sodium condensation of triphenylchlorosilane.

Use: High-temperature applications.

“Hexaphos” [FMC]. TM for a glassy phosphate of high molecular weight having superior water-softening properties.

Use: Water-softening, boiler-scale control, component of cleansers, laundry mixes, dishwashing compounds, pitch control in pulp industry, prevention of lime soap deposits in textile operations.

hexapropyldistanthiane.

CAS: 7328-05-4. mf: $\text{C}_{18}\text{H}_{42}\text{SSn}_2$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

Use: Drug.

hexatriacontane. $\text{C}_{36}\text{H}_{74}$.

Properties: Waxy solid. D 0.797, mp 75C.

Hazard: Combustible.

See paraffin wax.

1-hexene. (hexylene).

CAS: 592-41-6. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}=\text{CH}_2$.

Properties: Colorless liquid. D 0.6734 (20/4C), bp 63.55C, fp –139.8C, refr index 1.3876 (20C), flash p –15F (–26.1C). Insoluble in water; soluble in alcohol.

Grade: 95%, 99%, research.

Hazard: Irritant. Highly flammable, dangerous fire risk.

Use: Synthesis of flavors, perfumes, dyes, resins; polymer modifier.

2-hexene. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}=\text{CHCH}_3$.

Properties: (Mixed *cis* and *trans* isomers.) Colorless liquid. Bp 68C, fp –146C, refr index 1.3948 (20C), d 0.686 (15.5/15.5C), flash p –5F (20.5C). Insoluble in water; soluble in alcohol.

Grade: 95%, 99%.

Hazard: Highly flammable, dangerous fire risk.

Use: Chemical intermediate.

5-hexene-2-one. See allylacetone.

hexenol. (3-hexen-1-ol; leaf alcohol).

$\text{C}_6\text{H}_{11}\text{OH}$.

Properties: Liquid; odor of green leaves. Bp. 156C, refr index 1.438, d 0.85.

Occurrence: Grasses, leaves, herbs, tea, etc.

Hazard: Combustible.

Use: Odorant in perfumery.

hexestrol. (*p,p'*-(1,2-diethylethylene)diphenol).

CAS: 84-16-2.

$\text{HOC}_6\text{H}_4\text{CH}(\text{C}_2\text{H}_5)\text{CH}(\text{C}_2\text{H}_5)\text{C}_6\text{H}_4\text{OH}$. A nonsteroid, synthetic estrogen.

Properties: Odorless, white, crystalline powder; mp 185–188C; soluble in ether, acetone, alcohol, and methanol; practically insoluble in water; sensitive to light.

Derivation: From anethole, by reaction of diacetyl peroxide on *p*-methoxy-*n*-propylbenzene.

Use: Medicine (estrogenic hormone).

hexetidine. (amino-1,3-bis[β -ethylhexyl]-5-methylhexahydropyrimidine). $C_{21}H_{35}N_3$.

Properties: Liquid. D 0.860–0.875 (25/25C), bp 172–176C (1 mm Hg), refr index 1.460–1.466 (25C). Soluble in methanol, benzene, petroleum ether; insoluble in water.

Grade: Technical, NF.

Hazard: Combustible.

Use: Fungicide, bactericide, algicide, antistatic agent for synthetics, insect repellent, medicine (antifungal agent).

hexil. See hexanitrodiphenyl amine.

hexite. See hexanitrodiphenyl amine.

hexobarbital. (*n*-methyl-5-cyclohexenyl-5-methylbarbituric acid).

CAS: 56-29-1. $C_{12}H_{16}N_2O_3$.

Properties: White crystals. Mp 145–147C.

Use: Medicine (sedative).

See barbiturate.

“Hexogen Octoate” [AKZO]. TM for a series of paint driers made with odorless solvents, essentially solutions of metallic salts of 3-ethylhexoic acid.

Available forms: Supplied in a variety of high metal concentrations including calcium 4%, calcium 5%, cobalt 6%, lead 24%, manganese 6%, iron 6%, and zinc 8%.

hexoic acid. See caproic acid.

hexokinase. An enzyme that catalyzes the formation of adenosine diphosphate and hexose-6-phosphate from adenosine triphosphate and glucose or fructose.

Use: Biochemical research.

hexone. See methyl isobutyl ketone.

hexose. Aldehyde or ketone sugar containing six carbons.

hexyl. (1) The straight-chain group C_6H_{13} ; (2) Hexanitrodiphenylamine.

hexyl acetate.

CAS: 142-92-7. $CH_3COOC_6H_{13}$.

Properties: Colorless liquid; sweet ester odor. Bp 169.2C, d 0.890. Insoluble in water; very soluble in alcohol and ether.

Derivation: From primary and *sec*-hexyl alcohols.

Hazard: Combustible.

Use: Solvent for cellulose esters and other resins, spray base.

***sec*-hexyl acetate.** See methyl amyl acetate.

hexyl alcohol. (1-hexanol; amyl carbinol).

CAS: 111-27-3. $CH_3(CH_2)_4CH_2OH$.

Properties: Colorless liquid. D 0.8186, fp –51.6C, bp 157.2C, bulk d 6.8 lb/gal (20C), refr index 1.1469 (25C), flash p 149F (65C) (TOC), autoign temp 559F (292C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: (1) By reduction of ethyl caproate, (2) from olefins by the Oxo process.

Grade: Technical (90–99%), purified (99.8%).

Hazard: Combustible.

Use: Pharmaceuticals (introduction of hexyl group into hyponotics, antiseptics, perfume esters, etc.), solvent, plasticizer, intermediate for textile and leather finishing agents.

***n*-hexylamine.**

CAS: 111-26-2. $CH_3(CH_2)_5NH_2$.

Properties: Water-white liquid; amine odor. Boiling range 126–132C, fp –21C, d 0.767 (20/20C), refr index 1.419 (20C), flash p 85F (29.4C) (OC). Slightly soluble in water.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Flammable, moderate fire risk.

***n*-hexyl bromide.** (1-bromohexane).

$CH_3(CH_2)_5Br$.

Properties: Colorless to slightly yellow liquid. D 1.165 (20/20C), bp 155.5C. Soluble in alcohol, esters, ethers; insoluble in water.

Grade: 96–98% pure.

Use: Intermediate, for introduction of hexyl group.

hexyl-2-butenolate.

CAS: 19089-92-0. mf: $C_{10}H_{18}O_2$.

Properties: Colorless liquid; fruity odor. D: 0.880, refr index: 1.428–1.449. Sol in alc, fixed oils; insol in water, propylene glycol.

Hazard: Low toxicity by ingestion and skin contact. A skin irritant.

Use: Food additive.

***n*-hexyl 2-butenolate.** See hexyl-2-butenolate.

***n*-hexyl “Carbitol” [Dow].** TM for diethylene glycol monohexyl ether.

***n*-hexyl “Cellosolve” [Dow].** TM for ethylene glycol monohexyl ether.

hexyl cinnamaldehyde.

CAS: 101-86-0. $C_6H_{13}C(CHO):CHC_6H_5$.

Properties: Pale-yellow liquid; jasminelike odor, particularly on dilution. D 0.953–0.959 (25C), refr index 1.5480–1.5520 (20C). Soluble in most fixed oils and in mineral oil; insoluble in glycerol and in propylene glycol.

Grade: FCC.

Hazard: Combustible.

Use: Flavoring agent.

hexyl crotonate. See hexyl-2-butenolate.

hexylene. See 1-hexene.

hexylene glycol. (4-methyl-2,4-pentanediol).CAS: 107-41-5. $(\text{CH}_3)_2\text{COHCH}_2\text{CH}_2\text{OCH}_3$.**Properties:** Colorless liquid; nearly odorless. D 0.9216 (20/4C), bp 198.3C, refr index 1.4276 (20C), flash p 200F (OC) (93C); bulk d 7.69 lb/gal. Miscible with water; hydrocarbons, and fatty acids.**Hazard:** Toxic by ingestion and inhalation; irritant to skin, eyes, and mucous membranes. TLV: ceiling 25 ppm. Combustible.**Use:** Hydraulic brake fluids, printing inks, coupling agent and penetrant for textiles, fuel and lubricant additive, emulsifying agent, inhibitor of ice formation in carburetors, cosmetics.

See 1,6-hexanediol.

n-hexyl ether.CAS: 112-58-3. $\text{C}_6\text{H}_{13}\text{OC}_6\text{H}_{13}$.**Properties:** Colorless liquid; characteristic odor. D 0.7942 (20/20C), bulk d 6.6 lb/gal (20C), fp -43.0C , viscosity 1.68 cP (20C), flash p 170F (76.6C), autoign temp 369F (187C). Very slightly soluble in water.**Hazard:** Combustible.**Use:** Extraction processes, manufacture of collodion, photographic film, and smokeless powder.**hexylic acid.** See caproic acid.**hexyl isovalerate.** mf: $\text{C}_{11}\text{H}_{22}\text{O}_2$.**Properties:** Colorless liquid; pungent, fruity odor. D: 0.853, refr index: 1.417. Sol in alc, fixed oils; insol in water.**Use:** Food additive.**hexyl mercaptan.** $\text{C}_6\text{H}_{13}\text{SH}$.**Properties:** Colorless liquid; unpleasant odor. Bp 149–150C (768 mm Hg), d 0.8450 (20/4C), refr index 1.4492 (20C).**Grade:** 95% min purity.**Hazard:** Combustible.**Use:** Intermediate, synthetic rubber processing. See thiol.**hexyl methacrylate.** $\text{C}_6\text{H}_{13}\text{OOC}(\text{CH}_3)=\text{CH}_2$.**Properties:** Liquid. D 0.88, bp 67–85C (8 mm Hg).**Hazard:** Combustible.**Use:** Monomer for plastics, molding powder, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.**2-(2-(2-(hexyloxy)ethoxy)ethoxy)ethanol.**CAS: 25961-89-1. mf: $\text{C}_{12}\text{H}_{26}\text{O}_4$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**((hexyloxy)sulfinyl)methylcarbamic acid-2,3-dihydro-2,2-dimethyl-7-benzofuranyl ester.**CAS: 77248-43-2. mf: $\text{C}_{18}\text{H}_{27}\text{NO}_4\text{S}$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**p-tert-hexylphenol.** $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{OH}$.**Properties:** Water-white liquid; faint phenol odor. D 0.986 (20/20C), boiling range 155–165C, refr index 1.520 (20C), flash p 285F (140C).**Hazard:** Combustible.**Use:** Organic synthesis, preparation of resinous condensation products.**hexylresorcinol.** (1,3-dihydroxy-4-hexylbenzene).CAS: 136-77-6. $\text{C}_6\text{H}_3(\text{OH})_2(\text{C}_6\text{H}_{13})$.**Properties:** Yellow, viscous liquid that solidifies on standing, or needle-shaped crystals; faint fatty odor; astringent taste. Mp 62–67C, bp 333C. Slightly soluble in water; freely soluble in alcohol, glycerol, and vegetable oils.**Grade:** NF.**Hazard:** Irritant to respiratory tract and skin, concentrated solutions are vesicant.**Use:** Medicine (topical antiseptic).**hexyltrichlorosilane.** $\text{C}_6\text{H}_{13}\text{SiCl}_3$.**Properties:** Colorless liquid; sharp penetrating odor. Fumes strongly in moist air.**Hazard:** Toxic by ingestion and inhalation, strong irritant. Combustible.**Use:** Chemical intermediate.**1-hexyne.** (butyl acetylene). $\text{C}_4\text{H}_9\text{C}\equiv\text{CH}$.**Properties:** Water-white liquid; characteristic odor. D 0.7152 (20/4C), refr index 1.3990 (20C), bp 71.4C, fp -132C .**Hazard:** Probably flammable.**hexynol.** (1-hexyn-3-ol). $\text{CH}_3(\text{CH}_2)_2\text{CH}_2\text{OC}\equiv\text{CH}$.**Properties:** Light-yellow liquid; strong odor. Bp 142C, d 0.882 (20/20C). Slightly soluble in water; miscible with most hydrocarbons, chlorinated solvents, ketones, alcohols, and glycols.**Hazard:** Toxic by ingestion and inhalation, absorbed by skin. Probably flammable.**Use:** Corrosion inhibitor against mineral acids, high-temperature oil-well-acidizing inhibitor.**Heyrovsky, Jaroslav.** (1890–1967). A Czechoslovakian physiochemist who won the Nobel Prize for chemistry in 1959. He is known for work in electrochemistry. He developed polarographic and oscillo-polarographic methods. Although his Ph.D. was from the University of Prague, he later studied in London.**Hf.** Symbol for hafnium.**HFPO.** See hexafluoropropylene epoxide.

HFG. See glucagon.

Hg. Symbol for mercury (Latin: hydrargyrum).

HGP. Human Genome Project.

“HGR” [Dow]. TM for an ion exchange resin used in water-treating and chemical process applications, strong acid cation exchange resin, 10% divinylbenzene cross-linked.

HHDN. Abbreviation for hexachlorohexahydrodimethanonaphthalene. See aldrin.

HHMI. Howard Hughes Medical Institute.

hidden maximum system. See peritectic system.

hiding power. See opacity.

hi-flash naphtha. See naphtha (2a).

high-energy compound. A compound that on hydrolysis undergoes a large decrease in free energy under standard conditions.

high-fructose corn syrup.

Properties: Water-white to light yellow viscous liquid; sweet taste. Misc with water.

Use: Food additive.

highly conserved sequence. DNA sequence that is very similar across several different types of organisms.

See gene; mutation.

high-performance liquid chromatography.

(HPLC). A type of chromatography using relatively high pressures and small diameter column packings to achieve sharp and highly reproducible elution profiles. Used to be called high pressure liquid chromatography.

high polymer. See polymer, high.

high-throughput sequencing. A fast method of determining the order of bases in DNA. See sequencing.

high vacuum distillation. See molecular distillation.

Hilbert-Johnson reaction. Reaction of 2,4-dialkoxyprymidines with halogenoses to yield pyrimidine nucleosides.

Hildebrand, Joel. (1891–1983). One of the most distinguished American chemists and teachers. Born in New Jersey, he obtained his doctorate in chemistry and physics from the University of Penn-

sylvania. After studying abroad under Nernst and van't Hoff, he became professor of Chemistry at the University of California, Berkeley, in 1913 where he remained until retirement. He made many important contributions to physical chemistry, particularly in the area of nonelectrolyte solutions; his treatise on this subject is a recognized classic and his textbook on the principles of chemistry established a new standard of excellence. He also made important contributions to the thermodynamics of vaporization of liquids. He proposed the use of helium in deep-sea diving equipment, which has become accepted practice. A gifted teacher and lecturer, he continued his constructive research to the end of his long life. He was unusually active in outdoor sports such as swimming, skiing, and hiking. Among his numerous awards were the Nichols and William Gibbs medals and the Priestley medal.

hindered isocyanate. See isocyanate generator.

hindrance. See steric hindrance.

Hinsberg oxindole synthesis. Formation of oxindoles from secondary aryl amines and sodium bisulfite addition compound of glyoxal; primary aryl amines give glycine or glycinamide derivatives.

Hinsberg reaction. Reaction of primary and secondary amines with sulfonyl halides to give sulfonamides; because the products from primary amines are soluble in alkali and those from secondary amines are not, and since tertiary amines do not react, this method is useful for the separation and identification of amines.

Hinsberg sulfone synthesis. Formation of sulfonylquinol derivatives by addition of quinones to cold, dilute aqueous solutions of sulfinic acids.

Hinsberg synthesis of thiophene derivatives. Formation of thiophene carboxylic acids from α -diketones and dialkyl thiodiacetate.

Hinshelwood, Sir Cyril N. (1897–1968). An English chemist who won the Nobel Prize for chemistry in 1956 along with Semenov, a Russian. He authored “The Kinetics of Chemical Change,” “The Structure of Physical Chemistry,” and many other journal articles. His work clarified inorganic and organic reactions. He was educated at Oxford before he began lecturing and research.

“Hippuran” [Mallinckrodt]. TM for brand of iodohippurate sodium, a water-soluble X-ray contrast medium.

hippuric acid. (benzaminoacetic acid; benzoylaminoacetic acid; benzoylglucocoll; benzoylglycin).
CAS: 495-69-2. $C_6H_5CONHCH_2COOH$.

Properties: Colorless crystals. D 1.371 (20C), mp 188C, decomposes on further heating. Soluble in hot water, alcohol, and ether.

Use: Organic synthesis and medicine.

His. Abbreviation for histidine.

“Hi-Sil” [PPG]. TM for a group of hydrated, amorphous silicas used as reinforcing pigments in elastomers, as fillers and brightening agents in paper and paints, and as flow conditioners.

Use: In adhesives, caulks, and sealants.

histaminase. An enzyme occurring in the animal digestive system; it converts histidine to histamine.

histamine. (4-aminoethylglyoxaline; 4-(2-aminoethyl)imidazole; 4-imidazole ethylamine). CAS: 51-45-6. $\text{NH}_2\text{CH}_2\text{CH}_2\text{C}_3\text{H}_3\text{N}_2$.

Properties: White crystals. Mp 83–84C, bp 209–210C (18 mm Hg). Soluble in water; slightly soluble in alcohol. A product of the degradation of histidine, histamine occurs in animal and human body tissues and is liberated by injury to the tissue or whenever a protein is decomposed by putrefactive bacteria.

Use: (As hydrochloride or phosphate) Medicine (diagnostic aid).

See antihistamine.

histidine. (α -amino- β -imidazolepropionic acid).

CAS: 71-00-1. $\text{HOOCCH}(\text{NH}_2)\text{CH}_2\text{C}_3\text{H}_3\text{N}_2$. An amino acid essential for rats. It is found naturally in the L(-) form.

Properties: Colorless crystals. DL-histidine, mp 285–286C with decomposition; D(+)-histidine, mp 287–288C; L(-)-histidine, mp 277C with decomposition. Soluble in water; insoluble in alcohol and ether. Shows optical activity. Available commercially as L(+)-histidine hydrochloride and as the free base.

Derivation: From blood corpuscles, organic synthesis.

Use: Medicine, feed additive, biochemical research, dietary supplement.

histidine monohydrochloride. mf: $\text{C}_6\text{H}_9\text{N}_3\text{O}_2 \cdot \text{HCl} \cdot \text{H}_2\text{O}$.

Properties: White needles, plates, or crystalline

powder; sltly bitter taste. Decomp 250°. Sol in water; insol in alc, ether.

Use: Food additive.

histochemistry. A branch of biochemistry devoted to the study of the chemical composition and structure of animal and plant tissues. It involves the use of microscopic, X-ray diffraction, and radioactive tracer techniques in examining the cellular composition and structure of bones, blood, muscle, and other animal and vegetable tissues. It is also applied to study of the action of herbicides, defoliants, etc. See cytochemistry.

histone. The family of five basic proteins (H1, H2A, H2B, H3, and H4) that associate tightly with DNA in the chromosomes of all eukaryotic cells. They contain varying amounts of the amino acids lysine, arginine, cysteine, and glycine.

history, chemistry. See Appendix II A–E.

“HiTEC” Antioxidants [Albemarle]. TM for a series of gasoline antioxidants based on phenols (chiefly di-*tert*-butyl phenol). They inhibit formation of gum and peroxides in gasoline and the formation of decomposed products of jet fuels in storage. Also used for steam-turbine and industrial oils and to retard decomposition of antiknock compounds in gasoline.

“Hitec” [Du Pont]. TM for a eutectic mixture composed of sodium nitrite, sodium nitrate, and potassium nitrate.

Use: Heat-transfer medium for both heating and cooling operations in the range of 149–537C, such as maintaining reactor temperature, high-temperature distillation, and preheating of reactants.

HMAF. See 6-(hydroxymethyl)acylfulvene.

HMDS. Abbreviation for hexamethyldisilazane.

HMF black. Abbreviation for high-modulus furnace black.
See carbon black.

HMM. Abbreviation for hexamethylmelamine.
See hemel.

HMPA. Abbreviation for hexamethylphosphoramide.
See hempa.

HMTA. Abbreviation for hexamethylenetetramine.

HNM. Abbreviation for hexanitromannite.
See mannitol hexanitrate.

hnRNA. Heterogeneous nuclear RNA; refers collectively to the variety of RNAs found in the nu-

cleus, including primary transcripts, partially processed RNAs and snRNA. The term hnRNA is often used just for the unprocessed primary transcripts, however.

Ho. Symbol for holmium.

hob. A hardened steel master die used to make multiple mold cavities by forcing it into soft steel or beryllium-copper blanks.

Hoch-Campbell aziridine synthesis. Formation of aziridines by treatment of ketoximes with Grignard reagents and subsequent hydrolysis of the organometallic complex.

Hodgkin, Dorothy C. (1910–1994). An Egyptian-born chemist who was recipient of the Nobel Prize for chemistry in 1964. Her work involved determining the structure of vitamin B₁₂, cholesterol iodide, and the antibiotic penicillin by using X-ray crystallographic analysis. She was educated at Oxford and Cambridge.

Hoffman, Roald. (1937–). A Polish-born chemist who won the Nobel Prize for chemistry with Fukui in 1981. His work involved applying the theories of quantum mechanics to predict the course of chemical reactions.

Hofmann, August Wilhelm. (1818–1892). A German organic chemist who studied under Liebig. While professor of chemistry at the Royal College of Chemistry in London, he did original research on coal-tar derivatives that later led him into a study of organic dyes. Perkin, who first synthesized the dye mauveine in England, was a student of Hofmann. When the latter returned to Germany he continued his work in the field of dyes, which became the basis of German leadership in synthetic dye manufacture that continued until World War I.

Hofmann degradation. Formation of an olefin and a tertiary amine by pyrolysis of a quaternary ammonium hydroxide; useful for the preparation of some cyclic olefins and for opening nitrogen-containing ring compounds.

Hofmann isonitrile synthesis. Formation of isonitriles by the reaction of primary amines with chloroform in the presence of an alkali; the odor of the isocyanide is a test for a primary amine.

Hofmann-Löffler-Freytag reaction. Formation of pyrrolidines or piperidines by thermal or photochemical decomposition of protonated *N*-haloamines.

Hofmann-Martius rearrangement. Thermal conversion of *N*-alkylaniline hydrohalides to *o*- and *p*-alkylanilines.

Hofmann rule. When a quaternary ammonium hydroxide containing different primary alkyl radicals is decomposed, the least-substituted olefin is formed preferentially.

Hofmann-Sand reaction. Olefin mercuration with mercuric salts (halides, acetates, nitrates, or sulfates) in aqueous solution. In alcoholic solutions, the accelerated reaction produces alkoxyalkyl compounds.

Hofmann's reaction. Reaction used for preparation of a primary amine from an amide by treatment with a halogen (bromine usually) and caustic soda. The resulting amine has one fewer carbon atom than the amide used.

Hofmann's Violet. (triethylrosaniline hydrochloride; CI 42530). C₂₆H₃₂N₃HCl. Water-soluble green powder.

Use: Dye for inks and textiles, biological stain.

hog. A large enclosed chamber equipped either with rotating knives or heavy hammers by which wood is disintegrated to a uniform degree of fineness.

hole. In semiconductor terminology, a hole is an energy deficit in a crystalline lattice due to (1) electrons ejected from unsatisfied covalent bonds at sites where an atom is missing, i.e., a vacancy, or (2) electrons supplied by atoms of impurities in the crystal, e.g., arsenic or boron. The free electrons from these sources move through the crystal, leaving positively charged energy deficits that are considered to move as they become alternately filled and vacated by electrons, creating a flow of positive electricity.

See semiconductor.

Holliday intermediate. An intermediate in genetic recombination in which two double-stranded DNA molecules are joined by virtue of a reciprocal crossover involving one strand of each molecule.

holmium. Ho. Metallic element of atomic number 67, group IIIB of the periodic table, one of the rare-earth elements of the yttrium subgroup, aw 164.9303, valence of 3, no stable isotopes.

See rare-earth metals.

Properties: Crystalline solid with metallic luster. D 8.803, mp 1470C, bp 2720C. Reacts slowly with water; soluble in dilute acids. Has one of the highest nuclear moments of any rare earth. Important magnetic and electrical properties.

Occurrence: In gadolinite and monazite.

Derivation: Reduction of the fluoride by calcium.

Grade: Lumps, ingots, bulk sponge, powder. Highest purity is nuclear grade 99.9+%.

Use: Getter in vacuum tubes, research in electrochemistry, spectroscopy.

holmium chloride. HoCl_3 .

Properties: Bright-yellow solid. Mp 718C, bp 1500C. Soluble in water.

holmium fluoride. HoF_3 .

Properties: Bright-yellow solid. Mp 1143C, bp above 2200C. Insoluble in water.

holmium oxide. (holmia). Ho_2O_3 .

Properties: Light-yellow solid. Slightly hygroscopic; soluble in inorganic acids.

Grade: 98–99%.

Use: Refractories, special catalyst.

holocellulose. The entire water-insoluble carbohydrate fraction of wood (60–80%). It is composed of α -cellulose and hemicellulose; it contains hexosan and pentosan polymers and varies widely in degree of crystallinity.

holoenzyme. A catalytically active enzyme including all necessary subunits, prosthetic groups, and cofactors.

holography. Production of a unique three-dimensional image on photographic film by means of an interference pattern created by a laser beam that is split by a mirrorlike device. The beam is divided in such a way that one portion is reflected from the subject while the other forms a direct image; the resulting superimposition results in an unusual 3-D effect.

Use: The technique has a number of practical applications in airplane flight control, missile guidance systems; other uses will undoubtedly develop.

holopulping. A method for making paper pulp without use of sulfur compounds that has been proposed as an eventual replacement for the kraft process (sodium sulfate). More selective delignification of the wood fibers is obtained by alkaline oxidation of extremely thin (0.03 inch) wood chips at low temperature and pressure, followed by solubilization of the lignin fraction. Holopulping has other advantages over the kraft process: (1) A 65–80% carbohydrate yield compared to 45–50% for kraft. (2) Holopulp may be used for a dense paper such as glassine or for a bulky board. Its use in tissue and printing grades offers improved strength. (3) Low temperatures and atmospheric pressure. (Kraft pulping is carried out at 170C and under pressure.) Readily adaptable to continuous operation and automatic control. (4) Air pollution is greatly reduced because the organic materials are burned and few odorous compounds are formed. Stream pollution is minimized by countercurrent washing. The remaining calcium sludge waste is easily disposed of without harmful effects.

holothurin. Steroid glucoside (saponin) having antibiotic properties, extracted from the sea cucum-

ber. It is reported to have suppressed growth of tumors in mice.

homoaromoline.

CAS: 17132-74-0. mf: $\text{C}_{37}\text{H}_{40}\text{N}_2\text{O}_6$.

Hazard: A poison.

homatropine. $\text{C}_{16}\text{H}_{21}\text{NO}_3$. An alkaloid.

Properties: White crystals. Mp 95.5C. Slightly soluble in water.

Derivation: Condensation of tropine and mandelic acid.

Hazard: Toxic by ingestion and inhalation.

Use: Medicine (usually in the form of its salts).

homeobox. A short stretch of nucleotides whose base sequence is virtually identical in all the genes that contain it. It has been found in many organisms from fruit flies to human beings. In the fruit fly, a homeobox appears to determine when particular groups of genes are expressed during development.

homeostasis. The maintenance of a dynamic steady state by regulatory mechanisms that compensate for changes in circumstances. For example, maintaining body temperature whether in a 20C or a 4C environment.

homeotic genes. Genes originally defined as regulating the development of the pattern of segments in the *Drosophila* body plan. Similar genes are now known to occur in most vertebrates.

homo-. A prefix meaning the same or similar; usually designating a homolog of a compound, differing in formula from the latter by an increase of CH_2 .

See homologous series.

homocyclic. A ring compound containing only one kind of atom in the ring structure, e.g., benzene. See heterocyclic.

homogeneous. (Latin, "the same kind"). This term, in its strict sense, describes the chemical constitution of a compound or element. A compound is homogeneous since it is composed of one and only one group of atoms represented by a formula. For example, pure water is homogeneous because it contains no other substance than is indicated by its formula, H_2O . Homogeneity is a characteristic property of compounds and elements (collectively called substances) as opposed to mixtures. The term is often loosely used to describe a mixture or solution composed of two or more compounds or elements that are uniformly dispersed in each other. Actually, no solution or mixture can be homogeneous; the situation is more accurately described by the phrase "uniformly dispersed." Thus so-called homogenized milk is not truly homogeneous; it is a mixture in which the fat particles have been mechanically reduced to a size that permits uniform dispersion and

consequent stability.

See mixture; compound; heterogeneous; substance.

homogeneous catalysis. See catalysis, homogeneous.

homogeneous reaction. A chemical reaction in which the reacting substances are in the same phase of matter, i.e., solid, liquid, or gaseous. See catalysis, homogeneous.

homogenization. A mechanical process for reducing the size of the fat particles of an emulsion (usually milk) to uniform size, thus creating a colloidal system that is unaffected by gravity. The original diameter of the fat particles (6–10 microns) is reduced to 1–2 microns, with an increase in total surface area of 4–6 times. This is done by passing the milk through a homogenizer (or colloid mill), a machine having small channels, under a pressure of 2000–2500 psi at a speed of approximately 700 ft/sec. This operation not only brings about a permanently stable system, but also changes the properties of the milk in respect to taste, color, and the chemical nature of the protective coating on the fat particles. It also increases its sensitivity to light and its tendency to foam. The forces involved are shear, impingement, distention, and cavitation. See homogeneous; colloid mill.

homolog. A member of a chromosome pair in diploid organisms, or a gene that has the same origin and functions in two or more species.

homologies. Similarities in DNA or protein sequences between individuals of the same species or among different species.

homologous chromosomes. A pair of chromosomes containing the same linear gene sequences, each derived from one parent.

homologous genetic recombination. Recombination between two DNA molecules of similar sequence, occurring in all cells; occurs during meiosis and mitosis in eukaryotes.

homologous proteins. Proteins from different species having similar sequences and similar functions in each. For example, the many species that have hemoglobin, which transports oxygen in all.

homologous recombination. Swapping of DNA fragments between paired chromosomes.

homologous series. A series of organic compounds in which each successive member has one more CH_2 group in its molecule than the preceding member. For instance CH_3OH (methanol), $\text{C}_2\text{H}_5\text{OH}$ (ethanol), $\text{C}_3\text{H}_7\text{OH}$ (propanol), etc., form a homologous series.

homomenthyl salicylate. (3,3,5-trimethylcyclohexyl salicylate). $(\text{CH}_3)_3\text{C}_6\text{H}_8\text{OOC}_6\text{H}_4\text{OH}$. A homolog of menthyl salicylate.

Properties: Light-yellow oil; odorless. Neutral and nonirritating to the skin. Absorbs UV radiation in sunlight (2940–3200 Å). Insoluble in water; soluble in alcohol, chloroform, and ether.

Use: UV filter for antisonburn creams.

homomorphs. Molecules similar in size and shape. They need have no other characteristics in common. Many properties of several homomorphs can be predicted by knowing properties of one.

homophthalic acid. $\text{C}_6\text{H}_4(\text{CH}_2\text{COOH})\text{COOH}$.

Properties: Light-tan powder.

Use: Intermediate.

homopolar adsorption. See apolar adsorption.

homopolymer. A natural or synthetic high polymer derived from a single monomer. An example of a natural homopolymer is rubber hydrocarbon, whose monomer is isoprene; a synthetic homopolymer is typified by polychloroprene or polystyrene, whose monomers are, respectively, chloroprene and styrene.

See polyblend.

homopolysaccharide. A polysaccharide made up of only one type of monosaccharide unit.

homosalate. $\text{C}_{16}\text{H}_{22}\text{O}_3$.

Properties: Liquid. Bp 162C (4 mm Hg), d 1.05, refr index 1.51.

Use: Sunscreening agent.

***o*-homosalicylic acid.** See cresotic acid.

homotropic enzyme. An allosteric enzyme that is modulated by its substrate.

homotropine.

CAS: 87-00-3. mf: $\text{C}_{16}\text{H}_{21}\text{NO}_3$.

Hazard: Moderately toxic by ingestion and subcutaneous routes.

homoveratric acid. (3,4-dimethoxyphenylacetic acid). $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{COOH}$.

Properties: Crystals. Mp 94–101C. Very slightly soluble in water; soluble in most organic solvents.

homoveratrylamine. (3,4-dimethoxyphenylethylamine). $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3(\text{CH}_2)_2\text{NH}_2$.

Properties: Colorless to pale-yellow liquid; slight vanilla odor. D 1.09 (25/25C), solidifies 15C, bp 295C (decomposes), refr index 1.5442–1.5452 (25C).

homozygote. Having identical alleles at one or more loci in homologous chromosome segments.

honey. A unique mixture of a number of low-molecular-weight sugars (except sucrose) but including invert sugar. It is considerably sweeter than glucose.

Use: A food and sweetener since the beginning of civilization, also has applications in medicine and tobacco processing.

“Honeywell Bulk Etch” [Honeywell]. TM for liquid, wafer-thinning materials.

Use: For rapid and uniform removal of all remnants of individual back grind damage.

“Honeywell Polish Etch I & II” [Honeywell]. TM for a revealing liquid for wafer-thinning materials.

Use: Used as a contour etch to delineate cracks and scratches.

“Honeywell Texture Etch” [Honeywell].

TM for a liquid texture material.

Use: On wafer-thinning materials to increase surface area with uniform dimples to promote improved back metal tensile strength.

Hooker reaction. Oxidation of 2-hydroxy-3-alkyl-1,4-quinones with dilute alkaline permanganate with shortening of the alkyl side chain by a methylene group and simultaneous exchange of hydroxyl and alkyl or alkenyl group positions.

Hooke’s law. When a load is applied to any elastic body so that the body is deformed or strained, then the resulting stress (the tendency of the body to resume its normal condition) is proportional to the strain. Stress is measured in units of force per unit area, strain is the extent of the deformation. For example, when a bar of metal is subjected to a stretching load, the extent of the increase in length of the bar is directly proportional to the force per unit area, i.e., to the stretching load or stress. In general Hooke’s law applies only up to a certain stress called the yield strength.

hopcalite. A mixture of oxides of copper, cobalt, manganese, and silver.

Use: In gas masks, as a catalyst converting carbon monoxide to carbon dioxide.

Hazard: Not safe for a respirator when nitroparaffin vapors are present.

hop extract, modified.

Properties: An extract of hops by a variety of organic solvent extractions.

Use: Food additive.

hops. A plant of the genus *Humulus* widely grown in temperate climates.

Use: Beer making.

See brewing.

hops oil.

Properties: From steam distillation of cones from female *Humulus lupulus* L. or *Humulus americanus* Nutt. (Fam. *Moraceae*). Yellow liquid; aromatic odor. D: 0.825–0.926, refr index: 1.470–1.494 @ 20°. Sol in fixed oils, mineral oil; insol in glycerin, propylene glycol.

Use: Food additive.

horizon. See soil.

“Hormodin” [Merck]. TM for a formulation of indolebutyric acid.

17-hormoforin. See DHEA.

hormone. An organic compound (peptide, steroid) synthesized in small amounts by an endocrine tissue and carried in the blood to another tissue, where it acts as a messenger to regulate the function of the target tissue.

Hormones regulate such physiological processes as metabolism, growth, reproduction, molting, pigmentation, and osmotic balance. They are sometimes called “chemical messengers.” Hormones produced by one species usually show similar action in other species. They vary widely in chemical nature, some are steroids—estrogen, progesterone, cortisone—while others are amino acids (e.g., thyroxine), polypeptides (vasopressin), low-molecular-weight proteins (insulin), and conjugated proteins. Amino acid and steroid hormones have been isolated and many (including insulin) have been synthesized and are manufactured for medical purposes. Other types are made directly from the endocrine organs of animals.

hormone, plant. See plant growth regulator.

hormone receptor. A protein in, or on, the surface of the target cells of a tissue that functions as a sensor for the hormone by binding the hormone and initiating a cellular response.

hormone therapy. Treatment that prevents certain cancer cells from getting the hormones they need to grow.

“Hornstone” [Grace]. TM for zinc fluosilicate concrete hardener.

host-guest chemistry. Study of molecules which can enclose ions or atoms within their structure without the normal chemical bonding. See cavitands; buckminsterfullerene.

host strain (bacterial). The bacterium used to harbor a plasmid. Typical host strains include HB101 (general purpose *E. coli* strain), JM101 and JM109 (suitable for growing M13 phages), XL1-Blue. Many host strains are available commercially.

hot. Slang for highly radioactive, e.g., hot laboratory.

hot-melt composition. See adhesive, hot-melt; sealant; asphalt; bitumen.

hot-short. See short.

Houben-Fischer synthesis. Formation of aromatic nitriles by basic hydrolysis of trichloromethyl aryl ketimines obtained by Hoesch synthesis (but not from dichloro- or monochloromethyl aryl ketimines). Acidic hydrolysis yields ketones.

Houben-Hoesch reaction. Synthesis of acylphenols from phenols or phenolic ethers by the action of organic nitriles in the presence of hydrochloric acid and aluminum chloride as catalyst.

Houdrifiow process. A moving-bed type of catalytic cracking in which the catalyst pellets move downward through a reactor concurrently with the feed. The catalyst is then separated and regenerated for further use.

See Thermoform process.

Houdry cracking process. Decomposition of petroleum or heavy petroleum fractions into more useful lower-boiling materials by heating at 500C and 30 psi over a silica-alumina-manganese oxide catalyst.

housekeeping genes. Those genes expressed in all cells because they provide functions needed for sustenance of all cell types.

“Howmet Castings” [Alcoa Kasei]. TM for a wide variety of aluminum cast products.

HPA. Abbreviation for hydroxypropyl acrylate.

HPC black. Abbreviation for hard-processing channel black.
See carbon black.

HPLC. Abbreviation of high-performance liquid chromatography.
See: high-performance liquid chromatography.

HPMPC. See (s)-1-(3-hydroxy-2-phosphonyl-methoxypropyl)cytosine.

HS. (1) Symbol for hassium. (2) Abbreviation for hydroxylamine sulfate.

“HTH” [Olin]. TM for a high-test calcium hypochlorite product commercially available as a stable, water-soluble material in both granular and tablet form, containing a minimum of 70% available chlorine as calcium hypochlorite.

Use: Bleaching, sterilizing, oxidizing.

“HTH-15” [Olin]. TM for an all-purpose germicide, disinfectant, and stain remover. Contains 15% of available chlorine and yields sodium hypochlorite solutions directly when added to water.
Use: Dairy and poultry farm sanitation, for sterilizing glasses and food utensils and general sanitation.

“HTH Sock-It” [Arch]. TM for a shock system for swimming pools.

Use: To kill bacteria and control algae.

HTST. Abbreviation for high-temperature short-time, refers to processes such as pasteurization, sterilization, etc.

HTU. Abbreviation for height of a transfer unit: the height of a distillation column or fractionating tower in which unit separation is achieved by transfer from liquid to vapor or vice versa, of the materials being separated. Unit separation is defined by the differential equation that takes into account the varying concentrations along the column. HTU is also applied to extraction and other countercurrent separation processes.

“Huberfill 93 and 96” [Huber]. TM for sodium magnesium aluminosilicate.

Grade: Dry powder, slurry.

Use: Print quality enhancements, paper fillers, carbonless copy intensifier, and titanium dioxide extender.

Huber, Robert. (1937–). Awarded Nobel Prize for chemistry in 1988, along with Deisenhofer and Michel, for work that revealed the three-dimensional structure of closely-linked proteins which are essential to photosynthesis. Doctorate awarded in 1963 by Technical University of Munich, Germany.

Huber’s reagent. An aqueous solution of ammonium molybdate and potassium ferrocyanide used for detecting free mineral acid. With the exception of boric acid and arsenic trioxide, free mineral acids produce a reddish-brown precipitate, or a turbidity with the reagent.

Hubl’s reagent. (1) 50 g iodine dissolved in 1 L of 95% alcohol; (2) 60 g mercuric chloride dissolved in one L of alcohol; (3) Make up an iodine monochloride solution from (1) and (2). Add an excess to a known weight of the fat or oil dissolved in chloroform. The excess of iodine chloride can be estimated by the potassium iodide and thiosulfate method. By running a blank test, the amount of iodide absorbed can be estimated.

Use: Determination of iodine values of oils and fats.

Hudson isorotation rules. For anomeric (α and β) sugars, Hudson’s isorotation rule states that (1) the rotation of carbon 1 in many sugar derivatives is affected in only a minor degree by changes in the structure of the rest of the molecule and (2)

changes in the structure of carbon 1 affect in only a minor degree the rotation of the remainder of the molecule. Another way of stating the rule is to say that the rotation of any aldose derivative is the algebraic sum of A and B, where A is the contribution of the anomeric center and B is the contribution of the rest of the molecule.

Hudson lactone rule. The value of the rotation of aldonic acid lactones is decisively affected by the configuration of that carbon atom whose hydroxyl group is engaged in the cyclization. If, in the normal Fischer projection formula, the lactone ring is written on the right, the lactone is dextrorotatory; if it is written on the left, the lactone is levorotatory.

human artificial chromosome (HAC). A vector used to hold large DNA fragments.

human gene therapy. Insertion of normal DNA directly into cells to correct a genetic defect.

human genome. The full collection of genes needed to produce a human being.

Human Genome Initiative. Collective name for several projects begun in 1986 to (1) create an ordered set of DNA segments from known chromosomal locations; (2) develop new computational methods for analyzing genetic map and DNA sequence data; and (3) develop new techniques and instruments for detecting and analyzing DNA. This DOE initiative is now known as the Human Genome Program. The national effort, led by DOE and NIH (now including the National Human Genome Research Institute), is known as the Human Genome Project.

Human Genome Project. An international research effort (led in the United States by the National Institutes of Health and the Department of Energy) aimed at identifying and ordering every base in the human genome.

humectant. A substance having affinity for water with stabilizing action on the water content of a material. A humectant keeps within a narrow range the moisture content caused by humidity fluctuations. Example, glycerol.

Use: Tobacco, baked products, dentifrices.

humic acid. A brown, polymeric constituent of soils, lignite, and peat; it contains the brownish-black pigment melanin. It is soluble in bases, but insoluble in mineral acids and alcohols. It is not a well-defined compound, but a mixture of polymers containing aromatic and heterocyclic structures, carboxyl groups, and nitrogen. An excellent chelating agent, important in the exchange of cations in soils. It is a natural stream pollutant and is thought to be capable of triggering the "red tide" phenomenon

due to microorganisms in seawater. Detectable to 0.1 ppm in water.

Use: Drilling fluids, printing inks, plant growth.

humidity, absolute. The pounds of water vapor per pound of dry air in an air-water-vapor mixture.

humidity indicator. A cobalt salt (e.g., cobaltous chloride) that changes color as the humidity of the environment changes. Cobaltous compounds are pink when hydrated and greenish-blue when anhydrous.

humidity, relative. The percentage relation between the actual amount of water vapor in a given volume of air at a definite temperature and the maximum amount of water vapor that would be present if the air were saturated with water vapor at that temperature.

"Humulin" [Lilly]. TM for synthetic insulin. It is the first recombinant DNA product to be made commercially; approved by FDA.

humus. The organic component of soils containing humic acid, fulvic acid, and humin. It is formed by the decay of leaves, wood, and other vegetable matter.

Use: Top soil additive in horticulture, golf courses, and truck gardens; available in 100-lb paper bags and bulk shipments.

See soil (1).

Hunsdiecker reaction. Synthesis of organic halides by thermal decarboxylation of silver salts of carboxylic acids in the presence of halogens.

Hunter process. Production of titanium by reduction with sodium in an atmosphere of argon or helium.

"Huskey" [Specialty Lubes]. TM for specialty lubricants with multiple applications.

HVP. See acid hydrolyzed proteins.

"Hyalure" [LifeCore].

CAS: 9067-32-7. TM for hyaluronic acid.

Use: In orthopedic, ophthalmic, wound-care, drug-delivery, and surgical applications.

hyaluronic acid. A polymer of acetylglycosamine, $C_8H_{13}NO_6$, and glucuronic acid occurring as alternate units with a high molecular weight. Found in vitreous humor (of the eye), synovial fluid, pathologic joints, group A and C hemolytic streptococci, and skin. It appears to bind water in the interstitial spaces, forming a gel-like substance which holds the cells together. Its solutions are highly viscous. The polymeric structure is broken down by the enzyme hyaluronidase.

See "Actimoist" [Active].

“Hyamine” [*Rohm & Haas*]. TM for quaternary-ammonium-type bactericides, algicides, and fungicides, supplied as water-soluble crystals or aqueous solutions.

Hyatt, John Wesley. (1837–1920). Hyatt is generally credited as being the father of the plastics industry. In 1869, he and his brother patented a mixture of cellulose nitrate and camphor which could be molded and hardened. Its first commercial use was for billiard balls. The TM “Celluloid” was the first ever applied to a synthetic plastic product; its flammability hazard limits its use.

hybrid. The offspring of genetically different parents.
See heterozygote.

hybridization. The reaction by which the pairing of complementary strands of nucleic acid occurs. DNA is usually double-stranded, and when the strands are separated they will re-hybridize under the appropriate conditions. Hybrids can form between DNA-DNA, DNA-RNA or RNA-RNA. They can form between a short strand and a long strand containing a region complementary to the short one. Imperfect hybrids can also form, but the more imperfect they are, the less stable they will be (and the less likely to form). To “anneal” two strands is the same as to “hybridize” them.

“Hydan” [*Du Pont*]. TM for methionine hydroxy analog c. 90%.
Use: A source of methionine (an essential amino acid) for poultry, dog, and livestock feeds.

hydantoin. (glycolylurea).
CAS: 461-72-3. NHCONHCOCH_2 .
Properties: White, odorless solid; crystallizing in needles. Mp 220C. Slightly soluble in water and ether; soluble in alcohols and solutions of alkali hydroxides.
Use: Intermediate in the synthesis of pharmaceuticals, textile lubricants, and certain high polymers, including epoxy resins.

hydnocarpic acid. $\text{C}_{16}\text{H}_{28}\text{O}_2$. A component of chaulmoogra oil.

hydrabamine pencillin V. (hydrabamine phenoxymethylpenicillin).
Properties: A water-insoluble mixture of crystalline phenoxymethylpenicillin salts consisting chiefly of the salt of *N,N*-bis(dehydroabietyl)ethylenediamine with smaller amounts of the salts of the dihydro and tetrahydro derivatives.
Use: Medicine (antibacterial).

hydracrylic acid, acrylate.
CAS: 24615-84-7. mf: $\text{C}_6\text{H}_8\text{O}_4$.
Hazard: A severe skin irritant.

“Hydraid” [*Nalco*]. TM for a family of water-soluble organic polymers, some cationic, anionic, and nonionic of various molecular weights and coagulation properties.

Use: Paper and pulp mill retention, drainage and clarification aids.

hydralazine hydrochloride. (1-hydrazino-phthalazine hydrochloride). $\text{C}_8\text{H}_9\text{N}_2\text{NHNH}_2\text{HCl}$.
Properties: White, crystalline powder; odorless. Mp 270–280C (decomposes). Very slightly soluble in ether and alcohol; soluble in water, pH (2% solution) 3.5–4.5.

Grade: NF.
Use: Medicine (antihypertensive agent)

“Hydral”700 Series. [*ALCOA*] $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ or $\text{Al}(\text{OH})_3$, of extremely fine, uniform particle size. TM for several grades of hydrated aluminum oxides.
Properties: Fluffy, snow-white powders.
Use: As fillers in rubber, paper, plastics, adhesives, polishes, inks, paints, cosmetics, and as a flame retarder in plastics.

“Hydraphthal” [*Du Pont*]. TM for a combination solvent and detergent for textile scouring.

hydrargaphen. (phenylmercury methylenedipthalenesulfonate).
CAS: 14235-86-0. $\text{C}_{33}\text{H}_{24}\text{Hg}_2\text{O}_6\text{S}_2$.
Properties: Extremely fine powder. Insoluble in water. Forms colloidal dispersions with strong adsorptive power in sodium or potassium dinaphthylmethane disulfonates.
Hazard: A poison.
Use: Biocide for protection of wool, leather, paints, and wood products.

hydrase. See hydrolase.

hydrate. See hydration.

hydrated aluminum oxide. See alumina trihydrate.

hydrated silica. See silicic acid.

hydration. (1) The reaction of molecules of water with a substance in which the H–OH bond is not split. The products of hydration are called hydrates, e.g.,
 $\text{CuSO}_4 + 5\text{H}_2\text{O} \rightarrow \text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ A given compound often forms more than one hydrate; the hydration of sodium sulfate can give $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ (decahydrate), $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$ (heptahydrate), and $\text{Na}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ (monohydrate). In formulas of hydrates, the addition of the water molecules is conventionally indicated by a centered dot. The water is usually split off by heat, yielding the anhydrous compound.

See water of crystallization; gas hydrate. (2) The strong affinity of water molecules for particles of

dissolved or suspended substances that is the fundamental cause of electrolytic dissociation. Ions and other charged particles thus acquire a tightly held film of water, an effect that is important in the stabilization of colloidal solutions. The phenomenon is also called solvation. The term "hydration" is used in the paper industry to describe the combination of water with wood pulp in the beater, as a result of which fiber-to-fiber adhesion is increased by hydrogen bonding.

See solvation.

hydratropic aldehyde dimethyl acetal.

See 2-phenylpropionaldehyde dimethyl acetal.

hydraulic. (1) Descriptive of a machine or operation in which a liquid is used to exert or transfer pressure, e.g., hydraulic press, hydraulic fracturing. The liquid is usually water, but it may also be of higher viscosity such as a heavy oil or glycol-type lubricant, as in brake fluid. (2) Descriptive of a material that hardens on addition of water, e.g., hydraulic cement.

hydraulic barking. Removal of bark from logs by impingement of a stream of water delivered from one or more nozzles at a pressure of 1200–1400 psi. Several types of machines are used, the best known being the Hansel barker.

hydraulic cement. See cement, hydraulic.

hydraulic fluid. A liquid or mixture of liquids designed to transfer pressure from one point to another in a system on the basis of Pascal's law, i.e., pressure on a confined liquid is transmitted equally in all directions. For industrial use, such fluids are based on paraffinic and cycloparaffinic petroleum fractions, usually with added antioxidant and viscosity index improvers. Flame-resistant types include additives such as phosphate esters or emulsions of water and ethylene glycol. The brake fluids used in autos are composed of (1) a lubricant (polypropylene glycol of 1000–2000 mw, a castor oil derivative, or a synthetic polymeric mixture of monobutyl ethers of oxyethylene and oxypropylene glycols); (2) a solvent blend (mixture of glycol ethers); and (3) additives for corrosive resistance, buffering, etc.; bp 375–550F. The composition and performance characteristics are specified by the Society of Automotive Engineers.

hydraulic fracturing. A method of enhanced recovery of natural gas and petroleum. An aqueous solution of a water-soluble gum (e.g., guar), in which coarse sand or sintered bauxite is suspended, is introduced through a well bore under extremely high pressure into the rock structure in which the gas or oil is entrained. This creates minute fissures (fractures) in the rock which are held open by the suspended particles after the liquid has drained off. The hydrocarbon flows through these fissures to the well

bore, and is evacuated to a pipeline. The sand and bauxite are called "proppants" by petroleum engineers as they prevent the fissures from closing. Sand is used in shallower wells and bauxite in formations over 10,000 ft deep.

See chemical flooding.

hydraulic lime. See lime, hydraulic.

hydraulic press. A simple machine (the only one discovered since prehistoric times) that operates on Pascal's principle (1650): pressure applied to a unit area of a confined liquid is transmitted equally in all directions throughout the liquid. A hydraulic press is comprised of a large piston in an enclosed chamber; its top is attached to a platen that rests on the members of a metal frame when the press is open. Water (or oil) is pumped into the chamber through a valve; once it has been filled, whatever pressure per square inch is applied at the valve will be transmitted to every square inch of the piston and of the walls of the chamber as well. Thus, for a piston whose cross-sectional area is 100 sq in., 10 psi at the valve will exert 1000 lb pressure on the bottom of the piston, causing it to rise and the press to close. The pressure on the object being pressed varies inversely with its area. Hydraulic presses exerting pressures up to 15 tons are used for shaping steel products. Less dramatic are those for molding rubber and plastics, compressing laminates, de-watering solids, and expressing vegetable oils. Some have up to a dozen platens (decks) for multiple-product work. The same principle is used to activate plungers on injection-molding presses.

hydrazine. (hydrazine base; hydrazine, anhydrous; diamine).

CAS: 302-01-2. H_2NNH_2 .

Properties: Colorless, fuming, hygroscopic liquid. Mp 2.0C, bp 113.5C, d 1.004 (25/4C), bulk density 8.38 lb/gal, flash p 126F (52.2C) (OC), autoign temp 518F (270C). Miscible with water and alcohol; insoluble in chloroform and ether. Strong reducing agent and diacidic but weak base. Combustion of hydrazine is highly exothermic, yielding 148.6 kcal/mole; nitrogen and water are products.

Derivation: The preferred method is a two-step process: (1) reaction of sodium hypochlorite and ammonia to yield chloramine (NH_2Cl) and sodium hydroxide; (2) reaction of chloramine, ammonia, and sodium hydroxide to yield hydrazine, sodium chloride, and water. Noteworthy is the need to carry out the reactions in the presence of such colloidal materials as gelatin, glue, or starch to prevent unwanted side reactions that would reduce the yield of hydrazine. An older method utilized the reaction of sodium hypochlorite or calcium hypochlorite with urea.

Grade: To 99% pure.

Hazard: Severe explosion hazard when exposed to heat or by reaction with oxidizers. Toxic by ingestion, inhalation, and skin absorption; strong irritant

to skin and eyes; a carcinogen (OSHA). TLV: 0.1 ppm.

Use: Reducing agent for many transition metals and some nonmetals (arsenic, selenium, tellurium), as well as uranium and plutonium; corrosion inhibitor in boiler feedwater and reactor cooling water; wastewater treatment; electrolytic plating of metals on glass and plastics; nuclear fuel reprocessing; redox reactions; polymerization catalyst; shortstopping agent; fuel cells; blowing agent; scavenger for gases; drugs and agricultural chemicals (maleic hydrazide); component of high-energy fuels; rocket propellant.

hydrazine acid tartrate. (hydrazine tartrate). $N_2H_4 \cdot C_4H_6O_6$.

Properties: Colorless crystals. Mp 182–183C. Soluble in water.

Hazard: See hydrazine.

hydrazine, compd. with borane (1:1).

CAS: 14931-40-9. mf: BH_3N_2 .

Hazard: A poison by ingestion and inhalation. May be unstable at room temperature.

hydrazine dihydrochloride. $N_2H_4 \cdot 2HCl$.

Properties: Colorless crystals. D 1.42, mp 198C (loses hydrogen chloride), bp 200C (decomposes). Soluble in water; slightly soluble in alcohol.

hydrazine hydrate. (diamide hydrate).

CAS: 7803-57-8. $H_2NNH_2 \cdot H_2O$.

Properties: Colorless fuming liquid. Fp –51.7C, bp 119.4C, d 1.032, bulk d 8.61 lb/gal, flash p (OC) 163F. Miscible with water and alcohol; insoluble in chloroform and ether. Strong reducing agent; weak base. Combustible.

Hazard: See hydrazine.

Use: Chemical intermediate, catalyst, solvent for inorganic materials.

hydrazine monobromide. $N_2H_4 \cdot HBr$.

Properties: White, crystalline flakes. Mp 81–87C, decomposes at approximately 190C. Soluble in water and lower alcohols; insoluble in most organic solvents.

Grade: 95%.

Use: Soldering flux.

hydrazine monochloride. $N_2H_4 \cdot HCl$.

Properties: White, crystalline flakes. Mp 87–92C, decomposes at approximately 240C. Soluble in water (37g/100g H_2O at 20C); somewhat soluble in lower alcohols; insoluble in most organic solvents.

hydrazine nitrate. $N_2H_4NO_3$.

Hazard: Severe explosion risk. Poison.

hydrazine perchlorate. $N_2H_4 \cdot HClO_4 \cdot \frac{1}{2}H_2O$.

Properties: Solid. D 1.939, mp 137C, bp 145C. Decomposes in water; soluble in alcohol; insoluble in ether, benzene, chloroform, and carbon disulfide.

Hazard: Severe explosion risk.

Use: Rocket propellant.

hydrazine sulfate. (diamine sulfate; diamidogen sulfate).

CAS: 10034-93-2. $NH_2NH_2 \cdot H_2SO_4$.

Properties: White, crystalline powder. D 1.37, mp 85C. Very soluble in hot water, soluble at 1 part in 33 cold water, insoluble in alcohol, stable in storage, strong reducing agent.

Hazard: A carcinogen (OSHA).

Use: Manufacture of chemicals, condensation reactions, catalyst in making acetate fibers. Analysis of minerals, slags, and fluxes; determination of arsenic in metals; separation of polonium from tellurium; fungicide, germicide.

hydrazine tartrate. $C_4H_{10}N_2O_6$.

Properties: Colorless crystals. Mp 182C.

Use: Deposition of metals, as in silvering mirrors.

2-hydrazino-*n,n*-dimethylethanamine.

CAS: 1754-57-0. mf: $C_4H_{13}N_3$.

Hazard: A poison. Moderately toxic by ingestion and inhalation.

hydrazobenzene. (1,2-diphenylhydrazine).

CAS: 122-66-7. $C_6H_5NHNHC_6H_5$.

Properties: Mw 184.24, mp 123–126C, d 1.158(16/4C).

hydrazoic acid. (hydrogen azide).

CAS: 7782-79-8. HN_3 .

Properties: Colorless, volatile liquid; obnoxious odor. Fp –80C, bp 37C. Soluble in water.

Derivation: Reaction of hydrazine and nitrous acid, or of nitrous oxide and sodium amide (with heat).

Hazard: Dangerous explosion risk when shocked or heated. Strong irritant to eyes and mucous membranes. TLV: CL 0.1 ppm (vapor)

“Hydrex” [Huber]. (sodium magnesium aluminosilicate) TM for titanium dioxide extenders.

Use: Print enhancement; imparting high brightness and opacity; as a paper filler; and carbonless copy intensifier.

hydride. An inorganic compound of hydrogen with another element. Some are ionic and others are covalent. Hydrides may be either binary or complex; the latter are transition-metal complexes, e.g., carbonyl hydrides and cyclopentadienyl hydrides. Most common are hydrides of sodium, lithium, aluminum, boron, etc.

Hazard: Flammable, dangerous fire risk, react violently with water and oxidizing agents. Irritant. See lithium aluminum hydride; sodium borohydride.

hydriodic acid.

CAS: 10034-85-2.

Properties: Colorless or pale-yellow liquid (an aqueous solution of hydrogen iodide, which is a gas at

room temperature), a constant-boiling solution is formed (bp 127, d 1.7) containing 57% hydrogen iodide; strong acid and an active reducing agent.

Derivation: (1) By passing hydrogen with iodine vapor over warm platinum sponge and absorption in water. (2) By the action of iodine on a solution of hydrogen sulfide.

Grade: Technical, 47%; NF, diluted, 10%.

Hazard: Strong irritant to eyes and skin.

Use: Preparation of iodine salts, organic preparations, analytical reagent, disinfectant, pharmaceuticals.

See hydrogen iodide.

hydroabietyl alcohol. See dihydroabietyl alcohol.

hydrobiotite. A natural ore of magnesium, iron, and aluminum silicate occurring in Montana. Source of verxite.

hydroboration. The reaction of diboranes either with alkenes (olefins) to form trialkylboron compounds or with acetylene to yield alkenylboranes. Much research has been devoted to developing these reactions, the products of which are called organoboranes. They are useful in many complex organic syntheses, including prostaglandins and insect pheromones.

See borane; organoborane; carborane.

hydrobromic acid.

CAS: 10035-10-6. Hydrogen bromide in aqueous solution.

Properties: Colorless or faintly yellow liquid consisting of an aqueous solution of hydrogen bromide, which is a gas at room temperature. Soluble in water and alcohol, a constant-boiling solution is formed of d 1.49, containing 48% hydrogen bromide; bp at 700 mm Hg (122C), saturated solution contains 68.8% hydrogen bromide at 0C. Hydrobromic acid is a strong acid and sensitive to light. Noncombustible.

Derivation: By dissolving hydrogen bromide in water or by distilling from a mixture of sodium bromide and 50% sulfuric acid.

Grade: Technical 40%; medicinal 48%, 62%.

Hazard: Strong irritant to eyes and skin.

Use: Analytical chemistry, solvent for ore minerals, manufacture of inorganic and some alkyl bromides, alkylation catalyst.

See hydrogen bromide.

hydrocarbon. An organic compound consisting exclusively of the elements carbon and hydrogen. Derived principally from petroleum, coal tar, and plant sources. Following is a resume of the principal types.

I. Aliphatic (straight-chain)

(1) Paraffins (alkanes): generic formula C_nH_{2n+2} . Saturated, single bonds only.

(2) Olefins: generic formula C_nH_{2n} .

(a) alkenes: unsaturated (one double bond).

(b) alkadienes: unsaturated (two double bonds) (butadiene).

(3) Acetylenes: generic formula C_nH_{2n-2} . Unsaturated (triple bond).

(4) Acyclic terpenes. Unsaturated (polymers of isoprene, C_5H_8).

Note: Some aliphatic compounds have branched chains in which the subchain also contains carbon atoms (isobutane); both chains are essentially straight.

II. Cyclic (closed ring)

(1) Alicyclic: three or more carbon atoms in a ring structure with properties similar to those of aliphatics.

(a) Cycloparaffins (naphthenes): saturated compounds often having a boat or chair structure, e.g., cyclohexane, cyclopentane.

(b) Cycloolefins: unsaturated, two or more double bonds, e.g., cyclopentadiene (2), cyclooctatetraene (4).

(c) Cycloacetylenes (cyclynes): unsaturated (triple bond).

(2) Aromatic: unsaturated, hexagonal ring structure (three double bonds), single rings and double or triple fused rings.

(a) benzene group (1 ring).

(b) naphthalene group (2 rings).

(c) anthracene group (3 rings).

(3) Cyclic terpenes: monocyclic (dipentene); bicyclic (pinene).

Note: Olefinic (isoprenoid) hydrocarbons are produced by a number of plants, notably *Hevea brasiliensis* (rubber), guayule, and various members of the Euphorbiaceae family. Current research on the latter group indicates that they could be used as a source of liquid fuels and chemical feedstocks by genetic modification of the plants and control of their molecular constitution. It is estimated that oil obtained by large-scale cultivation of such plants, which grow well in semi-arid environments, could become economically competitive with petroleum within a few years.

See guayule; biomass; copaiba.

hydrocarbon gas streams. A hydrocarbon such as methane is contacted with a catalyst under moderate conditions of temperature and pressure and decomposed into carbon, which remains on the catalyst, and hydrogen, which is mechanically removed. The hydrogen produced is about 94% pure when the charge stock is methane.

hydrocarbon, halogenated. A hydrocarbon in which one or more of the hydrogen atoms has been replaced by fluorine, chlorine, bromine, or

iodine. Examples: carbon tetrachloride, chlorobenzene, chloroform, trifluoromethane. This greatly increases the anesthetic and narcotic action of aliphatic hydrocarbons. Many halogenated hydrocarbons are highly toxic; some may detonate on contact with barium. A number of the chlorinated types are used as insecticides.

See fluorocarbon; chlorofluorocarbon.

hydrocellulose. See cellulose, hydrated.

hydrochlorbenzethylamine.

CAS: 17692-34-1. mf: $C_{23}H_{31}ClN_2O_3$.

Hazard: Moderately toxic by ingestion.

hydrochloric acid. (HCl).

CAS: 7647-01-0. Hydrogen chloride in aqueous solution.

Properties: Colorless or slightly yellow, fuming, pungent liquid. Flash p none. A constant-boiling acid containing 20% hydrochloric acid is formed. Hydrochloric acid is a strong, highly corrosive acid. The commercial "concentrated" or fuming acid contains 38% hydrochloric acid and has a d 1.19. Soluble in water, alcohol, and benzene. Noncombustible.

Derivation: Dissolving hydrogen chloride in water at various concentrations.

Grade: USP (35–38%), NF dilution (10%), technical (usually 18, 20, 22, 23 degrees Bé, corresponding to 28, 31, 35, 37% hydrogen chloride), FCC.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin. TLV: CL 5 ppm

Use: Acidizing (activation) of petroleum wells, boiler scale removal, chemical intermediate, ore reduction, food processing (corn syrup, sodium glutamate), pickling and metal cleaning, industrial acidizing, general cleaning, e.g., of membrane in desalination plants, alcohol denaturant, laboratory reagent.

See hydrogen chloride.

hydrocinnamic acid. (3-phenylpropionic acid). $C_6H_5CH_2CH_2COOH$.

Properties: Crystals with hyacinth-rose odor. Mp 46C, bp 280C. Soluble in hot water, alcohol, benzene, ether.

Derivation: Reduction of cinnamic acid with sodium amalgam.

Use: Fixative for perfumes, flavoring.

hydrocinnamic alcohol. See phenylpropyl alcohol.

hydrocinnamic aldehyde. See phenylpropyl aldehyde.

hydrocinnamyl acetate. See phenylpropyl acetate.

hydrocolloid. A hydrophilic colloidal material used largely in food products as emulsifying, thickening, and gelling agents. They readily absorb wa-

ter, thus increasing viscosity and imparting smoothness and body texture to the product, even in concentrations of less than 1%. Natural types are plant exudates (gum arabic), seaweed extracts (agar), plant seed gums or mucilages (guar gum), cereal gums (starches), fermentation gums (dextran), and animal products (gelatin). Semisynthetic types are modified celluloses and modified starches. Completely synthetic types are also available, e.g., polyvinylpyrrolidone. Most are carbohydrate polymers but a few such as gelatin and casein are proteins.

hydrocortisone. (17-hydroxycorticosterone; cortisol; hydrocortisone alcohol).

CAS: 50-23-7. $C_{21}H_{30}O_5$. An adrenal cortical steroid hormone.

Properties: White, crystalline powder; odorless; bitter taste. Sensitive to light. Mp 212–220C with some decomposition. Soluble in sulfuric acid; partially soluble in alcohol and propylene glycol.

Derivation: Isolation from extracts of adrenal glands, synthesis from other steroids.

Grade: USP.

Use: Medicine (antiinflammatory agent), also used as the acetate and sodium succinate salts.

See cortisone.

hydrocracking. The cracking of petroleum or its products in the presence of hydrogen. Special catalysts are used, for example, platinum on a solid base of mixed silica and alumina or zinc chloride. See hydrogenation; hydrogenolysis; hydroforming.

hydrocyanic acid. (prussic acid; hydrogen cyanide; formonitrile).

CAS: 74-90-8. HCN.

Properties: Water-white liquid at temperatures below 26.5C; faint odor of bitter almonds. Usual commercial material is 96–99% pure. D (Liquid) 0.688 (20/4C), (gas) 0.938 g/L, bp 26.5C, fp –13.3C, flash p 0F (–17.7C). Soluble in water. The solution is weakly acidic, sensitive to light. When not absolutely pure or stabilized, hydrogen cyanide polymerizes spontaneously with explosive violence. Miscible with water, alcohol, soluble in ether, autoign temp 1000F (537C).

Derivation: (1) By catalytically reacting ammonia and air with methane or natural gas. (2) By recovery from coke oven gases. (3) From bituminous coal and ammonia at 1250C. Hydrogen cyanide occurs naturally in some plants (almond, oleander).

Grade: Technical (96–98%), 2, 5, and 10% solutions. All grades usually contain a stabilizer, usually 0.05% phosphoric acid.

Hazard: Flammable, dangerous fire risk, explosive limits in air 6–41%. Toxic by ingestion inhalation, and skin absorption. TLV: ceiling 4.7 ppm.

Use: Manufacture of acrylonitrile, acrylates, adiponitrile, cyanide salts, dyes, chelates, rodenticides, pesticides.

“Hydro-Darco” [Norit]. TM for activated carbon based adsorbent.

Use: For purification of water, fine chemicals, wastewater, air, and pharmaceuticals. Used for recovery of valuable products as in gold and organic solvents.

hydrodealkylation. (HDA). A type of hydrogenation used in petroleum refining in which heat and pressure in the presence of hydrogen are used to remove methyl or larger alkyl groups from hydrocarbon molecules, or to change the position of such groups. The process is used to upgrade products of low value, such as heavy reformate fractions, naphthenic crudes, or recycle stocks from catalytic cracking. Also toluene and pyrolysis gasoline are converted to benzene and methyl naphthalenes to naphthalene by this process.

See transalkylation.

hydrodistillation. (steam distillation). Removal of essential oils from plant components (flowers, leaves, bark, etc.) by the use of high-temperature steam. The process is used chiefly in the perfume and fragrance industry.

hydrofining. A petroleum refining process in which a limited amount of hydrogenation converts the sulfur and nitrogen in a petroleum fraction to forms in which they can be easily removed. Hydrofining is generally a separate treatment prior to more extensive hydrogenation. The usual catalysts are oxides of cobalt and molybdenum. Desulfurization, ultrafining, and catfining have a similar meaning.

hydroflumethiazide. (trifluoromethylhydrothiazide). $C_8H_8F_3N_2O_2S_2$.

Properties: White, crystalline solid; odorless. Mp 260–275C. Insoluble in water and acid; soluble in dilute alkali but unstable in alkaline solutions.

Grade: NF.

Use: Medicine (antihypertensive).

hydrofluoric acid.

CAS: 7664-39-3. Hydrogen fluoride in aqueous solution.

Properties: Colorless, fuming, mobile liquid. Bp (38% solution) 112C. Will attack glass and any silicon-containing material.

Derivation: Dissolving hydrogen fluoride in water to various concentrations.

Grade: CP, technical, 38%, 47%, 53%, 70%.

Hazard: Toxic by ingestion and inhalation, highly corrosive to skin and mucous membranes. TLV: ceiling 3 ppm.

Use: Aluminum production, fluorocarbons, pickling stainless steel, etching glass, acidizing oil wells, fluorides, gasoline production (alkylation), processing uranium.

See hydrogen fluoride.

hydrofluorosilicic acid. Legal label name (Rail) for fluosilicic acid.

hydrofluosilic acid. See fluosilicic acid.

“Hydrofol” [Ashland]. (stearic acid).

CAS: 57-11-4. TM for an additive.

Use: In esters, greases, candles, crayons, cosmetics, metallic salts, mono- and diglyceride, shaving creams, textile auxiliaries, white stearates, waxes, and rubber compounding.

hydroforming. The use of hydrogen in the presence of heat, pressure, and catalysts (usually platinum) to convert olefinic hydrocarbons to branched chain paraffins (isomerization) to yield high-octane gasoline. Catforming and similar terms are often used in the same sense.

hydrofuranide. (furfuramide).

CAS: 494-47-3. $OC_4H_3CH(NCHC_4H_3O)_2$.

Properties: Light-brown to white powder. Mp 117C, boils about 250C with decomposition. Insoluble in cold water; soluble in alcohol and ether.

Derivation: Treatment of furfural with ammonia.

Use: Rubber accelerator, hardening agent for resins, rodenticides, fungicides.

hydrogasification. Production of gaseous or liquid fuels by direct addition of hydrogen to coal. See gasification.

hydrogen.

CAS: 1333-74-0. H_2 . Nonmetallic element of atomic number 1, group IA of periodic table, atomic weight 1.0079, valence of 1. Molecular formula is H_2 . Isotopes: deuterium (2D), tritium (3T). Hydrogen discovered by Cavendish in 1766, named by Lavoisier in 1783.

Properties: A diatomic gas. D 0.08999 g/L, d 0.0694 (air = 1.0), specific volume 193 cu ft/lb (21.1C), fp -259C, bp -252C, autoign temp 1075F (580C). Very slightly soluble in water, alcohol, and ether; Noncorrosive; can exist in crystalline state at from 4–1 K; classed as an asphyxiant gas; rate of permeation through solids is approximately four times that of air.

Occurrence: Chiefly in combined form (water, hydrocarbons, and other organic compounds), traces in earth's atmosphere. Unlimited quantities in sun and stars. It is the most abundant element in the universe.

Derivation: (1) Reaction of steam with natural gas (steam reforming) and subsequent purification; (2) partial oxidation of hydrocarbons to carbon monoxide and interaction of carbon monoxide and steam; (3) gasification of coal (see Note 1); (4) dissociation of ammonia; (5) thermal or catalytic decomposition of hydrocarbon gases; (6) catalytic reforming of naphtha; (7) reaction of iron and steam; (8) catalytic reaction of methanol and steam; (9) electrolysis of water (see Note 2). In view of the importance of hydrogen as a major energy source of the future, development of the most promising of these methods may be expected.

See gasification.

Note 1: The projected cost of producing hydrogen from coal by proven gasification techniques has been estimated to be competitive with gasoline.

Note 2: More efficient methods than electrolysis for obtaining hydrogen from water are under investigation. One of these is thermochemical decomposition. Another is photochemical decomposition by solar radiation, either directly or via a solar power generator. Photolytic decomposition of water with platinum catalyst has been achieved. Hydrogen can also be obtained by photolytic decomposition of hydrogen sulfide with cadmium sulfide catalyst. See photolysis; thermochemistry.

Method of purification: By scrubbing with various solutions (see especially the Girbitol absorption process). For very pure hydrogen, by diffusion through palladium.

Grade: Technical, pure, from an electrolytic grade of 99.8% to ultra-pure with less than 10 ppm impurities.

See para-hydrogen.

Hazard: Highly flammable and explosive, dangerous when exposed to heat or flame, explosive limits in air 4–75% by volume.

Use: Production of ammonia, ethanol, and aniline; hydrocracking, hydroforming, and hydrofining of petroleum; hydrogenation of vegetable oils; hydrogenolysis of coal; reducing agent for organic synthesis and metallic ores; reducing atmosphere to prevent oxidation; as oxyhydrogen flame for high temperatures; atomic-hydrogen welding; instrument-carrying balloons; making hydrogen chloride and hydrogen bromide; production of high-purity metals; fuel for nuclear rocket engines for hypersonic transport; missile fuel; cryogenic research. A treatise on the physical properties of hydrogen compiled by the National Bureau of Standards is available from the U.S. Government Printing Office.

Note: A safe storage method for hydrogen for possible use as automotive fuel involves the use of metal hydrides from which the hydrogen is released at specified temperatures. Iron titanium hydride has been found the most satisfactory.

ortho-hydrogen. See para-hydrogen.

para-hydrogen. Type of molecular hydrogen preferred for rocket fuels. Molecular hydrogen (H₂) exists in two varieties, ortho- and para-, named according to their nuclear spin types. Ortho-hydrogen molecules have a parallel spin, para- an antiparallel spin. By cooling to liquid air temperature and use of a ferric oxide gel catalyst, the normal equilibrium of 3 ortho- to 1 para- is displaced and para-hydrogen may be isolated. It is being produced with less than 5 ppm impurities.

hydrogenated fish oil.

CAS: 8016-14-6.

Properties: Oil. Mp: >32°.

Use: Food additive.

hydrogenated sperm oil.

Use: Food additive.

hydrogenated terphenyls.

CAS: 61788-32-7. Complex mixtures of ortho-meta-, and para-terphenyls in various stages of hydrogenation.

Hazard: TLV: 0.5 ppm.

Use: A heat-transfer medium and plasticizer.

hydrogenated vegetable oil. See "Neobee" [Stepan].

hydrogenation. Any reaction of hydrogen with an organic compound. It may occur either as direct addition of hydrogen to the double bonds of unsaturated molecules, resulting in a saturated product, or it may cause rupture of the bonds of organic compounds, with subsequent reaction of hydrogen with the molecular fragments. Examples of the first type (called addition hydrogenation) are the conversion of aromatics to cycloparaffins and the hydrogenation of unsaturated vegetable oils to solid fats by addition of hydrogen to their double bonds. Examples of the second type (called hydrogenolysis) are hydrocracking of petroleum and hydrogenolysis of coal to hydrocarbon fuels.

See hydrogenolysis; hydrocracking; hydroforming.

hydrogen azide. See hydrazoic acid.

hydrogen bond. An attractive force, or bridge, occurring in polar compounds such as water in which a hydrogen atom of one molecule is attracted to two unshared electrons of another. The hydrogen atom is the positive end of one polar molecule and forms a linkage with the electronegative end of another such molecule. In the formula below, the hydrogen atom in the center is the "bridge."

Hydrogen bonds are only one-tenth to one-thirtieth as strong as covalent bonds but they have pronounced effects on the properties of substances in which they occur, especially as regards melting point, boiling point, and crystalline structure. They are found in compounds containing such strongly electronegative atoms as nitrogen, oxygen, and fluorine. They play an important part in the bonding of cellulosic compounds, e.g., in the paper industry, and occur also in many complex structures of biochemical importance, e.g., adenine-uracil linkage in DNA.

hydrogen bromide.

CAS: 10035-10-6. HBr.

Properties: Colorless gas. D 2.71 (air = 1.00), fp -86C, bp -66.4C, specific volume 4.8 cu ft/lb (70F,

1 atm). Soluble in water and alcohol. Nonflammable.

Derivation: (1) By passing hydrogen with bromine vapor over warm platinum sponge which acts as a catalyst; (2) As a by-product in the bromination of organic compounds.

Grade: Up to 99.8% min purity.

Hazard: Toxic by inhalation, strong irritant to eyes and skin. TLV: ceiling 3 ppm.

Use: Organic synthesis, makes bromides by direct reaction with alcohols, pharmaceutical intermediate; alkylation and oxidation catalyst, reducing agent.

See hydrobromic acid.

hydrogen chloride.

CAS: 7647-01-0. HCl.

Properties: Colorless gas or fuming liquid; suffocating odor. D 1.268 (air = 1.00), fp -114C, bp -85C, specific volume 10.9 cu ft/lb (21.1C, 1 atm). Very soluble in water; soluble in alcohol and ether. Nonflammable.

Derivation: (1) By-product of organic chlorination reactions (approximately 90%); (2) reaction of sodium chloride and sulfuric acid; (3) burning hydrogen in an atmosphere of chlorine in absence of air.

Hazard: Toxic by inhalation, strong irritant to eyes and skin. TLV: ceiling 5 ppm.

Use: Production of vinyl chloride from acetylene and alkyl chlorides from olefins, hydrochlorination (see rubber hydrochloride), polymerization, isomerization, alkylation, and nitration reactions.

See hydrochloric acid.

hydrogen cyanide. See hydrocyanic acid.

hydrogen dioxide. See hydrogen peroxide.

hydrogen electrode. See electrode, hydrogen.

hydrogen fluoride.

CAS: 7664-39-3. HF.

Properties: Colorless, fuming gas or liquid. Very soluble in water. The liquid and gas consist of associated molecules. The vapor density corresponds to hydrogen fluoride only at high temperatures. Fp -83C, bp 19.5C, d (liquid) 0.988 (14C), sp vol 17 cu ft/lb (21.1C, 1 atm). Nonflammable.

Derivation: Distillation from the reaction product of calcium fluoride and sulfuric acid, also from fluosilicic acid.

Grade: To 99.9% min purity.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes, skin, and mucous membranes. TLV: ceiling 3 ppm.

Use: Catalyst in alkylation, isomerization, condensation, dehydration, and polymerization reactions; fluorinating agent in organic and inorganic reactions; production of fluorine and aluminum fluoride; additive in liquid rocket propellants; refining of ura-

nium.

See hydrofluoric acid.

hydrogen hexafluorosilicate. See fluosilicic acid.

hydrogen iodide.

CAS: 10034-85-2. HI.

Properties: Colorless gas. Bp -35C, fp -51C, fumes in moist air, d 5.2 (25C). Freely soluble in water. Nonflammable.

Hazard: Strong irritant. Poison.

Use: Making hydriodic acid.

hydrogen ion concentration. See pH.

hydrogenolysis.

 (destructive hydrogenation).

A type of hydrogenation reaction in which molecular cleavage of an organic compound occurs with addition of hydrogen to each portion. An important application is hydrocracking (hydrogenative splitting) of large organic molecules, with formation of fragments that react with hydrogen by use of catalysts and high temperatures. Hydrogenolysis of coal to gaseous and liquid fuels was used in Germany in the 1940s; a similar method (Oil/Gas Process) is under development in the U.S. The German process used pulverized coal made into a paste with heavy oil and a metallic catalyst. The mixture plus the necessary hydrogen was subjected to 300-700 atm at approximately 500C. The coal was converted into heavy oil, distillable oil, gasoline, and hydrocarbon gases. Large quantities of hydrogen are necessary. See gasification; hydrogenation.

hydrogen overvoltage. The difference between actual cathode potential for hydrogen evolution and the equilibrium (theoretical) potential of hydrogen in the same electrolyte.

hydrogen peroxide.

CAS: 7722-84-1. H₂O₂ (molecular formula); H-O-O-H (structural formula).

Properties: (pure anhydrous) density of solid, 1.71 g/cc, density of liquid 1.450 g/cc at 20C, viscosity, liquid 1.245 cP, surface tension 80.4 dynes/cm at 20C, fp -0.41C, bp 150.2C. Soluble in water and alcohol. (Solutions): pure hydrogen peroxide solutions, completely free from contamination, are highly stable; a low percentage of an inhibitor such as acetanilide or sodium stannate, is usually added to counteract the catalytic effect of traces of impurities such as iron, copper, and other heavy metals. A relatively stable sample of hydrogen peroxide typically, decomposes at the rate of approximately 0.5% per year at room temperature.

Derivation: (1) autooxidation of an alkyl anthrahydroquinone such as the 2-ethyl derivative in a cyclic continuous process in which the quinone formed in the oxidation step is reduced to the starting material by hydrogen in the presence of a supported palladium catalyst; (2) by electrolytic processes in which

aqueous sulfuric acid or acidic ammonium bisulfate is converted electrolytically to the peroxydisulfate, which is then hydrolyzed to form hydrogen peroxide; (3) by autoxidation of isopropyl alcohol. Method (1) is most widely used.

Grade: USP (3%), technical (3, 6, 27.5, 30, 35, 50, and 90%), FCC. Most common commercial strengths are 27.5, 35, 50, and 70%.

Hazard: Dangerous fire and explosion risk, strong oxidizing agent. Concentrated solutions are highly toxic and strongly irritating. TLV: TWA 1 ppm; animal carcinogen.

Use: Bleaching and deodorizing of textiles, wood pulp, hair, fur, etc.; source of organic and inorganic peroxides; pulp and paper industry; plasticizers; rocket fuel; foam rubber; manufacture of glycerol; antichlor; dyeing; electroplating; antiseptic; laboratory reagent; epoxidation, hydroxylation, oxidation, and reduction; viscosity control for starch and cellulose derivatives; refining and cleaning metals; bleaching and oxidizing agent in foods; neutralizing agent in wine distillation; seed disinfectant; substitute for chlorine in water and sewage treatment. See "Kastone" [Du Pont].

hydrogen phosphide. See phosphine.

hydrogen, phosphoretted. See phosphine.

hydrogen selenide.

CAS: 7783-07-5. H_2Se .

Properties: Colorless gas. Bp $-42C$; fp $-64C$; d 2.00 (air = 1). Soluble in water, carbon disulfide, phosphene.

Grade: 98% pure.

Hazard: Dangerous fire and explosion risk; reacts violently with oxidizing materials. Toxic by inhalation, strong irritant to skin, damaging to lungs and liver. TLV: 0.05 ppm (as selenium).

Use: Preparation of metallic selenides and organoselenium compounds; in doping as mix for preparation of semiconductor materials containing controlled amounts of significant impurities.

hydrogen slush. A mixture of solid and liquid hydrogen at the hydrogen triple point 13.8K and 1.02 psia. It is denser and less hazardous than liquid hydrogen.

hydrogen sodium selenite. See selenious acid, monosodium salt.

hydrogen sulfide. (sulfuretted hydrogen).

CAS: 7783-06-4. H_2S .

Properties: Colorless gas; offensive odor. D 1.189 (air = 1.00), fp $-83.8C$, bp $-60.2C$, sp vol 11.23 cu ft/lb (21.1C, 1 atm), autoign temp 500F (260C). Soluble in water and alcohol.

Derivation: (1) By the action of dilute sulfuric acid on a sulfide, usually iron sulfide; (2) by direct union of hydrogen and sulfur vapor at a definite tempera-

ture and pressure; (3) as a by-product of petroleum refining.

Grade: Technical 98.5%, purified 99.5% min, CP. **Hazard:** Highly flammable, dangerous fire risk, explosive limits in air 4.3–46%. Toxic by inhalation, strong irritant to eyes and mucous membranes. TLV: TWA 10 ppm; STEL 15 ppm.

Use: Purification of hydrochloric acid and sulfuric acid, precipitating sulfides of metals, analytical reagent, source of sulfur and hydrogen.

hydrogen tellurate. See telluric acid.

hydrogen telluride. H_2Te .

Properties: Colorless gas. D (liquid): 2.57 ($-20C$), fp $-49C$, bp $-2C$. Soluble in water but unstable; soluble in alcohol and alkalis.

Hazard: See hydrogen selenide.

"Hydroholac" [Rohm & Haas]. TM for plasticized nitrocellulose lacquer emulsions, including clear finishes, binders and colors. Produce flexible, lacquer-type, cleanable leather finishes from aqueous systems.

Use: Finishes on glove, garment, handbag and shoe leather.

α -hydro- ω -hydroxypoly(oxy(methyl-1,2-ethanediyl) ether with bis((2-(hydroxyethyl)amino)methyl)phenol (3:1).

CAS: 68909-26-2.

Hazard: A moderate eye irritant.

hydrol. See tetramethyldiaminobenzhydrol.

hydrolase. (hydrase). An enzyme which catalyzes the removal of water from the substrate. See enzyme.

"Hydrolin" [Olin]. TM for ammonium nitrate preparations.

Hazard: See ammonium nitrate.

Use: Bleaching agent for pulp, clay, and mineral processing.

hydroliquefaction. Production of liquid hydrocarbon fuels by hydrogenation of coal. See gasification; Oil/Gas Process.

hydrolube. A water-glycol base noncombustible hydraulic fluid.

hydrolysis. A chemical reaction in which water reacts with another substance to form two or more new substances. This involves ionization of the water molecule as well as splitting of the compound hydrolyzed, e.g., $CH_3COOC_2H_5 + H_2O \rightarrow CH_3COOH + C_2H_5OH$. Examples are conversion of starch to glucose by water in the presence of suitable catalysts; conversion of sucrose (cane sugar) to glucose and fructose by reaction with water in the presence of an enzyme or acid catalyst; conversion of

natural fats into fatty acids and glycerol by reaction with water in one process of soap manufacture; and reaction of the ions of a dissolved salt to form various products, such as acids, complex ions, etc.

hydrolyzed vegetable proteins. See "Hydrotriticum" [*Croda*].

hydrometer. Device for measuring the density of liquids.
See Baumé.

hydronium ion. An ion (H_3O^+) formed by the transfer of a proton (hydrogen nucleus) from one molecule of water to another; a companion ion (OH^-) is also formed, the reaction is $2\text{H}_2\text{O} \rightarrow \text{H}_3\text{O}^+ + \text{OH}^-$. Formation of such ions is statistically rare, resulting from the interaction of water molecules in a ratio of 1:556 million.

hydropathy index. A scale that expresses the relative hydrophobic and hydrophilic tendencies of amino acid R groups. Used to predict membrane-spanning regions.

hydroperoxide. An organic peroxide having the generalized formula ROOH. An example is ethyl hydroperoxide ($\text{C}_2\text{H}_5\text{OOH}$). Methyl and ethyl hydroperoxides are unstable and thus are strong oxidizing agents and explosion hazards; those of higher molecular weight are more stable. Hydroperoxides can be derived by oxidation of saturated hydrocarbons, or by alkylating hydrogen peroxide in a strongly acidic environment. They are used as polymerization initiators.

hydrophilic. Having a strong tendency to bind or absorb water, which results in swelling and formation of reversible gels. This property is characteristic of carbohydrates, such as algin, vegetable gums, pectins, and starches, and of complex proteins such as gelatin and collagen.

hydrophobic. (1) Antagonistic to water; incapable of dissolving in water. This property is characteristic of all oils, fats, waxes, and many resins, as well as of finely divided powders like carbon black and magnesium carbonate.

(2) The association of nonpolar groups or compounds with each other in aqueous systems due to their insolubility in water.

hydroponics. See nutrient solution.

hydroquinol. See hydroquinone.

hydroquinone. (quinol; hydroquinol; *p*-dihydroxybenzene).

CAS: 123-31-9. $\text{C}_6\text{H}_4(\text{OH})_2$.

Properties: White crystals. D 1.330, mp 170C, bp 285C, flash p 329F (165C), autoign temp 960F

(515.5C). Soluble in water, alcohol, and ether. Combustible.

Derivation: Aniline is oxidized to quinone by manganese dioxide and is then reduced to hydroquinone.

Grade: Technical, photographic.

Hazard: Toxic by ingestion and inhalation, irritant. TLV: TWA 2 mg/m³; animal carcinogen.

Use: Photographic developer (except color film); dye intermediate; inhibitor; stabilizer in paints and varnishes, motor fuels, and oils; antioxidant for fats and oils; inhibitor of polymerization; skin hyperpigmentation.

hydroquinone benzyl ether. See *p*-benzylloxyphenol.

hydroquinone dibenzyl ether.

CAS: 103-16-2. $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_6\text{H}_4\text{OCH}_2\text{C}_6\text{H}_5$.

Properties: Tan powder. Mp 119C (min). Purity 90% (min). Insoluble in water; soluble in acetone, benzene, and chlorobenzene. Combustible.

Use: Solvent; perfumes, soap, plastics, and pharmaceuticals.

hydroquinone di-*n*-butyl ether. (1,4-dibutoxybenzene). $\text{C}_6\text{H}_4[\text{O}(\text{CH}_2)_3\text{CH}_3]_2$.

Properties: White flakes; no appreciable odor. Mp 45–46C; bp 124C (1.3 mm Hg), 158C (15.0 mm Hg). Insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible.

hydroquinone diethyl ether. (1,4-diethoxybenzene). $\text{C}_6\text{H}_4(\text{OC}_2\text{H}_5)_2$.

Properties: White granular solid with anise-like odor. Mp 71–72C, bp 246C. Neither boiling caustic nor acid solution causes any hydrolysis. Absorbs UV light. Insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible.

hydroquinone di(β -hydroxyethyl) ether.

(*p*-di-[2-hydroxyethoxy]benzene).

$\text{C}_6\text{H}_4(\text{OC}_2\text{H}_4\text{OH})_2$.

Properties: White solid. Mp 99C, bp 185–200C (0.3 mm Hg). Slightly soluble in water and most organic solvents; miscible with water at 80C. Combustible.

Use: Preparation of polyester, polyolefins, polyurethanes, and hard waxy resins, organic synthesis.

hydroquinone dimethyl ether. (1,4-dimethoxybenzene; DMB; dimethyl hydroquinone).

CAS: 654-42-2. $\text{C}_6\text{H}_4(\text{OCH}_3)_2$.

Properties: White flakes with sweet clover odor. Bp 213C, mp 56C, d 1.0293 (65C), viscosity 1.04 cP (65C), dielectric constant 2.8, absorbs UV light in range 2800–3000Å. Soluble in benzene and alcohol; insoluble in water. Combustible.

Use: Weathering agent in paints and plastics, fixative in perfumes, dyes, resin intermediate, cosmetics, especially suntan preparations, flavoring.

hydroquinone mono-*n*-butyl ether.

$\text{CH}_3(\text{CH}_2)_3\text{OC}_6\text{H}_4\text{OH}$.

Properties: White flakes. Mp 64–65C; bp 115C (1.4 mm Hg). Insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible.

hydroquinone monoethyl ether. (4-ethoxyphenol). $C_8H_{10}OC_2H_5OH$.

Properties: White solid. Mp 63–65C, bp 246–247C. Slightly soluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible.

Use: See hydroquinone monomethyl ether.

hydroquinone monomethyl ether. (4-methoxyphenol; *p*-hydroxyanisole).

CAS: 150-76-5. $CH_3OC_6H_4OH$.

Properties: White, waxy solid. Mp 52.5C, bp 243C, d 1.55 (20/20C). Slightly soluble in water; readily soluble in benzene, acetone, ethanol, and ethyl acetate. Combustible.

Hazard: TLV: TWA 5 mg/m³.

Use: Manufacture of antioxidants, pharmaceuticals, plasticizers, dyestuffs; stabilizer for chlorinated hydrocarbons and ethyl cellulose, inhibitor for acrylic monomers and acrylonitriles, UV inhibitor.

hydrosilicofluoric acid. See fluosilicic acid.

hydrosolvation. Solvent extraction of coal (containing up to 5% sulfur) under hydrogen pressure with the use of a catalyst such as zinc chloride; pressures from 1000–2000 psi are necessary for suitable conversion. This process offers a means of deriving fuel oil and petrochemical feedstocks directly from coal.

hydrosulfite. See sodium hydrosulfite.

hydrosulfite-formaldehyde. One of several mixtures of sodium formaldehyde hydrosulfite and sodium formaldehyde bisulfite used as discharges and stripping or reducing agents in dyeing and other textile operations. In some cases the zinc derivatives are used. Derivation is by the action of formaldehyde on aqueous sodium hydrosulfite or from zinc, formaldehyde, sulfur dioxide, and sodium hydroxide.

Hazard: Toxic by ingestion.

hydrothermal energy. See geothermal energy.

“Hydrotriticum” [Croda]. (hydrolyzed vegetable proteins). TM for wheat protein.

Use: For hair waving systems, shampoos, conditioners, and skin care products.

hydrotrope. A chemical which has the property of increasing the aqueous solubility of various slightly soluble organic chemicals.

Use: Formulation of liquid detergents.

hydroxocobalamin. (USAN) (α [5,6-dimethylbenzimidazolyl]hydroxocobaltamide).

$C_{62}H_{89}CoN_{13}O_{15}P$. A form of vitamin B₁₂.

Use: Medicine.

See vitamin B₁₂.

hydroxyacetal. See hydroxycitronellal dimethyl acetal.

***p*-hydroxyacetanilide.** See *p*-acetaminophenol.

hydroxyacetic acid. (glycolic acid). $CH_2OH-COOH$.

Properties: Colorless crystals, deliquescent. Mp 78–79C, bp decomposes. Soluble in water, alcohol, and ether; available commercially as a 70% solution, light straw-colored liquid, odor like burnt sugar, d 1.27, mp 10C. Combustible.

Derivation: From chloroacetic acid by reaction with sodium hydroxide, or by reduction of oxalic acid. Occurs naturally in sugar cane syrup.

Grade: Technical 70% solution, pure crystals.

Use: Leather dyeing and tanning; textile dyeing; cleaning, polishing, and soldering compounds; copper pickling; adhesives; electroplating; breaking of petroleum emulsions; chelating agent for iron; chemical milling; pH control.

hydroxyacetone. See hydroxy-2-propanone.

***o*-hydroxyacetophenone.** $C_6H_4(OH)COCH_3$.

Properties: Greenish-yellow liquid with minty odor. D 1.1307 (20.8C), bp 213C (717 min), refr index 1.5580 (20C). Slightly soluble in water. Combustible.

α -hydroxy acids. (fruit acids; alpha-hydroxy acids). Said to diminish fine skin lines and pigmentation spots and to stimulate collagen to allow the skin to repair itself.

2-hydroxyadipaldehyde.

$OHCH_2CH_2CH_2CH_2OCHO$.

Properties: (25% aqueous solution) d 1.066 (20C), bp 37C (50 mm Hg), vap press 17 mm Hg (20C), fp –3.5C, pH approximately 3.0. Combustible.

Hazard: Toxic by inhalation.

Use: Intermediate, insolubilizing agent for proteins and polyhydroxy materials, cross-linking agent for polyvinyl compounds, shrinkage control agent (textiles).

β -hydroxyalanine. See serine.

5-hydroxy-3-(β -aminoethyl)indole. See serotonin.

***n*-hydroxy *p*-aminooctanoylphenone.**

CAS: 253883-44-2. mf: $C_{14}H_{21}NO_2$.

Hazard: A poison.

p*-hydroxyamphetamine hydrochloride.**CAS: 6078-07-5. mf: C₉H₁₃NO•ClH.**Hazard:** A reproductive hazard.**3- β -hydroxyandrost-17-one acetate.**CAS: 1239-31-2. mf: C₂₁H₃₂O₃.**Hazard:** Low toxicity by ingestion. A reproductive hazard.**Use:** Hormone.**hydroxyaniline.** See aminophenol.o*-hydroxyanisole.** See guaiacol.***p*-hydroxyanisole.** See hydroquinone monomethyl ether.**9-hydroxyanthracene.** See anthranol.**hydroxyapatite.** Ca₁₀(PO₄)₆(OH)₂. The major constituent of bone and tooth mineral. It is finely divided, crystalline, nonstoichiometric material rich in surface ions (carbonate, magnesium, citrate) which are readily replaced by fluoride ion, thus affording protection to the teeth.

See fluoridation; calcium phosphate tribasic.

p*-hydroxyazobenzene-*p*-sulfonic acid.**HO-C₆H₄-N=N-C₆H₄-SO₃H.**Properties:** Orange-red crystals. Very soluble in water.**Use:** Analytical reagent, precipitant for numerous organic bases.m*-hydroxybenzaldehyde.**CAS: 100-83-4. HOC₆H₄CHO.**Properties:** Orange-pink crystals. Mp 101.5C. Slightly soluble in cold water; very soluble in hot water and aromatic hydrocarbons.**Hazard:** Toxic by ingestion.**Use:** Intermediate for dyes, plastics, pharmaceuticals, and bactericides; color reagent for Schiff's reagent, sensitizing agent in photographic emulsions.***o*-hydroxybenzaldehyde.** See salicylaldehyde.***p*-hydroxybenzaldehyde.**CAS: 123-08-0. HOC₆H₄CHO.**Properties:** Colorless needles. D 1.129, mp 116C (sublimes). Soluble in alcohol, ether, or hot water.**Use:** Pharmaceuticals.***o*-hydroxybenzamide.** See salicylamide.**hydroxybenzene.** See phenol.**2-hydroxy-1',2'-benzocarbazole-3-carboxylic acid.** C₁₇H₁₁NO₃.**Properties:** A four-ring structure, light-green powder. Mp 315–320C. Soluble in ethanol and acetone; insoluble in water.**Use:** Manufacture of dye intermediates and other organic chemicals.***m*-hydroxybenzoic acid.**CAS: 99-06-9. C₆H₄(OH)COOH.**Properties:** White powder. Mp 200C. Soluble in water and hot alcohol.**Use:** Intermediate for plasticizers, resins, light stabilizers, petroleum additives, pharmaceuticals.***o*-hydroxybenzoic acid.** See salicylic acid.***p*-hydroxybenzoic acid.**CAS: 99-96-7. C₆H₄(OH)COOH•H₂O.**Properties:** Colorless crystals. D 1.46, mp 210C. Soluble in alcohol and ether; partially soluble in water.**Derivation:** Interaction of *p*-aminobenzoic acid and nitrous acid.**Use:** Intermediate, synthetic drugs, food preservative (up to 0.1%) (approved by FDA). Its methyl, propyl, and butyl esters are preservatives for cosmetics and pharmaceuticals.**2-hydroxybenzophenone.** C₆H₅COC₆H₄OH.**Properties:** A solid. Mp 41C, bp 210C (27 mm Hg). Insoluble in water; soluble in alcohol.**Use:** UV absorber in plastics.**4-hydroxybenzothiophene.**CAS: 3610-02-4. mf: C₈H₆OS.**Hazard:** A poison.***o*-hydroxybenzyl alcohol.** See salicyl alcohol. **β -hydroxybutyraldehyde.** See aldol.***p*-hydroxybutyranilide.** (4'-hydroxybutyranilide). C₁₀H₁₃NO₂.**Properties:** Acicular crystals. Mp 138C. Soluble in alcohol; partially soluble in hot water.**Use:** Antioxidant for petroleum products. **β -hydroxybutyric acid.**CAS: 502-85-2. CH₃CH(OH)CH₂COOH.**Properties:** Viscid yellow mass. Mp 48–50C, bp 130C (12 mm Hg). Very soluble in water, alcohol and ether.**Derivation:** Interaction of acetoacetic acid and sodium amalgam.**Grade:** Technical, reagent.**Use:** Intermediate.**2-hydroxycamphane.** See borneol.**hydroxy- β -carotene.** See cryptoxanthin.

3- β -hydroxycholestane. See dihydrocholesterol.

hydroxycitronellal. (citronellal hydrate; 3,7-dimethyl-7-hydroxyoctenal).

CAS: 107-75-5.
(CH₃)₂C(OH)(CH₃)₃CH(CH₃)CH₂CHO.

Properties: Viscous, colorless or faintly yellow liquid; sweet lily-type odor. D 0.925–0.930 (15C), refr index 1.448–1.450 (20C), optical rotation (Java type) +9 to +10.5 degrees, boiling range 94–96C (1 mm Hg). Soluble in alcohol (50%), fixed oils; slightly soluble in water, glycerol and mineral oil. Combustible.

Derivation: From citronellal (*Java citronella* or *Eucalyptus citriodora*).

Grade: Perfume, FCC.

Use: Perfumery (fixative, muguet odor), flavoring, soap and cosmetic fragrances.

hydroxycitronellal dimethyl acetal. (hydroxyacetal).

(CH₃)₂C(OH)(CH₃)CH(CH₃)CH₂CH(OCH₃)₂.

Properties: Colorless liquid; light floral odor. D 0.925–0.930 (25/25C), refr index 1.4410–1.4440 (20C). Soluble in most fixed oils, mineral oil, propylene glycol; insoluble in glycerol. Combustible.

Grade: Perfume, FCC.

Use: Flavoring agent in foods, perfumery.

hydroxycitronellal-methyl anthranilate Schiff base. C₁₈H₂₇O₃N.

Properties: Linden–orange-flower odor; yellow, honeylike, viscous liquid. Stable, refr index 1.5350–1.5460 (20C), flash p 206F (96.6C) (TCC). Soluble in two parts of 70% alcohol, one part of 80% alcohol. Combustible.

Use: Perfumery.

17-hydroxycorticosterone. See hydrocortisone.

trans-1-(4-hydroxycyclohexyl)-4-(4-fluorophenyl)-5-(2-methoxypyrimidin-4-yl)imidazole.

CAS: 193551-21-2. mf: C₂₀H₂₂FN₄O₂.

Hazard: A poison by ingestion.

3-hydroxy-*p*-cymene. See thymol.

1-hydroxy-2,4-diamylbenzene. See diamylphenol.

6-hydroxy-3,7-dimethyloctanoic acid lactone. mf: C₁₀H₁₈O₂.

Properties: Colorless solid; maple syrup odor. D: 0.966, refr index: 1.457–1.461. Sol in alc; very sltly sol in water.

Use: Food additive.

hydroxydiphenyl. See phenylphenol.

***p*-hydroxydiphenylamine.** (anilinophenol).

CAS: 122-37-2. C₆H₅NHC₆H₄OH. Gray solid leaflets, mp approximately 70C, purity 98% (min), bp 330C. Insoluble in water; soluble in alcohol, ether, acetone, chloroform, alkali, and benzene.

Hazard: Irritant.

7-hydroxy-2-(di-propylamino)tetraline.

CAS: 74938-11-7. mf: C₁₆H₂₅NO.

Hazard: A poison.

8-hydroxy-2-(di-*n*-propylamino)tetraline.

CAS: 78950-78-4. mf: C₁₆H₂₅NO.

Hazard: A poison.

1-hydroxyestradiol.

CAS: 4147-05-1. mf: C₁₈H₂₄O₃.

Hazard: A reproductive hazard.

Use: Hormone.

4-hydroxyestrone.

CAS: 3131-23-5. mf: C₁₈H₂₂O₃.

Hazard: A reproductive hazard.

Use: Hormone.

2-hydroxyethanesulfonic acid. See isethionic acid.

hydroxyethylacetamide. See *n*-acetyethanolamine.

2-hydroxyethyl acrylate. (HEA). A functional monomer for the manufacture of thermosetting acrylic resins.

2-hydroxyethylamine. See ethanolamine.

***n*-(2-hydroxyethyl)ammonium benzothiazole-2-thiolate.**

CAS: 5902-85-2. mf: C₇H₃NS₂•C₂H₇NO.

Hazard: Moderately toxic by ingestion. A severe eye irritant.

2-hydroxyethyl carbamate.

CAS: 589-41-3. H₂NCOOCH₂CH₂OH.

Properties: Crystalline, deliquescent solid. Mp 43C, bp 130–135C (1 mm Hg), d 1.2852 g/cc (20C), flash p 370F (187.7C). Miscible with water; soluble in alcohol and acetone; insoluble in benzene and chloroform. Combustible.

Use: Chemical intermediate, especially for wash-and-wear cotton finishing agents.

2-hydroxyethyl dibutyl phosphate.

CAS: 130525-77-8. mf: C₁₀H₂₃O₅P.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and eye irritant.

hydroxyethylcellulose. (“Cellosize”).

Properties: Nonionic, water-soluble cellulose ether; white, free-flowing powder; insoluble in organic solvents; soluble in hot or cold water; stable in con-

centrated salt solutions; grease and oil resistant. Combustible.

Use: Thickening and suspending agent; stabilizer for vinyl polymerization; retards evaporation of water in cements, mortars, and concrete; binder in ceramic glazes, films, and sheeting; protective colloid; paper and textile sizing; secondary petroleum recovery.

***n*-(2-hydroxyethyl)-5,8,11,14-eicosatetraenamide (all-*z*)-.**

CAS: 94421-68-8. mf: C₂₂H₃₇NO₂.

Hazard: A reproductive hazard.

hydroxyethylethylenediamine. (aminoethylethanol amine).

CAS: 111-41-1. NH₂CH₂CH₂NHCH₂CH₂OH.

Properties: Hygroscopic liquid; mild ammoniacal odor. D 1.0304 (20/20C), bp 243.7C, vap press 0.01 mm Hg (20C), flash p 275F (135C), bulk d 8.6 lb/gal (20C). Soluble in water. Combustible.

Use: Textile finishing compounds (antifuming agents, dyestuffs, cationic surfactants), resins, rubber products, insecticides, and certain medicinals.

hydroxyethylethylenediaminetriacetic acid. (HEDTA).

CAS: 150-39-0. C₁₀H₁₈O₇N₂

Properties: Solid. Mp 159C. Soluble in water and methanol.

Use: Chelating compound.

***n*-(2-hydroxyethyl)ethyleneimine.** See 1-aziridineethanol.

1-(2-hydroxyethyl)-2-*n*-heptadecenyl-2-imidazoline. C₂₂H₄₂N₂O. A liquid cationic detergent.

Use: Corrosion inhibitor, acid-stable emulsifier.

β-hydroxyethylhydrazine. (ethanolhydrazine).

CAS: 109-84-2. HOCH₂CH₂NHNH₂.

Properties: Colorless, slightly viscous liquid. D 1.11 (20C), fp -70C, boiling range 145-153C (25 mm Hg), flash p 224F (106.6C). Miscible with water; soluble in lower alcohols; slightly soluble in ether. Combustible.

Grade: 70%.

Hazard: Moderate fire risk. Irritant.

Use: Intermediate, plant growth regulator, flowering inducer for pineapples.

2-hydroxy-2-ethyl-3-isobutyl-9,10-dimethoxy-1,2,3,4,6,7-hexahydrobenzo(a)chinolizin.

CAS: 303-75-3. mf: C₂₁H₃₃N₃O₃.

Hazard: A poison.

2-hydroxyethyl methacrylate. (HEMA).

CAS: 868-77-9. C₆H₁₀O₃.

Properties: Clear, mobile liquid. D 1.064 (77/60F), fp -12C, refr index 1.4505 (25C). Miscible with

water; soluble in common organic solvents. An inhibitor is usually added to solutions to prolong shelf life. The 30% solution is made with xylene.

Hazard: 30% grade (with xylene): Flammable, moderate fire risk.

Grade: 30%, 96%.

Use: Acrylic resins, binder for nonwoven fabrics, enamels.

***n*-(2-hydroxyethyl)-*n*-methyl-2-nitro-1*h*-imidazole-1-acetamide.**

CAS: 197004-63-0.

Properties: 2-Nitroimidazole hypoxic cell radiosensitizer mf: C₈H₁₂N₄O₄.

Hazard: A poison.

***N*-hydroxyethylmorpholine.** See *n*-morpholine ethanol.

***N*-hydroxyethyl piperazine.**

CAS: 103-76-4.

HOCH₂CH₂NCH₂CH₂NHCH₂CH₂.

Properties: Liquid. D 1.0614 (20/20C), bp 246.3C, fp -10C, flash p 255F (124C). Miscible with water. Combustible.

Use: Intermediate for pharmaceuticals, anthelmintics, surface-active agents, and synthetic fibers.

***N*-2-hydroxyethylpiperidine.** See 2-piperidinoethanol.

(2-hydroxyethyl)-2-propenenitrile.

CAS: 69521-64-8. mf: C₅H₇NO.

Hazard: A poison by ingestion and skin contact. A severe eye irritant.

hydroxyethylpyrrolidine. See 1-pyrrolidinoethanol.

hydroxyethyltrimethylammonium

bicarbonate. (choline bicarbonate).

(CH₃)₃NCH₂CH₂OH•HCO₃.

Properties: Colorless liquid. D 1.0965 (25/4C), fp -21.3C, refr index 1.3967 (25C). Miscible with water.

Grade: Industrial grade is a 44-46% aqueous solution of a mixture of carbonate and bicarbonate.

Use: Alkaline catalyst, intermediate for choline salts and surfactants.

β-hydroxyethyltrimethylammonium hydroxide. See choline.

1-hydroxyfenchane. See fenchyl alcohol.

13-hydroxygermacrone.

CAS: 213908-53-3. mf: C₁₅H₂₂O₂.

Hazard: A poison by ingestion.

5-hydroxy-1h-indole-3-ethanol.CAS: 154-02-9. mf: $C_{10}H_{11}NO_2$.**Hazard:** A reproductive hazard.***m*-hydroxyisopropylphenyl-*n*-methylcarbamate.**CAS: 17710-63-3. mf: $C_{11}H_{15}NO_3$.**Hazard:** A poison.**Use:** Agricultural chemical.**4-hydroxy-2-keto-4-methylpentane.** See diacetone alcohol.**hydroxylamine.** (oxammonium).CAS: 7803-49-8. NH_2OH .**Properties:** Colorless crystals. D 1.227, mp 33C, bp 70C (60 mm Hg), the free base is unstable. Soluble in alcohol, acids, and cold water.**Derivation:** By decomposing hydroxylamine hydrochloride or sulfate with a base and distilling in vacuo.**Hazard:** Decomposes rapidly at room temperature, violently when heated, detonates in flame-heated testtube. Irritant to tissue.**Use:** Reducing agent, organic synthesis.**hydroxylamine acid sulfate.** (hydroxylammonium acid sulfate; hydroxylamine hemisulfate; HAS). $NH_2OH \cdot H_2SO_4$.**Properties:** White to brown crystalline solid. Bulk d 15–16 lb/gal (20C), mp indefinite (decomposes), pH of 0.1 molar aqueous solution 1.6. Very hygroscopic; soluble in water and methanol; slightly soluble in alcohol.**Use:** Reducing agent, photographic developer, purification agent for aldehydes and ketone, synthesis of dyes and pharmaceuticals; rubber chemicals, reagent.**hydroxylamine hydrochloride.** (hydroxylammonium chloride).CAS: 5470-11-1. $NH_2OH \cdot HCl$.**Properties:** Colorless, hygroscopic crystals. D 1.67 (17C). Soluble in water, glycerol, and alcohol; insoluble in ether; mp 152C (decomposes); pH of 0.1 molar aqueous solution 3.4.**Derivation:** Reduction of ammonium chloride, frequently by electrolysis.**Hazard:** Toxic by ingestion, strong irritant to tissue.**Use:** Organic synthesis, photographic developer, medicine, controlled reduction reactions, nondiscoloring short-stopper for synthetic rubbers, antioxidant for fatty acids.**hydroxylamine sulfate.** (HS; hydroxylammonium sulfate).CAS: 10039-54-0. $(NH_2OH)_2 \cdot H_2SO_4$.**Properties:** Colorless crystals. Mp 177C (decomposes). Solution has a corrosive action on the skin. Soluble in water, slightly soluble in alcohol.**Hazard:** Irritant to tissue.**Use:** Reducing agent, photographic developer, puri-

fication agent for aldehydes and ketones, chemical synthesis, textile chemical, oxidation inhibitor for fatty acids, catalyst, biological and biochemical research, making oximes for paints and varnishes, rustproofing, nondiscoloring short-stopper for synthetic rubbers, unhairing hides.

hydroxylammonium acid sulfate. See hydroxylamine acid sulfate.**hydroxylammonium chloride.** See hydroxylamine hydrochloride.**hydroxylammonium sulfate.** See hydroxylamine sulfate.**hydroxylated lecithin.****Properties:** Light yellow liquid to paste; characteristic odor. Moderately sol in water.**Use:** Food additive.**hydroxyl group.** The univalent group $-OH$, occurring in many inorganic compounds that ionize in solution to yield OH^- radicals. Also the characteristic group of alcohols. See -ol.***o*-hydroxymercuribenzoic acid.**CAS: 14066-61-6. mf: $C_7H_5HgO_3$.**Properties:** IDLH 10 mg/m³ (as Hg).**Hazard:** A poison. TWA 0.1 mg(Hg)/m³ (skin)***p*-hydroxymercuribenzoic acid.**CAS: 1126-48-3. mf: $C_7H_5HgO_3$.**Properties:** IDLH 10 mg/m³ (as Hg).**Hazard:** A poison. TWA 0.1 mg(Hg)/m³ (skin)***N*-(7-hydroxyl-1-naphthyl)acetamide.** (1-acetylamino-7-naphthol). $C_{10}H_6(OH)NHCOOH_3$. A granular paste.**Use:** Chemical intermediate.**hydroxymercurichlorophenol.** (2-chloro-4-[hydroxymercuri]phenol). $C_6H_3Cl(HgOH)(OH)$.**Properties:** Insoluble in water and common organic solvents; soluble in solutions of acids and alkalis with the formation of salts.**Hazard:** Toxic by ingestion and inhalation, strong irritant to eyes and skin, use may be restricted. TLV: 0.01 (Hg) mg/m³.**Use:** Seed disinfectant and fungicide.**hydroxymercuricresol.** $C_6H_3CH_3(HgOH)(OH)$.**Hazard:** Toxic by ingestion and inhalation, strong irritant to eyes and skin, use may be restricted. TLV: 0.01 (Hg) mg/m³.**Use:** Pesticide.**hydroxymercurinitrophenol.** $C_6H_3NO_3(HgOH)(OH)$.**Hazard:** Toxic by ingestion and inhalation, strong

irritant to eyes and skin, use may be restricted. TLV: 0.01 (Hg) mg/m³.
Use: Pesticide.

2-hydroxymesitylene. See mesitol.

2-hydroxymestranol.

CAS: 26011-40-5. mf: C₂₁H₂₆O₃.

Hazard: A reproductive hazard.

Use: Hormone.

6-(hydroxymethyl)acylfulvene.

CAS: 158440-71-2. mf: C₁₅H₁₈O₃.

Hazard: A poison.

2-hydroxy-3-methylbenzoic acid. See cresotic acid.

3-hydroxy-3-methylbutan-2-one.

CH₃COH(CH₃)C(O)CH₃. Colorless liquid, d 0.95 (25/25°C). Combustible.

Use: Intermediate.

7-hydroxy-4-methylcoumarin. See β-methylumbelliferone.

4-hydroxymethyl-2,6-di-tert-butylphenol.

[(CH₃)₃C]₂C₆H₃(OH)(CH₂OH).

Properties: White, crystalline powder. Mp 140–141°C, bp 162°C (2.6 mm Hg), flash p 375°F (190.5°C), vap press 0.03 mm Hg (100°C), bulk d 26 lb/ft³. No odor. Partially soluble in methanol, ethanol, and acetone; insoluble in water. Combustible.

Hazard: Toxic by ingestion.

Use: Antioxidant for gasoline and other hydrocarbons.

hydroxymethylethylene carbonate. See glycerin carbonate.

5-hydroxymethyl-2-furaldehyde. (5-hydroxymethyl-2-formylfuran). C₆H₆O₃.

Properties: Crystalline solid (needles). D 1.20, refr index 1.56, UV absorption max: 283 nm, soluble in water and common organic solvents, protect from light and oxygen.

Derivation: From glucose, cornstarch, sucrose, molasses.

Use: Organic synthesis for glycols, acetals, aldehydes, etc.

dl-α-hydroxy-γ-methylmercaptobutyric acid, calcium salt. See methionine hydroxy analog calcium.

2-hydroxymethyl-5-norbornene. See 5-norbornene-2-methanol.

4-hydroxy-4-methylpentan-2-one. See diacetone alcohol.

2-(2'-hydroxy-5'-methylphenyl)benzotriazole. HOC₆H₃(CH₃)N₃C₆H₄.

Properties: Off-white, crystalline powder. Mp 129–130°C, bp 225°C (10 mm Hg). Insoluble in water; soluble in methylethyl ketone, methyl methacrylate.

Use: Protector against UV radiation, thermal stabilizer, antioxidant, chelation of metals.

α-hydroxy-α-methylpropiofenone.

CAS: 7473-98-5. mf: C₁₀H₁₂O₂.

Hazard: Moderately toxic by ingestion.

3-hydroxy-2-methyl-1,4-pyrone. See maltol.

2-hydroxy-4-(methylthio)butanenitrile.

CAS: 17773-41-0. mf: C₅H₉NOS.

Hazard: A poison by ingestion and skin contact. A moderate skin irritant.

hydroxynaphthalene. See naphthol.

3-(6-hydroxy-2-naphthalenyl)-1,2-dimethyl(2r,3s)-rel-3-pyrrolidinol hydrochloride.

CAS: 210828-80-1. mf: C₁₆H₁₉NO₂•ClH.

Hazard: A poison.

3-hydroxy-2-naphthoic acid. (β-hydroxynaphthoic acid; 3-naphthol-2-carboxylic acid; β-oxynaphthoic acid).

CAS: 92-70-6. C₁₀H₆OHCOOH.

Properties: Yellow, rhombic leaflets. Mp 217–219°C. Soluble in alcohol and ether; insoluble in water.

Derivation: By treating sodium-2-naphtholate with carbon dioxide under pressure.

Hazard: Irritant.

Use: Dyes and pigments.

β-hydroxynaphthoic anilide. (naphthol AS; azoic coupling component 2).

C₁₀H₆OHCONHC₆H₅.

Properties: Cream-colored crystals. Mp 246.0°C. Sodium salt is soluble in water.

Derivation: Condensation of β-hydroxynaphthoic acid and aniline.

Use: Dyes.

2-hydroxy-1,4-naphthoquinone.

C₁₀H₆O₂(OH).

Properties: Yellow to orange-yellow needles or powder. Mp 192–195°C (decomposes). Redox potential 0.362 volt. Soluble in cold water, benzene, carbon tetrachloride, and petroleum ether.

Use: Intermediate for pharmaceuticals, henna hair and wool dyes, bactericides; seed disinfectant.

5-hydroxy-1,4-naphthoquinone. (juglone).

CAS: 481-39-0. This compound derived from walnuts is the starting point in the 16-step synthesis of

oxytetracycline. It has also been found to be a natural herbicide with allelopathic properties.

4-hydroxy-3-nitrobenzenearsonic acid. (3-nitro-4-hydroxyphenylarsonic acid).

$\text{HOC}_6\text{H}_3(\text{NO}_2)\text{AsO}(\text{OH})_2$.

Properties: Pale-yellow crystals.

Derivation: Heating phenol with arsenic and treating the *p*-hydroxyphenyl arsonate with nitric and sulfuric acids.

Hazard: Toxic by ingestion.

4-hydroxy-nonachlorodiphenyl ether.

CAS: 21567-21-5. mf: $\text{C}_{12}\text{HCl}_9\text{O}_2$.

Hazard: A poison.

4-hydroxynonanoic acid, γ -lactone. See

γ -nonyl lactone.

cis-12-hydroxyoctadec-9-enoic acid. See

ricinoleic acid.

12-hydroxyoleic acid. See ricinoleic acid.

15-hydroxypentadecanoic acid lactone.

See pentadecanolide.

3-hydroxyphenol. See resorcinol.

2-hydroxy-2-phenylacetophenone. See

benzoin.

β -*p*-hydroxyphenylalanine. See tyrosine.

2-(2'-hydroxyphenyl)benzotriazole.

$\text{HOC}_6\text{H}_4\text{N}_3\text{C}_6\text{H}_4$. An UV light absorber.

Use: Plastics.

***p*-hydroxyphenyl benzyl ether.** See *p*-benzyloxyphenol.

4-(*p*-hydroxyphenyl)-2-butanone acetate.

See Cuelure.

(+)-4-hydroxy- α 1-(((6-(4-phenylbutoxy)hexyl)amino)methyl)-1,3-benzene-dimethanol.

CAS: 89365-50-4. mf: $\text{C}_{25}\text{H}_{37}\text{NO}_4$.

Hazard: A poison by inhalation.

***N*-(*p*-hydroxyphenyl)glycine.** (glycine

[photographic]; photo-glycin).

$\text{HOC}_6\text{H}_4\text{NHCH}_2\text{COOH}$.

Properties: White to buff crystals or powder. Mp 240C (with decomposition). Slightly soluble in water; soluble in alkaline solutions.

Derivation: By condensation of *p*-aminophenol with chloroacetic acid.

Use: Photographic developer, cellulose and nitrocellulose acetate lacquers and varnishes, analytical reagent.

2-hydroxyphenylmercuric chloride. (chloromercuriphenol).

CAS: 90-03-9. $\text{HOC}_6\text{H}_4\text{HgCl}$.

Properties: White to faint-pink fine crystals. Mp 152C. 0.1 Part in 100 soluble in water (25C); soluble in hot water, alkali, and alcohol.

Hazard: Skin irritant. TLV: 0.01 (Hg) mg/m³.

Use: Antiseptic, fungicide.

3-hydroxy-*n*-phenyl-2-naphthalene-carboxamide. See C.I. azoic coupling component 2.

hydroxyphenylstearic acid. A derivative of phenylstearic acid potentially useful as oxidation and corrosion inhibitor.

(s)-1-(3-hydroxy-2-phosphonyl-methoxy-propyl)cytosine.

CAS: 113852-37-2. mf: $\text{C}_9\text{H}_{14}\text{N}_3\text{O}_6\text{P}$.

Hazard: A severe skin irritant.

1-hydroxypiperidine. $\text{C}_5\text{H}_{10}\text{NOH}$.

Properties: Soluble in water, organic solvents, aqueous acids, and bases.

Use: Intermediate, reducing agent, polymerization inhibitor for vinyl monomers, antioxidant, metal ion reduction.

11- α -hydroxyprogesterone. $\text{C}_{21}\text{H}_{30}\text{O}_3$.

Properties: White, crystalline powder. Mp 163, specific rotation +179 degrees. Insoluble in water; soluble in alcohol.

Derivation: From progesterone by microbiological oxidation.

Use: A steroid intermediate, biochemical research.

4-hydroxyproline. (Hyp; 4-hydroxy-2-pyrrolidinedicarboxylic acid). $\text{HOC}_4\text{H}_7\text{NCOOH}$.

Properties: Colorless crystals. Very soluble in water; slightly soluble in alcohol; insoluble in ether. Optically active. *dl*-hydroxyproline, mp 261-262C with decomposition. *l*-hydroxyproline, mp 270C (natural). *d*-hydroxyproline, mp 274C.

Derivation: Hydrolysis of protein (gelatin), organic synthesis.

Use: Biochemical research. Available commercially as *l*-hydroxyproline.

3-hydroxy-1-propanesulfonic acid sultone.

See propane sultone.

2-hydroxy-1,2,3-propanetricarboxylic acid.

See citric acid.

hydroxy-2-propanone. (acetol; acetyl alcohol; acetylcarbinol; hydroxyacetone; pyruvic alcohol). $\text{CH}_3\text{COCH}_2\text{OH}$.

Properties: Colorless liquid. D 1.0824 at 20/20C, bp 146C, fp -17C. Soluble in water, alcohol and ether. Combustible.

Derivation: (1) By action of potassium acetate or potassium formate on a solution of bromo- or chloroacetone in dry methanol; (2) by bacterial fermentation of propylene glycol.

Grade: Technical.

Use: Solvent for nitrocellulose.

α -hydroxypropionic acid. See lactic acid.

α -hydroxypropionitrile. See lactonitrile.

β -hydroxypropionitrile. See ethylene cyanohydrin.

2-hydroxypropyl acrylate. (HPA).

CAS: 999-61-1. $\text{CH}_2\text{CHCOOCH}_2\text{CH}_2\text{OCH}_3$. A functional monomer used in manufacture of thermosetting acrylic resins for surface coatings.

Properties: A liquid. Mw 130.14, bp 77C at 5 mm Hg.

Hazard: TLV: 0.5 ppm. Corrosive to skin and eyes. Toxic by skin absorption.

Use: In manufacture of thermosetting resins for surface coatings.

2-hydroxypropylamine. See isopropanolamine.

hydroxypropyl cellulose.

CAS: 9004-64-2. A cellulose ether with hydroxypropyl substitution.

Properties: White powder. Soluble in water, methyl and ethyl alcohols, and other organic solvents. Thermoplastic; can be extruded and molded. Insoluble in water >37.7C. Combustible.

Grade: FCC.

Use: Emulsifier, film former, protective colloid, stabilizer, suspending agent, thickener, food additive.

s-(3-hydroxypropyl)-l-cysteine.

CAS: 13189-98-5. mf: $\text{C}_6\text{H}_{13}\text{NO}_3\text{S}$.

Hazard: A reproductive hazard.

hydroxypropylglycerin.

Properties: Pale straw-colored liquid. D 1.084 (25/25C), refr index 1.459 (25C), flash p 380F (193C), pour p -23C. Soluble in water and methanol. Combustible.

Use: Intermediate for alkyd resins and polyesters, plasticizer for cellulose, glue, starch, etc.

hydroxypropyl methacrylate.

$\text{CH}_2\text{CH}_2\text{OCH}_2\text{OCC}(\text{CH}_3)_2\text{CH}_2$.

Properties: Clear, mobile liquid. D 1.066 (25/16C), refr index 1.446 (25C), flash p 206F (96.6C). Limit-

ed solubility in water; soluble in common organic solvents. Combustible.

Use: Monomer for acrylic resins, nonwoven fabric binders, detergent lubricating-oil additives.

hydroxypropyl methylcellulose. (methylcellulose; propylene glycol ether).

Properties: White powder. Swells in water producing clear to opalescent, viscous, colloidal solution. Insoluble in anhydrous alcohol, ether, and chloroform. Combustible.

Grade: NF, FCC.

Use: Food products (except confectionery), as thickening agent, stabilizer, emulsifier; thickener in paint-stripping preparations.

N- β -hydroxypropyl-o-toluidine.

$\text{CH}_3\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}(\text{OH})\text{CH}_3$.

Properties: Amber color. Distillation range 170-180C (20 mm Hg), d 1.035-1.045 (20/20C), refr index 1.540-1.550 (20C).

Use: Dye intermediate.

4-hydroxy-2H-pyran-3,3,5,5(4H,6H)tetramethanol. See anhydroenneheptitol.

2-hydroxypyridine-N-oxide. Bactericidal agent related to aspergillic acid, made from pyridine-N-oxide.

1-hydroxy-2-pyridine thione. (2-pyridinethiol-1-oxide). $\text{C}_5\text{H}_4\text{NOH}(\text{S})$. Apparently exists in equilibrium with the -SH form. Forms chelates with iron, manganese, zinc, etc.

Use: Fungicide, bactericide.

4-hydroxy-2-pyrrolidinecarboxylic acid.

See hydroxyproline.

8-hydroxyquinoline. (8-quinolinol; oxyquinoline; oxine).

CAS: 148-24-3. $\text{C}_8\text{H}_6\text{NOH}$.

Properties: White crystals or powder; phenolic odor. Mp 73-75C; bp 267C. Darkens when exposed to light. Technical grade usually tan. Almost insoluble in water; soluble in alcohol, acetone, chloroform, benzene, and in formic, acetic, hydrochloric, and sulfuric acids, and alkalies

Grade: CP, technical.

Hazard: Toxic by ingestion.

Use: Precipitating and separating metals, preparation of fungicides, chelating agent, disinfectant.

8-hydroxyquinoline benzoate.

CAS: 86-75-9. $\text{C}_9\text{H}_6\text{NOH}:\text{C}_6\text{H}_5\text{COOH}$.

Properties: Yellowish-white crystals with a saffron odor. Mp 56-61C. Almost insoluble in water; soluble in alcohol and glycerol.

Use: Antiseptics, fungicide, recommended against Dutch elm disease.

8-hydroxyquinoline sulfate.CAS: 134-31-6. $(C_8H_7NO)_2 \cdot H_2SO_4$.**Properties:** Pale-yellow powder; slight saffron odor; burning taste. Melting range 167–182C. Soluble in water; slightly soluble in alcohol; insoluble in ether.**Use:** Antiseptic, antiperspirant, deodorant, fungicide.**4-hydroxysalicylic acid.** See β -resorcylic acid.**12-hydroxystearic acid.**CAS: 106-14-9. $CH_3(CH_2)_5(CH_2O)(CH_2)_{10}COOH$. A C_{18} straight-chain fatty acid with an $-OH$ group attached to the carbon chain, mp 79–82C. It is produced by hydrogenation of ricinoleic acid. Combustible.**Use:** Lithium greases, chemical intermediates.**1,12-hydroxystearyl alcohol.** (1,12-octadecanediol). A long-chain fatty alcohol made by reduction of 12-hydroxystearic acid by replacing the $-COOH$ group with a $-CH_2OH$. Combustible.**Properties:** Boiling range 315–335C, mp 69C.**Use:** Chemical intermediate, synthetic fibers, organic synthesis, pharmaceuticals, surface-active agents, plastics and resins, protective coatings.**hydroxysuccinic acid.** See malic acid.**2-hydroxy-1,2,3,3-tetrahydro-3h-pyrano (3,2-f)quinoline-8(7h)-one.**CAS: 128202-33-5. mf: $C_{12}H_{11}NO_3$.**Hazard:** Moderately toxic by ingestion.**4-hydroxy-3-(1,2,3,4-tetrahydro-3-(4-(4-(trifluoromethyl)phenoxy) phenyl)-1-naphthalenyl)2h-1-benzopyran-2-one.**CAS: 90035-14-6. mf: $C_{32}H_{23}F_3O_4$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**4-hydroxy-3-(1,2,3,4-tetrahydro-3-(4-(trifluoromethyl)phenyl)-1-naphthalenyl)2h-benzopyran-2-one.**CAS: 90034-99-4. mf: $C_{26}H_{19}F_3O_3$.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**hydroxythiospasmin.**CAS: 3569-58-2. mf: $C_{18}H_{27}O_3S \cdot I$.**Hazard:** A poison by ingestion.**hydroxytoluene.** See cresol. **α -hydroxytoluene.** See benzyl alcohol.**hydroxytoluic acid.** See cresotic acid.**1-hydroxytriacontane.** See 1-triacontanol.**(hydroxy)tributylstannane.** See tributyltin hydroxide.**hydroxytributylstannane-4,4-dimethyloctanoate.** See tributyltin neodecanoate.**2-hydroxy-3,5,6-trichloropyridine.**CAS: 6515-38-4. mf: $C_5H_2Cl_3NO$.**Hazard:** Moderately toxic by ingestion and skin contact.**hydroxytrimethylstannane.** See trimethyltin hydroxide.**5-hydroxytryptamine.** See serotonin.**4-hydroxyundecanoic acid, γ -lactone.** See γ -undecalactone.**hydrozincite.** (zinc bloom). $Zn_5(OH)_6(CO_3)_2$. A natural basic carbonate of zinc found in the upper zones of zinc deposits.**Properties:** White to gray or yellowish color, dull to silky luster. Fluorescent in UV light. D 3.5–4.0, Mohs hardness 2.0–2.5.**Occurrence:** Missouri, Pennsylvania, Utah, California, Nevada, Europe.**Use:** An ore of zinc.**“Hydrozon” [Carus].** TM for a system based on ozone.**Use:** To treat drinking water that incorporates oxidation, coagulation, flocculation, filtration, and disinfection.**hydyne.** Mixture of 60% (by weight) of *uns*-dimethylhydrazine and 50% diethylenetriamine.**Use:** High-energy fuel.**“Hyform” [Cytac].** TM for water emulsions of pure paraffin wax, microcrystalline wax, or a modification of one of these waxes.**Use:** Binders for pressed ceramic pieces, lubricants for die or mold release, and plasticizers during mold forming.**hygromycin.**CAS: 31282-04-9. $C_{23}H_{29}NO_{12}$.**Properties:** White powder. Weakly acidic. Freely soluble in water and alcohol. Produced by *Streptomyces hygrosopicus*.**Use:** Medicine (broad-spectrum antibiotic).**hygroscopic.** Descriptive of a substance that has the property of adsorbing moisture from the air, such as silica gel, calcium chloride or zinc chloride. The water-vapor molecules are held by the molecules of the agent, which is called a desiccant when used primarily for this purpose. Paper and cotton fabrics are hygroscopic, normally containing 5–8% water after standing in an atmosphere of normal humidity; they are usually kept in constant-humidity rooms before use. Many dry chemicals are hygroscopic and should be kept in well-stoppered bottles or tightly

closed containers.
See deliquescent.

“Hylene” [Du Pont]. TM for a series of organic isocyanates. “M-50”, 50% methylenebis(4-phenyl isocyanate) (C_6H_4NCO)₂, in monochlorobenzene. Used in adhesives.

See diphenylmethane diisocyanate. “MP” Bisphenol adduct of methylenebis(4-phenyl)isocyanate. Used as bonding agent for adhering “Dacron” fiber to rubber compositions. “T” Toluene-2,4-diisocyanate, used for urethane products. “TM” 80% toluene-2,4-diisocyanate and 20% toluene-2,6-diisocyanate. “TM-65” 65% 2,4-compound and 35% 2,6-compound.

Hyp. Abbreviation for hydroxyproline.

“Hypalon” [Du Pont]. TM for chlorosulfonated polyethylene, a synthetic rubber.

Properties: White chips. D 1.10–1.28. Resistant to ozone as well as the weather, oil, solvents, chemicals, and abrasion.

Use: Insulation for wire and cable, shoe soles and heels, automotive components, building products, coatings, flexible tubes and hoses, seals, gaskets, diaphragms. “Hypalon” 45 can accept large amounts of filler and is used as a binder for powdered metal to produce magnetic gaskets for doors and sheet goods for x-ray barriers.

hyperchromic effect. The large increase in light absorption at 260 nm occurring as a double-helical DNA is melted.

hyperfine structure. Structure of spectral line making each ordinary line a multiplet.

hyperglycemic-glycogenolytic factor. See glucagon.

hypergolic fuel. A liquid rocket fuel or propellant which consists of combinations of fuels and oxidizers which ignite spontaneously on contact.

hyperon. Short-lived nuclear particle with mass greater than that of the neutron.

hypersorption. Process in which activated carbon selectively adsorbs the less-volatile components from a gaseous mix, while the more-volatile components pass on unaffected. Particularly applicable to separations of low-boiling mixtures such as hydrogen and methane, ethane from natural gas, ethylene from refinery gas, etc.

hypertensin. See angiotensin.

hypertonic. (1) Possessing greater osmotic pressure than a standard; (2) Having a higher than isotonic concentration.

hypnone. See acetophenone.

hypo-. (1) A prefix used in chemical terminology to indicate a compound (usually an acid) in its lowest oxidation state or containing the lowest proportion of oxygen in a series of compounds, e.g., nitric acid (HNO_3), nitrous acid (HNO_2), hyponitrous acid ($H_2N_2O_2$). (2) Common term for a photographic chemical.

See sodium thiosulfate.

hypoallergenic. A term used in the cosmetics industry and defined by the FDA as describing a cosmetic product that is less likely to cause adverse allergic reactions than are competing products. Claims of hypoallergenicity must be substantiated by specific dermatological tests made by the manufacturer of the product.

hypobromous acid. $HBrO$. An unstable compound resulting from hydrolysis of bromine chloride.

Use: Bactericide and wastewater disinfectant.

hypochlorite solution. An aqueous solution of a metallic salt of hypochlorous acid. Strong oxidizing agent.

Hazard: Irritant to skin and eyes.

Use: Bleaching of textiles, antiseptic agent.

hypochlorous acid.

CAS: 7790-92-3. $HOCl$.

Properties: Greenish-yellow aqueous solution. Highly unstable, weak acid. Decomposes to hydrogen chloride and oxygen. Can exist only in dilute solutions.

Derivation: Water solution of chloride of lime (bleaching powder).

Hazard: Irritant to skin and eyes.

Use: Textile and fiber bleaching, water purification, antiseptic.

See hypochlorite solution; calcium hypochlorite; sodium hypochlorite.

“Hypol” [Grace]. TM for a family of hydrophilic polyurethane polymers derived from toluene diisocyanate (TDI). Foams with addition of water. Good fire retardancy, high additive loading.

Use: Consumer, medical, biomedical, and industrial applications.

α-hypophamine. See oxytocin.

β-hypophamine. See vasopressin.

hypophosphoric acid. $H_4O_6P_2$.

Properties: Platelike crystals. Commercially available as water solution. Readily forms hydrates. Mp 70C, mp (hydrated) 55C, the solution decomposes when concentrated.

Use: Baking powder (sodium salt).

hypophosphorous acid.CAS: 6303-21-5. H_3PO_2 .**Properties:** Colorless, oily liquid or deliquescent crystals; sour odor. D 1.439, mp 26.5C. Soluble in water. A strong monobasic acid and reducing agent, sold in solution.**Derivation:** Heating concentrated baryta water with white phosphorus and decomposing the barium hypophosphite with sulfuric acid, filtering the liquid, and concentrating under reduced pressure.**Grade:** Technical, NF (30–32% solution, d 1.13), 50% purified.**Hazard:** Fire and explosion risk in contact with oxidizing agents.**Use:** Preparation of hypophosphites, electroplating baths.**hypoxanthine.**CAS: 68-94-0. $C_5H_4N_2O$. An intermediate in the metabolism of animal purines, also widely distributed in the vegetable kingdom.**Properties:** White to cream powder. Decomposes at 150C. Almost insoluble in cold water; slightly soluble in boiling water; soluble in dilute acids and alkalis.**Derivation:** Deamination of adenine, reduction of uric acid.**Use:** Biochemical research.**hypoxanthine riboside.** See inosine.**hypoxanthine riboside-5-phosphoric acid.**

See inosinic acid.

hysteresis. (Derived from the Greek word meaning “to lag behind.”) A retardation of the effect, as if from viscosity, when the forces acting upon the body are changing. A common illustration is the retentivity of induction in ferromagnetic materials such as iron and its alloys when the magnetizing force is changed. When such a substance is placed in a magnetizing coil and the magnetizing field is gradually increased to a given value, and then decreased, the magnetic induction, in decreasing does not follow the same relation to the magnetizingfield that it did when the field was increasing, but lags behind the decreasing field. Hysteresis is analogous to mechanical inertia and the energy lost is analogous to that lost in mechanical friction. It presents a major problem in the design of electrical machines with iron cores such as transformers and rotating armatures. In instruments designed for very high frequencies, the retardation and losses are so great as to render iron cores useless. The stress-strain curves of vulcanized rubber also display hysteresis, in that strain (elongation, crystallization) persists when the deforming stress is removed, thus producing a hysteresis *loop* instead of a reversible pathway of the curves. This loop indicates a *loss* of resilient energy (Norman E. Gilbert).**Note:** The simple diagram shown below is a generalized representation of a hysteresis loop.**“Hystrene” [Crompton & Knowles].** (benenic acid). TM for fatty acids.**Properties:** Light colors and stable.**Grade:** Food grade products.**Use:** Waxes, textiles, pharmaceuticals, emulsifiers, and personal care products, lubricants, esters, chemical synthesis, and specialties.**“Hytrel” [Du Pont].** TM for a series of polyester elastomers.**Use:** In sports equipment, automobile parts, hoses, tubes, belts, couplings, gears, seals, and electronic parts.

I

I. Symbol for iodine.

¹³¹I. See iodine-131.

IAA. Abbreviation for 3-indoleacetic acid.

IATA. Abbreviation for International Air Transport Association (Geneva), which publishes annual regulations for air shipment of hazardous materials.

IBIB. Abbreviation for isobutyl isobutyrate.

ibuprofen. (*p*-isobutyl-hydratropic acid; 2-(4-isobutylphenyl)propionic acid).

CAS: 15687-27-1. C₁₃H₁₈O₂.

Properties: Mw 206.31.

Use: Ingredient in over-the-counter pain relievers.

-ic. A suffix, used in naming inorganic compounds, that indicates that the central element is present in its highest oxidation state. Thus in ferric chloride (FeCl₃) the iron has an oxidation number of +3, equivalent to its valence: in an ionized state it would have three positive charges (Fe³⁺). (A recommended change in this system of nomenclature is to use the common name of the element (iron) together with a Roman numeral showing the oxidation number; thus, ferric chloride would be iron (III) chloride.)

ICC. Abbreviation for ignition control compound; also Interstate Commerce Commission.

ice. (H₂O).

Properties: An allotropic, crystalline form of water. Mp 0C (32F), latent heat of melting 80 calories/g, d 0.91. Its property of melting under pressure accounts for slipperiness. Occurs in nature as ice I, but several other forms are known.

Use: Preservation of fish at sea, medicine (reduction of swelling).

See water.

Iceland moss.

Properties: A water-soluble gum that gels on cooling.

Derivation: A lichen growing in Scandinavia and Iceland.

Use: Flavoring for alcoholic beverages, food additive, cosmetics.

Iceland spar. A form of calcite having unique optical properties.

Use: Polarizing light (Nicol prism).

ichthammol. (ammonium ichthosulfonate).

Properties: Brownish-black, syrupy liquid. Burning taste. Tarry odor. Incompatible with acids, alkalis, carbonate, hydroxides, mercuric chloride; soluble in water, alcohol-ether, or alcohol-ether-water mixture; partially soluble in alcohol and ether; miscible with glycerol.

Derivation: Aqueous solution of sulfonated ammonium compounds derived from the action of sulfuric acid on distillates from bituminous shales.

Grade: NF.

Use: Pharmaceutical products such as skin ointments, cosmetic preparations, special dermatological soaps.

“Ichthymall” [*Mallinckrodt*]. TM for ichthammol.

“Ichthyol.” [*Mallinckrodt*]. TM for ichthammol.

ICP. See inductively coupled plasma emission spectroscopy.

-ide. A suffix used in naming compounds composed of two elements; in such names the first (electropositive) element retains its name without change, while the second (electronegative) bears the suffix *-ide* as a modification of the elemental name. Examples: sodium hydroxide, magnesium chloride, hydrogen sulfide, etc. Similarly, oxygen is modified to oxide, fluorine to fluoride, phosphorus to phosphide, and carbon to carbide.

ideal gas. (perfect gas). A gas in which there is complete absence of cohesive forces between the component molecules; the behavior of such a gas can be predicted accurately by the ideal gas equation through all ranges of temperature and pressure. The concept is theoretical, since no actual gas meets the ideal requirement; carbon dioxide especially lacks conformity. The generalized ideal gas law is derived from a combination of the laws of Boyle and Charles, namely $p\nu = RT$, where p is pressure, ν is volume, T is absolute temperature and R is the gas constant ($p0\nu0/273.2C$).

ideal solution. A solution that exhibits no change of internal energy on mixing and complete uniformity of cohesive forces. Its behavior is described by Raoult's law over all ranges of temperature and concentration.

identification limit. Minimum quantity of a material that can be revealed by a given reaction or test.

identity period. The repeating unit or monomer that occurs n times in a natural or synthetic polymer molecule; for example, the anhydroglucose unit in cellulose is enclosed in brackets:

IFT. Abbreviation for the Institute of Food Technologists.

Ig. Abbreviation for immunoglobulin.

“Igenal” [BASF]. TM for a series of dyestuffs for chrome-tanned leather. Characterized by unusual tinctorial power.

ignition control compound. A substance, such as methyl diphenyl phosphate or trimethyl phosphate, added to gasoline to control spark plug fouling, surface ignition, and engine rumble.

ignition point. See autoignition temperature.

ignotine. See carnosine.

IILE. Ion-induced light emission.

“Illum” [Stainless Foundry]. TM for a series of stainless-steel and nickel-base alloys with a high corrosion resistance.

illoxan.

CAS: 51338-27-3. mf: $C_{16}H_{14}Cl_2O_4$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation.

Use: Agricultural chemical.

ilmenite. (titanic iron ore). $FeO \cdot TiO_2$. Iron-black mineral, black to brownish-red streak, submetallic luster, resembles magnetite in appearance but is readily distinguished by feeble magnetic character, d 4.5–5, Mohs hardness 5–6.

Occurrence: Widely in U.S., Canada, Sweden, the former U.S.S.R., India; also made synthetically.

Use: Titanium paints and enamel, source of titanium metal, welding rods, titanium alloys, ceramics.

“Imag” [Mallinckrodt]. TM for a potassium iodide mixture containing 90% potassium iodide and made free-flowing with 8% magnesium carbonate and 2% potassium hydroxide.

imaging contrast agent. Added to a sample to increase the intensity of the signal detected by an imaging technique such as MRI and ultrasound. For

example, gadolinium fixed to a targeting antibody is used in MRI.

imazaquin.

CAS: 81335-37-7. mf: $C_{17}H_{17}N_3O_3$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation.

Use: Agricultural chemical.

Imhoff tank. A reinforced concrete structure of considerable size (approximately 35 ft high) designed especially for sewage clarification. Its principal features are (1) an upper or sedimentation compartment in which in-flowing sewage deposits its suspended solids by gravity (residence time 2–3 hours), the free water being drawn off through an outlet, and (2) a separate lower compartment in which digestion of the accumulated sediment (sludge) takes place. The sludge is passed from the upper compartment to the digestion chamber through an inclined slot or channel. The gases generated by digestion are released through suitably located vents. The digested sludge is removed through outlet pipes at intervals of about 6 months. The dried sludge contains 2–3% ammonia and 1% phosphoric acid, which make it suitable as a soil conditioner. See sewage sludge.

imidazo(2,1-a)isoquinoline, 5,6-dihydro-2-(*m*-methoxyphenyl)-.

CAS: 61001-21-6. mf: $C_{18}H_{16}N_2O$.

Hazard: A reproductive hazard.

imidazole. (glyoxalin).

CAS: 288-32-4.

HNCHNCHCH. A dinitrogen ring compound. An antimetabolite and inhibitor of histamine. Colorless crystals; mp 90C; bp 257C; soluble in water, alcohol, and ether.

Use: Biological control of pests, especially fabric-feeding insects, often in combination with *dl*-*p*-fluorophenylalanine, an amino-acid inhibitor; also as a contact insecticide in an oil spray. The mechanism is that of structural antagonism rather than active toxicity.

See antihistamine; antagonist, structural.

4,5-imidazoledicarboxamide. See glycarbylamide.

4-imidazole ethylamine. See histamine.

2-imidazolidinone. See ethylene urea.

2-imidazolidone. See ethylene urea.

imidazo(4,5-d)pyrimidine. See purine.

2-(1h-imidazol-4-ylmethyl)-8h-indeno(1,2-d)thiazole monofumarate.CAS: 159081-23-9. mf: $C_{14}H_{11}N_3S \bullet C_4H_4O_4$.**Hazard:** A poison by ingestion.**(1-imidazolyl)tributylplumbane.**CAS: 16128-42-0. mf: $C_{15}H_{30}N_2Pb$.**Hazard:** A poison.**imide.** A nitrogen-containing acid having two double bonds.

See succinimide; phthalimide.

imidine. Derivative of an acid amide. $R-C:NH-NH_2$.**imine.** A nitrogen-containing organic substance having a carbon-to-nitrogen double bond.

Such compounds are highly reactive, even more so than the carbon-nitrogen triple bond characteristic of nitriles.

3,3'-iminobispropylamine. (dipropylene triamine; 3,3'-diaminodipropylamine).CAS: 56-18-8. $H_2NC_3H_6NHC_3H_6NH_2$.**Properties:** Colorless liquid. D 0.9307 (20/20C), bp 240.6C, fp -6.1C, flash p 175F (79.4C) (CC). Soluble in water and polar organic solvents. Combustible.**Hazard:** Toxic by ingestion and inhalation; irritant.**Use:** Intermediate for soaps, dyestuffs, rubber chemicals, emulsifying agents, petroleum specialties, insecticides, and pharmaceuticals.**iminodiacetic acid disodium salt hydrate.**

(iminodiethanoic acid disodium salt hydrate).

CAS: 142-73-4. $HN(CH_2CO_2Na)_2 \bullet xH_2O$.**Properties:** Crystalline solid.**Hazard:** Irritant.**Use:** Intermediate for surface-active agents, complex salts, chelating agents, and aminocarboxylic acid synthesis.**iminodiacetonitrile.** $HN(CH_2CN)_2$.**Properties:** Light-tan, crystalline solid. Mp 77-78C.

Soluble in water and acetone.

Use: Chemical intermediate.**L-N⁶-(1-iminoethyl)lysine hydrochloride.**CAS: 150403-89-7. mf: $C_{18}H_{17}N_3O_2 \bullet ClH$.**Hazard:** A poison.**iminourea.** See guanidine.**“Imlar” [Du Pont].** TM for vinyl resin-base finish used where extreme resistance to abnormal chemical exposure is required.**“Immedial” [BASF].** TM for a series of sulfur dyestuffs. Characterized by very good fastness to light and good fastness to washing and perspiration.
Use: Dyeing of cotton and rayon.**immiscible.** Descriptive of substances of the same phase or state of matter that cannot be uniformly mixed or blended. Though usually applied to liquids such as oil and water, the term also may refer to powders that differ widely in some physical property, e.g., specific gravity, such as magnesium carbonate and barium sulfate.
See miscibility.**immune endoglobulin.**

CAS: 9007-83-4.

Hazard: Low toxicity by ingestion. Human systemic effects**Source:** Human natural product.**immune response.** The generation of antibodies to an antigen by a vertebrate organism.**immune serum globulin.** A sterile solution of globulins that contains those antibodies normally present in adult blood. Over 90% of the total protein is globulin. It is a transparent, nearly colorless, nearly odorless liquid. Must be kept refrigerated.**Derivation:** From a plasma or serum pool of venous or placental blood from 1000 or more individuals.**Grade:** USP.**Use:** Medicine (immunology).

See antigen; globulin.

immune system. The complex group of cells and organs that defends the body against infection and disease.**immunochemistry.** That branch of chemistry concerned with the various defense mechanisms of the animal organism against infective agents, particularly the response between the body and foreign macromolecules (antigens) and the interaction between the products of the response (antibodies) and the agents that have elicited them. This involves study of the many proteins (serum globulins, enzymes, bacteria, and viruses) involved in these responses. It developed from the original work of Jenner (1775) and Pasteur (1880).
See antigen-antibody; complement.**immunoglobulin.** See globulin; immune serum globulin.**immunotherapy.** Using the immune system to treat disease, for example, in the development of vaccines. May also refer to the therapy of diseases caused by the immune system.
See cancer.**IMP.** (1) Abbreviation for inosine monophosphate.

See inosinic acid; sodium inosinate. (2) Abbreviation for insoluble metaphosphate (Maddrell salt). See sodium metaphosphate.

impact strength. The ability of a material to accept a sudden blow or shock without fracture or other substantial damage, measured by standard impact-testing equipment (Izod, Charpy). It is a property of hard, friable materials such as metals, hard rubber, engineering plastics, Portland cement, glass, etc.

impalpable. Descriptive of a state of subdivision of particles so fine that the individual particles cannot be distinguished as such by pressing a powder between the thumb and index finger.

impeller. A type of agitator used in mixing or blending fluids of low viscosity, usually in a cylindrical chamber, either open or closed. The motion induced by an impeller is a combination of flow and turbulence, the proportion of each depending on the size, speed, and position of the impeller. In common use are the marine propeller, the turbine, and the helical ribbon types. Propeller and turbine impellers are attached to a power-driven rotating shaft that enters the container either vertically (top entering) or at an angle (side entering), they may be centered in a liquid or placed off center, depending on the flow pattern desired. The propeller type has from two to four elliptical blades, whereas the turbine has a number of rectangular blades set vertically or at an angle. A wide range of flow-turbulence patterns can be obtained with either type. Helical ribbon impellers are used for viscous liquids and dry powders. Many variations of impellers are available for liquids up to medium viscosity for a multitude of special mixing techniques.

See agitator; mixing.

imperial green. See copper acetoarsenite.

“Implex” [Rohm & Haas]. TM for thermoplastic, high-impact acrylic molding powder, supplied in natural and colored forms. Maximum toughness, gloss, stain-, and heat-resistant grades.

Use: Shoe heels, business-machine and musical instrument keys, housings, automotive parts, knobs, metalized parts, etc.

imprinting. A biochemical phenomenon that determines, for certain genes, which one of the pair of alleles, the mother's or the father's, will be active in that individual.

impurity. The presence of one substance in another, often in such low concentration that it cannot be measured quantitatively by ordinary analytical methods. It is impossible to prepare an ideally pure substance. In certain metal crystal lattices, foreign substances can exist in as low a concentration as one-millionth of an atomic percent. For example,

arsenic atoms are present in germanium crystals in this percentage; this fact is largely responsible for the semiconducting properties of germanium. Here the impurity is beneficial, but often it is detrimental, for example, in graphite used as a moderator in nuclear reactors, and in many metallic catalysts. In the air, trace amounts of sulfur dioxide and carbon monoxide are potentially dangerous impurities in concentration of 5 ppm of sulfur dioxide and 50 ppm of carbon monoxide.

See purity; chemical; trace element; air pollution; semiconductor; purification.

inborn errors of metabolism. Inherited diseases resulting from alterations in genes that code for enzymes.

incendiary gel. (1) Mixture of thermite suspended in oil set to a jelly with a small amount of soap; it undergoes spontaneous ignition on contact with air. Another type may contain magnesium in jellied oil. (2) Jellied gasoline combined with thickening agents such as napalm or finely divided magnesium.

incineration. Disposal of solid and liquid organic waste materials by burning at temperatures from 1200 to 1500C. This method is approved by the EPA for use on very toxic organic chemicals and chemical wastes. Use of specially equipped incinerator ships for burning chemical wastes at sea has become a common practice.

See waste control.

inclusion complex. (adduct). An unbonded association of two molecules in which a molecule of one component is either wholly or partly locked within the crystal lattice of the other. There are several types of such complexes, the most familiar being the so-called clathrates (from Latin, “cross-bars of a grating”). The clathrate compound $3C_6H_4(OH)_2 \cdot SO_2$ may be depicted as

where the interlocked rings denote mutual enclosure of two identical cages. The formula for any clathrate compound is determined by the ratio of available cavities to the amount of cage material. Inclusion compounds can be used to separate molecules of different shapes, e.g., straight-chain hydrocarbons from those containing side chains, as well as structural isomers. They can also be used as templates for directing chemical reactions.

See clathrate compound; gas hydrate.

“Incoloy” [Inco]. TM for a series of corrosion-resistant alloys of nickel, iron, and chromium.

incomplete penetrance. The gene for a condition is present, but not obviously expressed in all individuals in a family with the gene.

“Inconel” [Inco]. TM for a series of corrosion-resistant alloys of nickel and chromium.

IND. Abbreviation for investigational new drug.

“Indalone” [FMC]. TM for *n*-butyl mesityl oxide oxalate.

Use: Insect repellents that can be applied directly on the skin.

See butopyronoxyl.

indan. (hydrindene; 2,3-dihydroindene).

CAS: 496-11-7.

Bicyclic.

Properties: Colorless liquid. Bp 176.5C, fp -51.4C, refr index 1.5388 (16.4C), d 0.965 (20/4C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: From coal tar.

Hazard: Irritant to skin and eyes.

Use: Organic synthesis.

indanthren blue 3g. See 6,15-dihydroxy-droxy-5,9,14,18-anthrazinetetrone.

indanthrene. See indanthrone.

indanthrene yellow. See flavanthrene.

indanthrone. (Indanthrene Blue R; 6,15-dihydro-5,14,18-anthrazinetetrone).

CAS: 81-77-6. $\text{C}_{28}\text{H}_{14}\text{N}_2\text{O}_4$. A blue vat dye or pigment. The molecule consists of two anthraquinone nuclei linked through two -NH groups.

Properties: Heat- and light-stable blue powder. Decomposes at 470C. Soluble in concentrated sulfuric acid and dilute alkaline solutions.

Derivation: By fusion of β -aminoanthroquinone with caustic potash in the presence of potassium nitrate.

Use: Dyeing unmordanted cotton, pigment in quality paints and enamels.

indazol blue r. See C.I. basic blue 16.

indene.

CAS: 95-13-6.

Properties: Colorless liquid. D 0.996 (20/4C), fp -3.5C, bp 182C, refr index 1.5726 (25C), flash p 173F (78.3C). Insoluble in water; soluble in most organic solvents; oxidizes readily in air. Forms

polymers on exposure to air and sunlight. Combustible.

Derivation: Contained in the fraction of crude coal tar distillates that boils from 176–182C.

Hazard: Toxic by inhalation. TLV: 10 ppm.

Use: Preparation of coumarone-indene resins, intermediate.

See coumarone.

indenolol hydrochloride.

CAS: 68906-88-7. mf: $\text{C}_{15}\text{H}_{21}\text{NO}_2 \cdot \text{ClH}$.

Hazard: Moderately toxic by ingestion.

indeno(1,2,3-cd)pyrene.

CAS: 193-39-5. mf: $\text{C}_{22}\text{H}_{12}$.

Properties: Yellow crystals from cyclohexane; bright-yellow plates from pet ether

Hazard: Confirmed carcinogen.

independent assortment. During meiosis each of the two copies of a gene is distributed to the germ cells independently of the distribution of other genes.

See linkage.

indeterminate error. An error that cannot be identified.

indinavir sulfate.

CAS: 157810-81-6. mf: $\text{C}_{36}\text{H}_{47}\text{N}_5\text{O}_4 \cdot \text{H}_2\text{O}_4\text{S}$.

Hazard: Moderately toxic by ingestion.

Indian red. (iron saffron). A red (maroon) pigment made by calcining copperas to obtain red ferric oxide. Fine particle size.

Use: Pigment in paint, rubber, and plastics; polishing agent.

See iron oxide red; rouge.

Indian yellow. (1) (Aureolin) A yellow pigment distinguished by being unaffected by hydrogen sulfide. It is durable, without action on other pigments, and is permanent in oils and water-color. It consists of a double nitrite of cobalt and potassium and is prepared by adding excess of potassium nitrite solution to a solution of cobalt nitrate acidified with acetic acid. (2) Also sometimes used for the yellow synthetic dye primuline.

See cobalt potassium nitrite.

indicator. An organic substance (usually a dye or intermediate) that indicates by a change in its color the presence, absence, or concentration of some other substance, or the degree of reaction between two or more other substances. The most common example is the use of acid-base indicators such as litmus, phenolphthalein, and methyl orange to indicate the presence or absence of acids and bases, or the approximate concentration of hydrogen ion in a solution.

Use: Analytical chemistry. The pH ranges of several typical indicators are as follows:

alizarin yellow R	10.1–12.0 yellow to red
methyl orange	3.1– 4.4 red to yellow
phenolphthalein	8.3–10.0 colorless to red
phenol red	6.8– 8.4 yellow to red
litmus	4.4– 8.3 red to blue
Congo red	3.0– 5.2 blue to red
bromthymol blue	6.0– 7.6 yellow to blue
chlorophenol red	5.2– 6.8 yellow to red
cresol purple	7.4– 9.0 yellow to purple

See titration; pH.

indigo. (indigotin; synthetic indigo blue; CI 73000).
CAS: 482-89-3. $C_{16}H_{10}N_2O_2$. A double indole derivative.

Properties: Dark blue, crystalline powder; bronze luster. D 1.35, sublimes at 300C (decomposes). Soluble in aniline, nitrobenzene, chloroform, glacial acetic acid, and concentrated sulfuric acid; insoluble in water, ether, and alcohol.

Derivation: From aniline and chloroacetic acid, and fusing the resulting phenylglycine with alkali and sodium amide. Formerly from plants of genus *Indigofera*.

Grade: Technical, pure.

Use: Textile dyeing and printing inks, manufacture of indigo derivatives, paints, analytical reagents.

indirect dye. A mordant dye.

indium.

CAS: 7440-74-6. In. Metallic element atomic number 49, of group IIIA of the periodic table, av 114.82, valences of 1, 3; 2 stable isotopes.

Properties: Ductile shiny silver-white metal. D 7.31 (20C), mp 156C, bp 2075C, Mohs hardness 1.2. Softer than lead. Soluble in acids; insoluble in alkalis. Corrosion-resistant at room temperature. Oxidizes readily at higher temperatures.

Occurrence: Not found native but in a variety of zinc and other ores. The indium content is generally very low, rarely exceeding 0.001%. Indium-bearing ores occur in the western U.S., Canada, Peru, Japan, Europe, the former U.S.S.R.

Available forms: Small ingots or bars, shot, pencils, wire, sheets, powder, single crystals. Purity: Technical, high purity (below 10 ppm impurities).

Hazard: Metal and its compounds toxic by inhalation. TLV: 0.1 (In) mg/m³.

Use: Automobile bearings, electronic and semiconductor devices, low-melting brazing and soldering alloys, reactor control rods, electroplated coatings

on silver-plated steel aircraft bearings that are tarnish resistant, radiation detector.

indium acetylacetonate. $In(C_5H_7O_2)_3$.

Properties: Mp 186C.

Hazard: See indium.

Use: Catalyst.

indium antimonide. InSb.

Properties: Crystalline solid. Mp 535C.

Hazard: See indium; antimony.

Use: Electronic grade used for semiconductor devices and infrared detector, computer technology (Hall effect).

indium arsenide. InAs.

Properties: Crystals. Mp 943C. Insoluble in acids.

Hazard: See indium; arsenic.

Use: Electronic grade for semiconductor devices, in injection lasers.

indium chloride. (indium trichloride).

CAS: 10025-82-8. $InCl_3$.

Properties: White powder. Deliquescent. D 3.46 (25C), mp 586C, sublimes at 300C. Soluble in alcohol and water.

Derivation: Direct union of the elements or by the action of hydrochloric acid on the metal.

Hazard: See indium.

indium oxide. (indium sesquioxide; indium trioxide).

CAS: 1312-43-2. In_2O_3 .

Properties: White to light-yellow powder in both amorphous and crystalline forms, depending on temperature. D 7.179. Soluble in hot acid (amorphous); insoluble (crystals).

Derivation: By burning the metal in air or heating the hydroxide, nitrate, or carbonate.

Hazard: See indium.

Use: Manufacture of special glasses.

indium phosphide. InP. A brittle metallic mass, mp 1070C, slightly soluble in mineral acids.

Hazard: See indium.

Use: Electronic grade in semiconductor devices, injection lasers, and experimental solar cells.

indium sulfate.

CAS: 13464-82-9. $In_2(SO_4)_3$.

Properties: Grayish powder. Deliquescent. D 3.438. Soluble in water. Decomposed by heat.

Hazard: See indium; tellurium.

indium telluride. In_2Te_3 .

Properties: Black, friable crystals; D 5.8, mp 665C.

Hazard: See indium.

Use: Semiconductor technology.

indium trichloride.

CAS: 10025-82-8. $InCl_3$.

Properties: Tan to yellow deliquescent crystals. D

4.0, mp 585C (sublimes). Soluble in water. Keep in closed containers.

Hazard: See indium.

Use: Electroplating baths.

"Indo Carbon" [BASF]. TM for sulfur dye-stuffs.

Use: Dyeing and printing of cotton and rayon.

"Indocin." TM for the antiinflammatory drug indomethacin.

Use: Treatment of arthritis.

indole. (2,3-benzopyrrole).

CAS: 120-72-9.

Properties: White to yellowish scales, turning red on exposure to light and air; unpleasant odor in high concentration but pleasant in dilute solutions. Mp 52C, bp 254C. Soluble in alcohol, ether, hot water, and fixed oils; insoluble in mineral oil and glycerol.

Derivation: From indigo and by numerous syntheses. Also can be produced from the 220–260C fraction of coal tar.

Grade: Technical, CP, FCC.

Hazard: A carcinogen.

Use: Chemical reagent, perfumery.

3-indoleacetic acid. (IA; IAA; β -indoleacetic acid).

CAS: 87-51-4. $C_8H_7NCH_2COOH$. A plant hormone.

Properties: Crystals. Mp 168–170C. The natural material is levorotatory, specific rotation -3.8 degrees in alcohol (20C). Insoluble in water and chloroform; soluble in alcohol and ether.

Use: Agriculture and horticulture, growth-promoting hormone, plant cell enlarger.

See auxin; plant growth regulator.

indole- α -aminopropionic acid. See tryptophan.

3-indolebutyric acid. (hormodin).

CAS: 133-32-4. $C_8H_7N(CH_2)_3COOH$.

Properties: White or off-white powder; essentially odorless. Mp 123C. Insoluble in water; soluble in alcohols and ketones.

Use: Plant hormone, especially used in rooting plants.

See auxin; plant growth regulator.

indole-2,3-dione. See isatin.

indomethacin. (USAN name for 1-(*p*-chlorobenzoyl)-5-methoxy-2-methylindole-3-acetic acid).

CAS: 53-86-1. $C_{19}H_{16}ClNO_4$.

Use: Medicine for treatment of arthritis.

indomethacin sodium trihydrate.

CAS: 74252-25-8. mf: $C_{19}H_{15}ClNO_4 \cdot 3H_2O \cdot Na$.

Hazard: A poison by ingestion.

indophenine reaction. Intense blue coloration given by thiophene or its derivatives when treated with concentrated sulfuric acid with a trace of isatin.

"Indopol" [BP Amoco]. TM for viscous poly-butenes.

Available forms: Liquid.

Grade: 10 viscosity.

Use: In lubricating-oil additives for ashless dispersant; processing, rolling, and compressor oils; caulks, sealants, adhesives; as an elastomeric process aid; and cling improver in cling films.

indospicine monohydrochloride monohydrate.

CAS: 16377-01-8. mf: $C_7H_{15}N_3O_2 \cdot ClH \cdot H_2O$.

Hazard: A reproductive hazard.

Source: Natural product.

indoxacarb.

CAS: 173584-44-6. mf: $C_{22}H_{17}ClF_3N_3O_7$.

Hazard: A poison by ingestion. Low toxicity by inhalation and skin contact.

Use: Agricultural chemical.

induced fit. A change in the conformation of an enzyme in response to substrate binding that renders the enzyme catalytically active. It is one of the models used to explain substrate specificity.

inducer. A signal molecule that, when bound to a regulatory protein, produces an increase in the expression of a given gene.

induction. An increase in the expression of a gene in response to a change in the activity of a regulatory protein.

inductively coupled plasma emission spectroscopy. (ICP). An analysis system in which the energy of a plasma excites the atoms of an injected sample causing the excited atoms to emit light at signature wavelengths. Three-dimensional computer-generated images are used to interpret the results.

indulines. Blue azine dyestuffs obtained by the interaction of amino-azo benzene and aniline hydrochloride.

indurite. Explosive containing 40% guncotton and 60% nitrobenzene.

"Industrene" [Crompton & Knowles]. TM for fatty acids.

Use: Rubber compounding, foam dispersants, lubri-

cants, water repellents, polishes, metallic soaps, crayons, alkyd resins, mineral flotation adjuvants, and emulsifiers.

industrial alcohol. See alcohol, industrial.

industrial carbon. See carbon, industrial.

industrial chemistry. See chemical technology; chemical process industry.

industrial diamonds. See diamonds, industrial.

industrial dust. See dust, industrial.

industrial waste. See waste control; chemical waste.

inert. A term used to indicate chemical inactivity in an element or compound. Helium, neon, and argon are practically inert gaseous elements; carbon dioxide is a gaseous compound of low activity. Ingredients added to mixtures chiefly for bulk and weight purposes are said to be inert. See noble; extender.

inert gas. Gaseous element of group 18 of the periodic table, such as helium or argon, which is nonreactive under ordinary conditions. These gases are not completely unreactive and inert gas compounds have been synthesized.

infinite dilution. Point of maximum dissociation of an electrolyte at which point the greatest amount of conductivity has been reached.

informatics. The study of the application of computer and statistical techniques to the management of information. In genome projects, informatics includes the development of methods to search databases quickly, to analyze DNA sequence information, and to predict protein sequence and structure from DNA sequence data. See bioinformatics.

informational macromolecules. Biomolecules containing information in the form of specific sequences of different monomers; for example, many proteins, lipids, polysaccharides, and nucleic acids.

informed consent. An individual willingly agrees to participate in an activity after first being advised of the risks and benefits. See privacy.

infrared. The region of the electromagnetic spectrum including wavelengths from 0.78 micron to approximately 300 microns (i.e., longer than visible light and shorter than microwave).

Use: Spectroscopic analysis, medicine, baking of

enamels, drying, photography. See radiation.

infrared spectroscopy. An analytical technique that may measure either (1) the range of wavelengths in the infrared that are absorbed by a specimen, which characterize its molecular constitution (absorption spectroscopy), or (2) the infrared waves emitted by excited atoms or molecules (emission spectroscopy). Extremely hot bodies (stars) emit spectra in which the atomic composition can be determined by characteristic lines such as the sodium D line in the sun's spectrum. Infrared absorption bands identify molecular components and structures, some of which are:

Absorption Band (μ)	Structure Indicated
2.3–3.2	OH and NH groups; H ₂
3.2–3.3	aromatics, olefins
3.33–3.55	aliphatics
5.7–6.1	aldehydes, ketones, acids, amides

See microwave spectroscopy; absorption (2).

“Infrac” [Carborundum]. TM for a refractory insulation used as primary linings of fuel-fired and electric furnaces only when protected by a cement facing. Available in brick form.

infusion. An aqueous solution obtained by treating drugs with hot or cold water, without boiling. Generally prepared by pouring boiling water upon the vegetable substance and macerating the mixture in a tightly closed vessel until the liquid cools. When not otherwise specified, they are of 5% strength by weight.

infusorial earth. See diatomaceous earth.

ingot iron. Highly refined steel with a maximum of 0.15% impurity. Due to high purity it has excellent ductility and resistance to rusting.

ingrain dye. An insoluble dye developed by impregnating a fabric with one or more intermediates and then producing the dye by reaction with a different intermediate.

inherit. In genetics, to receive genetic material from parents through biological processes.

inherited. See inherit.

“Inhibisil” [PPG]. TM for a non-toxic corrosion inhibiting silica pigment for metal finishes. **Use:** Paints and coatings.

inhibitor. (1) A compound (usually organic) that retards or stops an undesired chemical reaction, such as corrosion, oxidation or polymerization. Examples are acetanilide which retards decomposition of hydrogen peroxide and salicylic acid, used to pre-

vent prevulcanization of rubber. Such substances are sometimes called negative catalysts. (2) A biological antagonist used to retard growth of pests and insects and in medicine.

See antagonist, structural; antioxidant.

“Inhibitor NPH” [Mallinckrodt]. TM for a synthetic organic chemical that provides an effective means of controlling hard polymer formation in synthetic rubber production.

Properties: Fine white to yellow-white platelets; ammoniacal odor. Bulk d 5 lb/gal, mp 160–164C (with decomposition).

initiating explosive. See explosive, initiating.

initiation codon. (AUG). Codes for the first amino acid in all polypeptide sequences, which is N-formyl-methionine in prokaryotes and methionine in eukaryotes.

initiation complex. A complex of all ribosomal components, a mRNA, and the initiating Met-tRNAMet (eukaryotes) or fMet-tRNAMet (prokaryotes).

initiator. An agent used to start the polymerization of a monomer. Its action is similar to that of a catalyst, except that it is usually consumed in the reaction. Organic peroxides and similar compounds are often used and shortwave radiation has a similar initiating effect. Free radicals usually play a part. See activator; free radical.

injection molding. A plastic-molding operation, introduced about 1935, performed in a single machine capable of producing both small articles of complex geometry (combs), and large units that could not be made economically in any other way (auto body parts, tubs, etc.). Though used primarily for thermoplastics, the injection method can be modified to handle thermosets. A simplified description is as follows: (1) A molding powder is fed into the heating chamber of the machine, which holds several times as much material as is necessary to fill the mold. The powder is heated to a viscous liquid. (2) An amount of molding powder that is just sufficient to fill the mold cavity is then forced into the rear of the heating chamber by a plunger, thus injecting an equal amount of liquid plastic from the front of the heating chamber into the mold. (3) The material remains in the mold under high pressure until it cools, and is then ejected. The rheological properties of the fluid plastic are of critical importance, as it must flow readily through the sprue and mold gate and fill the mold uniformly. The amount of material injected into a mold can range from less than 1 ounce to 25 pounds or more. Modern injection-molding machines have many specialized mechanical features and are of impressive dimensions. Of comparatively recent development is the technique of reaction injection molding, in which a two-

part semiliquid resin blend is flowed through a nozzle into the mold cavity, where it polymerizes as a result of chemical reaction. One of the components contains the activating agent or curative; the two parts must be mixed with the greatest care for satisfactory results. Isocyanate resins (urethanes) and epoxy resins are well adapted to this fast, low-energy process.

ink. See printing ink; writing ink.

“Inoc” [Nalco]. TM for bioaugmentation products.

Use: In the treatment of wastewater for removal of organics.

“Inol k65” [Degussa].

CAS: 188364-50-3.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin irritant.

TM for an antioxidant.

Use: In a wide range of petroleum products including lubricants, industrial oils, and refinery streams.

inorganic chemistry. A major branch of chemistry that is generally considered to embrace all substances except hydrocarbons and their derivatives, or all substances that are not compounds of carbon, with the exception of carbon oxides and carbon disulfide. It covers a broad range of subjects, among which are atomic structure, crystallography, chemical bonding, coordination compounds, acid-base reactions, ceramics, and the various subdivisions of electrochemistry (electrolysis, battery science, corrosion, semiconduction, etc.). It is important to state that inorganic and organic chemistry often overlap. For example, chemical bonding applies to both disciplines, electrochemistry and acid-base reactions have their organic counterparts; catalysts and coordination compounds may be either organic or inorganic. Regarding the importance of inorganic chemistry, R. T. Sanderson has written: “All chemistry is the science of atoms, involving an understanding of why they possess certain characteristic qualities and why these qualities dictate the behavior of atoms when they come together. All properties of material substances are the inevitable result of the kind of atoms and the manner in which they are attached and assembled. All chemical change involves a rearrangement of atoms. Inorganic chemistry [is] the only discipline within chemistry that. . . . examines specifically the differences among all the different kinds of atoms.”

inosine. (hypoxanthine riboside).

CAS: 58-63-9. $C_{10}H_{12}N_4O_5$. An important intermediate in animal purine metabolism. Also available as its barium salt.

Properties: (Dihydrate.) Crystallizes in needles from water. Mp 90C (anhydrous), 218C (decomposes). Levorotatory in solution. Slightly soluble in water; soluble in alcohol.

Derivation: By deamination of adenosine.

Use: Biochemical research.

inosine dialdehyde.

CAS: 23590-99-0. mf: $C_{10}H_{10}N_4O_5$.

Hazard: Moderately toxic.

inosinic acid. (IMP; hypoxanthine riboside-5-phosphoric acid).

CAS: 131-99-7. $C_{10}H_{13}N_4O_8P$. An important intermediate in the synthesis and metabolism of animal purines.

Properties: Syrup; agreeable sour taste. Freely soluble in water and formic acid; very sparingly soluble in alcohol and ether.

Derivation: From meat extract or by enzymatic deamination of muscle adenylic acid.

Use: Biochemical research, flavor enhancer. See sodium inosinate.

inositol. (hexahydroxycyclohexane).

CAS: 87-89-8. $C_6H_6(OH)_6 \cdot 2H_2O$. A constituent of body tissue. There are nine isomeric forms of inositol (myo-inositol or *meso*-inositol or specifically the *cis*-1,2,3,5-*trans*-4,6-hexahydroxycyclohexane has vitamin activity).

Properties: (I-inositol.) White crystals; odorless; sweet taste. Mp 224–227C, d 1.524 (dihydrate), 1.752 when anhydrous, dihydrate melts at 215–216C. Soluble in water; insoluble in absolute alcohol and ether. Stable to heat, strong acid, and alkali. Amounts are expressed in milligrams of inositol.

Source: Food source: vegetables, citrus fruits, cereal grains, liver, kidney, heart, and other meats. Commercial source: corn steep liquor by precipitation and hydrolysis of crude phytate.

Grade: NF, FCC.

Use: Medicine, nutrition, intermediate.

inositol hexaphosphoric acid. See phytic acid.

inositol hexaphosphoric acid ester, sodium salt. See sodium phytate.

INPC. Abbreviation for isopropyl-*N*-phenylcarbamate. See IPC.

INS. Ion neutralization spectroscopy.

insecticide. A type of pesticide designed to control insect life that is harmful to humans, either directly as disease vectors or indirectly as destroyers of crops, food products, or textile fabrics. General types are as follows: (1) Inorganic: arsenic, lead, and copper (inorganic compounds and mixtures); the use of these has diminished sharply in recent years because of the development of more effective types less toxic to humans. (2) Natural organic compounds, such as rotenone and pyrethrins (relatively

harmless to humans since they quickly decompose to nontoxic compounds), nicotine, copper naphthenate, and petroleum derivatives. (3) Synthetic organic compounds: (a) chlorinated hydrocarbons such as DDT, dieldrin, endrin, chlordane, lindane, *p*-dichlorobenzene; (b) the organic esters of phosphorus (the parathions and related substances). (4) Of comparatively recent development are pyrethroids, or insect growth regulators, which act as neurotoxins, preventing larvae from becoming adult forms (juvenile hormones); and metabolic inhibitors, e.g., imidazole, which function as structural antagonists.

Hazard: Insecticides are toxic to humans in varying degrees. Among the safest are the pyrethrins, rotenone, and methoxychlor. Most of the organophosphorus types (parathion and related compounds) are highly toxic but are reasonably biodegradable. The chlorinated hydrocarbons resist biodegradation; their use has been restricted and in some cases (DDT) banned for agricultural application, due to their harmful ecological effects. EPA is constantly monitoring new insecticides and issues warnings or restrictions on their use; its approval is required before they can be registered.

See pesticide; fumigant; herbicide; rodenticide; repellent.

insect wax. See shellac; Chinese insect wax.

insert. In a complete plasmid clone, there are two types of DNA—the “vector” sequences and the “insert”. The vector sequences are those regions necessary for propagation, antibiotic resistance, and all those functions necessary for useful cloning. The insert is the piece of DNA of interest.

insertion. A chromosome abnormality in which a piece of DNA is incorporated into a gene and thereby disrupts the gene’s normal function. See chromosome; DNA; gene; mutation.

insertion mutation. A mutation caused by insertion of one or more extra bases between bases in DNA, or a mutagen which itself is inserted between bases. See insertion.

insertion sequence. The specific base sequences at either end of a transposon which allow for insertion into DNA.

in situ hybridization. Use of a DNA or RNA probe to detect the presence of the complementary DNA sequence in cloned bacterial or cultured eukaryotic cells.

instantizing. See agglomeration (2).

Institute of Food Technologists. (IFT)

Founded in 1939, the Institute of Food Technologists is a nonprofit scientific society with 28,000 members working in food science, food technology,

and related professions in industry, academia and government. The Institute advances the science and technology of food through the exchange of knowledge. Its world headquarters are at 221 N. LaSalle St., Ste. 300, Chicago, IL 60601-1291. Website: [HTTP://www.ift.org](http://www.ift.org).

instrument. Any of a wide variety of devices used for one of the following purposes: (1) observation (microscope); (2) measurement (thermometer, thermocouple, flowmeter, balance); (3) chemical analysis (spectrometer).

See analytical chemistry; instrumentation.

instrumentation. (1) *Plant.* An inclusive term for sensing devices that measure, record, and control temperature, flow rate, thickness, pH, liquid level, and other process variables on a continuous basis. Some types, e.g., thickness gauges, utilize radioisotopes. Particularly sophisticated computerized instrumentation is required in petroleum refining and nuclear reactor control. (2) *Laboratory.* A broad range of analytical techniques and devices utilized in the many types of chromatography and spectroscopy. Significant advances in analytical instrumentation have been made in recent years, e.g., in liquid chromatography (HPLC). A notable event in this field is the annual Pittsburgh Conference on Analytical Chemistry and Applied Spectroscopy. (3) *General.* Of special significance for both laboratory and process control is the introduction of fiber optical devices that can transmit signals from many remote locations. They are particularly useful in analyzing samples of radioactive chemicals and other hazardous materials. They are also used in high-temperature thermometry and dosimetry.

See fiber, optical.

insulating oil. See transformer oil.

insulator. Any substance or mixture that has an extremely low dielectric constant, low thermal conductivity, or both. Electrical insulators are either solid or liquid, the latter being used in transformers (askarel, mineral oils, silicone oils). A wide variety of solid types includes porcelains, glass, mica, alumina, various high polymers (epoxies, polyethylene, polystyrene, phenolics), cellulosic materials, nylon, and silicone resins. All these may be used alone or combined with other insulators as composites.

See dielectric; transformer oil.

Thermal insulators comprise an equally broad range of materials. Such inorganics as mineral fibers, magnesia, aluminum silicate, cellulose, and glass fibers are widely used for steam and hot-water pipes, furnaces, and blown-in home insulation. Organic products that are effective include plastic foams (polyurethane, polyvinyl chloride, polystyrene) and cellular rubber. There are a number of materials that may be called double insulators, since they have both electrical and thermal insulating properties,

e.g., polystyrene, PVC, cellulose, glass, magnesia, and aluminum silicate.

Air is a unique case, as it is the only gaseous material in actual use as an insulator. Its dielectric constant is 1.0058, far less than that of any other dielectric material, and it has low thermal conductivity as well. It is particularly effective when trapped within a solid network, as in wool, cellular plastics, or glass fibers, or as an interlayer between wall panels.

insulin. A polypeptide hormone having a molecular weight of 5733. It is formed in the isles of Langerhans located in the pancreas and was so named for this reason. Insulin is composed of 16 amino acids arranged in a coiled chain and cross-linked in several places by the disulfide bonds of cystine residues. The sequence of amino acids has been elucidated. The insulin molecule was synthesized in 1963. In 1977, rat insulin was produced in the bacterium *E. coli* by recombinant DNA techniques. A year later human insulin was generated after chemically synthesized genes were added to *E. coli*. This synthetic insulin is now in commercial production and has been approved by FDA. Insulin regulates carbohydrate metabolism in the body by decreasing the blood glucose level. A systemic deficiency leads to diabetes.

Properties: White powder or hexagonal crystals.

Readily soluble in dilute acids; soluble in water.

Derivation: Extraction of minced pancreas with acidified dilute alcohol, followed by precipitation with absolute alcohol; also by gene-splicing methods.

Grade: USP, in various solutions or suspensions that include insulin injection; isophane insulin suspension; protamine zinc insulin suspension; NF, as globin zinc insulin injection.

Hazard: Overdosage can be fatal.

Use: Medicine (for diabetes control).

See Banting; recombinant DNA.

integral membrane proteins. Proteins inserted into a membrane by hydrophobic interactions. Contrast with peripheral proteins.

intercalating mutagen. A mutagen that inserts itself between two successive bases in a nucleic acid causing a frame-shift mutation.

intercalation compound. A compound composed of a crystalline lattice that acts as an electron donor, and "foreign" electron acceptor atoms interspersed or diffused between the planes of the lattice. An important group of intercalated compounds are composed of graphite, where bromine, for example, can act as electron acceptor. Graphite is particularly susceptible to this phenomenon because of its orderly stacked layers of crystals. Anhydrous metal nitrates such as copper and zinc nitrates also form intercalated compounds with graphite. A further example is trilithium nitride, whose structure consists of a series of layers of dilithium nitride, between

which is a layer of lithium atoms. This markedly increases the conductivity, so that the material becomes an effective solid electrolyte in batteries. Other substances having this property are sodium β -alumina, titanium disulfide, and some metal dioxides. The phenomenon does not impair the crystalline structure and is reversible. Intercalated compounds are used for superconductors, synthetic lubricants, catalysts, and storage batteries. They are used in biochemical research; an acridine-based compound that can intercalate between stacked pairs of bases in a DNA helix is used in cancer research.

“Intercar” [AKZO]. TM for a series of water-dispersible paint driers.

Available forms: Supplied in high metal concentration (calcium 4%, cobalt 6%, lead 24%, manganese 6%).

“Intercide” [AKZO]. TM for a series of fungicides and mildewcides.

Use: Wood and fabric preservatives.

interface. The area of contact between two immiscible phases of a dispersion which may involve either the same or different states of matter. Five types are possible: (1) solid-solid (carbon black-rubber), (2) liquid-liquid (water-oil), (3) solid-gas (smoke-air), (4) solid-liquid (clay-water), (5) liquid-gas (water-air). At a fresh surface of either liquid or solid the molecular attraction exerts a net inward pull. Hence the characteristic property of a liquid is surface tension and that of a solid surface is adsorption. Both have the same cause, namely, the inward cohesive forces acting on the molecules at the surface. These phenomena provide to some degree the fundamental mechanism for many industrially important processes (catalysis, emulsification, mixing, alloying) and products (detergents, adhesives, lubricants, paints). Such properties as wettability of solid powders, spreading coefficients of liquids, and protective action of colloidal substances are intimately associated with interfacial behavior. See surface; surface tension; catalysis; emulsion; detergent; wetting agent.

interfacial film. Skinlike structure that develops at the interface between the two emulsion phases, consisting of adsorbed and oriented molecules of the emulsifying agent in a state of loose aggregation. It surrounds the droplets of the internal phase and keeps them from flowing together.

interfacial surface energy. The tension measured in dynes per centimeter.

interference. One crossover event inhibits the chances of another crossover event. Also known as positive interference. Negative interference increases the chance of a second crossover.

See crossing over.

interferon. An antiviral protein produced by vertebrate cells in response to virus infection. Discovered in 1957, it is a product of the infected cell, rather than of the disease-inducing virus. It can be formed by any type of infected cell and is effective against many viruses, but only in the cells of the organism that produced it. It is quite different from an antibody which is produced only by specialized cells and acts by combining directly with a specific virus. Interferon does not inactivate viruses directly, but reacts with susceptible cells which then resist virus multiplication. Prostaglandins are believed to be effective in maintaining normal interferon production in the body. Four types of interferon are presently known. As a result of advanced recombinant DNA techniques, a biologically active protein almost identical with interferon has been made outside the body by exposing to virus action bacteria into which the genetic code controlling interferon formation in the body has been introduced. The “synthetic” interferon is available in quantities large enough to permit its use in treatment of various virus diseases. The interferon molecule itself has not yet been synthesized.

See recombinant DNA.

intergenic. Between two genes, e.g., intergenic DNA is the DNA found between two genes. The term is often used to mean non-functional DNA (or at least DNA with no known importance to the two genes flanking it). Alternatively, one might speak of the “intergenic distance” between two genes as the number of base pairs from the polyA site of the first gene to the cap site of the second. This usage might therefore include the promoter region of the second gene.

interification. See ester interchange.

interleukin-2. A type of biological response modifier (a substance that can improve the body’s natural response to disease). It stimulates the growth of certain disease-fighting blood cells in the immune system. Also called IL-2.

intermediary metabolism. The enzyme-catalyzed reactions that extract chemical energy from nutrient molecules and utilize it to synthesize molecules and perform cell functions.

intermediate. An organic compound, either cyclic (derived from coal tar or petroleum products such as benzene, toluene, naphthalene, etc.) or acyclic (e.g., ethyl and methyl alcohol). These compounds may be considered as chemical stepping stones between the parent substance and the final product. The cyclic type (e.g., aniline, β -naphthol, and benzoylbenzoic acid) still predominate as intermediates for synthetic dyes and have few other uses; the acyclic type in general have many independent uses. Exceptions are hexamethylenetetramine, an acyclic intermediate for phenolformaldehyde resin

and butadiene for synthetic elastomers. Intermediates are the foundation of the modern approach to organic technology. The distinction between an intermediate and an end product is not always precise. See azo dye intermediate.

intermetallic compound. (1) A compound or alloy formed by two metals that have been placed in intimate contact during the process of brazing or coating, the compound occurring at the interface between the metal surfaces. In some cases, as in galvanizing, the metals form bimetallic compounds; in others they form alloys or solid solutions of varying composition. (2) A two- or three-component metal system prepared with special metals having semiconducting properties, e.g., gallium, for use in lasers, diodes, transistors, etc. See galvanizing; semiconductor.

intermolecular. Describes an interaction (e.g., a chemical reaction) between different molecules.

internal compensation. (intramolecular compensation; *meso* form). The optical neutralization produced in a molecule when two asymmetric centers in the molecule produce equal, opposite amount of rotation of the plane of polarization. See *meso*-.

internal conversion. The effect of an atom produced by a γ -ray photon emerging from the nucleus, and giving up its energy on meeting with an extra nuclear electron.

internal energy. The sum of the kinetic and potential energies (including electromagnetic field energies) of the particles that make up a system.

International Union of Pure and Applied Chemistry. (IUPAC). A voluntary nonprofit association of national organizations representing chemists in 45 member countries. It was formed in 1919 with the object of facilitating international agreement and uniform practice in both academic and industrial aspects of chemistry. Examples are nomenclature, atomic weights, symbols and terminology, physicochemical constants, and certain methods of analysis and assay. In addition to standardization, IUPAC carries on several hundred research projects relating to food technology, water and air quality, single-cell proteins, etc. Its Secretariat can be reached at PO Box 13757, Research Triangle Park, NC 27709-3757, USA. Website: www.iupac.org.

interphase. The period in the cell cycle when DNA is replicated in the nucleus. It is followed by mitosis.

interstellar space. See astrochemistry.

interstitial. (1) Descriptive of a nonstoichiometric compound of a metal and a nonmetal whose structure conforms to a simple chemical formula, but exists over a limited range of chemical composition. Interstitial compounds are represented by borides, nitrides, and carbides of the transition metals. (2) Descriptive of an atom of an impurity that causes a defect or dislocation in a crystalline lattice, e.g., an atom of carbon or nitrogen in an iron crystal, or of arsenic in a semiconductor. (3) In a biological sense, the term describes cells located between or within layers of tissue.

“Interwax” [AKZO]. TM for a series of wax modifiers.
 “P” = High molecular weight polybutene and paraffin wax.
 “M” = High molecular weight polybutene and amber-colored, microcrystalline wax.
 “280” = A hard, high-melting-point synthetic wax.
Use: In lacquers and varnishes, as a plastic lubricant and antiblocking agent, as an extender or substitute for carnauba wax.

“Interwet” [AKZO]. TM for a series of wetting agents for emulsion paints, latex paints, and vinyl plastisols.

“Intracron” [Crompton]. TM for a group of fiber-reactive dyes.
Available forms: Liquid and powder.
Use: For cellulosic fibers and blends.

intramolecular compensation. See internal compensation; *meso*-.

intramolecular reaction. Change in position of an atom or group of atoms in a molecule giving rise to a different, though isomeric compound.

“Intrasil.” [Crompton] TM for a group of disperse dyes.
Available forms: Liquid and powder.
Use: Acetate and polyester apparel and polyester automotive fabrics.

introfier. Substance used to lower interfacial tension between two phases, usually a liquid soluble in both phases; a wetting accelerator.

introns. The DNA base sequences interrupting the protein-coding sequences of a gene; these sequences are transcribed into RNA but are cut out of the message before it is translated into protein. See: Exons.

intumescence. The foaming and swelling of a plastic or other material when exposed to high surface temperatures or flames.
Use: Polyurethane base coating materials for rocket reentry.

inulin. (alantín; alantárch).

Properties: Spherical crystals. Mp 158–165C. Hygroscopic in moist air. Soluble in hot water.

Source: From chicory root.

Use: Diagnostic aid for kidney function.

“Invar.” TM for an iron-nickel alloy containing 40–50% nickel and characterized by an extremely low coefficient of thermal expansion.

Use: Precision instruments, measuring tapes, weights, etc.

invariant point. State of system where the number of degrees of freedom is zero.

invention. The chief requirement of an invention is that it be unobvious to a person having ordinary skill in the art to which the claim pertains and knowing everything that has gone before, as shown by publication anywhere or public use in the U.S. When reliance for patentability is placed on a new mixture of components that have been used separately, it must be shown that there is some unexpected coaction between the ingredients and not just the additive effects of the several materials. The inventor is the one who contributes the inventive concept in workable detail, not the one who demonstrates it or tests it.

inversion. Splitting up of higher sugars into molecules of a lower sugar.

inversion point. Temperature at which one polymorphic form of a substance changes into another under variant conditions.

invertase. (sucrase; invertin). Enzyme produced by yeast and by the lining of the intestines. It is a white powder, soluble in water. It catalyzes the conversion of sucrose (ordinary sugar) to glucose and levulose (fructose) during fermentation of sugars.

Use: Production of invert sugar for syrups and candy; analytical reagent for sucrose.

invert soaps. Cationic detergents with disinfectant properties.

invert sugar. A mixture of 50% glucose and 50% fructose obtained by the hydrolysis of sucrose. It absorbs water readily and is usually handled only as a syrup. Because of its fructose content, invert sugar is levorotatory in solution and sweeter than sucrose. Invert sugar is often incorporated in products where loss of water must be avoided. Commercially it is obtained from the inversion of a 96% cane sugar solution.

Use: Food industry, brewing industry, confectionery, humectant.

investment casting. A ceramic or metal casting method originally used to make reproductions of

sculptured pieces (lost wax process) and adapted to industry for manufacture of precision metal parts. It is generally known as precision investment casting. The sequence of operations is (1) a wax prototype is made in a metal mold; (2) several of these are attached to a central member, also made of wax to form a “tree”; (3) the tree is dipped and dried eight times in a ceramic glaze, thus building up a coating or “investment”; (4) the assembly is baked in an oven, thus melting out the wax, leaving a cavity which is then used as a mold for liquid metal. Great accuracy can be obtained with this method. The exact nature of the waxes and coatings is not disclosed.

in vitro. A condition in which a reaction is carried out in a laboratory experiment (i.e., a glass container, test tube, or beaker), as opposed to a reaction occurring in a living organism (in vivo).

ioctamic acid.

CAS: 16034-77-8. mf: $C_{12}H_{13}IN_2O_3$.

Hazard: Low toxicity by ingestion.

iodosin. (tetraiodofluorescein). $C_{20}H_8I_4O_5$.

Properties: Red powder. Soluble in dilute alkalis; slightly soluble in alcohol and ether; insoluble in water.

Derivation: Interaction of fluorescein and iodine in presence of iodic acid.

Use: Indicator in analytical chemistry.

iodic acid.

CAS: 7782-68-5. HIO_3 .

Properties: Colorless, rhombic crystals or white, crystalline powder. D 4.629, mp 110C (decomposes). A moderately strong acid. Soluble in cold and hot water.

Derivation: By adding sulfuric acid to a solution of barium iodate and subsequent filtration and crystallization.

Hazard: Toxic by ingestion, strong irritant to eyes and skin.

Use: Analytical chemistry, medicine (1–3% solution).

iodic acid anhydride. (iodine pentoxide).

I_2O_5 .

Properties: White, crystalline powder. D 4.799, mp 300C (decomposes). Soluble in water and nitric acid; insoluble in absolute alcohol, chloroform, ether, carbon disulfide.

Hazard: Toxic by ingestion, strong irritant to eyes and skin, strong oxidizing agent.

Use: Oxidizing agent, organic synthesis.

iodinated casein.

Use: Drug (veterinary); food additive.

iodine.

CAS: 7553-56-2. I. Nonmetallic halogen element of atomic number 53; group VIIA of the periodic table;

the least reactive of the halogens, aw 126.9045; valences = 1,3,5,7; no stable isotopes but many artificial radioactive isotopes.

Properties: Heavy, grayish-black plates or granules having a metallic luster; characteristic odor. Readily sublimed having a violet vapor. D 4.98, mp 113.5C, bp 184C. Soluble in alcohol, carbon disulfide, chloroform, ether, carbon tetrachloride, glycerol, and alkaline iodide solutions; insoluble in water. A semiconductor.

Derivation: (a) From brine wells in Michigan, Oklahoma, Japan, Indonesia; (b) from mother liquors of Chilean nitrate. It can also be extracted from kelp.

Method of purification: Sublimation.

Grade: Crude, CP, USP.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin. TLV: ceiling 0.1 ppm.

Use: Dyes (aniline dyes, phthalein dyes), alkylation and condensation catalyst, iodides, iodates, antiseptics and germicides, X-ray contrast media, food and feed additive, stabilizers, photographic film, water treatment, pharmaceuticals, medicinal soaps, unsaturation indicator.

iodine 131. (¹³¹I). Radioactive iodine of mass number 131.

Properties: Half-life 8 days. Radiation: β and γ .

Derivation: By pile irradiation of tellurium and from the fission products of nuclear reactor fuels.

Available forms: As elemental iodine and in a weakly basic solution of sodium iodide in sodium sulfite; iodine 131 is also available in tagged compounds such as dithymol diiodide, potassium iodate, diiodo-fluorescein, insulin, ACTH, etc.

Grade: USP lists iodinated ¹³¹I serum albumin, rose bengal sodium ¹³¹I injection, sodium iodide ¹³¹I capsules and solution, sodium iodohippurate ¹³¹I injection.

Use: Diagnosis and treatment of goiter, hyperthyroidism, and other thyroid disorders; internal radiation therapy; in film gauges to measure film thicknesses of the order of one micron; for detecting leaks in water lines; as a source of radiation in oil field tests; as a tracer in chemical analysis; as a tracer in studying diet iodine for cattle, the functions of the thyroid gland, the efficiency of mixing pulp fibers, the thermal stability of potassium iodate in bread dough, chemical reaction mechanisms, etc.

iodine bromide. See iodine monobromide.

iodine chloride. See iodine monochloride; iodine trichloride.

iodine cyanide. See cyanogen iodide.

iodine monobromide. (bromine iodide).

CAS: 7789-33-5. IBr.

Properties: Crystals, purplish-black mass. Mp 42C, bp 116C (decomposes), d 4.41. Soluble in water with decomposition, alcohol, and ether.

Derivation: By the interaction of iodine and bromine.

Hazard: Toxic by ingestion and inhalation, vapors corrosive to tissue.

Use: Organic synthesis.

iodine monochloride.

CAS: 7790-99-0. ICl.

Properties: Black crystals (α and β forms) or reddish-brown, oily liquid. Mp (α) 27C, (β) 14C, bp 101C (decomposes), d (α) 3.18 (0C), (β) 3.24 (liquid at 34C). Soluble in alcohol, water (with decomposition), and dilute hydrochloric acid.

Derivation: By the action of dry chlorine on iodine.

Hazard: Toxic by ingestion and inhalation, strong irritant to eyes and skin.

Use: Analytical chemistry, organic synthesis.

iodine number. (iodine value). The percentage of iodine that will be absorbed by a chemically unsaturated substance (vegetable oils, rubber, etc.) in a given time under arbitrary conditions. A measure of unsaturation.

iodine pentafluoride.

CAS: 7783-66-6. IF₅.

Properties: Fuming liquid. Bp 98C, mp 9.4C, d 3.189 (25C). Attacks glass.

Derivation: Passing fluorine over iodine. Available in cylinders at 98.0% min purity.

Hazard: Dangerous fire risk, reacts violently with water. Toxic by ingestion and inhalation, corrosive to skin and mucous membranes. TLV: 2.5 mg(F)/m³.

Use: Fluorinating and incendiary agent.

iodine pentoxide. See iodic acid anhydride.

iodine test. Placing a few drops of potassium iodide solution on a sample to detect the presence of starch. The test is positive if sample turns blue.

iodine tincture. A solution of iodine and potassium iodide or sodium iodide in alcohol, a reddish-brown liquid having the odors of iodine and alcohol, contains 44–50% by volume alcohol, 2 g of iodine and 2.4 g sodium iodide per 100 cc.

Grade: USP

Hazard: Toxic by ingestion, avoid using on open cuts.

Use: Antiseptic (use on skin surface only).

iodine trichloride. ICl₃.

Properties: Orange-yellow, deliquescent, crystalline powder; pungent irritating odor. Mp 33C, d 3.11. Soluble in water (with decomposition), alcohol, and benzene.

Derivation: By interaction of iodine and chlorine.

Hazard: Toxic by ingestion and inhalation, corrosive to tissue.

Use: Agent for introducing iodine and chlorine in organic synthesis; topical antiseptic.

iodine value. See iodine number.

iodipamide. $(\text{CH}_2)_4(\text{CONHC}_6\text{H}_3\text{COOH})_2$.

Properties: White, crystalline powder; nearly odorless. Very slightly soluble in alcohol, chloroform, ether; insoluble in water; pH of saturated solution is 3.5–3.9.

Hazard: Toxic by ingestion.

Use: Medicine (X-ray contrast medium).

iodisan. See propiodal.

iodized oil. An iodine addition product of vegetable oil or oils containing 38–42% organically combined iodine.

Properties: Thick, viscous, oily liquid; affected by air and light. Soluble in solvent naphtha.

Hazard: Toxic by ingestion.

Use: Medicine (radiopaque medium).

iodoacetic acid, sodium salt. (sodium iodoacetate).

CAS: 305-53-3. $\text{ICH}_2\text{CO}_2\text{Na}$.

Properties: Colorless or white crystals. Mw 207.93, mp 210C. Soluble in water, alcohol, and very slightly soluble in ether. Hygroscopic in moist air.

Hazard: Toxic.

Use: Analytical reagent.

(iodoacetoxy)tributylstannane. See tributyltin iodoacetate.

(iodoacetoxy)tripropylstannane. See tripropyltin iodoacetate.

***o*-iodobenzoic acid tributylstannyl ester.**

See tributyltin-*o*-iodobenzoate.

(*o*-iodobenzoyloxy)tripropylstannane.

CAS: 73927-94-3. mf: $\text{C}_{16}\text{H}_{25}\text{IO}_2\text{Sn}$.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

4-iodo-3,5-dimethyl-*n*-(2-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 302542-42-3. mf: $\text{C}_{14}\text{H}_{16}\text{IN}_3\text{O}$.

Hazard: Moderately toxic by ingestion.

4-iodo-3,5-dimethyl-*n*-(3-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 302542-51-4. mf: $\text{C}_{14}\text{H}_{16}\text{IN}_3\text{O}$.

Hazard: Moderately toxic by ingestion.

4-iodo-3,5-dimethyl-*n*-(4-methylphenyl)-1h-pyrazole-1-acetamide.

CAS: 302542-63-8. mf: $\text{C}_{14}\text{H}_{16}\text{IN}_3\text{O}$.

Hazard: Moderately toxic by ingestion.

iodoethane. See ethyl iodide.

iodoethylene. See tetraiodoethylene.

iodoform. (triiodomethane).

CAS: 75-47-8. CHI_3 .

Properties: Small greenish yellow or lustrous crystals or powder; penetrating odor. D 4.08, mp 115C. Soluble in benzene and acetone; partially soluble in alcohol, glycerol, chloroform, carbon disulfide, and ether; insoluble in water.

Derivation: (a) By heating acetone or methanol with iodine in presence of an alkali or alkaline carbonates. (b) Electrolytically, by passing a current through a solution containing potassium iodide, alcohol, and sodium carbonate.

Grade: Technical, NF.

Hazard: Irritant. Decomposes violently at 400F (204C). TLV: 0.6 ppm.

Use: Medicine (antiseptic for external use only).

iodomethane. See methyl iodide.

1-iodooctadecane. (octadecyl iodide).

$\text{CH}_3(\text{CH}_2)_{17}\text{I}$.

Properties: Solid. Mw 380.40, mp 33-35C, bp 194–197C (2 mm Hg), fp 110C. Light sensitive.

Hazard: Irritant.

Use: Reagent for introduction of C_{18} chain.

iodopanoic acid. See iopanoic acid.

iodophenazone.

CAS: 129-81-7. mf: $\text{C}_{11}\text{H}_{11}\text{IN}_2\text{O}$.

Hazard: Moderately toxic by ingestion.

iodophor. ("tamed iodine"). (1) A complex of iodine with certain types of surface-active agents that have detergent properties. (2) More generally, any carrier of iodine.

iodophosphonium. See phosphonium iodide.

2-iodopropane. See isopropyl iodide.

(iodopropionyloxy)tributylstannane. See tributyltin- β -iodopropionate.

iodopyracet meglumine.

CAS: 3736-90-1. mf: $\text{C}_7\text{H}_5\text{I}_2\text{NO}_3 \cdot \text{C}_7\text{H}_{17}\text{NO}_5$.

Hazard: Low toxicity.

***N*-iodosuccinimide.** (succiniodimide).

$(-\text{CH}_2\text{CO})_2\text{NI}$.

Properties: Colorless crystals. Mp 200–201C. Soluble in acetone and methanol; insoluble in carbon tetrachloride and ether; decomposes in water.

Hazard: Skin irritant.

Use: Iodinating agent in synthetic organic chemistry.

iodotributylstannane.

CAS: 7342-47-4. mf: $\text{C}_{12}\text{H}_{27}\text{ISn}$.

Hazard: A poison by ingestion and skin contact. Moderately toxic by inhalation. Tributyl tin compounds are extremely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

iodotrimethyltin.CAS: 811-73-4. mf: C_3H_9ISn .**Properties:** White powder, insol in water and org solvs.**Hazard:** A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**iodotriphenylstannane.**CAS: 894-09-7. mf: $C_{18}H_{15}ISn$.**Hazard:** A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).**iodotripropylstannane.** See tripropyltin iodide.**iomeprol.**CAS: 78649-41-9. mf: $C_{17}H_{22}I_3N_3O_8$.**Hazard:** Low toxicity.

ion. An atom or radical that has lost or gained one or more electrons and has thus acquired an electric charge. Positively charged ions are cations and those having a negative charge are anions. An ion often has entirely different properties from the element (atom) from which it was formed. In sodium chloride solution, sodium exists as sodium ion (Na^+), i.e., sodium atoms that have lost one electron. The chlorine is present as chloride ion (Cl^-), i.e., chlorine atoms that have gained one electron. Copper sulfate solution contains copper ion (Cu^{2+}), i.e., copper atoms that have lost two electrons, and sulfate ion (SO_4^{2-}), i.e., sulfate radicals that have gained two electrons. Ions occur in water solution or in the fused state (except in the case of gases). Compounds that form ions are called electrolytes because they enable the solution to conduct electricity. Ion formation causes an abnormal increase in the boiling point of water and also lowers the freezing point, the extent depending on the concentration of the solution. Ions are also formed in gases as a result of electrical discharge.

See ionization; electrolysis; ion exchange.

ion channel. An integral membrane protein that provides for the regulated transport of specific a ion or ions across a membrane.

ion electrode. Electrode that develops and measures an electrical potential in response to the activity of an ion in solution to which it is selective.

ion exchange. A reversible chemical reaction between a solid (ion exchanger) and a fluid (usually a water solution) by means of which ions may be interchanged from one substance to another. The superficial physical structure of the solid is not affected. The customary procedure is to pass the fluid through a bed of the solid, which is granular and porous and has only a limited capacity for exchange. The process is essentially a batch type in which the ion exchanger, upon nearing depletion, is regenerated by inexpensive brines, carbonate solutions, etc.

Ion exchange occurs extensively in soils. Ion exchange resins are synthetic resins containing active groups (usually sulfonic, carboxylic, phenol, or substituted amino groups) that give the resin the property of combining with or exchanging ions between the resin and a solution. Thus, a resin with active sulfonic groups can be converted to the sodium form and will then exchange its sodium ions with the calcium ions present in hard water. Some specific applications of ion exchange: water softening, milk softening (substitution of sodium ions for calcium ions in milk), removal of iron from wine (substitution of hydrogen ions), recovery of chromate from plating solutions uranium from acid solutions, streptomycin from broths, removal of formic acid from formaldehyde solutions, demineralization of sugar solutions, recovery of valuable metals from wastes, recovery of nicotine from tobacco-dryer gases, catalysis of reaction between butyl alcohol and fatty acids, recovery and separation of radioactive isotopes from atomic fission, chromatography, establishment of mass micro standards, in cigarette filters to remove polonium from smoke.

See zeolite.

ion-exchange chromatography. A chromatographic method based on the ability of polymers to sorb ionized solutes reversibly, e.g., cross-linked resins with exchangeable hydrogen or hydroxyl ions. It can be carried out both in columns and on sheets.

ion-exchange resin. See ion exchange.

ion exclusion. The process in which a synthetic resin of the ion exchange type absorbs nonionized solutes such as glycerine or sugar while it does not absorb ionized solutes that are also present in a solution in contact with the resin. Thus, sodium chloride and glycerine can be separated by passage of their aqueous solution through a bed of particles of an ion exclusion resin.

ionic bond. (electrovalent bond). Refers to the formation of ions by transfer of one or more electrons from one atom to another.
See bond, chemical.

ionic detergent. See detergent.

ionization. A chemical change by which ions are formed from a neutral molecule of an inorganic solid, liquid, or gas. The most common type of ionization occurs when an ionically bonded inorganic compound such as sodium chloride or sulfuric acid is dissolved in water (or other solvent); the molecule separates or dissociates into two ions, the metallic ion being positively charged by loss of an electron and the nonmetallic ion being negatively charged by gaining an electron. The degree of dissociation varies with the type of compound, the solvent, and the temperature. Molecules or atoms of

gases are ionized by passage of an electric current through the gas; this removes electrons and leaves a positive charge. Compounds that ionize in solution greatly increase the conductivity of the solvent. Ionization is most effective in water because its high dielectric constant lowers the ionic bonding forces in the solute molecules enough to cause separation of their constituent atoms. Ion formation produces a notable rise in the boiling point and a depression of the freezing point of water. An electric current passed through a solution containing ions causes them to move to the oppositely charged electrode; this effect is the basis of many industrial electrochemical operations, such as electroplating and the manufacture of sodium hydroxide and chlorine. See ion; electroplating; electrolysis; electrolyte; dissociation.

ionizing radiation. See radiation, ionizing.

ionomer resin. A copolymer of ethylene and a vinyl monomer with an acid group, such as methacrylic acid. They are cross-linked polymers in that the linkages are ionic as well as covalent bonds. There are positively and negatively charged groups which are not associated with each other and this polar character makes these resins unique.

Properties: Transparent, electrically conductive, resilient, and thermoplastic. Cannot be completely dissolved in any commercial solvents. High resistance to abrasion, cracking, corona attack; high tensile strength. Working temperature approximately -108 to $+65.5^{\circ}\text{C}$.

Use: Break-resistant transparent bottles, packaging films, mercury flasks, protective equipment, pipe and tubing, electric distribution elements. As foam, insulation of fresh concrete.

See bond, chemical.

ionone. (α - or β -cyclocitrylideneacetone).

CAS: 8013-90-9. $\text{C}_{11}\text{H}_{20}\text{O}$.

Properties: Light-yellow to colorless liquid; violet odor. D $0.927-0.933$ (25°C), bp $126-128^{\circ}\text{C}$ (12 mm Hg), refr index $1.4970-1.5020$ (20°C). Soluble in alcohol, ether, mineral oil, and propylene glycol; insoluble in water and glycerol.

Grade: 95%, 99%, mixed isomers, FCC.

Derivation: (1) Condensing citral with acetone followed by ring closure with an acid, (2) reaction of acetylene with acetone followed by hydrogenation, condensation with diketone, and further reaction with acetylene.

Use: Perfumery, chemical synthesis, flavoring, vitamin A production (β isomer).

ionophore. A compound that binds metal ions and diffuses across membranes carrying the bound ion. An example is valinomycin, which transports potassium.

ion retardation. A process based on amphoteric (bifunctional) ion-exchange resins containing

both anion and cation adsorption sites. These sites will associate with mobile anions and cations in solution and thus remove both kinds of ions from solutions. These ions may be eluted by rinsing with water. Process can make clean separations of ionic-nonionic mixtures. Has also been suggested for demineralization of salt solutions.

See ion.

iopanoic acid. (iodopanoic acid; 3-amino- α -ethyl-2,4,6-triodohydrocinnamic acid).

CAS: 96-83-3. $\text{C}_9\text{H}_9\text{NH}_2\text{CH}_2\text{CH}(\text{COOH})\text{C}_2\text{H}_5$.

Properties: Cream-colored powder; tasteless; faintly aromatic odor. Mp $152-158^{\circ}\text{C}$ (decomposes), darkens on exposure to light. Soluble in acetone, ether, alcohol, chloroform, and dilute alkalies; insoluble in water.

Grade: USP.

Use: Medicine (radiopaque medium).

IPA. (1) Abbreviation for isophthalic acid. (2) Abbreviation for isopropyl alcohol.

IPAE. See isopropylaminoethanol.

Ipatieff, Vladimir N. (1890–1952). Born in Russia, Ipatieff was an army officer as well as a chemist. He was a member of the Academy of Science and carried out organic research at the Institute of Chemistry in Leningrad. He left the former U.S.S.R. under the Stalin regime and at the invitation of Gustav Egloff joined the Universal Oil Products Co. He and his close associate, Herman Pines, did basic development on catalytic alkylation and isomerization of hydrocarbons of the greatest importance for high-octane aviation gasoline.

IPC. (INPC; isopropyl-*N*-phenylcarbamate).

CAS: 122-42-9. $\text{C}_9\text{H}_9\text{NHCOOCH}(\text{CH}_3)_2$.

Properties: White to gray crystalline needles; odorless when pure. Mp 84°C (technical grade). Soluble in alcohol, acetone, isopropyl alcohol; insoluble in water.

Hazard: Toxic by ingestion.

Use: Herbicide.

IPC, chloro-. See chloro-IPC.

ipecac. Dried root of *Cephaelis ipecacuanha*.

Occurrence: Brazil and Bolivia, cultivated in India.

Grade: Technical, USP.

Hazard: Contains emetine, a toxic alkaloid.

Use: Medicine (emetic), production of emetine.

IPM. See *m*-phthalodinitrile.

Ir. Symbol for iridium

“Ircogel” [Lubrizol]. TM for a variety of calcium sulfonates, thixotropic.

Grade: 900 (paste), 903, 904, 905, 906, 907 (gel),

2064 (pourable liquid), 2050B (polymeric organic phosphate).

Available forms: Gel, pourable liquids.

Use: A thixotrope for PVC plastisols, organosol, and high-solids solvent-based paints; 2064: corrosion inhibitor for latex paint and other water-based coatings; 2085B: rust-preventative coatings.

“Irganox” [Novartis]. TM for a series of complex, high molecular weight stabilizers that inhibit oxidation and thermal degradation of many organic materials. They contain multifunctional chemical groupings. Several are hindered polyphenols. All are white, crystalline, free-flowing powders; nonstaining, nonvolatile, and odorless.

“Irgasan” [Novartis]. TM for broad-spectrum antibacterial agent.

Use: Deodorant soaps and underarm deodorants.

iridic chloride. (iridium chloride; iridium tetrachloride). IrCl_4 .

Properties: Brownish-black mass, hygroscopic. Soluble in water, alcohol, and dilute hydrochloric acid.

Derivation: Action of chlorine or aqua regia on the ammonium salt $(\text{NH}_4)_2\text{IrCl}_6$.

Use: Analysis (testing for nitric acid in the presence of nitrous acid), microscopy, plating solution.

iridium.

CAS: 7439-88-5. Ir. Metallic element of atomic number 77, one of the platinum metals, group VIII of the periodic table, aw 192.22, valences = 1,2,3,4,6, two stable isotopes.

Properties: Silver-white, low ductility. Does not tarnish in air. On heating strongly, a slightly volatile oxide is formed. Bulk d 22.65 (20C calculated) The most dense element known. Mp 2443C, bp approximately 4500C, most corrosion-resistant element, modulus of elasticity is one of highest (75,000,000 psi), Brinell hardness (cast) 218, highly resistant to chemical attack. Insoluble in acids; slowly soluble in aqua regia and in fused alkalis.

Occurrence: Canada, South Africa, the former U.S.S.R., Alaska.

Derivation: Occurs with platinum, remains insoluble when the crude platinum is treated with aqua regia, occurs as iridosmine. The powder is obtained by hydrogen reduction of ammonium chloroiridate.

Available forms: Powder, single crystals.

Use: Alloy with platinum for ammonia fuel-cell catalyst, electric contacts and thermocouples, commercial electrodes and resistance wires, laboratory ware, extrusion dies for glass fibers, jewelry. Primary standards of weight and length.

¹⁹²iridium. Radioactive iridium of mass number 192.

Properties: Half-life, 74 days. Radiation: β and γ .

Derivation: Pile irradiation of iridium.

Available forms: Iridium metal or potassium or sodium chloroiridate in hydrochloric acid solution.

Use: Radiography of light castings, treatment of cancer.

iridium bromide. See iridium tribromide.

iridium chloride. See iridic chloride; iridium trichloride.

iridium potassium chloride. (potassium chloroiridate; potassium iridium chloride).

K_2IrCl_6 .

Properties: Dark-red crystals. D 3.549. Soluble in water (hot).

Use: Black pigment (porcelain decoration). The iridium (III) salt is also known: K_3IrCl_6 , greenish-yellow.

iridium sesquioxide. Ir_2O_3 .

Properties: Black powder. Slightly soluble in hydrochloric acid (concentrated); insoluble in water. Decomposes at 400C.

Derivation: By heating the chloroiridate K_2IrCl_6 with sodium carbonate.

Use: Ceramics (porcelain decoration).

iridium tetrachloride. See iridic chloride.

iridium tribromide. (iridium bromide).

$\text{IrBr}_3 \cdot 4\text{H}_2\text{O}$.

Properties: Olive-green, brown, or black crystals. Soluble in water; insoluble in alcohol. Prepared by action of hydrobromic acid on iridium trihydroxide.

iridium trichloride. (iridium chloride).

CAS: 12645-45-3. IrCl_3 .

Properties: Dull green to blue-black particles. Mp 763C (decomposes). Insoluble in water and alcohol. Prepared by action of chlorine on iridium powder at 600C.

iridomyrmecin. $\text{C}_{10}\text{H}_{16}\text{O}_2$.

Properties: Colorless crystals. Mp 60C, bp 104C (1.5 mm Hg), characteristic odor, refr index 1.46, optically active. Soluble in ether and fatty alcohols; almost insoluble in water.

Use: Insecticide, biocide.

iridosmine. (osmiridium). A natural alloy of iridium and osmium containing some platinum, rhenium, ruthenium, iron, copper, palladium.

Properties: Tin-white to light steel gray in color; streak, same; metallic luster. D 18.8–21.12, Mohs hardness 6–7. Composition is variable ranging from 10.0–77.2% iridium, 17.2–80.0% osmium, 0–10.1% platinum, 0–17.2% rhenium, 0–8.9% ruthenium, 0–1.5% iron, 0.0.9% copper, trace, palladium. Unattacked by aqua regia.

Occurrence: Alaska, South Africa.

Use: Fountain-pen point tips, surgical needles, watch pivots, compass bearings, hardening platinum (standard weights, jewelry), source of iridium and osmium.

irinotectan hydrochloride hydrate.CAS: 136572-09-3. mf: $C_{33}H_{37}N_4O_6 \cdot ClH \cdot 3H_2O$.**Hazard:** Moderately toxic by ingestion.**Irish moss.** See carrageenan.**“Irish Moss” [Home Brewery].** TM for a beer clarifier.**Use:** Clarifier added in last 15 minutes of boil.**irloxacin.** See 6-fluoro-7-(1-pyrrolyl)-1-ethyl-1,4-dihydro-4-oxo-3.**“IRN” [Pfizer].** TM for a group of magnetic iron oxides, black ferroso-ferric oxides (Fe_3O_4) and brown γ -ferric oxides (Fe_2O_3), with application in ferric cores and electronic parts, magnetic inks, data-handling accounting systems, recording and instrumentation tapes.**iron.**

CAS: 7439-89-6. Fe. Metallic element of atomic number 26, group VIII of the periodic table, av 55.847, valences = 2,3; 4 stable isotopes, 4 artificial-radioactive isotopes.

Properties: Silver-white malleable metal. Tensile strength 30,000 psi, Brinell hardness 60, mp 1536C, bp 3000C, d 7.87 (20C), magnetic permeability 88,400 gauss (25C). The only metal that can be tempered. Mechanical properties are altered by impurities, especially carbon. Iron is highly reactive chemically, a strong reducing agent, oxidizes readily in moist air, reacts with steam when hot, to yield hydrogen and iron oxides. Dissolves in nonoxidizing acids (sulfuric and hydrochloric acid) and in cold dilute nitric acid. For biochemical properties, see below.**Source:** Hematite, limonite, magnetite, siderite, also taconite (low-grade 25–30% iron).**Occurrence:** Minnesota (Mesabi), Alabama, Labrador, Yukon, Europe, South America.**Available forms:** (1) Molten (or pig) iron. Derived (a) by smelting ore with limestone and coke in blast furnaces (purity 91–92%), (b) by continuous direct reduction in which iron ore and limestone are preheated in a fluidized bed, followed by heating to 926C, by melting at 1926C, and reduction to iron at 1648C with powdered coal (purity 99%—proprietary process).**Use:** Steels of various types, other alloys (cast and wrought iron), source of hydrogen by reaction with steam.

See steel.

Available forms: (2) Powdered iron. Derived (a) by treatment of ore or scrap with hydrochloric acid to give ferrous chloride solution, which is then purified by filtration, vacuum crystallized, and dehydrated to ferrous chloride dehydrate powder; this is reduced at 800C to metallic iron (briquettes or powder) of 99.5% purity; (b) by thermal decomposition of iron carbonyl [$Fe(CO)_5$] at 250C (99.6–99.9% pure); (c) by hydrogen reduction of high-purity ferric oxide or

oxalate; (d) by electrolytic deposition from solutions of a ferrous salt (99.9% pure).

Use: Powder metallurgy products, magnets, high-frequency cores, auto parts, catalyst in ammonia synthesis.**Available forms:** (3) Cast iron and wrought iron are mixtures of iron and other materials.**Available forms:** (4) Single crystals and whiskers are also available.**Available forms:** (5) Iron sponge.**Hazard:** Dust and fine particles suspended in air are flammable and an explosion risk. TLV: (as oxide fume) 5 mg/m³; for soluble salts (as iron) 1 mg/m³. Biochemistry: Iron is a constituent of hemoglobin and is essential to plant and animal life, an important factor in cellular oxidation mechanism.**Use:** Medicine and dietary supplements.**⁵⁵iron.** Radioactive iron, mass number 55.**Properties:** Half life 2.91 years, decays through K capture.

See iron 59.

Hazard: Toxic material.**⁵⁹iron.** Radioactive iron of mass number 59.**Properties:** Half-life 46.3 days. Radiation: β and γ .**Derivation:** Pile irradiation of iron metal, giving a product that contains iron 55 impurity. Both iron 55 and iron 59 are produced pure in the cyclotron. Enriched samples of each are also available.**Hazard:** Toxic material.**Use:** Medicine, tracer element in biochemical and metallurgical research.**iron acetate liquor.** (iron liquor; black liquor; black mordant; iron pyrolignite).**Properties:** Intensely black liquor, sometimes containing coppers or tannin. Absorbs oxygen from the air. D 1.09–1.115, containing 5–5.5% iron.**Derivation:** (1) By the action of pyroligneous acid on iron filings, (2) double decomposition of ferrous sulfate with calcium pyrolignite (calcium acetate).**Use:** Mordant, especially for alizarine and nitroso dyes.**iron alum.** See ferric potassium sulfate.**iron(II) ascorbate.** See ferrous ascorbate.**iron black.** (contains no iron).**Properties:** Fine black powder.**Derivation:** Action of zinc upon an acid solution of an antimony salt, a black antimony being precipitated as a fine powder.**Use:** Imparting the appearance of polished steel to papier mache and plaster of Paris.**iron blue.** A pigment (of which there are several varieties) prepared by precipitating ferrous ferrocyanide from a solution of ferrocyanide and ferrous sulfate. Subsequent oxidation produces a complex ferriferrocyanide whose shade and pigment proper-

ties are dependent upon the oxidizing agent, reactant concentrations, pH, temperature, size of batch, and other conditions of manufacture. Common oxidants are nitric acid, sulfuric acid, potassium dichromate with sulfuric acid, perchlorates, and peroxides.

Properties: Insoluble in water, oils, alcohol, hot paraffin, organic solvents; unaffected by dilute acids. Unstable to alkalis of all concentrations or reducing media. Resistant to light and ordinary baking temperatures.

Use: Paints, printing inks, plastics, cosmetics (eye shadow), artist colors, laundry blue, paper dyeing, fertilizer ingredient, baked enamel finishes for autos and appliances, industrial finishes.

iron caprylate.

Use: Food additive.

iron(II) carbonate. See ferrous carbonate.

iron carbonate, precipitated. See iron oxide, brown.

iron carbonyl. See iron pentacarbonyl.

iron, cast. See cast iron.

iron(II) citrate. See ferrous citrate.

iron compounds. See ferric-; ferrous-.

iron(III) diethyldithiocarbamate.

CAS: 13963-59-2. mf: $C_{15}H_{30}FeN_3S_6$.

Hazard: Moderately toxic.

iron.

(6-methylionone).

CAS: (α) 79-69-6; (β) 79-70-9; (γ) 79-68-5. $C_{14}H_{22}O$.

Properties: Yellowish liquid; Mw 206.32, mp 89–90C, refractive index 1.5017 (20C), d 0.9434 (21/4C). Soluble in alcohol. A mixture of three isomers (α -, β - and γ -irone).

Use: Perfumery, violet odor. The α isomer is also used as a flavoring agent.

iron(III)-edta complex.

CAS: 15275-07-7. mf: $C_{10}H_{12}FeN_2O_8$.

Hazard: A poison.

iron formation. Complex sedimentary or weakly metamorphosed rock that usually consists of oxides, sulfides, or carbonates of iron, often in association with chert.

iron linoleate.

Use: Food additive.

iron mass. See iron sponge.

iron naphthenate.

Use: Food additive.

iron octoate.

Use: Catalyst for curing silicone resins and rubbers. See soap (2).

iron-ore cement. Cements in which ferric oxide replaces a large part of the alumina. There must be some alumina present, however. Iron-ore cement is rather slow setting and hardening, but is more resistant to seawater than is Portland cement. It is light to chocolate brown in color, d about 3.31, higher than Portland cement.

iron ore, chrome. See chromite.

iron ore, magnetic. See magnetite.

iron ore, red. See hematite, red.

iron oxide, black. (ferroferrous oxide; ferroferric oxide; iron oxide, magnetic; black rouge).

CAS: 1309-37-1. $FeO \cdot Fe_2O_3$ or Fe_3O_4 .

See magnetite.

Properties: Reddish or bluish-black amorphous powder. D 5.18, mp 1538C (decomposes). Soluble in acids; insoluble in water, alcohol, and ether.

Derivation: (1) Action of air, steam, or carbon dioxide on iron; (2) specially pure grade by precipitating hydrated ferric oxide from a solution of iron salts, dehydrating, and reducing with hydrogen, (3) occurs in nature as the mineral magnetite.

Grade: Technical, pure (96% min).

Use: Pigment, polishing compound, metallurgy, magnetic inks, and in ferrites for electronic industry, coatings for magnetic tape, catalyst.

iron oxide, brown. (iron subcarbonate; iron carbonate, precipitated).

Properties: Reddish-brown powder containing ferric carbonate with ferric hydroxide $Fe(OH)_3$ and ferrous hydroxide $Fe(OH)_2$, in varying quantities; not a true oxide. Soluble in acids; insoluble in water and alcohol.

Derivation: By the interaction of solution of ferrous sulfate and sodium carbonate.

Grade: Technical.

Use: Paint pigment.

iron oxide, hydrated. See ferric hydroxide.

iron oxide, metallic brown. A naturally occurring earth, principally ferric oxide to which extenders have been added.

Use: Paint pigment.

iron oxide process. A process for the removal of sulfides from a gas by passing the gas through a mixture of iron oxide, Fe_2O_3 (called iron sponge or iron mass), and wood shavings. The iron oxide is converted to iron sulfide and can be regenerated by allowing the iron sulfide to contact air. See iron sponge, spent.

iron oxide red. (burnt sienna; Indian red; red iron oxide; red oxide; rouge (1); Turkey red).

CAS: 1332-37-2. Pigments composed mainly of ferric oxide (Fe_2O_3).

Use: Marine paints, metal primers, polishing compounds, pigment in rubber and plastic products, theatrical rouge, grease paints.

See ferric oxide.

iron oxide yellow. (hydrated ferric oxide).

$\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A precipitated pigment of finer particle size and greater tinctorial strength than the naturally occurring oxides such as ochre; excellent light-fastness and resistance to alkali.

Use: Paints, rubber products, plastics.

iron pentacarbonyl. (iron carbonyl).

CAS: 13463-40-6. $\text{Fe}(\text{CO})_5$.

Properties: Mobile, yellow liquid. D 1.466 (18C), bp 102.8C (749 mm Hg), decomposes at 200C, mp -21C, flash p 5F (-15C). Evolves carbon monoxide on exposure to air or to light. Soluble in nickel tetracarbonyl and most organic solvents; soluble with decomposition in acids and alkalies; insoluble in water.

Derivation: Finely divided iron is treated with carbon monoxide, in the presence of a catalyst such as ammonia.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 ppm (Fe); STEL 0.2 ppm.

Use: Catalyst in organic reactions, carbonyl iron for high-frequency coils.

iron powder. See iron.

iron protochloride. See ferrous chloride.

iron protoiodide. See ferrous iodide.

iron protosulfide. See ferrous sulfide.

iron pyrite. See pyrite.

iron pyrolignite. See iron acetate liquor.

iron pyrophosphate. See ferric pyrophosphate.

iron red. Red varieties of ferric oxide that are used as pigments.
See iron oxide red.

iron sponge. (iron mass, iron oxide). Finely divided iron oxide, distributed on a support so as to give a large surface area. One form is a mixture of wood shavings covered with a hydrated iron oxide. This may be made by mixing wet wood shavings with iron borings or similar material and allowing rusting to occur to produce finely divided iron oxide. In another method, wood shavings are mixed with a

slurry of the hydrated ferric oxide produced in purifying alum and then dried. The iron sponge or iron mass is used for removing sulfur from coal gas or similar materials.

Use: For precipitating copper or lead from solutions of their salts, and in electric furnace steel operations. See iron oxide process; iron sponge, spent.

iron, sponge. See Sponge iron.

iron sponge, spent. (iron mass, spent; spent oxide). Iron sponge after saturation with sulfur. It is liable to spontaneous heating.

See iron oxide process.

iron, stainless. Alloys containing 3–38% chromium, with or without traces of nickel, essentially magnetic and ferritic in character. High chromium irons are brittle after welding. Most popular composition for fabrication is 15–18% chromium, 0.1% C (max).

See steel, stainless.

iron-sulfur center. A prosthetic group of some redox proteins involved in respiration and other electron transfers. Fe^{2+} or Fe^{3+} is with Cys groups in the protein.

iron tallate.

Use: Food additive.

irradiation. Exposure to radiation of wavelengths shorter than those of visible light (γ , x-ray, or UV) either for medical purposes (cancer therapy, removal of skin blemishes), for destruction of bacteria in milk and other foodstuffs or for inducing polymerization of monomers or vulcanization of rubber. UV irradiation was formerly used to induce activation of vitamin D in milk and has been used for some time to sterilize the air in operating rooms, etc.

irreversible. A permanent chemical or physicochemical change. Examples are (1) a chemical reaction that can proceed only to the right, giving a product that is stable and that cannot revert to the original constituents; most reactions are of this type; (2) a colloidal system that cannot be restored to its original form after coagulation or precipitation, for example, the hardening of egg white or milk protein by heat, the formation of butter from milk (mechanical action), and the coagulation of rubber latex by acid (chemical action).

See reversible.

irreversible colloid. A colloidal substance that when coagulated cannot be brought back to the colloidal state.

“Iron.” [LaMotte] TM for 8-quinolinol-7-iodo-5-sulfonic acid.

Use: Colorimetric determination of iron.

“Irugalan” [Novartis]. TM for 1:2 metal complex dyes for wool and polyamide fibers.

ISAF black. Abbreviation for intermediate super abrasion furnace black.

isanic acid. (erythrogonic acid). $C_{18}H_{26}O_2$. A fatty acid with acetylenic triple bonds at the 9 and 11 positions.

Properties: Crystals. Mp 39C, d 0.93, refr index 1.49. Readily polymerizes and may explode on rapid heating to 250C. Soluble in acetone and alcohol. Turns red on exposure to air and heat.

Derivation: Vegetable oil from isano nuts grown in Zaire.

isatin. (indole-2,3-dione).
CAS: 91-56-5. $C_8H_4COC(OH)N$.

Properties: Yellowish-red or orange crystals; bitter taste. Mp 200–203C. Soluble in water, alcohol, and ether.

Derivation: From indigo by oxidation.

Use: Dyestuffs, pharmaceuticals, analytical reagent.

isatoic anhydride. $C_8NO_3H_5$. A bicyclic molecule composed of a benzene ring attached at the *o*- and *m*- positions to a heterocyclic ring. It forms useful anthranilic acid derivatives by reaction with hydrogen.

Properties: Tan powder.

Grade: Technical, 96% min.

Use: Intermediate for polymer curing agents, anthranilic esters, heterocyclic compounds, and benzene.

isepamicin disulfate.
CAS: 68000-78-2. mf: $C_{22}H_{43}N_5O_{12} \cdot 2H_2O_4S$.

Hazard: Low toxicity by ingestion.

isethionic acid. (2-hydroxyethanesulfonic acid).

CAS: 107-36-8. $HOCH_2CH_2SO_3H$.

Properties: Liquid. Bp 100C (decomposes). Very soluble in water; insoluble in alcohol.

Use: Detergents, surfactants, synthesis.

iso-. A prefix meaning “the same” as in such terms as *isomer* (the same part), *isotope* (the same place), *isometric* (the same measure), *isobar* (the same pressure), etc. In organic chemistry, it denotes an isomer of an alkyl hydrocarbon, alcohol, etc., having a subordinate chain of one or more carbon atoms attached to a carbon of the straight chain. See isobutane; isooctane; branched chain.

isactivity line. Locus of all points that represent a certain chemical activity of a component in an isothermal section of a ternary diagram.

isalloxazine. (flavin). $C_{10}H_6N_4O_2$. A derivative of isalloxazine, widely distributed in plants and animals, usually as yellow pigments.

See riboflavin.

isoamyl acetate.

CAS: 123-92-2. $CH_3COOCH_2CH_2CH(CH_3)_2$.

Properties: Colorless liquid; banana-like odor. Bp 142C, fp -78.5C, d 0.876 (15/4C), bulk d 7.30 lb/gal, (15C), flash p 80F (26.6C). Slightly soluble in water; miscible with alcohol and ether.

Derivation: Rectification of commercial amyl acetate.

Grade: Reagent, technical.

Hazard: Flammable, moderate fire risk. Irritant. TLV: 100 ppm; explosive limits in air 1–7.5%.

Use: Flavoring, perfumes, solvent for nitrocellulose, masking undesirable odors.

See amyl acetate.

isoamyl alcohol, primary. (3-methyl-1-butanol; isopentyl alcohol; isobutyl carbinol).

CAS: 123-51-3. $(CH_3)_2CHCH_2CH_2OH$.

Properties: Colorless liquid; pungent taste; disagreeable odor. Bp 132.0, fp -117.2C, d 0.813 (15/4C), bulk d 6.79 lb/gal, refr index 1.4075 (20C), flash p 109F (42.7C) (CC), autoign temp 657F (347C). Slightly soluble in water; miscible with alcohol and ether. Combustible.

Derivation: Distillation of fusel oil or the mixed alcohols resulting from the chlorination and hydrolysis of pentane.

Grade: Technical.

Hazard: Moderate fire risk. Vapor is toxic and irritant. TLV: TWA 100 ppm; STEL 125 ppm, explosive limits in air 1.2–9%.

Use: Photographic chemicals, organic synthesis, pharmaceutical products, solvent, determination of fat in milk, microscopy.

See fusel oil.

isoamyl alcohol, secondary. Similar to the primary form except bp is 113C, flash p 103F (39.4C), d 0.819. Combustible.

isoamyl benzoate. (amyl benzoate).

CAS: 94-46-2. $C_6H_5COOC_5H_{11}$.

Properties: Colorless liquid; fruity odor. D 0.986–0.989, refr index 1.493, bp 260C. Insoluble in water; soluble in alcohol. Combustible.

Use: Perfumery, flavors, cosmetics.

isoamyl benzyl ether. (benzyl isoamyl ether).

CAS: 122-73-6. $C_3H_{11}OCH_2C_6H_5$.

Properties: Colorless liquid; fruity odor. D 0.904–0.908, refr index 1.481–1.485. Soluble in four parts of 80% alcohol. Combustible.

Grade: Technical.
Use: Soap perfumes.

isoamyl butyrate.

CAS: 106-27-4. $C_9H_{18}O_2$.
Properties: Practically water-white. D 0.866–0.868 (15.5C), bp 189C, flash p 138F (58C). Soluble in alcohol and ether; slightly soluble in water. Combustible.
Derivation: By treating isoamyl alcohol with butyric acid.
Method of purification: Distillation.
Grade: Commercial 95–100% ester content, FCC (as amyl butyrate).
Use: Flavoring extracts, solvent and plasticizer for cellulose acetate.

isoamyl chloride.

CAS: 107-84-6. $(CH_3)_2CHCH_2CH_2Cl$. Any of several compounds or mixtures thereof may be referred to by this name, since numerous isomers are possible, the most common of which is 1-chloro-3-methylbutane. Combustible.
Properties: Colorless or slightly yellow liquid. Bp 99.7C (758 mm Hg), d 0.893, refr index 1.410. Slightly soluble in water; soluble in alcohol and ether.
Derivation: Isoamyl alcohol and hydrochloric acid or chlorination of isopentane.
Use: (Mixture, usually also containing normal amyl chloride). Solvent (nitrocellulose, varnishes, lacquers, neoprene), rotogravure inks, soil fumigation, organic compounds.

isoamyl dichloroarsine.

CAS: 64049-23-6. $C_5H_{11}AsCl_2$.
Properties: Oily liquid; sweetish odor. Bp 88.5–91.5C (15 mm Hg). Decomposed by water. Combustible.
Derivation: Interaction of phosphorus trichloride and isoamylarsenic acid.
Hazard: Strong irritant.

α -isoamylene. See 3-methyl-1-butene.

β -isoamylene. See 3-methyl-2-butene.

isoamyl ether.

$[(CH_3)_2CHCH_2CH_2]_2O$.
Properties: Colorless liquid; pleasant odor. Bp 172C, d 0.783 (12/4C), refr index 1.40. Insoluble in water; soluble in alcohol and ether. Combustible.
Use: Grignard reaction solvent, lacquer solvent.

isoamyl formate.

CAS: 110-45-2. $HCOOCH_2CH_2CH(CH_3)_2$.
Properties: Colorless liquid; fruity odor. Bp 122–124C, d 0.877. Partially soluble in water; soluble in alcohol and ether. Combustible.
Hazard: Strong irritant.
Use: Artificial fruit essences.

isoamyl furoate. $C_4H_3OCO_2C_5H_{11}$.

Properties: Colorless liquid, becoming brown in light. D 1.0335 (20/4C), bp 232–234C, 135–137C (25 mm Hg), refr index 1.4720. Insoluble in water; soluble in alcohol and ether.

isoamyl isovalerate. See isoamyl valerate.

sec-isoamyl mercaptan. (2-methylbutyl-3-thiol). $(CH_3)_2CHCH_2SH$.

Properties: Colorless liquid; offensive odor. Distillation range 101–127C, d 0.841 (20/4C), refr index 1.445 (20C), flash p 46F (7.7C). Insoluble in water; soluble in organic solvents.
Hazard: Flammable, dangerous fire risk.
Use: Polymerization modifier, insecticide intermediate, vulcanization accelerator intermediate, nonionic surface-active agent.

isoamyl nitrite. See amyl nitrite.

isoamyl pelargonate.

$(CH_3)_2CHCH_2CH_2OOCCH_2CH_2CH_2$.
Properties: Liquid; fruity odor. D 0.860 (15.5/15.5C), bp 260C, refr index 1.4300 (20C). Combustible.
Use: Flavors and perfumes, chemical intermediate.

isoamyl phthalate. $C_{18}H_{26}O_4$.

Properties: Colorless liquid; no odor. Bp 225C, d 1.02. Insoluble in water; soluble in organic solvents.
Use: Plasticizer for nitrocellulose, rubber cements, foam suppressant.

isoamyl propionate. See amyl propionate.

isoamyl salicylate. (amyl salicylate).

CAS: 87-20-7. $C_6H_4OHCOOC_5H_{11}$.
Properties: Water-white liquid; sometimes having a faint yellow tinge which should not be pink or red; orchid-like odor. D 1.053 (15C), refr index 1.5050–1.5080 (20C), optical rotation 0 to +2.30 degrees, bp 280C, flash p 132C. Soluble in alcohol, ether; insoluble in water and glycerol. Combustible.
Derivation: By esterifying salicylic acid with amyl alcohol. The usual article of commerce is the isoamyl ester.
Method of purification: Distillation.
Grade: A pure grade of at least 99% ester content which should not exceed 100% on analysis (indicating lower esters).
Use: Soap perfumes.

isoamyl valerate. (“apple essence,” “apple oil,” isoamyl isovalerate, amyl valerianate, amyl valerate). $C_4H_3CO_2C_5H_{11}$.

Properties: Clear liquid; odor of apples when diluted with alcohol. D 0.8812, bp 203.7C. Soluble in alcohol and ether; slightly soluble in water. Combustible.
Derivation: By adding sulfuric acid to a mixture of amyl alcohol and valeric acid. Subsequent recovery by distillation.

Grade: Technical, FCC (as isoamyl isovalerate).
Use: Fruit essences, flavoring agent.

isoascorbic acid. See erthorbic acid.

isobars. Nuclides having the same mass number but different atomic numbers, in contrast to isotopes, which have the same atomic number but different mass number. C-14 and N-14 are isobars.

isobenzan. (generic name for 1,3,4,5,6,7,8,8-octachloro-1,3,3a,4,7,7a-hexahydro-4,7-methanoisobenzofuran).

CAS: 297-78-9. $C_9H_6OCl_8$.

Properties: Solid. Mp 248–257C. Soluble in acetone and ether; slightly soluble in alcohols and kerosene; insoluble in water.

Use: Insecticide.

isobestic points. Points of equal absorption for solutions of the same total concentration.

isoborneol.

CAS: 124-76-5. $C_{10}H_{17}OH$. A geometrical isomer of borneol.

Properties: White solid; camphor odor. Mp 216C (sublimes). More soluble in most solvents than borneol.

Derivation: By reduction of camphor.

Use: Perfumery, chemical esters.

isobornyl acetate. $C_{10}H_{17}OOCCH_3$.

Properties: Colorless liquid; pine-needle odor. D 0.978 (20C), bp 220–224C. Soluble in most fixed oils and in mineral oil; insoluble in glycerol and water. Combustible.

Derivation: By heating camphene (50–60C) with glacial acetic acid and sulfuric acid and separating by adding water.

Grade: Technical, FCC.

Use: Compounding pine-needle odors, toilet waters, bath preparations, antiseptics, theater sprays, soaps, making synthetic camphor, flavoring agent.

isobornyl acrylate.

CAS: 5888-33-5. mf: $C_{15}H_{20}O_2$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A moderate skin and mild eye irritant.

p-(isobornyloxy)aniline.

CAS: 1740-15-4. mf: $C_{16}H_{23}NO$.

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A severe eye irritant.

isobornyl salicylate.

Properties: Viscous, colorless oil; sweet odor. Ester content 96%. Combustible.

Grade: Technical.

Use: Perfumery (fixative), cosmetics (filter for sun-tan preparations).

isobornyl thiocyanacetate.

CAS: 115-31-1. $C_{10}H_{17}OOCCH_2SCN$. The technical grade contains 82% or more of isobornyl thiocyanacetate, also other terpenes and derivatives.

Properties: Yellow oily liquid; terpene-like odor. D 1.1465 (25/4C), refr index 1.512 (25C), acid number 1.19. Very soluble in alcohol, benzene, chloroform, and ether; practically insoluble in water. Combustible.

Derivation: By treating isoborneol with chloroacetyl chloride and potassium thiocyanate.

Hazard: Toxic by ingestion, strong irritant.

Use: Insecticide chiefly in cattle spray, medicine.

isobornyl valerate. $(CH_3)_2CHCH_2COOC_{10}H_{17}$.

Properties: Colorless, neutral liquid; oily taste; peculiar, aromatic odor. Bp 132–138C (12 mm Hg), d 0.954. Does not irritate the stomach. Soluble in alcohol and ether; sparingly soluble in water.

isobutane. (2-methylpropane; trimethylmethane).

CAS: 75-28-5. $(CH_3)_2CHCH_3$.

A liquefied petroleum gas.

Properties: Colorless gas; slight odor. Stable. Bp –11.73C, fp –159C, d 0.5572 (20C at saturation pressure), d (air = 1) 2.01, soluble in water, slightly soluble in alcohol, flash p –117F (–83C), autoign temp 864F (462C). Does not react with water. Has no corrosive action on metals. Soluble in ether.

Derivation: An important component of natural gasoline, refinery gases, wet natural gas; also obtained by isomerization of butane.

Grade: Technical, 99 mole % (pure grade), 99.96 mole % (research grade), and other high-purity grades.

Hazard: Highly flammable, dangerous fire and explosive risk; explosive limits in air 1.9–8.5%.

Use: Organic synthesis, refrigerant, motor fuels, aerosol propellant, synthetic rubber, instrument calibration fluid.

isobutane hydrate. See gas hydrates.

isobutanol. See isobutyl alcohol.

isobutanolamine. See 2-amino-2-methyl-1-propanol.

isobutene. (2-methylpropene; isobutylene).

CAS: 115-11-7. $(CH_3)_2C=CH_2$. A liquefied petroleum gas.

Properties: Colorless, volatile liquid or easily liquefied gas; coal gas odor. Bp -6.9°C , fp -139°C , flash p -105°F (-76°C), d 0.6 (20C), autoign temp 869F (465C). Soluble in organic solvents. Polymerizes easily and also reacts easily with numerous materials.

Derivation: Fractionation of refinery gases, catalytic cracking of MTBE.

Hazard: Highly flammable, dangerous fire and explosion risk, explosive limits in air 1.8–8.8%.

Use: Production of isooctane, high-octane aviation gasoline, butyl rubber, polyisobutene resins, *tert*-butyl chloride, *tert*-butanol methacrylates; copolymer resins with butadiene, acrylonitrile, etc.; methyl-*tert*-butyl ether.

3-isobutoxy-2-pyrrolidino-*n*-phenyl-*n*-benzylpropylamine hydrochloride hydrate.

CAS: 74764-40-2. mf: $\text{C}_{24}\text{H}_{34}\text{N}_2\text{O}\cdot\text{ClH}\cdot\text{H}_2\text{O}$.

Hazard: Moderately toxic by ingestion.

isobutyl acetate.

CAS: 110-19-0. $\text{C}_7\text{H}_{14}\text{OOCCH}_3$.

Properties: Colorless, neutral liquid; fruitlike odor. Bp 116–117C, flash p 64F (17.7C) (CC), d 0.8685 (15C), refr index approximately 1.392, bulk d 7.23 lb/gal, fp -99°C , autoign temp 793F (422C). Soluble in alcohols, ether, and hydrocarbons; partially soluble in water.

Derivation: Treating isobutanol with acetic acid in the presence of catalysts.

Grade: Technical, solvent, perfume, FCC.

Hazard: Flammable, dangerous fire risk. TLV: 150 ppm.

Use: Solvent for nitrocellulose; in thinners, sealants, and topcoat lacquers; perfumery; flavoring agent.

isobutyl acrylate.

CAS: 106-63-8. $(\text{CH}_3)_2\text{CHCH}_2\text{OOCCH}=\text{CH}_2$.

Properties: Liquid. Bp 61–63C (51 mm Hg), d 0.884 (25C), refr index 1.4124 (25C), flash p 86F (30C) (TOC). Contains 100 ppm monomethyl ether hydroquinone as inhibitor.

Hazard: Flammable, moderate fire risk.

Use: Monomer for acrylate resins.

isobutyl alcohol. (isopropylcarbinol; 2-methyl-1-propanol).

CAS: 78-83-1. $(\text{CH}_3)_2\text{CHCH}_2\text{OH}$.

Properties: Colorless liquid. D 0.806 (15C), bp 107C, flash p 100F (37.7C) (OC), fp -108°C , refr index 1.397 (15C), autoign temp 800F (426C). Partially soluble in water; soluble in alcohol and ether.

Derivation: By-product of synthetic methanol production, purified by rectification.

Hazard: Flammable, moderate fire risk. Strong irritant. TLV: 50 ppm.

Use: Organic synthesis, latent solvent in paints and lacquers, intermediate for amino coating resins, substitute for *n*-butanol. Paint removers, fluorometric

determinations, liquid chromatography, fruit flavor concentrates.

isobutyl aldehyde. See isobutyraldehyde.

isobutylamine.

CAS: 78-81-9. $(\text{CH}_3)_2\text{CHCH}_2\text{NH}_2$.

Properties: Colorless liquid; amine odor. D 0.731 (20C), boiling range 66–69C, fp -85°C , flash p 15F (-9.4°C), autoign temp 712F (377C). Strongly caustic. Soluble in water, alcohol, ether, and hydrocarbons.

Hazard: Flammable, dangerous fire risk. Strong irritant to skin and mucous membranes.

Use: Organic synthesis, insecticides.

isobutyl-*p*-aminobenzoate.

CAS: 94-14-4. $\text{NH}_2\text{C}_6\text{H}_4\text{COOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: White, crystalline scales. Mp 64–65C. Almost insoluble in water; soluble in alcohol, benzene, acetone.

Use: Medicine (topical anesthetic), sunscreen preparations.

2-isobutylaminoethanol.

CAS: 17091-40-6. mf: $\text{C}_6\text{H}_{15}\text{NO}$.

Hazard: A poison.

isobutylated urea formaldehyde.

CAS: 68002-18-6.

Hazard: Low toxicity by ingestion and skin contact. A severe eye irritant.

isobutylbenzene.

CAS: 538-93-2. $(\text{CH}_3)_2\text{CHCH}_2\text{C}_6\text{H}_5$.

Properties: Liquid. D 0.8532 (20/4C), fp -51.6°C , bp 171.1, refr index 1.486 (20C), flash p 140F (60C), autoign temp 802F (427C). Combustible.

Hazard: Moderate fire risk. Toxic in high concentration, a skin and eye irritant.

isobutyl benzoate. (eglantine).

$\text{C}_6\text{H}_5\text{CO}_2\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; characteristic odor. D 1.002, bp 237C. Insoluble in water; miscible with alcohol and ether. Combustible.

Use: Perfumes, flavors.

isobutyl-2-butenolate. mf: $\text{C}_8\text{H}_{16}\text{O}_2$.

Properties: Colorless liquid; powerful fruity odor. D: 0.880, refr index: 1.426–1.430. Sol in alc, propylene glycol, fixed oils; sltly sol in water.

Use: Food additive.

isobutyl carbinol. See isoamyl alcohol, primary.

isobutyl chloroformate.

Properties: Liquid. Mw 136.58, bp 128.8C, d 1.053, fash p 27C.

Hazard: Flammable. Corrosive.

Use: Peptide reagent.

isobutyl cinnamate.

Properties: Colorless oil; amber fragrance. D 1.001–1.004, refr index 1.541. Soluble in two volumes of 70% alcohol. Combustible.

Use: Perfumery.

isobutyl cyanoacrylate. A tissue adhesive effective in surgery and medicine to retard bleeding from internal organs. Also applicable to the mounting of pearls and other jewels. Available as an aerosol spray.

isobutylene. See isobutene.

isobutylene-isoprene copolymer.

Properties: Viscosity controlling agent.

Use: Food additive.

See butyl rubber.

isobutylene-isoprene rubber. See butyl rubber.

isobutyl furoate. $\text{C}_4\text{H}_9\text{OCO}_2\text{C}_4\text{H}_9.$

Properties: Colorless liquid becoming brown in light. D 1.0383 (26.5/4C), bp 221–223C (corrosive), refr index 1.4676 (26.5C). Insoluble in water; soluble in alcohol and ether. Combustible.

N-isobutylhendecenamide. See *N*-isobutylundecenamide.

isobutyl heptyl ketone. See 2,6,8-trimethyl-4-nonanone.

isobutyl isobutyrate. (IBIB).

Properties: Colorless liquid; fruity odor. D 0.853–0.857 (20/20C), fp –80.7C, bp 148.7C, refr index 1.3999 (20C). Insoluble in water; soluble in alcohol and ether. Combustible.

Hazard: Toxic by inhalation.

Use: Flavoring, insect repellent, nitrocellulose lacquers and thinners, substitute for methyl amyl acetate.

isobutyl mercaptan. See 2-methyl-1-propanethiol.

isobutyl methacrylate.

Properties: Liquid. Bulk d 0.882 g/mL (25/25C), boiling range 155C, refr index 1.4172 (25C), flash p

120F (49C) (TOC). Contains 25 ppm hydroquinone monomethyl ether as inhibitor. Combustible.

Hazard: Moderate fire risk.

Use: Monomer for acrylic resins.

isobutyl phenylacetate.

Properties: Colorless liquid; honeylike odor. D 0.984–0.988 (25C), refr index 1.4860–1.4880 (20C). Soluble in most fixed oils; insoluble in glycerol, mineral oil, and propylene glycol. Combustible.

Grade: Technical, FCC.

Use: Flavoring agent, perfumes.

isobutyl propionate.

Properties: Water-white liquid. D 0.86–0.8635 (20/20C), bp 138C, fp –71.4C, refr index 1.3975 (20C). Insoluble in water; very soluble in alcohol and ether. Combustible.

Use: Solvent, fruit flavor concentration.

isobutyl salicylate.

Properties: Colorless liquid; may have slightly yellowish tinge. D 1.064–1.065 (25C), bp 259C. Soluble in alcohol and mineral oil, insoluble in water and glycerol. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

isobutyl stearate.

Properties: Waxy, crystalline solid. Mp 20C.

Use: Cosmetics, inks, coatings, polishes.

N-isobutylundecenamide. (*N*-isobutylhendecenamide). $\text{CH}_3(\text{CH}_2)_7\text{CH:CHCONHC}_4\text{H}_9.$ A synergist for pyrethrum.

Use: Insecticides.

isobutyl valerate. $\text{C}_9\text{H}_{18}\text{O}_2.$

Properties: Colorless liquid; pleasant odor. D 0.85, bp 170C, refr index 1.40. Insoluble in water; soluble in ether and alcohol.

Use: Food industry as flavoring, fruit extracts, and similar products.

isobutyl vinyl ether. See vinyl isobutyl ether.

isobutyraldehyde. (isobutyl aldehyde).

Properties: Transparent, highly refractive liquid; colorless; pungent odor. D 0.794 (20/4C), bp 65C, fp –66C, refr index 1.3730 (20C), flash p (CC) –40F (–40C), (OC) –11F (–23.9C), explosive limits in air 1.6–10.6%, autoign temp 490F (254C). Soluble in alcohol; insoluble in water.

Derivation: (1) Oxo process reaction of propylene with carbon monoxide and hydrogen, (2) dehydrogenation of isobutanol.

Hazard: Highly flammable, dangerous fire and explosion risk. Irritant to skin and eyes.

Use: Intermediate for rubber antioxidants and accelerators, for neopentyl glycol; synthesis of amino acids, cellulose esters, flavors, etc.

isobutyric acid. (2-methylpropanoic acid).

CAS: 79-31-2. $(\text{CH}_3)_2\text{CHCOOH}$.

Properties: Colorless liquid. D 0.946–0.950 (20/20C), bp 154.4C, fp –47C, refr index 1.3930 (20C), flash p 170F (76.6C) (TOC), autoign temp 935F (501C). Soluble in water, alcohol and ether. Combustible.

Grade: Technical.

Hazard: Toxic by ingestion, strong irritant to tissue.

Use: Manufacture of esters for solvents, flavors and perfume bases, disinfecting agent, varnish, delimiting hides, tanning agent.

isobutyric acid chloride.

CAS: 79-30-1. mf: $\text{C}_4\text{H}_7\text{ClO}$.

Hazard: Low toxicity by inhalation. A severe eye irritant.

isobutyric anhydride.

CAS: 97-72-3. $[(\text{CH}_3)_2\text{CHCO}]_2\text{O}$.

Properties: Liquid. Boiling range 180–187C, d 0.951–0.956 (20/20C), flash p 139F (59.4C), autoign temp 665F (351C). Combustible.

Hazard: Strong irritant to tissue.

Use: Chemical intermediate.

isobutyronitrile. (2-methylpropanenitrile; isopropyl cyanide).

CAS: 78-82-0. $(\text{CH}_3)_2\text{CHCN}$.

Properties: Colorless liquid. D 0.773 (20/20C), bp 107C, fp –75C. Slightly soluble in water; very soluble in alcohol and ether. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Intermediate for insecticides, etc.

isobutyryl chloride. (isobutyryl chloride; 2-methylpropanoyl chloride). $(\text{CH}_3)_2\text{CHCOCl}$.

Properties: Colorless liquid. Refr index 1.4079, d 1.017 (20/4C), fp –90C, bp 92C. Soluble in ether; reacts with water and alcohol.

Use: Chemical intermediate.

isocetyl laurate. $\text{C}_{11}\text{H}_{23}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid; almost odorless. D 0.858, fp approximately –65C, viscosity 19.6 cP at 25C. Insoluble in water; soluble in most organic solvents. Combustible.

Use: Cosmetics and pharmaceuticals (lubricant, fixative and solvent), plasticizer, mold release agent, textile softener.

isocetyl myristate. $\text{C}_{13}\text{H}_{27}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid; practically no odor. D 0.857, fp –39C, viscosity 25.6 cP at 25C. Insoluble in water; soluble in most organic solvents. Combustible.

See isocetyl laurate.

isocetyl oleate. $\text{C}_{17}\text{H}_{33}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid; practically no odor. D 0.862, fp –57C, viscosity 29.0 at 25C. Insoluble in water; soluble in most organic solvents. Combustible.

See isocetyl laurate.

isocetyl stearate. $\text{C}_{17}\text{H}_{35}\text{COOC}_{16}\text{H}_{33}$.

Properties: Oily liquid; practically no odor. D 0.862, fp +57C, viscosity 29.0 cP at 25C. Insoluble in water; soluble in most organic solvents. Combustible.

See isocetyl laurate.

isochromosome. A metacentric chromosome produced during mitosis or meiosis when the centromere splits transversely instead of longitudinally; the arms of such chromosome are equal in length and genetically identical, however, the loci are positioned in reverse sequence in the two arms.

isocil. (generic name for 5-bromo-3-isopropyl-6-methyluracil).

CAS: 314-42-1.

Properties: Crystals. Mp 158C. Soluble in absolute alcohol.

Hazard: Toxic by ingestion.

Use: Herbicide.

isocinchomeric acid. (2,5-pyridinedicarboxylic acid). $\text{HOOC}(\text{C}_5\text{H}_4\text{N})\text{COOH}$.

Properties: Light-tan powder, leaflets, or prisms; no odor. Mp 254C, sublimes as nicotinic acid above this temperature. Insoluble in cold water, alcohol, ether, benzene; slightly soluble in boiling water, boiling alcohol; soluble in hot dilute mineral acids.

Use: Intermediate for nicotinic acid, insecticides, polymers, dyestuffs.

isocrotonic acid. See crotonic acid.

isocurcumenol.

CAS: 24063-71-6. mf: $\text{C}_{15}\text{H}_{22}\text{O}_2$.

Hazard: A poison by ingestion.

isocyanate. A compound containing the isocyanate radical –NCO. Monoisocyanates are in use, as in the treatment of cellulose to obtain a cellulose tricarbamate, but the term *isocyanate* usually refers to a diisocyanate.

isocyanate generator. (hindered isocyanate).

An isocyanate derivative that will decompose to an

isocyanate upon heating. In one type, phenol is combined with an isocyanate, and the resulting urethane is stable at room temperature but dissociates at 160C to the original phenol and isocyanate. These generators are used commercially in a mixture with a polyester, which can be stored indefinitely but upon heating produces a polyurethane resin.

isocyanate resin. See polyurethane resin.

isocyanatoacetic acid ethyl ester. See ethyl isocyanatoacetate.

1-isocyanato-2-methylbenzene.

CAS: 614-68-6. mf: C₈H₇NO.

Hazard: A poison by inhalation. Moderately toxic by ingestion.

1-isocyanato-4-methylbenzene.

CAS: 622-58-2. mf: C₈H₇NO.

Hazard: A poison by inhalation. Moderately toxic by ingestion.

3-isocyanatopropyltriethoxysilane.

CAS: 24801-88-5. mf: C₁₀H₂₁NO₃Si.

Hazard: A poison by skin contact. Moderately toxic by inhalation. A mild skin and severe eye irritant.

isocyanic acid. (cyanic acid). HN=C=O. A gas resulting from depolymerization of cyanuric acid at 300–400C in a stream of carbon dioxide. An intermediate product in the formation of urethanes and allophanates. Direct synthesis from nitric oxide, carbon monoxide, and hydrogen with iridium or palladium catalyst at 300C was reported by Bell Laboratories in 1978.

Hazard: Severe explosion risk. Strong irritant to eyes, skin, and mucous membranes.

isocyanide. See carblyamine.

1-isocyano-2-methoxy-4-nitrobenzene.

CAS: 2008-62-0. mf: C₈H₆N₂O₃.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2-isocyano-1-methoxy-4-nitrobenzene.

CAS: 1983-95-5. mf: C₈H₆N₂O₃.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-isocyano-4-methyl-3-nitrobenzene.

CAS: 1930-92-3. mf: C₈H₆N₂O₂.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-isocyanonaphthalene.

CAS: 1984-04-9. mf: C₁₁H₇N.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

1-isocyano-4-nitrobenzene.

CAS: 1984-23-2. mf: C₇H₅N₂O₂.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

isocyanurate. A compound closely related to isocyanate but containing three NCO groups. Its products are similar to polyurethane resins and are particularly useful as rigid foams for insulation in the building and construction industry. For combustibility, see foam, plastic.

See isocyanuric acid.

isocyanuric acid. (s-triazine-2,4,6-trione).

CAS: 108-80-5.

OCNHCONHCONH.

Properties: White, crystalline powder. The ketone isomer of cyanuric acid. Derivatives of isocyanuric acid, such as dichloro- and trichloroisocyanuric acid and potassium and sodium dichloroisocyanurate, are bleaches and sanitizers.

isodecaldehyde. C₉H₁₆CHO. Mixed isomers.

Properties: Liquid. D 0.8290, bp 197.0C, fp –80C, bulk d 6.9 lb/gal, flash p 185F (85C). Insoluble in water. Combustible.

Use: Intermediate for pharmaceuticals, dyes, resins.

isodecane. See 2-methylnonane.

isodecanoic acid. C₁₀H₂₀O₂. Mixture of branched-chain acids, primarily trimethylheptanoic and dimethyloctanoic.

Properties: Liquid. Bp 254C, 137C (10 mm Hg), d 0.9019 (20/20C), fp glass at approximately –60C, very slightly soluble in water, viscosity 12.9 cP at 20C, refr index 1.4358 (20C). Combustible.

Use: Intermediate for metal salts, ester type lubricants, plasticizers.

isodecanol. C₁₀H₂₁OH. Mixed isomers.

Properties: Colorless liquid. D 0.8395, flash p 220F (104C), bp 220C. Insoluble in water. Combustible.

Use: Antifoaming agent in textile processing.

isodecyl chloride. C₁₀H₂₁Cl. Mixed isomers.

Properties: Colorless liquid. D 0.8767, bp 210.6C, fp glass at –180C, flash p 200F (93.3C). Insoluble in water. Combustible.

Use: Solvent for oils, fats, greases, resins, gums; extractants, cleaning compounds; intermediate for insecticides, pharmaceuticals, plasticizers, polysulfide rubbers, resins, and cationic surfactants.

isodecyl diphenyl phosphite.

CAS: 26544-23-0. mf: C₂₂H₃₁O₃P.

Hazard: A mild eye irritant.

isodecyl octyl adipate.

Properties: Light-colored oily liquid. D 0.924 (20/

20C), mid-bp 227C (4 mm Hg), refr index 1.448 (25C), viscosity at 20C 20 cP, flash p 400F (204C). Combustible.

Use: Plasticizer.

isodecyl pelargonate.

(CH₃)₂CH(CH₂)₆CH₂OOC(CH₂)CH₃. A synthetic lubricant.

isodecyl phosphite.

CAS: 25448-25-3. mf: C₃₀H₆₃O₃P.

Hazard: Low toxicity by ingestion, inhalation, and skin contact. A skin irritant.

isodiazine.

CAS: 1912-25-0. mf: C₁₀H₁₈ClN₅.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

isodiphenylbenzene. See *m*-terphenyl.

isodrin. (generic name for 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-1,4-*endo,endo*-5,8-dimethanonaphthalene).

CAS: 465-73-6. C₁₂H₈Cl₆. An isomer of aldrin.

Properties: Crystals. Decomposes above 100C.

Hazard: Toxic, use may be restricted.

Use: Insecticide.

isodurene. (1,2,3,5-tetramethylbenzene).

(CH₃)₄C₆H₂.

Properties: Liquid. D 0.896, bp 197C, fp -24C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: From coal tar.

Grade: Technical.

Use: Organic synthesis.

isoelectric focusing. An electrophoretic method for separating macromolecules on the basis of their pI.

isoelectric point. The pH at which the net charge on a molecule in solution is zero. At this pH, amino acids exist almost entirely in the zwitterion state, that is, the positive and negative groups are equally ionized. A solution of proteins or amino acids at the isoelectric point exhibits minimum conductivity, osmotic pressure, and viscosity. Proteins coagulate best at this point. Typical isoelectric points (pH) are glycine 6.6, gelatin 4.7, serum albumin 5.4.

isoelectronic. Two molecules are described as isoelectronic if they have the same number of valence electrons in similar orbitals, although they may differ in their distribution of nuclear charges (e.g., H-CN and H-N⁺C⁻).

isoanthic acid.

CAS: 628-46-6. mf: C₇H₁₄O₂.

Hazard: A reproductive hazard.

isoenzyme. An enzyme performing the same function as another enzyme but having a different set of amino acids. The two enzymes may function at different speeds.

isoeugenol. (1-hydroxy-2-methoxy-4-propenylbenzene).

CAS: 97-54-1. (CH₃CHCH)C₆H₃OHOCH₃.

Properties: Pale-yellow oil; spice-clove odor. D 1.081-1.084, mp 19C, bp 268C, refr index 1.5739 (19C). Soluble in alcohol, ether and other organic solvents; slightly soluble in water. Combustible.

Derivation: From eugenol by isomerization with caustic potash.

Grade: Perfumer's grade, FCC.

Use: Perfumes, vanillin, flavoring agent.

isoeugenol acetate. See acetylisoeugenol.

isoeugenol ethyl ether. (1-ethoxy-2-methoxy-4-propenylbenzene).

C₃H₅(CH₃O)C₆H₃OC₂H₅.

Properties: Synthetic, white, crystalline powder. Mp 64C. Insoluble in water; soluble in alcohol, ether, benzene. Combustible.

Use: Sweetening agent and odorant fixative.

isofluophate. See diisopropyl fluorophosphate.

Isomforming. Proprietary process for fixed-bed hydroisomerization, requiring a non-noble-metal catalyst. Claimed to give high yields of C₈ (xylene) isomers with low hydrogen consumption and minimal catalyst regeneration.

isoheptane. See 2-methylhexane.

isohexane. (1,2-dimethylbutane; 2-methylpentane).

CAS: 107-83-5. C₆H₁₄. A mixture of branched-chain isomers.

Properties: Colorless liquid. Boiling range 54-61C, d 0.671 (15.5/15.5C), flash p -26F (-32C) (CC).

Grade: Commercial.

Hazard: TLV: TWA 500 ppm; STEL 1000 ppm (hexane isomer). Highly flammable, dangerous fire and explosion risk, explosive limits in air 1-7%.

Use: Solvent, freezing-point depressant.

isohexenyl cyclohexenyl carboxaldehyde.

CAS: 37677-14-8. mf: C₁₃H₂₀O.

Hazard: Low toxicity by ingestion. A moderate skin and mild eye irritant.

isohexyl alcohol. See amyl methyl alcohol.

"Isolac" [Century Foods]. TM for a whey protein powder.

Use: For dietary, health, sport food and beverage systems.

isolan. See 1-isopropyl-3-methyl-5-pyrazolyl dimethylcarbamate.

isolated double bond. Double bond separated by more than one single bond linkage from the next double bond.

isolation. Identification and separation of a pure substance that is present in trace amounts in a complex mixture. A famous instance of this was the isolation of polonium (1898) and radium (1912) from pitchblende by the Curies by coprecipitation techniques followed by repeated fractional crystallization.

isoleucine. (2-amino-3-methylpentanoic acid; Ile).
CAS: 73-32-5. $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}(\text{NH}_2)\text{COOH}$. An essential amino acid, found naturally in the L(+) form.

Properties: Crystals. Slightly soluble in water; nearly insoluble in alcohol; insoluble in ether.

Derivation: Hydrolysis of protein (zein, edestin), amination of α -bromo- β -methylvaleric acid.

Use: Medicine, nutrition, biochemical research.

dl-isoleucine.

CAS: 443-79-8. mf: $\text{C}_6\text{H}_{13}\text{NO}_2$.

Properties: White crystalline powder from EtOH; sltly bitter taste. Mp: 292° (decomp). Sol in water; insol in alc, ether.

Use: Food additive.

“Isomate” [Pfizer]. TM for isocyanate foam systems. Available as nonburning, pour-in-place froth, or spray foams.

isomer. (1) One of two or more molecules having the same number and kind of atoms and hence the same molecular weight, but differing in respect to the arrangement or configuration of the atoms. Butanol ($\text{C}_4\text{H}_9\text{OH}$ or $\text{C}_4\text{H}_{10}\text{O}$) and ethyl ether ($\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ or $\text{C}_4\text{H}_{10}\text{O}$) have the same empirical formulas but are entirely different kinds of substances; normal butanol ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$) and isobutanol ($[\text{CH}_3]_2\text{CHCH}_2\text{OH}$) are the same kinds of substances, differing chiefly in the shape of the molecules; *sec*-butanol ($\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_3$) exists in two forms, one a mirror image of the other (enantiomer). Isomers often result from location of an atom or group of a compound at various positions on a benzene ring, e.g., xylene, dichlorobenzene.

(2) Nuclides (i.e. kinds of atomic nuclei) having the same atomic and mass numbers, but existing in different energy states. One is always unstable with respect to the other, or both may be unstable with respect to a third. In the latter instance the energy of transformation in the two cases will differ. See geometric isomer; optical isomer.

isomerases. Enzymes that catalyze the transformation of compounds into their positional isomers.

isomerization. A method used in petroleum refining to convert straight-chain to branched-chain hydrocarbons, or alicyclic to aromatic hydrocarbons, to increase their suitability for high-octane motor fuels. For example, butane (a gaseous paraffin hydrocarbon, $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$) can be slightly modified in structure by catalytic reactions to give the isomeric isobutane ($\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)$) used as a component of aviation fuel. Similarly, methylcyclopentane can be isomerized to cyclohexane, which is then dehydrogenated to benzene. Isomerization techniques were introduced on a large scale during World War II.

See isomer; chain.

α -isomethylionone. (γ -methylionone).

$\text{C}_{12}\text{H}_{22}\text{O}$.

Properties: Slightly yellow liquid. D 0.925–0.929 (25/25C), refr index 1.5000–1.5010 (20C), flash p 217F (102.7C) (TCC). Soluble in 5 parts of 70% alcohol. A synthetic product. Combustible.

Use: Floral perfumes, particularly of a violet character; flavoring.

isomorphism. The state in which two or more compounds that form crystals of similar shape have similar chemical properties and can usually be represented by analogous formulas, e.g., Ag_2S and Cu_2S .

isonipecaïne hydrochloride. See meperidine hydrochloride.

isonitrile. See carbylamine.

“Isonol C100” [Pfizer].

$\text{C}_6\text{H}_5\text{N}[\text{CH}_2\text{CH}(\text{CH}_3)\text{OH}]_2$. An aromatic reinforcing polyol.

Properties: Amber liquid. Viscosity (50C) 1000 cP (max), d 1.055 (23C), water content 0.05%. Combustible.

Use: Ingredient of polyurethane foams, coatings, sealants, and elastomers; intermediate in organic synthesis.

isononyl alcohol. $\text{C}_6\text{H}_{17}\text{CH}_2\text{OH}$. A higher alcohol developed in early 1968. Combustible.

Use: Basis of plasticizers such as diisononyl adipate.

isooctane. (2,2,4-trimethylpentane).

CAS: 540-84-1. $(\text{CH}_3)_3\text{CCH}_2\text{CH}(\text{CH}_3)_2$.

A branched-chain hydrocarbon.

Properties: Colorless liquid. D 0.6919 (20/4C), fp -107.4C , bp 99.2C, refr index 1.3914 (20C), flash p 10F (-12.2C), autoign temp 784F (417C). Insoluble in water; slightly soluble in alcohol and ether.

Grade: Technical, pure, research, spectrophotometric.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.1–6%. Toxic by ingestion and inhalation.

Use: Organic synthesis, solvent, motor fuel; used with normal heptane to prepare standard mix to determine antiknock property of gasoline. See octane number.

isooctene. C_8H_{16} . Mixture of isomers.

Properties: Colorless liquid. Boiling range 87.7–93.3C bromine number 137, d 0.726 (60/60F), flash p approximately 20F (–6.6C).

Hazard: Flammable, dangerous fire risk.

isooctyl adipate. $(C_8H_{17}OOCCH_2CH_2)_2$. Plasticizer providing low-temperature stability.

Use: In calendaring film, sheeting, vinyl dispersions, extrusions.

isooctyl alcohol. (isooctanol).

CAS: 26952-21-6. General term applied to any isomer of the formula $C_8H_{15}CH_2OH$ in which the eight carbon atoms form a branched chain. Usually refers to a mixture of isomers made by the Oxo process. A selected C_7 hydrocarbon fraction is reacted with hydrogen and carbon monoxide in the presence of a catalyst at pressures up to 3000 psi. The crude alcohol is recovered and purified.

Properties: Clear liquid. Distillation range 182–195C, bulk d 6.95 lb/gal, d 0.832 (20/20C), flash p 180F (82.2C) (TOC). Combustible.

Hazard: TLV: 50 ppm. Toxic by skin absorption.

Use: Ingredient of plasticizers; intermediate for non-ionic detergents and surfactants, synthetic drying oils, cutting and lubricating oils, hydraulic fluids; resin solvent; emulsifier; antifoaming agent; intermediate for introducing the isooctyl group into other compounds.

isooctyl isodecyl phthalate.

$C_8H_{17}OOC C_8H_{15}COOC_{10}H_{21}$.

Properties: Clear liquid; mild odor. D 0.976 (20/20C), flash p 445F (229C). Combustible.

Grade: Technical.

Use: Plasticizer.

isooctylmercapto acetate. See isooctyl thioglycolate.

isooctyl palmitate. $C_8H_{17}OOC C_{15}H_{31}$.

Properties: Clear liquid. D 0.863 (20C), acidity 0.2% max (palmitic), moisture 0.05% max, mp 6–9C, bp 228C (5 mm Hg). Soluble in most organic solvents. Combustible.

Use: Secondary plasticizer for synthetic resins, extrusion aid and plasticizer.

isooctylphenoxypolyoxyethylene ethanol.

(isooctylphenylpolyethylene glycol ether).

$C_{32}H_{55}O_{10}$.

Properties: Slightly viscous, pale-amber-colored liquid; oily musty odor. Mp 2–5C, bp 150C (initial) at 1 micron, bulk d 1.06 (20C), flash p 227F (108C). Combustible.

Use: Surface-active agent.

isooctyl thioglycolate. (isooctylmercaptoacetate).

CAS: 25103-09-7. $HSCH_2COOCH_2C_8H_{15}$.

Properties: Water-white liquid; faint fruity odor. Bp 125C (17 mm Hg) d 0.9736 (25C), refr index 1.4606 (21C), acid number less than 1. Combustible.

Grade: 99% (min purity).

Hazard: Toxic by ingestion.

Use: Antioxidants, fungicides, oil additives, plasticizers, insecticides, stabilizers, polymerization modifiers, stabilizer in tin-sulfur compounds, stripping agent for polysulfide rubber.

isoparaffinic petroleum hydrocarbons, synthetic.

CAS: 64742-88-7.

Use: Coating agent; float; food additive; froth-flotation cleaning; insecticide formulations component.

isopentaldehyde.

CAS: 590-86-3. C_4H_8CHO . A mix of isomeric 5-carbon aldehydes.

Properties: Water-white liquid; sharp odor. D 0.8089 (20/20C), bp 98.6C, fp –95.4C. Water dissolves 0.85% aldehyde at 20C, water soluble to 2.2% in the aldehyde. Combustible.

Use: Possible intermediate for bis-phenols, epoxy and polycarbonate resins, and modified formaldehyde resins.

isopentane. (2-methylbutane; ethyldimethylmethane).

CAS: 78-78-4. $(CH_3)_2CHCH_2CH_3$.

Properties: Colorless liquid; pleasant odor. Fp –159.890C, bp 27.854C, d 0.61967 (20C), flash p –70F (–57C), autoign temp 788F (420C). Soluble in hydrocarbons, oils, ether; very slightly soluble in alcohol, insoluble in water.

Derivation: Fractional distillation from petroleum, purified by rectification.

Grade: Research (99.99%), pure (99%), technical (95%), commercial.

Use: Solvent, manufacture of chlorinated derivatives, blowing agent for polystyrene.

Hazard: Highly flammable, dangerous fire risk.

isopentanoic acid.

CAS: 503-74-2. C_4H_8COOH . A mixture of isomeric five-carbon acids.

Properties: Water-white liquid; penetrating odor. D 0.9388 (20/20C), bp 183.2C, vap press 0.14 mm Hg (20C), fp –44C. Water dissolves 3.24 wt % of acid at 20C; acid dissolves 10.4% water at 20C. Combustible.

Hazard: Strong irritant to tissue.

Use: Intermediate for plasticizers, synthetic lubri-

cants, pharmaceuticals, metallic salts, vinyl stabilizers; extractant for mercaptans from hydrocarbons.

isopentyl alcohol. See isoamyl alcohol, primary.

isophane insulin suspension. See insulin.

isophorone. (3,5,5-trimethyl-2-cyclohexen-1-one).
CAS: 78-59-1.

$C(O)CHC(CH_3)CH_2C(CH_3)_2CH_2$.

Properties: Water-white liquid. D 0.9229 (20/20C), bulk d 7.7 lb/gal (20C), bp 215.2C, vap press 0.2 mm Hg (20C), fp -8.1C, viscosity 2.62 cP (20C), flash p 205F (96C), autoign temp 864F (462C). Has high solvent power for vinyl resins, cellulose esters, ether, and many substances soluble with difficulty in other solvents; slightly soluble in water. Combustible.

Hazard: Irritant to skin and eyes. TLV: ceiling 5 ppm.

Use: In solvent mixtures for finishes, for polyvinyl and nitrocellulose resins, pesticides, stoving lacquers.

isophorone diisocyanate. (3-isocyanatomethyl-3,5,5-trimethylcyclohexyl-isocyanate; IPDI).
CAS: 4098-71-9. $C_{12}H_{18}N_2O_2$.

Properties: Colorless to slightly yellow liquid. Mw 222.3, mp about -60C, bp 158C (10 mm Hg), vap press 0.0003 mm Hg (20C), d 1.056. Completely miscible with esters, ketones, ethers, and aromatic and aliphatic hydrocarbons.

Hazard: TLV: 0.005 ppm. A severe irritant, toxic by skin absorption.

Use: Yields polyurethanes with high stability, resistance to light discoloration, and chemical resistance.

isophoronitrile.
CAS: 7027-11-4. mf: $C_{10}H_{15}NO$.

Hazard: A poison by ingestion. Low toxicity by skin contact. A mild eye irritant.

isophthalic acid. (*m*-phthalic acid; IPA).
CAS: 121-91-5. $C_6H_4(COOH)_2$.

Properties: Colorless crystals. Mp 345-348C, sublimes. Slightly soluble in water; soluble in alcohol and acetic acid; insoluble in benzene and petroleum ether. Combustible.

Derivation: (1) Oxidation of *m*-xylene; (2) liquid phase oxidation of mixed xylenes; (3) direct oxidation of mixed alkyl aromatics with heavy metal salts and bromine as catalysts.

Grade: Technical.

Use: Polyester, alkyl; polyurethane and other high polymers, plasticizers.

isophthalodinitrile. See *m*-phthalodinitrile.

isophthaloyl chloride. (*m*-phthalyl dichloride).

CAS: 99-63-8. $C_6H_4(COCl)_2$.

Properties: Crystalline solid. Mp 41C, bp 276C, flash p 356F (180C) (COC). Soluble in ether and other organic solvents; reactive with water and alcohol. Combustible.

Use: Intermediate, dyes, synthetic fibers, resins, films, protective coatings, laboratory reagent.

isopimpinellin.

CAS: 482-27-9.

Properties: Coumarin derivative isolated from *Cnidii Monnieri Fructus* extract mf: $C_{13}H_{10}O_5$.

Hazard: A poison by ingestion.

“Isoplast” [Pfizer]. TM for an engineering-grade thermoplastic polyurethane for extrusion and injection molding. It is an impact-resistant glass based on methylenediphenyl isocyanate.

isopolyester. A polyester resin based on isophthalic acid.

isoprene. (3-methyl-1,3-butadiene; 2-methyl-1,3-butadiene).

CAS: 78-79-5. $CH_2=C(CH_3)CH=CH_2$. The molecular unit of natural rubber.

Properties: Colorless, volatile liquid. Fp -146C, bp 34.08C, refr index 1.4216 (20C), d 0.6808 (20/4C), flash p -55F (-48C), autoign temp 802F (427C). Insoluble in water; soluble in alcohol, ether, and hydrocarbon solvents.

Derivation: (1) From cracked products of heavy petroleum oils; (2) dehydrogenation of isopentene; (3) pyrolysis of methyl pentene or of isobutyleneformaldehyde condensation products; (4) dehydration of methyl butenol.

Grade: Polymerization (min purity 99%), research (99.99%).

Hazard: Highly flammable, dangerous fire and explosion risk. Irritant.

Use: Monomer for manufacture of polyisoprene, chemical intermediate, component of butyl rubber. See polyisoprene; rubber, natural.

isoprenoid. A compound based on the isoprene structure. These include many naturally occurring materials such as terpenes, rubber, cholesterol, and other steroids.

isopropanol. Legal label name for isopropyl alcohol.

isopropanolamine. (MIPA; 2-hydroxypropylamine; 1-amino-2-propanol).

CAS: 78-96-6. $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{NH}_2$.

Properties: Liquid; slight ammonia odor. D 0.9619, mp 1.4C, bp 159.9C, refr index 1.4462 (20C), flash p 170F (76.6C). Soluble in water. Combustible.

Use: Emulsifying agent, drycleaning soaps, soluble textile oils, wax removers, metal-cutting oils, cosmetics, emulsion paints, plasticizers, insecticides.

isopropenyl acetate.

CAS: 108-22-5. $\text{CH}_3\text{COOC}(\text{CH}_3)\text{CH}=\text{CH}_2$.

Properties: Water-white liquid. D 0.9226, bp 97.4C, fp -92.9C, solubility in water 3.25% by wt (20C), refr index 1.4020 (20C), flash p 60F (15.5C) (OC).

Hazard: Flammable, dangerous fire risk.

Use: Acylation reagent.

isopropenylacetylene. (2-methyl-1-buten-3-yne). $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{C}\equiv\text{CH}$.

Properties: Colorless liquid. Bp 33-34C, fp -113C, d 0.695 (20/20C), refr index 1.4168 (20C), flash p below 20F (-6.6C) (TOC). Very slightly soluble in water; miscible with acetone, alcohol, benzene, carbon tetrachloride, and kerosene.

Hazard: Flammable, dangerous fire risk.

isopropenyl chloride. See chloropropene.

isopropenylchloroformate.

$\text{ClCOOC}(\text{CH}_3)\text{CH}=\text{CH}_2$.

Properties: Liquid. D 1.103 (20C), bp 93C (746 mm Hg).

Derivation: Distillation of the reaction products of acetone and phosgene.

Hazard: Strong irritant to eyes and skin.

isopropenyl ethyl ketone.

CAS: 25044-01-3. mf: $\text{C}_6\text{H}_{10}\text{O}$.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin and mild eye irritant.

isopropenamine hydrochloride.

CAS: 6933-90-0. mf: $\text{C}_{11}\text{H}_{16}\text{ClNO}\cdot\text{ClH}$.

Hazard: Moderately toxic by ingestion.

p-isopropoxydiphenylamine.

$\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{OCH}(\text{CH}_3)_2$.

Properties: Dark-gray flakes. D 1.10, set point 80-86C, purity 92% (min), ash 0.10% (max). Insoluble in water; soluble in ethanol, acetone, benzene, and gasoline.

Use: Rubber antioxidant.

2-isopropoxyethanol. (IPE; isopropyl glycol; isopropyl 'Cellosolve').

CAS: 109-59-1. $(\text{CH}_3)_2\text{CHOCH}_2\text{CH}_2\text{OH}$.

Properties: A mobile liquid. Mw 104.15, d 0.91, bp 139.5-144.5, vap press 2.6 torr (20C).

Hazard: Combustible liquid with flash p 49C. TLV: 25 ppm. Toxic by skin absorption.

Use: As a component of lacquers and other coatings, and as a solvent.

2-isopropoxy-4-hydroxyphenyl methylcarbamate.

CAS: 17595-59-4. mf: $\text{C}_{11}\text{H}_{15}\text{NO}_4$.

Hazard: A poison.

Use: Agricultural chemical.

1-isopropoxypentachlorobutadiene.

CAS: 68334-67-8. mf: $\text{C}_7\text{H}_7\text{Cl}_5\text{O}$.

Hazard: Moderately toxic by ingestion and skin contact. Low toxicity by inhalation. A severe skin irritant.

2-isopropoxyphenyl (methyl)(t-butoxysulfinyl)carbamate.

CAS: 77276-08-5. mf: $\text{C}_{15}\text{H}_{23}\text{NO}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

o-isopropoxyphenyl-N-methylcarbamate. (propoxur).

CAS: 114-26-1. $(\text{CH}_3)_2\text{CHOC}_6\text{H}_4\text{OOCNHCH}_3$.

Properties: White, crystalline powder; odorless. Mp 91C. Soluble in most polar solvents; very slightly soluble in water; unstable in highly alkaline media; stable under normal use conditions.

Hazard: Toxic by ingestion and inhalation. TLV: TWA 0.5 mg/m³; animal carcinogen.

Use: Insecticide, molluscicide.

2-isopropoxyphenyl (methyl)(n-hexoxysulfinyl)carbamate.

CAS: 77267-49-3. mf: $\text{C}_{17}\text{H}_{27}\text{NO}_3\text{S}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

n,n'-(3-isopropoxy-1,2-propanedioxy-sulfinyl)bis(s-methyl-n-methylcarbamoyloxythioacetamide).

CAS: 81861-97-4. mf: $\text{C}_{16}\text{H}_{30}\text{N}_4\text{O}_9\text{S}_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

n,n'-(3-isopropoxy-1,2-propanedioxy-sulfinyl)bis(3-methylphenylmethylcarbamate).

CAS: 81862-11-5. mf: $\text{C}_{24}\text{H}_{32}\text{N}_2\text{O}_9\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

n,n'-(3-isopropoxy-1,2-propanedioxy-sulfinyl)bis(1-naphthylmethylcarbamate).

CAS: 81862-19-3. mf: $\text{C}_{30}\text{H}_{32}\text{N}_2\text{O}_9\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

β -isopropoxypropionitrile.

$(\text{CH}_3)_2\text{CHO}(\text{CH}_2)_2\text{CN}$.

Properties: Colorless to straw-colored liquid. Com-

bins the chemical and physical properties of ethers and nitriles. Fp -67°C , bp $82-86^{\circ}\text{C}$ (25 mm Hg) $65-65.5^{\circ}\text{C}$ (10 mm Hg), d 0.9058 (25C), flash p 155F (68.3C). Slightly soluble in water; soluble in organic solvents. Combustible.

isopropyl acetate.

CAS: 108-21-4. $\text{CH}_3\text{COOCH}(\text{CH}_3)_2$.

Properties: Colorless liquid; aromatic odor. Bp 89.4°C , d 0.8690 (25/4C), refr index 1.378 (20C), sp ht 0.46 cal/g, fp -73.4°C , heat of vaporization 135 Btu/lb, viscosity 0.49 cP (25C), solubility in water 2.9 wt %, flash p 40F (4.4C), bulk d 7.17 lb/gal (20C), autoign temp 860F (460C). Miscible with most organic solvents.

Derivation: By reacting isopropyl alcohol with acetic acid in the presence of catalysts.

Grade: 95%, 85–88%.

Hazard: Flammable, dangerous fire risk. TLV: TWA 250 ppm; STEL 310 ppm.

Use: Solvent for nitrocellulose, resin gums, etc.; paints, lacquers, and printing inks; organic synthesis, perfumery.

isopropylacetone. See methyl isobutyl ketone.

N-isopropylacrylamide. (NIPAM).

Properties: Crystalline solid. Homopolymers and copolymers prepared with this material show inverse solubility in water.

Use: Binders in textiles, paper, adhesives, detergents, cosmetics.

See acrylic resin.

isopropyl alcohol. (IPA; dimethylcarbinol; *sec*-propyl alcohol; isopropanol; 2-propanol).

CAS: 67-63-0. $(\text{CH}_3)_2\text{CHO}$.

Properties: Colorless liquid; pleasant odor. Bp 82.4°C , d 0.7863 (20/20C), refr index 1.3756 (20C), specific heat 0.65 cal/g, fp -86°C , critical temperature 235C, critical pressure 53 atm, vap press 33 mm Hg (20C), flash p 53F (11.7C) (TOC), heat of combustion 14,346 Btu/lb, heat of vaporization 288 Btu/lb, viscosity 2.1 cP (25C), autoign temp 850F (453C). Soluble in water, alcohol, and ether.

Derivation: By treatment of propylene with sulfuric acid and hydrolyzing.

Method of purification: Rectification.

Grade: 91%, 95%, 99%, NF (99%), nanograde.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2–12%. Toxic by ingestion and inhalation. TLV: TWA 400 ppm; STEL 500 ppm.

Use: Manufacture of acetone and its derivatives, manufacture of glycerol and isopropyl acetate, solvent for essential and other oils, alkaloids, gums, resins, etc.; latent solvent for cellulose derivatives, coatings solvent, deicing agent for liquid fuels, lacquers, extraction processes, dehydrating agent, preservative, lotions, denaturant.

isopropylamine. (2-aminopropane).

CAS: 75-31-0. $(\text{CH}_3)_2\text{CHNH}_2$.

Properties: Colorless, volatile liquid; amine odor. Strong alkaline reaction, bp 32.4°C , fp -101°C , d 0.6881 (20/20C), bulk d 5.7 lb/gal (20C), refr index 1.3770 (15C), flash p -35°F (-37.2°C) (OC), autoign temp 756F (402C). Miscible with water, alcohol, and ether.

Derivation: From acetone and ammonia under pressure.

Hazard: Highly flammable, dangerous fire risk. Strong irritant to tissue. TLV: TWA 5 ppm; STEL 10 ppm.

Use: Solvent, intermediate in synthesis of rubber accelerators, pharmaceuticals, dyes, insecticides, bactericides, textile specialties, and surface-active agents, dehairing agent, solubilizer for 2,4-D acid.

isopropyl 3-aminocrotonate.

CAS: 14205-46-0. mf: $\text{C}_7\text{H}_{13}\text{NO}_2$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation. A mild skin and eye irritant.

***p*-isopropylaminodiphenylamine.** See *N*-isopropyl-*N'*-phenyl-*p*-phenylenediamine.

isopropylaminoethanol. (IPAE).

CAS: 109-56-8. A commercial mixture of approximately 60% isopropylethanolamine $((\text{CH}_3)_2\text{CHNHCH}_2\text{CH}_2\text{OH})$ and 40% isopropyl diethanolamine $((\text{CH}_3)_2\text{CHN}(\text{CH}_2\text{CH}_2\text{OH})_2)$.

Properties: Amber to straw-colored liquid. Distillation range 110–165C, fp approximately -50°C , d 0.91–0.94 (20/20C), flash p 145–155F (62.7–68.3C) (OC). Combustible.

Use: Synthesis of emulsifiers.

N-isopropylaniline.

CAS: 768-52-5. $\text{C}_6\text{H}_5\text{NHCH}(\text{CH}_3)_2$.

Properties: Yellowish liquid. Bp 206°C , pour p below -67°C , refr index 1.5365 (20C), flash p 190F (87.7C) (COC). Combustible.

Hazard: Toxic by inhalation and skin absorption. TLV: 2 ppm.

Use: Dyeing acrylic fibers, chemical intermediate.

***p*-isopropylaniline.** See cumidine.

isopropyl antimonite. $[(\text{CH}_3)_2\text{CHO}]_3\text{Sb}$.

Properties: Colorless liquid. Bp 82°C (7 mm Hg).

Derivation: Reaction of antimony trichloride with isopropanol.

Use: Cross-linking agent, flameproofing agent.

***p*-isopropylbenzaldehyde.** See cuminic aldehyde.

isopropylbenzene. See cumene.

isopropyl *n*-benzoyl-*n*-(3-chloro-4-fluorophenyl)-*d*-alaninate. See flame-prop-*m*-isopropyl.

p-isopropylbenzyl alcohol. See cuminic alcohol.

isopropyl 6-benzyloxy-4-methoxymethyl- β -carboline-3-carboxylate.

CAS: 111841-85-1. mf: $C_{24}H_{24}N_2O_4$.

Hazard: Human systemic effects.

isopropylbiphenyl. See "Tanacol CG" [*Sybron*].

isopropyl bromide.

CAS: 75-26-3. $CH_3CHBrCH_3$.

Properties: Colorless liquid. D 1.304 (25/25C), bp 58.5–60.5C, fp –90C, refr index 1.422 (25C), flash p none. Slightly soluble in water; soluble in ethanol and ether. Nonflammable.

Use: Synthesis of pharmaceuticals, dyes, other organics.

isopropyl butyrate. $(CH_3)_2CHOOCC_4H_9$.

Properties: Colorless liquid. D 0.8652 (13C), bp 128C.

Use: Solvent for cellulose ethers, flavoring.

isopropylcarbinol. See isobutyl alcohol.

isopropyl carbitol.

CAS: 5412-01-1. mf: $C_7H_{16}O_3$.

Hazard: A poison by ingestion and skin contact. A moderate eye irritant.

isopropyl chloride.

CAS: 75-29-6. $CH_3CHClCH_3$.

Properties: Colorless liquid. D 0.858 (25/25C), bp 34.8C, fp –117.6C, refr index 1.374 (25C), flash p –26F (–32.3C), autoign temp 1100F (593C). Slightly soluble in water; soluble in ethanol and ether.

Hazard: Highly flammable, fire and explosion risk, explosive limits in air 2.8–10.7%.

Use: Solvent, intermediate.

N-isopropyl- α -chloroacetanilide. See 2-chloro-N-isopropylacetanilide.

isopropyl-3-chlorocarbanilate. See chloro-IPC.

isopropyl chloroformate.

CAS: 108-23-6. $(CH_3)_2CHOCCl$.

Properties: Colorless liquid. A phosgene derivative.

Hazard: Toxic by inhalation.

Use: Chemical intermediate for free-radical polymerization initiators, organic synthesis.

isopropyl-N-(3-chlorophenyl)carbamate.

See chloro-IPC.

isopropyl citrate.

Properties: Viscous colorless syrup. Crystallizes upon standing.

Use: Food additive.

isopropyl cresol. A mix of di- and monoisopropyl cresols.

Use: Antioxidant.

See thymol; carvacrol.

isopropyl-m-cresol. See thymol.

isopropyl-o-cresol. See carvacrol.

isopropyl cyanide. See isobutyronitrile.

isopropyl dichlorophenoxyacetate. See 2,4-D.

isopropyldiethanolamine. See isopropylaminoethanol.

isopropyl 3,4-diethoxycarbanilate.

CAS: 87130-20-9. mf: $C_{14}H_{21}NO_4$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

2-isopropyl-4-dimethylamino-5-methylphenyl-1-piperidinecarboxylate methyl chloride.

$C_{21}H_{29}N(CH_3)_2OOCNC_5H_{10}C_5H_3Cl$

Properties: White solid. Mp 151–153C. Insoluble in ether; soluble in methanol.

Use: A plant tranquilizer or antigibberellin, which causes some plants to become dwarfs without otherwise affecting their growth or health.

isopropyl dimethyl carbinol. See amyl methyl alcohol.

isopropylethanolamine. See isopropylaminoethanol.

isopropyl ether. (diisopropyl ether; diisopropyl oxide).

CAS: 108-20-3. $(CH_3)_2CHOCH(CH_3)_2$.

Properties: Colorless, volatile liquid; ethereal odor. Somewhat similar to ethyl ether in properties but does tend to form peroxides more readily than ethyl ether. Consequently, the presence or absence of peroxides should be determined; if present, they should be destroyed with sodium sulfite before distillation. Bp 67.5C, d 0.723 (15.5/4C), refr index 1.368, fp –60C, flash p approx 0F (–17.7C), autoign temp 830F (443C), bulk d 6.05 lb/gal (15.5C). Soluble in water 0.65% wt (25C); miscible with most organic solvents.

Grade: Technical.

See ether.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.4–21%. Toxic by inhalation, strong irritant. TLV: TWA 250 ppm; STEL 310 ppm.

Use: Solvent for animal, vegetable and mineral oils, waxes, and resins; extraction of acetic acid from aqueous solutions; solvent for dyes in presence of small amount of alcohol; paint and varnish removers; spotting compositions; rubber cements.

isopropylethylene. See 3-methyl-1-butene.

isopropyl furoate. $C_4H_7OCO_2C_3H_7$.

Properties: Colorless liquid becoming brown in light. D 1.0655 (23.7/4C), bp 198.6C (corrosive), refr index 1.4682 (23.7C). Insoluble in water; soluble in alcohol and ether.

α -isopropyl glycerol ether. See glycerin 1-isopropyl ether.

isopropyl glycidyl ether. (IGE).

CAS: 4016-14-2. $C_6H_{12}O_2$.

Properties: A liquid. Mw 116.16, d 0.9186, bp 127C, vap press about 9.4 torr (25C).

Hazard: Flammable liquid with flash p 92F (33.33C). TLV: TWA 50 ppm; STEL 75 ppm. Skin, eye, and respiratory irritant.

Use: Stabilizer of chlorinated solvents, and viscosity reducer of epoxy resins.

3-isopropyl-4-hydroxyphenyl methylcarbamate.

CAS: 19189-02-7. mf: $C_{11}H_{15}NO_3$.

Hazard: A poison.

Use: Agricultural chemical.

isopropylideneacetone. See mesityl oxide.

***p,p*-isopropylidenediphenol.** See bisphenol A.

4,4'-isopropylidenediphenol alkyl(C12-C15) phosphite.

CAS: 93356-94-6.

Hazard: A severe skin irritant.

isopropyl iodide. (2-iodopropane).

CAS: 75-30-9. CH_3CHICH_3 .

Properties: Colorless liquid that discolors in air and light; miscible with chloroform, ether, alcohol, and benzene; slightly soluble in water. D 1.703, fp -90C, bp about 90C, refr index 1.5026 (20C).

Use: Organic synthesis, pharmaceuticals.

isopropyl mercaptan.

CAS: 75-33-2. $(CH_3)_2CH(HS)$.

Properties: Liquid; extremely unpleasant odor. D 0.814 (15.5/15.5C), boiling range 51-55C, flash p -30F (-34.4C).

Derivation: Propylene and hydrogen sulfide.

Hazard: Highly flammable, dangerous fire hazard.

Use: Standard for petroleum analysis, intermediate.

***n*-isopropylmethoxamine.**

CAS: 550-53-8. mf: $C_{14}H_{23}NO_3$.

Hazard: Moderately toxic by ingestion.

2-isopropyl-5-methylbenzoquinone. See *p*-thymoquinone.

5-isopropyl-2-methyl-1,3-cyclohexadiene.

See α -phellandrene.

3-isopropyl-6-methylene-1-cyclohexene.

See β -phellandrene.

1-isopropyl-2-methylethylene. See 4-methyl-2-pentene.

***n*-isopropyl- α -methylphenethylamine hydrochloride.**

CAS: 26640-60-8. mf: $C_{12}H_{19}N \bullet ClH$.

Hazard: A poison. Human systemic effects.

1-isopropyl-3-methyl-5-pyrazolyl dimethylcarbamate. (isolan).

CAS: 119-38-0. $C_{10}H_{17}N_3O_2$.

Properties: Liquid. D 1.07 (20C), bp 103C (0.7 mm Hg). Miscible with water.

Derivation: By treating 1-isopropyl-3-methyl-5-pyrazolone with dimethylcarbamoyl chloride.

Hazard: Cholinesterase inhibitor.

Use: Insecticide.

isopropylmyristate.

CAS: 110-27-0. $CH_3(CH_2)_{12}CO_2CH(CH_3)_2$.

Properties: Colorless oil; practically odorless. D 0.850-0.860, fp 3C, refr index 1.435-1.438 (20C). Soluble in most organic solvents, vegetable oils; dissolves waxes, lanolin, and similar products; insoluble in water. Combustible.

Grade: Double-distilled from coconut oil.

Use: Cosmetic creams, topical medicinals.

2-isopropyl-naphthalene. $C_{13}H_{14}$.

Properties: Clear, yellowish-brown liquid; faint sweet odor. Bp 268C, flash p 252F (122C) (COC), autoign temp 475C, bulk d 8.1 lb/gal, d 0.973. Insoluble in water. Combustible.

Hazard: Avoid inhalation of vapors and prolonged skin contact.

Use: Organic intermediate.

isopropyl nitrate. (2-propanol nitrate).

CAS: 1712-64-7. $(CH_3)_2CHNO_3$.

Properties: Colorless liquid. Bp 102C.

Hazard: Oxidizing material, fire risk in contact with organic materials.

isopropyl palmitate. $(CH_3)_2CHOOC(C_{15}H_{31})$.

Properties: Colorless liquid. D 0.850-0.855 (25/25C), refr index 1.4350-1.4390 (20C), mp 14C. Soluble in 4 parts 90% alcohol; soluble in mineral and fixed oils; insoluble in water. Combustible.

Use: Emollient and emulsifier in lotions, creams, and similar cosmetic products.

isopropyl percarbonate. Legal label name for diisopropyl peroxydicarbonate.

isopropyl peroxydicarbonate. See diisopropyl peroxydicarbonate.

m,p-isopropylphenol. $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{OH}$.

Properties: A solid mixture of the *m*- and *p*- isomers. Fp (*m*-) 25.9C, (*p*-) 63.2C, bp (*m*-) 228.6C, (*p*-) 228.5C. Completely soluble in 10% sodium hydroxide. Combustible.

o-isopropylphenol.

CAS: 88-69-7. $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{OH}$.

Properties: Light yellow liquid. Bp 214C, fp 17C, d 0.995 (20C), flash p 220F (104C) (OC). Insoluble in water; soluble in isopentane, toluene, ethyl alcohol, 10% sodium hydroxide. Combustible.

Use: Intermediate for synthetic resins, plasticizers, surface active agents, perfumes.

isopropyl-N-phenylcarbamate. See IPC.**n-(4-isopropylphenyl)-n',n'-dimethylurea.**

CAS: 34123-59-6. mf: $\text{C}_{12}\text{H}_{18}\text{N}_2\text{O}$.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

Use: Agricultural chemical.

3-isopropylphenyl n-isobutyryl-n-methylcarbamate.

CAS: 5748-26-5. mf: $\text{C}_{15}\text{H}_{23}\text{NO}_3$.

Hazard: A poison by ingestion.

3-isopropylphenyl (methyl)(n-hexoxy-sulfinyl)carbamate.

CAS: 77267-48-2. mf: $\text{C}_{17}\text{H}_{27}\text{NO}_3\text{S}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

N-isopropyl-N'-phenyl-p-phenylenediamine.
(*p*-isopropylaminodiphenylamine).

CAS: 101-72-4. $\text{C}_3\text{H}_7\text{NHC}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Dark gray to black flakes. Fp range 72–76C, d 1.04 (25C). Soluble in benzene and gasoline; insoluble in water.

Use: Protection of rubbers against oxidation, ozone, flexcracking, and poisoning by copper and manganese.

isopropyl phosphorothioate.

CAS: 4486-44-6. mf: $\text{C}_6\text{H}_5\text{O}_3\text{PS}$.

Hazard: Moderately toxic by ingestion.

4-isopropylpyridine. $\text{C}_3\text{NH}_4\text{C}_3\text{H}_7$.

Properties: Liquid. Bp 182.2, d 0.9282 (20C), refr index 1.4960 (20C). Solubility in 100 g of water 1.17 g (20C); solubility of water in 100 g, 19.4 g at 20C.

isopropyl titanate. See tetraisopropyl titanate.**isopropyltoluene.** See cymene.**isopropyl-2,4,5-trichlorophenoxyacetate.**

See 2,4,5-trichlorophenoxyacetic acid.

isopropyltrimethylmethane. See 2,2,3-trimethylbutane.**isopropyl unoprostone.**

CAS: 120373-24-2. mf: $\text{C}_{25}\text{H}_{44}\text{O}_5$.

Hazard: A poison.

isopropyl xanthogen disulfide.

CAS: 105-65-7. mf: $\text{C}_8\text{H}_{14}\text{O}_2\text{S}_4$.

Hazard: Moderately toxic by ingestion.

isoprothiolane.

CAS: 50512-35-1. mf: $\text{C}_{12}\text{H}_{18}\text{O}_4\text{S}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

isopulegol. (1-methyl-4-isopropenylcyclohexan-3-ol).

CAS: 7786-67-6. $\text{C}_{10}\text{H}_{17}\text{OH}$. A terpene derivative.

Properties: Water-white liquid; mint-like odor. D 0.904–0.911, refr index 1.471–1.474. Combustible.

Available forms: The acetate.

Use: Perfumery (geranium and rose compounds), flavoring.

isoquinoline.

CAS: 119-65-3.

Properties: Colorless plates or liquid. D 1.099 (20C), mp 26.48C, bp 243C, refr index 1.6223 (25C). Insoluble in water; soluble in dilute mineral acids and most organic solvents. Combustible.

Derivation: From coal tar, also synthetic.

Hazard: Toxic by ingestion.

Use: Manufacture of pharmaceuticals (such as nicotinic acid), dyes, insecticides, rubber accelerators, and in organic synthesis.

1,3-isoquinolinediol. $\text{C}_9\text{H}_7\text{N}(\text{OH})_2$

Properties: Cream colored paste. Solids approx 80%.

Use: Intermediate.

isosafrole.

CAS: 120-58-1. $\text{C}_{10}\text{H}_{10}\text{O}_2$. Bicyclic.

Properties: Colorless, fragrant liquid; odor of anise. D 1.117–1.120, refr index 1.576, bp 253C. Soluble in alcohol, ether, and benzene. Combustible.

Derivation: Treatment of safrole with alcoholic potash.

Use: Manufacture of heliotropin, perfumes, flavors, pesticide synergists.

isosorbide. (1,4,3,6-dianhydrosorbitol).

CAS: 625-67-5.

A polyol with a hydroxyl group attached to each of two *cis*-oriented saturated furan rings. Intermediate for pharmaceuticals. Combustible.

Use: Medicine (diuretic).

isostearic acid. A coined name for a C_{18} saturated fatty acid of the formula $C_{17}H_{35}COOH$. It is a complex mixture of isomers, primarily of the methyl-branched series that are mutually soluble and virtually inseparable.

Use: Similar to stearic or oleic acids.

isosterism. Similarity in physical properties of elements, ions, or compounds, due to similar or identical outer shell electron arrangements.

isostilbene. See stilbene.

isotactic polymer. See polymer, isotactic.

isotherm. Constant temperature line used on climatic maps or in graphs of thermodynamic relations, particularly the graph of pressure-volume relations at constant temperature.

isothermal. Occurring at constant temperature.

isothiazolinone chloride.

CAS: 55965-84-9. mf: $C_4H_5NOS \cdot C_4H_4ClNOS$.

Hazard: A poison by ingestion.

isothiocyanatotrimethyltin.

CAS: 15597-43-0. mf: $C_4H_9N_3SSn$.

Properties: White needles from C_4H_9 . Mp: 108.5°.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

(isothiocyanato)tripropylstannane. See tripropyltin isothiocyanate.

isotone. A nuclide that has the same excess of neutrons over protons as another nuclide.

isotonic. A solution having the same osmotic pressure as another solution, for example, human blood and physiological salt solution.

isotope. One of two or more forms or species of an element that have the same atomic number, i.e., the same position in the periodic table, but different masses. The difference in mass is due to the presence of one or more extra neutrons in the nucleus. Thus, "regular" hydrogen, with atomic number 1 and a mass of 1 (proton), is one of the three isotopes of hydrogen. The other two are the naturally occurring deuterium, which has a neutron in its nucleus as well as a proton, giving a mass of 2; and the artificially produced tritium (1 proton and 2 neutrons) with a mass of 3 (approximately). The atomic weight of an element is the average weight percent of all its natural isotopes. The heavier isotopes usually occur very rarely in the atomic population (1 part in 4500 for ²H,

and 1 part in 140 for U-235; in the exceptional case of chlorine, the ratio of isotopes 35 and 37 is about 3 to 1).

The occurrence of isotopes among the 83 most abundant elements is widespread, but separation methods are complicated and costly. Twenty-one elements have no isotopes, each consisting of only one kind of atom (see note below). The remaining 62 natural elements have from 2 to 10 isotopes each. There are 287 different isotopic species in nature; noteworthy among them are oxygen-17, carbon-14, uranium-235, cobalt-60, and strontium-90, all but the first being radioactive.

There are three kinds of isotopes: (1) natural nonradioactive, (2) natural radioactive, and (3) artificial radioactive (made by neutron bombardment).

Use: (Nonradioactive.) Preparation of heavy water to moderate nuclear reactors. (Radioactive.) Tracers in biochemical, metallurgical, and medical research; in geochemical and archeological research (¹⁴C); irradiation source for polymerization, sterilization, etc.; therapeutic agents in various diseases (iodine, sodium, gold, etc.); electric power generation.

See Aston; chemical dating; radioactivity; heavy water; decay; tracer; nuclide.

Note: According to this definition, it is strictly improper to refer to elements that exist in only one atomic form as having "one isotope"; actually such elements as beryllium, aluminum, arsenic, iodine, and others have *no* isotopes, that is, they have no other atomic form that is like them in all respects except mass. The term *isotope* requires the existence of at least *two* elemental forms, in the same sense that the word *twin* requires the existence of a pair.

isotropic. Descriptive of the property of transmitting light equally in all directions, cubic (isometric) crystals have this property, as well as liquids, gases, and most glasses.

See anisotropic.

isovaleral. See isovaleraldehyde.

isovaleraldehyde. (isovaleral; isovaleric aldehyde; 3-methylbutyaldehyde).

CAS: 590-86-3. $(CH_3)_2CHCH_2CHO$. Occurs in orange, lemon, peppermint, and other essential oils.

Properties: Colorless liquid; applelike odor. D 0.785, fp -51C, bp 92C, refr index 1.390 (20C). Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: Oxidation of isoamyl alcohol, also by Oxo process from petroleum.

Use: Flavoring, perfumes, pharmaceuticals, synthetic resins.

isovaleric acid. (isopropylacetic acid).

CAS: 503-74-2. $(CH_3)_2CHCH_2COOH$. Occurs in valerian, hop oil, tobacco, and other plants.

Properties: Colorless liquid; disagreeable taste and odor. D 0.931 (20/20C), bp 176C, refr index 1.4043

(20C), fp -37C. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Derivation: With other valeric acids, by distillation from valerian, by oxidation of isoamyl alcohol.

Use: Medicine, flavors, perfumes.

isovaleric aldehyde. See isovaleraldehyde.

isovaleryl chloride. (3-methylbutanoyl chloride). $(\text{CH}_3)_2\text{CHCH}_2\text{COCl}$.

Properties: Colorless liquid. Refr index 1.4136 (24C), d 0.9854 (24/4C), bp 113C. Soluble in ether; decomposed by water and alcohols.

Use: Intermediate in synthesis.

isovaleryl-*p*-phenetidine.

$\text{C}_6\text{H}_5\text{OC}_2\text{H}_4\text{NHCOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: White, glistening needles. Almost insoluble in water and ether; soluble in alcohol and chloroform.

Derivation: By heating isovaleric acid with *p*-phenetidine.

isovaltrate.

CAS: 31078-10-1. mf: $\text{C}_{22}\text{H}_{30}\text{O}_8$.

Hazard: A poison.

isozymes. Two or more forms of an enzyme that catalyze the same reaction but differ from each other in their physical properties, such as amino acid se-

quence, substrate affinity, V_{max} , tissue expression, or regulatory properties.

itaconic acid. (methylene succinic acid).

$\text{CH}_2=\text{C}(\text{COOH})\text{CH}_2\text{COOH}$.

Properties: White, odorless, hygroscopic crystals. Mp 167-168C. Soluble in water, alcohols, and acetone; sparingly soluble in other organic solvents.

Derivation: Submerged fermentation by mold of various carbohydrates.

Use: Copolymerizations, resins, plasticizers, lube-oil additive, intermediate.

-ite. A suffix indicating an intermediate oxidation state of a metallic salt, analogous to "-ous" for acids, e.g., sodium sulfite (NaSO_3), containing one fewer oxygen atom than the sulfate.

IUPAC. Abbreviation for International Union of Pure and Applied Chemistry.

Ivanov reagent. Reaction product of aryl acetic acids and excess Grignard reagent. The reagent may be used in condensations with carbonyl compounds and other Grignard-type reactions.

IVE. Abbreviation for isobutyl vinyl ether. See vinyl isobutyl ether.

Izod. An impact-testing device of the notched-bar type.

J

J acid. (2-amino-5-naphthol-7-sulfonic acid).

Properties: Gray needles, white when pure. Soluble in hot water; sparingly soluble in cold water.

Derivation: β -naphthylamine sulfate is sulfonated with 66% oleum, the filtrate yields 2-naphthylamine-1,5,7-trisulfonic acid. On reaction with dilute sulfuric acid at 125C, this yields 2-naphthylamine-5,7-disulfonic acid; from this J acid is obtained on reaction with 58% sodium hydroxide solution at 200C and 210 psi.

Use: Azo dye intermediate.

J acid urea. See 5,5'-dihydroxy-7,7'-disulfonic-2,2'-disulfonic-2,2'-dinaphthylurea.

Jacobsen rearrangement. Reaction of polymethylbenzenes with concentrated sulfuric acid to give rearranged polymethylbenzenesulfonic acids. Under identical conditions, halogenated polymethylbenzenes undergo disproportionation.

Jacquemart's reagent. Analytical reagent used to test for ethyl alcohol. Consists of an aqueous solution of mercuric nitrate and nitric acid.

Janovsky reaction. Reaction of aldehydes and ketones containing α -methylene groups with *m*-dinitrobenzenes in the presence of a strong base, resulting in the formation of an intense purple coloration, used for the detection of carbonyl compounds. The color is due to the formation of a Meisenheimer complex.

Japan. A varnish yielding a hard, glossy, dark-colored film. Japans are usually dried by baking at relatively high temperatures (ASTM D 16–52). True Japan varnishes contain a strongly irritating chemical, more recent types contain kauri or copal resin, linseed oil, lead oxide, pigments, and solvents such as kerosene or turpentine.

Hazard: Flammable, irritant to eyes and skin.

Use: Coatings for miscellaneous wood and metal products.

Japan wax. (Japan tallow; sumac wax).

Properties: Pale-yellow solid; tallowlike rancid odor. Contains 10–15% palmitin and other glycerides. Soluble in benzene and naphtha; insoluble in water and in cold alcohol. D 0.970–0.980, mp 53C,

saponification number 220, iodine number 10–15. Combustible.

Derivation: From a species of Rhus by boiling the fruit in water.

Use: Candles, floor waxes, polishes, substitute for beeswax, food packaging.

Japp-Klingemann reaction. Formation of hydrazones by coupling of aryldiazonium salts with active methylene compounds in which at least one of the activating groups is acyl or carboxyl. This group usually cleaves during the process.

“Jarcoal” [Jarchem]. TM for potassium acetate based fluid.

Use: For spraying interior of coal barge, rail cars, and trailers to prevent freezeup.

“Jaracol” [James Robinson]. TM for a line of hair dye intermediates.

“Jargrip” [Jarchem]. TM for a potassium acetate based fluids.

Use: For deicing runways.

jar mill. An assembly of small ceramic jars containing porcelain or flint pebbles; the jars are often arranged in parallel tiers, each containing four or more jars, each tier being mounted on a rotating shaft. Such mills are used for production of small quantities of pulverized material. See ball mill; pebble mill.

jasmine absolute. See oil of jasmine.

jasmine aldehyde. See α -amylcinnamic aldehyde.

jasmine oil. An essential oil in perfumery and flavoring. It is dextrorotatory.

jamolin. $C_{21}H_{30}O_3$. Insecticidal principle of pyrethrum.

jasnone. (3-methyl-2-(2-pentenyl)-2-cyclopenten-1-one).

CAS: 488-10-8. $C_{11}H_{16}O$. A ketone found in jasmine oil and other flower oils.

Properties: Odor of jasmine. D 0.944 (22/0C).

Use: Perfumery.

jatrophone. A diterpenoid growth inhibitor isolated from an alcohol extract of the plant *Jatropha gossypifolia*. Its unique structure includes a 12-membered ring. It is readily attacked by nucleo-

philes. Useful in study of tumor growth inhibition and other biochemical research.

Javel water. NaHClO.

Use: A bleach.

“Jayflex” [*Exxon Chemical International*].

TM for a plasticizer.

“Jeffamine” [*Texaco*]. TM for polyoxypropyleneamines.

Grade: 3 diamine, 1 triamine.

Available forms: Liquid.

Hazard: Corrosive.

Use: Curing agent for epoxy resin systems in adhesives, elastomers, and foam formulations, and as an intermediate for textile and paper-treating chemicals.

jelly. A modified form of the word *gel* widely used in popular language but also used in chemical literature to refer to the mechanical strength of the gel structures occurring with pectins, gelatin, and various natural gums. “Jelly strength” is frequently specified in the food industry. Other uses of the word are found in “petroleum jelly” obtained as a distillation product of petroleum residues (petrolatum) and in the so-called *royal jelly*, a natural nutrient mixture of proteins and carbohydrates produced by bees as food for the queen bee.

See gel.

“Jel-O-Mer” [*Reichhold*]. TM for a thixotropic additive used in coatings.

Jenner, Edward. (1749–1823). An English physician, Jenner studied medicine in London and established his practice in the rural area of Gloucestershire. Here he discovered the technique of vaccination as a preventive of smallpox (1776). The idea of utilizing cowpox, a disease of cattle, as a protective medium was suggested by his observation that personnel working in dairies developed immunity to smallpox after contracting the much milder cowpox. Jenner’s work not only led to almost complete elimination of smallpox in Europe, but also anticipated the development of immune reactions by Pasteur a century later. His success was no accident, but rather the result of detailed observations from which he drew correct conclusions. He was a scientist of the highest caliber and a noteworthy benefactor of mankind.

JET. Abbreviation for Joint European Torus, an experimental nuclear fusion device in England. It is a project jointly undertaken by several European countries.

See tokamak; fusion.

jet fuel. A fuel for jet (turbine) engines, usually a petroleum distillate similar to kerosene. A number of

types with somewhat different compositions and properties have been used.

Jetset. A fast-setting cement developed by the Portland Cement Association. Reported to harden in 20 minutes after pouring. Accelerating agent has not been disclosed.

JH. (methyl-*cis*-10,11-epoxy-7-ethyl-3,11-dimethyl-*trans,trans*-2,6-tridecadienoate). A synthetic hormone containing a 13-carbon chain; said to have possibilities as an insecticide. It acts by preventing insects from maturing. Its future depends on the possibility of large-scale production.

See juvenile hormone.

“JHR Compound” [*Barium*]. TM for a thermoplastic compound impervious to mineral acid; does not decompose hydrogen peroxide.

Use: To coat interiors of tanks and containers for shipment of hydrogen peroxide, acids, etc.

“Jifix” [*Mallinckrodt*]. TM for an acid-hardening, ammonium thiosulfate fixing bath. Ready-mixed and rapid-acting.

“JinBest Paste” [*Jinicolor*]. TM for a semi discharge paste.

“JIN Print” [*Jinicolor*]. TM for a synthetic thickener for pigment printing.

Joint European Torus. See JET.

jojoba oil.

Properties: Colorless, odorless, waxy liquid; chemically similar to sperm oil.

Derivation: By crushing seeds of an evergreen desert shrub found in southwestern U.S. and northern Mexico. Experimental cultivation in California and Israel. Yield of oil from seeds approaches 50%.

Use: Substitute for sperm oil, especially in transmission lubricants, high-pressure lubricant, antifoam agent (antibiotic fermentation), substitute for carnauba wax and beeswax, cosmetic preparations.

Joliot-Curie, Frederick. (1900–1958). A French physicist who, along with his wife Irene Joliot-Curie, won the Nobel Prize in chemistry in 1935. His important discoveries included artificial radioactivity. He did much work on atom structure, dematerialization of electrons, and inverse transformation. Work on hormone synthesis and thyroid substances containing radioactively labeled elements was significant. ScD from the University of Paris was followed by a distinguished career filled with honors and appointments.

Joliot-Curie, Irene. (1897–1956). A French nuclear scientist who won the Nobel Prize for chemistry with her husband Frederic Joliet-Curie. Their joint work involved production of artificial radioac-

tive elements by using α -rays to bombard boron. They discovered that hydrogen-containing material when exposed to what they considered γ -rays would emit protons. They were involved in many firsts: they gave the first chemical proof of artificial transmutation and of capture of alpha particles, and were the first to prepare positron emitters. Her career started with a Sc.D., at the University of Paris, and included scores of honors and awards.

Jones oxidation. The oxidation of primary and secondary alcohols to acids and ketones by the addition of the calculated amount of chromic anhydride in dilute sulfuric acid to a solution of the alcohol in acetone. This procedure does not attack triple bonds or shift double bonds into conjugation with the ketone formed in the oxidation.

jonkmari, extract.

CAS: 84929-59-9.

Hazard: A poison.

Source: Natural product.

jordan. See beater.

Joule-Thomas coefficient. The change in temperature per atmosphere change of pressure on a gas or other fluid when the enthalpy remains constant. It is found by measuring the temperature change from T' to T when the pressure p' of a gas on one side of a porous plug changes to p on the other side. The change of temperature ($T' - T$) and of ($p' - p$) are measured under conditions such that no heat is gained or lost, and the pressure of the plug is great enough to insure a nearly constant pressure in the incoming and outgoing gas. The ratio of $(T' - T)/(p' - p)$ at several pressure ranges is extrapolated to the limiting case as $(p' - p)$ approaches zero. This limiting value is the Joule-Thomson coefficient, μ . Thus,

$$\mu = \left(\frac{\alpha T}{\alpha P} \right)_H$$

Jourdan-Ullmann-Goldberg synthesis.

Synthesis of substituted diphenylamines. The reaction products can be used as intermediates in the synthesis of acridones.

juglone. See 5-hydroxy-1,4-naphthoquinone.

juniper tar oil. (oil of cade, cade oil, oleum cadium). Chief constituent is cadinene, a sesquiterpene.

Properties: Yellow oil. D 0.980–1.055. Soluble in alcohol.

Derivation: By product of distillation of *Juniperus oxycedrus*

junk DNA. (non-coding DNA). Stretches of DNA that do not code for genes; most of the genome consists of so-called junk DNA which may have regulatory and other functions.

jute. Bast fibers, 4–10 ft long, obtained from the stems of several species of *Corchorus*, especially *C. capularis*. Contains a higher proportion of lignin and less cellulose than any other commercial vegetable fiber and has relatively poor strength and durability. The fibers are soft and lustrous but lose strength when wet. Combustible. Not self-extinguishing.

Hazard: Flammable in form of dust, may ignite spontaneously when wet.

Use: Burlap, sacking, linoleum, twine, carpet backing, packing, coarse paper.

juvenile hormone. One of several hormones that retard the development of insects in the larval stage; so called because they prevent the insect from maturing by maintaining its juvenile characteristics. Obtained naturally from silk moths; various syntheses indicate possible use as insecticides, especially for fire ants. Composition of one type is $C_{18}H_{30}O_3$. See JH.

K

K. (1) Symbol for potassium (from Latin kalium).
(2) symbol for Kelvin scale.

k. Abbreviation for kilo-, as in kcal.

K acid. (1-amino-8-naphthol-4,6-disulfonic acid). $C_{10}H_4NH_2OH(SO_3H)_2$.

Derivation: Fusion of a naphthylamine trisulfonic acid with sodium hydroxide.

Use: Azo dye intermediate.

kainic acid. ([2S-(2a,3b,4b)]-2-Carboxy-4-(1-methylethenyl)-3-pyrrolidineacetic acid).

CAS: 487-79-6. $C_{10}H_{15}NO_4$

Properties: White crystalline powder. Soluble in water or dilute aqueous base.

Use: To simulate brain degeneration in a laboratory environment.

kainite. $MgSO_4 \cdot KCl \cdot 3H_2O$.

Properties: A natural, hydrated, double salt of potassium and magnesium. White, gray, reddish, or colorless solid; streak, colorless; vitreous luster. D 2.05–2.13, hardness 2.5–3. Contains 30% potassium chloride.

Occurrence: Germany; one of the Stassfurt minerals.

Use: Chemicals (potassium salts), fertilizer (as such). See potash.

“Kalrez” [DuPont-Toray]. TM for engineering resins and high end specialty polymers.

kalsomine. See calcimine.

“Kamicryl 2089” [Kamsons]. TM for a water based overprint varnish hard nonfilm-forming liquid.

Use: In high gloss varnish and water based inks.

“Kamicryl Paint CP651” [Kamsons]. TM for a vinyl acetate acrylic copolymer.

Use: In a superior quality emulsion paint.

“Kamicryl Thickner 5360” [Kamsons].

TM for a crosslinked acrylic copolymer emulsifier.

Use: Keeps pigment and filler in suspension and prevents sedimentation.

kanamycin sulfate.

CAS: 25389-94-0. $C_{18}H_{36}N_4O_{11} \cdot H_2SO_4$. A broad-spectrum antibiotic.

Properties: White, crystalline powder; odorless. Decomposes over a wide range above 250C. Soluble in water; practically insoluble in methanol and ethanol.

Grade: USP.

Use: Medicine (antibacterial).

“Kansil” [PQ]. TM for potassium silicate.

Grade: Liquids, solids, and powders in $SiO_2:K_2O$ weight ratio of 1.60 to 2.5.

Use: Ceramics, welding rod coatings, detergents, corrosion inhibitor, electronics, and inorganic coatings.

kaolin. (China clay).

CAS: 1332-58-7. A white-burning aluminum silicate that, due to its great purity, has a high fusion point and is the most refractory of all clays. **Composition:** Mainly kaolinite (50% alumina, 55% silica, plus impurities and water).

Properties: White to yellowish or grayish fine powder. D 1.8–2.6. Darkens and develops clay odor when moistened. Insoluble in water, dilute acids, and alkali hydroxides; has high lubricity (slipperiness). Noncombustible.

Occurrence: Southeastern U.S., England, France. **Grade:** Technical, NF, also graded on basis of color and particle size.

Hazard: TLV: TWA 2 mg/m³; Respirable Fraction; not classifiable as a human carcinogen.

Use: Filler and coatings for paper and rubber, refractories, ceramics, cements, fertilizers, chemicals (especially aluminum sulfate), catalyst carrier, anticaking preparations, cosmetics, insecticides, paint, source of alumina, adsorbent for clarification of liquids, electrical insulators.

See Toth process; kaolinite; aluminum silicate; clay; “Pharmolin” [Engelhard].

kaolinite. $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$. A clay mineral rarely found pure, the main constituent of kaolin and some other clays.

kapok. Cottonlike fibers obtained from the seed pods of various species of Ceiba and Bombax. Extremely light and resilient but too brittle for spinning. Combustible; not self-extinguishing.

Source: Indonesia, Philippines, Ecuador.

Use: Life jackets, insulation, pillows, upholstery.

karatavic acid.

CAS: 21800-49-7. mf: $C_{24}H_{28}O_5$.

Hazard: A poison.

“Karathane” [Rohm & Haas]. TM for an agricultural fungicide-miticide based on dinitro(1-methylheptyl)phenyl crotonate, supplied as a wettable powder or liquid concentration. May be combined with most other insecticides and fungicides, except oil-based products.

Use: Controls powdery mildew and various species of mites on plants.
See dinocap.

karaya gum. (sterculia gum; India traganth; kadaya gum). A hydrophilic polysaccharide which exudes from certain Indian trees of the genus *Sterculia*. Color varies from white to dark brown or black.

Properties: A carbohydrate polymer of varying chemical composition. The properties depend on freshness and time of storage. Viscosity greatly decreases over 6 months storage. Forms a translucent colloidal gel in water.

Grade: Technical, FCC.

Use: Pharmaceuticals, textile coatings, ice cream and other food products, adhesives, protective colloids, stabilizers, thickeners, emulsifiers.
See gum, natural.

Karle, Jerome. (1918–). An American physical chemist who won the Nobel Prize for chemistry along with Hauptman in 1985. He developed a series of mathematical equations that allow determination of phase information from X-ray crystallography intensity patterns. The advent of computers allowed the use of the equations to determine the conformation of thousands of chemicals. The work was done at the Naval Research Laboratory in Washington, D.C. where Karle headed the Laboratory for the Structure of Matter.

Karl Fischer reagent. A solution of iodine, sulfur dioxide, and pyridine in methanol or methyl "Cellosolve."

Use: Determination of water.

Note: Do not confuse with Fischer's reagent.

Karrer, Paul. (1889–1971). A recipient of the Nobel Prize for chemistry in 1937 with Haworth. Although born in Moscow, he attended European universities and received his doctorate in Zurich. He initiated work on flavins, carotenoids, and vitamins A and B, and accomplished work on structure and synthesis of vitamin B₂ as well as vitamins A and E.

karyogamy. A process of fusion of the nuclei of two cells; the second step in syngamy.

karyotype. A photomicrograph of an individual's chromosomes arranged in a standard format showing the number, size, and shape of each chromosome type; used in low-resolution physical mapping to correlate gross chromosomal abnormalities with the characteristics of specific diseases.

"Kastone" [Du Pont]. (hydrogen peroxide)
CAS: 7722-84-1. TM for oxidizer and bleaching agent.

Use: For textile and pulp bleaching, cyanide destruction, wastewater and sewage treatment, food processing, electronics industry.

"Katadyne" process. A proprietary method of sterilizing water and other potable liquids with a specially prepared form of silver.

katapol vp-532.

CAS: 63091-06-5.

Hazard: A severe skin and eye irritant.

katharometer. A gas and air detector instrument. Its multiple uses include the comparison of two gases via comparison of the rate of heat loss from heating coils surrounded by the gases. Also can be used in gas chromatography as a detector and to detect impurities in the air.

kauri. A fossil (hard) copal resin, derived from the kauri pine (*Agathis australis*) of New Zealand. Soluble in alcohols and ketones, acid value 60–80, must be heat-treated (cracked) before use in varnishes. Combustible.

Use: Varnishes and lacquers, paints, organic cements, to evaluate the solvent power of hydrocarbons.

kauri-butanol value. A measure of the aromatic content and hence the solvent power of a hydrocarbon liquid. Kauri gum is readily soluble in butanol but insoluble in hydrocarbons. The kb value is the measure of the volume of solvent required to produce turbidity in a standard solution containing kauri gum dissolved in butanol. Naphtha fractions have a kb value of about 30, and toluene about 105.

KB. Abbreviation for kilobase—one thousand bases.

kcal. Abbreviation for kilocalorie; Cal has the same meaning.

K-capture. (K-radiation). A type of radioactive decay in which an electron is captured by an atomic nucleus and immediately combines with a proton to form a neutron. The product of this radioactivity has the same mass number as the parent but the atomic number is one unit less. Thus ⁵⁵iron with atomic number 26 decays by K-capture to form ⁵⁵manganese, with atomic number 25. Terms synonymous with *K-capture* are *K-electron capture* and *orbital electron capture*.

"KC Finings, Super-Kleer" [Home Brewery]. TM for is a two pouch system containing liquid Kieselsol and chitosan finings.

Use: In brewing.

"KE-106A Natural Insecticide" [Kinzua].

TM for a limonene-based (non-toxic) insecticide.

Use: Safe for use around children.

"KE Heavy Duty" [Kinzua]. TM for a degreaser.

Use: Environmentally safe degreaser.

Keene's cement. See gypsum cement.

Kekule, August. (1829–1896). Born in Darmstadt, Germany, Kekule laid the basis for the ensuing development of aromatic chemistry. His idea of a hexagonal structure for benzene in 1865 was a monumental contribution to theoretical organic chemistry. "This had been preceded in 1858 by the remarkable notion that carbon was tetravalent and that carbon atoms could be joined to each other in molecules." The theory of the benzene ring has been called the "most brilliant piece of scientific prediction to be found in the whole field of organic chemistry, for besides promulgating the idea, he had predicted the number and types of isomers which might be expected in various substitutions on the ring" (L. B. Clapp).

"Kelacid" [Kelco]. TM for alginic acid.

"Kelate CU" [Tri-K].

CAS: 14025-15-1. TM for copper disodium EDTA.
Use: Sequestering agent in cosmetics.

"Kelcoloid HVF" [Kelco]. TM for xanthan gum.

"Kel-F" [3M]. TM for a series of fluorocarbon products including polymers of chlorotrifluoroethylene and certain copolymers available as extrusion and molding powders, resins, dispersions, gums, oils, waxes, and greases that are characterized by high thermal stability, resistance to chemical corrosion, high dielectric strength, and high impact, tensile, and compressive strength.

Use: Corrosion control, contamination prevention, insulation, electrical equipment, molded and fabricated industrial equipment, lubricants, gyro and damping fluids. Especially useful under extreme conditions, including jet and space technology. See fluorocarbon polymer.

"Kelgin" [Kelco]. TM for sodium alginates.

"Kelmar" [Kelco]. TM for potassium alginates.

kelp. A large coarse seaweed occurring chiefly off the coast of California. It is a type of algae and is mechanically harvested by specially equipped barges. Dried kelp contains 2–4% ammonia, 1–2% phosphoric acid, 15–20% potash, and traces of iodine.

Use: Fertilizers, plastics and conversion to methane by microorganisms; permissible chewing-gum base.

"Keltex" [Kelco]. TM for alginate.

"Keltose" [Kelco]. TM for self-gelling alginates.

Kelvin scale. See absolute temperature.

"Kelzan" [Kelco]. TM for xanthan gum.

"Kelzan XC" [Kelco]. TM for xanthan gum.

"Kemamide" [ACH].

Properties: High-melting solids. TM for fatty amides and bisamides.

Use: For slip agents and for friction reduction in polyolefin films. As process lubricants for styrenics and PVC, mold release for phenolics, as antiblock agents for polyolefins.

"Kemester EGDS" [ACH]. (ethylene glycol distearate). TM for pearlizing agents.

Use: For shampoos, liquid soaps, and detergents.

"Kemstrene" [ACH]. TM for glycerin.

Use: For a solvent and humectant in cosmetics, liquid soaps, confections, inks, lubricants, in polyester and polyurethane formulations.

"Kenamine" [ACH]. TM for a series of straight-chain amines from primary through quaternary; available in chain lengths from C₁₂ through C₂₂. They are strongly hydrophobic and are biodegradable.

Use: Cationic intermediate, removal of moisture from surfaces.

"Ken-Cel" [Kenrich]. TM for a series of formulated blowing agent masterbatches.

"Kencolor" [Kenrich]. TM for a series of dispersions based on silicone binders.

Use: Pigmenting of silicone elastomers.

"Ken-Cure" [Kenrich]. TM for a series of specialty curative chemicals.

Kendall-Mattox reaction. Formation of a conjugated ketone from an α -bromoketone via a phenylhydrazone or semicarbozone.

Kendrew, John C. (1917–1997). An English molecular biologist who won the Nobel Prize for chemistry in 1962 with Perutz. His work verified Pauling's earlier thesis concerning the α -helix structure of the polypeptide chain. After receiving his Ph.D. from Cambridge, he was science advisor to the allied air commander-in-chief during World War II. He was also editor of the journal *Molecular Biology*.

"Kenflex" [Kenrich]. TM for a series of aromatic oligomers of dimethyl naphthalene and blends thereof.

Use: Processing and compounding aid for neoprene, "Hypalon," SBR, vinyl compounds and other plastics; potting compounds; protective coatings; paper

and textile coatings; insecticides; ink; chemical synthesis.

“Kenite” [*World Minerals*]. TM for diatomaceous earth and related products.

“Ken-Kem” [*Kenrich*]. TM for a series of specialty chemicals.

“Kenlastic” [*Kenrich*]. TM for a series of elastomer-based dispersions of rubber chemicals.
Use: Dispersion for elastomers.

“Ken-Mag” [*Kenrich*]. TM for a bar form of dispersed magnesium oxide.
Use: Curing of elastomers.

“Kenmix” [*Kenrich*]. TM for a series of paste dispersions of rubber chemicals.
Use: Dispersions for elastomers.

“Kenplast” [*Kenrich*]. TM for a series of plasticizers based on aromatic hydrocarbons or derivatives of cumyl phenol.
Use: Plasticizer for nitrile elastomers and reactive diluents for epoxy.

“Ken-React” [*Kenrich*]. TM for a series of organometallic coupling agents based on titanium, zirconium, and aluminum.
Use: Bonding agents, polymer process aids, catalysts, blowing agent activators, corrosion inhibitors, dispersing agents.

“Ken-React KR TTS” [*Kenrich*]. TM for a series of alkyl titanates.
Available forms: Liquid, powder, and pellets.
Use: Catalyst, intermediates for ceramic coatings.

“Ken-Stat” [*Kenrich*]. TM for a series of antistats based on combined neoalkoxy titanates or combined neoalkoxy zirconates.

“Ken-Zinc” [*Kenrich*]. TM for a bar form of dispersed zinc oxide.
Use: Curing of elastomers.

kepone. (chlordecone; decachlorooctahydro-1,3,4-metheno-2*H*-cyclobuta[cd]pentalene-2-one). CAS: 143-50-0. C₁₀Cl₁₀O.

Properties: Crystalline solid. Mp 350C (decomposes). Soluble in acetic acid, alcohols, ketones, acetone; slightly soluble in water.

Hazard: A carcinogen. Toxic by ingestion, inhalation, and skin absorption. Manufacture and use have been prohibited.

Use: Insecticide, fungicide.

keratin. A class of natural fibrous proteins occurring in vertebrate animals and humans, they are characterized by their high content of several amino acids, especially cystine, arginine, and serine. They

are generally harder than the fibrous collagen group of proteins. The softer keratins are components of the external layers of skin, wool, hair, and feathers, while the harder types predominate in such structures as nails, claws, and hoofs. The hardness is largely due to the extent of cross-linking by the disulfide bonds of cystine by the mechanism shown below:

Keratins are insoluble in organic solvents but do absorb and hold water. The molecules contain both acidic and basic groups and are thus amphoteric.

Use: Tablet coatings that dissolve only in the intestines, foam extinguishers, protein hydrolyzates.

keratinase. A water-soluble, proteolytic enzyme having the ability to digest the keratin in wool and other forms of hair, converting a portion of it to a water-soluble form. It thus acts as a depilatory and is used in removing hair from pelts and hides, as well as from human skin. It is inactivated by heating to 100C.

“Kerlone” [*Searle*]. TM for betaxolol hydrochloride.
Use: Drug.

kernite. Na₂B₄O₇•4H₂O. A natural sodium borate found in Kern County, California.

Properties: Colorless to white, two good cleavages, luster vitreous to pearly. Mohs hardness 3, d 1.95. Noncombustible.

Use: Major source of borax and boron compounds.

kerogen. The organic component of oil shale, it is a bitumen-like solid whose approximate composition is 75–80% carbon, 10% hydrogen, 2.5% nitrogen, 1% sulfur, and the balance oxygen. It is a mixture of aliphatic and aromatic compounds of humic and algal origin and comprises a substantial proportion of the shale; after fractionating and refining, the oil is reported to yield 18% gasoline, 30% kerosene, 27% gas oil, 15% light lube oil, and 10% heavy lube oil.

kerosene. (kerosine).
CAS: 8008-20-6.

Properties: Water-white, oily liquid; strong odor. D 0.81, boiling range 180–300C, flash p 100–150F (37.7–65.5C), autoign temp 444F (228C). Combustion properties can be greatly improved by a proprietary hydrotreating process involving a selective catalyst.

Derivation: Distilled from petroleum.

Hazard: Moderate fire risk, explosive limits in air 0.7–5.0%. Toxic by inhalation.

Use: Rocket and jet engine fuel, domestic heating, solvent, insecticidal sprays, diesel and tractor fuels.

ketal. Organic compound produced by addition of an alcohol to a ketone. Analogous to acetal.

See hemiketal.

ketene.

CAS: 463-51-4. $\text{H}_2\text{C}=\text{C}=\text{O}$.

Properties: Colorless gas; disagreeable odor. Readily polymerizes; cannot be shipped or stored in a gaseous state. Mp -151°C , bp -56°C .

Derivation: Pyrolysis of acetone or acetic acid by passing its vapor through a tube at $500\text{--}600^\circ\text{C}$.

Hazard: Toxic by inhalation, strong irritant to skin and mucous membranes. TLV: TWA 0.5 ppm; STEL 1.5 ppm.

Use: Acetylating agent, generally reacting with compounds having an active hydrogen atom; reacts with ammonia to give acetamide. Starting point for making various commercially important products, especially acetic anhydride and acetate esters.

ketimine. A type or class of curing agent for epoxy resins that makes it possible to use very-high-solids content coatings in spray equipment. Reacts with epoxies very slowly and thus delays curing time, which prevents setting up of the resin during spraying operation. In presence of water or water vapor, ketimine breaks down to a polyamine and a ketone. Epoxy coatings cured with ketimine should not exceed a thickness of 10 mils.

4-ketobenzotriazine. (benzazimide; 4-keto-(3H)-1,2,3-benzotriazine). $\text{C}_7\text{H}_5\text{N}_3\text{O}$ Bicyclic.

Properties: Tan powder. Mp 210°C (decomposes). Soluble in alkaline solutions and organic bases.

Use: Organic synthesis.

1-keto-2,3-dihydrocyclopentindole oxime.

CAS: 22942-83-2. mf: $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}$.

Hazard: A poison.

keto-enol tauterism. A compound with isomers in equilibrium between the keto form $-\text{CH}_2-\text{CO}-$ and the enol form $-\text{CH}=\text{C}(\text{OH})-$. It occurs by migration of a hydrogen atom between a carbon atom and the oxygen on an adjacent carbon. See isomerization.

ketogenic amino acids. Amino acids with carbon skeletons that are metabolized to ketone bodies. Contrast with the glucogenic amino acids.

α -ketoglutaric acid. (2-oxopentanedioic acid). $\text{HOOCCH}_2\text{CH}_2\text{COCOOH}$.

Properties: Mp 113.5°C . Soluble in water and alcohol. Important in amino-acid metabolism.

β -ketoglutaric acid. (ADA, acetonedicarboxylic acid). $\text{HOOCCH}_2\text{CH}_2\text{COCOOH}$

Properties: Colorless needles. Mp 135°C (decomposes). Soluble in water and alcohol; insoluble in benzene and chloroform.

Derivation: By heating dehydrated citric acid and concentrated sulfuric acid together.

Use: Organic synthesis.

α -ketoglutaric acid, disodium salt.

CAS: 305-72-6. mf: $\text{C}_5\text{H}_4\text{O}_5 \cdot 2\text{Na}$.

Hazard: Moderately toxic by ingestion.

ketoexamethylene. See cyclohexanone.

ketone. A class of liquid organic compounds in which the carbonyl group, $\text{C}=\text{O}$, is attached to two alkyl groups; they are derived by oxidation of secondary alcohols. The simplest member of the series is acetone, $\text{CH}_3\text{C}(\text{O})\text{CH}_3$, but many more complex ketones are known.

Use: Solvents, especially for cellulose derivatives, in lacquers, paints, explosives, and textile processing. See acetone; diethyl ketone; methyl ethyl ketone.

ketone bodies. A group of molecules normally produced in very low amounts, but increased amounts are found during fasting or in untreated diabetes mellitus.

ketone, Michler's. See tetramethyldiaminobenzophenone.

ketonimine dye. A dye whose molecules contain the $-\text{NH}=\text{C}=\text{C}$ chromophore group. There are only two members in the class: auramine and a closely related homolog, methyl aurin, in which a methyl group replaces one of the hydrogen atoms of aurin. These are basic dyes used on cotton with tannin or tartar emetic as mordant.

4-ketopentenal.

CAS: 5729-47-5. mf: $\text{C}_5\text{H}_8\text{O}_2$.

Hazard: A poison.

α -ketopropionic acid. See pyruvic acid.

ketose. A simple monosaccharide in which the carbonyl group is a ketone.

ketosis. A metabolic condition in which the concentration of ketone bodies in the blood, tissues, and urine is abnormally high.

γ -ketovaleric acid. See levulinic acid.

"Kevlar" [Du Pont]. TM for an aromatic polyamide fiber of extremely high tensile strength and greater resistance of elongation than steel. Its high energy-absorption property makes it particularly suitable for use in belting radial tires, for which it was specifically developed; it is also used as a

reinforcing material for plastic composites in bullet-proof vests and in cordage products. See aramid.

Keyes process. A distillation process involving the addition of benzene to a constant-boiling 95% alcohol-water solution to obtain absolute (100%) alcohol. On distillation, a ternary azeotropic mixture containing all three components leaves the top of the column while anhydrous alcohol leaves the bottom. The azeotrope (which separates into two layers) is redistilled separately for recovery and reuse of the benzene and alcohol.

kg. Abbreviation for kilogram. Equals 1000 grams.

Kick's law. The amount of energy required to crush a given quantity of material to a specified fraction of its original size is the same, regardless of the original size.

kier. A large metal tank or vessel in which wool or cotton fibers or fabrics are scoured, bleached, or dyed, usually in an alkaline solution (kier boiling).

kieselguhr. See diatomaceous earth.

kieserite. $\text{MgSO}_4 \cdot \text{H}_2\text{O}$. A natural magnesium sulfate occurring in enormous quantities in the Stassfurt salt beds (Germany), Austria, and India. See magnesium sulfate.

Kiliani-Fischer synthesis. Extension of the carbon atom chain of aldoses by treatment with cyanide. Hydrolysis of the cyanohydrins followed by reduction of the lactone yields the homologous aldose.

"killed" steel. Steel deoxidized by the addition of aluminum, ferrosilicon, etc., while the mixture is maintained at melting temperature until all bubbling ceases. The steel is quiet and begins to solidify at once without any evolution of gas when poured into the ingot molds.

kiln. (1) A refractory-lined cylinder, either stationary or rotary.

Use: Calcination of lime, magnesia, cement, ores, etc., and for incinerating gaseous, liquid, and solid wastes.

(2) A furnace for firing ceramic products.

kilo-. Prefix meaning 10^3 units (symbol k), e.g., 1 kg = 1 kilogram = 1,000 grams.

kilogram. (1) A mass identical with that of the international kilogram at the International Bureau of Weights and Measures in France. It is the mass of a liter of water at 4°C. (2) A force equal to the weight of one kilogram mass, measured at sea level.

kinase. A kinase is in general an enzyme that catalyzes the transfer of a phosphate group from ATP to something else. In molecular biology, it has acquired the more specific verbal usage for the transfer onto DNA of a radiolabeled phosphate group. This would be done in order to use the resultant "hot" DNA as a probe.

kinematic viscosity. See viscosity.

kinetic chain length. The average number of molecules of a monomer converted to a polymer for each active center formed in an initiation reaction.

kinetics, chemical. Chemical phenomena can be studied from two fundamental approaches: (1) *thermodynamics*, a rigorous and exact method concerned with equilibrium conditions of initial and final states of chemical changes; (2) *kinetics*, which is less rigorous and deals with the rate of change from initial to final states under nonequilibrium conditions. The two methods are related. Thermodynamics, which yields the driving potential—a measure of the tendency of a system to change from one state to another—is the foundation upon which kinetics is built. The rate at which a change will occur depends upon two factors: (1) directly with driving force or potential, and (2) inversely with a resistance. A measure of the tendency of a system to resist chemical change is the so-called activation energy, which is independent of the driving force or so-called free energy of the reaction. The diagram is a mechanical analogy illustrating the difference between activation energy and driving potential. The chemical system is represented by a sphere resting in a valley. The initial equilibrium state, A, is at a higher elevation than the final state, B. The difference in elevation between A and B is a measure of the free energy change of the reaction, that is, the driving force that will take the system from A to B. This quantity, ΔG , is determined by the classical methods of thermodynamics. Now A and B are equilibrium states represented by the valleys. For the system to go from A to B it must first overcome the hill separating the valleys. The elevation of this hill from the valley of the initial state is a measure of the resistance to change in the system in going from A to B. The quantity ΔG^* , known as free energy of activation, is determined by the methods of kinetics.

The system of molecules that is undergoing reaction consists of these molecules in different energy states. If the temperature of a gas is raised, there is an increase in the energy of these states and hence an

increase in the collisions of molecules which have the necessary activation energy; as a result, the rate of the reaction will increase. Also, if by means of a catalyst, the activation energy is decreased, more colliding molecules will react and again the rate of reaction will increase.

Note: Adapted from an article by Roger Gilmont in "Encyclopedia of Chemistry" Hampel and Hawley, editors, 3rd ed., 1973.

See thermodynamics, chemical; thermodynamics.

kinetic theory. A theory of matter based on the mathematical description of the relationship between the volumes, temperatures, and pressures of gases (P-V-T phenomena). This relationship is summarized in the so-called gas laws as follows: (1) Boyle's law (at constant temperature the volume of a gas is inversely proportional to its pressure); (2) Charles's law (at constant volume the pressure exerted by a gas is proportional to its absolute temperature); (3) Avogadro's law (equal volumes of the same or different gases under the same conditions of temperature and pressure contain the same number of molecules).

The theory involves the basic concept of matter as composed atoms and/or molecules that move more rapidly (gases) or vibrate more energetically (solids) as temperature increases. Thus, crystals melt at a point where the heat or energy input exceeds the bond energy of the solid state. See kinetics, chemical; gas; thermodynamics.

kinetin. (6-furfurylaminopurine).

CAS: 525-79-1. $C_{10}H_8N_5O$. A plant growth regulator used to promote growth in bacterial cultures and as dormancy breaker.

king's green. See copper acetoarsenite.

kinin. (cytokinin). One of a group of plant growth regulators that promote cell division and differentiation.

See kinetin.

Kipp's apparatus. An apparatus for producing a gas by the action of a liquid on a solid that consists of three globes. The top one has a funnel-shaped extension in to the bottom globe which stores the liquid. The middle globe contains the solid.

Kishner cyclopropane synthesis. Formation of cyclopropane derivatives by decomposition of pyrazolines formed by reacting α,β -unsaturated ketones or aldehydes with hydrazine.

Kistiakowsky, George B. (1900–1982). Born in Kiev, Russia, where he fought in the White Russian Army, he studied in Germany under Maxwell Bodenheimer, where he obtained his doctorate in chemistry. In 1926, he came to the U.S. and became an American citizen in 1933. For 41 years, he was Professor of Chemistry at Harvard; in addition to

many chemical awards, he was the recipient of the Priestley Medal as well as distinguished Medals of Honor from three Presidents of the U.S. President Eisenhower appointed him as his assistant for science and technology, and he was chairman of the Science Advisory Committee from 1957 to 1963. Among his many achievements in both chemistry and physics, he was a world-famous authority on explosives. A key member of the Manhattan Project, he devised the detonating mechanism for the first experimental atomic bomb in New Mexico, at which time he was head of the Los Alamos Laboratory. Though he ranks high among those who developed the bomb, he perceived the awesome destructive potential of nuclear weapons and became an ardent opponent of their future use. Resigning from the Pentagon in 1967, he returned to teaching at Harvard. Among other distinguished organizations, he was a member of the Royal Society of London, the AAAS, and the ACS.

Kjeldahl flask. A round bottom flask with a long wide neck that is used in the determination of nitrogen by Kjeldahl's method.

Kjeldahl test. An analytical method for determination of nitrogen in certain organic compounds. It involves addition of a small amount of anhydrous potassium sulfate to the test compound, followed by heating the mixture with concentrated sulfuric acid, often with a catalyst such as copper sulfate. As a result ammonia is formed. After alkalyzing the mixture with sodium hydroxide, the ammonia is separated by distillation, collected in standard acid, and the nitrogen determined by back-titration.

"Kjelgest" [Thomas]. TM for anhydrous granular magnesium perchlorate for use as a desiccant.

"Kleanrol" [Du Pont]. TM for a soldering flux crystal based on zinc chloride and ammonium chloride.

"Klearol" [Crompton & Knowles]. TM for a white mineral oil, technical grade, d 0.828–0.838. Use: Cosmetic preparations, eggshell preservation.

Klein's reagent. A saturated solution of cadmium borotungstate, formula variously given, possibly $2CdO \cdot B_2O_3 \cdot 18H_2O$, d 3.28.

Use: Separation of minerals by specific gravity.

"Klucel" [Hercules]. TM for hydroxypropyl cellulose.

Use: A thickener for paint removers, tablet binders, aqueous film-coating polymers, sustained-release matrix polymer for pharmaceuticals.

Klug, Aaron S. (1926–). A South African-born chemist who won the Nobel Prize for chemistry in 1982 for his work with the electron microscope and research into the structure of nucleic

and protein complexes. He used crystallographic electron microscopy to analyze the structures of biologically important complex chemicals was noteworthy. He was cited in particular for his establishment of Fourier microscopy.

kneading. Blending of soft, plastic, semisolid materials into a uniform mixture by subjecting them to a rolling pressure exerted by agitators of specific shape rotating in trough-like containers. The action is a combination of turning, folding, and pressing. The operation is used in processing bakery doughs, printing inks, clays, and pastes of various types. See blend; sigma blade.

knife. See doctor knife.

knock. Ignition of a portion of the gasoline in the cylinder head due to spontaneous oxidation reactions rather than to the spark. It causes serious power loss, especially in high-compression engines. See octane number.

knock-out experiment. A technique for deleting, mutating or otherwise inactivating a gene in a mouse. This laborious method involves transfecting a crippled gene into cultured embryonic stem cells, searching through the thousands of resulting clones for one in which the crippled gene exactly replaced the normal one (by homologous recombination), and inserting that cell back into a mouse blastocyst. The resulting mouse will be chimaeric but its germ cells will carry the deleted gene. A few rounds of careful breeding can then produce progeny in which both copies of the gene are inactivated. See gene; locus; model organisms.

Knoevenagel condensation; Doebner modification. Condensation of aldehydes or ketones with active methylene compounds (specifically malonic ester) in the presence of ammonia or amines; the use of malonic acid and pyridine is known as the Doebner modification.

Knoop hardness. See hardness.

Knoop-Oesterlin amino acid synthesis.

Preparation of α -amino acids by catalytic hydrogenation of α -oxo acids in aqueous ammonia in the presence of platinum, palladium, or Raney nickel catalysts, probably via an unstable iminocarboxylate ion intermediate.

Knoop scale. Comparative hardness scale, ranges from glass (300–600) to diamond (6000–6500).

Knorr pyrazole synthesis. Formation of pyrazole derivatives from hydrazines, hydrazides, semicarbazides, and aminoguanidines by condensation with 1,3-dicarbonyl compounds; with substitut-

ed hydrazines, two structurally isomeric pyrazoles are formed.

Knorr pyrrole synthesis. Formation of pyrrole derivatives by condensation of α -amino ketones as such or generated in situ from isonitroso ketones with carbonyl compounds containing active α -methylene groups.

Knorr quinoline synthesis. Formation of α -hydroxyquinolines from β -ketoesters and arylamines above 100C. The intermediate anilide undergoes cyclization by dehydration with concentrated sulfuric acid.

Knowles, William S. (1917–). An American born in Taunton, Massachusetts who won the Nobel Prize for chemistry in 2001 for his pioneering work concerning chirally catalysed hydrogenation reactions. He was awarded an undergraduate degree from Harvard and worked many years for the Monsanto Corporation. Knowles received the ACS Award for Creative Invention 1982.

“KOALA-TY” [Accurate]. TM for laboratory apparatus.

Koch acid. (1-naphthylamine-3,6,8,-trisulfonic acid).

Properties: White solid. Slightly soluble in water.

Derivation: Naphthalene- β -sulfonic acid is sulfonated with 60% oleum at 165C, the resulting naphthalene-1,3,6-trisulfonic acid is nitrated and the product reduced with iron.

Use: Azo dye intermediate.

Koch-Haaf carboxylations. Formation of tertiary carboxylic acids by treating alcohols with carbon monoxide in strong acid.

Kochi reaction. Synthesis of organic chlorides by decarboxylation of carboxylic acids in the presence of lead tetraacetate and lithium chloride.

Koenigs-Knorr synthesis. Formation of glycosides from acetylated glycosyl halides and alcohols or phenols in the presence of silver carbonate or silver oxide. The reaction proceeds with inversion of configuration.

Kohlrausch's law. Ions have independent migrations, and the conductance of a solution is the sum of the conductances of the anions and cations.

KOH number. In the electrometric titration of latex with KOH, the number of grams of KOH per 100 grams of rubber necessary to obtain a pH of 10.7-11.

Kohn, Walter (1923-). Awarded Nobel Prize in chemistry in 1998 jointly with John A. Pople for their pioneering contributions in developing methods that can be used for theoretical studies of the properties of molecules and the chemical processes in which they are involved. He performs his research at the University of California at Santa Barbara.

kojic acid. [5-hydroxy-2-(hydroxymethyl)-4-pyrone].
CAS: 501-30-4. $C_6H_6O_4$.

Properties: Crystals. Mp 152-154C. Soluble in water, acetone, alcohol; slightly soluble in ether; insoluble in benzene. Mildly antibiotic.

Derivation: Fermentation of starches and sugars by certain molds.

Use: Chemical intermediate, metal chelates, insecticide, antifungal and antimicrobial agent.

kola. See cola.

Kolbe electrolytic synthesis. Formation of hydrocarbons by the electrolysis of alkali salts of carboxylic acids (decarboxylative dimerization).

Kolbe-Schmidt reaction. The preparation of salicylic acid or its derivatives from carbon dioxide and sodium or potassium phenolate.

“Kolene” DGS Salt [Kolene]. TM for an anhydrous molten oxidizing salt bath using a sodium hydroxide base with additives necessary to provide controlled chemical oxidizing and dissolving properties.

Use: Descaling of heat-treated and hot-work oxides and scales; deglazing (removal of glass-drawing lubricants), investment, and silica removal; removal of burned-in carbon deposits; cleaning of oils, greases, and organic materials from the surface of metals.

Komarowsky reaction. The reaction between certain alcohols and *p*-hydroxybenzaldehyde in dilute sulfuric acid solutions to give soluble colored complexes. 1,2-Propylene glycol gives a colored product while ethylene glycol does not. The reaction has also been employed to determine cyclohexanol in cyclohexanone.

Kondakov rule. Olefins that add mineral acids readily react with chlorine or bromine to give unsaturated monohalides; those that do not add mineral acids readily form dihalides.

Konowaloff rule. The vapor over a liquid is relatively rich in the component whose addition to

the liquid mixture results in an increase of the total vapor pressure.

Kopp’s law. The molecular heat of a solid compound is an additive function of the atomic heat capacities of its individual atoms. The molecular volume of a liquid is equal to the sum of the atomic volumes of its constituent atoms.

korax.

CAS: 600-25-9. Generic name for 1-chloro-1-nitropropane. $ClCH_2CH(CH_3)NO_2$.

Properties: Liquid. Bp 170.6C (745 mm Hg), flash p 144F (62.2C). Miscible with most organic solvents; slightly soluble in water. Combustible.

Hazard: Moderate fire risk. Strong irritant. TLV: 2 ppm.

Use: Fungicide.

Kostanecki acylation. Formation of chromones or coumarins by acylation of *o*-hydroxyaryl ketones with aliphatic acid anhydrides followed by cyclization.

“KR” [Kenrich]. TM for a prefix for a series of monoalkoxy, chelate, and coordinate type titanates and zirconates.

Kr. Symbol for krypton.

Krafft degradation. Conversion of carboxylic acids, especially of high molecular weight, into the next-lower homolog by dry distillation of the alkaline earth salt with the corresponding acetate, followed by chromic acid oxidation of the methyl ketone.

Krafft point. Temperature (°C) at which cogel or crystal formation takes place in a soap solution and produces opacity.

kraft paper. A strong and relatively cheap paper made chiefly from pine by digestion with a mixture of caustic soda, sodium sulfate, sodium carbonate, and sodium sulfide. It is by far the largest volume paper made in the U.S.
See holopulping process.

“Kraton” 101 [Shell]. TM for a styrene-butadiene elastomer that requires no vulcanization, while displaying most of the properties of conventional vulcanized polymers. White, free-flowing crumb, readily soluble in a large number of commercially used solvents.

Use: In pressure-sensitive wet lay-up and hot-melt adhesives, dip coating, spraying, and spreading applications.

“Kraton Liquid 1-207” [Ripplewood].

CAS: 103599-19-5. TM for a basic polymer liquid.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion. A mild skin irritant.

Krebs cycle. See TCA cycle.

"Krenite" 10 [Du Pont]. TM for a solution of urea and ammonium nitrate in aqueous ammonia; contains 43.5% nitrogen.

Use: Manufacture of mixed fertilizers.

"K-Resin" [Phillips]. TM for a styrene-butadiene copolymer.

Use: Clear packaging, film, medical applications, and toys.

Krohnke aldehyde synthesis. Transformation of benzyl halides into aldehydes via their pyridinium salts which, on treatment with *p*-nitrosodimethylaniline, give nitrones. Hydrolysis of the nitrones yields aldehydes.

Kroll process. A widely used process for obtaining titanium metal. Titanium tetrachloride is reduced with magnesium metal at red heat and atmospheric pressure, in the presence of an inert gas blanket of helium or argon. Magnesium chloride and titanium metal are produced. The reaction is $TiCl_4 + 2Mg \rightarrow Ti + 2MgCl_2$. Essentially the same process is also used for obtaining zirconium.

"Kromatherm" [Pfizer]. TM for high-temperature pigments designed for silicone- and fluorocarbon-resin-based paint vehicles.

"Kronitex" [FMC]. TM for a series of synthetic phosphate esters to replace such natural products as tricresyl and cresyl diphenyl phosphates.

Use: Flame-retardant plasticizers for vinyls, dust filter medium, gas additives, wood-treating chemical, foam control.

krotiline.

CAS: 2971-38-2. mf: $C_{12}H_{11}Cl_3O_3$.

Hazard: Moderately toxic by ingestion and inhalation.

Use: Agricultural chemical.

Kroto, Sir Harold W. (1939–). A British chemist who won the Nobel Prize for chemistry along with Robert F. Curl, Jr. and Richard E. Smalley in 1996, the 100th anniversary of Alfred Nobel's death. The trio won for the discovery of the C_{60} compound called buckminsterfullerene. He received a Ph.D. from the University of Sheffield. See buckminsterfullerene; Curl, Robert F., Jr.; Smalley, Richard E.

"Krum" [Silbrico]. TM for horticultural perlite.

krypton.

CAS: 7439-90-9. Kr. Element of atomic number 36, noble-gas group of the periodic table, aw 83.80, valence = 2 (possibly others), has six stable isotopes and a number of artificially radioactive forms.

Properties: Colorless gas; odorless. Bp $-152.9C$ (1 atm), fp $-157.1C$, d 2.818 (air = 1), sp vol 4.61 cu ft/lb (21C, 1 atm). Only slightly soluble in water. Known to combine with fluorine at liquid nitrogen temperature by means of electric discharges or ionizing radiation to make KrF_2 and KrF_4 . These compounds decompose at room temperature. Noncombustible.

See noble gas.

Derivation: By fractional distillation of liquid air. Air contains 0.000108% of krypton by volume.

Use: Incandescent bulbs and fluorescent light tubes, lasers, high-speed photography. *Note:* Solid krypton exists at cryogenic temperatures as a white, crystalline substance; mp 116K.

krypton-86. Radioactive krypton of mass number 85.

Properties: Half-life 10.3 years. Radiations: β with a small component of γ . Low radiotoxicity.

Derivation: A fission product extracted from irradiated nuclear fuel.

Available forms: Gas of high chemical purity, but mixed with other isotopes of krypton in sealed glass flasks.

See kryptonates.

Use: Activation of phosphors for self-luminous markers, detecting leaks, medicine to trace blood flow, and in measurement of standard meter.

kryptonates. Materials impregnated with krypton-85 in such a way that the radioactive atoms are held within the crystalline lattice structure. Elements, alloys, glasses, inorganic compounds, rubbers, and plastics have been so impregnated with tracer atoms.

"Krytox" [Du Pont]. TM for a series of hexafluoropropylene epoxide polymers of medium molecular weight, used as lubricating oils and greases; in high-temperature or corrosive conditions, good chemical inertness, even with boiling sulfuric acid; low solubility in most solvents; good lubricity under load; nonflammable, have thermal stability up to 260C.

"K-Selectride" [Sigma-Aldrich]. TM for potassium tri-*sec*-butylborohydride, 1.0 molar solution in tetrahydrofuran. $KB[CH(CH_3)C_2H_5]_3H$.

Properties: Moisture-sensitive liquid. Mw 222.27, d 0.913, fp $-17C$.

Hazard: Flammable liquid, handle under nitrogen.

Use: Stereoselective reduction of ketones; conjugate reduction and alkylation of α,β -unsaturated ketones.

"K-Tea Algacide" [Agrisel]. TM for an algacide.

Use: To kill most forms of algae in lakes and fish hatcheries, rivers, streams, and golf course waters.

KTPP. Abbreviation for potassium tripolyphosphate.

Kucherov reaction. Hydration of acetylenic hydrocarbons with dilute sulfuric acid in the presence of mercuric sulfate or boron trifluoride as catalyst.

Kuhn, Richard. (1900–1967). A German chemist who won the Nobel Prize in 1938. He worked on cartinoids and synthetic vitamins and discovered the chemical formula for vitamin B₆. He also discovered a method for dissolving symplexes from plants using invert soaps. He received his PhD in Munich, and went on to teach in Switzerland.

Kuhn-Roth method for C-methyl determination. Oxidation of organic compounds with chromic and sulfuric acids in such a manner that the C-methyl groups are converted to acetic acid which can be assayed volumetrically. The method has been modified and extended (1) to saturated fatty acids and alcohols containing up to about 20 carbon atoms, and (2) to aliphatic long-chain compounds of very high molecular weight.

Kuhn-Winterstein reaction. Conversion of 1,2-glycols into *trans* olefins by reaction with diphosphotetraiodide (P₂I₄) or other halogenated reagents. This reaction is useful in the preparation of polyenes.

“K-Universal Line Klusters” [Swix]. TM for ski wax.
Use: Versatile wax products utilizing newest raw materials.

“Kuron” [Dow]. TM for a hormone-type weed and brush killer.

Kurroll’s salt. NaPO₃(IV). A high-temperature crystalline form of sodium metaphosphate.

“Kuzo” [Afrocare]. TM for a beeswax formulation.
Use: For dreadlocks and braid ends.

kyanite. (cyanite; disthene; rhoetizite). Al₂O₃·SiO₂. A mineral.

“Kydex” [Rohm & Haas]. TM for a thermofomed acrylic polyvinyl chloride alloy plastic sheet.
Use: Housings, trays, covers, containers, protective guards, and decorative parts exposed to severe service conditions.

“Kynol” [Carborundum]. TM for a flame-resistant fiber available as 1.5 inch staple, 1.7 denier. It is a cross-linked, amorphous phenolic polymer, inert to all solvents and with fair resistance to oxidizing acids and strong alkalies. Will not ignite up to 2500C, but will char slowly at 260C. Potential uses are as ablative agent in spacecraft, flameproof apparel, protective clothing, etc.
See ablation.

kynurenine. C₁₀H₁₂N₂O₃. An amino acid that is a metabolic product of tryptophan.
Use: Biochemical and nutritional research, especially in connection with B-complex deficiencies.

L

L. (l). Abbreviation for liter.

L-. (L-). Prefix indicating the left-handed enantiomer of an optical isomer. Often displayed as a small capital letter.

See *D-*.

l-. (l-). Prefix indicating that a compound is levorotatory. A minus sign (–) is now preferred.

See *d-*.

La. Symbol for lanthanum.

label. (1) A warning notice required by DOT or IATA to be placed on the shipping container of a hazardous material transported by air, highway, rail, or water. Names of some labels are as follows:

Corrosive	Irritant
Dangerous when Wet	Nonflammable Gas
Explosive	Organic Peroxide
Flammable Gas	Oxidizer
Flammable Liquid	Poison
Flammable Solid	Radioactive

(2) A notice required to appear on a food product indicating its composition and nutritional value (RDA), or on a pharmaceutical or household product stating its hazardous properties. (3) A radioactive isotope or fluorescent dye added to a chemical compound to trace its course and behavior through a series of reactions, usually in living organisms. This technique has also been used to measure frictional wear of moving parts of automotive engines.

See tracer; tagged compound.

labeled compound. Refers to material containing radioactive atoms.

Use: As a tracer in chemical reactions and medical diagnosis.

labeling. (labelling). Replacement of a stable atom in a compound with a radioisotope of the same element. This facilitates tracing the path of the chemical through a biological or mechanical system by detection of the radiation. Triated compounds have a hydrogen atom replaced by a tritium atom.

labile. Descriptive of a substance that is inactivated by high temperature or radiation, e.g., a heat-labile vitamin, unstable.

laboratory conditions. An ideal set of conditions in which all variant factors except the one under test can be held constant, as for example, rooms provided with constant temperature and humidity control, clean rooms, and the like. Less spe-

cifically, the term refers to experimental or small-batch conditions as opposed to large-scale production.

laboratory machinery. Small-scale working models of basic types of equipment used for experimental purposes in the laboratories of many chemical process industries. Commercially available are such items as calenders, mills of various kinds, mixers, autoclaves, extruders, electric furnaces, distillation columns, etc. A machine as complex as a four-drainer can be duplicated in laboratory size (about 10 ft by 18 in.).

laccase. An enzyme that oxidizes phenols or *o*- and *p*-quinones.

Occurrence: It occurs in the latex of the lac tree, in potatoes, sugar beets, apples, cabbages, and other plants.

lac dye. (CI Natural Red 25; lacchaid acid).

CAS: 60687-93-6. A brilliant red dye obtained by maceration of crude lac.

See shellac.

lachrymator. (lacrimator). A material (gas) that is strongly irritant to the eyes; tear gas.

L acid. (1-naphthol-5-sulfonic acid).

$C_{10}H_6(OH)SO_3H$.

Properties: White solid. Soluble in water.

Derivation: From naphthalene-1,5-disulfonic acid by fusion with sodium hydroxide.

Use: Azo dye intermediate.

lacmoid. (resorcinol blue).

$(HO)_2C_6H_3N[C_6H_3(OH)_2]_2$.

Properties: Lustrous, dark-violet, crystalline scales. Soluble in alcohol, ether, acetone, phenol, and glacial acetic acid; slightly soluble in water; pH 4.4–6.2.

Derivation: From resorcinol by treatment with sodium nitrite.

Use: Indicator in analytical chemistry (more sensitive than litmus).

lacquer. A protective or decorative coating that dries primarily by evaporation of solvent, rather than by oxidation or polymerization. Lacquers were originally comprised of high-viscosity nitrocellulose, a plasticizer (dibutyl phthalate or blown castor oil), and a solvent. Later, low-viscosity nitrocellulose became available; this was frequently modified with resins, such as ester gum or rosin. The solvents used are ethanol, toluene, xylene, and butyl acetate. Together with nitrocellulose, alkyd resins are used

to improve durability. The nitrocellulose used for lacquers has a nitrogen content of 11–13.5% and is available in a wide range of viscosities, compatibilities, and solvencies. Chief uses of nitrocellulose-alkyd lacquers are for coatings for metal, paper products, textiles, plastics, furniture, and nail polish. Various types of modified cellulose are also used as lacquer bases, combined with resins, and plasticizers. Many noncellulosic materials such as vinyl and acrylic resins are also used, as are bitumens, with or without drying oils, resins, etc.

See nitrocellulose.

Hazard: Flammable, dangerous fire and explosion risk.

lactalbunin. See albumin, milk.

lactam. A cyclic amide produced from amino acids by the removal of one molecule of water. An example is caprolactam, $\text{CH}_2(\text{CH}_2)_4\text{CONH}$, derived from epsilon-aminocaproic acid, $\text{NH}_2(\text{CH}_2)_5\text{COOH}$.

lactase. An enzyme present in intestinal juices and mucosa that catalyzes the production of glucose and galactose from lactose.

Use: Biochemical research.

lactase enzyme preparations from *Kluyveromyces lactis*.

Properties: Derived from *Kluyveromyces lactis*.

Use: Food additive.

lactate. An ester or salt of lactic acid, for example, ethyl lactate.

lactated mono-diglycerides.

Properties: Soft to hard waxy solid. Dispersible in hot water; moderately sol in hot isopropanol, xylene, cottonseed oil.

Use: Food additive.

lactic acid. (α -hydroxypropionic acid; milk acid).

CAS: 50-21-5. $\text{CH}_3\text{CH}_2\text{COOH}$.

Properties: Colorless or yellowish syrupy liquid; odorless; hygroscopic. Bp 122C (15 mm Hg), mp 18C, d 1.2. Miscible with water, alcohol, glycerol, and furfural; insoluble in chloroform, petroleum ether, carbon disulfide. Cannot be distilled at atmospheric pressure without decomposition; when concentrated above 50% it is partially converted to lactic anhydride. It has one asymmetric carbon and two enantiomeric isomers. The commercial form is a racemic mixture.

Derivation: (1) By fermenting starch, milk whey, molasses, potatoes, etc. and neutralizing the acid as

soon as formed with calcium or zinc carbonate. The solution of lactates is concentrated and decomposed with sulfuric acid. (2) Synthetically by hydrolysis of lactonitrile.

Grade: Technical 22% and 44%, food 50–80%, plastic 50–80%, USP (85–90%), CP, FCC.

Use: Cultured dairy products, as acidulant, chemicals (salts, plasticizers, adhesives, pharmaceuticals), mordant in dyeing wool, general-purpose food additive, manufacture of lactates.

lactic acid dehydrogenase. An enzyme found in animal tissues and yeast which takes part in controlling carbohydrate metabolism in the cell.

Use: Biochemical research.

lactogenic hormone. See luteotropin.

lactoglobulin. A protein found in milk. It comprises from 7 to 12% of the skim milk protein and is closely associated with casein.

lactone. An inner ester of a carboxylic acid formed by intramolecular reaction of hydroxylated or halogenated carboxylic acids with elimination of water. The resulting ring compound contains the group $-\text{CO}\bullet\text{O}-$.

Derivation: In nature as odor-bearing components of various plant products; also made synthetically. See butyrolactone; propiolactone.

lactonitrile. (α -hydroxypropionitrile; acetaldehyde cyanohydrin).

CAS: 78-97-7. $\text{CH}_3\text{CH}_2\text{OCN}$.

Properties: Straw-colored liquid. Acid to methyl red, fp -40C , bp 182–184C (slight decomposition), d 0.9919 (18.4C), refr index 1.4058 (18.4C), flash p 170F (76.6C). Soluble in water and alcohol; insoluble in petroleum ether and carbon disulfide. Combustible.

Derivation: Acetaldehyde and hydrocyanic acid.

Grade: Technical, 95–97% purity.

Hazard: Toxic by inhalation, ingestion, and skin absorption; evolves hydrocyanic acid in presence of alkali.

Use: Solvent, intermediate in production of ethyl lactate and lactic acid.

lactose. (milk sugar; saccharum lactis).

CAS: 63-42-3. $\text{C}_{12}\text{H}_{22}\text{O}_{11}\bullet\text{H}_2\text{O}$.

Properties: White, hard, crystalline mass or white powder; sweet taste; odorless; stable in air. D 1.525,

mp decomposes at 203.5C. Soluble in water; insoluble in ether and chloroform; very slightly soluble in alcohol.

Derivation: From whey, by concentration and crystallization. Cows' milk contains about 5% lactose.

Grade: Crude, fermentation, spray-dried, edible, USP.

Use: Pharmacy; infant foods; bacteriology; baking and confectionery; margarine and butter manufacture; manufacture of penicillin, yeast, edible protein, and riboflavin; culture media; adsorbent in chromatography.

lactylic esters of fatty acids.

Properties: Hard, waxy solid to liquid. Dispersible in hot water; sol in org solvs, vegetable oil.

Use: Food additive.

lac wax. A wax obtained from lac consisting of myricyl and ceryl alcohols, free and combined with various fatty acids. Combustible.

See shellac.

LAD. Abbreviation for lithium aluminum deuteride.

ladder polymer. An ordered molecular network of double-stranded chains connected by hydrogen or chemical bonds located at regular intervals along the chains. Many complex proteins, including DNA, are of this nature.

Ladenburg rearrangement. Thermal rearrangement of an alkyl- or benzylpyridinium halide to an alkyl- or benzylpyridine.

ladle. A refractory-lined pot or vessel equipped a spout and with lugs for handling by a crane used to transport molten metal from the furnace to ingot molds, into which the metal is poured from the ladle.

lagging strand. The DNA strand that, during replication, must be synthesized in the direction opposite to that in which the replication fork moves. It is synthesized via a series of fragments called Okazaki fragments.

lagoon. A scientifically constructed pond 3–5 ft deep in which sewage and other organic wastes are decomposed by the action of algae, sunlight, and oxygen, thus restoring water to a purity equal to that obtained with other types of treatment. These so-called oxidation ponds are often used following activated sludge treatment. The waste may be retained in the lagoon for as long as 30 days and is then chlorinated and passed through a trickle filter.

LAH. Abbreviation for lithium aluminum hydride.

laid (papermaking). See dandy roll.

lake. An organic pigment produced by the interaction of an oil-soluble organic dye, a precipitant, and an absorptive inorganic substrate. Insoluble in water; poor lightfastness makes lakes unsuitable for use in exterior paints.

Use: Printing inks, wallpaper inks, metal decorative coatings, coated fabrics, rubber, plastics, food colorants.

See toner; alizarin; madder lake.

Lake Red carbon. Red pigments made by coupling 2-chloro-5-aminotoluene-4-sulfonic acid with β -naphthol and forming various metal salts.

Properties: Good resistance to bleeding, reasonable light resistance, good transparency. Produces inks with good flow.

Grade: Resinated and nonresinated.

Use: General purpose colors for letterpress, gravure, flexographic, moisture-set, heat-set inks, especially for offset printing inks.

"Lamchem PE-130" [Lambent]. TM for a phosphate ester.

Use: As a PE additive lubricant and metal working fluid.

lambda-cyhalothrin.

CAS: 91465-08-6. mf: $C_{23}H_{19}ClF_3NO_3$.

Hazard: A poison by ingestion. Moderately toxic by skin contact and inhalation.

Use: Agricultural chemical.

lamb shift. A small energy difference between two levels ($^2S_{1/2}$ and $^2P_{1/2}$) in the hydrogen spectrum. The shift results from the quantum interaction between the electromagnetic radiation and the atomic electron. It was first explained by Willis Eugene Lamb.

lamepon. An acetylated peptide used as a surface-active agent.

laminat. A composite made of any one of several types of thermosetting plastic (phenolic, polyester, epoxy, or silicone) bonded to paper, cloth, asbestos, wood, or glass fiber. High tensile and dielectric strength and low moisture absorption are characteristic of these products. Available as sheet, rod, or tubing in mechanical, electrical, and general-purpose grades (National Electrical Manufacturers Association). Plywood is composed of a veneer with grain oriented at a 90-degree angle on successive layers and bonded with a thermosetting adhesive of the urea or phenol-formaldehyde type to give a high strength, dimensionally stable, weather-resistant construction material. It can be made nonflammable by treatment with salt solution. Polyvinyl butyral sheet is used in safety glass. See reinforced plastic.

"Lamitex" [Fudow]. TM for laminated fiber material.

lampblack. A black or gray pigment made by burning low-grade heavy oils or similar carbonaceous materials with insufficient air and in a closed system such that the soot can be collected in settling chambers.

Properties: Markedly different from carbon black. Strongly hydrophobic. Nonflammable.

Use: Black pigment for cements, ceramic ware, mortar, inks, linoleum, surface coatings, crayons, polishes, carbon paper, soap, etc.; ingredient of insulating compositions, liquid-air explosives, matches, fertilizer, furnace lutes, lubricating compositions, carbon brushes; reagent in cementation of steel. See carbon black.

“Lanaset” [Cytac]. TM for wool dyes with optimal fastness and minimal fiber damage.

land. (1) The portion of a mold that provides the separation or cutoff of the flash from the molded article. (2) The surface along the top of the flights or ribs of the screw of an extruder. (3) In an extrusion die, the surface parallel to the flow of material.

“Lanette O” [Henkel]. (cetearyl alcohol)
TM for viscosity builder.

Use: For lotions, creams, and other cosmetic emulsions.

“Lanfrax” [Henkel]. TM for lanolin wax emulsifier, stabilizer, emollient, crystallization inhibitor and film former.

Properties: Waxy solid.

Use: In creams lotions, make-up, lip products, and suntan preparations.

langbeinite. $K_2Mg_2(SO_4)_3$. A natural sulfate of potassium and magnesium found in salt deposits.
Properties: Colorless to yellowish, reddish greenish; luster vitreous. Mohs hardness 3.5–4, d 2.83.

Occurrence: New Mexico, Germany, India.

Use: Source of potash.

Langmuir, I. (1881–1957). An American physical chemist who was awarded the Nobel Prize in 1932 for his fundamental research in surface chemistry, especially monomolecular films. This led to development of modern knowledge of emulsification and detergency. Langmuir also investigated electrical discharges in gases and did pioneer work on cloud-seeding techniques.

“Lannate” [Du Pont]. TM for methomyl insecticides.
See methomyl.

“Lanogene” [Dow]. TM for liquid lanolin consisting of low melting point esters. A crystal-clear, amber, viscous liquid; anhydrous. Soluble in mineral and vegetable oils.

Use: Nonionic with out emulsifier; pigment dispersant; plasticizer; emollient.

lanolin.

Properties: (Hydrous): Yellowish to gray semisolid containing 25–30% water. Slight odor. (Anhydrous): Brownish-yellow semisolid containing no more than 0.25% water but can be mixed with about twice its weight of water without separation.

Derivation: Purification of degreas, a crude grease obtained by solvent-treatment of wool. Contains cholesterol esters of higher fatty acids. Hydrogenated, ethoxylated, and acetylated derivatives are available.

Grade: Technical, cosmetic, USP.

Use: Ointments, leather finishing, soaps, face creams, facial tissues, hair-set, and suntan preparations.

See degreas.

lanolin, anhydrous.

Properties: Yellow-white semisolid. Insol in water; sol in chloroform, ether.

Use: Food additive.

lanosterol. (isocholesterol). $C_{30}H_{50}O$. An unsaturated sterol closely related to cholesterol.

Properties: Optically active crystals. Mp 139–140C.

lanthana. See lanthanum oxide.

lanthanide series. (lanthanoid series). The rare earth series of elements, atomic numbers 58 through 71.
See rare earth.

lanthanum.

CAS: 7439-91-0. La. Metallic element of atomic number 57, group IIIB of the periodic table, a rare earth of the cerium group, aw 138.9055, valence = 3; two stable isotopes.

Properties: White, malleable ductile metal. Oxidizes rapidly in air. D 6.18–6.19, mp 920C, bp 3454C. Corrodes in moist air. Soluble in acids; decomposes water to lanthanum hydroxide and hydrogen. Superconducting at approximately 6K.

Derivation: By cracking of monazite or bastnasite ores with concentrated sulfuric acid and subsequent separation.

Available forms: Ingots, rods, 20-mil sheets, powdered, 99.9% pure.

Hazard: Ignites spontaneously in powdered form. May delay blood clotting and cause liver injury upon ingestion.

Use: Lanthanum salts, electronic devices, pyrophoric alloys, rocket propellants, reducing agent catalyst for conversion of nitrogen oxides to nitrogen in exhaust gases (usually in combination with cobalt, lead, or other metals), phosphors in x-ray screens. See rare-earth metal.

lanthanum acetate. $\text{La}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot x\text{H}_2\text{O}$.

Properties: White powder. Soluble in water and acids.

Grade: Purities up to 99.9+%.

lanthanum ammonium nitrate.

Properties: Colorless crystals. Soluble in water.

Grade: Purities to 99.9+%.

Hazard: Oxidizer; explosion and fire risk.

lanthanum antimonide. LaSb. A binary semiconductor.

lanthanum arsenide. LaAs. Made in high purity for use as a binary semiconductor.

Hazard: Highly toxic.

lanthanum carbonate. $\text{La}_2(\text{CO}_3)_3 \cdot 8\text{H}_2\text{O}$.

Properties: White powder. D 2.6. Insoluble in water; soluble in acids.

Grade: Up to 99.9+% lanthanum salts.

lanthanum chloranilate.

$\text{La}_2(\text{O}:\text{C}_6\text{Cl}_2\text{O}_2:\text{O})_3 \cdot x\text{H}_2\text{O}$.

Use: Reagent for fluoride determination.

lanthanum chloride.

CAS: 10099-58-8. $\text{LaCl}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals, transparent, hygroscopic. Mp (hydrate) 91C (decomposes); (anhydrous) d 3.842 (25C), mp 87.C; soluble in alcohol, water, acids.

Derivation: Treatment of lanthanum carbonates or oxides with hydrochloric acid in an atmosphere of dry hydrogen chloride.

Grade: Purities to 99.9+%, single crystals available.

Use: Anhydrous trichloride of rare-earth metal is often used to prepare the metal.

lanthanum fluoride. LaF_3 .

Properties: White powder. Insoluble in water, acids.

Grade: Purities up to 99.9+%, single crystals available.

Hazard: Toxic by ingestion. TLV: 2.5 mg(F)/m³.

Use: Phosphor lamp coating (gallium arsenide solid-state lamp), carbon arc electrodes, lasers.

lanthanum nitrate.

CAS: 10099-59-9. $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals, hygroscopic. Bp 126C, mp 40C. Soluble in alcohol, water, acids.

Grade: Purities to 99.9+%.

Hazard: Explosion and fire risk.

Use: Antiseptic, gas mantles.

lanthanum oxalate. $\text{La}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White powder. Insoluble in water; soluble in acids.

Grade: Purities to 99.9+%.

lanthanum oxide. (lanthana; lanthanum trioxide; lanthanum sesquioxide). La_2O_3 .

Properties: White or buff amorphous powder. D 6.51 (15C), mp 2315C, bp 4200C. Soluble in acids; insoluble in water.

Derivation: Ignition of hydroxide or oxyacid (oxalate, sulfate nitrate, etc.), direct combustion of free metal (burns with brilliant, white light).

Grade: Purities to 99.9+%.

Use: Calcium lights, optical glass, technical ceramics, cores for carbon-arc electrodes, fluorescent phosphors, refractories.

lanthanum phosphide. LaP. Made in high purity for use as binary semiconductor.

lanthanum sesquioxide. See lanthanum oxide.

lanthanum sulfate. $\text{La}_2(\text{SO}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White crystals. D 2.821, refr index 1.564 (20C). Insoluble in alcohol; slightly soluble in water, acids.

Derivation: By dissolving hydroxide, carbonate, or oxide in dilute sulfuric acid.

Grade: Purities to 99.9+%.

Use: The sulfates of the rare-earth elements are often used for atomic weight determination of the element.

lanthanum trioxide. See lanthanum oxide.

lanthionine. $\text{S}(\text{CH}_2\text{CHNH}_2\text{COOH})_2$. A nonessential amino acid first obtained from deaminated wool.

“Lantrol” [Henkel]. TM for lanolin oil emollient and moisturizer.

Properties: Liquid.

Use: In make-up as a pigment dispersant and cream, lotions, hair care products, bath oils, and medicinal preparations.

lard. Purified internal fat of the hog.

Properties: Soft, white, unctuous mass; faint odor; bland taste. Mp 36–42C. High in saturated fats. Soluble in ether, chloroform, light petroleum hydrocarbons, carbon disulfide; insoluble in water. Combustible.

Chief constituents: Stearin, palmitin, olein.

Use: Cooking, pharmacy (ointments, cerates), perfumery (pomades), source of lard oil.

lard oil.

Properties: Colorless or yellowish liquid; peculiar odor; bland taste. Mp –2C, refr index 1.470 (20C), d 0.915, saponification value 195–196, iodine value

56–74, subject to spontaneous heating, flash p 420F (215C), autoign temp 883F (472C). Soluble in benzene, ether, chloroform, and carbon disulfide; slightly soluble in alcohol. Combustible.

Chief constituents: Olein with a small percentage of the glycerides of solid fatty acids.

Derivation: By cold-pressing lard.

Grade: Prime winter edible, prime winter inedible, antibiotic, off prime, extra #1, #1, #2.

Use: Lubricant, metal cutting compounds, oiling wool, soap manufacture, antibiotic fermentation.

lard (unhydrogenated).

Properties: Whitish fat rendered from pork fat. Mp: 42°

Use: Food additive.

larva. Among invertebrates, an immature stage in the life cycle which usually is much smaller than, and morphologically different from, the adult. In insects with metamorphosis, the larva must become a pupa before reaching adulthood.

larvicide. A chemical agent that kills the eggs of insects. Examples are *p*-dichlorobenzene, chloropicrin, and copper acetoarsenite.

LAS. See alkyl sulfonate, linear.

laser. A device that produces a beam of coherent or monochromatic light as a result of photon-stimulated emission. Such beams have extremely high energy, because they consist of a single wavelength and frequency. Laser is an acronym for light amplification by stimulated emission of radiation. Materials capable of producing this effect are certain high-purity crystals (ruby, yttrium garnet, and metallic tungstates or molybdates doped with rare-earth ions); semiconductors such as gallium arsenide, neodymium-doped glass; various gases, including carbon dioxide, helium, argon, and neon; and plasmas. A chemical laser is one in which the excitation energy is furnished by a chemical reaction, e.g., $H + Cl_2 \rightarrow HCl \text{ (active)} + Cl$; or combustion of carbon monoxide to form excited carbon dioxide.

Hazard: Laser radiation can irreparably damage the eyes. Proper shielding is essential at all times.

Use: Laser beams are used in industry for cutting diamonds that are used for wire-drawing dies, and in flash photolysis, spectroscopy, and photography. They also have developing applications in medicine and surgery. They are being used for controlled fusion reactions, for biomedical investigations, for organic chemical research, for sophisticated analytical techniques, and in three-dimensional photography (holography). It is possible to increase the abundance of certain isotopes of such elements as uranium, chlorine, and boron by use of laser irradiation. Research on uranium enrichment by this method has been under way for several years.

See fusion (2); enrichment; holography.

laser-induced nuclear polarization. A technique for making the spin vectors of an assembly of nuclei point preferentially in one direction by means of an optical pumping process using either circularly or linearly polarized laser light.

laser spectroscopy. A branch of spectroscopy in which a laser is used as an intense monochromatic light source. In particular it includes saturation spectroscopy as well as the application of laser sources to Raman spectroscopy and other techniques. See spectroscopy.

LATB. See lithium aluminum tri-*tert*-butoxyhydride.

latent heat. The quantity of energy in calories per gram absorbed or given off as a substance undergoes a change of state, that is, as it changes from liquid to solid (freezes), from solid to liquid (melts), from liquid to vapor (boils), or from vapor to liquid (condenses). No change in temperature occurs. Water has unusually high latent heat values; the latent heat of fusion (melting) of ice is 80 cal/g and the latent heat of condensation of steam (latent heat of vaporization of water) is 540 cal/g. The considerable energy delivered by steam condensation is utilized for power generation and for heating a variety of chemical plant equipment (dryers, evaporators, reactors, and distillation columns). See evaporation; heat.

latent solvent. See solvent, latent.

laterite. A low-grade ore similar to bauxite, but containing only half as much aluminum oxide. Possible substitute for bauxite.

latex. A white, tacky, aqueous suspension of a hydrocarbon polymer occurring naturally in some species of trees, shrubs, or plants, or made synthetically. The most important natural latex is that of the tropical tree *Hevea brasiliensis*, which was the only source of rubber up to 1945. It is composed of globules of rubber hydrocarbon coated with protein; the particles are of irregular shape, varying from 0.5 to 3 microns in diameter; the suspension is stabilized by electric charges. The composition is about 60% water, 35% hydrocarbon, 2% protein, and low percentages of sugars and inorganic salts. For commercial purposes, rubber latex can be concentrated by evaporation or centrifugation. Ammonia is added as a preservative. Coagulation is induced by addition of acetic or formic acid. A vulcanized form is available. Natural latex is used in the manufacture of thin articles (surgeons' gloves and other medical equipment), as an adhesive, in foamed products, and for coating various products such as tire cord. Conversion of latex to gasoline via zeolite catalysts has been reported. Other sources of rubber-containing latex are guayule, a shrub grown in Mexico and the southwestern U.S., and several types of dandelions

and related species. The botanical function of latex in the plant is unknown. Synthetic latexes are made by emulsion polymerization techniques from styrene-butadiene copolymer, acrylate resins, polyvinyl acetate, and similar materials. Their particle size is much smaller than in natural latex, ranging from 0.05 to 0.15 micron; thus, they are truly colloidal suspensions. Their chief use is as a binder in exterior and interior paints, replacing drying oils; they are also used for foams and coatings.

See guayule; gutta percha; electrophoresis; paint; emulsion; "Vultex."

latex paint. See paint; emulsion.

"Latron AG-98" [Rohm & Haas]. TM for alkylaryl polyoxyethylene glycols.

Use: As a spray adjuvant for agricultural pesticides.

lattice. (1) The structural arrangement of atoms in a crystal. Accurate information is obtained by X rays, which are diffracted by the lattice at various angles. As the atoms are from 1.5 to 3 Å apart in most crystals, the lattice acts as a diffraction grating. See crystals; dislocation.

(2) The array of nuclear fuel elements and moderator in a nuclear reactor.

"Latyl" [Du Pont]. TM for a group of disperse dyes developed particularly for coloration of "Dacron" polyester fiber, on which they have exceptionally good light- and wetfastness properties.

laudanidine. (*l*-laudanine; tritopine).

$C_{20}H_{25}O_4N$. An alkaloid.

Properties: White crystals. Mp 182–185C. Insoluble in water; soluble in alcohol, benzene, chloroform, and slightly soluble in ether.

Derivation: From opium.

Hazard: Toxic by ingestion.

Use: Medicine (analgesic).

laudanum. Tincture of opium (tinctura opii BP).

laughing gas. See nitrous oxide.

laundry sour. See sour.

lauraldehyde. See lauryl aldehyde.

lauramidopropyl betaine.

CAS: 86438-78-0.

Hazard: An eye irritant.

Laurent's acid. (1-naphthylamine-5-sulfonic acid).

Properties: White or pink needles, gives greenish fluorescence in dilute aqueous solution.

Derivation: From naphthalene- α -sulfonic acid by nitration, reduction with iron, and separation from the 1-naphthylamine-8-sulfonic acid also formed.

Use: Azo dye intermediate.

Laurent's α -acid. (1-nitronaphthalene-5-sulfonic acid). $C_{10}H_6(NO)_2(SO_3H)$.

Properties: Pale yellow needles. Soluble in water, alcohol, and ether. Combustible.

Derivation: By sulfonating nitronaphthalene with a mixture of chlorohydrin and sulfuric acid.

Use: Azo dye intermediate.

"Laurex" [Uniroyal]. TM for the zinc salts of a mixture of fatty acids in which lauric acid predominates.

Properties: Yellowish-white granulated waxy powder. D 1.15, mp 95–105C. Soluble in benzene; insoluble in acetone, gasoline, ethylene dichloride, and water. Combustible.

Use: Accelerator, activator, and plasticizer for rubber.

lauric acid. (dodecanoic acid).

CAS: 143-07-7. $CH_3(CH_2)_{10}COOH$. A fatty acid occurring in many vegetable fats as the glyceride, especially in coconut oil and laurel oil. Combustible.

Properties: Colorless needles. D 0.833, mp 44C, bp 225C (100 mm Hg), refr index 1.4323 (45C). Insoluble in water; soluble in benzene and ether.

Derivation: Fractional distillation of mixed coconut or other acids.

Grade: 99.8% pure, technical, FCC.

Use: Alkyd resins, wetting agents, soaps, detergents, cosmetics, insecticides, food additives.

lauric aldehyde. See lauryl aldehyde.

laurone. An aliphatic ketone, insoluble in water, stable to high temperatures, acids, alkalis. Compatible with high-melting vegetable waxes, fatty acids, paraffins, etc. Incompatible with resins, polymers, and organic solvents at room temperature, but compatible with them at high temperature.

Use: As antilock agent.

N-lauroyl-*p*-aminophenol.

$HO(C_6H_4)NHCOC(CH_2)_{10}CH_3$.

Properties: White to off-white powder. Mp 123–126C. Insoluble in water; soluble in polar organic solvents (especially when heated), including alcohol, acetone, and dimethylformamide.

Use: Rubber antioxidant.

lauroyl chloride. $C_{11}H_{23}COCl$.

Properties: Water-white liquid. Refr index 1.445 (20C), fp $-17C$, bp $145C$ (18 mm Hg). Decomposes in water and alcohol, soluble in ether.

Use: Surfactant, polymerization initiator, antienzyme agent, foamer; synthesis of lauroyl peroxide, sodium *N*-lauroyl sarcosinate, and other sarcosinates.

(lauroyloxy)tributylstannane. See tributyltin laurate.

lauroyl peroxide. (dodecanoyl peroxide).

CAS: 105-74-8. $(C_{11}H_{23}CO)_2O_2$.

Properties: White, coarse powder; tasteless; faint odor. Mp $49C$. Soluble in oils and in most organic solvents. Slightly soluble in alcohols. Insoluble in water.

Grade: Technical (about 95%).

Hazard: Dangerous fire and explosion risk, will ignite organic materials, strong oxidizer. Toxic by ingestion and inhalation, strong irritant to skin.

Use: Bleaching agent, intermediate and drying agent for fats, oils, and waxes; polymerization catalyst.

***N*-lauroylsarcosine.**

$CH_3(CH_2)_{10}CON(CH_3)CH_2COOH$.

Properties: White solid. Mp $31-35C$, d 0.970.

Use: Surfactant, antienzyme, in cosmetics and pharmaceuticals. Also used in form of sodium *N*-lauroyl sarcosinate.

lauroyl acetate. See dodecyl acetate.

lauroyl alcohol. (alcohol C12; *n*-dodecanol; dodecyl alcohol).

CAS: 112-53-8. $CH_3(CH_2)_{10}CH_2OH$.

Properties: Colorless solid; fatty repulsive odor. D 0.830-0.836, refr index 1.428, mp $24C$, bp $259C$, flash p above $212F$ ($100C$) (CC). Insoluble in water; soluble in two parts of 70% alcohol. Combustible.

Derivation: Reduction of coconut-oil fatty acids.

Grade: Technical, FCC.

Use: Synthetic detergents, lube additives, pharmaceuticals, rubber, textiles, perfumes; flavoring agent.

lauroyl aldehyde. (lauric aldehyde; dodecyl aldehyde; aldehyde C-12 lauric; dodecanal; lauraldehyde).

CAS: 112-54-9. $CH_3(CH_2)_{10}CHO$.

Properties: Colorless solid or liquid; strong fatty floral odor. D 0.828-0.836, refr index 1.433-1.440, mp $44C$. Soluble in 90% alcohol; insoluble in water. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavoring agent.

lauroyl bromide. (*n*-dodecyl bromide; 1-bromododecane). $C_{12}H_{25}Br$.

Properties: Amber liquid; coconut odor. Low volatility, d 1.026 (25/25C), bp $175C$ (45 mm Hg), fp $-15.5C$, flash p $291F$ (144C). Insoluble in water; soluble in alcohol, ether. Combustible.

Grade: Technical, approximately 60% pure.

Derivation: Coconut oil.

Use: Intermediate for quaternary ammonium compounds, organometallics, and vinyl stabilizers.

lauroyl chloride.

Properties: Commercially a mixture of *n*-alkyl chlorides, with $C_{12}H_{25}Cl$ dominant. A clear, water-white, oily liquid; faint fatty odor. Crystallization point $-19C$, d 0.863 (15.5/15.5C), distillation range $112-160C$ (5 mm Hg), flash p $235F$ (112C). Completely miscible with most organic solvents; slightly miscible with alcohol; immiscible with water. Combustible.

Grade: Refined, technical.

Use: Synthesis of esters, sulfides, lauryl mercaptan (used in styrene-butadiene polymerization), other organics.

lauroyldimethylamine.

CAS: 112-18-5. $CH_3(CH_2)_{11}N(CH_3)_2$. A liquid cationic detergent.

Use: Corrosion inhibitor, acid-stable emulsifier.

lauroyldimethylamine oxide.

CAS: 1643-20-5. $CH_3(CH_2)_{11}N(CH_3)_2 \cdot H_2O$. A non-ionic detergent.

Use: As a foam stabilizer; stable at high concentration of electrolytes and over a wide pH range. See "Admox" [*Albemarle*].

lauroyl lactate. See "Ceraphyl."

lauroyl mercaptan. (*n*-dodecyl mercaptan).

CAS: 112-55-0. $C_{12}H_{25}SH$ (approximately).

Properties: (Technical material, mixture of isomers): Water-white or pale-yellow liquid; mild odor. D 0.85 (20/20C), fp $-7.5C$, distillation range $200-235C$, refr index 1.45-1.47, flash p $210F$ (99C). Insoluble in water; soluble in methanol, ether, acetone, benzene, gasoline, and ethyl acetate. Combustible.

Grade: 95% min.

Hazard: May be injurious to eyes.

Use: Manufacture of synthetic rubber and plastics, also in the synthesis of pharmaceuticals and in insecticides and fungicides; nonionic detergent. See thiol.

lauroyl methacrylate.

CAS: 142-90-5. $CH_2=C(CH_3)COO(CH_2)_{11}CH_3$. The commercial material is a mixture containing both lower and higher fatty derivatives.

Properties: Boiling range $272-344C$, bulk d 0.868 g/mL, flash p $270F$ (132C) (COC). Combustible.

Use: Polymerizable monomer for plastics, molding powders, solvent coatings, adhesives, oil additives;

emulsions for textile, leather, and paper finishing. See acrylic resin.

lauryl pyridinium chloride. $C_{15}H_{24}NCIC_{12}H_{25}$.
Properties: Mottled-tan semisolid. Soluble in water and organic solvents. Flash p 347F (175C). Combustible.

Grade: Technical, contains higher and lower fatty acid derivatives.

Use: Cationic detergent, dispersing and wetting agent, ingredient of fungicides and bactericides.

lauryltrimethylammonium chloride.

CAS: 112-00-5. mf: $C_{15}H_{34}N\bullet Cl$.

Hazard: A poison by ingestion.

lताल. A hard aluminum alloy containing 4–5% copper, 1.5–2% silicon, and fractional percentages of other metals such as iron, manganese, or magnesium.

lava. Molten rock (magma) that has reached the surface of the earth.

lavandin oil. See lavender oil.

lavender oil.

CAS: 8000-28-0. An essential oil used in perfumery, 35% ester content as linalyl acetate required. Terpeneless grade has about twice the concentration of the natural oil.

Lavoisier, Antoine Laurent. (1743–1794). A French chemist generally regarded as the “father” of chemistry. His “*Traite elementaire de chimie*” (1789) listed 30 elements, clarified the nomenclature of acids, bases, and salts, and described the composition of numerous organic substances. He erroneously believed that oxygen is the characteristic element of acids. However, his fundamental work on combustion, as a result of which he identified and named nitrogen (azote), and on the separation of hydrogen from water by a unique reduction experiment carried out in a heated gun barrel, earned him a leading position among early chemists. See Mendeleev.

law of mass action. The law stating that the rate of any given chemical reaction is proportional to the product of the concentrations of the reactants. At extremely low concentrations, activities are used.

Lawrence, Ernest O. (1901–1958). An American physicist who invented the cyclotron in 1929. Both the element lawrencium and the Lawrence Livermore Research Laboratory at the University of California were named after him. See cyclotron; bombardment.

lawrencium. Lr. A synthetic radioactive element with atomic number 103, discovered in 1961, aw 257, only one other isotope is known (256); the 257

isotope has a half-life of 8 sec. It has been made by bombarding californium with boron ions. It exhibits α radiation.

See actinide series.

lay-up. In the reinforced-plastics industry, a term used to refer to placement of the reinforcing material in the mold.

“L-64 Barrier Foaming Quat” [Ace].

TM for drain and floor protection system.

Use: Floor cleaner for the food industry.

LC₅₀. (lethal concentration 50%). That quantity of a substance administered by inhalation that is necessary to kill 50% of test animals exposed to it within a specified time. The test applies not only to gases and vapors but to fumes, dusts, and other particulates suspended in air.

LCL. Abbreviation for “less than carload lot,” used by shippers, traffic managers, railroads, etc.

LD₅₀. (lethal dose 50%). That quantity of a substance necessary to kill 50% of exposed animals in laboratory tests within a specified time. A substance having an oral LD₅₀ of less than 400 mg/kg of body weight is considered to be highly toxic.

LDPE. Abbreviation for low-density polyethylene.

leaching. See solvent extraction.

lead. (from Latin *plumbum*).

CAS: 7439-92-1. Pb. Metallic element of atomic number 82, group IVA of the periodic table, aw 207.2, valences = 2, 4, four stable isotopes. The isotopes are the end products of the disintegration of three series of natural radioactive elements uranium (206), thorium (208), and actinium (207).

Properties: Heavy, ductile, soft, gray solid. D 11.35, mp 327.4C, bp 1755C. Soluble in dilute nitric acid; insoluble in water but dissolves slowly in water containing a weak acid. Resists corrosion; relatively impenetrable to radiation. Poor electrical conductor, good sound and vibration absorber. Noncombustible.

Occurrence: U.S., Mexico, Canada, South America, Australia, Africa, Europe.

Derivation: Roasting and reduction of galena (lead sulfide), anglesite (lead sulfate), and cerussite (lead carbonate). Also from scrap.

Method of purification: Desilvering (Parkes process), electrolytic refining (Betts process), pyrometallurgical refining (Harris process). Bismuth is removed by Betterton-Kroll process.

Grade: High purity (less than 10 ppm impurity), pure (99.9+%), powdered (99% pure), pig lead, paste.

Available forms: Ingots, sheet, pipe, shot, buckles or straps, grids, rod, wire, etc.; paste; powder; single crystals.

Hazard: Toxic by ingestion and inhalation of dust or fume. TLV: (fumes and dusts and inorganic compounds) 0.15 mg (Pb)/m³. For ambient air the EPA standard is 1.5 µg/m³. A cumulative poison. FDA regulations require zero lead content in foods and less than 0.05% in house paints.

Use: Storage batteries, tetraethyllead (gasoline additive), radiation shielding, cable covering, ammunition, chemical reaction equipment (piping, tank linings, etc.), solder and fusible alloys, type metal, vibration damping in heavy construction, foil, Babbitt and other bearing alloys.

lead acetate. (sugar of lead).

CAS: 301-04-2. Pb(C₂H₃O₂)₂•3H₂O.

Properties: White crystals or flakes (commercial grades are frequently brown or gray lumps); sweetish taste. D 2.50, mp loses water at 75C, at 200C decomposes, bp (anhydrous) 280C. Absorbs carbon dioxide when exposed to air, becoming insoluble in water. Soluble in water; slightly soluble in alcohol; freely soluble in glycerol. Combustible.

Derivation: By the action of acetic acid on litharge or thin lead plates.

Grade: Powdered, granular, crystals, flakes, CP.

Hazard: Toxic by ingestion, inhalation, and skin absorption; use may be restricted.

Use: Dyeing of textiles, waterproofing, varnishes, lead driers, chrome pigments, gold cyanidation process, insecticide, antifouling paints, analytical reagent, hair dye.

lead alkyl, mixed. A mixture containing various methyl and ethyl derivatives of tetraethyl lead and tetramethyl lead. Thus, methyl triethyl lead, dimethyl diethyl lead, and ethyl trimethyl lead may all be present with or without tetraethyl and tetramethyl lead.

Hazard: Toxic by ingestion and skin absorption.

Use: Antiknock agents in aviation gasoline.

lead antimonate. (Naples yellow; antimony yellow). Pb₃(SbO₄)₂.

Properties: Orange-yellow powder; insoluble in water. D 6.58 (20C). Noncombustible.

Derivation: Interaction of solutions of lead nitrate and potassium antimonate, concentration, and crystallization.

Hazard: Toxic by inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Staining glass, crockery, and porcelain.

lead arsenate. (lead orthoarsenate).

CAS: 7784-40-9. Pb₃(AsO₄)₂.

Properties: White crystals. D 5.8, mp 1042C (decomposes). Soluble in nitric acid; insoluble in water.

Derivation: By the action of a soluble lead salt on a solution of sodium arsenate, concentration, and crystallization.

Hazard: Highly toxic. TLV: 0.15 mg/m³; a carcinogen.

Use: Insecticide, herbicide.

lead arsenite.

CAS: 10031-13-7. Pb(AsO₂)₂.

Properties: White powder. D 5.85. Soluble in nitric acid; insoluble in water.

Hazard: Highly toxic.

Use: Insecticide.

lead azide.

CAS: 13424-46-9. Pb(N₃)₂.

Properties: Colorless, very sensitive needles. An initiating explosive. Should always be handled submerged in water.

Derivation: Reaction of sodium azide with a lead salt.

Hazard: Severe explosion risk, detonates at 350C (660F). Highly toxic. TLV: 0.15 mg(Pb)/m³.

Use: Primary detonating compound for high explosives.

Note: Explosions have occurred in cases where azide compounds have reacted with the lead in plumbing after being washed down sinks.

lead-base Babbitt. See Babbitt metal.

lead biorthophosphate. See lead phosphate, dibasic.

lead, blue. A term applied to galena to distinguish it from white lead ore. It is also applied to blue basic lead sulfate.

lead borate. Pb(BO₂)₂•H₂O.

Properties: White powder. D 5.598, mp 160C (loses water). Soluble in dilute nitric acid; insoluble in water. Noncombustible.

Derivation: Interaction of solutions of lead hydroxide and boric acid with subsequent crystallization.

Hazard: Toxic by inhalation. TLV: 0.15 mg/m³.

Use: Varnish and paint drier, waterproofing paints, lead glass, electrically conductive ceramic coatings.

lead borosilicate. A constituent of optical glass, composed of a mixture of the borate and silicate of lead.

lead bromate.

CAS: 34018-28-5. Pb(BrO₃)₂•H₂O.

Properties: Colorless crystals. D 5.53, decomposes at about 180C. Soluble in hot water.

Hazard: Toxic by inhalation or ingestion.

lead bromide. PbBr₂.

Properties: White powder. D 6.66, bp 916C, mp 373C. Slightly soluble in hot water; insoluble in alcohol.

Hazard: Toxic by inhalation. TLV: 0.15 mg(Pb)/m³.

lead carbolate. See lead phenate.

lead carbonate. PbCO₃.

See lead carbonate, basic.

lead carbonate, basic. (lead subcarbonate; white lead; lead flake). $2\text{PbCO}_3 \cdot \text{Pb}(\text{OH})_2$.

Properties: White amorphous powder. D 6.86. Soluble in acids; insoluble in water, decomposes at 400C. Noncombustible.

Derivation: (1) Dutch process. By the corrosion of lead buckles in pots by acetic acid and carbon dioxide generated by the fermentation of waste tanbark. (2) Carter process. By treating very finely divided lead in revolving wooden cylinders with dilute acetic acid and carbon dioxide.

Hazard: Toxic by inhalation. TLV: 0.15 mg(Pb)/m³.
Use: Exterior paint pigment, ceramic glazes.

lead chloride.

CAS: 7758-95-4. PbCl_2 .

Properties: White crystals. D 5.88, mp 498C, bp 950C. Slightly soluble in hot water; insoluble in alcohol and cold water. Noncombustible.

Derivation: By the addition of hydrochloric acid or sodium chloride to a solution of a lead salt with subsequent crystallization.

Hazard: Toxic by inhalation. TLV: 0.15 mg(Pb)/m³.
Use: Preparation of lead salts, lead chromate pigments, analytical reagent.

lead chromate.

(chrome yellow).
CAS: 7758-97-6. PbCrO_4 .

Properties: Yellow crystals. D 6.123, mp 844C. Soluble in strong acids and alkalis; insoluble in water.

Derivation: Reaction of sodium chromate and lead nitrate in solution.

Hazard: Toxic by ingestion and inhalation; suspected human carcinogen. TLV: 0.05 mg(Cr)/m³; Human Carcinogen.

Use: Pigment in industrial paints, rubber, plastics, ceramic coatings; organic analysis.
See chrome pigment.

lead coating. Coatings of lead or lead-rich alloys are (1) deposited by dipping into the molten metal after applying a layer of tin to secure good adhesion of the lead coating, (2) by electroplating from a fluosilicate or fluoborate bath, or (3) by spraying.

lead cyanide.

CAS: 592-05-2. $\text{Pb}(\text{CN})_2$.

Properties: White to yellowish powder. Slightly soluble in water; decomposes in acid.

Derivation: Interaction of solutions of potassium cyanide and lead acetate.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.15 mg(Pb)/m³.

Use: Metallurgy.

lead dimethyldithiocarbamate.

CAS: 19010-66-3. $\text{Pb}[\text{SCSN}(\text{CH}_3)_2]_2$.

Properties: White powder. D 2.43, melting range 310C. Insoluble in all common organic solvents; slightly soluble in cyclohexanone.

Use: Vulcanization accelerator with litharge.

lead dioxide. (lead oxide, brown; plumbic acid, anhydrous; lead peroxide; lead superoxide).

CAS: 1309-60-0. PbO_2 .

Properties: Brown, hexagonal crystals. D 9.375, mp 290C (decomposition), an oxidizing agent. Soluble in glacial acetic acid; insoluble in water and alcohol.

Derivation: By adding bleaching powder to an alkaline solution of lead hydroxide.

Hazard: Dangerous fire risk in contact with organic materials. TLV: 0.15 mg(Pb)/m³.

Use: Oxidizing agent, electrodes, lead-acid storage batteries, curing agent for polysulfide elastomers, textiles (mordant, discharge in dyeing with indigo), matches, explosives, analytical reagent.

lead dross. (lead scrap). Consists of the scrap, dross, or waste from sulfuric acid tanks; a mixture of metallic lead, lead sulfate, and free sulfuric acid.

lead, electrolytic. Pure lead obtained by electrolytic deposition.

See Betts process.

leader. A short sequence near the amino terminus of a protein or the 5' end of an RNA molecule that has a specialized targeting or regulatory function. Often the leader is cleaved after the targeting event.

lead flake. See lead carbonate, basic.

lead fluoborate.

CAS: 13814-96-5. $\text{B}_2\text{F}_8 \cdot \text{Pb}$.

Properties: Liquid. Mw 380.81.

Grade: Technical 51%.

Hazard: TLV: 0.15 mg(Pb)/m³.

Use: Salt for electroplating lead; can be mixed with stannous fluoborate to electroplate any composition of tin and lead as an alloy.

lead fluoride.

CAS: 7783-46-2. PbF_2 .

Properties: Colorless crystals. D 8.2 g/cc, mp (approximately) 824C. Very slightly soluble in water. Noncombustible.

Grade: Crystals, 99.93%.

Hazard: Toxic. Strong irritant. TLV: 0.15 mg(Pb)/m³.

Use: Electronic and optical applications, starting materials for growing single crystal solid-state lasers, high-temperature dry film lubricants in the form of ceramic-bonded coatings.

lead fluosilicate. (lead silicofluoride).

CAS: 25808-74-6. $\text{PbSiF}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water; decomposes when heated.

Hazard: Toxic. Strong irritant. TLV: 0.15 mg(Pb)/m³.

Use: Solution for electrorefining lead.

lead formate. $\text{Pb}(\text{CHO}_2)_2$.

Properties: Brownish-white lustrous needles. D 4.63. Soluble in water; decomposes at 190C. Noncombustible.

Hazard: Toxic by ingestion.

Use: Reagent in analytical determinations.

lead glass. See glass.

lead hydroxide. (lead hydrate; hydrated lead oxide). $\text{Pb}(\text{OH})_2$.

Properties: White, bulky powder. D 7.592, mp decomposes at 145C, absorbs carbon dioxide from air. Soluble in alkalis; slightly soluble in water; soluble in nitric and acetic acids. Noncombustible.

Derivation: By the addition of sodium or ammonium hydroxide to a solution of a lead salt with subsequent filtration and drying.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Lead salts, lead dioxide.

lead hyposulfite. See lead thiosulfate.

leading strand. The DNA strand that, during replication, is synthesized in the same direction in which the replication fork moves. Synthesized in a continuous fashion.

lead iodide. PbI_2 .

Properties: Golden-yellow crystals or powder; odorless. D 6.16, mp 402C, bp 954C. Soluble in potassium iodide and concentrated sodium acetate solutions; soluble in boiling water. Noncombustible.

Derivation: Interaction of lead acetate and potassium iodide.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Bronzing, printing, photography, cloud seeding.

lead linoleate. (lead plaster). $\text{Pb}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Yellowish-white paste. Soluble in oils; insoluble in water. Combustible.

Derivation: By heating a solution of lead nitrate with sodium linoleate.

Grade: Technical, fused (contains 26.5% lead).

Hazard: Toxic material. Absorbed by skin.

Use: Medicine, drier in paints and varnishes.

lead maleate, tribasic. $\text{C}_4\text{H}_2\text{O}_5 \cdot \text{Pb}$.

Properties: Soft, yellowish-white, crystalline powder. D 6.3, refr index 2.08.

Hazard: Toxic material. Absorbed by skin.

Use: Vulcanizing agent for chlorosulfonated polyethylene. Highly basic stabilizer with high heat stability in vinyls.

lead metavanadate. See lead vanadate.

lead molybdate. PbMoO_4 .

Properties: Yellow powder. D 5.9, mp 1060–1070C. Soluble in nitric acid; insoluble in water and alcohol. Noncombustible.

Derivation: By adding a solution of lead nitrate to a

solution of ammonium molybdate, concentration, and crystallization.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Analytical chemistry, pigments. Single crystals are available for electronic and optical uses.

See molybdate oranges.

lead monohydrogen phosphate. See lead phosphate, dibasic.

lead mononitroresorcinate.

CAS: 51317-24-9. $\text{PbO}_2\text{C}_6\text{H}_3\text{NO}_2$.

Hazard: An initiating explosive, dangerous. Forbidden for transport.

lead monoxide. See litharge, massicot.

lead β -naphthalenesulfonate.

$\text{Pb}(\text{C}_{10}\text{H}_7\text{SO}_3)_2$.

Properties: White, crystalline powder. Soluble in alcohol; insoluble in water. Combustible.

Derivation: By the action of lead acetate on β -naphthalenesulfonic acid.

Hazard: Toxic material. Absorbed by skin.

Use: Organic preparations.

lead naphthenate.

CAS: 61790-14-5. $\text{C}_7\text{H}_{12}\text{O}_2 \cdot x\text{Pb}$.

Properties: Soft, yellow, resinous, semitransparent. Mp approximately 0C. Gives deposits in highly acid oils but not when mixed with suitable quantities of cobalt or manganese; soluble in alcohol. Combustible.

Derivation: Addition of lead salt to aqueous sodium naphthenate solution.

Grade: liquid 16%, 24% lead, solid 37% lead.

Hazard: Toxic material. A known carcinogen (OSHA), absorbed by skin.

Use: Paint and varnish drier, wood preservative, insecticide, catalyst for reaction between unsaturated fatty acids and sulfates in the presence of air, lube oil additive.

See soap (2).

lead nitrate.

CAS: 10099-74-8. $\text{Pb}(\text{NO}_3)_2$.

Properties: White crystals. D 4.53, decomposes at 470C. Soluble in water and alcohol.

Derivation: By the action of nitric acid on lead.

Hazard: Strong oxidizing material, dangerous fire risk in contact with organic materials. TLV: 0.15 mg(Pb)/m³.

Use: Lead salts, mordant in dyeing and printing calico, matches, mordant for staining mother-of-pearl, oxidizer in the dye industry, sensitizer in photography, explosives, tanning, process engraving, and lithography.

lead nitrite, basic. (basic lead nitrite; lead subnitrite).

Properties: Light-yellow powder, variable composi-

tion, essentially $3\text{PbO}\cdot\text{N}_2\text{O}\cdot\text{H}_2\text{O}$. Soluble in dilute nitric acid; easily decomposed.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

lead ochre. See massicot (1).

lead octoate. See soap (2).

lead oleate.

CAS: 1120-46-3.
[CH₃(CH₂)₇CH:CH(CH₂)₇COO]₂Pb.

Properties: White powder or ointment-like granules or mass. Soluble in alcohol, ether, turpentine, and benzene; insoluble in water. Combustible.

Derivation: Reaction of oleic acid with lead hydrate or carbonate, or of lead acetate and sodium oleate.

Hazard: Toxic material. Absorbed by skin.

Use: Varnishes, lacquers, paint drier, high-pressure lubricants.

See soap (2).

lead orthoarsenate. See lead arsenate.

lead orthophosphate, normal. See lead phosphate.

lead orthosilicate. See lead silicate.

lead oxide, black. See lead suboxide.

lead oxide, brown. See lead dioxide.

lead oxide, hydrated. See lead hydroxide.

lead oxide, red. (red lead; minium; lead tetroxide).

CAS: 1314-41-6. Pb₃O₄.

Properties: Bright red powder. D reported variously 8.32–9.16, decomposes between 500 and 530C. Partly soluble in acids; insoluble in water. An oxidizing agent, may react with reducing agents.

Derivation: By carefully heating litharge in a furnace in a current of air.

Grade: Technical, 95%, 97%, 98%.

Hazard: Toxic as dust. TLV: 0.15 mg(Pb)/m³.

Use: Storage batteries, glass, pottery and enameling, varnish, purification of alcohol, packing pipe joints, metal-protective paints, fluxes, and ceramic glazes.

lead oxide, yellow. See litharge.

lead perchlorate.

CAS: 13637-76-8. Pb(ClO₄)₂•3H₂O.

Properties: White crystals. D 2.6, mp 100C (decomposes). Very soluble in cold water; soluble in alcohol.

Hazard: Dangerous in contact with organic materials, strong oxidizing agent. Very toxic material.

lead peroxide. See lead dioxide.

lead phenate. (lead phenolate; lead carbonate). Pb(OH)OC₆H₅.

Properties: Yellowish to grayish-white powder. Soluble in nitric acid; insoluble in water and alcohol.

Derivation: By boiling phenol with litharge.

Hazard: Toxic material. Absorbed by skin.

lead phenolsulfonate. (lead sulfocarbonate). Pb(C₆H₄OHSO₃)₂•5H₂O.

Properties: White crystals or powder. Soluble in water and alcohol.

Hazard: Toxic material. Absorbed by skin.

lead phosphate. (normal lead orthophosphate).

CAS: 7446-27-7. Pb₃(PO₄)₂.

Properties: White powder. D 6.9–7.3, mp 1014C. Insoluble in water; soluble in acids and alkalis.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Stabilizing agent in plastics.

lead phosphate, dibasic. (lead monohydrogen phosphate; lead biorthophosphate). PbHPO₄.

Properties: Soft, white powder or fine, platelike crystals. D 5.66 (15C), mp decomposes.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Imparting heat resistance and pearlescence to polystyrene and casein plastics.

lead phosphite, dibasic.

CAS: 1344-40-7. 2PbO•PbHPO₃•1/2H₂O.

Properties: Fine, white, acicular crystals. D 6.94, refr index 2.25. Insoluble in water.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³. Store in closed containers away from open flame or sparks and at temperatures not to exceed 400F.

Use: Heat and light stabilizer for vinyl plastics and chlorinated paraffins. As an UV screening and anti-oxidizing stabilizer for vinyl and other chlorinated resins in paints and plastics.

lead phthalate, dibasic.

C₆H₄(COO)₂Pb•PbO.

Properties: Fluffy white crystalline powder. D 4.5, refr index 1.99 (avg). Insoluble in water.

Derivation: By boiling litharge with phthalic acid.

Hazard: Toxic by inhalation and skin absorption.

Use: Heat and light stabilizer for general vinyl use.

lead plaster. See lead linoleate.

lead protoxide. See litharge.

lead, red. See lead oxide, red.

lead resinate. Pb(C₂₀H₂₉O₂)₂.

Properties: Brown, lustrous, translucent lumps or yellow-white powder, or yellowish-white paste. Insoluble in most solvents. Combustible.

Derivation: By heating a solution of lead acetate and rosin oil.

Grade: Precipitated 23% lead.

Hazard: Toxic material. Absorbed by skin.

Use: Paint and varnish drier, textile waterproofing agent.

lead salicylate. $\text{Pb}(\text{OOC}_6\text{H}_4\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: Soft, creamy-white, crystalline powder. D 2.3, refr index 1.78. Soluble in hot water and alcohol. Combustible.

Use: Stabilizer or costabilizer for flooring and other vinyl compounds requiring good light stability.

lead selenide. PbSe .

Properties: Gray crystals. D 8.10 (15C), mp 1065C. Insoluble in water; soluble in nitric acid.

Hazard: Moderate fire hazard as dust or in presence of moisture. TLV: 0.15 mg(Pb)/m³.

Use: As a semiconductor in infrared detectors and thermoelectric devices.

lead sesquioxide. Pb_2O_3 .

Properties: Reddish-yellow powder. Soluble in alkalis and acids; insoluble in water; decomposes at 370C.

Derivation: By gently heating metallic lead.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Ceramics, ceramic cements, metallurgy, varnishes.

lead silicate. (lead metasilicate).

CAS: 10099-76-0. PbSiO_3 .

Properties: White, crystalline powder. Insoluble in most solvents. Noncombustible.

Derivation: Interaction of lead acetate and sodium silicate.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Ceramics, fireproofing fabrics.

lead silicate, basic. (white lead silicate; lead silicate sulfate). A pigment made up of an adherent surface layer of basic lead silicate and basic lead sulfate cemented to silica.

Properties: Excellent film-forming properties with drying oils combined with low density.

Derivation: Fine silica is mixed with litharge and sulfuric acid. The mixture is then furnaceed in a rotary kiln and ground to break up agglomerates.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Pigment in industrial paints.

lead silicochromate. A yellow, lead-silicon pigment. Normal lead silicon chromate is used as a yellow prime pigment for traffic marking paints. Basic lead silicon chromate is used as a corrosive inhibitive pigment for metal protective coatings, primers and finishers. Also for industrial enamels requiring a high gloss.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

lead silicofluoride. See lead fluosilicate.

lead-soap lubricants. Lead salts saponified with fats, hard at low temperatures, viscous at medi-

um temperatures, but become somewhat fluid on heating by friction.

Use: "Extreme-pressure lubricants," but are not suited for high speeds.

See lead naphthenate; lead oleate; lead stearate; soap (2).

lead sodium hyposulfite. See lead sodium thiosulfate.

lead sodium thiosulfate. (lead sodium hyposulfite; sodium lead hyposulfite; sodium lead thiosulfate). $\text{PbS}_2\text{O}_3 \cdot 2\text{Na}_2\text{S}_2\text{O}_3$.

Properties: Heavy, small, white crystals. Soluble in solutions of thiosulfates.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Matches.

lead stannate. $\text{PbSnO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Light-colored powder. Insoluble in water. Approximate temperature of dehydration 170C.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Additive in ceramic capacitors, pyrotechnics.

lead stearate.

CAS: 7428-48-0. $\text{Pb}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White powder. Mp 100–115C, d 1.4. Soluble in hot alcohol; insoluble in water. Combustible.

Derivation: By heating a solution of lead acetate with sodium stearate.

Hazard: Toxic material. Absorbed by skin.

Use: Varnish and lacquer drier, high-pressure lubricants, lubricant in extrusion processes, stabilizer for vinyl polymers, corrosion inhibitor for petroleum, component of greases, waxes, and paints.

lead styphnate. Legal label name for lead trinitroresorcinate.

lead subacetate.

CAS: 1335-32-6. $(2\text{Pb}(\text{OH})_2\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2)$.

Properties: White, heavy powder. Mw 807.75. Partially soluble in cold water; more soluble in hot water; absorbs atmospheric carbon dioxide becoming almost insoluble.

Hazard: Suspected carcinogen and poisonous. Toxic by ingestion.

Use: Decolorizing agent (sugar solutions, etc.).

lead subcarbonate. See lead carbonate, basic.

lead subnitrite. See lead nitrite.

lead suboxide. (lead oxide, black; litharge, leaded). Pb_2O .

Properties: Black amorphous material. D 8.342, decomposes on heating. Insoluble in water; soluble in acids and bases.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: In storage batteries.

lead, sugar of. See lead acetate.

lead sulfate.

CAS: 7446-14-2. PbSO_4 .

Properties: White, rhombic crystals. D 6.12–6.39, mp 1170C. Slightly soluble in hot water; insoluble in alcohol; soluble in sodium hydroxide solution and concentrated hydriodic acid. Noncombustible.

Derivation: Interaction of solutions of lead nitrate and sodium sulfate.

Hazard: Strong irritant to tissue. TLV: 0.15 mg(Pb)/m³.

Use: Storage batteries, paint pigments.

lead sulfate, basic. (white lead, sublimed; white lead sulfate). Approximate formula $\text{PbSO}_4 \cdot \text{PbO}$.

Properties: White, monoclinic crystals. D 6.92, mp 977C. Slightly soluble in hot water or acids. Noncombustible.

Grade: Vary from 72–85% lead sulfate and remainder lead oxide. Sold dry or ground in oil.

Derivation: Three methods are used: (1) lead sulfide ore (galena) is subjected to high temperatures in an oxidizing atmosphere; (2) molten lead is sprayed into a jet of ignited fuel gas and air in the presence of sulfur dioxide gas; (3) atomized metallic lead is mixed with water, and sulfuric acid is added under controlled conditions.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Paints, ceramics, pigments.

lead sulfate, blue basic. (sublimed blue lead; blue lead). **Composition:** Lead sulfate (min) 45%, lead oxide (min) 30%, lead sulfide (max) 12%, lead sulfite (max) 5%, zinc oxide 5%, carbon and undetermined matter (max) 5%.

Properties: Blue-gray, corrosion-inhibiting pigment. D 6.2. Insoluble in water or alcohol. Noncombustible.

Derivation: By heating lead ores in special furnaces.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Component of structural-metal priming coat paints, rust-inhibitor in paints, lubricants, vinyl plastics, and rubber products.

lead sulfate, tribasic. $3\text{PbO} \cdot \text{PbSO}_4 \cdot \text{H}_2\text{O}$.

Properties: Fine, white powder. D 6.4, refr index 2.1.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Electrical and other vinyl compounds requiring high heat stability.

lead sulfide. (plumbous sulfide).

CAS: 1314-87-0. PbS .

Properties: Silvery, metallic crystals or black powder. D 7.13–7.7, mp 1114C, sublimes at 1281C. Soluble in acids; insoluble in water and alkalis.

Derivation: (1) Found in nature as the mineral galena, (2) by passing hydrogen sulfide gas into an acid solution of lead nitrate.

Grade: Technical, CP, electronic.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Ceramics, infrared radiation detector, semiconductor, ceramic glaze, source of lead.

lead sulfite. PbSO_3 .

Properties: White powder. Decomposes on heating. Insoluble in water; soluble in nitric acid.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

lead sulfocarbolate. See lead phenolsulfonate.

lead sulfocyanide. See lead thiocyanate.

lead superoxide. See lead dioxide.

lead tallate. A mixture of lead and tall oil. Combustible.

Grade: Liquid: 16% lead, 24% lead; solid: 30% lead.

Derivation: By the fusion process.

Hazard: Toxic material. Absorbed by skin.

See soap (2).

lead telluride. PbTe .

Properties: Crystalline solid. D 8.2, mp 905C. Insoluble in water and most acids.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Single crystals used as photoconductor and semiconductor in thermocouples.

lead tetraacetate. $\text{Pb}(\text{CH}_3\text{COO})_4$.

Properties: Colorless or faintly pink crystals, sometimes moist with glacial acetic acid. Mp 175C, d 2.228 (17C). Soluble in benzene, chloroform, nitrobenzene, hot glacial acetic acid. Combustible.

Derivation: From red lead (Pb_3O_4) and glacial acetic acid in the presence of acetic anhydride.

Hazard: Toxic material. Absorbed by skin.

Use: Oxidizing agent in organic synthesis, laboratory reagent.

lead tetraethyl. See tetraethyl lead.

lead tetroxide. See lead oxide, red.

lead thiocyanate. (lead sulfocyanate).

CAS: 592-87-0. $\text{Pb}(\text{SCN})_2$.

Properties: White or light-yellow crystalline powder. D about 3.8. Soluble in potassium thiocyanate, nitric acid; slightly soluble in cold water; decomposes in hot water.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Ingredient of priming mix for small-arms cartridges, safety matches, dyeing.

lead thiosulfate. (lead hyposulfite). PbS_2O_3 .

Properties: White crystals. D 5.18, mp decomposes.

Soluble in acids and sodium thiosulfate solution; insoluble in water.

Derivation: By the interaction of solutions of lead nitrate and sodium thiosulfate, concentration, and crystallization.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

lead titanate. PbTiO₃.

Properties: Pale-yellow solid. D 7.52. Insoluble in water.

Derivation: Interaction of oxides of lead and titanium at a high temperature. Contains lead sulfate and lead oxide as impurities.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Industrial paint pigment.

lead trinitroresorcinate. (lead styphnate).

CAS: 63918-97-8. C₆H(NO₂)₃(O₂Pb).

Properties: Monohydrate is monoclinic orange-yellow crystals. D 3.1 (monohydrate), 2.9 (anhydrous). Practically insoluble in water.

Derivation: Prepared by adding a solution of magnesium styphnate (from magnesium oxide and styphnic acid) to a lead salt solution.

Hazard: Detonates at 500F (260C), dangerous explosion risk, an initiating explosive.

lead, tris(lauroyloxy)phenyl- See phenyl-lead trilaurate.

lead tungstate. (lead wolframate). PbWO₄.

Properties: White powder. D 8.235, mp 1130C. Soluble in sodium hydroxide solutions; insoluble in water.

Derivation: By mixing solutions of lead nitrate and sodium tungstate, concentrating, and crystallizing.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Pigment.

lead vanadate. (lead metavanadate).

Pb(VO₃)₂.

Properties: Yellow powder. Insoluble in water; decomposes in nitric acid.

Hazard: Toxic material. TLV: 0.15 mg(Pb)/m³.

Use: Preparation of other vanadium compounds, pigment.

lead water. A 1% solution of basic lead acetate.

Hazard: Toxic. See lead acetate.

lead, white. See lead carbonate, basic; lead silicate, basic; and lead sulfate, basic.

lead wolframate. See lead tungstate.

lead wool. Fine filaments or threads of metallic lead, prepared and used for packing pipe joints.

lead zirconate titanate. (LZT). PbTiZrO₃.

Available forms: Piezoelectric crystals.

Use: Element in high fidelity stereo units and as a transducer for ultrasonic cleaners, ferroelectric materials in computer memory units.

leaf, filter. A unit of a shell-and-leaf filter press on which the cake is formed. In general, a leaf consists of a circular or rectangular metal frame in which is fastened a coarse wire screen. This is covered on both sides with a fine-mesh wire cloth, over which is placed the filter medium proper, e.g., nylon fabric. The filtrate passes through the fabric and into an escape pipe to the discharge port. Each shell may contain as few as six or as many as 50 leaves of varying dimensions; the entire assembly can be pulled out of the shell for cake removal. In some models the leaves rotate.

leafseal. A formulation of decenylsuccinic acid and its esters.

Use: Direct application to plants to enable them to resist frost and drought.

leather. An animal skin or hide that has been permanently combined with a tanning agent that causes a physicochemical change in the protein components of the skin. This change renders it resistant to putrefactive bacteria, enzymes, and hot water, increases its strength and abrasion resistance, and makes it serviceable for long periods of time. Tanning agents are either vegetable, mineral, or synthetic. Hides from cows or steers are chiefly used for men's shoes, transmission belting, and other heavy-duty service. These are usually vegetable-tanned. Lighter grades made from the skins of sheep, calves, or reptiles are used for shoe uppers, luggage, gloves, and similar end products (chrome-tanned). Leather is a naturally poromeric material that retains the microporosity of the original skin; this property makes it uniquely applicable to footwear; to a limited extent it is able to conform to the contour of the individual foot. Leather is made in many colors, weights, and finishes. However, it has been replaced to an increasing extent by plastics for many minor uses, and by synthetics for shoe uppers and soling. See poromeric; tanning.

leavening agent. See yeast; baking powder.

Lebedev process. Formation of butadiene from ethanol by catalytic pyrolysis. The catalysts used are mixtures of silicates and aluminum and zinc oxides.

Le Blanc. (1742–1806). A French inventor of the first successful process for making soda ash. His patent was confiscated by the Revolutionist government, and the process was used widely for years without either acknowledgment or remuneration. His original formula was 100 parts salt cake, 100 parts limestone, and 50 parts coal.

Lechance cell. See dry cell.

Le Chatelier. (1850–1936). A French physical chemist, famous chiefly for his statement of the equilibrium principle (often known as Le Chatelier's law). His work included investigations of cements, alloys, and gaseous combustion. The principle may be stated: every system in equilibrium is conservative and tends to resist changes upon it by reacting in such a way as to help nullify the imposed change.

“Lecisun” [Lucas Meyer]. TM for a skin friendly mineral sunscreen.

lecithin. $C_8H_{17}O_2NRR'$, R and R' being fatty acid groups. Pure lecithin is a phosphatidyl choline. The lecithins are mixtures of diglycerides of fatty acids linked to the choline ester of phosphoric acid. The lecithins are classed as phosphoglycerides or phosphatides (phospholipids). Commercial lecithin is a mixture of acetone-insoluble phosphatides. FCC specifies not less than 50% acetone-insoluble matter (phosphatides).

Properties: Light brown to brown, viscous semiliquid with a characteristic odor. Partly soluble in water and acetone; soluble in chloroform and benzene.

Derivation: Usually from soybean oil, also from corn, other vegetable seeds, egg yolk, and other animal sources.

Grade: Technical, unbleached, bleached; fluid, plastic, edible, FCC, 96+% for biochemical or chromatographic standards.

Use: Emulsifying, dispersing, wetting, penetrating agent, and antioxidant; in margarine, mayonnaise, chocolate and candies, baked goods, animal feeds, paints, petroleum industry (drilling, leaded gasoline), printing inks, soaps and cosmetics, mold release for plastics, blending agent in oils and resins, rubber processing, lubricant for textile fibers.

lectin. A type of protein occurring in the seeds of certain plants, especially legumes, characterized by unusual binding specificity; their precise function in the plant is being researched. Studies have been made on the molecular structure and carbohydrate content of the lectin found in the European herb sainfoin.

Leduc's rule. States that the volume occupied by a gas mixture is equal to the sum of the volumes occupied separately by each constituent at the same temperature and pressure as the mixture.

LEED. Low-energy electron diffraction.

lees. The sediment at bottom of wine storage tank.

Leeuwenhoek, van. See van Leeuwenhoek, Anton.

Lee, Yuan T. (1936–). Awarded Nobel Prize in chemistry in 1986 jointly with Polanyi and

Herschbach. A former student of Herschbach, Lee refined molecular-beam and laser techniques, combining them with theory to perform definitive studies of reactions of individual complex molecules. Doctorate from University of California in 1965.

legal chemistry. (forensic chemistry). The application of chemical knowledge and procedures to matters involving civil or criminal law and to all questions where control of chemical compounds, products, or processes is vested in agencies of Federal or state governments. Legal chemistry applies to the following areas:

(1) Crime detection: primarily identification of poisons, of bloodstains, writing and typewriter inks, and a host of miscible materials such as textile fibers from clothing, hair, skin, etc. A variety of analytical methods are used in police laboratories, including microscopes, spot tests, color reactions, and spectrophotometry.

(2) Food, drugs, and cosmetics are under the control of the U.S. Food and Drug Administration. New products and proposed additives must be submitted by the manufacturer and approved before being placed on public sale. Control of the manufacture of illicit drugs is an important phase of legal chemistry.

(3) Pesticides are subject to Federal regulation. New products must be registered, labeling must be specific as to chemical composition, active and inert ingredients, and directions for use.

(4) Marketing and competitive pricing of chemical products' fair trade agreements and discriminatory practices are also under Federal supervision (Robinson-Patman Act). This includes mergers, tie-in sales, and other merchandising practices.

(5) Interstate shipment and labeling of hazardous chemicals is regulated by the Department of Transportation and the Federal Aviation Agency as well as by state and local laws. See labeling, toxicology.

(6) Patent law comprises a vast body of legal practice and court decisions. The patent system is designed to protect inventions and new discoveries, and most chemical companies retain legal counsel in this field.

(7) Water pollution is subject to federal regulations (Federal Water Pollution Control Act, 1956). This covers the discharge of contaminating industrial waste, sewage, oil, etc., into navigable streams and their tributaries as well as into coastal waters.

(8) Flammability of fabrics.

(9) Use of volatile, toxic solvents on an industrial scale.

(10) Air pollution including gases and particulates from industrial stacks and auto exhaust emissions.

Lehmstedt-Tanasescu reaction. Preparation of acridones (and 10-hydroxyacridones) from *o*-nitrobenzaldehyde and a halobenzene in the presence of concentrated sulfuric acid containing nitrous acid as catalyst.

Lehn, Jean-Marie Pierre. (1939–). Awarded Nobel Prize for chemistry, together with Cram, in 1987 for work in elucidating mechanisms of molecular recognition, which are fundamental to the enzymic catalysis, regulation, and transport. He also studied three-dimensional cyclic compounds that maintained a rigid structure, accepting substrates in a structurally preorganized cavity. Lehn named these compounds cryptands, while Cram called them cavitands. Awarded Doctorate by University of Strasbourg, France in 1963.

lehr. A long oven designed for controlled slow cooling of glass (annealing). The hot glass is carried through the lehr on a conveyor at a predetermined rate, traversing areas of gradually decreasing temperature. The entire process may require several days.

See annealing.

Loeir, Luis F. (1906–1987). A French-born biochemist who won the Nobel Prize for chemistry in 1970 for work in biosynthesis of carbohydrates. He discovered chemical compounds that affect the storage of chemical energy in humans and animals. He headed the Department of Biochemistry at the University of Buenos Aires for many years.

“Lemol” [Borden]. TM for a series of polyvinyl alcohols in partially and fully hydrolyzed form at various molecular weights. Supplied as nondusting, white granules with d 1.2–1.3.

Use: Adhesives, emulsions, polymerization, film coatings, polyester release agents, textile printing, finishing, and sizing.

lemon chrome. See barium chromate.

lemongrass oil. (verbena oil, Indian). An essential oil obtained by steam distillation of a grass (*Cymbopogon*).

Properties: Dark-yellow to light-brown-red; pronounced heavy lemonlike odor. D 0.900–0.910 (15/15C), optical rotation –3 to +1 degrees, refr index 1.4830–1.4890 (20C). Soluble in alcohol; slightly soluble in glycerol. Combustible.

Source: India, East and West Indies, Guatemala.
Chief constituents: Citral (75–85%), geraniol, ethylheptenone.

Use: Perfumes, flavoring, isolates and ionones, source of citral.

lemon oil. See citrus peel oils.

lenacil. $C_{13}H_{18}N_2O_2$.

Properties: Colorless solid. Mp 315C, d 1.32. Almost insoluble in water; soluble in pyridine.

Use: Herbicide.

lentagran. See fenpyrate.

lepicidin a.

CAS: 131929-60-7. mf: $C_{41}H_{63}NO_{10}$.

Hazard: Moderately toxic by ingestion and inhalation.

lepidine. (γ -methylquinoline; cincholepidine).

CAS: 491-35-0. $C_9H_9NCH_3$. An alkaloid.

Properties: Oily liquid; quinoline-like odor. Turns red-brown on exposure to light. D 1.086, bp 266C, solidifies at about 0C, soluble in alcohol, ether, and benzene. Slightly soluble in water.

Derivation: From cinchonine.

Use: Organic preparations, medicine.

lepidolite. (lithia mica). $K_2Li_3Al_4Si_7O_{21}(OH,F)_3$. A fluosilicate of potassium, lithium, and aluminum, found in pegmatites. Rubidium occurs as an impurity. A variety of mica.

Properties: Pink and lilac to gray color; pearly luster; perfect micaceous cleavage. Mohs hardness 2.5–4, d 2.8–3.0.

Occurrence: California, South Dakota, New Mexico, South Africa.

Use: Source of lithium and rubidium, flux in glass and ceramics production.

lethal mutation. A mutation that inactivates a biological function essential to the life of the cell or organism.

“Lethane” [Rohm & Haas]. TM for a group of thiocyanate insecticides. 60:2-thiocyanoethyl laurate. 384: β -butoxy- β' -thiocyanodiethyl ether. A-70 diethylene glycol dithiocyanate.

Hazard: Toxic by ingestion.

Letts nitrile synthesis. Formation of nitriles by heating aromatic carboxylic acids with metal thiocyanates.

Leu. Abbreviation for leucine.

leucine. (α -amino- γ -methylvaleric acid; α -aminoisocaproic acid).

CAS: 61-90-5. $(CH_3)_2CHCH_2CH(NH_2)COOH$. An essential amino acid. Found naturally in the L(–) form.

Properties: White crystals. Soluble in water; slightly soluble in alcohol; insoluble in ether. Optically active (natural form). DL-leucine mp 332C with decomposition; L(–)-leucine mp 295C, d 1.239 (18/4C).

Derivation: Hydrolysis of protein (edestin, hemoglobin, zein), organic synthesis from the α -bromo acid.

Grade: Commercial (DL), FCC (L-).

Use: Nutrient and dietary supplement, biochemical research.

leucine zipper. A motif found in certain proteins in which Leu residues are evenly spaced through an α -helical region, such that they would

end up on the same face of the helix. Dimers can form between two such proteins. The Leu zipper is important in the function of transcription factors such as Fos and Jun and related proteins.

Leuckart thiophenol reaction. Decomposition of diazoxanthates by warming gently in faintly acidic cuprous media to the corresponding aryl xanthates which produce aryl thiols on alkaline hydrolysis and aryl thioethers on warming.

Leuckart-Wallach reaction. Reductive alkylation of ammonia or of primary or secondary amines with carbonyl compounds and formic acid or formamides as reducing agents.

leuco-compound. See vat dye.

leucothol B.

CAS: 38302-26-0. mf: $C_{20}H_{32}O_5$.

Hazard: A poison.

Source: Natural product.

leucovorin. Preferred name for folinic acid.

“Leukanol” [Rohm & Haas]. TM for synthetic tanning assistants of the sulfonic type supplied in liquid and solid grades. Powerful dispersants for vegetable tannins, and bleaches for chrome-tanned leather.

leukocyte. A white blood cell.

leukotriene. One of a group of physiologically active compounds derived directly from arachidonic acid. They are chemically related to the prostaglandins and occur in white blood cells (leukocytes). They cause muscle contractions that constrict air passages in the lungs and are involved in asthma.

leutenizing hormone-releasing factor (pig), 6-*d*-leucine-9-(*n*-ethyl-*l*-prolinamide)-10-deglycinamide-, monoacetate (salt).

CAS: 74381-53-6. mf: $C_{59}H_{84}N_{16}O_{12} \cdot C_2H_4O_2$.

Hazard: A poison.

leveling. (1) A term used in the paint industry to describe the application properties of a paint, i.e., its ability to cover a dry surface easily and to hold its level without sagging or running. (2) The ability of a nickel-plated coating to cover surface irregularities of the substrate, achieved by the incorporation of one or more brighteners in the plating formulation. (3) Aiding the uniform dispersion of a dye in a dye bath or solution by addition of a suitable material, e.g., lignin.

“Levelume” [ATOTECH]. TM for bright high-leveling nickel process. Prepared from nickel sulfate, nickel chloride, boric acid, and organic addition agents.

Use: Electrical appliances, automotive trim, plumbing fixtures.

Levene-Hudson phenylhydrazide rule.

The direction of rotation of the phenylhydrazides of the sugar acids indicates the configuration of the hydroxyl on the α -carbon atom. If the phenylhydrazide rotates to the right, the hydroxyl on the α -carbon is to the right, and vice-versa. The rule was shown to be valid for salts, amides, and corresponding acylated nitriles. In connection with the rule, Hudson mentioned that, “the sugar benzylphenylhydrazones rotate to the left when the asymmetric α -carbon atom of the configuration has its hydroxyl to the right, and vice-versa.”

“Levnite” [Solutia]. TM for sodium aluminum phosphate.

Grade: Regular and high calcium powder.

Use: Imparts volume, lightness, tenderness, tolerance in use, and good crumb resiliency to cake products.

levocabastine hydrochloride.

CAS: 79547-78-7. mf: $C_{26}H_{29}FN_2O_2 \cdot ClH$.

Hazard: Moderately toxic by ingestion.

levo form. An optical isomer that produces levorotation in a beam of plane polarized light.

See levorotatory.

levorotatory. Having the property when in solution of rotating the plane of polarized light to the left or counterclockwise. Levorotatory compounds may have the prefix *l*- to distinguish them from their dextrorotatory or *d*- isomers, but the minus sign (–) is preferred.

levulinic acid. (γ -ketovaleric acid; acetylpropionic acid; 4-oxopentanoic acid; levulic acid). CAS: 123-76-2. $CH_3CO(CH_2)_2COOH$.

Properties: Crystals. Bp 245–246C, mp 33–35C, d 1.1447 (25/4C), refr index 1.442 (16C). Miscible with water, alcohol, esters, ethers, ketones, aromatic hydrocarbons; insoluble in aliphatic hydrocarbons. Combustible.

Use: Intermediate for plasticizers, solvents, resins, flavors, pharmaceuticals, acidulant and preservative; chrome plating; solder flux; stabilizer for calcium greases; control of lime deposits.

levulose. See fructose.

Lewis acid. Any molecule or ion (called an electrophile) that can combine with another molecule or ion by forming a covalent bond with two electrons from the second molecule or ion. An acid is thus an electron acceptor. Hydrogen ion (proton) is the simplest substance that will do this, but many compounds such as boron trifluoride, BF_3 , and aluminum chloride, $AlCl_3$, exhibit the same behavior and are therefore properly called acids. Such substances

show acid effects on indicator colors and when dissolved in the proper solvents.

Lewis base. A substance that forms a covalent bond by donating a pair of electrons, neutralization resulting from reaction between the base and the acid with formation of a coordinate covalent bond. It is also called a nucleophile.
See Lewis electron theory.

Lewis electron theory. A theory involving acid and base formation, neutralization, and related phenomena on the basis of exchange of electrons between substances and the formation of coordinate bonds. It represented an important advance in chemical theory, largely replacing earlier concepts. Advanced in 1923 by Gilbert N. Lewis, it contributed much to the development of coordination chemistry in which the base is represented by the ligand and the acid by the metal ion.

Lewis, Gilbert N. (1875–1946). An American chemist, native of Massachusetts, professor of chemistry at MIT from 1905 to 1912 after which he became dean of chemistry at University of California at Berkeley. His most creative contribution was the electron-pair theory of acids and bases which laid the groundwork for coordination chemistry. He was also a leading authority on thermodynamics.

lewisite. Legal label name for β -chlorovinyl-dichloroarsine.

Lewis metal. Alloy of one part tin and one part bismuth.

Properties: Expands when cooling. Mp 138C.

Use: Sealing and holding die parts.

“Lewisol” 28 [Aqualon]. TM for a pale, hard resin, a maleic-modified glycerol ester of rosin. Acid number 36, softening point 141C, USDA color WG.

Lewis, Warren P. (1882–1974). Born in Laurel, Maryland, graduated from MIT in 1905, Ph.D. from University of Breslau, Germany in 1908. He became professor of chemical engineering at MIT in 1910. He is often regarded as the father of chemical engineering in the U.S., as his outstanding books and other publications did much to establish the fundamental principles of this field.

Leyden temperature scale. A low-temperature thermometer scale based on a boiling point of hydrogen equal to -252.74°C and of oxygen equal to -182.95°C .

“L-310 Fatty Acid” [Procter & Gamble].

TM for a fatty acid derived from linseed oil.

Properties: The major component acids are oleic, linoleic, and linolenic. Light yellow liquid at ambi-

ent temperature, obtained from naturally occurring triglycerides.

Use: Chemical intermediate, paint and varnishes, alkyd resins and soaps.

Li. Symbol for lithium.

Libby, Willard F. (1908–1980). An American chemist who won the Nobel Prize for chemistry in 1960 and in 1980. His first Nobel work involved radiochemistry and isotope tracer work in the space program. He is known for the “atomic time clock” which is a way of estimating the age of ancient materials by measuring the amount of radioactive ^{14}C in organic or carbon-containing objects. His Doctorate was awarded at Wesleyan University. He also worked at Syracuse, Carnegie Institute of Technology, and Georgetown institutions, among others.

library. Biology: An unordered collection of clones (i.e., cloned DNA from a particular organism), whose relationship to each other can be established by physical mapping.
See genomic library.

“Librium” Hydrochloride [Hoffmann-La Roche]. TM for chlordiazepoxide hydrochloride. Manufacture and use restricted.

“Lica” [Kenrich]. TM for a prefix for a series of neoalkoxy zirconates.

licanic acid. (4-keto-9,11,13-octadecatrienoic acid). $\text{CH}_3(\text{CH}_2)_3(\text{CH}=\text{CH})_3(\text{CH}_2)_7\text{COCH}_2\text{COOH}$.

Properties: White crystals. α -licanic acid (naturally occurring isomer) melts at $74\text{--}75\text{C}$, readily isomerizes to the β -form, mp 99.5C . Soluble in organic solvents.

Derivation: Occurs in oiticica and other oils as glycerides.

lichenic acid. See fumaric acid.

licorice. See glycyrrhizin.

lidocaine. (α -diethylaminoaceto-2,6-xylylidide).

CAS: 137-58-6. $\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NHCOCH}_2\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: White or slightly yellow crystalline powder; characteristic odor. Mp $66\text{--}69\text{C}$, bp $180\text{--}182\text{C}$ (at 4 mm Hg). Soluble in alcohol, ether, or chloroform; insoluble in water.

Derivation: By action of diethylamine on chloroacetylxylylidide.

Grade: USP.

Use: Medicine (local anesthetic).

Lieben iodoform reaction. Cleavage of methyl ketones with halogens (mostly iodine) and base to carboxylic acids and haloform.

Liebig, Justus von. (1803–1873). A German chemist who founded the *Annalen*, a world-famous

chemical journal. He was a great teacher of chemistry, training such men as Hoffmann, who did basic work on organic dyes. Liebig contributed original research in the fields of human physiology, plant life, soil chemistry, and was the discoverer of chloroform, chloral, and cyanogen compounds. He was the first to recommend addition of nutrients to soils and thus may be considered the originator of the fertilizer industry.

life, origin. (biogenesis). The succession of chemical events that led up to the appearance of living organisms on earth about 3.3 billion years ago. According to one theory, substantiated by experimental evidence, this occurred as follows. The inorganic compounds originally present were carbides, water, ammonia, and carbon dioxide. The carbides reacted with water to form methane, which in turn reacted with ammonia and water vapor as a result of an electric impulse to form amino acids, porphyrins, and nucleotides (or their precursors). All these compounds have been created artificially in the laboratory. It has further been shown that amino acids and nucleotides can be concentrated into proteins (and probably nucleic acids) by the action of zinc-bearing clays, which were present along the shores of the primeval oceans. Little or no free oxygen existed in the primordial atmosphere, that consisted chiefly of reducing gases. The complex chemical reactions which eventually resulted in the formation of DNA took place in an anaerobic aqueous environment, and the earliest living organisms developed in a nutrient solution in which free oxygen finally appeared as the result of photosynthesis by blue-green bacteria. Another theory advances the idea that essential life chemicals such as purines and amino acids were formed under primitive conditions from aqueous solutions of hydrogen cyanide.

ligand. A molecule, ion, or atom that is attached to the central atom of a coordination compound, a chelate, or other complex. Thus, the ammonia molecules in $[\text{Co}(\text{NH}_3)_6]^{3+}$ and the chlorine atoms in $[\text{PtCl}_6]^{2-}$ are ligands. Ligands are also called complexing agents, e.g., EDTA, ammonia, etc. See chelate; coordination compound.

ligase. An enzyme, T4 DNA ligase, which can link pieces of DNA together. The pieces must have compatible ends (both of them blunt, or else mutually compatible sticky ends), and the ligation reaction requires ATP.

ligation. The process of splicing two pieces of DNA together. In practice, a pool of DNA fragments are treated with ligase (see "ligase") in the presence of ATP, and all possible splicing products are produced, including circularized forms and end-to-end ligation of 2, 3 or more pieces.

light hydrocarbon. One of a group of hydrocarbon products derived from natural gas or petroleum; ethane, propane, iso- and normal butane, and natural gasoline (C₃ and heavier). Produced largely in southwest Texas and Louisiana, these are used as feedstocks for a wide variety of organics. See liquefied petroleum gas.

"Light-Lead" [Reactor]. TM for lead-lined polyethylene shielding bricks. Weight of one brick is 7 pounds.

light metal. In engineering terminology, a metal of specific gravity less than three that is strong enough for construction use (aluminum, magnesium, beryllium).

light microscope. See optical microscope.

light oil. (coal tar light oil). A fractional distillate from coal tar with bp range from 110–210C, consisting of a mixture of benzene, pyridine, toluene, phenol, and cresols. The term is also sometimes used for oils of about the same bp range, but from other sources.

Grade: Technical.

Hazard: Highly flammable, dangerous fire risk.

Use: Source of benzene, solvent naphthas, toluene, phenol, and cresols.

light reactions. The reactions of photosynthesis occurring only in the light.

light water. (1) A fire-fighting agent consisting of a water solution of perfluorocarbon compounds mixed with a water-soluble thickener of the polyoxyethylene compound type. It can be used simultaneously with a dry chemical to smother gasoline or similar fires. (2) Ordinary water (as distinct from heavy water) used to both cool and moderate nuclear reactors.

lignaleo oil. See bois de rose oil.

lignin. A phenylpropane polymer of amorphous structure comprising 17–30% wood. It is so closely associated with the holocellulose which makes up the balance of woody material that it can be separated from it only by chemical reaction at high temperature. It is believed to function as a plastic binder for the holocellulose fibers. It is recovered from wood-processing wastes in limited amounts.

Use: Stabilization of asphalt emulsions, ceramic binder and deflocculant, dye leveler and dispersant, drilling-fluid additive, precipitation of proteins, extender for phenolic plastics, special molded products, source of vanillin, phenol, and of a component of battery expanders.

lignin sulfonate. (lignosulfonate). A metallic sulfonate salt made from the lignin of sulfite pulp-mill liquors, mw range 1000–20,000.

Properties: Light-tan to dark-brown powder; no pronounced odor. Stable in dry form and relatively stable in aqueous solution. Nonhygroscopic, no definite mp, decomposes above 200C, d about 1.5. Forms colloidal solutions or dispersions in water; practically insoluble in all organic solvents.

Use: Dispersing agent in concrete and carbon black-rubber mixes, extender for tanning agents, oil-well drilling mud additives, ore flotation agents, production of vanillin, industrial cleaners, gypsum slurried, dyestuffs, pesticide formulations. Commercially available as the salts of most metals and of ammonium.

See "Raykrome" [*Rayonier*].

lignite. (brown coal). A low rank of coal between peat and subbituminous; it contains 35–40% water. It occurs in the continental U.S., Alaska, Germany and the Netherlands. Its Btu value is low. Drying, crushing, and pelletizing lignite with an asphaltic binder for direct use as fuel has been successfully demonstrated. Polymer resins (polyesters and polyamides) can be derived from lignite by oxidation with nitric acid, followed by extraction of the nitrocoal acids, which are the basis of the polymer molecules. Peat can also be used. A process for gasification of lignite to produce methanol alcohol is approaching commercial development in Sweden. See peat; gasification.

lignoceric acid. (*n*-tetracosanoic acid).

$\text{CH}_3(\text{CH}_2)_{22}\text{COOH}$. A long-chain saturated fatty acid found in minor quantities in most natural fats.

Properties: Crystals. Mp 84.2C, bp 272C (10 mm Hg), d 0.8207, refr index 1.4287 (100C). Nearly insoluble in ethanol.

Source: Lignite and beechwood tar, peanut oil, sphingomyelin.

Grade: Technical, 99%.

Use: Biochemical research.

lignosulfonate. See lignin sulfonate.

ligroin. A saturated volatile fraction of petroleum boiling in the range 60–110C. There is a special grade of ligroin known as petroleum benzin.

Hazard: Highly flammable, dangerous fire risk. Toxic by ingestion and inhalation.

Use: Solvent for resins, paints, varnishes, etc.

lime. Specifically, calcium oxide (CaO); more generally, any of the various chemical and physical forms of quicklime, hydrated lime, and hydraulic lime (adapted from ASTM definition C41-47). Non-combustible.

Hazard: Unslaked lime (quicklime) yields heat on mixing with water and is a caustic irritant.

Use: See calcium oxide, calcium hydroxide.

See calcium oxide.

lime acetate. See calcium acetate.

lime, agricultural. Lime slaked with a minimum amount of water to form calcium hydroxide.

lime, air-slaked. Lime which has absorbed carbon dioxide and moisture from the atmosphere. It consists of a powder composed of calcium carbonate and calcium hydroxide.

lime, chlorinated. (chloride of lime; bleaching powder). $\text{CaCl}(\text{ClO})\cdot 4\text{H}_2\text{O}$

Properties: White powder; chlorine odor. Mp (decomposes). Decomposes in water, acids.

Derivation: By conducting chlorine into a boxlike structure containing slaked lime spread upon perforated shelves.

Grade: 35–37% active chlorine, technical.

Hazard: Evolves chlorine and, at higher temperatures oxygen. With acids or moisture evolves chlorine freely at ordinary temperatures.

Use: Textile and other bleaching applications, organic synthesis, deodorizer, disinfectant.

See calcium hypochlorite; bleach.

lime citrate. See calcium citrate.

lime, fat. A pure lime that combines readily with water to form a fine, white powder, free from grit, and makes a smooth, stiff paste with excess of water. Must not be loaded hot.

See lime, lean.

lime, hydrated. See calcium hydroxide.

lime, hydraulic. A variety of calcined limestone that when pulverized absorbs water without swelling or heating and gives a cement that hardens under water. The limestone burned for this purpose usually contains 10–17% silica, alumina, and iron, and 40–45% lime, magnesia sometimes replacing lime. Must not be loaded hot.

lime hypophosphite. See calcium hypophosphite.

lime, lean. A lime which does not lake freely with water because it has been prepared from limestone containing a high percentage of impurities, e.g., silica, iron, alumina, etc. Must not be loaded hot.

lime-nitrogen. See calcium cyanamide.

lime oil, distilled.

CAS: 8008-26-2. Colorless to greenish-yellow, volatile oil obtained by distillation from the juice or whole crushed fruit of *Citrus aurantifolia* Swingle.

Properties: Refr index 1.4745–1.4770 (20C), d 0.855–0.863 (25C), angular rotation +34 to +47 degrees. Soluble in most fixed oils and mineral oil; insoluble in glycerol and propylene glycol. Combustible.

Chief constituents: Terpeneol, citral.

Grade: FCC (contains between 0.5 and 2.5% of aldehydes, calculated as citral).

Use: Extracts, flavoring, perfumery, toilet soaps, cosmetics.

lime oil, expressed. See citrus peel oil.

lime salt peter. See calcium nitrate.

lime, slaked. See calcium hydroxide.

limestone.

CAS: 1317-65-3. CaCO_3 . A noncombustible solid characteristic of sedimentary rocks and composed mainly of calcium carbonate in the form of the mineral calcite, Mohs hardness about 3. Limestones are sometimes classed according to the impurities contained. For example, dolomitic limestone: usually a limestone containing more than 5% magnesium carbonate; magnesium limestone: dolomitic limestone, used as a solid diluent and carrier in pesticides; argillaceous limestone: contains clays, used in cement manufacture as "cement rock"; siliceous limestone: a limestone containing sand or quartz. Limestones are also named according to the formation in which they occur.

See marble; dolomite.

Use: Building stone, metallurgy (flux), manufacture of lime, source of carbon dioxide, agriculture, road ballast, cement (Portland and natural), alkali manufacture, removal of sulfur dioxide from stack gases and sulfur from coal.

lime, sulfurated. (calcium sulfide, crude). A mix of calcium sulfide and calcium sulfate.

Properties: Yellowish-gray or grayish-white powder; odor of hydrogen sulfide. Soluble in acids; insoluble in water and alcohol. Noncombustible.

Derivation: By roasting calcium sulfate with coke.

Use: Medicine, depilatory, luminous paint.

lime-sulfur solution. A solution made by boiling together lime (50 lb), sulfur (100 lb), and water (100 gal) and diluting to one-tenth strength. Contains calcium polysulfide, free sulfur, and calcium thiosulfate.

Use: Fungicidal spray on fruit trees, sheep dip.

lime, unslaked. See calcium oxide.

lime water. (calcium hydroxide solution).

CAS: 1305-62-0.

Properties: Clear, colorless, odorless, alkaline aqueous solution of calcium hydroxide containing more than 0.14 g of $\text{Ca}(\text{OH})_2$ in each 100 mL at 25°C (the strength varies with the temperature at which the solution is stored), *d* about 1.00 (25°C), absorbs carbon dioxide from air.

Grade: USP (as calcium hydroxide solution).

Use: Medicine (external).

limonene.

CAS: 138-86-3. $\text{C}_{10}\text{H}_{16}$. A widely distributed, optically active terpene, closely related to isoprene. It occurs naturally in both *d*- and *l*-forms. The racemic mixture of the two isomers is known as dipentene.

Properties: Colorless liquid. (1) *D* 0.8411 (20°C), bp 176–176.4°C; (2) *d* 0.8422 (20°C), bp 176–176.4°C. Oxidizes to a film in air, oxidation behavior similar to that of rubber or drying oils.

Derivation: (1) Lemon, bergamot, caraway, orange, and other oils, (2) peppermint and spearmint oils.

Use: Flavoring, fragrance and perfume materials, solvent, wetting agent, resin manufacture.

limonene dioxide. See dipentene dioxide.

limonene, inactive. (or racemic or dl).

See dipentene.

limonene monoxide. See dipentene monoxide.

linalool. (linalol; 3,7-dimethyl-1,6-octadien-3-ol).

CAS: 78-70-6.

$(\text{CH}_3)_2\text{C}:\text{CHCH}_2\text{CH}_2\text{C}(\text{CH}_3)\text{OHCH}:\text{CH}_2$. Linalool is the *l*-isomer, coridandrol is the *d*-isomer.

Properties: Colorless liquid; odor similar to that of bergamot oil and French lavender. *D* 0.858–0.868 (25°C), bp 195–199°C, angular rotation –2 to +2 degrees. Soluble in alcohol, ether, fixed oils. Combustible.

Derivation: Citrus peel oils, especially from oranges. Made synthetically from geraniol.

Method of purification: Rectification.

Grade: Ex bois de rose oil, synthetic, FCC.

Use: perfumery, flavoring agent.

linalool, dehydro-

CAS: 29171-20-8. mf: $\text{C}_{10}\text{H}_{16}\text{O}$.

Hazard: A poison by ingestion. A mild skin and moderate eye irritant.

linalool oxide. (tetrahydro- α,α -5-trimethyl-5-vinylfurfuryl alcohol). $\text{C}_{10}\text{H}_{17}\text{O}_2$.

Properties: Liquid. Refr index 1.4523 (20°C).

Derivation: Synthetically from acetone.

Use: Perfuming and flavoring agent.

linalyl acetate.

CAS: 115-95-7. $\text{C}_{10}\text{H}_{17}\text{C}_2\text{H}_3\text{O}_2$.

Properties: Clear, colorless, oily liquid; odor of bergamot. Bp 108–110°C, *d* 0.908–0.920, refr index

1.450–1.458 (20C), angular rotation -1 to $+1$ degrees. Soluble in alcohol, ether, diethyl phthalate, benzyl benzoate, mineral oil, fixed oils, alcohol; slightly soluble in propylene glycol; insoluble in water, glycerol. Combustible.

Derivation: Action of acetic anhydride on linalool in presence of sulfuric acid. May also be obtained from bergamot and other oils.

Method of purification: Rectification.

Grade: Ex bois de rose oil 92%, 96–98%, FCC (natural and synthetic).

Use: Extracts, perfumery, flavoring agent, substitute for petitgrain oil.

linalyl formate. $C_{10}H_{17}OOCH_3$.

Properties: D 0.915 (25/4C), bp 100–103C (10C), refr index 1.456–1.457 (20C). Insoluble in water; soluble in alcohol. Combustible.

Derivation: Synthetically from acetone.

Use: Perfume, flavoring.

linalyl isobutyrate.

CAS: 78-35-3. $C_{10}H_{17}OOCCH(CH_3)_2$.

Properties: liquid. D 0.890, refr index 1.4490. Combustible.

Derivation: Synthetically from acetone.

Use: Perfume, flavoring.

linalyl propionate. $C_{10}H_{17}OOCCH_2CH_3$.

Properties: Colorless liquid; floral odor similar to bergamot oil. D 0.895–0.902 (25C), refr index 1.4500–1.4550 (20C). Soluble in most fixed oils and in mineral oil; slightly soluble in propylene glycol; insoluble in glycerol. Combustible.

Derivation: Synthetically, starting with acetone.

Grade: FCC.

Use: Perfumery, flavoring agent.

lincomycin.

CAS: 154-21-2. $C_{18}H_{34}N_2O_6S$. An antibacterial substance produced by *Streptomyces lincolnensis*. The hydrochloride is stable in the dry state and in aqueous solution for at least 24 months, soluble in water at room temperature in concentrations up to 500 mg/mL.

lindane. (γ -benzene hexachloride).

CAS: 58-89-9. $C_6H_6Cl_6$. Legal label name for γ isomer of 1,2,3,4,5,6-hexa-chlorocyclohexane.

Hazard: Toxic by inhalation, ingestion, and skin absorption. TLV: 0.5 mg/m³.

Use: Pesticide. Use may be restricted.

linear alkylbenzene A-315.

CAS: 68648-87-3.

Hazard: Low toxicity by ingestion and skin contact. A mild eye and severe skin irritant.

linear molecule. See alkyl sulfonate, linear; polyethylene, high-density.

Lineweaver-Burk equation. An algebraic transformation of the Michaelis-Menten equation (plot of $1/V$ vs $1/[S]$), allowing determination of V_{max} and K_m by extrapolation of $[S]$ to infinity.

linkage. (a) The greater association in inheritance of two or more nonallelic genes than is to be expected from independent assortment; genes are linked because they reside on the same chromosome.

(b) Analysis of pedigree; the tracking of a gene through a family by following the inheritance of a (closely associated) gene or trait and a DNA marker.

linkage analysis. A gene-hunting technique that traces patterns of heredity in large, high-risk families in an attempt to locate a disease-causing gene mutation by identifying traits that are co-inherited with it.

linkage disequilibrium. Where alleles occur together more often than can be accounted for by chance. Indicates that the two alleles are physically close on the DNA strand.

See Mendelian inheritance.

linkage map. A map of the relative positions of genetic loci on a chromosome, determined on the basis of how often the loci are inherited together. Distance is measured in centimorgans (cM).

linker. A small piece of synthetic double-stranded DNA which contains something useful, such as a restriction site. A linker might be ligated onto the end of another piece of DNA to provide a desired restriction site.

linoleamide.

CAS: 3999-01-7.

Properties: An antistatic agent, opacifier, viscosity controlling agent.

Use: Food additive.

linoleic acid. (linolic acid).

CAS: 60-33-3.

A polyunsaturated fatty acid (2 double bonds) existing in both conjugated and unconjugated forms. A plant glyceride essential to human diet.

Properties: Colorless to straw-colored liquid. D 0.905 (15/4C), fp $-5C$, bp 228C (14 mm Hg), refr

index 1.4710 (15C). Insoluble in water; soluble in alcohol and ether. Combustible.

Source: Linseed oil, safflower oil, tall oil.

Grade: Technical, purified (99+%), edible.

Use: Soaps, special driers for protective coatings, emulsifying agents, feeds, biochemical research, dietary supplement, margarine.

Note: Do not confuse with linolenic acid.

linoleic acid amide. See linoleamide.

linolein. A glyceride of linoleic acid. It is one of the constituents of linseed oil which induces drying.

linolenic acid. (9,12,15-octadecatrienoic acid). CAS: 463-40-1.

A polyunsaturated fatty acid (3 double bonds) which occurs as the glyceride in many seed fats. It is an essential fatty acid in the diet. It is also a constituent of drying oils.

Properties: Colorless liquid. D 0.916 (20/4C), fp -11C , bp 230C (17 mm Hg). Soluble in most organic solvents; insoluble in water. Combustible.

Grade: Purified 99+%.

Use: Nutrient, biochemical research, drying oils.

Note: Do not confuse with linoleic acid.

linolenin. A glyceride of linolenic acid. Like linolein it is a constituent of drying oils. See linseed oil.

(linoleoyloxy)tributylstannane.

CAS: 24124-25-2. mf: $\text{C}_{30}\text{H}_{58}\text{O}_2\text{Sn}$.

Properties: Antifoulant, disinfectant. Bp: $<-45^\circ$, d: 1.17–1.18

Hazard: A poison. Tributyl tin compounds are extremely toxic to marine life. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

linolenyl alcohol. (octadecatrienol). $\text{C}_{18}\text{H}_{32}\text{O}$. The fatty alcohol derived from linolenic acid.

Properties: Colorless solid. Iodine value 190, cloud point 50.0F (10C), d 0.864. Combustible.

Available forms: Available commercially as 50% pure.

Derivation: Reduction of acid made from linseed oil.

Impurities: Oleyl and linoleyl alcohols with some saturated alcohols.

Use: Paints, flotation, lubricants; surface-active agents, resins, synthetic fibers.

linoleyl alcohol.

The fatty alcohol derived from linoleic acid.

Properties: Colorless solid. Iodine value 137, d 0.855, cloud point 59F (15C). Combustible.

Derivation: Reduction of linoleic acid.

Available forms: Available commercially as 50–60% pure alcohol.

Impurities: Mostly oleyl alcohol with some linolenyl and saturated alcohols.

Use: Paints, flotation, paper, surface-active agents, resins, leather.

linoleyltrimethylammonium bromide. An amorphous solid from yellow to very light-brown in color. Soluble in water, alcohol.

Use: Germicide, deodorant, algicide, slime control.

linolic acid. See linoleic acid.

linseed cake. The press cake formed when the seeds are crushed and the oil is extracted. See linseed-oil meal.

linseed oil. (flaxseed oil).

CAS: 8001-26-1.

Properties: Golden-yellow, amber, or brown drying oil; peculiar odor; bland taste. D 0.921–0.936, iodine value 177, saponification value 189–195, acid number (max) 4 (ASTM D 234-48), flash p 432F (222C), autoign temp approximately 650C (343C), polymerizes on exposure to air. Soluble in ether, chloroform, carbon disulfide, and turpentine; slightly soluble in alcohol; spontaneous heating. Combustible.

Chief constituents: Glycerides of linolenic, oleic, linoleic, and saturated fatty acids. The drying property is due to the linoleic and linolenic groups.

Derivation: From seeds of the flax plant *Linum usitatissimum* by expression or solvent extraction. Various refining and bleaching methods are used.

Grade: Raw, boiled, doubled-boiled, blown, varnish maker's, refined.

See linseed oil, boiled.

Use: Paints, varnishes, oilcloth, putty, printing inks, core oils, linings, and packings, alkyd resins, soap, pharmaceuticals.

Note: Use of linseed oil in paints has decreased sharply since the introduction of emulsion paints.

linseed oil, blown. Linseed oil whose viscosity is increased by air bubbled through it at 93C. The reaction is mainly oxidation followed by polymerization. The resulting product dries to a harder film than heat-bodied oils and is used in interior paints and enamels.

linseed oil, boiled. The term is a misnomer since the oil does not boil. Small amounts of driers (e.g., oxides of manganese, lead, or cobalt or their naphthenates, resinates, or linoleates) are added to hot linseed oil to accelerate drying. The "boiled oil" becomes thicker and darker.

linseed oil, heat-bodied. Linseed oil that has been polymerized by heating at 287–315C. This increases viscosity and acid content and reduces

iodine value. Bodied oil dries much faster than unprocessed oil.

linseed-oil meal. (linseed cake). The crushed and extracted residue from flaxseed (linseed), generally prepared by crushing the seeds, cooking with steam, and hydraulic expression of the oil. The resulting cake is sold by its protein content.

lisinopril.

CAS: 76547-98-3. mf: $C_{21}H_{31}N_3O_5$.

Hazard: Low toxicity by ingestion. Human systemic effects.

linters, cotton. See cotton linters.

LINUP. See laser-induced nuclear polarization.

linuron. (generic name for 3-(3,4-dichlorophenyl)-1-methoxy-1-methylurea).

CAS: 330-55-2. $C_6H_3Cl_2NHC(O)N(OCH_3)CH_3$.

Properties: Solid. Mp 93–94C. Slightly soluble in water; partially soluble in acetone and alcohol.

Use: Herbicide.

“Lipal” [Drew]. TM for a series of polyoxyethylene esters and ethers of fatty acids.

Use: Detergents, emulsifiers, solubilizers, wetting agents, and coupling agents.

lipase.

CAS: 9001-62-1. Any of a class of enzymes that hydrolyze fats to glycerol and fatty acids. Lipase is abundant in the pancreas but also occurs in gastric mucosa, in the small intestine, and in fatty tissue. It is found in milk, wheat germ, and various fungi. Commercial pancreatin and most trypsin preparations contain lipase.

Derivation: From pork pancreas or calf glands.

Use: Manufacture of cheese and similar foods, for removal of fat spots in dry cleaning or grease accumulations, in analytical chemistry of fats because it selectively hydrolyzes only fatty acids on the ends of triglycerides.

lipases. Enzymes that catalyze the hydrolysis of triacylglycerols.

lipid. (lipide). An inclusive term for fats and fat-derived materials. It includes all substances which are (1) relatively insoluble in water but soluble in organic solvents (benzene, chloroform, acetone, ether, etc.); (2) related either actually or potentially to fatty acid esters, fatty alcohols, sterols, waxes, etc.; and (3) utilizable by the animal organism. One of the chief structural components of living cells. See phospholipid; fat; fatty acid.

Lipmann, Fritz. (1899–1986). A German-born biochemist who won the Nobel Prize in 1953 for the discovery of coenzyme A (CoA). He earned doctor-

ates at the University of Berlin in both chemistry and medicine. He worked at Cornell and Harvard Universities. He founded the biochemistry department of Brandeis University and later joined the faculty of Rockefeller University.

lipoate. (lipoic acid). A coenzyme involved as a carrier of acyl groups.

“Lipo GMC Glyceryl Cocoate” [Lipo].

TM for an emulsifier, and emulsion stabilizer.

dl- α -lipoic acid. (6,8-dithiooctanoic acid; thioctic acid; POF).

CAS: 62-46-4.

$\text{SSCH}_2\text{CH}_2\text{CH}(\text{CH}_2)_4\text{COOH}$. A pyruvate oxidation factor. Pyruvate is a normal intermediate in carbohydrate metabolism.

Properties: Crystals. Mp 60–61C, bp 160–165C.

Practically insoluble in water; soluble in fat solvents; forms a water-soluble sodium salt.

Source: Yeast and liver.

Use: Nutrition, biochemical research.

See lipoate.

“Liponate CL” [Lipo]. TM for a cetyl lactate formulation.

Use: Adds a creamy feel in skin products.

lipopolysaccharide, -esc.

CAS: 93572-42-0.

Hazard: A poison by ingestion.

Source: Natural product.

lipoprotein. A protein-lipid complex that functions in the transport of lipids in the blood. In cyclical fashion, present as chylomicrons, VLDL, LDL, IDL, HDL or chylomicron remnants. The protein component alone is an apolipoprotein.

liposome. A nanoparticle consisting of lipids, or fat molecules, surrounding a water core. They were the first type of nanoparticle used to create therapeutic agents.

lipostat.

CAS: 81131-70-6. mf: $C_{23}H_{35}\bullet\text{Na}$.

Hazard: Low toxicity by ingestion. Human systemic effects.

lipotropic agent. An agent that because of its affinity for fats and oils, helps to regulate the metabolism of fat and cholesterol in the animal body. Inositol is an example.

“Lipovol MOS-70” [Lipo]. TM for blends of specialty esters that exhibit tactile properties of mineral oil.

Lipowitz's metal. A fusible alloy.
See alloy, fusible.

lipoxidase. An enzyme that catalyzes the addition of oxygen to the double bonds of unsaturated fatty acids of plant origin.

Use: Biochemical research, whitening bread.

Lipscomb, William N. (1919–). An American chemist who won the Nobel Prize for chemistry in 1976 for his studies on the structure and bonding mechanisms of boranes. Much of the research concerned structure and function of enzymes and natural products in organic and theoretical chemistry. He studied at the Universities of Kentucky, California, and Minnesota.

liquation. The separation of two or more components of a mixture by heating to a temperature at which one component melts, leaving the others as solids.

Use: Separation of alloy components.

liquefaction. (coal).
See gasification; Fischer-Tropsch process.

liquefied natural gas. See natural gas.

liquefied petroleum gas. (compressed petroleum gas; liquefied hydrocarbon gas; LPG).
CAS: 68476-85-7. A compressed or liquefied gas obtained as a by-product in petroleum refining or natural gasoline manufacture, e.g., butane, isobutane, propane, propylene, butylenes and their mixtures.

Properties: Colorless. Noncorrosive. Flash p -100F (-74C), autoign temp $800\text{--}1000\text{F}$ ($426\text{--}537\text{C}$).

Hazard: Highly flammable, dangerous fire and explosion risk. TLV: 1000 ppm.

Use: Domestic and industrial fuel, automotive fuel, welding, brazing, and metal cutting.

See compressed gas; natural gas.

liqueur. (cordial). Distilled spirits treated with fruit, herb, pulp, juice, and natural flavorings that are sugar sweetened.

liquid. An amorphous (noncrystalline) form of matter intermediate between gases and solids in which the molecules are much more highly concentrated than in gases but much less concentrated than in solids. The molecules of liquids are free to move within the limits set by intermolecular attractive forces. At the air-liquid interface the vibration of the molecules causes some to be ejected from the liquid at a rate depending on the surface tension. The tendency of molecules to escape from a liquid surface is called fugacity and is largely responsible for evaporation, which occurs when the air space above the liquid is unrestricted. In a closed system, where the air space is restricted, the escaping molecules eventually saturate the air, and thus the number of mole-

cules leaving the liquid will be equal to those returning to it as a result of molecular attraction. In these circumstances the liquid-air system is said to be in equilibrium.

Liquids vary greatly in viscosity, melting point, vapor pressure, and surface tension. Mercury has a density of 13.6 and the highest surface tension of all liquids. Glass has the highest viscosity. Polar liquids are those whose molecules have opposite electrical charges on their terminal atoms or groups, that impart a force called dipole moment. Water is a polar liquid with high dielectric constant. Pure hydrocarbon liquids are generally nonpolar.

See liquid, Newtonian; glass; amorphous; solid; liquid crystals; kinetic theory.

liquid air. Air cooled below -189C .

Properties: A cloudy or blue-grey liquid.

Use: As a source of oxygen and nitrogen.

liquid chromatography. An analytical method based on separation of the components of a mixture in solution by selective adsorption. All systems include a moving solvent, a means of producing solvent motion (such as gravity or a pump), a means of sample introduction, a fractionating column, and a detector. Innovations in functional systems provide the analytical capability for operating in three separation modes: (1) liquid-liquid: partition in which separations depend on relative solubilities of sample components in two immiscible solvents (one of which is usually water); (2) liquid-solid: adsorption where the differences in polarities of sample components and their relative adsorption on an active surface determine the degree of separation; (3) molecular size separations which depend on the effective molecular size of sample components in solution.

Solvents, often referred to as carriers, include isooctane, methyl ethyl ketone, acetone/chloroform, tetrahydrofuran, hexane, and toluene.

Packing materials in columns of various lengths include silica gel, alumina, glass beads, polystyrene gel, and ion exchange resins.

High-performance liquid chromatography (HPLC) is the term applied to new and more effective instrumental techniques developed in recent years that have greatly increased the scope of this analytical method. It can now be applied to biological as well as chemical research. Among the separations possible are peptides (by reverse phase chromatography), proteins and enzymes (hydrophobic and size exclusion modes of chromatography), amino acids, and inorganic and organometallic compounds (neutral species, including clusters, by adsorption and size exclusion, and ionic species including coordination compounds). A comparatively recent development is the use of supercritical fluids as solvents, e.g., carbon dioxide and sulfur hexafluoride. See supercritical fluid; gas chromatography; paper chromatography; thin-layer chromatography; instrumentation.

liquid crystal. An organic compound in an intermediate or mesomorphic state between solid and liquid. This phenomenon was first noted in 1888 in cholesteryl benzoate, a crystalline solid. It becomes a turbid liquid, or liquid crystals, when heated to 145C; on further heating to 179C the liquid becomes isotropic. This sequence is reversed when the substance is cooled. Color changes occur on both heating and cooling. Many organic compounds, e.g., sodium benzoate, exhibiting this behavior are known and used extensively in electric and electronic displays, thermometers, color TV tubes, electronic clocks and calculators, and similar devices dependent on temperature determination. Liquid crystals have several varieties of molecular order: nematic, smectic (nine types), and cholesteric. They indicate small temperature differences by changing color when applied to the skin and are used in medicine for this purpose. They can align with dichroic dye molecules in a thin-layer cell to produce color changes.

Available forms: Microencapsulated.

See nematic; smectic; cholesteric.

liquid dioxide. See nitrogen dioxide.

liquid-liquid extraction. The transfer of components between two liquid phases.

liquid-liquid interface. See dineric interface.

liquid, Newtonian. Characteristic of liquids is their ability to flow, a property depending largely on their viscosity and sometimes also on the rate of shear. A Newtonian liquid is one that flows immediately on application of force and for which the rate of flow is directly proportional to the force applied. Water, gasoline, and motor oils at high temperatures are examples. Some liquids have abnormal flow response when force is applied, that is, their viscosity is dependent on the rate of shear. Such liquids are said to exhibit non-Newtonian flow properties. Some will not flow until the force exerted is greater than a definite value called the yield point. (W. A. Gruse)

liquid pitch oil. See creosote; coal tar.

liquid rosin. See tall oil.

liquid rubber. See rubber, liquid.

“Liquigreen” [Regal]. TM for a liquid with clear, self flowing low salt index, stable at all temperatures.

Use: As a turf fertilizer.

“Liquinox” [Alconox]. TM for an anionic liquid detergent.

Use: For hard and soft water cleaning in laboratories.

liquor. In chemical technology, any aqueous solution of one or more chemical compounds. In sugar manufacturing, it refers to the syrups obtained from various refining steps (mother liquors). The paper industry uses this term extensively as follows: (1) black liquor is liquid digester waste (also called spent sulfate liquor) containing sulfonated lignin, rosin acids, and other waste wood components from which tall oil is made; (2) green liquor is a solution made by dissolving chemicals recovered in the alkaline pulping process in water; (3) white liquor is made by adding caustic soda to sodium sulfide solution. In dyeing technology, red liquor is an alternate name for mordant rouge.

liter. (L, l). The volume of one kilogram of water at its temperature of maximum density (4C) at standard atmospheric pressure. A liter is 1.05 quart, or 0.26 gallon.

“Lithafrax” [Carborundum]. TM for a ceramic material made from β -spodumene.

litharge. (lead oxide, yellow; plumbous oxide; lead monoxide).

CAS: 1317-36-8. PbO. An oxide of lead made by controlled heating of metallic lead.

Properties: Yellow crystals. D 9.53, mp 888C. Insoluble in water; soluble in acids and alkalies. A strong base. Commercial grades are yellow to reddish, depending on treatment and purity.

See massicot.

Derivation: By oxidizing metallic lead in air. Various forms of lead and various temperatures from 500–1000C are used.

Grade: CP, fused, powdered.

Hazard: Toxic by ingestion and inhalation. TLV: 0.15 mg(Pb)/m³.

Use: Storage batteries, ceramic cements and fluxes, pottery and glazes, glass, chromium pigments, oil refining, varnishes, paints, enamels; assay of precious metal ores, manufacture of red lead, cement (with glycerol), acid-resisting compositions, match-head compositions, other lead compounds, rubber accelerator.

litharge-glycerol cement. Made by mixing glycerol with $\frac{1}{4}$ to $\frac{1}{2}$ portion of water and mixing with enough litharge to give a paste of desired consistency. Must be used as soon as mixed. Fillers retard the setting and avoid cracking. The product is somewhat resistant to acids.

Hazard: Toxic by ingestion.

litharge, leaded. See lead suboxide.

lithia. See lithium oxide.

lithic acid. See uric acid.

lithium.

CAS: 7439-93-2. Li. Metallic element of atomic

number 3, group IA of periodic table, aw 6.941, valence = 1; two isotopes. It is the lightest and least reactive of the alkali metals and the lightest solid element.

Properties: Very soft, silvery metal. D 0.534 (20C), mp 179C, bp 1317C, Mohs hardness 0.6, viscosity of liquid lithium less than water, heat capacity about the same as water. Reacts exothermally with nitrogen in moist air at high temperatures; high electrical conductivity; soluble in liquid ammonia.

Source: Spodumene, lepidolite, amblygonite occurring in U.S., Canada, central Africa, Brazil, Argentina, Australia, Europe. Also desert lake brines.

Derivation: By electrolysis of a mixture of lithium chloride and potassium chloride, high-temperature extraction from spodumene by sodium carbonate, solar evaporation of lake brines.

Grade: 99.86% to 99.9999%.

Available forms: Ingots, rods, wire, ribbon, and pellets.

Hazard: Ignites in air near its melting point; dangerous fire and explosion risk when exposed to water, acids, or oxidizing agents. Extinguish lithium fires only with chemicals designed for this purpose. Lithium in solution is toxic to the central nervous system.

Use: Production of tritium, reducing and hydrogenating agents, alloy hardeners, pharmaceuticals, Grignard reagents. Scavenger and degasifier for stainless and mild steels in molten state, modular iron, soaps and greases, deoxidizer in copper and copper alloys, catalyst, heat-transfer liquid, storage batteries (with sulfur, selenium, tellurium, and chlorine). Rocket propellants, vitamin A synthesis, silver solders, underwater buoyancy devices, nuclear reactor coolant.

See "Lith-Ex."

lithium acetate, dihydrate. (acetic acid, lithium salt; Quilonum).

CAS: 546-89-4. $\text{CH}_3\text{CO}_2\text{Li}\cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. Mw 102.02, mp 53–56C. Soluble in water and alcohol.

lithium aluminate. LiAlO_2 .

Properties: White powder. Mp 1900–2000C, d 2.55 (25C). Insoluble in water.

Grade: Ceramic.

Use: As a flux in high-refractory porcelain enamels.

lithium aluminum deuteride. (LAD)

LiAlD_4 .

Properties: White to gray crystals. D 1.02. Stable in dry air at room temperature, but very sensitive to moisture. Decomposes above 140C liberating deuterium. Soluble in diethyl ether, tetrahydrofuran; slightly soluble in other low molecular weight ethers.

Preparation: By reacting aluminum chloride with lithium deuteride.

Hazard: Flammable, dangerous fire risk, requires special handling; ignites in air.

Use: Introduction of deuterium atoms into molecules by reduction of same groups attacked by lithium aluminum hydride.

lithium aluminum hydride. (LAH).

CAS: 16853-85-3. LiAlH_4 .

Properties: White powder. D 0.917. Sometimes turns gray on standing. Stable in dry air at room temperature, but highly sensitive to moisture, including atmospheric. Decomposes to lithium hydride, aluminum metal, and hydrogen above 125C without melting. Soluble in diethyl ether, tetrahydrofuran, dimethyl "Cellosolve"; slightly soluble in dibutyl ether; insoluble or very slightly soluble in hydrocarbons and dioxane.

Preparation: Reaction of aluminum chloride with lithium hydride.

Hazard: Flammable, dangerous fire risk; may ignite spontaneously on grinding or rubbing, or from static sparks. Reacts violently with air, water, and many organic materials. Fires must be extinguished with powdered limestone or dry chemical.

Use: Reducing agent for over 60 different functional groups, especially for pharmaceutical, perfume, and fine organic chemicals; converts esters, aldehydes, and ketones to alcohols and nitriles to amines; source of hydrogen; propellant; catalyst in polymerizations.

lithium aluminum hydride, ethereal.

LiAlH_4 , plus ether.

Properties: Colorless solution in ether. Very reactive to water.

Derivation: From lithium hydride and ether solution of aluminum chloride.

Hazard: Flammable, dangerous fire risk.

Use: See lithium aluminum hydride.

lithium aluminum-tri-*tert*-butoxyhydride.

(LATB; lithium-tri-*tert*-butoxyaluminumhydride).

CAS: 17476-04-9. $\text{LiAl}[\text{OC}(\text{CH}_3)_3]_3\text{H}$.

Properties: White powder. D 1.03, stable in dry air but sensitive to moisture. Soluble in the diethyl ether of diethylene glycol, tetrahydrofuran, diethyl ether; slightly soluble in other ethers.

Hazard: Evolves flammable hydrogen at 400C. Dangerous.

Use: For stereospecific reductions of steroid ketones and for reductions of acid chlorides to aldehydes.

lithium amide.

CAS: 7782-89-0. LiNH_2 .

Properties: White, crystalline solid; ammonia-like odor. D 1.18, mp 380–400C. Decomposes in water to form ammonia.

Derivation: Reaction of lithium hydride with ammonia.

Grade: 92–95% lithium amide.

Hazard: Flammable, dangerous fire risk. Do not use water to extinguish.

Use: Organic synthesis, including antihistamines and

other pharmaceuticals.
See "Lith-Ex."

lithium arsenate. Li_3AsO_4 .

Properties: White powder. D 3.07 (15C). Slightly soluble in water; soluble in dilute acetic acid.

Hazard: A poison.

lithium benzoate.

CAS: 553-54-8. $\text{LiC}_7\text{H}_5\text{O}_2$.

Properties: White crystals or powder. Soluble in water and alcohol.

Derivation: Reaction of benzoic acid with lithium carbonate.

lithium bicarbonate. LiHCO_3 . A lithium salt formed by dissolving lithium carbonate in water with excess carbon dioxide. The solution, called Lithia Water, is used in medicine and prepared mineral waters.

lithium borate. See lithium tetraborate.

lithium borohydride.

CAS: 16949-15-8. LiBH_4 .

Properties: White to gray crystalline powder. D 0.66; extremely hygroscopic. Decomposes in vacuum above 200C, in air at 275C. Soluble in water, lower primary amines, and ethers.

Derivation: Reaction of sodium borohydride and lithium chloride.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Source of hydrogen and borohydrides; reducing agent for aldehydes, ketones, and esters.

lithium bromide.

CAS: 7550-35-8. LiBr .

Properties: White, cubic, deliquescent crystals, or as a white to pinkish-white, granular powder; odorless; sharp bitter taste. D 3.464, mp 547C, bp 1265C. Very soluble in water, alcohol, and ether; slightly soluble in pyridine; soluble in methanol, acetone, glycol; a hot concentrated solution dissolves cellulose; forms addition compounds with ammonia and amines; forms double salts with CuBr_2 , HgBr_2 , HgI_2 , $\text{Hg}(\text{CN})_2$, and SrBr_2 ; greatly depresses vapor pressure over its solutions.

Derivation: Reaction of hydrobromic acid with lithium carbonate.

Grade: 53% (min) LiBr brine; solid, single crystals.

Use: Pharmaceuticals, air conditioning, humectant, drying agent, batteries, low-temperature heat-exchange medium, medicine (sedative).

lithium tert-butanolate.

CAS: 1907-33-1. mf: $\text{C}_4\text{H}_9\text{O}\cdot\text{Li}$.

Hazard: Moderately toxic by ingestion.

CAS: 75225-51-3. mf: $\text{C}_{24}\text{H}_{38}\text{O}_6\cdot\text{H}_3\text{N}$.

Hazard: A reproductive hazard.

lithium butyl. See butyllithium.

lithium carbide. Li_2C_2 .

Properties: Crystalline, white powder. D 1.65 (18C). Decomposes in water; soluble in acid with evolution of acetylene.

Hazard: Fire risk in contact with acids.

lithium carbonate.

CAS: 554-13-2. Li_2CO_3 .

Properties: White powder. D 2.111, mp 735C, bp (decomposes) at 1200C. Slightly soluble in water; insoluble in alcohol; soluble in dilute acid.

Derivation: (1) Finely ground ore is roasted with sulfuric acid at 250C, lithium sulfate is leached from the mass and converted to the carbonate by precipitation with soda ash. (2) Reaction of lithium oxide with carbon dioxide or ammonium carbonate solution.

Grade: Technical, CP.

Hazard: Water solution is strong irritant.

Use: Ceramics and porcelain glazes, pharmaceuticals, catalyst, other lithium compounds, coating of arc-welding electrodes, nucleonics, luminescent paints, varnishes and dyes, glass ceramics, aluminum production.

lithium chlorate. LiClO_3 .

Properties: Needlelike crystals. Deliquescent, d 1.119 (18C), mp 128C, decomposes at 270C. More soluble in water than any other inorganic salt (313 g per 100 mL water at 18C); very soluble in alcohol.

Hazard: Dangerous explosion hazard when shocked or combined with organic materials. Strong oxidant.

Use: Air conditioning, inorganic and organic chemicals, propellants.

See "Lith-X."

lithium chloride.

CAS: 7447-41-8. LiCl .

Properties: White, deliquescent crystals. D 2.068, mp 614C, bp 1360C. Very soluble in water, alcohols, ether, pyridine, nitrobenzene. One of the most hygroscopic salts known. Not to be used as dietary salt substitute.

Derivation: Reaction of lithium ores with chlorides, natural brines.

Grade: Technical 99% minimum assay, 35–40% brine, inhibited; single crystals.

Use: Air conditioning, welding and soldering flux, dry batteries, heat-exchange media, salt baths, desiccant, production of lithium metal, carbon drinks and mineral water to reduce escape of carbon dioxide.

lithium chromate. $\text{Li}_2\text{CrO}_4\cdot 2\text{H}_2\text{O}$.

Properties: Yellow, crystalline, deliquescent powder. Soluble in water and forms a eutectic at -60C; soluble in alcohols.

Hazard: Toxic by ingestion.

Use: Corrosion inhibitor in alcohol-base antifreezes and water-cooled reactors. Oxidizing agent for organic material, especially in the presence of light; heat-transfer medium.

lithium citrate.CAS: 919-16-4. $\text{Li}_3\text{C}_6\text{H}_5\text{O}_7 \cdot 4\text{H}_2\text{O}$.**Properties:** White powder or granules. Loses four waters at 105C; mp (decomposes). Soluble in water; slightly soluble in alcohol.**Derivation:** Reaction of citric acid with lithium carbonate.**Use:** Beverages, pharmaceuticals, dispersion stabilizer (clay deflocculant).**lithium cobaltite.** LiCoO_2 .**Properties:** Dark-blue powder. Insoluble in water. The compound exhibits both the fluxing property of lithium oxide and the adherence-promoting property of cobalt oxide.**Use:** Ceramics.**lithium deuteride.** LiD .**Properties:** Gray crystals. D 0.906. Reacts slowly with moist air. Thermally stable to its mp of 680C.**Use:** Thermonuclear fusion, See deuterium.**lithium dichromate.** $\text{Li}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.**Properties:** Yellowish-red, crystalline powder. D 2.34 (30C), mp 130C, deliquescent. Soluble in water; forms eutectic at -70C.**Use:** Dehumidifying, refrigeration.**lithium ferrosilicon.**

CAS: 64082-35-5.

Properties: Dark, crystalline, brittle, metallic lumps or powder. Evolves flammable gas in contact with moisture. Must be kept cool and dry.**Hazard:** Flammable, dangerous fire risk.**lithium fluoride.**CAS: 7789-24-4. LiF .**Properties:** Fine white powder. D 2.635 (20C), mp 842C, bp 1670C. Slightly soluble in water; does not react with water at red heat. Soluble in acids; insoluble in alcohol.**Derivation:** Reaction of hydrogen fluoride with lithium carbonate.**Grade:** Guaranteed 98% (min) lithium fluoride, CP, single pure crystals.**Hazard:** Strong irritant to eyes and skin. TLV: 2.5 mg(F)/m³**Use:** Welding and soldering flux, ceramics, heat-exchange media, synthetic crystals in infrared and ultraviolet instruments, rocket fuel component, radiation dosimetry. Component of fuel for molten salt reactors, X-ray diffraction.**lithium fluorophosphate.** $\text{LiF} \cdot \text{Li}_3\text{PO}_4 \cdot \text{H}_2\text{O}$.**Properties:** White crystals.**Derivation:** Interaction of lithium fluoride and lithium phosphate.**Use:** Ceramics.**lithium grease.** A grease using a lithium soap of the higher fatty acids as a base. Water-resistant,

stable when heated above its melting point and cooled again. Lithium hydroxy-stearate from hydrogenated castor oil is also widely used.

Use: Aircraft and low-temperature service. See lithium stearate; lubricating grease.**lithium hydride.**CAS: 7580-67-8. LiH .**Properties:** White, translucent, crystalline mass or powder. Commercial product is light bluish-gray due to minute amount of colloiddally dispersed lithium. D 0.82 (20C), mp 680C, decomposition pressure nil at 25C, 0.7 mm Hg (500C), 760 mm Hg (approximately 850C). Decomposed by water-forming hydrogen and lithium hydroxide. Insoluble in benzene and toluene; soluble in ether.**Derivation:** Reaction of molten lithium with hydrogen.**Grade:** 93-95%, based on hydrogen evolution.**Hazard:** Flammable, dangerous fire risk, ignites spontaneously in moist air, use dry chemical to extinguish. TLV: 0.025 mg/m³.**Use:** Desiccant, source of hydrogen, condensing agent in organic synthesis, preparation of lithium amide and double hydrides, nuclear shielding material, reducing agent.

See "Lith-X."

lithium hydroxide.CAS: 1310-65-2. LiOH .**Properties:** Colorless crystals. D 2.54, mp 470C, bp 924C (decomposes). Slightly soluble in alcohol; soluble in water; absorbs carbon dioxide and water from air.**Derivation:** Causticizing of lithium carbonate, action of water on metallic lithium, or by addition of Li_2O to water.**Hazard:** Water solutions are strongly irritant.**Use:** Storage battery electrolyte, carbon dioxide absorbent in space vehicles, lubricating greases, ceramics, catalyst, photographic developers, lithium soaps.**lithium hydroxystearate.** $\text{LiOOC}(\text{CH}_2)_{10}\text{CH}_2\text{O}(\text{CH}_2)_2\text{CH}_3$.**Properties:** White powder. Mp 205C. Dissolves in hot petroleum oil to form greases. Combustible.**Derivation:** From hydrogenated castor oil.**Use:** Lubricating greases.**lithium hypochlorite.**CAS: 13840-33-0. LiOCl .**Hazard:** Strong oxidant, may ignite organic materials.**Use:** Bleach, sanitizing agent.**lithium iodate.** LiIO_3 .**Properties:** White powder. D 4.487 (25C), mp 50-60C (transition point from α to β form). Soluble in water; insoluble in alcohol. An oxidizing material.

lithium iodide trihydrate. $\text{LiI}\cdot 3\text{H}_2\text{O}$.

Properties: White crystals. D 3.48 (25C), mp 72C, loses water (anhydrous) 450C. bp 1171C, extremely hygroscopic. Soluble in water and in alcohol.

Derivation: Action of hydriodic acid on lithium hydroxide with subsequent crystallization.

Use: Air conditioning, catalyst in acetal formation, solubilizes lithium in propylamine, nucleonics.

lithium lactate. $\text{LiC}_3\text{H}_5\text{O}_3$.

Properties: White, odorless powder. Very soluble in water with practically neutral reaction. Lithium lactate is nonhygroscopic and stable, whereas sodium lactate can be prepared in solution only.

Use: Wherever a dry alkali lactate is required.

lithium manganite. Li_2MnO_3 .

Properties: Reddish-brown powder. Insoluble in water; extremely stable.

Use: Smelter addition in the manufacturing of frit, as a mill addition, ceramic-bonded grinding wheels.

lithium metaborate dihydrate.

Properties: White, crystalline powder. Mp 840C (anhydrous). Soluble in water.

Use: Ceramics (flux in enamel cover coats, increases resistance to torsion), welding and brazing (anhydrous form), nucleonics.

lithium metasilicate. (lithium silicate).

Properties: White powder. Mp 1201C, d 2.52 (25C). Insoluble in water.

Use: Flux in glazes and ceramic enamels, welding-rod coating.

lithium methoxide. (lithium methylate).

Properties: White, free-flowing powder. Soluble in methanol. Must be protected from moisture.

Available forms: A 10% solution in methanol.

Hazard: Solution very toxic by ingestion.

Use: Strong base and chemical intermediate where water is undesirable.

lithium methylate. See lithium methoxide.**lithium molybdate.** Li_2MoO_4 .

Properties: A white, crystalline compound. Mp 705C, d 2.66. Soluble in water.

Use: Steel coating, petroleum cracking catalyst.

lithium niobate. (lithium metaniobate). LiNbO_3 .

Properties: Mp 1250C.

Available forms: Single crystals available in sizes up to 6 inches long and 0.5 inch in diameter.

Use: Infrared detectors, transducer in laser technology.

lithium nitrate. LiNO_3 .

Properties: Colorless powder. D 2.38, mp 261C. Soluble in water and alcohol.

Derivation: Reaction of nitric acid with lithium carbonate.

Grade: Technical, commercially pure, reagent.

Hazard: Dangerous explosion risk when shocked or heated, strong oxidizing agent.

Use: Ceramics, pyrotechnics, salt baths, heat-exchange media, refrigeration systems, rocket propellant.

lithium nitride.

CAS: 26134-62-3. Li_3N .

Properties: Brownish-red crystals of hexagonal structure or fine, free-flowing red powder. D approximately 1.3 (25C), mp 845C, decomposition pressure not measurable below 1250C. Water vapor in moist air causes slow decomposition. Reacts with water giving LiOH and ammonia; insoluble in polyethers.

Hazard: Ignites in air, use dry chemicals to extinguish ("Lith-X.")

Use: Nitriding agent in metallurgy, reducing and nucleophilic reagent in organic reactions, source of bound nitrogen in organic reactions.

lithium octadecanoate. See lithium stearate.**lithium orthophosphate.** See lithium phosphate.**lithium oxide.** (lithia).

CAS: 12057-24-8. Li_2O .

Properties: White powder. Mp 1427C, d 2.023 (25C). A strong alkali. Absorbs carbon dioxide and water from air.

Hazard: Water solutions of high concentration are strongly irritant.

Use: Ceramics and special glass formulations, carbon dioxide absorbent (mineral water).

lithium perchlorate. LiClO_4 .

Properties: Colorless, deliquescent crystals. D 2.429, mp 236C, decomposes at 430C, has more available oxygen than liquid oxygen (on a volume basis), reacts with 4NH_3 to form an ammoniate. Forms $\text{LiClO}_4\cdot 3\text{H}_2\text{O}$, colorless crystals with d 1.84, mp 75C. Soluble in water and alcohol.

Hazard: Oxidizing agent, dangerous fire and explosion risk in contact with organic materials. Irritant to skin and mucous membranes.

Use: Solid rocket propellants.

lithium peroxide.

CAS: 12031-80-0. Li_2O_2 .

Properties: Fine white powder. Mp (decomposes), d 2.14 (20C), in closed container no detectable loss of available oxygen. Soluble in water, 8% (20C); anhydrous acetic acid 5.6% (20C); insoluble in absolute alcohol (20C).

Derivation: Addition of hydrogen peroxide to lithium hydroxide.

Hazard: Dangerous fire and explosion risk in contact with organic materials. Strong oxidizing agent.
Use: As supplier of active oxygen, commercial samples have 32.5–34% available oxygen content.

lithium phosphate. (lithium orthophosphate).
 $2\text{Li}_3\text{PO}_4 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.41. Soluble in dilute acids; slightly soluble in water.

lithium ricinoleate. $\text{LiOOC}_{17}\text{H}_{33}\text{OH}$.

Properties: White powder. Mp 174C. Insoluble or limited solubility in most organic solvents. Combustible.

Derivation: Castor oil.

Use: Alcoholysis and ester interchange catalyst.

lithium silicate. See lithium metasilicate.

lithium silicon.

CAS: 68848-64-6. An alloy of lithium and silicon.

Properties: Black, shiny lumps or powder; sharp irritant odor. Keep cool and dry.

Hazard: Dangerous fire risk, reacts with water to form flammable gases.

lithium stearate. (lithium octadecanoate; octadecanoic acid, lithium salt).

CAS: 4485-12-5. $\text{LiC}_{18}\text{H}_{35}\text{O}_2$.

Properties: White crystals. D 1.025, mp 220C. Insoluble in cold and hot water, alcohol and ethyl acetate; forms gels and mineral oils.

Derivation: Reaction of stearic acid with lithium carbonate.

Grade: Grease, cosmetic.

Hazard: Low toxicity by ingestion. TLV: TWA 10 mg/m³, total dust. Warning: This substance is spontaneously combustible.

Use: Cosmetics, plastics, waxes, greases, lubricant in powder metallurgy, corrosive inhibitor in petroleum, flattening agent in varnishes and lacquers, high-temperature lubricant.

lithium sulfate.

CAS: 10377-48-7. $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals. D 2.06, mp 130C. Soluble in water; insoluble in 80% alcohol. Does not form alums.

Derivation: Reaction of sulfuric acid with lithium carbonate or with spodumene ore.

Grade: Technical and pharmaceutical.

Use: Pharmaceutical products, ceramics.

lithium tetraborate. $\text{Li}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Mp loses water at 200C. Very soluble in water; insoluble in alcohol.

Derivation: Reaction of boric acid with lithium carbonate.

Use: Ceramics, vacuum spectroscopy, metal refining and degassing.

lithium titanate. Li_2TiO_3 .

Properties: White powder. Insoluble in water. Has strong fluxing properties in small percentage in titanium-bearing enamels. The insolubility permits its use in vitreous and semivitreous glazes.

lithium tri-tert-butoxyaluminumhydride.

See lithium aluminum tri-tert-butoxyhydride.

lithium tungstate. Li_2WO_4 .

Properties: White crystals. D 3.71. Soluble in water.

lithium vanadate. (lithium metavanadate).

$\text{LiVO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish powder. Soluble in water.

lithium zirconate. Li_2ZrO_3 .

Properties: White powder. Insoluble in water. Efficient flux in glasses containing zirconium dioxide. Recommended as a flux in zirconium-opacified enamels, glazes, and porcelains.

lithium-zirconium silicate. $\text{Li}_2\text{O} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$.

Properties: White powder. A strong flux in enamels, glazes, and porcelains. It can be used in place of lithium zirconate.

lithocholic acid.

CAS: 434-13-9. $\text{C}_{24}\text{H}_{39}\text{O}_2\text{OH}$. A bile acid.

Properties: Crystals in leaflets from alcohol. Mp 184–189C. Not precipitated by digitonin. Freely soluble in hot alcohol; soluble in ethyl acetate; slightly soluble in glacial acetic acid; insoluble in water, ligroin.

Derivation: From bile and gallstones, from deoxycholic acid or cholic acid.

Use: Biochemical research.

“Lithol” Red [BASF]. TM for one of a group of pigments made by combining Tobias acid and β -naphthol.

Properties: Poor resistance to sunlight and weathering, generally good resistance to bleeding and to chemicals.

Available forms: Sodium, barium, and calcium lithols.

Use: Industrial enamels, toys and dipping enamels, rubber, plastics, etc.

“Lithol” Rubine [BASF].

$\text{OOC}_{10}\text{H}_5(\text{OH})\text{N}:\text{NC}_6\text{H}_3(\text{CH}_3)\text{SO}_2\text{OCa}$. TM for the calcium salt of an azo pigment made by diazotizing *p*-toluidine-*m*-sulfonic acid and coupling with 3-hydroxy-2-naphthoic acid. Has poor hiding power, good resistance to bleeding and baking, fair lightfastness and alkali resistance.

Use: Paints, plastics, printing inks, cosmetics.

lithopone.

CAS: 1345-05-7. A white pigment consisting of

zinc sulfide, barium sulfate, and zinc oxide; formerly used widely in paints, white rubber goods, paper, white leather etc. It has been largely replaced by titanium dioxide.

“Lith-X” [Ansul]. TM for a graphite-base, dry chemical extinguishing agent suitable for fires of lithium, titanium, and zirconium.

litmus. (lichen blue).

Properties: A blue, amorphous powder frequently compressed into small cakes or strips (“paper”). Soluble in water; changes color with acidity of solution, red at pH 4.5, blue at pH 8.3.

Derivation: By treating lichens (particularly *Variolaria lecanora* and *V. rocella*) with ammonia and potash and then fermenting the mass.

Use: Indicator in analytical chemistry where precision is not required, soil testing.

Little, Arthur D. (1863–1935). Born in Boston, Little was a pioneer in the field of industrial research and chemical consulting. Originally an authority on paper technology, he established a consulting industrial chemical laboratory in 1886, which has since become a large institution of worldwide reputation, located in Cambridge, MA. It has served as a prototype of many industrially oriented consulting firms that have become a significant factor in the growth of research in the last half century. It has made significant contributions in such fields as flavors, food chemistry and acceptability, paper chemistry, and rubber chemistry, as well as in corporate management.

liver. A term formerly used to characterize compounds containing sulfides or sulfates, possibly because of the dark-brown color, e.g., liver of sulfur, liver of lime, etc. The word is outmoded and should be avoided.
See *livering*.

livering. A pronounced increase in the viscosity of a paint or printing ink as a result of which it becomes a coagulated and unusable mass. This may be due to oxidation or to partial polymerization of the components.

lixiviation. The separation of mixtures by dissolving soluble constituents in water.
See *solvent extraction*.

LNG. Abbreviation for liquefied natural gas.
See *natural gas*.

loam. A soil comprising 25–50% sand, 30–50% silt, and 5–25% clay.
See *soil*.

“Lo-Bax” [Olin]. TM for a hypochlorate product.

Use: Bactericide, fungicide, germicide, disinfectant, and deodorizer.

Lobry de Bruyn-van Ekenstein transformation. Isomerization of carbohydrates in alkaline media, considered to embrace both epimerization of aldoses and ketoses and aldose-ketose interconversion.

localize. Determination of the original position (locus) of a gene or other marker on a chromosome.

locus. The position on a chromosome of a gene or other chromosome marker; also, the DNA at that position. The use of locus is sometimes restricted to mean regions of DNA that are expressed. Plural is loci.

See: *gene expression*.

Lochs Schmidt’s constant. (Lochs Schmidt number). The number of particles per unit volume of an ideal gas at STP. It has the value $2.686763 \times 10^{25} \text{ m}^{-3}$. Named after its discoverer Joseph Lochs Schmidt (1821-1895).

“Loctite” [Loctite]. TM for anaerobic polymers that retain liquid while exposed to air and that automatically harden without heat or catalysts when confined between closely fitted metal parts. Applied to mating surfaces before, during, and after assembly.

Available forms: A range of strengths and viscosities for a wide variety of applications.

locust-bean gum. See *carob-seed gum*.

lod score. Logarithm of the odd score; a measure of the likelihood of two loci being within a measurable distance of each other.

“Lo Foam” [West Agro]. TM for concentrated iodophor.

Use: For formulation of sanitizers, disinfectants, and handsoaps.

logwood. (hematoxylin). $\text{C}_{10}\text{H}_{14}\text{O}_6 \cdot 3\text{H}_2\text{O}$.
See *hematin*; *dye, natural*.

lolinine. See *n-acetylolloline*.

“Lomotil” [Searle]. TM for diphenoxylate hydrochloride with atropine sulfate.

Use: Antidiarrhea drug.

London dispersion force. See *van der Waals forces*

London purple.
CAS: 8012-74-6. An insecticide containing arsenic trioxide, aniline, lime, and ferrous oxide; insoluble in water.

Hazard: Toxic by ingestion and inhalation.

lone pair. Two valence electrons of an atom that share an orbital but do not participate in a bond.

long-range restriction mapping. Restriction enzymes are proteins that cut DNA at precise locations. Restriction maps depict the chromosomal positions of restriction-enzyme cutting sites. These are used as biochemical "signposts," or markers of specific areas along the chromosomes. The map will detail the positions where the DNA molecule is cut by particular restriction enzymes.

lorica. A vase-shaped or cup-shaped outer covering. Found in many protists, including some flagellates, ciliates, chrysophytes, and choanoflagellates, as well as in some animal cells.

"Lorox" [Rohm & Haas]. TM for either a powder or solution containing linuron.

Lossen rearrangement. Conversion of a hydroxamic acid, via a Hofmann-like arrangement, to an amine containing one less carbon than the original hydroxamic acid.

"Lo-Vel" [PPG]. TM for flattening silicas to reduce the gloss of paints, varnishes, lacquers, and industrial finishes.

Use: Automotive and specialty coating finishes.

"Lovibond" [Tintometer]. TM for color measurement and water testing equipment used in standard methods specified by ASTM, AOCS, APHA, European and U.S. Pharmacopoeia, ISO, BA, and IP.

low-alloy steel. See alloy steel.

low-energy phosphate compound. A phosphorylated compound with a relatively small standard free energy of hydrolysis.

low explosive. See explosive, low.

low-melting alloy. See alloy, fusible.

low-pressure resin. See contact resin.

low-soda alumina. Aluminum oxide (Al_2O_3) with <0.15% sodium oxide content.

Use: High-grade electric insulator and other ceramic bodies.

LOX. Abbreviation for liquid oxygen, especially when used as a rocket fuel.

loxiglumide.

CAS: 107097-80-3. mf: $\text{C}_{21}\text{H}_{30}\text{Cl}_2\text{N}_2\text{O}_3$.

Hazard: Moderately toxic by ingestion.

LPG. Abbreviation for liquefied petroleum gas.

Lr. Symbol for element lawrencium.

LSD. Abbreviation for lysergic acid diethylamide.

"L-Selectride" [Sigma-Aldrich]. TM for lithium tri-*sec*-butylborohydride, 1.0 molar solution in tetrahydrofuran. $\text{LiB}[\text{CH}(\text{CH}_3)\text{C}_2\text{H}_5]_3\text{H}$.

Properties: Liquid. Mw 190.11, d 0.890, freezing p -17C. Moisture sensitive. Packaged under nitrogen.

Hazard: Pyrophoric, must be handled under inert atmosphere.

Use: Reagent for the stereoselective reduction of ketones. Has been used in prostaglandin synthesis.

LTH. Abbreviation for luteotropic hormone. See luteotropin.

Lu. Symbol for lutetium.

lube-oil additive. A chemical added in small amounts to lubricating oils to impart special qualities, such as low pour point when chlorinated hydrocarbons are added. Other special properties include the following:

low viscosity indexbutene polymers
detergent and suspensoid propertiesmetallic
stearate soaps
oxidation stabilitycalcium stearate
reduced foaming tendencysilicone compounds
resistance to high operating temperaturesphosphorus pentasulfide,
zinc dithiophosphate

lubricant, solid. A material having a characteristic crystalline habit that causes it to shear into thin, flat plates, which readily slide over one another and thus produce an antifriction or lubricating effect, for example, mica, graphite, molybdenum disulfide, talc, boron nitride.

lubricant, synthetic. Any of a number of organic fluids having specialized and effective properties that are required in cases where petroleum-derived lubricants are inadequate. Each type has at least one property not found in conventional lubricants. Though their cost is much higher, they can be used over a wide range of temperatures and are stable to heat and oxidation. The major types are polyglycols (hydraulic and brake fluids), phosphate esters (fire-resistant), dibasic acid esters (aircraft turbine engines), chlorofluorocarbons (aerospace), silicone oils and greases (electric motors, antifriction bearings), silicate esters (heat-transfer agents and hydraulic fluids), neopentyl polyol esters (turbine engines), and polyphenyl ethers (excellent heat and oxidation resistance, but poor performance at low temperatures). An unusual property of synthetic lubricants is their exceptional resistance to ionizing radiation.

lubricating grease. A mixture of a mineral oil or oils with one or more soaps. The most common soaps are those of sodium, calcium, barium, aluminum, lead, lithium, potassium, and zinc. Oils thickened with residuum, petrolatum, or wax may be called greases. Some form of graphite may be added. Greases range in consistency from thin liquids to solid blocks, and in color from transparent to black. The specifications for a grease are determined by the speed, load, temperature, environment, and metals in the desired application. Texture of grease may be smooth, buttery, ropy or stringy, fibrous, spongy, or rubbery. The texture does not necessarily indicate the viscosity of the grease, but is related to the formulation and methods of manufacture. See lubricating oil.

lubricating oil. (lube oil). A selected fraction of refined mineral oil used for lubrication of moving surfaces, usually metallic and ranging from small precision machinery (watches) to the heaviest equipment. Lubricating oils usually have small amounts of additives to impart special properties such as viscosity index and detergency. They range in consistency from thin liquids to greaselike substances. In contrast to lubricating greases, lube oils do not contain solid or fibrous materials. See porpoise oil; lubricant, synthetic; extreme-pressure additive (2); lube oil additive.

lubrication. The introduction of a substance of low viscosity between two adjacent solid surfaces, one of which is in motion (bearing). From an engineering point of view, the chemical nature of the substance is not of critical importance. Thus, materials as diverse as air, water, and molasses could theoretically be used as lubricants under appropriate conditions. Air and water have been used, as well as some solids such as graphite, but in general oils, fats, and waxes are utilized. The ability of a substance to act as a lubricant is sometimes called lubricity.

lubricity. See lubrication.

“Lubriscal” [Thomas]. TM for a low-vapor-pressure, stable grease.
Use: Lubricating ground glass and metal joints and stopcocks, and for sealing desiccators and similar vessels.

luciculine.
 CAS: 5008-52-6. mf: $C_{22}H_{33}NO_3$.
Hazard: A poison.
Source: Natural product.

luciferase. An enzyme occurring in fireflies. See luciferin.

luciferin. An albumin present in some life forms (notably fireflies) that under the influence of the enzyme luciferase, exhibits bioluminescence. When luciferin (along with luciferase) comes in contact

with adenosine triphosphate, present in all living cells, a chemical reaction occurs that causes luminescence. By correlating its intensity with the amount of adenosine triphosphate present, a means of measuring bacterial growth is obtained. Applications in biomedical technology are envisaged for this so-called luminescence biometer.

“Lucifer Yellow CH” [Aldrich].

$C_{13}H_7Li_2N_3O_9S$. The dye spreads rapidly through the injected cell and binds effectively to tissue by a variety of fixatives. The movement from cell to cell is termed *dye-coupling*.

Properties: Fluffy-orange, hygroscopic powder. Mw 457.25.

Use: Highly fluorescent dye for marking nerve cells.

“Lucite” [ICI]. TM for acrylic resins consisting of a series of polymeric esters of methacrylic acid, $CH_2C(CH_3)COOR$, in which R is methyl, ethyl, *n*-butyl, isobutyl, or combinations of these alkyl groups. These are water-white, transparent, thermoplastic resins in granular or solution forms, used in lacquers, coatings, adhesives, modifiers for other resins. “Lucite” is also a TM for an acrylic monomer, methyl methacrylate, for acrylic resins in the form of injection molding and extrusion powders; for acrylic resin dental materials; and for acrylic syrup, a liquid methyl methacrylate for use in translucent and decorative panels. See acrylic resin.

“Ludox” [Du Pont]. TM for series of aqueous colloidal silica solutions.

Use: Floor polishes, paints, adhesives, paper coatings, catalyst supports, latex products, textile cleaning treatments, photosensitized paper, binder for inorganic fibrous materials, reactant for synthetic silicates.

Ludwig-Soret effect. The difference in concentration of one of the components of a mixed crystal due to temperature.

“Lugatol” [BASF]. TM for anionic dyes having good tinctorial and fastness properties for all kinds of leather.

Luggin probe. A device that transmits a significant current density on the surface of an electrode to measure its potential.

Lugol’s solution. An aqueous solution containing 5 g iodine and 10 g potassium iodide per 100 mL water. Grade USP.

Use: Medicine and pharmaceuticals.

“Lumatex” [BASF]. TM for a series of mineral and organic pigment dyestuffs that can be fixed on all types of textile fibers with suitable binders.

lumen. (lm). The SI unit of luminous flux equal to the flux emitted by a uniform point source of 1 candela in a solid angle of 1 steradian.

luminescence. The emission of visible or invisible radiation unaccompanied by high temperature by any substance as a result of absorption of exciting energy in the form of photons, charged particles, or chemical change. It is a general term which includes both fluorescence and phosphorescence. Special types are chemiluminescence, bioluminescence, electroluminescence, photoluminescence, and triboluminescence. Common examples are light from the firefly, fluorescent lamp tubes, and television screens.

See fluorescence; phosphorescence; phosphor.

LUMO. Acronym for lowest unoccupied molecular orbital.

“Lumulse EST-300” [Lambent]. TM for an emulsifier and lubricant, a unique high HLB ester easy to formulate.

Use: Additive to many base fluids.

2,6-lupetidine. See 2,6-dimethylpiperidine.

“Luran S” [BASF]. (ASA polymer). TM for acrylic ester-modified styrene-acrylonitrile terpolymer. A thermoplastic material claimed to be excellent for outdoor use. Highly resistant to sunlight and weathering.

Lurgi process. See gasification.

luster. The appearance of the surface of a substance in reflected light. The term is used particularly in describing minerals. Types of luster include (1) metallic, like metals or the mineral pyrite; (2) vitreous, like glass or quartz; (3) adamantine, exceedingly brilliant, like diamond; (4) resinous, like resin, or sphalerite; (5) dull, not bright or shiny, like chalk. See delustrant.

“Lustralite” [Reichhold]. TM for sulfonamide formaldehyde resins used as coating vehicles.

“Lustran” [Solutia]. TM for ABS and SAN molding and extruding compounds.

“Lustrasol” [Reichhold]. TM for acrylic and acrylic-modified alkyd solutions.

“Lustrex” [Solutia]. TM for styrene molding compound and extruding and calendaring material.

“Lustrone” [Rohm & Haas]. TM for plasticized nitrocellulose lacquers tinted with dyes.

Use: Transparent color effects on leather.

lutein. A yellow pigment isolated from the corpus luteum and found in body fats and egg yolks. It is a

carotenoid and is similar to or identical with xanthophyll.

luteolin-7-*o*-rutinoside.

CAS: 20633-84-5.

Properties: Flavonoid glycoside isolated from the aerial part of *Mentha piperita* L. mf: C₂₇H₃₀O₁₅.

Hazard: A poison by ingestion.

luteotropin. (adenohypophyseal luteotropin; prolactin; lactogenic hormone; LTH). One of the hormones secreted by the anterior lobe of the pituitary gland. It aids in causing growth of the mammary gland and initiates milk secretion by the mammary gland, it also influences the activity of the corpus luteum, including the secretion of progesterone.

Properties: Crystalline protein. Mw approximately 33,300. Almost insoluble in water; soluble in dilute acids and acidified methanol and ethanol.

lutes. Cements and adhesives composed of oxides, clays, and silicas.

lutetia. See lutetium oxide; rare earths.

lutetium. Lu. Metallic element, atomic number 71, group IIIB of the periodic table, a lanthanide rare earth, aw 174.97, valence = 3. It has one natural radioactive isotope (¹⁷⁶Lu) with half-life of 2.2 × 10¹⁰ years.

See rare-earth metals.

Properties: Metallic luster, soft and ductile. D 0.849, mp 1652C, bp 3327C. Reacts slowly with water; soluble in dilute acids; difficult to isolate.

Occurrence: Monazite (approximately 0.003%) (India, Brazil, Africa, Australia, U.S.).

Derivation: Reduction of the fluoride or chloride with calcium.

Grade: Regular, high purity (ingots, lumps).

Use: Nuclear technology.

lutetium chloride. LuCl₃•xH₂O (anhydrous).

Properties: D 3.98, mp 905C. Water-soluble.

Grade: Up to 99.9% lutetium salts.

lutetium fluoride. LuF₃•2H₂O (anhydrous).

Properties: Mp 1182C, bp 2200C. Insoluble in water.

Grade: Up to 99.9% lutetium salts.

Hazard: Irritant. TLV: 2.5 mg(F)/m³.

lutetium nitrate. Lu(NO₃)₃•6H₂O.

Grade: Up to 99.9% lutetium salts.

Hazard: Fire and explosion risk.

lutetium oxide. (lutetia). Lu₂O₃.

Properties: White solid. Slightly hygroscopic. Mp approximately 2500C, d 9.42. Absorbs water and carbon dioxide.

Derivation: Monazite sand.

Grade: Up to 99.9% purity.

lutetium sulfate. $\text{Lu}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Soluble in water.

Grade: Up to 99.9% lutetium salts.

2,6-lutidine. (2,6-dimethylpyridine).

Properties: Colorless, oily liquid; peppermint odor. D 0.932, bp 143C, fp -6.6C , refr index 1.4973 (20C). Derived from coal tar.

Available forms: 2,3-, 2,4-, 2,5-, 3,4-, 3,5-isomers.

Hazard: Flammable.

Use: Pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides.

“Lutonal” [BASF]. TM for vinyl ether polymers, solid and in solution.

lutrelin acetate. See luteinizing hormone-releasing factor (pig), 6-*d*-tryptophan.

lux. (lx). The SI unit of illuminance equal to the illumination produced by a luminous flux of 1 lumen distributed uniformly over an area of 1 square meter.

“Luxol” [Du Pont]. TM for a series of spirit and lacquer-soluble dyes.

Use: Lacquers, wood stains, stamp inks, ball point pen inks.

“LX-685” [Neville]. TM for a heat-reactive resin used in the manufacture of ready-mixed aluminum paints, grease- and gasoline-resistant coatings, floor and deck enamels, and concrete curing compounds.

lyases. Enzymes that catalyze the removal of a group from a molecule to form a double bond, or the addition of a group to a double bond.

lycopene. (carotene). $\text{C}_{40}\text{H}_{56}$. A long-chain hydrocarbon with 13 double bonds of which 11 are conjugated. Combustible.

Properties: Red crystals. Mp 175C. Soluble in chloroform and carbon disulfide; slightly soluble in alcohol, insoluble in water.

Source: The main pigment of tomato, paprika, rose hips, etc.

lycopodium. Spores from *Lycopodium clavatum*, a fungus native to North America and Europe.

Properties: A flammable yellowish powder.

Hazard: Flammable, protect from open flame.

Use: In the pharmaceutical industry as a coating, in flashlight powders and pyrotechnics.

“Lycra” [Du Pont]. TM for a spandex fiber in the form of continuous monofilaments. Available in yarn with denier from 40 to 2240.

Properties: Tensile strength 0.8 gpd, d 1.21, break elongation 550%, moisture regain 1.3%, mp 230C,

tensile recovery 95% from 50% elongation. Soluble in dimethyl formamide (hot).

Available forms: Yarn with denier from 40–2240.

Hazard: Combustible, but self-extinguishing.

Use: Foundation garments, swim wear, surgical hose, and other elastic products.

lye. See sodium hydroxide; potassium hydroxide.

“Lykopen” [Rohm & Haas]. TM for sodium hydrosulfite.

lymph. An almost colorless fluid that travels through the lymphatic system and carries cells that help fight infection and disease.

lymphatic system. The tissues and organs, including the bone marrow, spleen, thymus, and lymph nodes, that produce and store cells that fight infection and disease. This system also has channels that carry lymph.

lymph nodes. Small, bean-shaped organs located along the channels of the lymphatic system. Bacteria or cancer cells that enter the lymphatic system may be found in the nodes. Also called lymph glands.

lymphocytes. A subclass of leukocytes characterized as mononuclear, with a small amount of cytoplasm. Involved in the immune response and divided into two types: B lymphocytes (synthesize and secrete antibodies) and T lymphocytes (participate in cell-mediated immunity).

lyocratic. See lyophilic.

lyophilic. Characterizing a material that readily goes into colloidal suspension in a liquid; if into water, it is called hydrophilic. The colloid is stabilized by the formation of an adsorbed layer of molecules of the dispersing medium about the suspended particles. Systems of this type are said to be lyocratic. Examples: glue, gelatin, milk-fat particles.

lyophilic colloid. See reversible colloid.

lyophilization. See freeze-drying.

lyophobic. Characterizing a material that exists in the colloidal state but with a tendency to repel liquids; if the liquid is water, the material is called hydrophobic. Such colloids are generally stabilized by the adsorption of ions and coagulate when the charge is neutralized. Examples: colloidal gold, colloidal arsenic sulfide.

lyophobic colloid. Colloid that is readily precipitated from solution and cannot be redispersed by an addition of the solvent.

lyotropic series. Ions, radicals, or salts placed in order of their effect on various catalytic, colloidal, and physiological phenomena.

Lys. Abbreviation for lysine.

lysergic acid. $C_{16}H_{16}N_2O_2$. Structure based on a condensed four-ring nucleus.

Properties: Crystals (with 1–2 molecules of water) in plates from water. Mp 240C (decomposes). Amphoteric; moderately soluble in pyridine; slightly soluble in water and neutral organic solvents; soluble in alkaline and acid solutions.

Derivation: Alkaline hydrolysis of ergot alkaloids, organic synthesis.

Use: Medical research, synthesis of ergonovine.

D-lysergic acid diethylamide. (LSD).

CAS: 50-37-3. $C_{20}H_{25}N_3O$. Synthetic derivative of lysergic acid. Only the D-form is active. Tasteless, colorless, odorless.

Hazard: A strong hallucinatory and habit-forming drug with possible mutagenic effects. Manufacture and sale are under legal restraint.

lysine. (α,ϵ -diaminocaproic acid; Lys).

CAS: 56-87-1. $NH_2(CH_2)_4CH(NH_2)COOH$. An essential amino acid.

Properties: Colorless crystals. Optically active: D(-)-lysine, mp 224C with decomposition; L(+)-lysine mp 224C with decomposition. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: Extraction of natural proteins, syntheti-

cally by fermentation of glucose or other carbohydrates, and by synthesis from caprolactam.

Use: Biochemical and nutritional research, pharmaceuticals, culture media, fortification of foods and feeds (wheat flour), nutrient and dietary supplement, animal feed additive.

Available forms: As DL- and L-lysine monohydrochloride.

lysergic acid α -hydroxyethylamide.

CAS: 3343-15-5. mf: $C_{18}H_{21}N_3O_2$.

Hazard: A reproductive hazard.

lysosome. Eukaryotic organelle which carries digestive enzymes. The lysosome fuses with a vacuolar membrane containing ingested particles, which are then acted upon by the enzymes.

lysozyme. An antibiotic enzyme found in egg white. By hydrolyzing certain sugar linkages in glycoproteins, it can dissolve the mucopolysaccharides found in the walls of certain bacteria and hence acts as a mild antiseptic. Its three-dimensional structure has been determined by x-ray crystallography. It is a molecule containing approximately 2200 atoms comprising 129 amino acid units strung together and intricately folded (mw 14,500).

lyxoflavine. $C_{17}H_{20}N_4O_6$.

Properties: Yellowish crystals. Mp 284C (decomposes). Optically active. Almost insoluble in water and alcohol; soluble in alkaline solutions. It is a chemical analog of riboflavin.

Use: Growth promoter for agricultural products.

M

- M.** Abbreviation for molar, used to characterize the concentration of a solution. A molar solution contains one mole of a substance in one liter of solution.
- m.** Abbreviation for meter.
- m-**. (m-). Abbreviation for meta-
- M13.** A bacteriophage which infects certain strains of *E. coli*. The salient feature of this phage is that it packages only a single strand of DNA into its capsid. If the investigator has inserted some heterologous DNA into the M13 genome, copious quantities of single-stranded DNA can subsequently be isolated from the phage capsids. M13 is often used to generate templates for DNA sequencing.
- μm.** Abbreviation for micrometer.
- mm.** Abbreviation for millimicron.
- MAA.** See methylarsenic acid.
- MAC.** Abbreviation for methyl allyl chloride.
- MacDiarmid, Alan G.** (1927–). Awarded Nobel Prize in chemistry in 2000 jointly with Alan J. Heeger and Hideki Shirakawa for the discovery and development of conductive polymers. He performs his research at University of Pennsylvania, Philadelphia.
- “Mace” [Mace].** (“Chemical Mace”). TM for a riot-control gas dispersed as an aerosol. See chloroacetophenone.
- macerate.** To soften or break up a fibrous substance by long soaking in water at or near room temperature, often accompanied by mechanical action, as in the preparation of paper stock in the beater. In the plastics industry, to comminute a fabric so that it can be used as a filler in a plastics composition. The term is also used in pharmacy to describe a method of preparing medicinal compositions.
- “Machadet EZ-154 High Foam Powder” [McIntyre].** TM for shampoo blend.
- M acid.** (1-amino-5-naphthol-7-sulfonic acid). $C_{10}H_5NH_2OHSO_3H$.
Properties: Gray needles. Slightly soluble in cold water; soluble in hot water and alcohol.
Use: Azo dye intermediate.
- “Mackadet EQ 112 P” [McIntyre].** TM for pearlized baby shampoo concentrate.
- “Mackalene 110” [McIntyre].** TM for cocamidopropyl dimethylamine lactate.
Grade: Cosmetic and industrial.
Use: Hair conditioning agent for shampoos and conditioners.
- “Mackamide CMA” [McIntyre].** TM for cocamide monoethanol amine (MEA).
Properties: Low solubility in water.
Grade: Flaked and cosmetic.
Use: Viscosity builder and foam enhancement.
- “Mackine 301” [McIntyre].** TM for stearamidopropyl dimethylamine.
Grade: Flaked, cosmetic, and industrial.
Use: Hair conditioning agent for shampoos and conditioners.
- MacKinnon, Roderick.** (1956–). An American born in Burlington, MA, who won the Nobel Prize for chemistry in 2003 for his pioneering work discovering channels in cell membranes, in particular for the structural and mechanistic studies of ion channels. He received a B.A. in biochemistry from Brandeis University and an M.D. from Tufts University School of Medicine. MacKinnon is a member of the National Academy of Sciences and was awarded the 1999 Albert Lasker Basic Medical Research Award.
- “Macpearl DR-140V” [McIntyre].** TM for a glycol diesterate pearl concentrate.
- macroanalysis.** Analysis of chemicals in gram quantities.
 See microanalysis.
- macrocylic.** An organic molecule with a large ring structure containing over 15 carbon atoms.
- macromolecule.** A molecule, usually organic, composed an aggregation of hundreds or thousands of atoms. Such giant molecules are generally of two types. (1) Individual entities (compounds) that cannot be subdivided without losing their chemical identity. Typically these are proteins, many of which have molecular weights running into the millions. (2) Combinations of repeating chemical units (monomers) linked together into chain or network structures called polymers; each monomer has the same chemical constitution as the polymer, e.g., isoprene (C_5H_8) and polyisoprene (C_5H_8)_n. Synthetic elastomers (plastics) are typical of this kind of macromol-

ecule; cellulose is the most common example found in nature. Most macromolecules are in the colloidal size range.

See polymer, high; protein; colloid chemistry.

macrorestriction map. Map depicting the order of and distance between sites at which restriction enzymes cleave chromosomes.

macrose. See dextran.

madder. A natural dyestuff.
See alizarin; lake; dye, natural.

Maddrell's salts. (IMP). Insoluble sodium metaphosphate, $\text{NaPO}_3\text{-II}$ and $\text{NaPO}_3\text{-III}$.
See sodium metaphosphate.

Madelung synthesis. Formation of indole derivatives by intramolecular cyclization of an *N*-(2-alkylphenyl)alkanamide by a strong base at high temperature.

"MagClean HSAIO" [Martin Marietta].
TM for a micronized high activity MgO.

Use: A scorch retarder in chloroprene and fluorelastomers, thickening agents for SMC/BMC acid acceptors in halogenated and chloroprene adhesives.

magenta. See fuchsin.

magic acid. A superacid containing equal molar concentrations of antimony pentafluoride (SbF_6) and fluorosulfonic acid (FSO_2OH).

magic numbers. Atoms whose nuclei have the number of protons, neutrons, or both with any of the values, 8, 20, 28, 50, 82, 126. These elements have a stability and binding energy that are greater than average and have other special properties.

"Maglite" [Hall]. (magnesium oxide).

CAS: 1309-48-4. TM for acid acceptor and stabilizer.

Use: In rubber, plastic thickener filler, and smoke suppressant.

mag-lith. A magnesium-lithium alloy used as a structural metal in space vehicles.

magma. (1) In medicine, a class of preparations in which finely divided, freshly precipitated, insoluble, inorganic hydroxides are suspended in water to form a viscous, opaque mixture that may settle out on standing. Magmas of bismuth, magnesium, and iron are used, commonly called milk of bismuth, milk of magnesia, etc.

(2) In geology, a molten mass within the earth's crust (e.g., lava). The source of igneous rock.

"Magnacide H Herbicide" [Baker Petrolite]. TM for a liquid herbicide.

Use: To destroy submersed aquatic weeds in irrigation systems.

magnalium. An alloy of aluminum and magnesium.

magnesia. Magnesium oxide that has been specially processed.
See magnesium oxide.

magnesia alba. See magnesium carbonate; magnesium carbonate, basic.

magnesia-alumina. $\text{MgO}\cdot\text{Al}_2\text{O}_3$. A synthetic spinel.

magnesia, burnt. See magnesite, dead-burned.

magnesia, calcined. See magnesite, caustic-calcined.

magnesia, caustic-calcined. See magnesite, caustic-calcined.

magnesia-chromia. $\text{MgO}\cdot\text{Cr}_2\text{O}_3$. A synthetic spinel.

magnesia, dead-burned. See magnesite, dead-burned.

magnesia, fused.

Use: As a refractory and to handle electricity at high temperatures.

magnesia, lightburned. A special high-purity magnesium oxide.

magnesite. (natural magnesium carbonate).
CAS: 546-93-0. (MgCO_3). The term magnesite is loosely used as a synonym for magnesia as are also the terms *caustic-calcined magnesite*, *dead-burned magnesite*, and *synthetic magnesite*.

Hazard: A nuisance particulate.

Properties: White, yellowish, grayish-white, or brown crystalline solid. D 3–3.12, Mohs hardness 3.5–4.5.

Occurrence: U.S. (California, Washington, Nevada), Austria, Greece.

Use: To make the various grades of magnesium oxide, to produce carbon dioxide, refractory.

Hazard: TLV: 10 mg/m^3 .
See magnesium carbonate.

magnesite, burnt. See magnesite, dead-burned.

magnesite, caustic-calcined. (caustic-calcined magnesia; calcined magnesite; calcined magnesia. Principally magnesia (magnesium oxide) MgO). The product obtained by firing magnesite or other substances convertible to magnesia

upon heating at some temperature below 1450C so that some carbon dioxide is retained (2–10%) and the magnesium oxide displays adsorptive capacity or activity.

Grade: Technical, chemical, synthetic rubber, USP (light, medium light, heavy).

Use: Magnesium oxychloride and oxysulfate cements, 85% magnesia insulation, rubber (reinforcing agent, accelerator), uranium processing, chemical processing, rayon, refractories, paper pulp, acid-neutralizing fertilizers, welding-rod coatings, fillers, glass constituents, abrasives.

See magnesium oxide.

magnesite, dead-burned. (burnt magnesia; dead-burned magnesia; refractory magnesia; burnt magnesite; magnesium oxide). MgO. The granular product obtained by burning (firing) magnesite or other substances convertible to magnesia upon heating above 1450C long enough to form granules suitable for use as a refractory (ASTM). Synthetic magnesium hydroxide or chloride is sometimes used instead of magnesite as a source.

Grade: 85–87% (from magnesite ores); 97–99% (from seawater and brines).

Use: Refractories, as grains or basic brick, the latter especially in open hearth furnaces for steel, furnaces for nonferrous metal smelting, and in cement and other kilns.

See magnesium oxide.

magnesite, synthetic. Magnesium oxide, MgO, as obtained from seawater, seawater bitterns, or well brines. The preliminary product is usually magnesium hydroxide or chloride, which is then heated, or sometimes treated with steam and heated in the case of the chloride, to obtain the oxide. Synthetic magnesite constitutes the purer grades of dead-burned magnesite.

magnesium.

CAS: 7439-95-4. Mg. Metallic element of atomic number 12, group IIA of the periodic table, aw 24.305, valence = 2; 3 isotopes. Magnesium is the central element of the chlorophyll molecule; it is also an important component of red blood corpuscles.

Properties: Silvery, moderately hard, alkaline-earth metal; readily fabricated by all standard methods. Lightest of the structural metals; strong reducing agent; electrical conductivity similar to aluminum. D 1.74, mp 650C, bp 1107C. Soluble in acids; insoluble in water.

Source: Magnesite and dolomite; seawater and brines.

Derivation: (1) Electrolysis of fused magnesium chloride (Dow seawater process); (2) reduction of magnesium oxide with ferrosilicon (Pidgeon process).

Available forms: Ingots, bars, fine powder (up to 99.6% pure), sheet and plate, rods, tubing, ribbon, flakes.

Hazard: (Solid metal) Combustible at 650C. (Powder, flakes, etc.) Flammable, dangerous fire hazard. Use dry sand or talc to extinguish.

Use: Aluminum alloys for structural parts, die-cast auto parts, missiles, space vehicles; powder for pyrotechnics and flash photography, production of iron, nickel, zinc, titanium, zirconium; antiknock gasoline additives; magnesium compounds and Grignard syntheses; cathodic protection; reducing agent; desulfurizing iron in steel manufacture; precision instruments; optical mirrors; dry and wet batteries.

magnesium acetate.

CAS: 142-72-3. (1) $Mg(OOCCH_3)_2$ or (2) $Mg(OOCCH_3)_2 \cdot 4H_2O$.

Properties: Colorless, crystalline aggregate or monoclinic crystals; acetic acid odor. (1) Mp 323C, d 1.42; (2) mp 80C, d 1.45. Soluble in water and dilute alcohol.

Derivation: Interaction of magnesium carbonate and acetic acid.

Use: Dye fixative in textile printing, deodorant, disinfectant, and antiseptic.

magnesium acetylacetonate. $Mg(C_5H_7O_2)_2$. Crystalline powder, slightly soluble in water, resistant to hydrolysis, a chelating nonionizing compound.

magnesium amide. $Mg(NH_2)_2$.

Properties: Whitish to gray crystals. D 1.40. Decomposes when heated.

Derivation: Reaction of magnesium with ammonia under elevated pressure.

Hazard: A pyrophoric material igniting in air at room temperature. Evolves ammonia on vigorous reaction with water.

Use: Catalyst for polymerization.

magnesium ammonium arsenate dihydrate.

CAS: 14644-70-3. mf: $AsO_4 \cdot H_3N \cdot Mg \cdot 2H_2O$.

Hazard: A poison by ingestion and skin contact.

magnesium ammonium orthophosphate.

See magnesium ammonium phosphate.

magnesium ammonium phosphate. (magnesium ammonium orthophosphate).

$MgNH_4PO_4 \cdot 6H_2O$.

Properties: White powder. D 1.71, mp (decomposes to magnesium pyrophosphate, $Mg_2P_2O_7$). Soluble in acids; insoluble in alcohol and water.

Derivation: By the interaction of solutions of a magnesium salt and ammonium phosphate.

Use: Fire retardant for fabrics, fertilizer.

magnesium arsenate. (arsenic acid, magnesium salt).

CAS: 10103-50-1. $Mg_3(AsO_4)_3 \cdot xH_2O$.

Properties: White powder. When pure it is insoluble

in water. Technical material is highly hydrated and made from magnesium carbonate and arsenic acid.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide.

magnesium benzoate. $\text{Mg}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Loses $3\text{H}_2\text{O}$ at 110°C , mp approximately 200°C . Soluble in water and alcohol.

magnesium biphosphate. See magnesium phosphate, monobasic.

magnesium borate. $3\text{MgO} \cdot \text{B}_2\text{O}_3$ (orthoborate) or $\text{Mg}(\text{BO}_2)_2 \cdot 8\text{H}_2\text{O}$ (metaborate).

Properties: Transparent, colorless crystals or white powder. Soluble in alcohol, acetic acid, and inorganic acids; slightly soluble in water.

Derivation: By heating magnesium oxide, boric anhydride.

Use: Preservative, antiseptic, fungicide.

magnesium borocitrate.

$\text{Mg}(\text{BO}_2)_2 \cdot \text{Mg}_3(\text{C}_2\text{H}_3\text{O}_7)_2 \cdot 14\text{H}_2\text{O}$.

Properties: White powder or small, white, lustrous scales. Soluble in water.

Derivation: By mixing magnesium borate and magnesium citrate.

magnesium boron fluoride.

Grade: Technical.

Hazard: Strong irritant. TLV: $2.5 \text{ mg}/(\text{F})\text{m}^3$.

Use: Metal flux.

magnesium bromate. $\text{Mg}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals or crystalline powder. D 2.29, mp loses $6\text{H}_2\text{O}$ at 200°C , bp (decomposes). Soluble in water; insoluble in alcohol.

Derivation: By adding magnesium sulfate to a solution of barium bromate.

Hazard: Dangerous fire risk in contact with organic materials.

Use: Analytical reagent, oxidizing agent.

magnesium bromide. $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless, very deliquescent crystals; bitter taste. D 2.00, mp 172°C , mp (anhydrous) 700°C . Soluble in water; slightly soluble in alcohol.

Derivation: Reaction of hydrobromic acid with magnesium oxide and subsequent crystallization.

Use: Organic syntheses, medicine (sedative).

magnesium carbonate. MgCO_3 . The term *magnesium carbonate* is generally reserved for the synthetic, pure variety. The naturally occurring material is called magnesite.

Properties: Light, bulky, white powder. Bulk d approximately $4 \text{ lb}/\text{ft}^3$, d 3.0, decomposes 350°C , refr index about 1.52. Soluble in acids; very slightly soluble in water; insoluble in alcohol. Noncombustible.

Derivation: (1) Mined as natural material; (2) carbo-

nation of magnesium oxide or $\text{Mg}(\text{OH})_2$ with CO_2 ; (3) reaction of a soluble magnesium salt solution with sodium carbonate or bicarbonate.

Grade: Technical, NF, FCC.

Use: Magnesium salts, heat insulation and refractory, rubber reinforcing agent, inks, glass, pharmaceuticals, dentifrice and cosmetics, free-running table salts, antacid, making magnesium citrate, filtering medium.

Use: In foods as drying agent, color retention agent, anticaking agent, carrier.

magnesium carbonate, basic. (magnesia alba). Various formulas are given and may all be possible because of the method of derivation. A typical formula is $\text{Mg}(\text{OH})_2 \cdot 3\text{MgCO}_3 \cdot 3\text{H}_2\text{O}$. Properties and uses are almost identical with those listed for magnesium carbonate.

Derivation: Precipitation from magnesium salt solution.

See magnesium carbonate.

magnesium chlorate.

CAS: 10326-21-3. $\text{Mg}(\text{ClO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White powder; bitter taste. Very hygroscopic. D 1.8, mp 35°C (decomposes at 120°C). Soluble in water; slightly soluble in alcohol.

Hazard: Dangerous fire risk in contact with organic materials, strong oxidizing agent.

Use: Defoilant, desiccant.

magnesium chloride.

CAS: 7786-30-3. (1) MgCl_2 , (2) $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless or white crystals. Deliquescent, d (1) 2.32, (2) 1.56; mp (1) 708°C , (2) loses $2\text{H}_2\text{O}$ at 100°C , if heated rapidly melts at $116\text{--}118^\circ\text{C}$. Bp (1) 1412°C , (2) decomposes to oxychloride. Soluble in water and alcohol.

Derivation: Action of hydrochloric acid on magnesium oxide or hydroxide, especially the latter when precipitated from seawater or brines (Great Salt Lake).

Method of purification: Recrystallization.

Grade: Technical (crystals, fused, flakes, granulated), CP.

Hazard: Toxic by ingestion.

Use: Source of magnesium metal, disinfectants, fire extinguishers, fireproofing wood, magnesium oxychloride cement, refrigerating brines, ceramics, cooling drilling tools, textiles (size, dressing and filling of cotton and woolen fabrics, thread lubricant, carbonization of wool), paper manufacture, road dust-laying compounds, floor sweeping compounds, flocculating agent, catalyst.

magnesium chromate. $\text{MgCrO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Small, readily soluble, yellow crystals.

Use: Since it does not produce a fusible alkaline residue when thermally decomposed, it is used as a corrosion inhibitor in the water coolant of gas turbine engines. Insoluble basic magnesium chromates

also are available. Their potential applications are in the treatment of light metal surfaces.

Hazard: Toxic by ingestion.

magnesium citrate, dibasic. (acid magnesium citrate). $\text{MgHC}_6\text{H}_5\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White or slightly yellow granules or powder; odorless. Soluble in water; insoluble in alcohol.

Derivation: Reaction of citric acid and magnesium hydroxide or carbonate.

Use: Laxative, dietary supplement.

magnesium dichromate. $\text{MgCr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Characterized by high solubility in water. It is an orange-red, deliquescent, crystalline hydrate.

Use: Potential applications are in formulations for corrosion prevention and metal treatment. Noncombustible.

magnesium dioxide. See magnesium peroxide.

magnesium fluoride. (magnesium flux).

CAS: 7783-40-6. MgF_2 .

Properties: White crystals. D 3.15, mp 1263C, bp 2239C. Exhibits fluorescence by electric light. Soluble in nitric acid; insoluble in alcohol and water. Noncombustible.

Derivation: By adding sodium fluoride or hydrofluoric acid to a solution of magnesium salt.

Grade: Technical, CP, single crystals.

Hazard: Strong irritant. TLV: 2.5 mg(F)/m³.

Use: Ceramics, glass, single crystals for polarizing prisms, lenses and windows.

magnesium fluosilicate. (magnesium silico-fluoride).

CAS: 18972-56-0. $\text{MgSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: White, efflorescent, crystalline powder. D 1.788, decomposes 120C. Soluble in water.

Derivation: By treating magnesium hydroxide or carbonate with hydrofluosilicic acid.

Grade: Technical (crystals, solution).

Hazard: Strong irritant. TLV: 2.5 mg(F)/m³.

Use: Ceramics, concrete hardeners, waterproofing, mothproofing, laundry sour, magnesium casting.

magnesium flux. See magnesium fluoride.

magnesium formate. $\text{Mg}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water; insoluble in alcohol and ether. Combustible.

Derivation: Action of formic acid on magnesium oxide.

Use: Analytical chemistry.

magnesium gluconate. $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White powder or fine needles; odorless; almost tasteless. Soluble in water. Combustible.

Derivation: Magnesia or magnesium carbonate dissolved in gluconic acid.

Grade: Pharmaceutical.

Use: Medicine, vitamin tablets.

magnesium glycerophosphate. (magnesium glycerinophosphate).

$\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{OP}(\text{O})_2\text{Mg}$.

Properties: Colorless powder. Soluble in water; insoluble in alcohol. Combustible.

Derivation: Action of glycerophosphoric acid on magnesium hydroxide.

Use: Food additive; plasticizer.

magnesium hydrogen phosphate. See magnesium phosphate, dibasic.

magnesium hydroxide. (magnesium hydrate in aqueous suspension; milk of magnesia; magnesia magma).

CAS: 1309-42-8. $\text{Mg}(\text{OH})_2$.

Properties: White powder; odorless. D 2.36, mp decomposes at 350C. Soluble in solution of ammonium salts and dilute acids; almost insoluble in water and alcohol. Noncombustible.

Derivation: Precipitation from a solution of a magnesium salt by sodium hydroxide, precipitation from seawater with lime. It occurs naturally as brucite.

Grade: Technical, NF, FCC.

Use: Intermediate for obtaining magnesium metal, sugar refining, medicine (antacid, laxative), residual fuel oil additive, sulfite pulp, uranium processing, dentrifices, in foods as drying agent, color retention agent, frozen desserts.

magnesium lauryl sulfate.

$\text{Mg}(\text{OSO}_3\text{C}_{12}\text{H}_{25})_2$.

Properties: Pale yellow liquid; mild odor. Soluble in methanol, acetone, and water; insoluble in kerosene. Combustible.

Derivation: Sulfonation of lauryl alcohol and interaction with a magnesium salt.

Use: Surfactant and anionic detergent, foaming, wetting, and emulsifying agent.

magnesium lime. Same as magnesium limestone.

See limestone.

magnesium limestone. See limestone.

magnesium methoxide. (magnesium methylate). $(\text{CH}_3\text{O})_2\text{Mg}$.

Properties: Colorless, crystalline solid. Decomposes on warming.

Derivation: Reaction of magnesium and methanol.

Use: Dielectric coating, cross-linking agent to form stable gels, catalyst.

magnesium methylate. See magnesium methoxide.

magnesium molybdate. MgMoO_4 .

Properties: Crystalline powder. Absolute d 2.8, mp approximately 1060C. Soluble in water.

Use: Electronic and optical applications.

magnesium nitrate.

CAS: 10377-60-3. $\text{Mg}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals. D 1.45, mp 95–100C, decomposes at 330C. Soluble in water and alcohol; deliquescent.

Derivation: Action of nitric acid on magnesium oxide with subsequent crystallization.

Hazard: Dangerous fire and explosion risk in contact with organic materials, strong oxidizing agent.

Use: Pyrotechnics.

magnesium oleate. $\text{Mg}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Yellowish mass. Soluble in linseed oil, hydrocarbons, alcohol, and ether; insoluble in water. Combustible.

Derivation: Interaction of magnesium chloride and sodium oleate.

Use: Varnish driers, in dry-cleaning solvents (to prevent spontaneous ignition), emulsifying agent, lubricant for plasticizers.

magnesium orthophosphate. See magnesium phosphate.**magnesium oxide.** (magnesia).

CAS: 1309-48-4. MgO . Two forms are produced, one a light, fluffy material prepared by a relatively low-temperature dehydration of the hydroxide, the other a dense material made by high-temperature furnacing of the oxide after it has been formed from the carbonate or hydroxide.

See periclase.

Properties: White powder, either light or heavy depending upon whether it is prepared by heating magnesium carbonate or the basic magnesium carbonate. D approximately 0.36 (varies), mp 2800C, bp 3600C. Slightly soluble in water; soluble in acids and ammonium salt solutions. Noncombustible.

Derivation: (1) By calcining magnesium carbonate or magnesium hydroxide, (2) by treating magnesium chloride with lime and heating or by heating it in air, (3) from seawater via the hydroxide.

Grade: Technical, CP, USS, FCC, 99.5%, fused, low boron, rubber, semiconductor, single crystals.

Hazard: Toxic by inhalation of fume. TLV: 10 mg(Mg)/ m^3 (fume).

Use: Refractories, especially for steel furnace linings, polycrystalline ceramic for aircraft windshields, electrical insulation, pharmaceuticals and cosmetics, inorganic rubber accelerator, oxychloride and oxysulfate cements, paper manufacture, fertilizers, removal of sulfur dioxide from stack gases, adsorption and catalysis, semiconductors, pharmaceuticals, food and feed additive.

See "Maglite" [Hall].

magnesium oxychloride cement. (Sorel cement). A mixture of magnesium chloride and magnesium oxide that reacts with water to form a solid mass, presumed to be magnesium oxychloride. Fillers such as wood flour, sawdust, sand, powdered stone, talc, etc., are usually present. A variety of proprietary mixtures are available. Strength ranges from 7000 to 10,000 psi. Copper powder minimizes water solubility.

magnesium palmitate. $\text{Mg}(\text{C}_{16}\text{H}_{31}\text{O}_2)_2$.

Properties: Crystalline needles or white lumps. Mp 121.5C; insoluble in water and alcohol. Combustible.

Use: Varnish drier, lubricant for plastics.

magnesium perborate. $\text{Mg}(\text{BO}_3)_2 \cdot 7\text{H}_2\text{O}$.

Properties: White powder. Sparingly soluble in water; decomposes with evolution of oxygen.

Derivation: Action of peroxide or electrolytic oxidation of borate solutions.

Hazard: Moderate fire risk in contact with organic materials.

Use: Driers, bleaching, antiseptic (tooth powders).

magnesium perchlorate.

CAS: 10034-81-8. (1) $\text{Mg}(\text{ClO}_4)_2$; (2) $\text{Mg}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals. Deliquescent; very soluble in water and alcohol. (1) D 2.21 (18C), decomposes at 251C (2) d 1.98, decomposes at 185–190C.

Derivation: Reaction of magnesium hydroxide and perchloric acid.

Hazard: Dangerous fire and explosion risk in contact with organic materials.

Use: (1) As a regenerable drying agent for gases and (2) oxidizing agent.

magnesium permanganate.

$\text{Mg}(\text{MnO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Bluish-black, friable, deliquescent crystals. D 2.18, mp (decomposes). Soluble in water.

Hazard: Fire hazard in contact with organic materials. Powerful oxidizer.

Use: Polymerization catalyst, antiseptic.

magnesium peroxide. (magnesium dioxide).

CAS: 14452-57-4. MgO_2 .

Properties: White, powder; tasteless; odorless. Decomposes above 100C. Insoluble in water; soluble in dilute acids with formation of hydrogen peroxide. Available oxygen 28.4%. Keep cool and dry. A powerful oxidizing material.

Derivation: From sodium or barium peroxide with magnesium sulfate in a concentrated solution.

Grade: Technical, 15, 25, and 50%.

Hazard: Powerful oxidizer and dangerous fire risk, reacts with acidic materials and moisture.

Use: Bleaching and oxidizing agent, medicine (antacid).

magnesium phosphate. (magnesium orthophosphate).
See magnesium phosphate, dibasic; magnesium phosphate, monobasic; magnesium phosphate, tribasic.

magnesium phosphate, dibasic. (dimagnesium orthophosphate; dimagnesium phosphate; magnesium phosphate, secondary; magnesium hydrogen phosphate).
CAS: 7782-75-4. $\text{MgHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.13, loses water at 205C, decomposes at 550–650C, decomposes to pyrophosphate on heating. Soluble in dilute acids; slightly soluble in water. Nonflammable.

Derivation: Action of orthophosphoric acid on magnesium oxide.

Grade: Technical, FCC.

Use: Stabilizer for plastics, food additive, medicine (laxative).

magnesium phosphate, monobasic. (magnesium biphosphate; acid magnesium phosphate; magnesium tetrahydrogen phosphate).
 $\text{MgH}_2(\text{PO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, hygroscopic, crystalline powder. Decomposes to metaphosphate on heating. Soluble in water and acids; insoluble in alcohol. Nonflammable.

Derivation: Action of orthophosphoric acid on magnesium hydroxide.

Use: Fireproofing wood, stabilizer for plastics.

magnesium phosphate, neutral. See magnesium phosphate, tribasic.

magnesium phosphate, secondary. See magnesium phosphate, dibasic.

magnesium phosphate, tribasic. (Magnesium phosphate, neutral; trimagnesium phosphate). $\text{Mg}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ or $4\text{H}_2\text{O}$.

Properties: Soft, bulky, white powder; odorless; tasteless. Loses all water at 400C. Soluble in acids; insoluble in water. Nonflammable.

Derivation: Reaction of magnesium oxide and phosphoric acid at high temperatures.

Grade: Technical, reagent, NF (5 H_2O variety), FCC (4, 5, or 8 H_2O).

Use: Dentifrice polishing agent, pharmaceutical antacid, adsorbent, stabilizer for plastics, food additive and dietary supplement.

magnesium potassium sulfate.
CAS: 13826-56-7. mf: $\text{O}_{12}\text{S}_3 \cdot 2\text{K} \cdot 2\text{Mg}$.

Hazard: Moderately toxic by inhalation. Low toxicity by ingestion.

magnesium pyrophosphate. $\text{Mg}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.
Properties: White powder. D 2.56, loses water at 100C, mp (anhydrous) 1383C. Soluble in acids; insoluble in alcohol and water.

magnesium ricinoleate. $\text{Mg}(\text{OOC}_{17}\text{H}_{32}\text{OH})_2$.
Properties: Coarse, yellow granules; faint fatty acid odor. Mp 98C, d 1.03 (25/25C). Combustible.
Use: Cosmetics.

magnesium salicylate. $\text{Mg}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 4\text{H}_2\text{O}$.
Properties: Colorless, efflorescent, crystalline powder. Soluble in water and alcohol.
Derivation: Action of salicylic acid on magnesium hydroxide.
Use: Medicine (antiinfective).

magnesium silicate. $3\text{MgSiO}_3 \cdot 5\text{H}_2\text{O}$ (variable). The FCC specifies a ratio of $2\text{MgO}:5\text{SiO}_2$. See magnesium trisilicate; serpentine; talc.

Properties: Fine, white powder. Insoluble in water or alcohol. An absorbent. Noncombustible.

Derivation: Interaction of a magnesium salt and a soluble silicate.

Grade: Technical, FCC.

Hazard: Toxic by inhalation, use in foods restricted to 2%.

Use: Rubber filler; ceramics, glass, refractories; absorbent for crude oil spills; manufacture of permanently dry resins and resinous compositions; paints, varnishes, and paper (filler); animal and vegetable oils (bleaching agent); odor absorbent; filter medium; catalyst and catalyst carrier; anticaking agent in foods.

See asbestos.

magnesium silicide. Mg_2Si .
Properties: Bluish crystals. Mp 1085C, d 1.9, decomposes on heating above 500C, also by water and hydrochloric acid.

Derivation: By heating magnesium powder with silicon in ratio of 20:6.

Use: Semiconductor technology, electrical equipment.

magnesium silicofluoride. See magnesium fluosilicate.

magnesium stannate. $\text{MgSnO}_3 \cdot 3\text{H}_2\text{O}$.
Properties: White, crystalline powder. Decomposes at 340C. Soluble in water.
Hazard: Toxic by inhalation. TLV: 2 mg(Sn)/m³.
Use: Additive in ceramic capacitors.

magnesium stannide. Mg_2Sn .
Properties: Blue-white crystals. Mp 775C. Soluble in water and dilute hydrochloric acid. Has electrical and magnetic properties.
Use: Semiconductor technology, magnetochemistry, thermoelectric research.

magnesium stearate. (octadecanoic acid, magnesium salt).
CAS: 557-04-0. $\text{Mg}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$ or with one H_2O . Technical grade contains small amounts of the oleate and 7% magnesium oxide, MgO .
Properties: Soft, white, light powder; tasteless;

odorless. D 1.028, mp 88.5C (pure), 132C (technical). Insoluble in water and alcohol. Nonflammable.

Grade: Technical, USP FCC.

Hazard: TLV: TWA 10 mg/m³.

Use: Dusting powder, lubricant in making tablets, drier in paints and varnishes, a flattening agent, stabilizer and lubricant for plastics, an emulsifying agent in cosmetics, a dietary supplement, and in medicines.

magnesium sulfate.

CAS: 7587-88-9. (1) MgSO₄, (2) (epsom salts) MgSO₄•7H₂O.

Properties: Colorless crystals; saline bitter taste. Neutral to litmus. D (1) 2.65, (2) 1.678. (1) Decomposes at 1124C, (2) loses 6H₂O at 150C, loses water at 200C. Soluble in glycerol; very soluble in water; sparingly soluble in alcohol. Noncombustible.

Derivation: (1) Action of sulfuric acid on magnesium oxide, hydroxide, or carbonate, (2) mined in a high degree of purity.

Grade: Technical, CP, USP, FCC.

Use: Fireproofing, textiles (warp-sizing and loading cotton goods, weighting silk, dyeing and calico printing), mineral waters, catalyst carrier, ceramics, fertilizers, paper (sizing), cosmetic lotions, dietary supplement.

magnesium sulfide. MgS.

Properties: Red-brown, crystalline solid. D 2.84.

Decomposes above 2000C; decomposes in water.

Use: Source of hydrogen sulfide, laboratory reagent.

magnesium sulfite. MgSO₃•6H₂O.

Properties: White, crystalline powder. D 1.725, mp loses 6H₂O at 200C, bp (decomposes). Slightly soluble in water; insoluble in alcohol.

Derivation: Action of sulfurous acid on magnesium hydroxide.

Use: Manufacture of paper pulp (as bisulfite).

magnesium tetrahydrogen phosphate.

See magnesium phosphate, monobasic.

magnesium trisilicate. USP specifies not less than 20% magnesium oxide and 45% SiO₂, similar to the FCC requirements for magnesium silicate. See talc.

Properties: Fine, white; odorless; tasteless powder; free from grittiness. Insoluble in water and alcohol; readily decomposed by mineral acids. Noncombustible.

Derivation: By reaction of soluble magnesium salts with soluble silicates.

Grade: Technical, USP.

Use: Industrial odor absorbent, decolorizing agent, antioxidant, medicine (antacid).

magnesium tungstate. (magnesium wolframate). MgWO₄.

Properties: White crystals. D 5.66. Soluble in acids; insoluble in water and alcohol. Noncombustible.

Derivation: Interaction of solutions of magnesium sulfate and ammonium tungstate.

Use: Fluorescent screens for X rays, luminescent paint.

magnesium zirconate. MgO•ZrO₂.

Properties: Powder. D 4.23, mp 2060C.

Use: Electronics.

magnesium zirconium silicate. MgZrSiO₅, or MgO•ZrO₂•SiO₂.

Properties: White solid. Mp 1760C, d 80 lb/ft³. Insoluble in water and alkalies; slightly soluble in acids. Noncombustible.

Use: Electrical resistor, ceramics, glaze opacifier.

“Magnesol” [Dallas]. TM for a synthetic, amorphous, adsorptive magnesium silicate.

Use: Solvent purification, clarification, and recovery; oil refining and recovery; deodorizing and decolorizing oils and fats; chill-proofing fruit and vegetable-based beverages; anticaking; flavor and fragrance carrier.

magnetic double refraction. See Cotton-Mouton effect.

magnetic separation. Use of a magnetic field to remove unwanted magnetic particulates from solid or liquid mixtures of nonmagnetic materials, e.g., removal of impurities from clays, bauxite, glass sands, and mineral processing. Low-gradient fields are suitable for separation of strongly magnetic materials, whereas high-gradient fields can separate particles of materials that are weakly magnetic, such as coliform bacteria from municipal wastes and sulfur from coal. Removal of magnetic impurities from industrial wastewater is called magnetic filtration, e.g., reconditioning of boiler water and regeneration of condensate in power plants.

See electromagnetic separation; mass spectrometry.

magnetite. (lodestone; iron ore, magnetic).

Fe₃O₄ often with titanium or magnesium.

A component of taconite.

Properties: Black mineral, black streak, submetallic or dull to metallic luster. Contains 72.4% iron. Readily recognized by strong attraction by magnet. Soluble in powder form in hydrochloric acid. Decomposes at 1538C to ferric oxide Fe₂O₃, d 4.9–5.2, hardness 5.5–6.5.

See iron oxide, black.

magnetochemistry. A subdivision of chemistry concerned with the effect of magnetic fields on chemical compounds; analysis and measurement of these effects, (e.g., magnetic moment and magnetic susceptibility) are important tools in crystallographic research and determination of molecular structures. Substances that are repelled by a magnetic field are diamagnetic (water, benzene); those that are attracted are paramagnetic (oxygen, transition

element compounds). Diamagnetic materials have only induced magnetic moment; paramagnetic materials have permanent magnetic moment. Magnetochemistry has been useful in detection of free radicals, elucidation of molecular configurations of highly complex compounds, and in its application to catalytic and chemisorption phenomena.

See nuclear magnetic resonance.

magneto hydrodynamics. (MHD). The behavior of high-temperature ionized gases passed through a magnetic field. A power-generating method using MHD involves an open cycle in which hot combustible gases from coal, seeded with cerium or potassium to increase electrical conductivity, constitute the working fluid. These are sent through a nozzle surrounded by a magnet; the electricity induced by movement of the ionized gas through the magnetic field is passed to electrodes and the gas sent to a steam generator. Efficiency is rated at 50–60% compared with 40% for conventional fossil fuel plants and 33% for plants using nuclear fuels. Two-phase liquid-metal systems are being studied as auxiliary units for a number of energy converters. MHD is an important field of expansion of research activity on new sources of energy; its high efficiency and low pollution factor indicate that it may have a significant future in electric power supply. See plasma (2).

“Magnifloc” [Cytex]. TM for water soluble polymers for flocculation, coagulation, dispersion, and viscosification.

Available forms: Emulsion, dry and liquid forms, cationic, anionic and nonionic charges, and a broad range of molecular weights and chemistries.

Use: Liquid and solid separation applications.

Maillard reaction. See browning reaction.

“Maintain” [Aqualon]. TM for a line of products for cleaning, inhibiting corrosion, and coating architectural copper, brass, and bronze.

maitotoxin.

CAS: 59392-53-9. mf: $C_{164}H_{256}O_{68}S_2 \cdot 2Na$.

Hazard: A poison.

Source: Natural product.

Malachite Green. (Benzaldehyde Green; CI 42,000; Victoria Green).

CAS: 569-64-2. $C_{25}H_{25}ClN_3$.

Properties: Green crystals. Soluble in water; ethyl, methyl, and amyl alcohol.

Derivation: Condensation of benzaldehyde with *N,N*-dimethylaniline, oxidation of the phenylmethane product, and reaction with hydrochloric acid. It may be formed as a double salt of zinc chloride.

Hazard: Toxic by ingestion.

Use: Dyeing textiles, either directly or with mordant; plant fungicide, staining bacteria, antiseptic.

Malachite Green G. See Brilliant Green.

Malaprade reaction. Compounds containing two hydroxyl groups or a hydroxyl and an amino group attached to adjacent carbon atoms undergo cleavage of the carbon-to-carbon bond when treated with periodic acid.

malathion. (*S*-[1,2-bis(ethoxycarbonyl)ethyl]-*O,O*-dimethyl phosphorodithioate).

CAS: 121-75-5.

$(CH_3O)_2P(S)SCH(COOC_2H_5)CH_2COOC_2H_5$.

Properties: Yellow, high-boiling liquid. Bp 156–157°C under 0.7 mm Hg with slight decomposition, mp 3.0°C, refr index 1.4985 (25°C), d 1.2315 (25°C), vap press (20°C) approximately 0.00004 mm Hg. Miscible with most polar organic solvents; slightly soluble in water. Combustible.

Derivation: From diethyl maleate and dimethyldithiophosphoric acid.

Grade: Technical grade is 95+% pure.

Hazard: Absorbed by skin, cholinesterase inhibitor. TLV: TWA 10 mg/m³ (skin); not classifiable as a human carcinogen.

Use: Insecticide; has been used effectively on the Mediterranean fruit fly.

malathion-fenitrothion mixture. See fenitrothion-malathion mixture.

malaxate. To soften and mix dry materials in the presence of water or other liquid by rubbing, kneading, or rolling, thus producing a soft plastic mass. This term is used by one manufacturer, the Fitzpatrick Co., 832 Industrial Drive, Elmhurst, IL 60126, to describe a machine designed for this purpose, it provides continuous mixing of dry solids with one or more liquids by means of single or double screw-type agitators rotating in a channel.

maleic acid. (maleinic acid; *cis*-butenedioic acid).

CAS: 110-16-7.

Properties: Colorless crystals; repulsive astringent taste; faint odor. D 1.59, mp 130–131°C. Soluble in water, alcohol and acetone; very slightly soluble in benzene. At temperatures slightly higher than its melting point, it is converted partly to fumaric acid. Combustible.

Derivation: Same as for maleic anhydride with special recovery conditions.

Grade: Technical, reagent.

Hazard: Toxic by ingestion.

Use: Organic synthesis (malic, succinic, aspartic, tartaric, propionic, lactic, malonic and acrylic acids);

dyeing and finishing of cotton, wool and silk; preservative for oils and fats.

maleic anhydride. (2,5-furandione).
CAS: 108-31-6.

Properties: Colorless needles. D 0.934 (20/4C), mp 53C, bp 200C, flash p 218F (103C), autoign temp 890F (476C). Soluble in water, acetone, alcohol, and dioxane; partially soluble in chloroform and benzene.

Derivation: (1) Vapor-phase oxidation of benzene with atmospheric oxygen with V_2O_5 catalyst at 400C. (2) Under development is a fixed-bed process involving oxidation of butane with undisclosed catalyst.

Grade: Technical; rods, flakes, lumps, briquettes, and molten.

Hazard: Irritant to tissue. TLV: 0.25 ppm.

Use: Polyester resins, alkyd coating resins, fumaric and tartaric acid manufacture, pesticides, preservative for oils and fats, permanent-press resins (textiles), Diels-Alder reactions.

maleic hydrazide. (1,2-dihydro-3,6-pyridazinedione).
CAS: 108-31-6.

HC:CHC(O)NHNHC(O). A plant growth regulator.
Properties: Crystals. Mp 297C. Slightly soluble in hot alcohol; more soluble in hot water.

Derivation: By treating maleic anhydride with hydrazine hydrate.

Hazard: Toxic by ingestion.

Use: Systemic herbicide, treatment of tobacco plants, postharvest sprouting inhibitor, weed control, sugar content stabilizer in beets.

maleimide. (pyrrole-2,5-dione).
CAS: 541-59-3. mf: $C_4H_3NO_2$

Properties: Plates. Mw: 97.08, mp: 93C.

Hazard: A poison.

maleinic acid. See maleic acid.

maleo-pimaric acid. Reaction product of maleic anhydride and *l*-pimaric acid; derived from pine gum.

Properties: Crystalline solid. Mp approximately 225C. Soluble in most organic solvents; insoluble in water or aliphatic hydrocarbons.

Use: Resins.

malic acid. (hydroxysuccinic acid; apple acid).

CAS: 6915-15-7. $COOHCH_2CH(OH)COOH$

Note: Do not confuse with maleic acid.

Properties: Colorless crystals; sour taste. D (*dl*-form) 1.601, (*d*- or *l*-form) 1.595 (20/4C); mp (*dl*) 128C, (*d*- or *l*-) 100C; bp (*dl*) 150C (decomposes), (*d*- or *l*-) 140C (decomposes). Very soluble in water and alcohol; slightly soluble in ether. Combustible.

Derivation: Occurs naturally in unripe apples and other fruits. Made synthetically by catalytic oxidation of benzene to maleic acid, which is converted to malic acid by heating with steam under pressure.

Grade: Technical, active, and inactive; FCC. The natural material is levorotatory but the synthetic material is inactive.

Use: Manufacture of various esters and salts, wine manufacture, chelating agent, food acidulant, flavoring.

malloside.

CAS: 17489-40-6. mf: $C_{29}H_{44}O_9$.

Hazard: A poison.

Source: Natural product.

malonamide. (carboxamidoacetamide; malonic acid diamide).

CAS: 108-13-4. mf: $C_3H_6N_2O_2$

Properties: Dimorphous, tetragonal or monoclinic. Mw: 102.11, mp: 170C. Soluble in water @ 8C; insoluble in EtOH and Et_2O ; insoluble in ether.

Hazard: Mildly toxic by ingestion.

malonamide nitrile. See cyanoacetamide.

malonic acid. (methanediacetic acid).

CAS: 141-82-2. $CH_2(COOH)_2$.

Properties: White crystals. Mp 132–134C, bp (decomposes), d 1.63. Soluble in water, alcohol and ether.

Derivation: From monochloroacetic acid by reaction with potassium cyanide followed by hydrolysis.

Hazard: Strong irritant.

Use: Intermediate for barbiturates and pharmaceuticals.

malonic acid diamide. See malonamide.

malonic dinitrile. (malononitrile).

CAS: 109-77-3. $CH_2(CN)_2$.

Properties: Colored crystals. Mp 32.1C, bp 220C.

Hazard: Toxic by ingestion and inhalation.

Use: Organic synthesis, leaching agent for gold.

malonic ester. See ethyl malonate.

malonic ester synthesis. Syntheses based on the strongly activated methylene group of malonic esters which on reaction with sodium ethoxide form a resonance-stabilized ion that can be alkylated and acylated. After hydrolysis, the free alkylmalonic

acids readily decarboxylate to mono- or disubstituted monocarboxylic acids.

malonic ethyl ester nitrile. See ethyl cyanoacetate.

malonic methyl ester nitrile. See methyl cyanoacetate.

malonic mononitrile. See cyanoacetic acid.

malononitrile. See malonic dinitrile.

malonylurea. See barbituric acid.

malt. Yellowish or amber-colored grains of barley that have been partially germinated by artificial means. It contains dextrin, maltose, and amylase; characteristic odor and taste. Black malt is grain that has been scorched in the drying process.

Use: Brewing, malted milk and similar food products, extract of malt (with 10% glycerol).

maltase. (glucase; α -glucosidase). An enzyme that hydrolyzes maltose to glucose. Occurs in the small intestine, in yeast, molds, and malt; usually associated with the enzyme amylase.

malt extract. (maltine).

Properties: Light-brown, sweet, viscous liquid; contains dextrin, maltose, a little glucose, and an amylolytic enzyme. It is capable of converting not less than five times its weight of starch into water-soluble sugars; soluble in cold water but more readily soluble in warm water, d greater than 1.350 and less than 1.430 (25C).

Derivation: By infusing malt with water at 60C, concentrating the expressed liquid below 60C, and adding 10% by weight of glycerol.

Use: Nutrient, emulsifying agent.

maltha. A black, viscous, natural bitumen consisting of a complex mixture of hydrocarbons. Its viscosity and rheological properties lie between those of crude oil and semisolid asphalt. It is the chief component of Athabaska oil sands.

malthenes. See petrolenes.

maltodextrin.

CAS: 9050-36-6. mf: $(C_6H_{10}O_5)_n$

Properties: White powder or solution from partial hydrolysis of wheat or corn starch.

Use: Food additive.

maltol. (3-hydroxy-2-methyl-4-pyrone).

CAS: 118-71-8. $CH_3C_5H_2O(O)(OH)$

Properties: White, crystalline powder; characteristic caramel-butterscotch odor and suggestive of a fruity-strawberry aroma in dilute solution. Melting range 160–164C. Slightly soluble in water; more soluble in alcohol and propylene glycol.

Grade: FCC.

Use: Flavoring agent in bakery products.

maltose. (malt sugar; maltobiose).

CAS: 69-79-4. $C_{12}H_{22}O_{11} \cdot H_2O$. The most common reducing disaccharide, composed of two molecules of glucose. Found in starch and glycogen.

Properties: Colorless crystals. Mp 102–103C. Soluble in water; insoluble in ether; slightly soluble in alcohol. Combustible.

Derivation: By the enzymatic action of diastase (usually obtained from malt extract) on starch.

Use: Nutrient, sweetener, culture media, stabilizer for polysulfides, brewing.

malt syrup.

Properties: Derived from barley (*Hordeum vulgare* L.). Brown liquid; sweet taste. Sol in water.

Use: Food additive.

Man. Abbreviation for mannose, also for methacrylonitrile.

mandarin oil. See citrus peel oils.

mandarin oil, coldpressed.

Properties: From expression of peel of *Citrus reticulata* Blanco var. *Mandarin*. Clear orange to brown-orange liquid; orange odor. D: 0.846. Sol in fixed oils, mineral oil; slt sol in propylene glycol; insol in glycerin.

Use: Food additive.

mandelic acid. (phenylglycolic acid; α -phenylhydroxyacetic acid; benzoglycolic acid, known also as amygdalic acid).

CAS: 90-64-2. $C_6H_5CH_2COOH$. Exists in stereoisomeric forms. The properties are those of the *dl*-form.

Properties: Large, white crystals or powder; faint odor. D 1.30, mp 117–119C, darkens on exposure to light. Soluble in ether; slightly soluble in water and alcohol.

Derivation: Hydrolysis of the cyanohydrin formed from benzaldehyde, sodium bisulfite, and sodium cyanide. Can be obtained from amygdalin.

Hazard: Toxic by ingestion.

Use: Organic synthesis, medicine (urinary anti-septic).

mandelonitrile. (benzaldehyde cyanohydrin; "Laetrile").

CAS: 532-28-5. $C_6H_5CH(OH)CN$.

Properties: Oily, yellow liquid. D 1.1165 (20/4C), fp –10C, bp 170C (decomposes). Soluble in alcohol, chloroform, ether; nearly insoluble in water.

mandelyltropeine. See homotropine.

maneb. (generic name for manganese ethylenebis(dithiocarbamate)).

CAS: 12427-38-2. (SSCNCH₂CH₂NHCSS)Mn.

Properties: Brown powder. Decomposes on heating. Partially soluble in water; soluble in chloroform.

Derivation: Reaction of disodium ethylenbis(dithiocarbamate) and a manganese salt.

Use: Fungicide for foliage.

See zineb.

manganese.

CAS: 7439-96-5. Mn. Metallic element of atomic number 25, group VIIB of periodic table, aw 64.9380, valences = 2, 3, 4, 6, 7; no stable isotopes; four artificial radioisotopes.

Properties: There are four allotropic forms of which α is most important. Brittle silvery metal, d 7.44, Mohs hardness 5, mp 1245C, bp 2097C, decomposes water. Readily dissolves in dilute mineral acids. Pure manganese cannot be fabricated. Manganese is considered essential for plant and animal life.

Occurrence: Usually associated with iron ores in submarginal concentration. Important ores of manganese are pyrolusite, manganite, psilomelane, rhodochrosite. An important source of manganese is open-hearth slags. Ores occur chiefly in Brazil, India, South Africa, Gabon, Ghana, Zaire, Montana; 90% of U.S. consumption is imported. So-called nodules rich in manganese and containing also cobalt, nickel, and copper have been found in huge quantities (estimated at 1.5 trillion tons) on the floor of the Pacific south of Hawaii. Such nodules have been located in other areas such as in Lake Michigan.

Derivation: Reduction of the oxide with aluminum or carbon. Pure manganese is obtained electrolytically from sulfate or chloride solution.

Grade: Technical, pure or electrolytic, powdered.

Hazard: Dust or powder is flammable. Use dry chemical to extinguish. Toxic. TLV: (fume) 1 mg/m³; (metal and most compounds): ceiling 5 mg/m³.

Use: Ferroalloys (steel manufacture), nonferrous alloys (improved corrosion resistance and hardness), high-purity salt for various chemical uses, purifying and scavenging agent in metal production, manufacture of aluminum by Toth process.

manganese acetate. (acetic acid manganese(2+) salt).

CAS: 638-38-0. Mn(C₂H₃O₂)₂•4H₂O.

Properties: Pale-red crystals. D 1.59, mp 80C. Soluble in water and alcohol. Combustible.

Derivation: Action of acetic acid on manganese hydroxide.

Use: Textile dyeing, oxidation catalyst, paint and varnish (drier, boiled oil manufacture), fertilizers, food packaging, feed additive.

manganese ammonium sulfate. (manganous ammonium sulfate).

MnSO₄•(NH₄)₂SO₄•6H₂O.

Properties: Light-red crystals. D 1.83. Soluble in water.

manganese arsenate. See manganous arsenate.

manganese binoxide. See manganese dioxide.

manganese, bis(2-benzoylbenzoato)bis(3-(1-methyl-2-pyrrolidinyl)pyridine)-, trihydrate. See nicotine, compounded with manganese(ii) *o*-benzoyl benzoate.

manganese black. See manganese dioxide.

manganese borate. MnB₄O₇.

Properties: Reddish-white powder. Insoluble in water.

Derivation: By the action of boric acid on manganese hydroxide.

Grade: Technical.

Use: Varnish and oil drier.

manganese-boron. An alloy of manganese and boron used in making brass, bronze, and other alloys.

manganese bromide. See manganous bromide.

manganese bronze. Alloy of 55–60% copper, 38–42% zinc, up to 3.5% manganese with or without small amounts of iron, aluminum, tin or lead.

manganese caprylate.

Use: Food additive.

manganese carbonate. (manganous carbonate; rhodochrosite). MnCO₃.

Properties: Rose-colored crystals, almost white when precipitated. D 3.125, mp (decomposes). Soluble in dilute inorganic acids; almost insoluble in common organic acids; both concentrated and dilute, insoluble in water.

Derivation: (1) A precipitate from the addition of sodium carbonate to a solution of a manganese salt; (2) hydrometallurgical treatment of manganiferrous iron ore.

Grade: Chemical (46% manganese).

manganese carbonyl. Mn₂(CO)₁₀.

Properties: Yellow crystals. Mp 154C. Decomposition begins at 110C in absence of CO, d 1.75. Insoluble in water; soluble in most organic solvents.

Hazard: Toxic material. TLV: ceiling of 5 mg(Mn)/m³.

Use: Antiknock gasoline, catalyst.

manganese chloride. See manganous chloride.

manganese chromate. See manganous chromate.

manganese citrate. (manganous citrate).

Properties: White powder. Soluble in water in presence of sodium citrate. Combustible.

Derivation: Action of citric acid on manganese hydroxide.

Use: Feed additive, food additive, and dietary supplement.

manganese cyclopentadienyl tricarbonyl.

Hazard: Toxic material absorbed by skin. TLV: 0.1 ppm(Mn).

Use: Antiknock agent.

manganese dioxide. (manganese binoxide; manganese black; battery manganese; manganese peroxide).

Properties: Black crystals or powder. D 5.026, mp (decomposes). Soluble in hydrochloric acid; insoluble in water.

Derivation: (1) Natural as pyrolusite and as a special African ore of different atomic structure used exclusively for the battery grade; (2) by electrolysis; (3) by heating manganese oxide in presence of oxygen; (4) by decomposition of manganese nitrate.

Grade: Technical, CP, Battery.

Hazard: Oxidizing agent, may ignite organic materials.

Use: Oxidizing agent, depolarizer in dry cell batteries (African and synthetic types only), pyrotechnics, matches, etc., catalyst, laboratory reagent, scavenger and decolorizer, textile dyeing, source of metallic manganese (as pyrolusite).

manganese dithionate. MnS_2O_6 .

Properties: Crystals. D 1.76. Soluble in water.

manganese ethylenebisdithiocarbamate.

See maneb.

manganese ethylhexoate. See manganese octoate.

manganese fluoride. See manganous fluoride.

manganese gluconate. $\text{Mn}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Light-pinkish powder or coarse, pink granules. Soluble in water; insoluble in alcohol and benzene. Combustible.

Grade: Pharmaceutical, FCC.

Use: Feed additive, food additive and dietary supplement, vitamin tablets.

manganese glycerophosphate.

Properties: Yellow-white or pinkish powder; odorless. Nearly tasteless. Soluble in water in presence of citric acid; insoluble in alcohol.

Derivation: Action of glycerophosphoric acid on manganese hydroxide.

Grade: Technical, FCC.

Use: Food additive and dietary supplement.

manganese green. See barium manganate.

manganese hydrate. See manganic hydroxide, manganous hydroxide.

manganese hydrogen phosphate. See manganous phosphate, acid.

manganese hydroxide. See manganic hydroxide, manganous hydroxide.

manganese hypophosphite.

Properties: Pink crystals or powder; odorless; tasteless. Soluble in water; insoluble in alcohol.

Derivation: Interaction of manganese sulfate and calcium hypophosphite.

Grade: Technical, FCC.

Hazard: Dangerous fire and explosion risk when heated (evolves phosphine) or in presence of strong oxidizing agents.

Use: Food additive and dietary supplement.

manganese iodide. See manganous iodide.

manganese linoleate. $\text{Mn}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Dark-brown, plasterlike mass. Soluble in linseed oil. Combustible.

Derivation: By boiling a manganese salt, sodium linoleate, and water.

Use: Paint and varnish drier, pharmaceutical preparations.

manganese monoxide. See manganous oxide.

manganese naphthenate.

Properties: Hard, brown, resinous mass. It is a pale buff in color when precipitated in the cold, but darkens immediately in solution. Mp approximately 130–140C, commercial solution contains 6% manganese. Soluble in mineral spirits. Hardens on exposure to air. Combustible.

Derivation: Precipitation from a mixture of soluble manganese salts and aqueous sodium naphthenate solution.

Hazard: Solution is flammable.

Use: Paint and varnish drier.

manganese nitrate. See manganous nitrate.

manganese octoate. (manganese ethylhexoate). $\text{Mn}(\text{OCC}_6\text{H}_{13}[\text{C}_2\text{H}_5]_2)_2$. Commercially formed from 2-ethylhexoic acid and manganous hydroxide. Sold as a clear brown solution in a petroleum solvent containing 6% manganese.

Hazard: Solution is flammable.

Use: Primarily as drier for paints, enamels, varnishes, and printing inks.

manganese oleate. $\text{Mn}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown, granular mass. Soluble in oleic acid and ether; insoluble in water.

Derivation: By boiling manganese chloride, sodium oleate, and water.

Hazard: Solution is flammable.

Use: Paint and varnish drier.

manganese oxalate. $\text{MnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. D 2.453, loses $2\text{H}_2\text{O}$ at 100C. Soluble in dilute acids; very slightly soluble in water. Combustible.

Derivation: By adding sodium oxalate to manganous chloride.

Use: Paint and varnish drier.

manganese peroxide. See manganese dioxide.

manganese phosphate. See manganous phosphate; manganous phosphate, acid.

manganese phosphate, dibasic. See manganous phosphate, acid.

manganese protoxide. See manganous oxide.

manganese pyrophosphate. See manganous pyrophosphate.

manganese resinate. $\text{Mn}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Dark, brownish-black mass or flesh-colored powder. Soluble in hot linseed oil; insoluble in water.

Derivation: By boiling manganese hydroxide, rosin oil, and water.

Hazard: Flammable, dangerous fire risk.

Use: Varnish and oil drier.

manganese sesquioxide. See manganic oxide.

manganese silicate. See manganous silicate.

manganese sulfate. See manganous sulfate.

manganese sulfide. See manganous sulfide.

manganese sulfite. See manganous sulfite.

manganese tallate. Manganese salts of tall oil fatty acids. Marketed as a solution containing 6% manganese. Combustible.

Use: Drier.

manganese tetroxide. (manganese oxide; trimanganese tetroxide).

CAS: 1317-35-7. Mn_2O_4 .

Properties: A brownish-powder. Mw 228.79, d 4.876, mp 1564C. Insoluble in water; soluble in hydrochloric acid with evolution of chlorine.

Occurrence: Generated in the pouring and casting of molten ferromanganese.

Hazard: Chronic manganese poisoning and pulmonary effects. TLV: 1 mg/m³.

manganese-titanium. An alloy containing manganese, titanium, aluminum, iron, silicon.

Properties: (Regular) Mp 1454C, (special) mp 1332C.

Use: (Regular) Deoxidizer in high grade steel; (special) nonferrous alloys deoxidizer.

manganic acetylacetonate.

$\text{Mn}[\text{OC}(\text{CH}_3)_2\text{CHCO}(\text{CH}_3)]_3$.

Properties: Brown, crystalline solid. Mp 172C. Combustible.

Derivation: Reaction of a manganese salt with acetylacetonone and sodium carbonate.

manganic fluoride. MnF_3 .

Properties: Red, crystalline solid. D 3.54. Decomposed by water and by heat. Soluble in acids. Attacks glass when hot.

Hazard: Toxic material. TLV: 2.5 mg(F)/m³.

Use: Fluorinating agent.

manganic hydroxide. (manganese hydroxide; hydrated manganic oxide). $\text{Mn}(\text{OH})_3$; rapidly loses water to form $\text{MnO}(\text{OH})$.

Properties: Brown powder. D 4.2–4.4, mp (decomposes). Decomposes in acids. Insoluble in water.

Derivation: By the action of oxygen on precipitated manganous hydroxide.

Use: Pigment for fabrics, ceramics.

manganic oxide. (manganese sesquioxide).

Mn_2O_3 . In nature as manganite, a manganese ore.

Properties: Black, lustrous powder, sometimes tinged brown. Very hard. D 4.5, decomposes at 1080C. Soluble in cold hydrochloric acid; not soluble in nitric acid (decomposes), hot sulfuric acid; insoluble in water. Noncombustible.

Hazard: Flammable in finely divided form. Toxic by inhalation of dust.

manganic oxide, hydrated. See manganic hydroxide.

manganous ammonium sulfate. See manganous ammonium sulfate.

manganous arsenate. (manganese arsenate; manganous arsenate, acid). MnHAsO_4 .

Properties: Reddish-white powder. Hygroscopic. Soluble in acids; slightly soluble in water.

Hazard: Highly toxic.

manganous bromide. (manganese bromide). $\text{MnBr}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Red crystals. Loses water at 64C. Very soluble in water; deliquescent. Noncombustible.

Derivation: Action of hydrobromic acid with manganous carbonate or manganous hydroxide.

Hazard: Irritant.

manganous carbonate. See manganese carbonate.

manganous chloride. (manganese chloride). CAS: 7773-01-5. (1) MnCl_2 , (2) $\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Rose-colored crystals; deliquescent. D (1) 2.98, (2) 1.913; mp (1) 650C, (2) 87.5C; bp (1) 1190C. Very soluble in water; soluble in alcohol; insoluble in ether. Noncombustible.

Grade: CP, anhydrous.

Use: Catalyst in the chlorination of organic compounds, paint drier, dyeing, pharmaceutical preparations, fertilizer compositions, feed additive, dietary supplement.

manganous chromate. (manganese chromate; manganous chromate, basic). $2\text{MnO} \cdot \text{CrO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Brown powder. Slightly soluble in water with hydrolysis.

Hazard: Toxic by inhalation.

manganous citrate. See manganese citrate.

manganous fluoride. (manganese fluoride). MnF_2 .

Properties: Reddish powder. D 3.98, mp 856C. Soluble in acids; insoluble in water, alcohol, and ether. Noncombustible.

Derivation: Action of hydrogen fluoride on manganous hydroxide.

Grade: Technical.

Hazard: TLV: 2.5 mg(F)/m³.

manganous hydroxide. (manganese hydroxide). $\text{Mn}(\text{OH})_2$. Occurs naturally as pyrochroite.

Properties: White to pink crystals. D 3.258, Mohs hardness 2.5, decomposes with heat. Insoluble in water and alkali; soluble in acids and ammonium salts.

manganous iodide. (manganese iodide). (1) MnI_2 , (2) $\text{MnI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: (1) White, deliquescent, crystalline mass; (2) rose crystals. D (1) 5.01, mp (1) 638C (in vacuum), bp (1) 1061C. Soluble in water with gradual decomposition; soluble in alcohol.

Derivation: Action of hydriodic acid on manganous hydroxide.

manganous nitrate. (manganese nitrate).

CAS: 10377-66-9. $\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Pink crystals. D 1.82, bp 129C, mp 26C. Very soluble in water; deliquescent; soluble in alcohol.

Hazard: Fire and explosion risk in contact with organic materials.

Use: Ceramics, intermediates, catalyst, manganese dioxide.

manganous orthophosphate. See manganous phosphate.

manganous oxide. (manganese protoxide; manganese monoxide).

CAS: 1317-35-7. MnO .

Properties: Grass-green powder. D 5.45, mp 1650C, but converted to Mn_3O_4 if heated in air. Soluble in acids; insoluble in water. Noncombustible.

Derivation: (1) By reduction of the dioxide in hydrogen, (2) by heating the carbonate with exclusion of air.

Grade: Technical.

Use: Textile printing, analytical chemistry, catalyst in manufacture of allyl alcohol, ceramics, paints, colored glass, bleaching tallow, animal feeds, fertilizers, food additive and dietary supplement.

manganous phosphate. (manganese phosphate; manganous orthophosphate).

$\text{Mn}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Reddish-white powder. Soluble in mineral acids; insoluble in water.

Derivation: By the action of orthophosphoric acid on manganous hydroxide.

Use: Conversion coating of steels, aluminum, and other metals.

manganous phosphate, acid. (manganese hydrogen phosphate; manganous phosphate, secondary; manganese phosphate, dibasic).

$\text{MnHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Pink powder, contains some tribasic phosphate. Soluble in acids; slightly soluble in water.

Use: Feed additive.

manganous pyrophosphate. (manganese pyrophosphate). (1) $\text{Mn}_2\text{P}_2\text{O}_7$, (2) $\text{Mn}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: White powder. D (1) 3.71, mp 1196C. Soluble in solutions of potassium or sodium pyrophosphate; insoluble in water.

manganous silicate. (manganese silicate).

MnSiO_3 . Occurs naturally as rhodonite.

Properties: Red crystals or yellowish-red powder. D 3.72, mp 1323C. Insoluble in water. Noncombustible.

Derivation: Interaction of manganous salts with sodium silicate.

Use: Colorant for glass and ceramic glazes.

manganous sulfate. (manganese sulfate).

CAS: 7785-87-7. $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Translucent, pale-rose-red, efflorescent prisms. D 2.107, mp 30C, anhydrous mp 700C, decomposes at 850C. Soluble in water; insoluble in alcohol.

Derivation: By-product of production of hydroquinone, or by the action of sulfuric acid on manganous hydroxide or carbonate.

Grade: Technical, CP, fertilizer, feed.

Use: Fertilizers, feed additive, paints and varnishes, ceramics, textile dyes, medicines, fungicides, ore flotation, catalyst in viscose process, synthetic manganese dioxide.

manganous sulfide. (manganese sulfide).

CAS: 18820-29-6. MnS . Green crystals, d 3.99, decomposes on melting, almost insoluble in water.

Use: Additive in steel making.

manganous sulfite. (manganese sulfite; manganous sulfite, normal). MnSO_3 .

Properties: Grayish-black or brownish-red powder. Soluble in solution of sulfur dioxide; insoluble in water.

Manila fiber. See abaca.

Manila resin. A type of copal resin similar to Congo and kauri.

Properties: D 1.062, mp 230–250C. Soluble in ether, methanol, and ethanol; partially soluble in amyl alcohol; insoluble in water. Combustible.

Occurrence: Philippine Islands and East Indies.

Use: Varnishes, paints, lacquers, printing inks.

manna. The water-soluble exudate of a plant occurring in the Mediterranean area, used in medicine as a laxative. It has a high carbohydrate content, especially of mannitol.

Mannheim furnace. A muffle furnace used for the manufacture of salt cake and hydrogen chloride. It consists of a firebrick compartment in which is a circular pan some 10–15 ft in diameter, usually made of cast iron. The charge is fed through a hopper at the top and plows maintain continuous movement of the materials being heated. The temperature of the hydrogen chloride gas evolved is approximately 145C. Salt cake is removed through an opening at the side. The furnace is run continuously. The Mannheim furnace is no longer widely used because most salt cake is now obtained from natural sources.

Mannich reaction. Reaction of active methylene compounds with formaldehyde and ammonia or primary or secondary amines to give β -aminocarbonyl compounds.

mannitol. (manna sugar; mannite).

CAS: 69-65-8. $\text{C}_6\text{H}_8(\text{OH})_6$. A straight-chain hexahydric alcohol.

Properties: White, crystalline powder or granules; odorless; faint sweet taste. D 1.52, mp 165–167C, specific rotation (20C) between +23 and +24 degrees, bp 290–295C (3–3.5 mm Hg). Soluble in water; slightly soluble in lower alcohols and amines; almost insoluble in other organic solvents. Combustible.

Derivation: (1) A natural plant exudate; (2) by hydrogenation of corn sugar or glucose.

Grade: Reagent, commercial, NF, FCC.

Use: Base for dietetic foods, diluent, determination of boron, pharmaceutical products, medicine, thickener and stabilizer in food products.

mannitol hexanitrate. (hexanitromannite;

HNM; nitromannite; nitromannitol).

CAS: 15825-70-4. $\text{C}_6\text{H}_8(\text{ONO}_2)_6$.

Properties: Colorless crystals. Mp 112–113C. Soluble in alcohol, acetone, ether; insoluble in water.

Derivation: By nitrating mannitol with mixed acid, purifying the precipitate from organic solvents and stabilizing.

Grade: Technical, pharmaceutical.

Hazard: Dangerous fire and explosion risk; an initiating explosive.

Use: Explosive cap ingredient, medicine (admixed with at least 10 parts of carbohydrate).

D(+)-mannose. $\text{C}_6\text{H}_{12}\text{O}_6$. A carbohydrate occurring in some plant polysaccharides.

Properties: Crystals from alcohol or acetic acid; sweet taste with bitter aftertaste. Mp 132C (decomposes).

Use: Biochemical research.

“Manugel C” [Kelco]. TM for specialty algin blends.

manure salts. Potash salts that have a high proportion of chloride and 20–30% potash.

Use: in fertilizers.

“MAPEG” [PPG]. (ethylene glycol distearate). TM for emulsifier and pearling opacifier.

Use: For cosmetics and pharmaceutical creams, lotions, and ointments.

MAPP. See methylacetylene-propadiene, stabilized.

mapping population. The group of related organisms used in constructing a genetic map.

maraging steel. An alloy steel containing nickel, cobalt, and titanium.

Use: Solid rocket cases.

maranta. See arrowroot.

Marathon-Howard process. A treatment of waste sulfite liquor from sulfite pulp manufacture to recover chemicals and reduce stream pollution. The waste sulfite is treated with lime and precipitates (1) calcium sulfite for use in preparing fresh cooking acid for the sulfite pulp process; and (2) a basic calcium salt of lignin sulfonic acid (lignin sulfonates) that can be pressed and used as a fuel or used as raw material for vanillin, lignin plastics, and other chemicals. The remaining liquor with its BOD reduced 80% is the effluent.

marble. A metamorphic form of calcium carbonate, usually containing admixtures of iron and other minerals that impart variegated color patterns. Marble chips are often used as source of carbon dioxide in laboratory experiments.

Marcus, Rudolph A. (1923–). An American who won the Nobel Prize for chemistry in 1992 for his theories of electron transfer. The processes Marcus has studied, the transfer of electrons between molecules in solution, underlie a number of exceptionally important chemical phenomena, and the practical consequences of his theory extend over all areas of chemistry. The Marcus theory describes, and makes predictions concerning, such widely differing phenomena as the fixation of light energy by green plants, photochemical production of fuel, chemiluminescence ('cold light'), the conductivity of electrically conducting polymers, corrosion, the methodology of electrochemical synthesis and analysis, and more.

margaric acid. See *n*-heptadecanoic acid.

marijuana. See cannabis.

marjoram oil. A yellowish essential oil, optically active.

Use: Soap perfume and in toilet preparations. The Spanish grade is used as a flavoring ingredient.

marker.

(1) Molecular weight size marker is a piece of DNA of known size, or a mixture of pieces with known size, used on electrophoresis gels to determine, by comparison, the size of unknown DNAs.

(2) Genetic marker is a known site on the chromosome. It may for example be the site of a locus with some recognizable phenotype, or it may be the site of a polymorphism that can be experimentally discerned.

Mark-Houwink equation. Defines the relationship between the intrinsic viscosity and molecular weight for homogeneous linear polymers.

Markownikoff rule. When a halogen acid adds to an asymmetrical ethylenic compound, the halogen usually appears on the carbon atom carrying the smaller number of hydrogen atoms; this order of addition is frequently reversed with hydrogen bromide if peroxides are present (peroxide effect).

"Marlate" [Du Pont]. TM for technical grade methoxychlor insecticides, supplied in 50% wettable powder and an emulsifiable formulation containing 2 lb/gal.

"Marlex" [Phillips]. TM for high-density polyethylene.

Use: Packaging, consumer and industrial goods, pipe, film, transportation, building, and construction.

Marquis' reagent. Formaldehyde-sulfuric acid reagent for alkaloids.

marsh gas. See methane.

martensite. The chief constituent of hardened carbon tool steels. It is a solution of carbon or Fe₃C in β -iron, or an exceedingly fine-grained α -iron with carbon or Fe₃C in atomic or molecular dispersion. Carbon content up to 1%; easily obtained by quenching small bodies of hypereutectoid steel in cold water; more difficult to obtain in low-carbon steels.

Martin, Archer J. P. (1910–1994). An English chemist and engineer who won the Nobel Prize for chemistry in 1952 along with Syngge. His work involved partition chromatography in analysis which led to development of new antibiotics and amino acids. He received his doctorate from Cambridge University.

Martinet dioxindole synthesis. Formation of derivatives of dioxindole from esters of mesoxalic acid and aromatic amines or amino quinolines.

martonite. A lachrymator gas containing 80% bromoacetone and 20% chloroacetone.

"Marvess" [Phillips]. TM for olefin (polypropylene) fiber.

Use: Consumer, home furnishings, and industrial applications.

mash. A mixture of malted barley (or other grain) and water used for preparing wort in brewing operations. Also a mixture of grain, etc., prepared for fermentation in distilling, e.g., "sour mash whiskey."

“Masonex” [*Masonite*]. TM for a hemicellulose extract.

Properties: Liquid containing 65% solids, 55% carbohydrates, pH 5.5. Water soluble; the spray-dried product is also water soluble with 97% solids and 84% carbohydrates (pH 3.7).

Derivation: From wood fibers after mild acid hydrolysis in steam.

Use: (Liquid) Intermediate in furfuryl production, animal feeds; (dried) binder in refractory bricks, tackifier in adhesives.

“Masonite” [*Masonite*]. TM for composition hardboard made by treating wood chips with steam at high pressure and compressing the resulting fibers into mats from which rigid panels are made by hot-pressing. The fiber is waterproofed with a water repellent sizing agent having a paraffin base.

masonry cement. A group of special cements more workable and plastic than Portland cement. Some are similar to waterproofed Portland cement while others are Portland cement mixed with hydrated lime, crushed limestone, diatomaceous earth, or granulated slag.

mass. The quantity of matter contained in a particle or body regardless of its location in the universe. Mass is constant, whereas weight is affected by the distance of a body from the center of the earth (or of any other planet or satellite, e.g., the moon). At extremely high temperatures (for example the sun’s interior), mass is converted into energy. According to the Einstein equation $E = mc^2$, all forms of energy, such as radiant energy and energy of motion, possess a mass equivalent, even though they have no independent rest mass (photons); thus there is no absolute distinction between mass and energy. See energy; matter.

mass action law. The rate of a chemical reaction for a uniform system of constant temperature is proportional to the concentrations of the substances reacting. See chemical laws (1).

mass-action ratio. The ratio which describes the kinetics of a reaction, given as products over reactants. For a hypothetical reaction $aA + bB \rightleftharpoons cC + dD$, the ratio would be $[A]^a [B]^b / [C]^c [D]^d$

mass conservation law. See chemical laws (4).

mass defect. The difference between the total mass of the constituents of an atomic nucleus (protons and neutrons) taken independently, and the actual mass of the nucleus as a whole. The latter is always slightly less than the sum of the masses of the constituents, the difference being the mass equivalent of the energy of formation (binding energy) of the nucleus. This accounts for the high energy re-

lease obtained from nuclear fission. See fission, nuclear; mass number.

massecuite. Term used in the sugar industry for the mixture of sugar and molasses prior to removal of the molasses.

massicot. PbO. (1) (Lead ocher) Natural lead monoxide, PbO. Contains 92.8% lead; found in U.S. (Colorado, Idaho, Nevada and Virginia). (2) An oxide of lead corresponding to the same formula as litharge (PbO), but having a different physical state. **Properties:** It is a yellow powder formed by the oxidation of a bath of metallic lead at approximately 345C so that the oxide formed is not melted. D 9.3, mp 600C. If the oxide is melted, it is converted into litharge.

mass number. The number of neutrons and protons in the nucleus of an atom. Thus, the mass number of normal helium is 4; of carbon, 12; of oxygen, 16; and of uranium 238. A given atom is characterized by its atomic number, equivalent to the number of protons, which give it its charge and thus determine the kind of element, and by its mass number, which includes the neutrons that make up the remainder of its mass. Helium has 2 protons and 2 neutrons (mass number 4 and atomic number 2). Protons and neutrons each have very close to unit mass, and since the mass change associated with binding the particles together in the nucleus is very small, the mass number is always within 1/10th unit of the atomic weight of the nuclide. See mass; mass defect; atomic weight.

mass spectrometry. A method of chemical analysis in which the substance to be analyzed is heated and placed in a vacuum. The resulting vapor is exposed to a beam of electrons that causes ionization to occur, either of the molecules or their fragments. The ions thus produced are accelerated by an electric impulse and then passed through a magnetic field, where they describe curved paths whose directions depend on the speed and mass-to-charge ratio of the ions. This has the effect of separating the ions according to their mass (electromagnetic separation). Because of their greater kinetic energy, the heavier ions describe a wider arc than the lighter ones and can be identified on this basis. The ions are collected in appropriate devices as they emerge from the magnetic field.

mass susceptibility. Magnetic susceptibility of a compound per gram.

mast cell degranulating peptide (vespa basalis).

Properties: Isolated from the venom of the Taiwan hornet *Vespa basalis*.

CAS: 137354-65-5. mf: $C_{78}H_{138}N_{20}O_{16}$.

Hazard: A poison.

Source: Natural product.

master batch. A previously prepared mixture composed of a base material and a high percentage of an ingredient (usually a dry powder) that is critical to the product being manufactured. Aliquot parts of this mixture are added to production-size quantities (batches) during the mixing operation. This method permits uniform dispersion of very small amounts (less than 1%) of such additives as dry curing agents in rubber and colorants in plastics and paints. Modifying elements may be incorporated in alloys in this way. Master batches of organic dyes dispersed in rubber or plastic are prepared by manufacturers of colorants for direct use. Master-batched accelerators (mixtures of rubber, zinc oxide and accelerator) are commonly used in rubber mixes.

mastic. (1) A solid, resinous exudation of the tree *Pistachia lentiscus*, of recent geologic origin. Found in the Mediterranean area. Soluble in alcohol and ether, balsamic odor, turpentine taste. Used in chewing gum, varnishes, and to some extent in adhesives and dentistry. (2) A soft, putty-like sealant; often packed in cartridges and applied by a gun with a nozzle of appropriate size or in bulk for application by a knife or other spreading device. Such mastics often contain bituminous ingredients or polymerized rosin acids, used for laying floor and wall tiles and similar applications.

mastication. Permanent softening of crude natural rubber and certain other elastomers by application of mechanical energy, as on a roll mill or in a Banbury mixer. The softening is said to be due to

formation of free radicals resulting from the rupture of the polymer chain and the addition of oxygen at these active points. The study of this phenomenon has been called mechanochemistry. This "breaking down" of a high polymer substance, first practiced by Hancock in England, is essential in preparing it for the incorporation of curatives and other modifying substances and is an essential operation in the manufacture of useful products from rubber and rubberlike substances.

mastigoneme. Small hair-like filaments found on the "hairy" flagellum of the Chromista.

material. A nonspecific term used with various shades of meaning in the technical literature. It should not be used as a synonym for substance, but is generally used in the collective expressions "raw materials" and "materials handling." The term *material balance*, in chemical engineering denotes the sum of all the substances entering a reaction and all those that leave it in a given time period. *Material* also loosely refers to closely associated mixtures, either of natural origin (petroleum, wood, ores) or man-made (glass, cement, composites). See substance; engineering material; raw material.

material balance. See material.

materials handling. A general term that includes the methods used for in-plant transportation, distribution, and storage of raw materials and semi-processed products, as by forklift trucks, elevators, conveyor systems, pipelines, etc., as well as safe practices for storage and movement of toxic and flammable substances.

matte. A product containing a metal sulfide as obtained after roasting and fusion of sulfide minerals. Oxides or metals may also be present. Common examples are copper matte and nickel matte.

matter. Anything that has mass or occupies space.

See mass. (1) *States:* There are three generally accepted states (phases) in which substances can exist, i.e., solid, liquid, and gas (vapor). From time to time it has been proposed that specialized forms of matter be regarded as states, such as the vitreous (glassy) state, the colloidal state, and the plasma state, but none of these suggestions has gained substantial acceptance.

See phase (1); solid; liquid; gas. (2) *Levels:* Matter is basically composed of particles in the following levels of size and complexity: (a) subatomic (protons, neutrons, electrons); (b) atomic and molecular (below 10 Å); (c) colloidal (from 10 Å to 1 micron); (d) microscopic; (e) macroscopic; (f) space or celestial. Level (a) is invisible by any means; levels (b) and (c) can be resolved in field-ion or electron microscopes; level (d) lies in the range of the optical microscope; (e) is visible to the naked eye; (f) re-

quires telescopes for detailed observation.
See particle; electron microscope; field-ion microscope.

“Maxaquin” [Searle]. TM for lomefloxacin hydrochloride.
Use: Drug.

“Maxarome” [DSM China]. TM additive for UV coatings.

“Maxatase” [Pfizer]. TM for subtilisins.

maxilon golden yellow gl. See C.I. basic yellow 28.

maxilon yellow 3gl. See C.I. basic yellow 11.

“MaxiThermo” [Matheson Tri-Gas]. TM for primary grade natural gas standard now available for measuring the BTU content of natural gas. It offers direct traceability for natural gas.

Mayer’s reagent. See mercuric potassium iodide.

“Mazawax” [PPG]. TM for all-purpose emulsifying waxes.
Available forms: Solid and flaked.
Use: In creams, lotions, hair relaxant and hair dipilatory formulas.

MBMC. Abbreviation for monobutyl-*m*-cresol. See *tert*-butyl-*m*-cresol.

MBT. Abbreviation for mercaptobenzothiazole.

MBTE. Abbreviation for methyl-*tert*-butyl ether.

MBTS. Abbreviation for 2-mercaptobenzothiazyl disulfide.
See 2,2'-dithiobisbenzothiazole.

mCi. Abbreviation for millicurie.
See curie.

MCA. Abbreviation for monochloroacetic acid. See chloroacetic acid.

McFadyen-Stevens reaction. Base-catalyzed thermal decomposition of aroylbenzenesulfonylhydrazines to aldehydes.

McLafferty rearrangement. Electron-impact-induced cleavage of carbonyl compounds having a hydrogen in the γ -position, to an enolic fragment and an olefin.

McMillan, Edwin M. (1907–1991). An American physicist who won the Nobel Prize for chemistry in 1951 along with Seaborg. His work

included research in nuclear physics and particle accelerator development as well as microwave radar and sonar. He and his colleagues discovered neptunium and plutonium. He was the recipient of the Atoms for Peace prize in 1963. His Ph.D. in physics was awarded from Princeton University.

MCPA. (2-methyl-4-chlorophenoxyacetic acid; 4-chloro-2-methylphenoxyacetic acid).
CAS: 94-74-6. $\text{CH}_3\text{C}(\text{Cl})_2\text{H}_2\text{OCH}_2\text{COOH}$.

Properties: White, crystalline solid. Mp 118–119C. Free acid insoluble in water but sodium and amine salts are soluble.

Grade: Emulsifiable concentration.

Use: Selective herbicide.

MCPB. (4-(2-methyl-4-chlorophenoxy)butyric acid).
CAS: 94-81-5.

Hazard: Toxic by ingestion.

Use: Herbicide.

MCPP. (2-(2-methyl-4-chlorophenoxy)-propionic acid).
See mecoprop.

Md. Symbol for mendelevium.

MDA. (1) Abbreviation for metal deactivator. (2) Abbreviation for *p,p'*-methylenedianiline; *p,p'*-diaminodiphenylmethane.

MDAC. 4-methyl-7-diethylaminocoumarin.
See 7-diethylamino-4-methylcoumarin.

MDEA. See *n*-ethyl-3,4-methylenedioxyamphetamine.

MDI. methylene di-*p*-phenylene isocyanate.
See diphenylmethane-4,4'-diisocyanate.

Me. Symbol for methyl.

MEA. Abbreviation for monoethanolamine.
See ethanolamine.

mean free path. In a given system, the average distance that particles travel between collisions with other particles. The particles may be molecules of a gas, free electrons, neutrons, etc. The value is determined by statistical methods.

mecamylamine hydrochloride. (methylaminoisocamphane hydrochloride). $\text{C}_{11}\text{H}_{21}\text{N}\cdot\text{HCl}$.

Properties: White, crystalline powder; almost odorless. Mp 245C with some decomposition. Soluble in water, alcohol, chloroform; somewhat soluble in benzene, isopropyl alcohol; insoluble in ether.

Grade: USP.

Use: Medicine (antihypertensive).

mecarbam. (*S*-[(ethoxycarbonyl)methylcarbamoyl]methyl-*O,O*-diethyl phosphorodithioate).

CAS: 2595-54-2.

$(C_2H_5O)_2P(S)SCH_2CON(CH_3)COOC_2H_5$.

Properties: Yellow oil. Bp 144C (0.02 mm Hg).

Hazard: Highly toxic, cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

mechanochemistry. See mastication.

meclorethamine hydrochloride. [methylbis-(2-chloroethyl)amine hydrochloride].

CAS: 55-86-7. $CH_3N(CH_2CH_2Cl)_2 \cdot HCl$. A nitrogen mustard.

Properties: White, crystalline, hygroscopic powder; nasal irritant and a vesicant. Mp 108–111C. Soluble in water.

Grade: USP.

Hazard: Highly toxic, vesicant, and strongly irritant to mucous membranes.

Use: Medicine (antineoplastic).

meclizine hydrochloride. (1-*p*-chlorobenzhydryl-4-methylbenzylpiperazine dihydrochloride).

CAS: 36236-67-6. $C_{25}H_{27}ClN_2 \cdot 2HCl \cdot H_2O$.

Properties: White or yellowish powder or crystals; slight odor. Insoluble in water and ether; very soluble in chloroform, pyridine, and acid-alcohol-water mixture; slightly soluble in dilute acids and alcohol.

Grade: USP.

Use: Medicine (antihistamine).

meclofenoxate hydrochloride.

CAS: 3685-84-5. $C_{12}H_{17}Cl_2NO_3$.

Properties: Colorless crystals. Mp 135C. Soluble in water, insoluble in benzene.

Use: Plant growth hormone.

“Mecopex” [Morton]. TM for a broad-leaf herbicide containing potassium salt of mecoprop (31.5%).

Hazard: See mecoprop.

mecoprop. (2-(4-chloro-2-methylphenoxy)propionic acid; MCPPE; CMPP).

CAS: 93-65-2. $ClC_6H_4(CH_3)OCH(CH_3)COOH$.

Properties: Solid. Mp 93–94C. Insoluble in water; soluble in alcohol, acetone, and ether.

Hazard: Toxic by ingestion and inhalation, irritant to skin and eyes.

Use: Herbicide.

medicinal chemistry. A subdivision of chemistry that deals with the effects of drugs and pharmaceuticals on the human body and on various infective organisms, and with the synthesis of compounds specifically for certain diseases, such as antimalarials and antihypertensive agents. It also is

concerned with immunology, hormone activity, etc. See clinical chemistry.

medlure. (*sec*-butyl-4-(or 5)-chloro-2-methylcyclohexanecarboxylate). $C_{12}H_{21}ClO_2$.

Properties: Liquid. Bp 78–79C (0.25 mm Hg). Insoluble in water; soluble in most organic solvents.

Use: Insect attractant.

2,2-MEDP. See 2-formyl-2'-methyl-1,1'-(oxydimethylene)dipyridinium.

medroxyprogesterone acetate. (17-hydroxy-6a-methyl-preg-4-ene-3,20-dione-17-acetate).

CAS: 71-58-9. $C_{24}H_{34}O_4$. A hormone derivative.

Properties: White to off-white, crystalline powder; odorless. Melting range 200–208C. Stable in air. Insoluble in water; freely soluble in chloroform; sparingly soluble in alcohol.

Use: Medicine (injectable contraceptive).

Meerwein-Ponndorf-Verley reduction.

Reduction of aldehydes or ketones to the corresponding alcohols with aluminum alkoxides.

mega-. Prefix meaning 10^6 units (symbol M), e.g., 1 megaton = 1,000,000 tons.

megabase (Mb). Unit of length for DNA fragments equal to 1 million nucleotides and roughly equal to 1 μ m.

megatomoic acid. (*trans*-3,*cis*-5-tetradecadienoic acid). The active ingredient of the sex attractant in the female carpet beetle. Research is underway on synthesis of this substance to be used as a lure in control of this pest.

megaton. One million tons, usually used in defining the blast effect of a nuclear explosion. A 1-megaton bomb is equivalent in destructive potential to 1 million tons of TNT.

megestrol acetate. (17-hydroxy-6-methylpregna-4,6-diene-3,20-dione acetate).

CAS: 595-33-5. $C_{27}H_{42}O_4$.

Properties: Crystals. Mw 384.50, mp 214–216C. Soluble in water.

Use: Antineoplastic and oral contraceptive.

meclumine diatrizoate. (methylglucamine diatrizoate; diatrizoate methylglucamine).

CAS: 131-49-7.

$(CH_2CONH)_6C_6I_3COOH \cdot CH_3NHCH_2(CH_2O)_6 \cdot CH_2OH$.

Properties: Available in solution for injection, pH between 6.0–7.6.

Grade: USP (as injection).

Use: Medicine (radiopaque medium).

Note: The iodipamide and iothalamate are also available.

meiosis. A two-stage type of cell division in sexually reproducing organisms. In meiosis, a diploid cell divides to produce four haploid cells, each with half the original chromosome content. For this reason, meiosis is often called a "reduction division." In organisms with a diploid life cycles, the products of meiosis are usually called gametes. In organisms with an alternation of generations, the products of meiosis are called spores.

Meisenheimer complexes. Sigma-complexes obtained as brightly colored solutions on interaction of 1,3,5-trinitrobenzene to similar compounds.

Meisenheimer rearrangement. Rearrangement of tertiary amine oxide to *O,N,N*-trisubstituted hydroxylamines.

meitnerium. Mt. A transfermium element. Atomic number 109. Very short half-life.

MEK. Abbreviation for methyl ethyl ketone.

"MEKON" [Baker Petrolite]. TM for a hard grade of petroleum microcrystalline wax.

melamine. (cyanurtriamide; 2,4,6-triamino *s*-triazine).
CAS: 108-78-1.

Properties: White, monoclinic crystals. D 1.573 (14C), mp 354C. Sparingly soluble in water, glycol, glycerol, pyridine; very slightly soluble in ethanol; insoluble in ether, benzene, carbon tetrachloride. Nonflammable.

Derivation: (1) By heating urea and ammonia. The resulting mixture of isocyanic acid and ammonia reacts over a solid catalyst at approximately 400C to form melamine. (2) From cyanamide, dicyanamide, or cyanuric chloride.

Method of purification: Recrystallization from water.

Grade: 99% min.

Hazard: Toxic by ingestion, skin, and eye irritant.

Use: Melamine resins, organic syntheses, leather tanning.

melamine, formaldehyde, toluenesulfonamide polymer, butylated.

CAS: 68891-01-0.

Hazard: Low toxicity by ingestion and skin contact. A moderate eye irritant.

melamine resin. A type of amino resin made from melamine and formaldehyde. The first step in resin formation is the production of trimethylol mel-

amine, $C_3N_3(NHCH_2OH)_3$, the molecules of which contain a ring with three carbon and three nitrogen atoms, the $-NHCH_2OH$ groups being attached to the carbon atoms. This molecule can combine further with others of the same kind by a condensation reaction. Excess formaldehyde or melamine can also react with trimethylol melamine or its polymers, providing many possibilities of chain growth and cross-linking. The nature and degree of polymerization depend upon pH, but heat is always needed for curing. Melamine resins are more water- and heat-resistant than urea resins. They may be water-soluble syrups (low molecular weight) or insoluble powders (high molecular weight) dispersible in water. Widely used as molding compounds with α -cellulose, wood flour, or mineral powders as fillers and with coloring materials; also for laminating, boil-proof adhesives, increasing wet strength of paper, textile treatment, leather processing, and for dinnerware and decorative plastic items.

Butylated melamine resins are formed by incorporating butyl or other alcohols during resin formation, whereupon the $-NHCH_2OH$ groups convert to $-NHCH_2OC_4H_9$. These resins are soluble in paint and enamel solvents and in surface coatings, often in combination with alkyds. They give exceptional curing speed, hardness, wear resistance, and resistance to solvents, soaps, and foods.

Melamine-acrylic resins are water soluble and used for formation of water-base industrial and automotive finishes. See urea-formaldehyde resin.

melaniline. See diphenylguanidine.

melanin. A brownish-black pigment that occurs normally in the retina, skin, and hair of higher animals with the exception of albinos. Formed from tyrosine by the action of tyrosinase.

melanoma. Cancer of the cells that produce pigment in the skin. Melanoma usually begins in a mole.

melinamide. See *dl-n*-(α -methylbenzyl)linoleamide.

melissic acid. (triacontanoic acid).

$CH_3(CH_2)_{28}COOH$. A long-chain fatty acid.

Properties: Crystalline solid. Mp 94C. Soluble in benzene and hot alcohol; insoluble in water. Combustible.

Derivation: By oxidation of 1-triacontanol, occurs in minor amounts in many plant and insect waxes and in montan wax.

Use: Biochemical research.

melissyl alcohol. See 1-triacontanol.

melittin.

CAS: 37231-28-0. $C_{131}H_{229}N_{39}O_{31}$. A polypeptide derived from bee venom that has strong antibacterial activity, especially against *Staphylococcus aureus*

80 which is resistant to penicillin. It inhibits growth of many Gram-positive and Gram-negative bacteria.

Properties: White powder. Water soluble.

Use: Antirheumatic drug.

mellitate. An ester or salt of mellitic acid.

“Melmac” [Cytec]. TM for products molded from melamine-formaldehyde resins.

“Melonite” [Kolene]. TM for an anhydrous molten salt bath used to nitride ferrous work pieces.

The bath operates at a subcritical temperature and produces a continuous ϵ -iron nitride layer on carbon steels, and alloy nitride surfaces on alloy steels.

Use: For many components to enhance fatigue strength, wear and corrosion resistance. It is also used for tooling and dies to extend service life.

melpalhan. (*p*-di(2-chloroethyl)aminophenylalanine; formerly called sarcosylisin).

CAS: 148-82-3.

(ClCH_2CH_2)₂NC₆H₄CH₂CH(NH₂)COOH. Melpalhan is both the USAN name for the acid and the generic name for the hydrochloride.

Properties: A nitrogen mustard, crystals. Mp 180C.

Grade: ND (in medicine, for the acid).

Hazard: Strong irritant to eyes and mucous membranes.

Use: Medicine, insect chemosterilant.

melt index. The viscosity of a thermoplastic polymer at a specified temperature and pressure, it is a function of the molecular weight. Specifically, the number of grams of such a polymer that can be forced through a 0.0825-inch orifice in 10 minutes at 190C by a pressure of 2160 g.

melting point. (mp) The melting point or freezing point of a pure substance is the temperature at which its crystals are in equilibrium with the liquid phase at atmospheric pressure. The term *melting point* is used when the equilibrium temperature is approached by heating the solid. Ordinarily, mp refers to temperatures above 0C, the melting point of ice. The terms *melting point* and *freezing point* are often used interchangeably, depending on whether the substance is being heated or cooled. The number of calories required to convert one mole of pure crystals to the liquid state is called the molar heat of fusion.

“Melurac” [Cytec]. TM for urea-melamine-formaldehyde condensation products used mainly as adhesives for bonding of veneers for the production of exterior-grade plywood.

membrane. Semi-fluid structure which bounds all cells and partitions the interior of eukaryotic cells. It consists primarily of two lipid layers, with proteins “dissolved” in the lipids.

membrane cell. See diaphragm cell.

membrane equilibrium. Equilibrium between the ions of a salt solution and the giant and normal ions of a colloidal electrolyte separated by a membrane.

membrane hydrolysis. Hydrolysis that occurs when a colloidal electrolyte, consisting of giant ions and normal ions, is separated from pure water by a membrane. The diffusing ions are substituted by the OH⁻ or H⁺ ions of the dissociating water.

membrane, semipermeable. A microporous structure, either natural or synthetic, that acts as a highly efficient filter in the range of molecular dimensions, allowing passage of ions, water, and other solvents and very small molecules, but is almost impermeable to macromolecules (proteins) and colloidal particles. The thickness is about 100 Å, the pore diameter is from 8 Å for the walls of tissue cells to 100 Å or more for manufactured membranes. Plant cell wall membranes are proteinaceous substances that function in natural osmosis. Membranes of cellophane, collodion, asbestos fiber, etc., are used in such industrial operations as waste-liquor recovery, desalination, and electrolysis; processing whey proteins, biomedical research; gas separations, e.g., adjusting carbon monoxide/hydrogen ratios for ammonia production from synthesis gas; metal extraction and recovery.

See osmosis; dialysis.

membrane transport. Movement of a polar molecule across a membrane via a specific membrane protein (a transporter).

memtetrahydrophthalic anhydride. (methyl norbornene dicarboxylic anhydride).

CAS: 85-43-8. C₈H₈O₃.

Properties: Clear, transparent, slightly viscous liquid; colorless to light yellow.

Hazard: Strong irritant to eyes and skin.

Use: Curing epoxy resins, electrical laminating and filament winding, intermediate for polyesters, alkyd resins, and plasticizers.

MENA. Abbreviation for the methyl ester of naphthaleneacetic acid.

See α -naphthaleneacetic acid methyl ester.

menadiol diphosphate tetrasodium salt.

See 1:4-naphthaquinol-bisdisodium phosphate.

menadione. (2-methyl-1,4-naphthoquinone; menaphthone; vitamin K₃).

CAS: 58-27-5. C₁₀H₈CH₃O₂.

Properties: Yellow, crystalline powder; nearly odorless. Mp 105–107C. Affected by sunlight. Soluble in alcohol, benzene, and vegetable oils; insoluble in water.

Derivation: Oxidation of β -methylnaphthalene.

Grade: USP.

Hazard: Irritant to skin and mucous membranes, especially the alcoholic solution.

Use: Medicine, fungicides, animal feed additives.

menazon. (generic name for *S*-[(4,6-diamino-*s*-triazin-2-yl)methyl]-*O,O*-dimethyl phosphorodithioate).
CAS: 78-57-9.

$(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{C}:\text{NC}(\text{NH}_2):\text{NC}(\text{NH}_2):\text{N}$.

Properties: Off-white solid. Mp 160–162C. Slightly soluble in water and organic solvents.

Hazard: Highly toxic, cholinesterase inhibitor.

Use: Acaricide, insecticide.

mendelevium. (Md). Synthetic radioactive element produced in a cyclotron by bombarding einsteinium with alpha particles; atomic number 101, aw 256, 4 isotopes, valence = 3. Mendelevium decays by spontaneous fission with a half-life of 1.5 hr. The heaviest isotope, Md-258, has half-life of 60 days. Mendelevium is thought to have chemical properties similar to those of the rare earth thulium. It is made in research quantities only and no uses are reported.

See actinide series.

Mendeleev, D. I. (1834–1907). Born in Siberia, Mendeleev made a fundamental contribution to chemistry in 1869 by establishing the principle of periodicity of the elements. His first periodic table was compiled on the basis of arranging the elements in ascending order of atomic weight and grouping them by similarity of properties. So accurate was Mendeleev's thinking that he predicted the existence and atomic weights of several elements that were not actually discovered until years later. The original table has been modified and corrected several times, notably by Moseley, but it has accommodated the discovery of isotopes, rare gases, etc. Its importance in the development of chemical theory can hardly be overestimated.

See Becquerel; Moseley; periodic table.

Mendelian inheritance. One method in which genetic traits are passed from parents to offspring. Named for Gregor Mendel, who first studied and recognized the existence of genes and this method of inheritance.

See autosomal dominant; recessive gene; sex-linked.

menhaden oil.

Properties: Yellowish-brown or reddish-brown, drying oil; characteristic odor. D 0.927–0.933, saponification value 191–196, iodine value 139–180, refr index 1.480. Soluble in ether, benzene, naphtha, and carbon disulfide. Combustible.

Derivation: By cooking or pressing the body of the menhaden fish.

Method of purification: Filtration and bleaching with fuller's earth.

Grade: Prime crude, brown strained, strained, bleached, winter oil, bleached winter white oil.

Hazard: Subject to spontaneous heating.

Use: Hydrogenated fats for cooking and industrial use (soap, rubber compounding), printing inks, animal feed, leather dressing lubricants, paint drier, cleansers, lipstick.

meniscus. The concave curve of a liquid surface in a graduate or narrow tube. Caused by surface tension. In reading a value (e.g., 5 cc), it is conventional to ignore the higher liquid around the perimeter. In the case of mercury, which does not wet the tube because of its extremely high surface tension, the meniscus is convex.

Menschutkin reaction. Reaction of tertiary amines with alkyl halides to form quaternary salts.

menthamediamine. (*p*-menthane-1,8-diamine).
CAS: 80-52-4.

$(\text{CH}_3)_2\text{C}(\text{NH}_2)\text{CHC}_2\text{H}_4\text{C}(\text{CH}_3)(\text{NH}_2)\text{CH}_2\text{CH}_3$. A primary alicyclic diamine, also a *tert*-alkylamine.

Properties: Clear liquid; terpene odor. Boiling range 107–126C (10 mm Hg), fp –45C, refr index 1.4794 (25C). Miscible with water and most organic solvents.

Hazard: Strong irritant to eyes and skin, calls for eye protection.

Use: Curing agent for epoxy resins, chemical intermediate.

***p*-menthane-8-hydroperoxide.**

CAS: 80-47-7. $\text{C}_{10}\text{H}_{20}\text{O}_2$.

Properties: Clear, pale-yellow liquid. D 0.910–0.925 (15.5/4C), refr index 1.460–1.475 (20C).

Hazard: Strong oxidizing agent, dangerous in contact with organic materials. Strong irritant to skin and eyes.

Use: Catalyst for rubber and polymerization reactions, coatings.

***p*-menthan-3-one.** See menthone.

menthol. (hexahydrothymol; methylhydroxyisopropyl-cyclohexane; *p*-menthan-3-ol; peppermint camphor).

CAS: 89-78-1. $\text{CH}_3\text{C}_6\text{H}_3(\text{C}_2\text{H}_5)\text{OH}$. It may be *l*- (from natural sources) or *dl*- (natural or synthetic).

Properties: White crystals; cooling odor and taste. Mp 41–43C (*l*-form), congealing temperature 27–28C (*dl*-form), specific rotation –45 to –51 degrees (25C) (*l*-menthol), –2 to +2 degrees (*dl*-menthol). Soluble in alcohol, light petroleum solvents, glacial acetic acid, and fixed or volatile oils; slightly soluble in water. Combustible.

Occurrence: Brazil (natural product), Japan.

Derivation: By freezing from peppermint oil, by hydrogenation of thymol.

Grade: Technical, USP, FCC.

Hazard: Irritant to mucous membranes on inhalation.

Use: Perfumery, cigarettes, liqueurs, flavoring agent, chewing gum, chest rubs, cough drops.

menthol acetic ester. See menthyl acetate.

menthol valerate. (menthyl isovalerate).

$(\text{CH}_3)_2\text{CHCH}_2\text{COOC}_{10}\text{H}_{19}$.

Properties: Colorless liquid; mild odor; cooling, faintly bitter taste. D 0.907 (15.4C). Insoluble in water; soluble in alcohol, chloroform, ether, and oils.

Derivation: By action of valeric acid on menthol.

Use: Medicine, flavoring.

menthone. (*p*-menthan-3-one).

CAS: 1074-95-9. $\text{C}_{10}\text{H}_{18}\text{O}$.

Properties: Colorless, oily, mobile liquid; slight peppermint odor. D 0.897 (15C), bp 207C. Slightly soluble in water; soluble in organic solvents. Combustible.

Derivation: A ketone found in oil of peppermint.

Use: Flavoring.

menthyl acetate. (menthol acetic ester).

CAS: 16409-45-3. $\text{C}_{10}\text{H}_{19}\text{OOCCH}_3$.

Properties: Colorless liquid; menthol-like odor. Bp 227–228C, d 0.922–0.927, optical rotation -72 degrees 47 minutes to -73 degrees 18 minutes, refr index 1.447. Slightly soluble in water; miscible with alcohol and ether. Combustible.

Derivation: (1) By boiling menthol with acetic anhydride in the presence of sodium acetate; (2) peppermint oil.

Use: Perfumery, flavoring.

menthyl isovalerate. See menthyl 3-menthylbutyrate.

menthyl 3-menthylbutyrate.

CAS: 16409-46-4. mf: $\text{C}_{15}\text{H}_{28}\text{O}_2$.

Hazard: Low toxicity by ingestion and skin contact. A moderate skin contact irritant.

Source: Natural product.

menthyl salicylate. $\text{C}_6\text{H}_4(\text{OH})\text{COOC}_{10}\text{H}_{19}$.

Properties: Colorless liquid. Miscible with alcohol, ether, chloroform, and fatty oils; insoluble in water; soluble in organic solvents. Combustible.

Use: Sunscreen preparations.

See homomenthyl salicylate.

MEP. Abbreviation for methyl ethyl pyridine.

mepiridine hydrochloride. (Demerol).

CAS: 50-13-5. $\text{C}_{15}\text{H}_{21}\text{NO}_2\text{HCl}$. An addictive drug, use by prescription only.

Use: Analgesic.

mepiquat chloride.

CAS: 24307-26-4. mf: $\text{C}_8\text{H}_{16}\text{N}\cdot\text{Cl}$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation and skin contact.

Use: Agricultural chemical.

mepivacaine. (Carbocaine; 1-methyl-2-(2,6-xylylcarbonyl)piperidine).

Use: Local anesthetic.

meprobamate. (2-methyl-2-*n*-propyl-1,3-propanediol dicarbamate).

CAS: 57-53-4.

$\text{H}_2\text{NCOOCH}_2\text{C}(\text{CH}_3)(\text{C}_3\text{H}_7)\text{CH}_2\text{OOCNH}_2$.

Properties: White powder; characteristic odor; bitter taste. Mp 103–107C. Slightly soluble in water and ether; soluble in alcohol and acetone.

Grade: NF.

Hazard: Central nervous system depressant, use restricted by law.

Use: Medicine (antianxiety agent).

meq. Abbreviation for milliequivalent. See eq.

merbromin.

(dibromohydroxymercurifluorescein disodium salt; 2,7-disodiumdibromo-4-hydroxymercurifluorescein; mercurochrome).

CAS: 129-16-8. $\text{C}_{20}\text{H}_8\text{Br}_2\text{HgNa}_2\text{O}_6$.

Properties: Iridescent green scales or granules; odorless. Soluble in water; insoluble in alcohol, acetone, chloroform, or ether; stable in air.

Derivation: From dibromofluorescein and mercuric acetate.

Grade: Technical, NF.

Hazard: Toxic by ingestion. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (antiseptic).

mercapsol process. Process of removing mercaptans from gasoline by counter-current liquid-liquid extraction with various liquids, as with a water solution of caustic soda and tar acids.

mercaptamine. See 2-aminoethanethiol.

mercaptan. See thiol.

mercaptoacetic acid. See thioglycolic acid.

2-mercaptobenzoic acid. See thiosalicylic acid.

2-mercaptobenzothiazole. (MBT).

CAS: 149-30-4.

$\text{CHCHCHCHCCSC}(\text{SN})\text{N}$.

Properties: Yellowish powder; distinctive odor (depends on degree of purification). D 1.52, melting range 164–175C. Soluble in dilute caustic soda,

alcohol, acetone, benzene, chloroform; insoluble in water and gasoline. Combustible.

Grade: Technical, 97%.

Use: Vulcanization accelerator for rubber (requires use of stearic acid for full activation), tire treads and carcasses, mechanical specialties, etc., fungicide, corrosion inhibitor in cutting oils and petroleum products, extreme-pressure additive in greases.

2-mercaptobenzothiazole monoethanol-amine salt. See *n*-(2-hydroxyethyl)ammonium benzothiazole-2-thiolate.

(2-mercaptobenzothiazolyl)-2-(2-aminothiazol-4-yl)-2-methoxyiminoacetate (syn).

CAS: 80756-85-0. mf: $C_{13}H_{10}N_4O_2S_3$.

Hazard: Low toxicity by ingestion.

2-mercaptobenzothiazyl disulfide. See 2,2'-dithiobisbenzothiazole.

2-mercaptoethanol. $HSCH_2CH_2OH$. CAS: 60-24-2.

Properties: Water-white, mobile liquid; disagreeable odor. D 1.1168 (20/20C), 9.29 lb/gal (20C), bp 157.1C, vap press 1.0 mm Hg (20C), viscosity 3.43 cP (20C), flash p 165F (74C), fp sets to a glass approximately -100C, refr index 1.5011 (20C). Miscible with water, and most organic solvents. Combustible.

Hazard: Toxic by inhalation and ingestion.

Use: Solvent for dyestuffs, intermediate for producing dyestuffs, pharmaceuticals, rubber chemicals, flotation agents, insecticides, plasticizers, water-soluble reducing agent, biochemical reagent, PVC stabilizers, agricultural chemicals, textile auxiliary.

β -mercaptoethylamine hydrochloride.

CAS: 156-57-0. $HS(CH_2)_2NH_2 \cdot HCl$.

Properties: Hygroscopic, white powder. Mp 71C. Very soluble in water and ethanol alcohol.

Hazard: Toxic by inhalation and ingestion.

***N*-(2-mercaptoethyl)benzenesulfonamide.**

(*S*-(*O*,*O*-diisopropyl phosphorodithioate; *N*- β -diisopropyl dithiophosphorylethyl)benzenesulfonamide).

CAS: 741-58-2.

$C_6H_5SO_2NH(CH_2)_2SP(S)[OCH(CH_3)_2]$.

Properties: Colorless liquid; slight odor. D 1.25 (22C). Insoluble in water; soluble in kerosene and xylene.

Hazard: Highly toxic, cholinesterase inhibitor. Use may be restricted.

Use: Herbicide.

2-mercapto-4-hydroxypyrimidine. See thiouracil.

2-mercaptoimidazoline. See "NA-22."

3-mercaptolvaline. See *l*-penicillamine.

mercaptomerin. See thiomerin.

3-mercapto-*n*-methylpropanamide. See *n*-methyl 3-mercaptopropanamide.

β -mercaptopropionic acid.

$HSCH_2CH_2COOH$.

Properties: Clear liquid. D 1.218 (21C), mp 16.8C, bp 111C (15 mm Hg). Soluble in water and alcohol.

Use: Stabilizer, antioxidant, catalyst, chemical intermediate.

6-mercaptopurine. (6-MP; 6-purinethiol).

CAS: 50-44-2. $C_4H_4N_4S \cdot H_2O$. A sulfur-containing purine base not found in animal nucleoproteins.

Properties: Yellow, crystalline powder; nearly odorless. Mp 308C (decomposes). Insoluble in water; soluble in hot alcohol and dilute alkali solutions; slightly soluble in dilute sulfuric acid.

Grade: USP.

Use: Medicine (to prevent rejection of kidney transplants).

mercaptosuccinic acid. See thiomalic acid.

2-mercaptothiazoline. C_2H_4NSSH . White crystals.

Use: Synthesis of pharmaceuticals.

***d*-3-mercaptovaline.** See penicillamine.

mercerized cotton. See cotton, mercerized.

mercerizing assistant. A compound used to increase the penetration of mercerizing baths. Cresylic acid derivatives, special sulfonated oils, and other wetting agents are typical.

Mercer's liquor. A solution containing potassium ferricyanide.

Use: For etching.

merchant acid. A crude phosphoric acid (51-54% P_2O_5).

mercurate(1-), (1-cysteinato(2-)-s)methyl-, hydrogen.

CAS: 32754-35-1. mf: $C_2H_5HgNO_2S \cdot H$.

Properties: IDLH 10 mg/m³ (as Hg).

Hazard: A reproductive hazard.

mercuric acetate. (mercury acetate).

CAS: 1600-27-7. $Hg(C_2H_3O_2)_2$.

Properties: White, crystalline powder. D 3.2544. Soluble in alcohol and water; sensitive to light.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.01 mg(Hg)/m³.

Use: Catalyst in organic synthesis, pharmaceuticals.

mercuric arsenate. (mercury arsenate).

CAS: 7784-37-4. $HgHASO_4$.

Properties: Yellow powder. Soluble in hydrochloric acid; slightly soluble in nitric acid; insoluble in water.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Waterproof paints, antifouling paints.

mercuric barium bromide. (barium mercury bromide; mercury barium bromide).

Properties: Colorless, crystalline mass. Very hygroscopic; soluble in water.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

mercuric barium iodide. (barium mercury iodide; mercury barium iodide).

Properties: Reddish or yellow crystalline mass. Unstable; deliquescent; soluble in alcohol and water.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Microanalysis (testing for alkaloids), preparing Rohrbach solution.

mercuric benzoate. (mercury benzoate).

Properties: White crystals. Mp 165C. Sensitive to light. Soluble in solutions of sodium chloride and ammonium benzoate; slightly soluble in alcohol and water.

Derivation: By the interaction of a mercuric salt and sodium benzoate.

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (antisyphilitic).

mercuric bromide. (mercury bromide).

Properties: White, rhombic crystals. Sensitive to light. D 6.11, mp 235C, bp 322C. Soluble in alcohol and ether; sparingly soluble in water.

Derivation: By adding potassium bromide to a solution of a mercuric salt and crystallizing.

Hazard: Toxic by inhalation, ingestion, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine.

mercuric chloride. (mercury bichloride;

mercury chloride; corrosive sublimate).

Properties: White crystals or powder; odorless. D 5.44 (25C), bp 303C, mp 276C. Soluble in water, alcohol, ether, pyridine, glycerol, and acetic acid.

Derivation: (1) Direct combination of chlorine with mercury heated to volatilizing point, (2) by subliming mercuric sulfate with common salt.

Method of purification: Recrystallization and sublimation.

Impurities: mercurous chloride.

Grade: Technical, crystals, granular, powder, CP, NF.

Hazard: Toxic by ingestion, inhalation, and skin absorption; a poison. TLV: TWA 0.1 mg(Hg)/m³.

Use: Manufacture of calomel and other mercury compounds, disinfectant, organic synthesis, analytical reagent, metallurgy, tanning, catalyst for vinyl chloride, sterilant for seed potatoes; fungicide, insecticide, and wood preservative; embalming fluids, textile printing, dry batteries, photography, process engraving and lithography.

mercuric chloride, ammoniated. See mercury, ammoniated.

mercuric cuprous iodide. (copper mercury iodide; mercury copper iodide). $\text{HgI}_2 \cdot 2\text{CuI}$.

Properties: Dark-red, crystalline powder. D 6.12. Insoluble in alcohol and water.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Thermoscopy (detecting overheating of machine bearings) by reversible color change.

mercuric cyanate. See mercury fulminate.

mercuric cyanide. (mercury cyanide).

Properties: Colorless, transparent prisms darkened by light. D 4.018, mp (decomposes). Soluble in water and alcohol.

Derivation: Interaction of mercuric oxide and an aqueous solution of hydrogen cyanide.

Grade: Technical, CP.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (antiseptic), germicidal soaps, manufacturing cyanogen gas, photography.

mercuric dichromate. See mercury dichromate.

mercuric dimethyldithiocarbamate.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Turf fungicides.

mercuric fluoride. (mercury fluoride). HgF_2 .

Properties: Transparent crystals. D 8.95, mp 645C decomposes. Moderately soluble in water and alcohol.

Derivation: Mercuric oxide and hydrogen fluoride.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Synthesis of organic fluorine compounds.

mercuric iodide. (mercury iodide, red).

Properties: Red, tetragonal crystals; turn yellow when heated to 130C, returning to red on cooling. D 6.28, mp 259C, bp 349C. Soluble in boiling alcohol and in solutions of sodium thiosulfate or potassium iodide or other hot alkali chloride solutions, almost completely insoluble in water.

Derivation: By the direct union of mercury and iodine.

Grade: Technical, reagent.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (antiseptic), analytical reagents (Nessler's reagent, Mayer's reagent).

See mercuric potassium iodide.

mercuric lactate. Hg(C₃H₅O₃)₂.

Properties: White, crystalline powder. Soluble in water; decomposed by heat.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Fungicide.

mercuric naphthenate. (mercury naphthenate).

Properties: Dark-amber liquid. Bulk d 10.4 lb/gal. Soluble in lubricating oils and mineral spirits.

Grade: 25% mercury.

Hazard: Poison by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Gasoline antiknock compounds and as a paint antimildew promoter.

mercuric nitrate. (mercury nitrate; mercury pernitrate).

CAS: 10045-94-0. Hg(NO₃)₂.

Properties: Colorless crystals or white, deliquescent powder. D 4.3, mp 79C. Decomposed by heat; soluble in water and nitric acid; insoluble in alcohol.

Derivation: By action of hot nitric acid on mercury.

Hazard: Dangerous fire risk in contact with organic materials. Very toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Nitration of aromatic organic compounds, felt manufacture, mercury fulminate manufacturing.

mercuric oleate. (mercury oleate).

CAS: 1191-80-6. C₃₆H₆₆HgO₄.

Properties: Yellowish to red semisolid or solid mass. Soluble in fixed oils; insoluble in water; slightly soluble in alcohol or ether.

Derivation: By mixing yellow mercuric oxide with oleic acid.

Grade: Technical, pharmaceutical.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Antiseptic, antifouling paints.

mercuric oxide, red. (red precipitate; mercury oxide, red).

CAS: 21908-53-2. HgO.

Properties: Heavy, bright orange-red powder. D 11.00–11.29, mp (decomposes). Soluble in dilute

hydrochloric acid and nitric acid; insoluble in water, alcohol, and ether.

Derivation: By heating mercurous nitrate.

Grade: Technical, paint, ACS reagent.

Hazard: Fire risk in contact with organic materials. Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Chemicals, paint pigment, perfumery and cosmetics, pharmaceuticals for topical disinfection, ceramics (pigment), dry batteries, especially for miniaturized equipment, polishing compounds, analytical reagent, antifouling paints, fungicide, antiseptic.

mercuric oxide, yellow. (mercury oxide, yellow; yellow precipitate).

CAS: 21908-53-2. HgO.

Properties: Light, orange-yellow powder; odorless. Stable in air but turns dark on exposure to light; finer powder than the red form. D 11.03 (27.5C), mp decomposes. Slightly soluble in cold water, more so after boiling; soluble in dilute hydrochloric acid and nitric acid, potassium iodide solution, concentrated solutions of alkaline-earth chloride, magnesium chloride; insoluble in alcohol.

Derivation: (1) By the action of either potassium hydroxide or sodium hydroxide on mercuric chloride. (2) By the action of sodium carbonate upon mercuric nitrate solution.

Grade: CP, technical, NF.

Hazard: Fire risk in contact with organic materials. Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Antiseptic, mercury compounds.

See mercuric oxide, red.

mercuric oxycyanide.

CAS: 1335-31-5. HgO•Hg(CN)₂.

Properties: White, crystalline powder. D 4.44. Moderately soluble in water.

Hazard: Detonates on heating, dangerous explosion risk. Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (topical antiseptic).

mercuric phosphate. (normal mercuric phosphate; neutral mercuric phosphate; trimercuric orthophosphate; mercuric phosphate, tertiary; mercury phosphate). Hg₃(PO₄)₂.

Properties: Heavy, white or yellowish powder. Soluble in acids; insoluble in alcohol, water.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

mercuric potassium cyanide. (mercury potassium cyanide).

CAS: 591-89-9. Hg(CN)₂•2KCN.

Properties: Colorless crystals. Soluble in water and alcohol.

Derivation: By mixing mercuric and potassium cyanides and crystallizing.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Silvering glass in mirror manufacture.

mercuric potassium iodide. (Mayer's reagent; potassium mercuric iodide). K_2HgI_4 or $2KI \cdot HgI_2$.

Properties: Odorless, yellow crystals; deliquescent in air; crystallizes with either 1, 2, or 3 molecules of water. The commercial product is the anhydrous form containing approximately 25.5% mercury; d 4.29; neutral or alkaline to litmus; very soluble in water; soluble in alcohol, ether, and acetone.

Derivation: (1) Action of hydrochloric acid and potassium iodide on mercuric cyanide or mercuric chloride; (2) action of potassium iodide on mercuric oxide.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Analytical chemistry.

See Nessler's reagent.

mercuric salicylate. (salicylated mercury).

CAS: 5970-32-1.

Properties: White powder, yellow or pink tinge; odorless; tasteless. A compound of mercury and salicylic acid of somewhat varying composition, mercury replacing both phenolic and carboxylic hydrogen; contains more than 54% but less than 59.5% mercury. Soluble in solutions of the fixed alkalis or their carbonates, and in warm solutions of the alkali halides; insoluble in water and alcohol.

Derivation: By gently heating freshly precipitated yellow mercuric oxide and salicylic acid in presence of water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (topical antiseptic).

mercuric silver iodide. (mercury silver iodide; silver mercury iodide). $HgI_2 \cdot 2AgI$.

Properties: Yellow powder, becomes red at 40–50C. D 6.08. Soluble in solutions of potassium cyanide or potassium iodide; insoluble in dilute acids and water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Thermoscopy (detecting overheating in journal bearings).

mercuric sodium phenolsulfonate.

CAS: 535-55-7. $C_{12}H_8HgNa_2O_4S_2$.

Properties: Colorless, water-soluble powder.

Derivation: Reaction of sodium salt of *p*-phenolsulfonic acid and mercuric oxide.

Hazard: Toxic by ingestion and skin absorption.

Use: Antiseptic and germicide, in soaps, ointments, etc. (1% concentration).

mercuric stearate. (mercury stearate).

$(C_{17}H_{35}CO_2)_2Hg$.

Properties: Yellow, granular powder. Soluble in fatty oils; insoluble in water and alcohol.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Germicide.

mercuric sulfate. (mercury persulfate; mercury sulfate).

CAS: 7783-35-9. $HgSO_4$.

Properties: White, crystalline powder. D 6.466, decomposes at red heat. Soluble in acids; insoluble in alcohol; decomposes in water.

Derivation: By the action of sulfuric acid on mercury with subsequent crystallization.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Calomel and corrosive sublimate, catalyst in the conversion of acetylene to acetaldehyde, extracting gold and silver from roasted pyrites, battery electrolyte.

mercuric sulfide, black. (mercury sulfide, black).

CAS: 1344-48-5. HgS .

Properties: Black powder. D 7.55–7.70, mp sublimes at 446C, mp 583C. Soluble in sodium sulfide solution; insoluble in water, alcohol and nitric acid.

Derivation: By passing hydrogen sulfide into a solution of mercury salt, reaction of mercury with sulfur.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Pigment.

mercuric sulfide, red. (vermilion; quicksilver vermilion; chinese vermilion; red mercury sulfide; artificial cinnabar; red mercury sulfuret).

CAS: 1344-48-5. HgS .

Properties: Fine, bright-scarlet powder. D 8.06–8.12, mp sublimes at 583C. Insoluble in water and alcohol.

Derivation: By heating mercury and sulfur with subsequent recovery by sublimation. A precipitated form is known as English vermilion.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Pigment.

mercuric thiocyanate. (mercuric sulfocyanate; mercuric sulfocyanide; mercury sulfocyanate; mercury thiocyanate).

CAS: 592-85-8. $Hg(SCN)_2$.

Properties: White powder. Mp decomposes. Slightly soluble in alcohol; insoluble in water.

Derivation: By precipitation of mercuric nitrate with ammonium sulfocyanate and subsequent solution in a large amount of hot water and crystallizing.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Photography, pyrotechnics.

“**Mercurochrome**” [BD]. TM for merbromin.

mercurous acetate. (mercury proto-acetate; mercury acetate).

CAS: 631-60-7. $C_2H_4Hg_2O_4$.

Properties: Colorless scales or plates, decomposed by boiling water and by light into mercury and mer-

curic acetate. Slightly soluble in water; insoluble in alcohol and ether; soluble in dilute nitric acid.

Derivation: Reaction of sodium acetate with mercurous nitrate solution acidified with nitric acid.

Grade: Technical.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (antibacterial).

mercurous acetylde. Hg_2C_2 .

Properties: White powder. A salt of acetylene.

Derivation: Reaction of acetylene with aqueous solution of mercurous salts.

Hazard: Severe explosion risk when shocked or heated. Highly toxic.

mercurous bromide. (mercury bromide).

CAS: 10031-18-2. HgBr or Hg_2Br_2 .

Properties: White powder or colorless crystals; odorless; tasteless. Becomes yellow on heating, returning to white on cooling. Darkens on exposure to light. D 7.307, sublimates at 340–350C, mp 405C. Soluble in fuming nitric acid (prolonged heating), hot concentrated sulfuric acid, hot ammonium carbonate or ammonium succinate solutions; sparingly soluble in water; insoluble in alcohol and ether.

Derivation: (1) Action of potassium bromide on solution of mercurous nitrate in dilute nitric acid; (2) sublimation from mixture of mercury and mercuric bromide.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

mercurous chlorate. (mercury chlorate).

$\text{Hg}_2(\text{ClO}_3)_2$.

Properties: White crystals. D 6.409, mp 250C (decomposes). Soluble in alcohol, water, and acetic acid.

Hazard: Explodes in contact with organic or combustible materials. Keep away from light. Highly toxic.

mercurous chloride. (mercury monochloride; mercury protochloride; mercury chloride, mild; calomel).

CAS: 10112-91-1. Hg_2Cl_2 .

Properties: White, rhombic crystals or crystalline powder; odorless. Stable in air but darkens on exposure to light. D 6.993, mp 302C, bp 384C; decomposed by alkalis. Insoluble in water, ether, alcohol, and cold dilute acids.

Derivation: By heating mercuric chloride and mercury with subsequent sublimation.

Grade: Technical, CP, NF.

Hazard: Toxic dose is uncertain.

Use: Fungicide, electrodes, pharmaceuticals, pyrotechnics, ceramic painting, maggot control in agriculture.

mercurous chromate. (mercury chromate).

Hg_2CrO_4 .

Properties: Brick-red powder, variable composition.

Decomposes on heating. Soluble in nitric acid (concentrated); insoluble in alcohol and water.

Hazard: Moderate fire hazard in contact with organic materials. Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Ceramics (coloring green).

mercurous iodide. (mercury protoiodide).

CAS: 7783-30-4. HgI or Hg_2I_2 .

Properties: Bright-yellow powder, becoming greenish on exposure to light due to decomposition into metallic mercury and mercuric iodide. Becomes dark yellow, orange, and orange-red on heating. Undergoes same color change in opposite order on cooling. Odorless and tasteless. D 7.6445–7.75, sublimates at 140C, mp 290C (with partial decomposition). Soluble in castor oil, liquid ammonia, aqua ammonia; insoluble in water, alcohol, and ether.

Derivation: (1) Action of potassium iodide on a mercurous salt. (2) Boiling a solution of mercurous nitrate containing nitric acid with excess of iodine.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.1 mg(Hg)/m³.

Use: Medicine (topical antibacterial).

mercurous nitrate, hydrated.

CAS: 10415-75-5. $\text{HgNO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Short prismatic crystals, effloresces and becomes anhydrous in dry air, sensitive to light. D 4.785 (3.9C), mp 70C (decomposes). Soluble in small quantities of warm water (hydrolyzes in larger quantities) and water acidified with nitric acid.

Derivation: Action of cold dilute nitric acid upon an excess of mercury and warming slightly.

Hazard: May be explosive if shocked or heated. Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Analytical agent.

mercurous oxide.

CAS: 15829-53-5. Hg_2O .

Properties: Black powder. D 9.8, decomposes at 100C. Soluble in acids; insoluble in water.

Derivation: Action of sodium hydroxide on mercurous nitrate.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

mercurous sulfate.

CAS: 7783-36-0. Hg_2SO_4 .

Properties: White to yellow, crystalline powder. D 7.56, decomposes on heating. Soluble in hot sulfuric acid, dilute nitric acid; slightly soluble in water.

Derivation: (1) Dissolving mercury in sulfuric acid and heating gently; (2) adding sulfuric acid to mercurous nitrate solution.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³.

Use: Chemical (admixed with sulfuric acid as a catalyst, in oxidation of naphthalene to phthalic acid), batteries (Clark cell, Weston cell).

mercury. (quicksilver; hydrargyrum).

CAS: 7439-97-6. Hg. Metallic element of atomic

number 80, group IIB of the periodic table, aw 200.59, valences = 1,2; 4 stable isotopes and 12 artificially radioactive isotopes.

Properties: Silvery, extremely heavy liquid, sometimes found native. D 13.59, fp -38.85°C , bp 356.6°C . Insoluble in hydrochloric acid; soluble in sulfuric acid upon boiling; readily soluble in nitric acid; insoluble in water, alcohol, and ether; soluble in lipids; extremely high surface tension (480 dynes/cm) giving it unique rheological behavior; high electric conductivity. Noncombustible.

Source: Cinnabar.

Occurrence: Spain, Yugoslavia, Mexico, Canada, Algeria.

Derivation: By heating cinnabar in air or with lime and condensing the vapor.

Method of purification: Distillation; an important proportion of used mercury is recovered by redistillation.

Grade: Technical, virgin, redistilled, ACS.

Hazard: (1) Mercury, metallic: Highly toxic by skin absorption and inhalation of fume or vapor, absorbed by respiratory and intestinal tract. FDA permits zero addition to the 20 micrograms of mercury contained in average daily diet. TLV: (elemental) TWA 0.025 mg(Hg)/m^3 ; Not Classifiable as a Carcinogen. (2) All inorganic compounds of mercury are highly toxic by ingestion, inhalation, and skin absorption. TLV: TWA 0.025 mg(Hg)/m^3 ; Not Classifiable as a Carcinogen. (3) Most organic compounds of mercury are highly toxic; inorganic mercury can be converted to methylmercury by bacteria in water. TLV: (alkyl compounds) 0.01 mg(Hg)/m^3 ; (aryl compounds) TWA 0.1 mg(Hg)/m^3 .

Note: Spillage may be a toxic hazard due to droplet proliferation. Clean-up requires special care.

Use: Amalgams, catalyst, electrical apparatus, cathodes for production of chlorine and caustic soda, instruments (thermometers, barometers, etc.), mercury vapor lamps, extractive metallurgy, mirror coating, arc lamps, boilers, coolant and neutron absorber in nuclear power plants.

mercury, ammoniated. (mercuric chloride, ammoniated; ammonobasic mercuric chloride; ammoniated mercury chloride, white precipitate; fusible; aminomercuric chloride; mercury cosmetic). HgNH_2Cl .

Properties: White, pulverulent lumps or powder; earthy, metallic taste; odorless. Stable in air, darkens on exposure to light. Soluble in ammonium carbonate and sodium thiosulfate solutions and in warm acids; insoluble in water and alcohol.

Derivation: By precipitating mercuric chloride with ammonium hydroxide in excess.

Grade: USP, technical.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m^3 .

Use: Medicine (local anti-infective), pharmaceuticals.

mercury bichloride. Legal label name for mercuric chloride.

mercury cell. An electrolytic cell for the production of caustic soda and chlorine from sodium chloride brine. Continuously fed brine is decomposed in one compartment between graphite anodes, where chlorine is liberated, and a mercury cathode, where a sodium amalgam is formed. The amalgam flows continuously or intermittently to a second compartment where it is decomposed with water, forming a caustic solution. The decomposition is usually performed electrolytically by making the amalgam anodic with respect to an iron or graphite cathode. Pure water is supplied to the decomposition compartment at such a rate as to maintain a constant concentration of caustic in the product. With respect to the diaphragm cell, the mercury cathode cell has generally a more concentrated solution (50–70%); it has the disadvantages of higher operating voltage and lower efficiency (52–55%) and a high capital investment in mercury. Examples of mercury-cathode cells are Castner cell and DeNora cell.

mercury compounds. See mercury chlorate; mercurous chlorate; mercury oxide; mercuric oxide.

mercury dichromate. (mercuric dichromate; mercury bichromate). HgCr_2O_7 .

Properties: Heavy, red, crystalline powder. Soluble in acids; insoluble in water.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m^3 .

mercury fulminate. (mercuric cyanate). Hg(CNO)_2 .

Properties: Gray, crystalline powder. D 4.42, mp (explodes). Soluble in alcohol, ammonium hydroxide, and hot water; slightly soluble in cold water.

Derivation: By treating mercury with strong nitric acid and alcohol.

Grade: Technical.

Hazard: Explodes readily when dry, keep moist till use, an initiating explosive. Highly toxic. TLV: TWA 0.1 mg(Hg)/m^3 .

Use: Manufacture of caps and detonators for producing explosions of military, industrial, and sporting purposes.

mercury nitrilotriacetate. CAS: 73128-65-1. mf: $\text{C}_{12}\text{H}_{12}\text{HgN}_3\text{O}_{12}$.

Properties: IDLH 10 mg/m^3 (as Hg).

Hazard: A poison by ingestion. TWA 0.01. STEL 0.03 mg/m^3 (skin)

mercury selenide. HgSe . Sublimes in a vacuum, d 8.266, insoluble in water.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m^3 .

Use: Semiconductor in solar cells, thin-film transistors, infrared detectors, ultrasonic amplifiers.

mercury telluride. HgTe .

Grade: 99.99%.

Use: Semiconductor in solar cells, thin-film transistors, infrared detectors, ultrasonic amplifiers.

“Merlon” [Bayer]. TM for a polycarbonate resin. Rods, tubes, pipes, sheets, film extrusions, and special types may be produced by extrusion, thermoforming, injection, and blow moldings.

Properties: Transparent, slightly straw-colored resin. D 1.2, refr index 1.587.

Use: Electrical and electronic component industries, protective equipment, graphic arts and photographic film, cable wrapping and protective overlays for other thermoplastic sheeting, missile applications.

merocyanine. See cyanine dye.

“Merpertine” [Du Pont]. TM for a surface-active compounded anionic wetting, penetrating and leveling agent used in leather and textile fields.

“Merpol” [Du Pont]. TM for fatty alcohol-ethylene oxide condensates.

Use: As nonionic dispersing and emulsifying agents for paper, leather, and textile industries.

Merrifield, R. Bruce. (1921–2006). An American chemist who won the Nobel Prize for chemistry in 1984. Merrifield was cited for work on the use of a solid matrix as an aid to chemical synthesis of complex peptides and proteins. His synthesis techniques have been used in the development of solid matrix-bound inorganic and organic agents. He was awarded a doctorate from U.C.L.A.

Merrifield solid-phase peptide synthesis.

Synthesis of large peptides by stepwise chain elongation on a polymeric support.

“Mertect” [MSD Agvet]. TM for a post harvest fungicide.

“Merthiolate” [Lilly]. TM for a 0.1% solution of thiomersal in alcohol.

Hazard: Highly toxic by ingestion, for external use only.

Use: General antiseptic.

mescaline. (3,4,5-trimethoxymethoxyphenethylamine).

CAS: 54-04-6. $(\text{CH}_3\text{O})_3\text{C}_6\text{H}_2\text{CH}_2\text{CH}_2\text{NH}_2$. An alkaloid derived from a Mexican cactus.

Properties: Crystals. Mp 35–36C, bp 180C. Soluble in water, alcohol, chloroform, benzene; nearly insoluble in ether.

Hazard: Highly toxic by ingestion.

Use: Biochemical and medical research, hallucinogenic drug.

mesh. The number of apertures per square inch of a screen or sieve, it is the square of the number of strands of metal or plastic per linear inch. See screen.

mesitol. (2,4,6-trimethyl phenol; 2-hydroxy mesitylene).

Properties: Needles. Mp 69C, bp 220C. Soluble in water and alcohol.

mesitylene. (1,3,5-trimethylbenzene; *sym*-trimethylbenzene).

CAS: 108-67-8. $\text{C}_6\text{H}_3(\text{CH}_3)_3$.

Properties: Liquid. D 0.863, fp –52.7C, bp 164.6C. Insoluble in water; soluble in alcohol and ether. Derived from coal tar. Combustible.

Hazard: Moderate fire hazard. Toxic by inhalation. TLV: 25 ppm.

Use: Intermediate, including anthraquinone vat dyes, UV oxidation stabilizers for plastics.

2-mesitylenesulfonyl chloride. 1,3,5- $(\text{CH}_3)_3\text{C}_6\text{H}(\text{SO}_2\text{Cl})_2$.

Properties: White crystalline solid. Mw 317.21, mp 123–125C, moisture sensitive.

Hazard: Corrosive.

Use: Pharmaceutical intermediate, protective reagent for the guanidino group in peptide synthesis, selective sulfonating agent.

mesityl oxide. (isopropylideneacetone; methyl isobutenyl ketone; 4-methyl-3-penten-2-one).

CAS: 141-79-7. $(\text{CH}_3)_2\text{CHCOCH}_3$.

Properties: Oily, colorless liquid; honeylike odor. D 0.8569 (20/20C), bp 130–131C, vap press 8.7 mm Hg (20C), flash p 90F (32.3C), bulk d 7.1 lb/gal (20C), fp –46.4C, viscosity 0.0060 cP (20C), autoign temp 652F (344C). Soluble in water, alcohols, and ethers.

Derivation: Dehydration of acetone or diacetone alcohol.

Grade: Technical.

Hazard: Flammable, moderate fire risk. Toxic by ingestion, inhalation, and skin absorption. TLV: TWA 15 ppm; STEL 25 ppm.

Use: Solvent for cellulose esters and ethers, vinyl resins, lacquers, roll-coating inks, stains, ore flotation, paint and varnish-removers, insect repellent, manufacture of methyl isobutyl ketone.

meso-. A prefix meaning middle or intermediate, specifically (1) an optically inactive stereoisomeric form resulting from the presence of an even number of dextro and levorotatory isomers in a natural substance. This cancels the optical activity and causes formation of an intermediate structure which is its own mirror image. This effect is called internal compensation. Tartaric acid is an example. See racemization; tartaric acid.

(2) An intermediate hydrated form of an inorganic acid. (3) Designating a middle position in certain

cyclic organic compounds. (4) A ring system characterized by a middle position of certain rings.

mesokaryotic. Nuclear condition unique to the dinoflagellates in which the chromosomes remain permanently condensed.

mesomerism. See resonance (1).

mesomorphic. A molecular arrangement intermediate between crystals (solid) and amorphous (liquid) that characterizes liquid crystals.

messenger RNA (mRNA). RNA that serves as a template for protein synthesis. See genetic code.

mesyl chloride. See methanesulfonyl chloride.

Met. Symbol for methionine.

meta-. A prefix. For definition of *meta*-compounds
See *ortho*-.

metabolism. The chemical transformations occurring in an organism from the time a nutrient substance enters it until it has been utilized and the waste products eliminated. In animals and humans, digestion and absorption are primary steps, followed by a complicated series of degradations, syntheses, hydrolyses, and oxidations, in which agents such as enzymes, bile acids, and hydrochloric acid take part. These transformations are often localized with respect to organs, tissues, and types of cells involved. Basal metabolism is the rate of total heat production of an individual who is awake but in complete mental and physical repose, at comfortable temperature and without having had food for at least 12 hrs. Under these conditions, oxidation of stored nutrients provides the sole source of energy expended and heat is measurable by calorimetry. See digestion (1).

metabolite. An intermediate substance produced and used in the processes of a living cell or organism. Metabolites effect replacement and growth in living tissue and are also a source of energy in the body. Examples are nucleic acids, enzymes, glucose, cholesterol, and many similar substances.

metabolic acid. HBO_2 .
Properties: White crystals. D 2.486, mp 236C. Slightly soluble in water.

metacetone. See diethylketone.

“Metacaulk 350i” [Rectorseal]. TM for a general purpose fire rated sealant.
Use: Sealant for construction joints.

Metachrome Yellow. (alizarine yellow GG; sodium-*m*-nitrobenzeneazosalicylate; CI 14025).
CAS: 584-42-9. $\text{C}_{13}\text{H}_8\text{N}_3\text{NaO}_5$.

Properties: Finely divided yellow crystals. Soluble in hot water.

Derivation: Diazotizing *m*-nitroaniline and coupling with salicylic acid.

Use: Acid-base indicator, biological stain.

metaformaldehyde. See *sym*-trioxane.

metal. An element that forms positive ions when its compounds are in solution and whose oxides form hydroxides rather than acids with water. Approximately 75% of the elements are metals that occur in every group of the periodic table except VIIA and the noble gas groups. Most are crystalline solids with metallic luster, conductors of electricity, and have rather high chemical reactivity; many are quite hard and have high physical strength. They also readily form solutions (alloys) with other metals. The presence of very low percentage of other elements (not necessarily metals) profoundly affects the properties of many metals, e.g., carbon in iron. Mercury, cesium, and gallium are liquid at room temperature. Geologically, metals usually occur in the form of compounds that must be physically or chemically processed to yield the pure metal; common methods are application of heat (smelting), carbon reduction, electrolysis, and reduction with aluminum or magnesium. Metals fall into the following classifications, which are not mutually exclusive:

alkali metals	rare metals
alkaline-earth metals	rare-earth metals
transition metals	actinide metals
noble metals	light metals
platinum metals	heavy metals

The chemistry of metals, i.e., their behavior as atoms or ions, is a fundamental factor in electrochemical reactions, as well as in the metabolism of plants and animals, where many have essential nutrient and other biochemical functions. Among these are iron, copper, cobalt, potassium, and sodium, often in traces. Some metals are quite toxic, especially cadmium, mercury, lead, barium, chromium, and beryllium, both in elemental form and as compounds.
See alloy; trace element; electroplating.

metal alkyl. One of the family of organometallic compounds. It is a combination of an alkyl organic radical with a metal atom or atoms.
See Ziegler catalyst.

metalaxyl.
CAS: 57837-19-1. mf: $\text{C}_{15}\text{H}_{21}\text{NO}_4$.

Properties: White crystals.

Hazard: Moderately toxic by ingestion.

Use: Food additive; fungicide; agricultural chemical.

metal deactivator. A compound added to gasoline to neutralize the catalytic effect of copper in promoting fuel oxidation.

metaldehyde. $(\text{CH}_3\text{CHO})_n$. A polymer of acetaldehyde in which n usually is 4–6.

Properties: White prisms, decomposes with partial regeneration of acetaldehyde, when heated above 80C. Sublimes at 112–115C; mp 246C in sealed tube. Soluble in benzene, chloroform; slightly soluble in alcohol, ether; insoluble in water.

Hazard: Flammable, dangerous fire risk. Strong irritant to skin and mucous membranes.

Use: Fuel to replace alcohol, to destroy snails and slugs.

metal dye. See dye, metal.

metal fiber. See fiber.

metal, foamed. A light metal such as aluminum or zinc to which titanium hydride has been added. The latter evolves hydrogen to give a blown structure with about the same specific gravity as water.

metal glass. See glass, metallic.

metallic bond. See bond, chemical.

metallic soap. See soap (2).

metallized dye. A soluble dye including any one of a variety of metals chemically combined, applied to wool in an acid bath, by use of sodium chloride to salt out the dye onto the fiber.

metallizing. Coating a plastic or similar material with a deposit of metal (usually aluminum) by means of vacuum deposition. The thickness of such films may vary from 0.01 to as much as 3 mils. Metallized plastic films are used for yarns, packaging, stamping foil, labels, etc.

metallocene. An organometallic coordination compound obtained as a cyclopentadienyl derivative of a transition metal or metal halide. The metal is bonded to the cyclopentadienyl ring by electrons moving in orbitals extending above and below the plane of the ring (π bond). There are three types of metallocenes: (1) dicyclopentadienyl-metals with the general formula $(\text{C}_5\text{H}_5)_2\text{M}$, (2) dicyclopentadienyl-metal halides with the general formula $(\text{C}_5\text{H}_5)_2\text{MX}_{1-3}$, (3) monocyclopentadienyl-metal compounds with the general formula $\text{C}_5\text{H}_5\text{MR}_{1-3}$, where R is CO, NO, halide group, alkyl group, etc. Types (1) and (2) are known as molecular sandwiches since the two cyclopentadiene rings lie above and below the plane on which the metal atom is situated.

Most metallocenes are crystalline and those belonging to the first transition series of the periodic table, from vanadium to nickel, have the same melting

point, 173C. The metal complexes are soluble in many organic solvents while the halides are soluble primarily in polar solvents. When the central metal atom is in a stable oxidation state the metallocene is not decomposed by high temperature, air, water, dilute acids, or bases.

Some metallocenes, such as ferrocene, undergo a wide variety of aromatic ring substitution reactions, including Friedel-Crafts acylation, arylation, and sulfonation; a few such as nickelocene and cobaltocene are too unstable to be directly substituted.

Derivation: The most important industrial method is the reaction of a cyclopentadienide (for example the sodium salt) with a transition metal halide in an organic solvent.

Use: Catalysts, polymers, UV absorbers, reducing agents, free radical scavengers, antiknock agents. See ferrocene; cobaltocene; nickelocene; titanocene dichloride; zirconocene dichloride; uranocene.

metalloendoprotease. See glycoprotease.

metalloid. See nonmetal; semiconductor.

metalloprotein. A protein having a metal ion as its prosthetic group.

metallurgical coke. See coke.

metal, powdered. Metals are produced in powdered form for a variety of uses in several industries. In this form they are the raw materials for powder metallurgy in which the powders are pressed in molds and heated (sintered) at high temperature. Metal powders range in size from –325 mesh (0.045–0.060 mm “diameter”) to +100 mesh and are available in practically all industrial metals. They are produced by machining, milling, shotting, granulation, atomizing, condensation, reduction, chemical precipitation, or electrodeposition. Their properties and purities vary with the method of preparation.

Hazard: Dangerous fire risk, especially as dust. Toxic by inhalation.

Use: Electric, automotive, machinery, tool and refractory-metal industries; paint pigments, flares and incendiary bombs, brazing materials, calorizing, metal-spraying, metallurgical agents; heat-generating agents, catalysts, etc.

“Metalyn” [Aqualon]. TM for a series of distilled methyl esters of tall-oil fatty acids.

metamorphosis. A process of developmental change whereby a larva reaches adulthood only after a drastic change in morphology; occurs in most amphibians and insects; for some insects, this change may include another stage (pupa) before the adult stage.

“**Metamucil**” [*Procter & Gamble*]. Proprietary preparation of psyllium mucilloid, dextrose, benzyl benzoate, NaHCO₃, KH₂PO₄, and citric acid.
Use: Laxative.

metanilic acid. (*m*-sulfanilic acid; *m*-aminobenzenesulfonic acid).

CAS: 121-47-1. C₆H₄(NH₂)SO₃H.

Properties: Small, colorless needles. Soluble in water, alcohol, and ether.

Derivation: By the reduction of metal-nitrobenzenesulfonic acid. Nitrobenzene is sulfonated until the product is soluble in water. The mixture is then poured into water and reduced with iron, made alkaline with lime, and the lime salt dissociated with sodium carbonate.

Hazard: See aniline.

Use: Azo dye manufacture (sodium salt), sulfa drug synthesis.

metaphase. A stage in mitosis or meiosis during which the chromosomes are aligned along the equatorial plane of the cell.

meta-phosphoric acid. See phosphoric acid, *meta*-.

metapon. (methyl-dihydromorphine). A narcotic drug.
 See narcotic.

“**Metasol**” [*Merck*]. TM for a series of chemicals used as fungicides, mildewicides, bactericides, slime control agents for pulp- and paper-mill systems, and as preservatives for all types of systems. Type (J-26) is claimed to be a broad-spectrum antimicrobial agent with a minimum ecological hazard.

metastable. A system is metastable if it is above its minimum-energy state, but requires an energy input before it can reach a lower-energy state.

metastasis. The spread of cancer from one part of the body to another. Cells in the metastatic (secondary) tumor are like those in the original (primary) tumor.

“**Meta-Systox R**” [*Bayer*]. TM for *O,O*-dimethyl-*S*-2-(ethylsulfinyl)ethyl phosphorothioate.

metathesis. See double decomposition.

metazine.

CAS: 67704-68-1. mf: C₁₁H₁₉N₇.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

metepa. (generic name for tris(methyl-1-aziridinyl)phosphine oxide).

CAS: 57-39-6. (C₃H₆N)₃PO.

Properties: Amber liquid; amine odor. Bp 188C (1

mm Hg), d 1.079. Miscible with water and organic solvents.

Hazard: Toxic by ingestion and skin absorption, strong irritant to skin.

Use: Insect chemosterilant, addition products for textile treatments, adhesives, paper and rubber processing, cross-linking agent in polymer systems which contain active hydrogens, monomer.

meter. (1) The basic unit of length of the metric system (39.37 in.). Originally defined as one ten-millionth of the distance from the equator to the North Pole. Now defined as 1,650,763.73 wavelengths of the orange-red line of the isotope krypton 86. (2) A device for measuring the flow rate of liquids, gases, or particulate solids, e.g., flowmeters, rotameters, proportioning equipment.

See gauge.

“**Metglas**” [*General Electric*]. TM for an amorphous metal alloy developed for use as transformer coils.

“**Methac**” [*Borden*]. TM for a series of blends of methyl acetate with methanol in varying proportions.

Hazard: Toxic by ingestion.

Use: Lacquer solvents, paint removers, organic synthesis.

methacrolein. (methacrylaldehyde).

CAS: 78-85-3. CH₂:C(CH₃)CHO.

Properties: Liquid. D 0.8474 (20/20C), bp 68.0C, flash p 35F (1.7C) (OC). Soluble in water 5.9% by wt (20C), shipped with 0.1% hydroquinone as polymerization inhibitor.

Hazard: Flammable, dangerous fire risk. Strong irritant.

Use: Copolymers, resins.

methacrylaldehyde. See methacrolein.

methacrylamide. (methacrylic acid amide).

CAS: 79-39-0. CH₂:C(CH₃)CONH₂.

Properties: Solid. Mp 110C.

Use: A monomer for acrylic resins.

methacrylamidopropyltrimethylammonium chloride. (MAPTAC).

Properties: (50% water solution): Amber liquid. D 1.059, refr index 1.427, flash p none (CC), bulk d 8.66 lb/gal.

Use: Reactive cationic monomer for wide range of industrially useful polymers.

methacrylate ester. $\text{CH}_2\text{:C}(\text{CH}_3)\text{COOR}$ where R is usually methyl, ethyl, isobutyl, or *n*-butyl-isobutyl (50:50). Esters of methacrylic acid; supplied commercially as the polymers. See acrylic resin.

methacrylate resin. See acrylic resin.

methacrylatochromic chloride.

Properties: Water-soluble solid.

Derivation: Reaction of methacrylic acid with basic chromic chloride.

Use: Water repellent, nonadhesive, insolubilizer for vinyl polymer.

See "Volan" [Du Pont].

methacrylic acid. (α -methacrylic acid) (monomer).

CAS: 79-41-4. $\text{H}_2\text{C:C}(\text{CH}_3)\text{COOH}$.

Properties: Colorless liquid. Mp 15–16C, bp 161–162C, d 1.015 (20C), flash p 170F (76.6C). Soluble in water, alcohol, ether, most organic solvents. Polymerizes readily to give water-soluble polymers. Combustible.

Derivation: Reaction of acetone cyanohydrin and dilute sulfuric acid; oxidation of isobutylene.

Grade: 40% aqueous solution, bp 76–78C (25 mm Hg); crude monomer 85% pure, glacial (99% assay).

Hazard: Toxic material. Strong irritant to skin. TLV: 20 ppm.

Use: Monomer for large-volume resins and polymers, organic synthesis. Many of the polymers are based on esters of the acid, as the methyl, butyl, or isobutyl esters.

See acrylic resin.

α -methacrylic acid. See methacrylic acid.

β -methacrylic acid. See crotonic acid.

methacrylic acid-divinylbenzene copolymer.

Use: Food additive.

methacrylonitrile. (2-cyanopropene-1; isopropenenitrile).

CAS: 126-98-7. $\text{CH}_2=\text{C}(\text{CH}_3)\text{C}\equiv\text{N}$.

Properties: Clear, colorless liquid. Bp 90.3C, fp –38.8C, flash p 55F (12.7C) (TOC), d 0.789. Slightly soluble in water; soluble in acetone. Thermoplastic; resistant to acids and alkalis.

Hazard: Flammable. Toxic by ingestion, inhalation, and skin absorption. TLV: 1 ppm.

Use: Vinyl nitrile monomer, copolymer with styrene, butadiene, etc., elastomers, coatings, plastics.

γ -methacryloxypropyltrimethoxysilane.

Properties: Liquid. D 1.045 (25C), bp approximately 80C (1 mm Hg), refr index 1.4285 (25C), flash p 135F (57.2C). Soluble in acetone, benzene, ether, methanol, and hydrocarbons. Combustible.

Grade: 97% min purity.

Hazard: Moderate fire risk.

Use: Coupling agent for promotion of resin-glass, resin-metal, and resin-resin bonds, for formulation of adhesives having "built in" primer systems.

methacryloyl chloride.

CAS: 920-46-7. $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COCl}$.

Properties: Liquid. Mw 104.54, bp 95–96C, d 1.070, fp 2C.

Available forms: Technical 90% stabilized with phenothiazine.

Hazard: Flammable and corrosive liquid.

methadone hydrochloride. (*dl*-6-dimethylamino-4,4-diphenyl-3-heptanone hydrochloride).

CAS: 1095-90-5.

$(\text{C}_6\text{H}_5)_2\text{C}(\text{COC}_2\text{H}_5)\text{CH}_2\text{CH}(\text{CH}_3)\text{N}(\text{CH}_3)_2\cdot\text{HCl}$. A synthetic narcotic.

Properties: Crystalline substance with a bitter taste; no odor. Mp 232–235C. Soluble in water, alcohol, and chloroform; practically insoluble in ether and glycerol; pH (1% aqueous solution) 4.5–6.5.

Grade: USP.

Hazard: Toxic. Addictive narcotic. Use restricted.

Use: Medicine (sedative, treating heroin addiction).

methallenestril. (β -ethyl-6-methoxy- α,α -dimethyl-2-naphthalenepropionic acid).

Properties: Crystals. Mp 132.5C. Soluble in ether, vegetable oils.

Use: Medicine (estrogen).

methallyl acetate. See methylallyl acetate.

methallyl alcohol. See methylallyl alcohol.

β -methallyl chloride. See β -methylallyl chloride.

methallylidene diacetate.

Properties: Liquid. D 1.510 (20/20C), bp 191.0C, fp –15.4C, flash p 215F (101C) (COC). Slightly soluble in water. Combustible.

Use: Chemical intermediate, can provide controlled release of methacrolein in acid solution.

methamidophos. (*O,S*-dimethyl phosphoramidothioate).

CAS: 10265-92-6.

Properties: Mp 39–41C. Water-miscible.

Use: Insecticide for cotton, cole crops, lettuce, potatoes.

d-methamphetamine. See *d*-1-phenyl-2-methylaminopropan.

methamphetamine hydrochloride. See amphetamine.

methanal. See formaldehyde.

methanamide. See formamide.

methanation. A reaction by which methane is formed from the hydrogen and carbon monoxide derived from coal gasification. It requires a catalyst, e.g., nickel, and temperatures in the range of 500C. In one process the reaction is performed in an adiabatic fixed-bed reactor. The reaction is $3\text{H}_2 + \text{CO} \rightarrow \text{CH}_4 + \text{water}$. See gasification.

methane. (marsh gas; methyl hydride). CAS: 74-82-8. CH_4 . The first member of the paraffin (alkane) hydrocarbon series.

Properties: Colorless gas; odorless; tasteless. Lighter than air. Practically inert toward sulfuric acid, nitric acid, alkalis, and salts but reacts with chlorine and bromine in light (explosively in direct sunlight). Flash p -306F (-188C), bp -161.6C , fp -182.5C , autoign temp 1000F (537C), vap d 0.554 (0C), critical temperature -82.1C , critical pressure 672 psia, heating value 1009 Btu/cu ft. Soluble in alcohol, ether; slightly soluble in water.

Occurrence: Natural gas and coal gas, from decaying vegetation and other organic matter in swamps and marshes.

Derivation: (1) From natural gas by absorption or adsorption. (2) From coal mines for use as fuel gas. (3) From a mixture of carbon monoxide and hydrogen (synthesis gas) obtained by reaction of hot coal with steam; the mixed gas is passed over a nickel-based catalyst at high temperature. See methanation. Methane can also be obtained by a nickel-catalyzed reaction of carbon dioxide and hydrogen. (4) Anaerobic decomposition of manures and other agricultural wastes. (5) By horizontal drilling of coal seams.

Grade: Research 99.99%; CP 99%; technical 95%; Btu grade, which must have heating value of 1000 Btu/cu ft at 15.5C and a pressure of 30 inches of mercury.

Hazard: Severe fire and explosion hazard, forms explosive mixture with air (5–15% by volume). An asphyxiant gas.

Use: Source of petrochemicals by conversion to hydrogen and carbon monoxide by steam cracking or partial oxidation. Important products are methanol, acetylene, hydrogen cyanide, and ammonia. Chlorination gives carbon tetrachloride, chloroform, methylene chloride, and methyl chloride. In the form of natural gas, methane is used as a fuel, as a source of carbon black, and as the starting material for manufacture of synthetic proteins.

See natural gas; synthetic natural gas; biogas.

methanecarboxylic acid. See acetic acid.

methanededicarbonic acid. See malonic acid.

methanephosphonic acid, diphenyl ester.

CAS: 7526-26-3. mf: $\text{C}_{13}\text{H}_{13}\text{O}_3\text{P}$.

Hazard: A poison by ingestion.

methanesulfonic acid.

CAS: 75-75-2. $\text{CH}_3\text{SO}_3\text{H}$.

Properties: Liquid at room temperature. D 1.4812 (18/4C), mp 17–20C, bp 200C, refr index 1.4317 (16C), flash p none. Soluble in water, alcohol, ether.

Grade: 70%.

Hazard: Corrosive to tissue (eyes, skin, and mucous membranes).

Use: Catalyst in esterification, alkylation, olefin polymerization, peroxidation reactions.

methanesulfonic acid, nonamethylene ester.

CAS: 4248-77-5. mf: $\text{C}_{11}\text{H}_{24}\text{O}_6\text{S}_2$.

Hazard: A reproductive hazard.

methanesulfonyl chloride. (mesyl chloride).

$\text{CH}_3\text{SO}_2\text{Cl}$.

Properties: Pale yellow liquid. D 1.485 (20/20C), bp 164C, fp -32C . Soluble in most organic solvents; insoluble in water (hydrolyzes slowly).

Grade: 98%, 99+%.

Use: Intermediate, flame-resistant products, stabilizer for liquid sulfur trioxide, biological chemicals.

***n,n'*-methanetetrayl biscyclohexanamine.**

CAS: 538-75-0. mf: $\text{C}_{13}\text{H}_{22}\text{N}_2$.

Hazard: A poison by skin contact. Moderately toxic by ingestion and inhalation.

***n,n'*-methanetetraylbis(2,6-bis(1-methylethyl)benzenamine).** See bis(2,6-diisopropylphenyl)carbodiimide.

methanethiol. (methyl mercaptan).

CAS: 74-93-1. CH_3SH .

Properties: Water-white liquid when below its boiling point, or colorless gas; powerful, unpleasant odor. Fp -121C , d 0.87 (20C), flash p 0F (-17C), bp 5.96C . Slightly soluble in water; soluble in alcohol, ether, and petroleum naphtha.

Derivation: Methanol and hydrogen sulfide.

Grade: 98.0% purity.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 3.9–21.8%. Strong irritant. TLV: 0.5 ppm.

Use: Synthesis, especially of methionine, jet fuel additives, fungicides; also as catalyst.

methanethiomethane. See dimethyl sulfide.

methanoic acid. See formic acid.

methanol. See methyl alcohol.

methapyrilene.CAS: 91-80-5. $C_{14}H_{19}N_3S$.**Properties:** Colorless liquid. Bp 173C (3 mm Hg). Soluble in water and alcohol; insoluble in benzene.**Hazard:** Toxic by ingestion, a carcinogen.**Use:** Medicine (antihistamine).**“Methazate” [Uniroyal].** TM for zinc dimethylthiocarbamate.

See ziram.

methenamine. See hexamethylenetetramine.**“Methendic” Anhydride [Velsicol].** TM for a mix of bicyclic unsaturated dibasic anhydrides as a relatively nonvolatile liquid at room temperature.**Properties:** Pale-amber liquid, color Gardner 3–6. D 1.2–1.3 (25C), 1.5052 (27C), flash p 275–285F (135–140C) (COC). Miscible with acetone, aromatic and aliphatic hydrocarbons at room temperature. Combustible.**Use:** Cross-linking or curing agent for epoxy-type resin systems.**methenyl tribromide.** See bromoform.**methicillin.** $C_6H_3(OCH_3)C=O$. A semisynthetic antibiotic.**Use:** Effective against resistant staphylococci.**methidathion.** (an ester of dithiophosphoric acid).CAS: 950-37-8. $C_6H_{11}N_2O_4PS_3$.**Properties:** Crystalline solid. Almost insoluble in water; soluble in common organic solvents.**Hazard:** Toxic by ingestion, a cholinesterase inhibitor.**Use:** Insecticide.**methiocarb.** (4-methylthio-3,5-xylyl-*N*-methylcarbamate).

CAS: 2032-65-7.

Properties: Mp 121C.**Use:** Insecticide for vegetables and fruits.**methiodal sodium.** See sodium methiodal.**methiomeprazine hydrochloride.**CAS: 14056-64-5. mf: $C_{19}H_{24}N_2S_2 \cdot ClH$.**Hazard:** A poison.**methionamine.** See *n*-acetyl-*l*-methionine.**methionine.** (2-amino-4-(methylthio)butyric acid).CAS: 59-51-8. $CH_3SCH_2CH_2CH(NH_2)COOH$. An optically active, essential sulfur-containing amino acid important in biological *trans*-methylation processes. The levo form is biologically active.**Properties:** (*dl*-racemic mix) White, crystalline platelets or powder; faint odor. Soluble in water,

dilute acids and alkalis, very slightly soluble in alcohol, practically insoluble in ether, pH (1% aqueous solution) 5.6–6.1.

Derivation: Hydrolysis of protein, synthesized from hydrogen cyanide, acrolein, and methyl mercaptan.**Grade:** NF, feed 98%.**Use:** Pharmaceuticals, feed additive, vegetable-oil enrichment, single-cell protein.**methionine hydantoin.**CAS: 13253-44-6. mf: $C_6H_{10}N_2O_2S$.**Hazard:** Low toxicity by ingestion and skin contact.**methionine hydroxy-analog calcium.** (*dl*- α -hydroxy- γ -methylmercaptobutyric acid, calcium salt; 2-hydroxy-4-methylthiobutyric acid, calcium salt). $(CH_3SCH_2CH_2CH_2OCOO)_2Ca$. Free methionine hydroxy analog is a metabolite in methionine utilization.**Properties:** Free-flowing light tan powder. Soluble in water; insoluble in common organic solvents.**Use:** Animal feed, synthesis of pharmaceuticals.**methiotepa.** (generic name for tris(2-methyl-1-aziridinyl)-phosphine sulfide.)

See metepa.

“Methocel” [Dow]. TM for methylcellulose.**methomyl.** (*S*-methyl-*N*-(methylcarbamoyloxy)-thioacetimidate).CAS: 16752-77-5. $C_5H_{10}N_2O_2S$.**Properties:** Crystalline solid. Mp 78C, d 1.30. Partially soluble in water, alcohol, and acetone; soluble in methanol.**Hazard:** Toxic by ingestion. TLV: TWA 2.5 mg/m³; not classifiable as a human carcinogen.**Use:** Insecticide, nematocide.**methoprene.**CAS: 40596-69-8. $C_{19}H_{24}O_3$. An insecticidal preparation said to act in the manner of a juvenile hormone, which arrests development of insects in the larval stage.**methotrexate.** (amethopterin; 4-amino-10-methylfolic acid).

CAS: 59-05-2.

Properties: Orange-brown, crystalline powder. Insoluble in water, alcohol, chloroform, ether; slightly soluble in dilute hydrochloric acid; soluble in dilute solutions of alkali hydroxides and carbonates; folic acid antagonist.**Grade:** USP.**Hazard:** Very toxic.**Use:** Chemosterilant, cancer treatment.**methoxsalen.** (8-methoxypsoralen).CAS: 298-81-7. $C_{12}H_8O_4$, tricyclic.**Properties:** White to cream-colored, crystalline solid; odorless. Slightly soluble in alcohol; practically insoluble in water. Combustible.

Use: Suntan accelerator, sunburn protector.

methoxyacetaldehyde. A highly reactive aldehyde derivative available in 77% aqueous solution. Clear colorless liquid with odor characteristic of lower aldehydes, miscible with water and many organic solvents. Resembles butyraldehyde in structure and some properties. Claimed as possible antimicrobial agent, preservative, and polymer modifier.

methoxyacetic acid.

CAS: 625-45-6. $\text{CH}_3\text{OCH}_2\text{COOH}$.

Properties: Liquid. Mp (min) 7.7C, boiling range 197–198C (min at 733 mm Hg), d 1.1738 (25/4C), refr index 1.415 (25C), flash p 260F (126C), acid number 612 (min). Combustible.

Use: Synthesis.

***p*-methoxyacetophenone.** (*p*-acetoanisole; acetanisole; *p*-acetylanisole).

CAS: 100-06-1. $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_3$.

Properties: Crystalline solid; pleasant odor. Bp 258C, congealing p 36.5C. Soluble in alcohol, ether, fixed oils. Combustible.

Derivation: Interaction of anisole and acetyl chloride in the presence of aluminum chloride and carbon disulfide.

Grade: Technical, FCC.

Use: Perfumery (for floral odors), flavoring.

methoxyamine. (hydroxylamine methyl ether).

CAS: 67-62-9. CH_3ONH_2 .

Properties: Colorless liquid; unpleasant odor. Bp 50C. Soluble in water and alcohol.

Derivation: From hydroxylamine disulfonic acid and methyl sulfate.

Hazard: Toxic by ingestion, strong skin irritant.

Use: Analytical reagent, mainly for ketones and aldehydes.

***o*-methoxyaniline.** See *o*-anisidine.

***p*-methoxyaniline.** See *p*-anisidine.

methoxybenzaldehyde. See anisaldehyde.

methoxybenzene. See anisole.

***p*-methoxybenzoic acid.** See anisic acid.

***p*-methoxybenzoic acid 2-phenylhydrazide.**

CAS: 15089-03-9. mf: $\text{C}_{14}\text{H}_{14}\text{N}_2\text{O}_2$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

***p*-methoxybenzyl acetate.** See anisyl acetate.

***p*-methoxybenzyl alcohol.** See anisic alcohol.

***p*-methoxybenzyl formate.** See anisyl formate.

2-methoxy-4,6-bis(isopropylamino)-s-triazine. (2,4-bis(isopropylamino)-6-methoxy-*s*-triazine). $\text{CH}_3\text{OC}_3\text{N}_3[\text{NHCH}(\text{CH}_3)_2]_2$.

Properties: White solid. Almost insoluble in water.

Use: Herbicide.

3-methoxybutanol.

$\text{CH}_3\text{CH}(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Liquid. D 0.9229, bp 161.1C, flash p 165F (74C), vap press 0.9 mm Hg (20C), sets to glass at –85C. Soluble in water. Combustible.

Hazard: Toxic by ingestion.

Use: High-boiling lacquer solvent, coupling agent for brake fluids, intermediate for plasticizers, herbicides, film-forming additive in PVA emulsions, solvent for pharmaceuticals.

1-(methoxycarbonyl)aziridine. See methyl 1-aziridineacetate.

3-methoxycarbonyl-6-*n*-butyl-7-benzyloxy-4-oxoquinoline. See nequinatate.

1-methoxycarbonyl-1-propen-1-yl dimethylphosphate. See mevinphos.

methoxychlor. (methoxy DDT; DMDT; 2,2-bis(*p*-methoxyphenol)-1,1,1-trichloroethane).

CAS: 72-43-5. $\text{Cl}_3\text{CCH}(\text{C}_6\text{H}_4\text{OCH}_3)_2$.

Properties: White, crystalline solid. Mp 89C. Insoluble in water; soluble in alcohol. Not compatible with alkaline materials.

Derivation: Reaction of methyl phenyl ether and chloral hydrate.

Hazard: Toxic material. TLV: TWA 10 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide effective against mosquito larvae and house flies; recommended for use in dairy barns.

2-methoxy-3,6-dichlorobenzoic acid. See dicamba.

***n*-methoxy-3-(3,5-di-*tert*-butyl-4-hydroxybenzylidene)-2-pyrrolidone.**

CAS: 107746-52-1. mf: $\text{C}_{20}\text{H}_{29}\text{NO}_3$.

Hazard: A poison by ingestion.

2-methoxy-4-(*o*-(*o*,*o*-diethylphosphorothioyl)benzaldoximino-*n*-methylcarbamate.

CAS: 22936-03-4. mf: $\text{C}_{14}\text{H}_{21}\text{N}_2\text{O}_6\text{PS}$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

9-methoxyellipticine lactate.

CAS: 26691-08-7. mf: $\text{C}_{18}\text{H}_{16}\text{N}_2\text{O}_3 \cdot \text{C}_3\text{H}_6\text{O}_3$.

Hazard: A poison.

2-(β-methoxyethoxy)ethanol. See diethylene glycol monomethyl ether.

α-((2-methoxyethoxy)methyl)-ω-hydroxypoly(oxy-1,2-ethanediyl)coco alkyl ethers.
CAS: 73507-40-1.

Hazard: A severe eye irritant.

methoxyethylene. See vinyl methyl ether.

2-methoxyethylmercury acetate.

CAS: 151-38-2. $\text{CH}_3\text{OCH}_2\text{CH}_2\text{HgOOCCH}_3$. A fungicide and disinfectant used in treating seeds.

Hazard: Highly toxic. TLV: TWA 0.1 mg(Hg)/m³; STEL 0.03 mg(Hg)/m³.

2-methoxyethyl 2-(*m*-nitrobenzylidene)acetoacetate.

CAS: 39562-22-6. mf: $\text{C}_{14}\text{H}_{15}\text{NO}_6$.

Hazard: Low toxicity by ingestion and inhalation. A moderate eye irritant.

methoxyethyl oleate.

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{OOC C}_{17}\text{H}_{33}$.

Properties: Oily liquid; mild odor. Fp approximately -18C, d 0.898 (25C), boiling range 180–206C (4 mm Hg), flash p 385F (196C) (OC), viscosity 8 cP (25C). Combustible.

Use: Plasticizer and solvent.

methoxyethyl stearate.

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{OOC C}_{17}\text{H}_{35}$.

Properties: Oily liquid; mild odor. Fp 19–24C, boiling range 186–205C (4 mm Hg), flash p 378F (192C) (OC), viscosity 9 cP at 25C. Combustible.

Use: Plasticizer and solvent.

methoxyfenozone.

CAS: 161050-58-4. mf: $\text{C}_{22}\text{H}_{28}\text{N}_2\text{O}_3$.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

methoxyflurane. See 2,2-dichloro-1,1-difluoroethyl methyl ether.

3-methoxy-4-hydroxybenzaldehyde. See vanillin.

methoxyhydroxymercuripropylsuccinyl urea. 3-hydroxymercuri-2-

methoxypropylcarbamoylsuccinamic acid.

$\text{C}_9\text{H}_{16}\text{HgN}_2\text{O}_6$.

Properties: Bitter crystals. Mp 198.5C.

Derivation: Made by the mercuration of allylsuccinylurea.

Hazard: Highly toxic.

9-(1-(methoxyimino)ethyl)-6-oxo-*n,n*,2,2,5-pentamethyl-7-oxa-3,4-dithia-5,8-diazadec-8-en-10-amide.

CAS: 90293-50-8. mf: $\text{C}_{13}\text{H}_{24}\text{N}_4\text{O}_4\text{S}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***n*-(2-(5-methoxy-4-indolyl)ethyl)acetamide.**

CAS: 190650-04-5. mf: $\text{C}_{13}\text{H}_{16}\text{N}_2\text{O}_2$.

Hazard: Low toxicity by ingestion.

4'-methoxy-2-(*p*-methoxyphenyl)acetophenone. See deoxyanisoin.

2-methoxy-5-methylaniline. See 5-methyl-*o*-anisidine.

6-methoxy-2-methyl-2*h*-1-benzopyran-3-carbonitrile.

CAS: 57543-75-6. mf: $\text{C}_{12}\text{H}_{11}\text{NO}_2$.

Hazard: Moderately toxic.

2-(((methoxy(1-methylethoxy)phosphinothioyl)thio)methyl)thio)ethylethylcarbamate.

CAS: 3853-74-5. mf: $\text{C}_{10}\text{H}_{22}\text{NO}_4\text{PS}_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-methoxy-4-methylpentanol-2.

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{OCH}_3$.

Properties: Liquid. Boiling range 163.8–167C. Combustible.

Use: Solvent for resin-coating formulation.

4-methoxy-4-methylpentan-2-one.

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{COCH}_3$.

Properties: Water-white liquid. Boiling range 147–163C, flash p 141F (60.5C). Combustible.

Derivation: Diacetone alcohol.

Hazard: Moderate fire risk. Irritant to skin and eyes.

Use: Solvent for a variety of resin coatings.

***n*-(2-(2-methoxy-5-methylphenyl)ethyl)propionamide.**

CAS: 156482-84-7. mf: $\text{C}_{13}\text{H}_{19}\text{NO}_2$.

Hazard: Moderately toxic by ingestion.

***n*-(2-(2-methoxy-5-methylphenyl)ethyl)trifluoroacetamide.**

CAS: 156482-85-8. mf: $\text{C}_{12}\text{H}_{14}\text{F}_3\text{NO}_2$.

Hazard: Low toxicity by ingestion.

2-methoxy-2-methylpropane. See methyl *t*-butyl ether.

2-(methoxy(methylthio)phosphinylimino)-3-methyl-1,3-thiazoline.

CAS: 33918-12-6. mf: $\text{C}_6\text{H}_{13}\text{N}_2\text{O}_2\text{PS}_2$.

Hazard: A poison by ingestion and skin contact.

Use: Agricultural chemical.

2-methoxynaphthalene. See β-naphthyl methyl ether.

3-(6-methoxy-2-naphthalenyl)-1,2-dimethyl (2r,3s)-rel-3-pyrrolidinol hydrochloride.CAS: 302959-30-4. mf: $C_{17}H_{21}NO_2 \bullet ClH$.**Hazard:** A poison.***n*-(2-(2-methoxynaphthyl)ethyl)butyramide.**CAS: 156482-71-2. mf: $C_{17}H_{21}NO_2$.**Hazard:** Moderately toxic by ingestion.***n*-(2-(2-methoxy-1-naphthyl)ethyl)cyclopropylcarboxamide.**CAS: 156482-69-8. mf: $C_{17}H_{19}NO_2$.**Hazard:** Moderately toxic by ingestion.***n*-(2-(2-methoxy-1-naphthyl)ethyl)pentanamide.**CAS: 156482-72-3. mf: $C_{18}H_{23}NO_2$.**Hazard:** Moderately toxic by ingestion.**1-methoxy-4-nitrobenzene.** See *p*-nitroanisole.***o*-methoxyphenol.** See guaiacol.**4-methoxyphenol.** (*p*-methoxyphenol).

See hydroquinone monomethyl ether.

p*-methoxyphenylacetic acid.** (*p*-methoxy- α -toluic acid). $CH_3OC_6H_4CH_2COOH$.**Properties:** Off-white to pale-yellow flakes. Mp 85C.**Use:** Preparation of pharmaceuticals, other organic compounds.p*-methoxyphenylbutanone.** See anisylacetone.**4-(4-methoxyphenyl)-6h-1,3,5-oxathiazine.**CAS: 58955-83-2. mf: $C_{10}H_{11}NO_2S$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**methoxypolyethylene glycol.** One of a series of compounds with properties similar to the polyethylene glycols of comparable molecular weight; slightly viscous liquids to soft, waxlike solids.**Use:** Manufacture of detergents and emulsifying and dispersing agents through the preparation of the mono derivatives of fatty acids.**methoxypropanol.** (monopropylene glycol methyl ether). $CH_3OCH_2CH(OH)CH_3$.**Properties:** Colorless liquid. Bp 120C, flash p 102F (39C), d 0.92 (25C). Combustible.**Hazard:** Moderate fire risk.**Use:** Antifreeze and coolant for diesel engines.**2-methoxy-1-propanol.**CAS: 1589-47-5. mf: $C_4H_{10}O_2$.**Hazard:** A reproductive hazard.***p*-methoxypropenylbenzene.** See anethole.***p*-methoxypropiophenone.** $C_6H_5COC_6H_4OCH_3$.**Properties:** Clear colorless liquid. Distillation range 110–140C (3 mm Hg), refr index 1.543–1.545 (25C).**3-methoxypropylamine.** (3-MPA). $CH_3OCH_2CH_2CH_2NH_2$.**Properties:** Colorless liquid. Bp 119C, d 0.873 (20/20C), refr index 1.4153 (25C), flash p 80F (26.6C) (TCC). Miscible with water, ethanol, toluene, acetone, carbon tetrachloride, hexane, and ether.**Hazard:** Flammable, moderate fire risk. Toxic by ingestion and inhalation.**Use:** Organic intermediate, emulsifier in anionic coatings and wax formulations.**6-methoxy-8-(5-propylaminoamylamino)quinoline phosphate.**CAS: 3818-70-0. mf: $C_{18}H_{27}N_3O \bullet xH_3O_4P$.**Hazard:** A poison by ingestion.**8-methoxypsoralen.** See methoxsalen.***p*-methoxytoluene.** See *p*-methylanisole.***p*-methoxy- α -toluic acid.** See *p*-methoxyphenylacetic acid.**methoxytriethylene glycol acetate.** See methoxytriglycol acetate.**methoxytriglycol.** $CH_3O[C_2H_4O]_3H$.**Properties:** Colorless liquid. D 1.0494, bp 249C, fp –44C, flash p 245F (118C). Soluble in water. Combustible.**Use:** Plasticizer intermediate.**methoxytriglycol acetate.** (methoxytriethyleneglycol acetate). $CH_3COO(C_2H_4O)_3CH_3$.**Properties:** Colorless liquid; fruity odor. D 1.0940 (20/20C), bulk d 9.2 lb/gal (20C), bp 244.0C, flash p 260F (126C). Water-soluble. Low volatility. Combustible.**Use:** Antidusting agent for finely powdered materials, especially for certain dyestuffs.**methyl abietate.**CAS: 127-25-3. $C_{19}H_{29}COOCH_3$.**Properties:** Colorless to yellow liquid. D 1.033–1.043 (20C), refr index 1.525–1.535, flash p 360F (182C), bp 365C. Miscible with most organic solvents. Combustible.**Use:** Solvent and plasticizer, lacquers, varnishes, coating compositions, adhesives.**methyl acetate.**CAS: 79-20-9. $CH_3CO_2CH_3$.**Properties:** Colorless, volatile liquid; fragrant odor. Miscible with the common hydrocarbon solvents, soluble in water, d 0.92438, fp –98.05C, bp 54.05C,

flash p 15F (−9.4C), refr index 1.3619 (20C), bulk d 7.76 lb/gal (20C), autoign temp 935F (501C).

Derivation: By heating methanol and acetic acid in presence of sulfuric acid and distilling.

Grade: Technical, CP.

Hazard: Flammable, dangerous fire and explosion risk, explosive limits in air 3–16%. Irritant to respiratory tract. TLV: TWA 200 ppm; STEL 250 ppm.

Use: Paint remover compounds, lacquer solvent, intermediate, synthetic flavoring.

methylacetic acid. See propionic acid.

methyl acetoacetate.

CAS: 105-45-3. $\text{CH}_3\text{COCH}_2\text{CO}_2\text{CH}_3$.

Properties: Colorless liquid. D 1.0785 (20/20C), bp 171.7C, vap press 0.7 mm Hg (20C), flash p 170F (78C), bulk d 9.0 lb/gal (20C), fp −80C. Soluble in alcohol; slightly soluble in water. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Solvent for cellulose ethers, ingredient of solvent mixture for cellulose esters, organic synthesis.

methyl acetone.

Properties: Water-white, anhydrous liquid, consisting of various mixtures of acetone, ethyl acetate, and methanol; miscible with hydrocarbons, oils, and water. Flash p near 0F (−17C).

Derivation: A by-product in the wood-distillation industry, also synthetic.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion.

Use: Solvent for nitrocellulose, cellulose acetate, rubber, gum, resins; lacquers, paint and varnish removers, extracting perfumes, dewaxing natural gums.

methylacetophenone. (methyl-*p*-tolyl ketone). $\text{CH}_3\text{C}_6\text{H}_4\text{COCH}_3$.

Properties: Colorless or pale-yellow liquid; fragrant coumarin odor. D 1.001–1.004, refr index 1.533–1.535. Soluble in seven parts of 50% alcohol and in most fixed oils. Combustible.

Derivation: Action of acetic anhydride on toluene.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

See glycine (2).

methylacetypyranone. See dehydroacetic acid.

methyl acetylene. (allylene; propyne).

CAS: 74-99-7. $\text{CH}_2\text{C}\equiv\text{CH}$.

Properties: Colorless, liquefied gas. Bp −23.1C, fp −101.5C, sp vol 9.7 cu ft/lb (70F).

Hazard: Flammable, dangerous fire risk. Toxic by inhalation. TLV: 1000 ppm.

Use: Specialty fuel, chemical intermediate.

methylacetylene-propadiene, stabilized. (MAPP).

CAS: 59355-75-8.

Properties: Colorless, liquefied gas. D (liquid): 0.576 (15/15C), boiling range −39 to −20C, flame temperature (in oxygen) 2925C. A mixture containing 60–66.5% methylacetylene and propadiene, with the balance being propane and butane.

Hazard: Flammable gas; dangerous fire risk. Toxic by inhalation. TLV: 1000 ppm; STEL 1250 ppm.

Use: Industrial fuel gas for cutting, welding, brazing, heat treating, and metallizing.

methyl acetylricinoleate.

$\text{C}_{17}\text{H}_{32}(\text{OCOCH}_3)\text{COOCH}_3$.

Properties: Pale yellow, low viscosity, oily liquid. Mild odor, d 0.938 (25/25C), solidifies at −26C. Soluble in most organic liquids; insoluble in water. Combustible.

Derivation: Castor oil, methanol and acetic anhydride.

Use: Plasticizer, lubricant, protective coatings, synthetic rubbers, vinyl compounds.

methyl acetylsalicylate.

$\text{CH}_3\text{COOC}_6\text{H}_4\text{COOCH}_3$.

Properties: White crystals. Mp 52C, 134–136C (9 mm Hg).

Derivation: By heating methyl salicylate with a slight excess of acetic anhydride, adding alcohol, then water, and separating the resulting precipitate.

Use: Perfumery (fixative).

methyl acid phosphate. See methylphosphoric acid.

β-methylacrolein. See crotonaldehyde.

methyl acrylate.

CAS: 96-33-3. $\text{CH}_2=\text{CHCOOCH}_3$.

Properties: Colorless, volatile liquid. Bp 80.5C, fp −76.5C, vap press 65 mm Hg (20C), d 0.9574 (20/20C), bulk d 8.0 lb/gal, flash p 25F (−3.8C) (TOC). Slightly soluble in water. Readily polymerized.

Derivation: (1) Ethylene cyanohydrin, methanol, and dilute sulfuric acid; (2) Oxo reaction of acetylene, carbon monoxide, and methanol in the presence of nickel or cobalt catalyst; (3) from β-propiolactone.

Grade: Technical (inhibited).

Hazard: Flammable, dangerous fire and explosion risk. Toxic by inhalation, ingestion, and skin absorption; irritant to skin and eyes. TLV: TWA 2 ppm; not classifiable as a human carcinogen.

Use: Acrylic polymers, amphoteric surfactants, vitamin B₁, chemical intermediate.

See acrylate.

β-methylacrylic acid. See crotonic acid.

methylal. (dimethoxymethane; formal).

CAS: 109-87-5. $\text{CH}_3\text{OCH}_2\text{OCH}_3$.

Properties: Colorless, volatile liquid; chloroform-like odor; pungent taste. Fp −105C, d 0.86 (20/4C), bp 42.3C, flash p approximately 0F (−17.7C)

(OC)(toc, autoign temp 459F (237C). Soluble in water at 20C to extent of 32 wt %; miscible with alcohol, ether, and hydrocarbons.

Hazard: Flammable, dangerous fire and explosion risk. Toxic by ingestion and inhalation. TLV: 1000 ppm.

Use: Solvent, organic synthesis, perfumes, adhesives, and protective coatings; special fuel.

2-methylalanine. See aminoisobutyric acid.

methyl alcohol. (methanol; wood alcohol).

CAS: 67-56-1. CH₃OH.

Properties: Clear, colorless, mobile, highly polar liquid. D 0.7924, fp -97.8C, bp 64.5C, bulk d 6.59 lb/gal (20C), refr index 1.329 (20C), surface tension 22.6 dynes/dm (20C), viscosity 0.00593 cP (20C), vap press 92 mm Hg (20C), flash p 54F (12.2C) (OC), autoign temp 867F (464C). Miscible with water, alcohols, and ether.

Derivation: (1) By high-pressure catalytic synthesis from carbon monoxide and hydrogen; (2) partial oxidation of natural gas hydrocarbons; (3) several processes for making methanol by gasification of wood, peat, and lignite have been developed but have not yet proved out commercially; (4) from methane with molybdenum catalyst (experimental).

Method of purification: Rectification.

Grade: Technical, CP (99.85%), electronic (used to cleanse and dry components), fuel.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 6–36.5% by volume. Toxic by ingestion (causes blindness). TLV: TWA 200 ppm; STEL 250 ppm.

Use: Manufacture of formaldehyde, acetic acid, and dimethyl terephthalate; chemical synthesis (methyl amines, methyl chloride, methyl methacrylate); antifreeze; solvent for nitrocellulose, ethylcellulose, polyvinyl butyral, shellac, rosin, manila resin, dyes; denaturant for ethanol; dehydrator for natural gas; fuel for utility plants (methyl fuel); feedstock for manufacture of synthetic proteins by continuous fermentation; source of hydrogen for fuel cells; home-heating-oil extender.

methylallyl acetate. (methylallyl acetate).

CH₂:C(CH₃)CH₂OOCCH₃.

Properties: Colorless liquid. D 0.9162 (20C), bulk d 7.6 lb/gal.

Hazard: Probably flammable.

Use: Monomer, preparation of methylallyl derivatives.

methylallyl alcohol. (methylallyl alcohol; 2-methyl-2-propen-1-ol). H₂C:C(CH₃)CH₂OH.

Properties: Colorless liquid; pungent odor. D 0.8515 (20/4C), bp 115C, refr index 1.4255 (25C), flash p 92F (33.3C). Soluble in water, alcohols, esters, ketones, and hydrocarbons.

Grade: 98.5% min purity.

Hazard: Flammable, moderate fire risk. Irritant to eyes and skin.

Use: Intermediate.

β-methylallyl chloride. (methylallyl chloride; 3-chloro-2-methyl-1-propene; MAC).

CH₂:C(CH₃)CH₂Cl.

Properties: Colorless to straw-colored, volatile liquid; sharp penetrating odor. D 0.925 (20C), bp 73C, refr index 1.427 (25C), flash p -3F (-19.4C) (TOC).

Hazard: Flammable, dangerous fire risk. Explosive limits in air 3.2–8.1%. Toxic by ingestion, irritant to eyes and skin.

Use: Intermediate for production of insecticides, plastics, pharmaceuticals, and other organic chemicals; fumigant for grains, tobacco, and soil.

methylaluminum sesquibromide.

(CH₃)₃Al₂Br₃.

Properties: Cloudy, yellow liquid at 25C. Fp -4C, bp (extrapolated) 166C, d 1.514 (25C).

Hazard: Ignites spontaneously in air, reacts violently with water, keep out of contact with air and moisture.

Use: Catalyst for polymerization of olefins and hydrogenation of aromatics, chemical intermediate.

methylaluminum sesquichloride.

(CH₃)₃Al₂Cl₃.

Properties: Colorless liquid at 25C. Fp 22.8C, bp (extrapolated) 143.7C, d 1.1629 (25C), 9.705 lb/gal (25C).

Hazard: Ignites spontaneously in air, reacts violently with water, keep out of contact with air and moisture.

Use: Catalyst for polymerization of olefins, catalyst for hydrogenation of aromatics.

methylamine. (monomethylamine; amino-methane).

CAS: 74-89-5. CH₃NH₂.

Properties: Colorless gas; strong ammoniacal odor. Bp -6.79C, fp -92.5C, flash p (gas) 14F (-10C), (30% solution) 34F (1.1C) (TOC), autoign temp 806F (430C). Soluble in water, alcohol, ether.

Derivation: Interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di-, and trimethylamines are all produced and yields are regulated by conditions. They are separated by azeotropic or extractive distillation.

Grade: Technical (anhydrous, 30–40% solutions).

Hazard: (Gas and liquid) Dangerous fire risk. Explosive limits in air 5–21%. Strong irritant to tissue. TLV: TWA 5 ppm; STEL 15 ppm.

Use: Intermediate for accelerators, dyes, pharmaceuticals, insecticides, fungicides, surface active agents, tanning, dyeing of acetate textiles, fuel additive, polymerization inhibitor, component of paint removers, solvent, photographic developer, rocket propellant.

methylaminoacetic acid. See sarcosine.

methyl-*o*-aminobenzoate. See methyl anthranilate.

2-(4-methylaminobutoxy)diphenylmethane hydrochloride.

CAS: 62232-46-6. mf: $C_{18}H_{23}NO \cdot ClH$.

Hazard: Moderately toxic by ingestion.

methylaminodimethylacetal.

$(CH_3O)_2CHCH_2NHCH_3$.

Properties: Water-white to slightly yellow, clear liquid; sharp ammoniacal odor. Refr index 1.406–1.409 (20C), d 0.924 (25/25C). Combustible.

1-methylaminoethanolcatechol. See epinephrine.

2-(methylamino)glucose. See *N*-methylglucosamine.

2-methylaminoheptane.

$CH_3(CH_2)_5CH(NHCH_3)CH_3$.

Properties: Oily liquid; slight amine odor. Bp 155C. Somewhat soluble in water.

Use: Medicine, usually as the hydrochloride.

***N*-methyl-*p*-aminophenol.** $CH_3NHC_6H_4OH$.

Properties: Colorless needles. Mp 87C. Soluble in water, alcohol, and ether. Combustible.

Derivation: (1) Interaction of hydroquinone and methylamine; (2) methylation of *p*-aminophenol hydrochloride.

Hazard: Eye and skin irritant.

Use: Organic synthesis, photographic developer.

***N*-methyl-*p*-aminophenol sulfate.**

$HOC_6NHCH_3 \cdot 1/2H_2SO_4$.

Properties: Colorless needles. Mp 250–260C with decomposition. Soluble in water and alcohol; insoluble in ether; discolors in air. Combustible.

Derivation: By methylation of *p*-aminophenol and conversion of the resulting methylated base by neutralization with sulfuric acid.

Grade: CP, photographic.

Use: Photographic developer.

methylamyl acetate. (methylisobutyl carbinol acetate; *sec*-hexyl acetate; 4-methyl-2-pentanol acetate).

CAS: 108-84-9. $CH_3COOCH(CH_3)CH_2CH(CH_3)_2$.

Properties: Colorless liquid; mild odor. D 0.8598 (20/20C), bp 146.3C, fp –64C, vap press 3 mm Hg (20C), flash p 110F (43.3C) (OC), bulk d 7.1 lb/gal. Insoluble in water; soluble in alcohol. Combustible.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by inhalation. TLV: 50 ppm.

Use: Solvent for nitrocellulose and other lacquers.

methylamyl alcohol. (methylisobutyl carbinol; MIBC; 4-methylpentanol-2).

CAS: 108-11-2. $(CH_3)_2CHCH_2CH(CH_3)OH$.

Properties: Colorless, stable liquid. Bp 131.8C, d 0.8079 (20/20C), bulk d 6.72 lb/gal (20C), sets to a glass at approximately –90C, refr index 1.4089 (25C), vap press 2.8 mm Hg (20C), flash p 105F (40.5C) (OC). Miscible with most common organic solvents; slightly soluble in water. Combustible.

Derivation: From methyl isobutyl ketone.

Grade: Technical.

Hazard: Moderate fire risk, explosive limits in air 1–5.5%. TLV: TWA 25 ppm; STEL 40 ppm.

Use: Solvent for dyestuffs, oils, gums, resins, waxes, nitrocellulose, and ethylcellulose; organic synthesis; froth flotation; brake fluids.

methyl-*n*-amyl carbinol. (heptanol-2,2-methyl-1-pentanol).

CAS: 543-49-7. $CH_3(CH_2)_4CH_2OCH_3$.

Properties: Stable, colorless liquid; mild odor. D 0.8187 (20/20C), bp 160.4C, vap press 1.0 mm Hg (20C), flash p 130F (54.4C), bulk (OC) d 6.8 lb/gal (20C). Miscible with common organic liquids. Combustible.

Grade: Technical.

Hazard: Moderate fire risk.

Use: Solvent for synthetic resins, frothing agent in ore flotation.

methyl-*n*-amylketone. (2-heptanone).

CAS: 110-43-0. $CH_3CH_2CH_2CH_2CH_2COCH_3$.

Properties: Water-white liquid. D 0.8166 (20/20C), bp 150.6C, vap press 2.6 mm Hg (20C), flash p 102F (38.9C), autoign temp 991F (532C), refr index 1.4110 (20C), bulk d 6.8 lb/gal (20C), nitrocellulose-toluene dilution ratio 3.9, fp –35C. Almost insoluble in water; miscible with organic solvents. Combustible.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by inhalation, skin irritant, narcotic in high concentration. TLV: 50 ppm.

Use: Solvent for nitrocellulose lacquers, synthetic flavoring, perfumery.

***N*-methylaniline.**

CAS: 100-61-8. $C_6H_5NH(CH_3)$.

Properties: Colorless to reddish-brown oily liquid, discolors on standing. D 0.991, fp –57C, bp 190–191C. Soluble in alcohol and ether. Combustible.

Derivation: By heating aniline chloride and methanol and subsequent distillation.

Grade: Technical.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.5 ppm.

Use: Organic synthesis, solvent, acid acceptor.

α -methylanisalacetone. (1-[*p*-methoxyphenyl]-1-penten-3-one).

$CH_3OC_6H_4CH:CHCOCH_2CH_3$.

Properties: White to pale-yellow solid; sharp odor. Stable, mp 60C min, 1 g is soluble in 5 mL 95% alcohol. Combustible.

Grade: 99% pure min.

Use: Flavoring.

5-methyl-*o*-anisidine. (*p*-cresidine; 2-methoxy-5-methylaniline).

CAS: 120-71-8. $\text{CH}_3\text{C}_6\text{H}_3(\text{NH}_2)\text{OCH}_3$.

Properties: White crystals. Mp 51.5C, bp 235C. Insoluble in water; soluble in organic solvents.

Derivation: 2-Nitro-*p*-cresol, obtained by the action of nitrous and excess nitric acids upon *p*-toluidine, is methylated and reduced.

Grade: Technical.

Hazard: A carcinogen.

Use: Dyes.

***p*-methylanisole.** (*p*-cresyl methyl ether; *p*-methoxytoluene; methyl-*p*-cresol).

CAS: 104-93-8. $\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_3$.

Properties: Colorless liquid; strong floral odor. D 0.966–0.970, refr index 1.5100–1.5130 (20C); one part dissolves in three parts of 80% alcohol. Combustible.

Grade: FCC, technical.

Use: Perfumery, flavoring.

α -methylanthracene. (1-methylanthracene).

$\text{C}_{15}\text{H}_{12}$ or $\text{C}_6\text{H}_4(\text{CH}_2)\text{C}_6\text{H}_3\text{CH}_3$. (a tricyclic aromatic).

Properties: Colorless leaflets. D 1.101, bp 200C, mp 86C. Soluble in alcohol; insoluble in water. Combustible.

Grade: Technical.

Use: Organic synthesis.

1-methylanthracene. See α -methylanthracene.

methyl anthranilate. (methyl-*o*-aminobenzoate; neroli oil, artificial).

CAS: 134-20-3. $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{CH}_3$.

Properties: Crystals or pale-yellow liquid with bluish fluorescence; orange blossom odor. D 1.167–1.175 (15C), refr index 1.5820–1.5840 (20C), bp 135C, mp 23.8C (min). Soluble in five volumes or more of 60% alcohol; soluble in fixed oils, propylene glycol, volatile oils; slightly soluble in water, mineral oil; insoluble in glycerol. Combustible.

Derivation: By heating anthranilic acid and methanol in presence of hydrochloric acid with subsequent distillation. Occurs in many flower oils.

Grade: Technical, FCC.

Use: Flavoring, perfume (cosmetics and pomades).

methylanthraquinone. $\text{CH}_3\text{C}_6\text{H}_3(\text{CO})_2\text{C}_6\text{H}_4$. (tricyclic).

Properties: White needles. Mp 177C, bp sublimes. Soluble in organic solvents; insoluble in water. Combustible.

Derivation: By heating anthraquinone and methanol in presence of sulfuric acid.

Use: Organic synthesis.

methyl apholate. 2,2,4,4,6,6-hexahydro-2,2,4,4,6,6-hexakis(2-methyl-1-aziridinyl)-1,3,5,2,4,6-triazatriphosphorine.

Use: Insect chemosterilant.

methyl arachidate. (methyl eicosanoate).

$\text{CH}_3(\text{CH}_2)_{18}\text{COOCH}_3$. The methyl ester of arachidic acid.

Properties: Waxlike solid. Mp 45.8C, bp 284C (100 mm Hg), 216C (10 mm Hg), refr index 1.4352 (50C). Insoluble in water; soluble in alcohol and ether.

Derivation: Esterification of arachidic acid with methanol and vacuum distillation.

Grade: Purified (99.8%+).

Use: Special synthesis, intermediate for pure arachidic acid, reference standard for gas chromatography, medical research.

methylarsenic acid.

CAS: 124-58-3. mf: CH_3AsO_3 .

Properties: Plates from EtOH or Me_2CO . Mp: 159.8°. Sol in H_2O and EtOH.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

methyl azinphos. See azinphos methyl.

methyl 1-aziridineacetate.

CAS: 14745-52-9. mf: $\text{C}_3\text{H}_9\text{NO}_2$.

Hazard: A poison.

methyl behenate. (methyl docosanoate).

$\text{CH}_3(\text{CH}_2)_{20}\text{COOCH}_3$. The methyl ester of behenic acid.

Properties: Wax-like solid. Mp 53.2C, bp 215.5C (3.75 mm Hg), refr index 1.4262 (80C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of behenic acid with methanol followed by fractional distillation.

Grade: Purified (99.8%+).

Use: Special synthesis, intermediate for pure behenic acid, biochemical and medical research, reference standard in gas chromatography.

methylbenzaldehydes. See tolyl aldehydes.

methylbenzene. See toluene.

4-methylbenzenesulfonyl isocyanate.

CAS: 4083-64-1. mf: $\text{C}_6\text{H}_4\text{NO}_3\text{S}$.

Hazard: Moderately toxic by ingestion. Low toxicity by inhalation. A mild skin and moderate eye irritant.

methylbenzethonium chloride. (benzyl-dimethyl-2-[2-(*p*-1,1,3,3-tetramethylbutylcresoxy)ethoxy]ethyl) ammonium chloride).
CAS: 25155-18-4. A quaternary ammonium compound.

Properties: Colorless crystals; odorless; bitter taste. Mp 161–163C. Readily soluble in alcohol, hot benzene, "Cellosolve," chloroform, and water; insoluble in carbon tetrachloride and ether.

Grade: NF.

Use: Medicine (bactericide).

methyl benzoate. (benzoic acid, methyl ester; niobe oil).

CAS: 93-58-3. $C_6H_5COOCH_3$,

Properties: Liquid of fragrant odor, colorless, oily. D 1.085–1.088, refr index 1.514, fp –12.3C, bp 198.6C, flash p 181F (82.7C). Soluble in three parts of 60% alcohol, in most fixed oils, in ether; insoluble in water. Combustible.

Derivation: (1) By heating methanol and benzoic acid in presence of sulfuric acid; (2) passing dry hydrogen chloride through a solution of benzoic acid and methanol; (3) occurs naturally in oils of clove, ylang-ylang, tuberose.

Grade: Technical, FCC.

Hazard: Toxic by ingestion.

Use: Perfumery; solvent for cellulose esters and ethers, resins, rubber; flavoring.

methylbenzoic acid. See *o*-toluic acid; *m*-toluic acid; *p*-toluic acid.

methylbenzophenone. See phenyl tolyl ketone.

methyl-*o*-benzoylbenzoate.

$C_6H_5COC_6H_4COOCH_3$.

Properties: Colorless liquid. D 1.190 (25C), refr index 1.587 (25C), vap press 4.0 mm Hg (175C), bp 351C, mp 40C, flash p 350F (176C). Very slightly soluble in water. Combustible.

Use: Plasticizer.

α -methylbenzyl acetate. (methylphenylcarbonyl acetate; styrallyl acetate; *sec*-phenylethyl acetate; phenylmethylcarbonyl acetate).

$C_6H_5CH(CH_3)OOCCH_3$.

Properties: Colorless liquid; strong floral odor. D 1.023–1.026 (25/25C), refr index 1.4935–1.4960 (20C), flash p 178F (81.1C) (TCC). Soluble in 70% alcohol, glycerol, and mineral oil; insoluble in water. Combustible.

Grade: 98% min, FCC.

Use: Perfumery, flavoring.

α -methylbenzyl alcohol. (styrallyl alcohol; phenylmethylcarbonyl; 1-phenylethan-1-*sec*-phenethyl alcohol; methylphenylcarbonyl).

CAS: 589-18-4. $C_6H_5CH(CH_3)OH$.

Properties: Colorless liquid; mild floral odor; congeals below room temperature. D 1.009–1.014 (25C), mp 20.7C, bp 204C, refr index 1.525–1.529 (20C), flash p 205F (96.1C) (COC). Soluble in alcohol, glycerol, mineral oil; slightly soluble in water. Combustible.

Grade: FCC.

Use: Perfumery, flavoring dyes, laboratory reagent.

α -methylbenzylamine.

CAS: 98-84-0. $C_6H_5CH(CH_3)NH_2$.

Properties: Water-white liquid; mild ammoniacal odor. D 0.9535 (20/20C), refr index 1.5366 (20C), bp 80C (18 mm Hg), vap press 0.5 mm Hg (20C), fp sets to a glass approximately –65C, flash p 175F (79.4C) (COC). Soluble in most organic solvents; somewhat soluble in water. Combustible.

Hazard: Toxic by ingestion.

Use: Synthesis, emulsifying agent.

α -methylbenzyl diethanolamine.

$C_6H_5CH(CH_3)N(C_2H_5OH)_2$.

Properties: Dark amber liquid; ammonia-like odor. D 1.0812 (20C), bp 244C (50 mm Hg), flash p 370F (187C) (OC), vap press less than 0.01 mm Hg (20C), sets to glass at –7C. Moderately soluble in water. Combustible.

Use: Emulsifying agents, textile specialties, quaternaries.

α -methylbenzyl dimethylamine.

$C_6H_5CH(CH_3)N(CH_3)_2$.

Properties: Colorless liquid. D 0.9044 (20/20C), bp 195.6C, vap press 0.6 mm Hg (20C), fp sets to a glass approximately –70C, refr index 1.5024 (20C), flash p 175F (79.4C) (OC), viscosity 1.85 cP (20C). Slightly soluble in water. Combustible.

Use: Polymerization catalyst.

α -methylbenzyl ether.

CAS: 93-96-9. $C_6H_5CH(CH_3)OCH(CH_3)C_6H_5$.

Properties: Straw-yellow, mobile liquid; faint odor. D 1.0017 (20/20C), bp 286.3C, vap press less than 0.01 mm Hg (20C), fp sets to a glass at approximately –30C, very slightly soluble in water, flash p 275F (135C) (COC). Soluble in most organic solvents. Combustible.

Use: Solvent, styrenating agent, softener for synthetic rubbers.

***dl*- n -(α -methylbenzyl)linoleamide.**

CAS: 14417-88-0. mf: $C_{26}H_{41}NO$.

Hazard: Low toxicity by ingestion.

methyl blue. (sodium triphenyl-*p*-rosaniline sulfonate; CI 42780). $C_{37}H_{27}N_3O_3S \cdot 2NaSO_3$. A dark-blue powder or dye.

Use: Medicine, as an antiseptic, and in biological and bacteriological stains.

Note: Do not confuse with methylene blue.

methyl borate. See trimethyl borate.

methyl bromide. (bromomethane).

CAS: 74-83-9. CH_3Br .

Properties: Colorless, transparent, easily liquefied gas or volatile liquid; burning taste; chloroform-like odor. D 1.732 (0C), bp 3.46C, vap press 1250 mm Hg (20C), fp -94C, flash p none, nonflammable in air; burns in oxygen. Miscible with most organic solvents; forms a voluminous crystalline hydrate with cold water.

Derivation: Action of bromine on methanol in presence of phosphorus with subsequent distillation.

Grade: Technical, pure (99.5% min).

Hazard: Toxic by ingestion, inhalation, and skin absorption; strong irritant to skin. TLV: TWA 1 ppm (skin); not classifiable as a human carcinogen.

Use: Soil and space fumigant; disinfection of potatoes, tomatoes, and other crops; organic synthesis; extraction solvent for vegetable oils.

methyl bromoacetate.

CAS: 96-32-2. $\text{BrCH}_2\text{COOCH}_3$.

Properties: Colorless to straw-colored liquid. Fp approximately -50C, bp 145.0-146.7C, d 1.655 (25/25C), refr index 1.456 (25C). Very slightly soluble in water; soluble in methanol, ether.

Hazard: Vapor is strong irritant to eyes.

Use: Synthesis of weed killers, dyes, vitamins, pharmaceuticals; lachrymator.

2-methyl-1,3-butadiene. See isoprene.

2-methylbutanal. See 2-methylbutyraldehyde.

2-methylbutane. See isopentane.

2-methyl-2-butanethiol. (*tert*-butyl mercaptan). $(\text{CH}_3)_3\text{CSH}(\text{C}_2\text{H}_5)_2$.

Properties: Boiling range 95-119C, d 0.828 (15.5/15.5C), refr index 1.438 (20C), flash p 30F (-1.1C); strong offensive odor.

Grade: 95%.

Hazard: Flammable, dangerous fire risk.

Use: Odorant, intermediate, bacterial nutrient.

2-methyl-1-butanol. (amyl alcohol, primary, active; *sec*-butyl carbinol).

CAS: 137-32-6. $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$. The active alcohol from fusel oil. The synthetic product is a racemic mixture of both dextro- and levorotatory compounds and therefore not optically active.

Properties: Colorless liquid. D 0.81-0.82 (20C), fp below -70C, bp 128C, refr index 1.41 (20C), flash p (OC) 115F (46.1C). Slightly soluble in water; miscible with alcohol and ether. Combustible.

Derivation: Occurs in fusel oil; is made synthetically by fractional distillation of the mixed alcohols re-

sulting from the chlorination and alkaline hydrolysis of pentane.

Hazard: Moderate fire and explosion risk. Toxic by ingestion, inhalation, and skin absorption.

Use: Solvent, organic synthesis (introduction of active amyl group), lubricants, plasticizers, additives for oils and paints.

2-methyl-2-butanol. See *tert*-amyl alcohol.

3-methyl-1-butanol. See isoamyl alcohol, primary.

3-methyl-2-butanone. See methyl isopropyl ketone.

2-methyl-1-butene.

CAS: 563-46-2. C_5H_{10} or $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless, volatile liquid; disagreeable odor. Bp 31.11C, refr index 1.378 (20C), d 0.650 (20/20C), fp -137.52C, flash p approximately -20F (-28C). Soluble in alcohol; insoluble in water.

Derivation: Refinery gas.

Grade: 95%, 99%, and research.

Hazard: Highly flammable, dangerous fire and explosion risk.

Use: Organic synthesis, pesticide formulations.

2-methyl-2-butene. See 3-methyl-2-butene.

3-methyl-1-butene. (isopropylethylene; α -isoamylene).

CAS: 563-45-1. C_5H_{10} or $\text{H}_2\text{C}=\text{CHCH}(\text{CH}_3)_2$.

Properties: Colorless, extremely volatile liquid or gas; disagreeable odor. Bp 20.1C, refr index 1.3643 (20C), d 0.6272 (20C), fp -168.5C, flash p -70F (-57C). Soluble in alcohol; insoluble in water.

Derivation: Cracking of petroleum, a component of refinery gas.

Grade: Research, 99% min, technical 95% min.

Hazard: Highly flammable, dangerous fire and explosion risk, explosive limits 1.6-9.1%.

Use: Organic synthesis, high-octane fuel manufacture.

3-methyl-2-butene. (2-methyl-2-butene; trimethylethylene; β -isoamylene). C_5H_{10} or $\text{H}_3\text{CCH}=\text{C}(\text{CH}_3)_2$.

Properties: Colorless, volatile liquid; disagreeable odor. Bp 38.51C, refr index 1.387 (20C), d 0.6623 (20/4C), fp -133.83C, flash p -50F (-45C). Soluble in alcohol; insoluble in water.

Derivation: Cracking of petroleum, a component of refinery gas.

Grade: 90%, 95% (technical), 99% (pure), and research.

Hazard: Highly flammable, dangerous fire and explosion risk.

Use: Organic synthesis, hydrogenation, halogenation, alkylation, condensation reactions.

cis-2-methyl-2-butenic acid. See angelic acid.

trans-2-methyl-2-butenic acid. See tiglic acid.

2-methyl-1-buten-3-yne. See isopropenylacetylene.

1-methylbutyl alcohol. See 2-pentanol.

N-methylbutylamine.

CAS: 110-68-9. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{NHCH}_3$.

Properties: Liquid. D 0.7335, bp 91.1C, fp -75.0C, flash p 35F (1.6C) (TOC). Miscible with water.

Hazard: Flammable, dangerous fire risk.

Use: Intermediate.

methyl-tert-butyl ether. (MTBE).

CAS: 1634-04-4. $(\text{CH}_3)_3\text{COCH}_3$.

Properties: Colorless liquid. Mw 88.17, bp 55C, fp -110C, d 0.74, bulk d 6.18 lb/gal, heat of vaporization 145 Btu/lb (7 kcal/mole) (55C), heat of combustion 101,000 Btu/gal (804 kcal/mole) (25C). Solubility in water 4 wt %; solution of water in 1.3 wt %. Octane blending value: 115-125 (Research), 98-110 (Motor).

Derivation: Catalytic reaction of methanol and isobutene (38-93C at 100-200 psi). There are several variations of the process.

Hazard: Slightly toxic by ingestion and inhalation. Flammable when exposed to heat or flame.

Use: Octane booster for unleaded gasoline (up to 7% by volume), manufacture of isobutene. Approved by EPA.

See octane number.

2-methylbutyl isovalerate. mf: $\text{C}_{10}\text{H}_{20}\text{O}_2$.

Properties: Colorless liquid; herbaceous, fruity odor. D: 0.852, refr index: 1.413. Sol in alc, fixed oils; insol in water.

Use: Food additive.

methyl butyl ketone. (propylacetone; 2-hexanone).

CAS: 591-78-6. $\text{CH}_3\text{COC}_4\text{H}_9$.

Properties: Colorless liquid. Bp 127.2C, d 0.830 (20/20C), refr index 1.4024 (20C), vap press 10 mm Hg (20C), flash p 95F (35C) (OC). Soluble in alcohol and ether.

Grade: Technical.

Hazard: Flammable, moderate fire risk, explosive limits 1.2-8% in air. Irritant to eyes and mucous membranes, narcotic in high concentration, absorbed by skin. TLV: 5 ppm.

Use: Solvent.

2-methylbutyl-3-methylbutanoate. See 2-methylbutyl isovalerate.

2-methyl-6-tert-butylphenol.

$\text{C}_6\text{H}_3(\text{OH})(\text{CH}_3)\text{tert-C}_4\text{H}_9$.

Properties: Crystalline solid, light straw color. Mp 28C, d 0.9618 (30C), bp 230C, flash p 220F (104C) (OC). Soluble in methyl ethyl ketone, ethanol, benzene, and isooctane; insoluble in water. Combustible.

Use: Chemical intermediate.

2-methylbutyl-3-thiol. See *sec*-isoamyl mercaptan.

2-methyl-4-tert-butylthiophenol. (*4-tert-butyl-o*-thiocresol). $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{CH}_3)\text{SH}$.

Properties: Water-white liquid, no mercaptan odor. D 0.983 (25C), refr index 1.546 (25C), fp -4C, bp 177C (100 mm Hg). Soluble in aliphatic and aromatic hydrocarbons; insoluble in water. Combustible.

Use: Chemical intermediate.

2-((o-(n-methyl-n(tert-butylthiosulfonyl) carbamoyl)oximino))-1,3-dithiolane.

CAS: 76858-53-2. mf: $\text{C}_9\text{H}_{16}\text{N}_2\text{O}_2\text{S}_4$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-methyl-3-butyn-2-amine.

CAS: 2978-58-7. mf: $\text{C}_5\text{H}_9\text{N}$.

Hazard: Moderately toxic by ingestion. A moderate eye irritant.

methyl butynol. (2-methyl-3-butyn-2-ol).

$\text{HC}=\text{CCOH}(\text{CH}_3)_2$.

Properties: Colorless liquid; fragrant odor. Bp 104-105C, mp 2.6C, d 0.8672 (20/20C), refr index 1.4211 (20C), flash p 77F (25C) (TOC). Miscible with water; soluble in most organic solvents.

Grade: Technical, 95% min.

Hazard: Flammable, dangerous fire risk.

Use: Stabilizer in chlorinated solvents, viscosity reducer and stabilizer, electroplating brightener, intermediate.

2-methylbutyraldehyde. (2-methylbutanal).

$\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Liquid. D 0.8029 (20/4C), bp 92-93C, refr index 1.3869 (20C). Soluble in alcohol and ether; insoluble in water. Combustible.

Use: Flavoring.

3-methylbutyraldehyde. See isovaleraldehyde.

methyl butyrate.

CAS: 623-42-7. $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOCH}_3$.

Properties: Colorless liquid. D 0.898 (20C), bp 102C, fp -92C, refr index 1.3875 (20C), flash p 57F (14C) (CC). Slightly soluble in water; soluble in alcohol.

Grade: Technical.

Hazard: Flammable, dangerous fire risk.

Use: Solvent for ethylcellulose, solvent mixture for nitrocellulose, flavoring.

2-methylbutyric acid. See isopentanoic acid.

3-methylbutyric acid. See isopentanoic acid.

methyl caprate. (methyl decanoate).

Properties: Colorless liquid. D 0.8733 (20/4C), fp -13.3C , bp 224C, 130.6C (30 mm Hg), refr index 1.4237 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of capric acid with methanol or alcoholysis of coconut oil, purified by fractional vacuum distillation.

Grade: Technical, 99.8% pure.

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers.

methyl caproate. (methyl hexanoate).

CAS: 106-70-7. $\text{CH}_3(\text{CH}_2)_4\text{COOCH}_3$. The methyl ester of caproic acid.

Properties: Colorless liquid. D 0.8850 (20/4C), fp -71C , bp 151.2C, 63.0C (30 mm Hg), refr index 1.4054 (20C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of caproic acid with methanol or alcoholysis of coconut oil.

Grade: Technical, 99.8+%.

Use: Intermediate for caproic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, flavoring.

2-methylcaproic acid. See 2-hexanecarboxylic acid.

5-methylcaproic acid. See isoenanthic acid.

methyl caprylate. (methyl octanoate).

$\text{CH}_3(\text{CH}_2)_6\text{COOCH}_3$. The methyl ester of caprylic acid.

Properties: Colorless liquid. D 0.8784 (20/4C), fp -37.3C , bp 192C (759 mm Hg), 98.3 (30 mm Hg), refr index 1.4152 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: (1) Esterification of caprylic acid with methanol, (2) alcoholysis of coconut oil.

Grade: Technical, 99.8%.

Use: Intermediate for caprylic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, flavoring.

methylcarbamic acid 4-hydroxy-*m*-cumenyl ester. See 3-isopropyl-4-hydroxyphenyl methylcarbamate.

methylcarbamic acid 4-hydroxy-3,5-diisopropylphenyl ester.

CAS: 17710-64-4. mf: $\text{C}_{14}\text{H}_{21}\text{NO}_3$.

Hazard: A poison.

Use: Agricultural chemical.

2-(*o*-(methylcarbamoyl)oximino)-3,3-dimethyltetrahydro-1,4-thiazin-5-one.

CAS: 66637-25-0. mf: $\text{C}_8\text{H}_{13}\text{N}_3\text{O}_3\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-(*o*-(methylcarbamoyl)oximino)-1,4-dithiane.

CAS: 55391-34-9. mf: $\text{C}_6\text{H}_{10}\text{N}_2\text{O}_2\text{S}_2$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

methyl "Carbitol" [Dow]. TM for diethylene glycol monomethyl ether.

methyl "Carbitol" acetate. TM for diethylene glycol monomethyl ether acetate.

methyl carbonate. (dimethyl carbonate).

CAS: 616-38-6. $\text{CO}(\text{OCH}_3)_2$.

Properties: Colorless liquid; pleasant odor. D 1.0718 (20C), bp 90.6C, mp 0C. Miscible with acids and alkalis; stable in the presence of water; soluble in most organic solvents; insoluble in water.

Derivation: Interaction of phosgene and methanol.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation, strong irritant.

Use: Organic synthesis, specialty solvent.

methyl "Cellosolve" [Dow]. TM for ethylene glycol monomethyl ether.

methylcellulose. (cellulose methyl ether; "Methocel").

CAS: 9004-67-5.

Properties: Grayish-white, fibrous powder; aqueous suspensions neutral to litmus. Swells in water to a viscous colloidal solution. Insoluble in alcohol, ether, chloroform, and in water warmer than 50.5C; soluble in glacial acetic acid; unaffected by oils and greases; stable up to approximately 300C; stable to light. Combustible.

Molecular weights vary from 40,000 to 180,000. Specifications call for methoxy group content of narrow or wide ranges within 25–33%.

Derivation: From cellulose by conversion to alkali cellulose and then reacting this with methyl chloride, dimethyl sulfate, or methanol and dehydrating agents. The proportions of the reacting materials are varied to control the properties of the product, such as water solubility and viscosity of water solutions.

Grade: USP, technical, FCC.

Use: Protective colloid in water-based paints to prevent flocculation of pigment; film and sheeting; binder in ceramic glazes; leather tanning; dispersing, thickening, and sizing agent; adhesive; food additive.

See cellulose, modified; carboxymethylcellulose; hydroxyethylcellulose.

methylcellulose, propylene glycol ether.

See hydroxypropyl methylcellulose.

methyl cerotate. (methyl hexacosanoate).

$\text{CH}_3(\text{CH}_2)_{24}\text{COOCH}_3$. The methyl ester of cerotic acid.

Properties: Waxlike solid. Mp 62.9C, bp 237C (1.95 mm Hg), refr index 1.4301 (80C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of cerotic acid with methanol.

Grade: Purified (99+%).

Use: Intermediate in special synthesis, medical research, reference standard for gas chromatography.

methyl chloride. (chloromethane; monochloromethane).

CAS: 74-87-3. CH_3Cl .

Properties: Colorless compressed gas or liquid; faintly sweet; ethereal odor. D 0.92 (20C), bp -23.7C , fp -97.6C , flash p approximately 32F (0C), refr index 1.3712 (-23.7C), critical temperature 143C, critical pressure 970 psi absolute, autoign temp 1170F (632C), bulk d 7.68 lb/gal (20C). Slightly soluble in water, by which it is decomposed; soluble in alcohol, chloroform, benzene, carbon tetrachloride, glacial acetic acid; attacks aluminum, magnesium, and zinc.

Derivation: (1) Chlorination of methane; (2) action of hydrochloric acid on methanol either in vapor or liquid phase.

Grade: Pure (99.5% min), technical, and two refrigerator grades.

Hazard: Flammable, dangerous fire risk, explosive limits in air 10.7–17%. Narcotic. Psychic effects. TLV: TWA 50 ppm; STEL 100 ppm; not classifiable as a human carcinogen.

Use: Catalyst carrier in low-temperature polymerization (butyl rubber), tetramethyl lead, silicones, refrigerant, fluid for thermometric and thermostatic equipment, methylating agent in organic synthesis, such as methylcellulose, extractant and low-temperature solvent, herbicide, topical anesthetic.

methyl chloroacetate.

CAS: 96-34-4. $\text{ClCH}_2\text{COOCH}_3$.

Properties: Colorless liquid; sweet pungent odor. D 1.236 (20/4C), fp -32.7C , bp 131C, refr index 1.419–1.420 (25C). Insoluble in water; miscible with alcohol and ether. Combustible.

Hazard: Toxic by ingestion and inhalation.

Use: Solvent, intermediate.

methyl (chlorocarbonyl)(4-(trifluoromethoxy)phenyl)carbamate.

CAS: 173903-15-6. mf: $\text{C}_{10}\text{H}_7\text{ClF}_3\text{NO}_4$.

Hazard: Moderately toxic by ingestion. A moderate eye irritant.

methyl chloroform. See 1,1,1-trichloroethane.**methyl chloroformate.** (methyl chlorocarbonate).

CAS: 79-22-1. ClCOOCH_3 .

Properties: Colorless liquid. Decomposed by hot water; stable to cold water. D 1.23 (15C), bp 71.4C, vapor d 3.9 (air = 1), flash p 54F (12.2C). Soluble in methanol alcohol, ether, and benzene.

Derivation: Reaction between methanol and carbonyl chloride.

Grade: Technical (95% min).

Hazard: Flammable, dangerous fire risk. Highly corrosive and irritant to skin and eyes.

Use: Military poison (lachrymator), organic synthesis, insecticides.

methylchloromethyl ether. (chloromethyl methyl ether).

CAS: 107-30-2. $\text{ClCH}_2\text{OCH}_3$.

Properties: Colorless liquid. D 1.0625 (10/4C), fp -103.5C , bp 59.5C. Decomposes in water; soluble in alcohol and ether.

Hazard: Flammable, dangerous fire and explosion risk. Toxic by ingestion and inhalation. TLV: Suspected Human Carcinogen.

2-methyl-4-chlorophenoxyacetic acid. See MCPA.**4-(2-methyl-4-chlorophenoxy)butyric acid.**

See 4-MCPB.

2-(2-methyl-4-chlorophenoxy)propionic acid. See mecoprop.**2-methyl-3-(2-chlorophenyl)chinazolone-4.**

CAS: 340-57-8. mf: $\text{C}_{15}\text{H}_{11}\text{ClN}_2\text{O}$.

Hazard: Moderately toxic by ingestion.

methyl chlorosilane. CH_3ClSi . One of several intermediates in the formation of silicones or siloxanes, they react with hydroxyl groups on many types of surfaces to produce a permanent, thin-surface film of silicone that imparts water repellency. Examples are methyltrichlorosilane, dimethyldichlorosilane, and trimethylchlorosilane.

Hazard: Toxic by ingestion and inhalation, strong irritant to skin and eyes.

methyl chlorosulfonate. $\text{CH}_3\text{OSO}_2\text{Cl}$.

Properties: Colorless liquid; pungent odor. D 1.492 (10C), bp 133–135C (decomposes), fp -70C , vap d 4.5 (air = 1). Decomposed by water. Soluble in alcohol, carbon tetrachloride, chloroform; insoluble in water.

Derivation: Interaction of sulfuryl chloride and methanol.

Grade: Technical.

Hazard: Highly toxic by ingestion and inhalation, strong irritant to skin and eyes.

Use: Organic synthesis, military poison.

methyl-3-((5-(2-chloro-4-(trifluoromethyl)phenoxy)-2-nitrophenyl)amino) butyrate.CAS: 116929-00-1. mf: $C_{18}H_{16}ClF_3N_2O_5$.**Hazard:** A reproductive hazard.**Use:** Agricultural chemical.**methylcholanthrene.**CAS: 56-49-5. $C_{21}H_{16}$. A polynuclear hydrocarbon.**Properties:** Yellow crystals. Mp 180C. Soluble in benzene; insoluble in water.**Derivation:** From bile acids via 1,2-benzanthracene.**Hazard:** Powerful carcinogen.**Use:** Biochemical research.**methyl cinnamate.**CAS: 103-26-4. $C_9H_8CH:CHCOOCH_3$.**Properties:** White crystals; strawberry-like odor. D 1.0415, mp 34C, bp 259.6C. Soluble in alcohol and ether, in glycerol, most fixed oils, and mineral oil; insoluble in water. Combustible.**Derivation:** By heating methanol, cinnamic acid, and sulfuric acid with subsequent distillation.**Grade:** Technical, FCC.**Use:** Perfumes, flavoring.**methylcoumarin.** $C_{10}H_8O_2$.**Properties:** White crystals with vanilla flavor. Exists as α and β forms, mp (α) 90C, (β) 82C, both forms are soluble in alcohol. Combustible.**Use:** Perfumes, flavoring.**methyl-*p*-cresol.** See *p*-methylanisole.***cis*- α -methylcrotonic acid.** See angelic acid.***trans*- α -methylcrotonic acid.** See tiglic acid.**methyl cyanide.** See acetonitrile.**methyl cyanoacetate.** (malonic methyl ester nitrile). $CNCH_2COOCH_3$.**Properties:** Colorless liquid. Bp 203C (115C) at 6 mm Hg, fp -22.5C, d 1.1225 (15/4C), refr index 1.419-1.420 (20C). Soluble in water, alcohol, and ether. Combustible.**Derivation:** Esterification of cyanoacetic acid with methanol, reaction of an alkali cyanide and chloroacetic methyl ester.**Use:** Organic synthesis, pharmaceuticals, dyes.**methyl-2-cyanoacrylate.**CAS: 137-05-3. $CH_2:C(CN)COOCH_3$.**Properties:** Colorless liquid. Bp 48-49C (2.5-2.7 mm Hg), d 1.1044 (27/4C), viscosity 2.2 cP (25C).**Hazard:** Toxic by inhalation. TLV: TWA 2 ppm; STEL 4 ppm.**Use:** Adhesive, dentistry.

See cyanoacrylate adhesives.

methyl cyanoethanoate. See cyanomethyl acetate.**methyl cyanoformate.** $CNCOOCH_3$.**Properties:** Colorless liquid; ethereal odor. D approximately 1.00 (20C), bp 100C. Decomposed by alkalis and water. Soluble in alcohol, benzene, ether.**Derivation:** Methylchloroformate is dissolved in methanol and subjected to the action of (hot) sodium cyanide or potassium cyanide.**Use:** Organic synthesis.**methylcyclohexane.** (hexahydrotoluene).CAS: 108-87-2. $CH_3C_6H_{11}$.**Properties:** Colorless liquid. D 0.769, bp 100.8C, fp -126.9C, refr index 1.42312, flash p 25F (-3.89C) (CC), autoign temp 545F (285C).**Source:** Petroleum.**Grade:** Technical (95%), 99%, and research.**Hazard:** Flammable, dangerous fire risk. Lower explosive limit 1.2% in air. TLV: 400 ppm.**Use:** Solvent for cellulose ethers, organic synthesis.**methylcyclohexanol.** (hexahydromethyl phenol; hexahydroresol).CAS: 25639-42-3. $CH_3C_6H_{10}OH$. *o*-, *m*-, and *p*-forms.**Properties:** Colorless, viscous liquid; aromatic menthollike odor. Bp 155-180C, d 0.924, flash p 154F (67.7C) (CC). Combustible.**Derivation:** (1) A mixture of three isomeric (*o*-, *m*-, and *p*-) cyclic secondary alcohols made by the hydrogenation of cresol, (2) catalytic oxidation of methylcyclohexane.**Grade:** Technical.**Hazard:** Toxic by ingestion. TLV: 50 ppm.**Use:** Solvent for cellulose esters and ethers and for lacquers, antioxidant for lubricants, blending agent for special textile soaps and detergents.**methylcyclohexanol acetate.** (heptalin acetate; methyl cyclohexyl acetate). $C_7H_{13}OOCCH_3$.**Properties:** Colorless liquid, esterlike odor. Slower rate of evaporation than amyl acetate. Bp 176-193C, d 0.941, flash p 147F (64C) (CC), toluene dilution ratio 2.5. Combustible.**Derivation:** Catalytic hydrogenation and esterification of cresols by means of acetic acid.**Use:** Solvent.***o*-methylcyclohexanone.**CAS: 583-60-8. $CH_3C_5H_9CO$.

Properties: Water-white to pale-yellow liquid; acetone-like odor. A mixture of cyclic ketones. Closely resembles cyclohexanone in physical properties. Bp 160–170C, d 0.925, flash p 138F (58.9C). Miscibility, tolerance for nonsolvent and solvent action. Combustible.

Derivation: By high-temperature, catalytic hydrogenation of cresols or by the dehydrogenation of methylcyclohexanol.

Hazard: Moderate fire risk. Toxic by ingestion, inhalation, and skin absorption. TLV: (*o*-isomer) 50 ppm.

Use: Solvent, lacquers.

methylcyclohexanone glyceryl acetal.

$\text{CH}_3\text{C}_6\text{H}_{10}\text{I}_2\text{C}_3\text{H}_5\text{OH}$. Spiro rings.

Properties: Colorless liquid. D 1.074 (20C), refr index 1.474 (20C), bp 130–140C (20 mm Hg), flash p 200F (93.3C). Insoluble in water. Combustible.

Use: Plasticizer.

methylcyclohexanyl oxalate.

$(\text{CH}_3\text{C}_6\text{H}_{10}\text{OOC})_2$.

Properties: Colorless liquid; odorless; neutral; stable. Comprising a mixture of isomers. Miscible with most lacquer solvents and diluents.

4-methylcyclohex-1-ene. $\text{CH}_3\text{C}_6\text{H}_9$.

Properties: Colorless liquid. Fp -121.1C , distillation range 110C–117C, d 0.818 (60/60F), refr index 1.450 (20C), flash p 30F (-1.1C). Insoluble in water; soluble in alcohol.

Grade: Pure, 99.0 mol%; technical, 95.0 mol%.

Hazard: Flammable, dangerous fire risk. May be irritant to skin and eyes.

Use: Intermediate.

6-methyl-3-cyclohexene carboxaldehyde.

$\text{CH}_3\text{CHCH}_2\text{CH}:\text{CHCH}_2\text{CHCHO}$.

Properties: Colorless liquid. D 0.9484, bp 176.4C, fp -39.0C . Soluble in water 0.3% by wt at 20C.

Use: Intermediate.

N-methyl-5-cyclohexenyl-5-methylbarbituric acid. See hexobarbital.

N-methylcyclohexylamine. $\text{C}_6\text{H}_{11}\text{NHCH}_3$.

Properties: Water-white liquid. D 0.86 (20C). Soluble in alcohol and ether; slightly soluble in water. Purity 99%, distillation range 5–95 cc within 2C, including 149C, corrected to 760 mm Hg. Combustible.

Hazard: Toxic. Strong irritant to tissue.

Use: Intermediate, solvent, acid acceptor.

methylcyclohexylcarbinol. See 1-cyclohexylethanol.

4-methylcyclohexylmethylcarbinol.

CAS: 34884-20-3. mf: $\text{C}_9\text{H}_{18}\text{O}$.

Hazard: Moderately toxic by ingestion and skin contact. A severe skin and eye irritant.

2-methyl-1,3-cyclopentadiene.

CAS: 3727-31-9. mf: C_6H_8 .

Hazard: Moderately toxic by ingestion.

methylcyclopentadiene dimer. (methyl-1,3-cyclopentadiene). $\text{C}_{12}\text{H}_{16}$.

Properties: Colorless liquid. D 0.9341 (20/4C), bp 78–183C, flash p 140F (60C) (TOC). Insoluble in water; very soluble in alcohol, benzene, and ether. Combustible.

Hazard: Moderate fire risk.

Use: High-energy fuels, curing agents, plasticizers, resins, surface coatings, pharmaceuticals, dyes.

methylcyclopentadienyl manganese tricarbonyl.

CAS: 12108-13-3. $\text{CH}_3\text{C}_5\text{H}_4\text{Mn}(\text{CO})_3$.

Derivation: Reaction of methylcyclopentadiene with manganese carbonyl.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TWA 5 mg(Mn)/m³.

Use: Antiknock agent for unleaded gasoline. Its use has been prohibited by EPA because of its deleterious effect on catalytic converters.

methylcyclopentane.

CAS: 96-37-7. $\text{C}_5\text{H}_9\text{CH}_3$.

Properties: Colorless liquid. D 0.750 (20/4C), fp -142.5C , refr index 1.40983 (20C), bp 72C (742 mm Hg), flash p approximately 20F (-6.6C). Immiscible with water.

Grade: Technical (95%), 99%, and research.

Hazard: Flammable, dangerous fire and explosion risk. May be irritant and narcotic.

Use: Organic synthesis, extractive solvent, azeotropic distillation agent.

methylcyclopentenolone.

Use: In soap, cosmetic perfumery, and flavor compounding.

5-methylcytosine. (5-methyl-2-oxy-4-aminopyrimidine). $\text{C}_5\text{H}_7\text{N}_3\text{O}$. A pyrimidine found in deoxyribonucleic acids, nucleotides, and nucleosides.

Properties: Crystals in prisms from water. Mp 270C (decomposes).

methyl decanoate. See methyl caprate.

methyl demeton. (generic name for *O,O*-dimethyl-*O*(and *S*)-2-ethylthioethyl phosphorothioates).

CAS: 8022-00-2.

Properties: Slightly soluble in water. Soluble in most organic solvents.

Hazard: Cholinesterase inhibitor. Use may be restricted, absorbed by skin. TLV: 0.5 mg/m³.

Use: Systemic insecticide.

methyl dichloracetate.CAS: 116-54-1. $\text{Cl}_2\text{CHCOOCH}_3$.**Properties:** liquid. D 1.3759–1.3839 (20/20C), refr index 1.4374–1.4474 (20C), bp 143C, flash p 176F (80C). Slightly soluble in water; soluble in ether and alcohol. Combustible.**Grade:** 99.0% pure.**Hazard:** Strong irritant to tissue. Forms corrosive products on hydrolysis, keep dry.**Use:** Organic intermediate.**methyldichloroarsine.**CAS: 593-89-5. CH_3AsCl_2 .**Properties:** A colorless, mobile liquid; agreeable odor. Decomposed by water. Bp 136C, mp –59C, d 1.838.**Hazard:** Toxic. Highly irritant.**Use:** Military poison, intermediate.**methyl-3,4-dichlorocarbanilate.** See swep.**methyl-N-3,4-dichlorophenylcarbamate.**

See swep.

methyldichlorosilane.CAS: 75-54-7. $\text{CH}_3\text{SiHCl}_2$.**Properties:** Colorless liquid. Bp 41C, d 1.10 (27C), flash p –26F (–32.2C). Soluble in benzene, ether, heptane.**Derivation:** Reaction of methyl chloride with silicon and copper.**Hazard:** Flammable, dangerous fire risk. Very toxic.**Use:** Manufacture of siloxanes.**methyl dichlorostearate.** $\text{C}_{17}\text{H}_{33}\text{Cl}_2\text{COOCH}_3$.**Properties:** Light-yellow, oily liquid; slight odor. Freezing range +7 to –5C, bp decomposes 250C, d 0.997 (15.5/15.5C), refr index 1.4599 (25C), flash p 358F (181C). Completely miscible with most organic solvents. Combustible.**Use:** Intermediate, plasticizer extender.**methyldiethanolamine.**CAS: 105-59-9. $\text{CH}_3\text{N}(\text{C}_2\text{H}_4\text{OH})_2$.**Properties:** Colorless liquid; amine-like odor. Miscible with benzene and water, d 1.0418 (20C), bp 247.2C, bulk d 8.7 lb/gal, vap press less than 0.01 mm Hg (20C), fp –21.0C, refr index 1.4699, flash p 260F (126.6C) (COC). Combustible.**Grade:** Technical.**Use:** Intermediate, absorption of acidic gases, catalyst for polyurethane foams, pH control agent.**methyldiethylamine.** $\text{CH}_3\text{N}(\text{C}_2\text{H}_5)_2$.**Properties:** Water-white to straw-colored liquid. Bp 62.5C, d 0.724 (20C). Has inverse water solubility. Combustible.**Use:** Desalination of brackish water, chemical intermediate, acid neutralizer.**4-methyl-7-(diethylamino)coumarin.** See 7-diethyl-amino-4-methylcoumarin.**3-methyl-2,5-dihydrothiophene-1,1-dioxide.**(3-methylsulfolene). $\text{CH}_3\text{C}_4\text{H}_2\text{SO}_2$ (cyclic).**Properties:** Solid. Mp 63C, bp decomposes. Slightly soluble in water, acetone, and toluene. Combustible.**Use:** Chemical intermediate, catalyst.**methyl 3,3-dimethoxy-2-oxa-7,10-diaza-3-silatridecan-13-oate.**CAS: 1067-66-9. mf: $\text{C}_{12}\text{H}_{28}\text{N}_2\text{O}_5\text{Si}$.**Hazard:** A moderate skin irritant.**methyl-3-(dimethoxyphosphinyloxy) crotonate.** See mevinphos.**methyldimethoxysilane.**CAS: 16881-77-9. mf: $\text{C}_2\text{H}_6\text{O}_2\text{Si}$.**Hazard:** A poison by ingestion. A moderate eye irritant.**methyl 1,1-dimethylethyl ether.** See methyl *t*-butyl ether.**methyl-N,3,7-dimethyl-7-hydroxyoctyliden anthranilate.** See hydroxycitronellal-methyl anthranilate Schiff base.**methyldinitrobenzene.** See dinitrotoluene.**Methyl “Dioxitol” [Shell].** TM for diethylene glycol monomethyl ether having an ASTM distillation range 192–196C.**methyldioxolane.** (2-methyl-1,3-dioxolane). $\text{OCH}(\text{CH}_3)\text{OCH}_2\text{CH}_2$.**Properties:** Water-white liquid. D 0.982 (20/20C), bp 81C. Soluble in water. Combustible.**Hazard:** Irritant.**Use:** Extractant and solvent for oils, fats, waxes, dyestuffs, and cellulose derivatives.**methyldiphenylamine.** (diphenylmethylaniline). $(\text{C}_6\text{H}_5)_2\text{NCH}_3$.**Properties:** Colorless liquid. D 1.048, fp –7.5C, bp 295C, refr index 1.62. Insoluble in water; soluble in alcohol.**Derivation:** Heating diphenylamine with methanol and hydrochloric acid.**Hazard:** Toxic by ingestion.**Use:** Analytical reagent, dye synthesis.**methyl diphenyl phosphate.** (methyl phenyl phosphate). $\text{CH}_3\text{OP}(\text{O})(\text{OC}_6\text{H}_5)_2$.**Properties:** Clear, oily liquid. D 1.225–1.235 (25C), refr index 1.5370 (20C), pour p –85F (–65C). Non-flammable.**Use:** Ignition control compound.**methyldipropylmethane.** See 4-methylheptane.

2-methyl-*m*-dithiane-2-carboxaldehyde *o*-(methylcarbamoyl)oxime.CAS: 26419-72-7. mf: C₈H₁₄N₂O₂S₂.**Hazard:** A poison by ingestion.**Use:** Agricultural chemical.**methyl docosanoate.** See methyl behenate.**methyl dodecanoate.** See methyl laurate.**methyl eicosanoate.** See methyl arachidate.**methyl elaidate.**(CH₃(CH₂)₇)₂CH:CH(CH₂)₇COOCH₃. The methyl ester of elaidic acid (*trans*-octadec-9-enoic acid).**Properties:** Colorless liquid. D 0.8702 (25C), mp less than 15C, bp 213.5C (15 mm Hg), refr index 1.4462 (25C). Insoluble in water; soluble in most organic solvents. Combustible.**Derivation:** Prepared from oleic acid by elaidination and esterification.**Use:** Pure grade (99+%) used in biochemical research.**6-methylenandrosta-1,4-diene-3,17-dione.**CAS: 107868-30-4. mf: C₂₀H₂₄O₂.**Hazard:** A reproductive hazard.**methylene.** (1) The divalent hydrocarbon group $\text{-CH}_2\text{-}$, in which the carbon atom has its normal valence of 4; it is derived from methane by dropping two hydrogen atoms. It occurs in many organic compounds, e.g., methylene chloride (dichloromethane), CH₂Cl₂. (2) See carbene.**N,N'-methylenebisacrylamide.**CH₂(NHCOCH:CH)₂.**Properties:** Colorless, crystalline powder. Mp 185C.**Hazard:** Toxic by ingestion.**Use:** Organic intermediate, cross-linking agent.**4,4'-methylenebis(2-chloroaniline).** (3,3'-dichloro-4,4'-diaminodiphenylmethane; p,p'-methylene-bis-*o*-chloroaniline; MOCA).CAS: 101-14-4. CH₂(C₆H₄ClNH₂)₂.**Properties:** Tan-colored pellets. D 1.44, melting range 99–107C. Soluble in hot methyl ethyl ketone, acetone, esters, and aromatic hydrocarbons.**Hazard:** Toxic: A carcinogen, absorbed by skin. TLV: 0.02 ppm; suspected human carcinogen.**Use:** Curing agent for polyurethanes and epoxy resins.**p,p'-methylenebis(*o*-chloroaniline).** See 4,4'-methylenebis(2-chloroaniline).**2,2'-methylenebis(4-chlorophenol).** See dichlorophene.**methylene bis(4-cyclohexylisocyanate).**CAS: 5124-30-1. C₁₅H₂₂N₂O₂.**Properties:** Liquid. Mw 262.35, sp g 1.07, fp <−10C,

vp 0.4 torr at 150C. Soluble in acetone; reacts with water or ethanol.

Hazard: Strong skin and eye irritant. TLV: 0.005 ppm.**Use:** To produce non-yellowing urethane products.**4,4'-methylenebis(2,6-di-*tert*-butylphenol).**[(C₄H₉)₂C₆H₂(OH)]₂CH₂. A sterically hindered bisphenol.**Properties:** Light-yellow powder. Mp 155C, bp 217C (1 mm Hg), d 0.99 (20C). Insoluble in water and 1.0 N sodium hydroxide. Combustible.**Use:** Oxidation inhibitor and antiwear agent for motor oils, aviation piston engine oils, industrial oils, antioxidant for rubbers, resins, adhesives.**2,2'-methylenebisfuran.** See 2-(2-furfuryl)furan.**3,3'-methylenebis(4-hydroxycoumarin).**

See bishydroxycoumarin.

See hexachlorophene.

methylene blue. (CI 52015; methylthionine chloride).CAS: 61-73-4. C₁₆H₁₈N₃SCl•3H₂O (medicinal); (C₁₆H₁₈N₃SCl)₂•ZnCl₂•H₂O (dye).**Properties:** Dark green crystals or powder with bronzelike luster; odorless or slight odor. Stable in air. Soluble in water, alcohol, chloroform. Water solutions are deep blue.**Derivation:** By oxidation of *p*-aminodimethylaniline with ferric chloride in the presence of hydrogen sulfide. The dye is the zinc chloride double salt of the chloride.**Grade:** USP, technical.**Hazard:** Toxic by ingestion.**Use:** Dyeing cotton and wool, biological and bacteriological stains, reagent in oxidation-reduction titrations in volumetric analysis, indicator.**Note:** Do not confuse with methyl blue.**methylene bromide.** (dibromomethane).CAS: 74-95-3. CH₂Br₂.**Properties:** Clear, colorless liquid. D 2.47, solidifies −52C, bp 97C. Slightly soluble in water; miscible with alcohol, ether, chloroform, and acetone. Non-flammable.**Use:** Organic synthesis, solvent.**methylene chloride.** (methylene dichloride; dichloromethane).CAS: 75-09-2. CH₂Cl₂.**Properties:** Colorless, volatile liquid; penetrating

ether-like odor. D 1.335 (15/4C), fp -97°C , bp 40.1°C , bulk d 11.07 lb/gal (20C), refr index 1.4244 (20C), viscosity 0.430 cP (20C), autoign temp 1224F (662C). Soluble in alcohol and ether; slightly soluble in water. Nonflammable and nonexplosive in air.

Derivation: Chlorination of methyl chloride and subsequent distillation.

Hazard: Toxic. A narcotic. TLV: TWA 50 ppm; animal carcinogen.

Use: Paint removers, solvent degreasing, plastics processing, blowing agent in foams, solvent extraction, solvent for cellulose acetate, aerosol propellant.

methylene chlorobromide. See bromochloromethane.

4,4'-methylenedianiline. See *p,p'*-diaminodiphenylmethane.

methylene dichloride. See methylene chloride.

3,4-methylenedioxybenzaldehyde. See piperonal.

methylenedioxyamphetamine. See *n*-ethyl-3,4-methylenedioxyamphetamine.

7,8-methylenedioxyisoquinoline.

CAS: 234-17-3. mf: $\text{C}_{10}\text{H}_7\text{NO}_2$.

Hazard: A poison by ingestion.

3,4-methylenedioxypropylbenzene. (dihydro-safrole). $\text{C}_3\text{H}_7\text{C}_6\text{H}_3\text{O}_2\text{CH}_2$.

Properties: Colorless liquid. D 1.065 (25/25C). Somewhat soluble in alcohol. Combustible.

Use: Essential oil compositions.

methylene-di-*p*-phenylene isocyanate. See diphenylmethane-4,4'-diisocyanate.

5,5'-methylenedisalicylic acid.

$\text{CH}_2[\text{C}_6\text{H}_3(\text{OH})\text{COOH}]_2$.

Properties: Nonhygroscopic, light-tan, coarse powder. Stable in air; darkens in light. Tends to decarboxylate at very high temperatures. Decomposes at 238°C . Soluble in alcohol, ether, and acetone; insoluble in benzene, chloroform. Combustible.

Use: Alkyd resins and modified phenolic compositions for paints and varnishes, intermediate for dye-stuffs and printing ink.

methylene glutaronitrile. (acrylonitrile dimer; 2,4-dicyanobutene-1). $\text{NCC}_2\text{H}_4\text{C}(\text{CH}_3)\text{CN}$.

Properties: Colorless liquid. Bp 103°C (5 mm Hg), fp -9.6°C , refr index 1.4504 (25C), d 0.9756 (25/4C). Slightly soluble in water; insoluble in aliphatic and alicyclic hydrocarbons, soluble in aromatic hydrocarbons and polar organic solvents.

Derivation: From acrylonitrile by catalytic dimerization.

Use: Vinyl monomer for polymerization and copolymerization, intermediate in making fibers and pharmaceuticals.

methylene iodide. (diiodomethane).

CAS: 75-11-6. CH_2I_2 .

Properties: Yellow liquid. D 3.33, mp 6°C , bp 180°C (decomposes). Soluble in alcohol and ether; insoluble in water.

Hazard: May be irritating and narcotic.

Use: Separating mixture of minerals, organic synthesis, X-ray contrast media.

5-methylene-2-norbornene. A copolymer in EPDM elastomers.

methylene succinic acid. See itaconic acid.

methylenesuccinyloxybis(tributylstannane). See bis(tributyltin) itaconate.

methylene-*p*-toluidine. See formaldehyde-*p*-toluidine.

6-*o*-methylerythromycin.

CAS: 81103-11-9. mf: $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$.

Hazard: Moderately toxic by ingestion. Human systemic effects.

methyl esters. Any of a group of fatty esters derived from coconut and other vegetable oils, tallow, etc.; alkyl groups range from C_8 to C_{18} in varying percentages.

Use: Lubricants for metal-cutting fluids, high-temperature grinding, cold-rolling of steel.

***N*-methylethanolamine.**

CAS: 109-83-1. $\text{CH}_3\text{NHC}_2\text{H}_4\text{OH}$.

Properties: Liquid. D 0.9414, bp 159.5°C , vap press 0.7 mm Hg (20C), fp -4.5°C , flash p 165F (73.9C). Soluble in water. Combustible.

Use: Textile chemicals, pharmaceuticals.

methyl ether. See dimethyl ether.

4-methyl-7-ethoxycoumarin.

$\text{C}_2\text{H}_5\text{OC}_2\text{H}_4\text{C}(\text{CH}_3)\text{:CHC}(\text{O})\text{O}$.

Properties: White solid; walnut odor. Mp $113\text{--}114^{\circ}\text{C}$. Slightly soluble in alcohol.

Use: Perfumery, flavoring.

2-(1-methylethoxy)phenol methylcarbamate.

$(\text{CH}_3)_2\text{CHOC}_6\text{H}_4\text{OOCNHCH}_3$.

Properties: White, crystalline powder; odorless. Mp 91°C . Soluble in most alcohols; very slightly soluble in water; unstable in highly alkaline media; stable under normal conditions.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide.

1-methylethyl 3-amino-2-butenolate. See isopropyl 3-aminocrotonate.

methylethylcarbinol. See *sec*-butyl alcohol.

methyl ethyl cellulose. The methyl ether of ethylcellulose in which both methyl and ethyl groups are attached to anhydroglucose units by ether linkages.

Properties: White to pale-cream-colored fibrous solid or powder; practically odorless. Disperses in cold water to form aqueous solutions which undergo a reversible transformation from solution to gel upon heating and cooling, respectively. Combustible.

Grade: Technical, FCC.

Use: Emulsifier, stabilizer, foaming agent.

See cellulose, modified.

methyl ethyl diketone. See acetyl propionyl.

2-methyl-2-ethyl-1,3-dioxolane.

Properties: Colorless liquid. D 0.9392, bp 117.6C, fp -81.96C, flash p 74F (23.3C) (OC). Soluble in water 2.2% by wt.

Hazard: Flammable, dangerous fire risk.

Use: Solvent.

sym-methylethylethylene. See 2-pentene.

methylethylglyoxal. See acetyl propionyl.

methylethylhydantoin formaldehyde resin.

Properties: Clear, pale, solid resin. Softening point (B&R) 85C, d 1.30, pH (10% aqueous solution) 6.5-7.5.

4,4'-(1-methylethylidene)bis(2,6-dibromophenol).

CAS: 79-94-7. mf: $\text{C}_{15}\text{H}_{12}\text{Br}_4\text{O}_2$.

Hazard: Moderately toxic by inhalation and skin contact. An eye irritant.

Use: Reproductive Effector.

9-(3'-methyl-4'-ethylidene-thiosemicarbazido)acridine.

CAS: 28846-43-7. mf: $\text{C}_{17}\text{H}_{16}\text{N}_4\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

methyl ethyl ketone. (ethyl methyl ketone; 2-butanone; MEK).

CAS: 78-93-3. $\text{CH}_3\text{COCH}_2\text{CH}_3$.

Properties: Colorless liquid; acetone-like odor. Bp 79.6C, d 0.8255 (0/4C), 0.805 (20/4C) and 0.7997 (25/4C), refr index 1.379 (20C), sp heat 0.549 cal/g, fp -86.4C, viscosity 0.40 cP (25C), soluble in water

22.6 wt %, solubility of water 9.9 wt %, flash p (TOC) 24F (-4.4C), bulk d 6.71 lb/gal (20C), autoign temp 960F (515C). Soluble in benzene, alcohol, and ether; miscible with oils.

Derivation: (1) From mixed *n*-butylenes and sulfuric acid to cause hydrolysis followed by distillation to separate *sec*-butyl alcohol which is dehydrogenated; (2) by controlled oxidation of butane; (3) by fermentation.

Grade: Technical.

Use: Solvent in nitrocellulose coatings and vinyl films, "Glyptal" resins, paint removers, cements and adhesives, organic synthesis, manufacture of smokeless powder, cleaning fluids, printing, catalyst carrier, acrylic coatings.

Note: Does not dissolve cellulose acetate and most waxes.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2-10%. Toxic by inhalation. TLV: TWA 200 ppm; STEL 300 ppm.

methyl ethyl ketone peroxide. (ethyl methyl ketone peroxide).

CAS: 1338-23-4. $\text{C}_8\text{H}_{16}\text{O}_4$.

Properties: Colorless liquid, strong oxidizing agent.

Hazard: Fire risk in contact with organic materials. Strong irritant to skin and tissue. TLV: ceiling 0.2 ppm.

Use: Manufacture of acrylic resins, hardening agent for fiberglass-reinforced plastics.

methyl 3-((ethyl(propylamino)phosphorothioyl)oxy)-2-butenolate.

CAS: 37902-85-5. mf: $\text{C}_{10}\text{H}_{20}\text{NO}_2\text{PS}$.

Hazard: A poison by ingestion and skin contact.

2-methyl-5-ethylpyridine. (MEP; aldehyde; aldehyde collidine; 5-ethyl-2-picoline).

CAS: 104-90-5. $\text{CH}_3\text{C}_5\text{H}_7\text{NC}_2\text{H}_5$.

Properties: Colorless liquid; sharp penetrating odor. D 0.921 (20/20), bp 178.3C, fp -70.3C, flash p (COC) 165F (73.9C), refr index 1.4970 (20C). Almost insoluble in water; soluble in alcohol, ether, benzene, concentrated sulfuric acid.

Derivation: Paraldehyde is treated with ammonia under high pressure and in the presence of ammonium acetate as a catalyst. Picolines and other substituted pyridines are by-products.

Grade: Technical.

Hazard: Toxic. Corrosive and strong irritant to tissue.

Use: Nicotinic acid and nicotinamide, vinyl pyridines for copolymers, intermediates for germicides and textile finishes, corrosion inhibitor for chlorinated solvents.

methyl eugenol. (Generic name for 4-allyl-1,2-dimethoxybenzene; 4-allyl veratrole; 1,2-dimethoxy-4-allylbenzene; eugenyl methyl ether).

CAS: 93-15-2. $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{CH}=\text{CH}_2$.

Properties: Colorless to pale yellow liquid. Bp 91-95C (0.3 mm Hg), d 1.032-1.036 (25C). Insoluble

ble in water; soluble in most organic solvents. Combustible.

Grade: Technical, FCC.

Use: Insect attractant, flavoring.

methyl fluoride. Legal label name (Air) for fluoromethane.

methyl fluorosulfonate.

CAS: 421-20-5. $\text{CH}_3\text{OSO}_2\text{F}$.

Properties: Colorless liquid; ethereal odor. Bp 92C, d 1.42.

Hazard: Toxic. Strong irritant to tissue, inhalation of fume must be avoided. Reacts with water, steam, and acids, evolving corrosive vapor.

Use: Methylating agent, organic synthesis.

N-methylformanilide. $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)\text{CHO}$.

Properties: Colorless to light-yellow liquid. Refr index 1.5570–1.5600 (25C), distillation range 127–131C (16 mm Hg).

Grade: 95% min.

Use: Organic synthesis.

methyl formate.

CAS: 107-31-3. HCOOCH_3 .

Properties: Colorless liquid; agreeable odor. Saponified by water or alkaline solutions. D 0.950–0.980 (20/20C), fp –99.8C, bp 31.8C, flash p –2F (–18.9C), bulk d 8.03 lb/gal (68F), refr index 1.3431 (20C), autoign temp 853F (456C). Soluble in water, alcohol, and ether.

Derivation: By heating methanol with sodium formate and hydrochloric acid with subsequent distillation.

Grade: Technical, refined, FCC.

Hazard: Flammable, dangerous fire and explosion risk, explosive limits in air 5.9–20%. Irritant. TLV: TWA 100 ppm; STEL 150 ppm.

Use: Organic synthesis, cellulose acetate solvent, fumigant, larvicides.

methyl fuel. Auxiliary fuel for automotive equipment, electric power production, fuel cells, etc. A mixture of methanol and alcohols of up to four carbon atoms, it is made by catalytic treatment of synthesis gas. It can be blended with gasoline in low percentage. Its combustion products contain less polluting components than No. 5 fuel oil.

See methanol.

2-methylfuran.

CAS: 534-22-5. $\text{C}_4\text{H}_8\text{OCH}_3$.

Properties: Colorless liquid; etherlike odor. Fp –88.68C, bp 63.2–65.6C, d 0.913 (20/4C), refr index 1.4320 (20C), flash p –22F (–30C). Insoluble in water 0.3 g/100 g water. Miscible with most organic solvents. Forms a binary azeotrope with methanol, a ternary azeotrope with methanol-water.

Hazard: Highly flammable, dangerous fire and explosion risk. Irritant.

Use: Chemical intermediate.

N-methylfurfurylamine. $\text{C}_4\text{H}_3\text{OCH}_2\text{NHCH}_3$.

Properties: Colorless to light-yellow. Refr index 1.4700–1.4720 (25C), distilling range 144–153C. Combustible.

Use: Intermediate.

methyl-2-furoate. (methyl pyromucate).

CAS: 611-13-2. $\text{C}_4\text{H}_3\text{OCO}_2\text{CH}_3$.

Properties: Colorless liquid turning yellow in light; pleasant odor. D 1.1739 (15/15C), bp 181.3C (corrosive), refr index 1.4860 (20C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: By esterification of furoic acid.

Use: Solvent, organic synthesis.

methyl gallate. (methyl-3,4,5-trihydroxybenzoate).

CAS: 99-24-1. $\text{C}_6\text{H}_2(\text{OH})_3\text{COOCH}_3$.

Properties: White, crystalline powder.

Use: Industrial antioxidant.

N-methylglucamine.

$\text{CH}_2\text{OH}(\text{CH}_2\text{O})_4\text{CH}_2\text{NHCH}_3$.

Properties: White crystals. Mp 128C. Soluble in water; slightly soluble in alcohol; complexes with metals.

Derivation: From glucose and methylamine.

Use: Detergents, pharmaceuticals, dyes.

methyl- α -D-glucopyranoside. See methyl glucoside.

α -methyl glucoside. (methyl- α -D-glycopyranoside).

$\text{CH}_2\text{OHCH}(\text{CH}_2\text{O})_4\text{CHOOCH}_3$.

Properties: Odorless, white crystals. Mp 168C, bp 200C (0.2 mm Hg). Specific optical rotation (aqueous solution) +158.9C (20C), d (30/4C) 1.46. Soluble in water; slightly soluble in 80% alcohol and methanol, insoluble in ether. Combustible.

Derivation: (1) By treating dextrose with methanol in the presence of hydrochloric acid or cation exchange resin, (2) enzymatic synthesis from yeast.

Grade: Technical.

Use: Plasticizer for phenolic, amine, and alkyd resins; nonionic surfactants; tall-oil varnishes; reclaiming drying oils; polyurethane foams.

methyl glycoll. See sarcosine.

methyl glycol. See propylene glycol.

methyl group. The simplest alkyl group, CH_3 , formed by dropping a hydrogen atom from methane (CH_4). It occurs at both ends of paraffinic molecules having two or more carbon atoms in the chain, as well as in many other organic compounds.

See alkyl.

N-methyl-N-guanylglycine. See creatine.

methyl heneicosanoate. $\text{CH}_3(\text{CH}_2)_{19}\text{COOCH}_3$.

The methyl ester of heneicosanoic acid.

Properties: White waxlike solid. Mp 48–9C, bp 207C (3.75 mm Hg). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Purified 96%, 99.5%.

Use: Intermediate in organic synthesis.

methyl heptadecanoate. (methyl margarate).

$\text{CH}_3(\text{CH}_2)_{15}\text{COOCH}_3$. The methyl ester of heptadecanoic acid (margaric acid).

Properties: White, waxlike solid. Mp 29C, bp 184–7C, 130C (1 mm Hg). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Purified 96%, 99.5%.

Use: Intermediate in organic synthesis.

2-methylheptane. $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_4\text{CH}_3$.

See isooctane.

3-methylheptane. $\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)(\text{CH}_2)_3\text{CH}_3$.

Properties: Colorless liquid. Fp –120.5C, bp 118.9C, d 0.70582 (20/4C), refr index 1.39849 (20C).

Grade: 99%, 95%.

Hazard: Flammable, dangerous fire risk.

Use: Calibration, organic synthesis.

4-methylheptane. (methyldipropylmethane).

C_8H_{18} or $\text{CH}_3(\text{CH}_2)_2\text{CHCH}_3(\text{CH}_2)_2\text{CH}_3$.

Properties: Colorless liquid. D 0.7161, bp 122.2C. Soluble in alcohol and ether; insoluble in water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

methylheptenone. (6-methyl-5-heptene-2-one).

$(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{COCH}_3$. Constituent of lemongrass oil and many other essential oils.

Properties: Colorless liquid. D 0.860 (20C), fp –67.1C, bp 173–174C. Insoluble in water; miscible with alcohol or ether. Combustible.

Derivation: From oil of lemongrass or by controlled oxidation of corresponding secondary alcohol.

Use: Organic synthesis, inexpensive perfumes, flavoring.

methyl heptyne carbonate. (methyl-2-octynoate).

CAS: 111-12-6. $\text{CH}_3(\text{CH}_2)_4\text{C}\equiv\text{CCOOCH}_3$

Properties: Colorless liquid; strong violet-type odor. D 0.919–0.923, refr index 1.446–1.450 (20C). Soluble in most fixed oils and mineral oil; soluble in five parts of 70% alcohol. Combustible.

Derivation: From heptaldehyde.

Grade: Technical, FCC.

Use: Perfumery, flavoring.

methyl hexacosanoate. See methyl cerotate.**methyl hexadecanoate.** See methyl palmitate.**2-methylhexane.** (ethylisobutylmethane; isohexane). $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_3\text{CH}_3$.

Properties: Colorless liquid. D 0.6789, bp 90.0C, fp –118.5C, refr index 1.38498 (20C), flash p approximately 0F (–17.7C). Soluble in alcohol; insoluble in water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1–6%.

Use: Organic synthesis.

3-methylhexane.

$\text{H}_3\text{CCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Bp 92C, d 0.692 (15.5/15.5C), refr index 1.388 (20C), flash p 25F (–3.9C).

Grade: Technical 95%.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis, oil extender solvent.

methyl hexanoate. See methyl caproate.**5-methyl-2-hexanone.** See methyl isoamyl ketone.**methyl hexyl ketone.** (2-octanone).

CAS: 111-13-7. $\text{CH}_3\text{COC}_6\text{H}_{13}$.

Properties: Colorless liquid; pleasant odor; camphor taste. D 0.82 (20/4C), mp 20.9C, bp 173.5C, distillation range 166–173C, flash p 160F (71.1C), refr index 1.416 (20C). Insoluble in water; soluble in alcohol, hydrocarbons, ether, esters, etc. Combustible.

Derivation: By distilling sodium ricinoleate with caustic soda.

Use: Perfumes, high-boiling solvent, especially for epoxy resin coatings, leather finishes, flavoring, odorant, antiblushing agent for nitrocellulose lacquers.

methyl hydrazine. (monomethylhydrazine; MMH).

CAS: 60-34-4. CH_3NHNH_2 .

Properties: Colorless, hygroscopic liquid; ammonia-like odor. D 0.874 (25C), fp –52.4C, bp 87.5C, flash p approximately 80F (26.6C). Soluble in water, hydrazine, hydrocarbons, and monohydric alcohols.

Hazard: Flammable, dangerous fire risk, vapors may explode, may self-ignite in air and on contact with oxidizing agents. Toxic by ingestion and inhalation. TLV: ceiling 0.2 ppm, suspected human carcinogen.

Use: Missile propellant, intermediate, solvent.

methyl hydride. See methane.**methylhydrogen sulfate.** See methylsulfuric acid.**methyl-*p*-hydroxybenzoate.** See methyl paraben.

methylhydroxybutanone. (3-methyl-3-hydroxybutan-2-one). $(\text{CH}_3)_3\text{COHCOCH}_3$.

Properties: Clear, colorless liquid; sweet camphor-like odor. Bp 140.3C, fp -86.5C , d 0.9553 (20/20C), refr index 1.4153 (20C). Miscible with water, acetone, benzene, mineral spirits. Combustible.

Use: Specialty solvent, chemical intermediate, flavor formulations.

4-methyl-7-hydroxycoumarin diethoxythiophosphate. See potasan.

methyl-3-hydroxy- α -crotonate dimethyl phosphate. See mevinphos.

methylhydroxyisopropylcyclohexane. See menthol.

methyl 4-(2-hydroxy-3-((1-methylethyl) amino)propoxy)benzenepropanoate.

CAS: 81147-92-4. mf: $\text{C}_{16}\text{H}_{25}\text{NO}_4$.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

4-methyl-4-hydroxy-1-octyne.

CAS: 22128-43-4. mf: $\text{C}_9\text{H}_{16}\text{O}$.

Hazard: Moderately toxic by ingestion. A moderate eye irritant.

methyl-12-hydroxystearate.

CAS: 141-23-1. $\text{C}_{17}\text{H}_{33}\text{O}_2$.

Properties: White, waxy solid in the form of short flat rods. Mp 48C, acid value 4, saponification value 177, iodine value 5. Insoluble in water; limited solubility in organic solvents. Combustible.

Use: Adhesives, inks, cosmetics greases.

2-methylimidazole. (2MZ).

$\text{CHCHNC}(\text{CH}_3)\text{NH}$.

Properties: Solid. Mp 142–143C.

Use: Dyeing auxiliary for acrylic fibers, plastic foams.

3-methylindole. See skatole.

methyl iodide. (iodomethane).

CAS: 74-88-4. CH_3I .

Properties: Colorless liquid, turns brown on exposure to light. D 2.24–2.27 (25/25C), fp -66.1C , bp 42C, refr index 1.526–1.527 (25C). Soluble in alcohol and ether; partially soluble in water. Nonflammable.

Derivation: Interaction of methanol, sodium iodide, and sulfuric acid with subsequent distillation.

Hazard: Toxic by ingestion, inhalation, and skin absorption; narcotic, irritant to skin. TLV: TWA 0.01 ppm; animal carcinogen.

Use: Organic synthesis, microscopy, testing for pyridine.

methylionone. (irone). $\text{C}_{14}\text{H}_{22}\text{O}$.

Properties: Colorless to amber-yellow liquid; floral odor.

Grade: Several isomers are available as α , β , γ , Δ , and mixtures. The constants are approximately: d 0.926–0.939, refr index 1.501–1.504, bp 144C (16 mm Hg). Soluble in alcohol, insoluble in water.

Derivation: Oil of orris.

Use: Perfumery, flavoring.

See α -isomethylionone.

methyl isoamyl ketone. (5-methyl-2-hexanone; MIAK).

CAS: 110-12-3. $\text{CH}_3\text{COC}_2\text{H}_4\text{CH}(\text{CH}_3)_2$.

Properties: Colorless, stable liquid; pleasant odor. D 0.8132 (20/20C), refr index 1.4062 (20C), bp 144C, fp -73.9C , bulk d 6.77 lb/gal, flash p (OC) 110F (43.3C). Slightly soluble in water; miscible with most organic solvents. Combustible.

Grade: 97.5%.

Hazard: Moderate fire risk. TLV: 50 ppm.

Use: Solvent for nitrocellulose, cellulose acetate butyrate, acrylics, and vinyl copolymers.

methyl isobutenyl ketone. See mesityl oxide.

methylisobutyl carbinol. See methylamyl alcohol.

methylisobutyl carbinol acetate. See methylamyl acetate.

methyl isobutyl ketone. (hexone; 4-methyl-2-pentanone; isopropylacetone).

CAS: 108-10-1. $(\text{CH}_3)_2\text{CHCH}_2\text{COCH}_3$.

Properties: Colorless, stable liquid; pleasant odor. D 0.8042 (20/20C), bp 115.8C, fp -85C , bulk d 6.68 lb/gal (20C), vap press 15.7 mm Hg (20C), refr index 1.3959 (20C), flash p 73F (22.7C), autoign temp 860F (460C). Slightly soluble in water; miscible with most organic solvents.

Derivation: Mild hydrogenation of mesityl oxide.

Grade: Technical, 98.5%.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.4–7.5%. Avoid ingestion and inhalation. TLV: TWA 50 ppm; STEL 75 ppm.

Use: Solvent for paints, varnishes, nitrocellulose, lacquers; manufacture of methyl amyl alcohol; extraction processes including extraction of uranium from fission products; organic synthesis; denaturant for alcohol.

methyl isocyanate.

CAS: 624-83-9. CH_3NCO .

Properties: Colorless liquid. D 0.9599 (20/20C), bp 39.1C, reacts with water, flash p less than 20F (-6.6C).

Hazard: Flammable, dangerous fire risk. Toxic by skin absorption and a strong irritant. TLV: 0.02 ppm.

Use: Intermediate.

methylisoeugenol. (propenyl guaiacol).

CAS: 93-16-3. $\text{CH}_3\text{CH}:\text{CHC}_6\text{H}_4(\text{OCH}_3)_2$.

Properties: Colorless to light-yellowish liquid; spicy odor. D 1.050–1.053, bp 262–264C, refr index 1.566–1.569, soluble in two parts of 70% alcohol. Almost insoluble in mineral oil; insoluble in glycerol. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavoring agent.

methyl isonicotinate. $\text{C}_5\text{NH}_4\text{COOCH}_3$.

Properties: Clear amber to red liquid; mild odor. D 1.15 (20/20C).

Use: Intermediate for synthesis of isonicotinic acid hydrazide.

1-methyl-4-isopropenylcyclohexan-3-ol.

See isopulegol.

methyl isopropenyl ketone.

CAS: 814-78-8. $\text{CH}_3\text{COC}(\text{CH}_3):\text{CH}_2$.

Properties: Colorless liquid; pleasant odor; sweet taste. D 0.854 (20C). Polymerizes readily.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.8–9.0%.

Use: Plastics.

5-methyl-2-isopropyl-2-hexenal. mf:

$\text{C}_{10}\text{H}_{18}\text{O}$.

Properties: Slightly yellow liquid; herbaceous, woody, fruity, chocolate odor. D: 0.845–0.860, refr index: 1.448. Sol in alc, fixed oils; insol in water, propylene glycol.

Use: Food additive.

methyl isopropyl ketone. (3-methyl-2-butanone).

CAS: 563-80-4. $\text{CH}_3\text{COCH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Bp 93C, fp –92C, refr index 1.38788 (16C), d 0.815 (15/4C). Very slightly soluble in water; soluble in alcohol and ether.

Derivation: Synthetic, also by fermentation.

Hazard: Toxic material. TLV: 200 ppm.

Use: Solvent for nitrocellulose lacquers.

See ketones.

2-methyl-5-isopropylphenol. See carvacrol.

5-methyl-2-isopropylphenol. See thymol.

methyl-*p*-isopropylphenyl propyl aldehyde.

See cyclamen aldehyde.

methyl isothiocyanate. (methyl mustard oil).

CAS: 556-61-6. $\text{CH}_3\text{N}:\text{CS}$.

Properties: Colorless crystals. Mp 35C, bp 120C. Soluble in alcohol and ether; partially soluble in water.

Derivation: Reaction of methylamine and carbon disulfide.

Hazard: Toxic by ingestion, strong irritant to eyes and skin.

Use: Insecticide, a possible military poison.

methyl lactate.

CAS: 547-64-8. $\text{CH}_3\text{CH}_2\text{OCOOCH}_3$.

Properties: Colorless liquid. Decomposed by water, bp 144.8C, fp approximately –66C, refr index 1.4156 (20C), flash p (CC) 125F (51.6C), autoign temp 725F (385C), bulk d 9 lb/gal (68F). Soluble in alcohol and ether. Combustible.

Hazard: Moderate fire risk.

Use: Solvent for cellulose acetate, nitrocellulose, cellulose acetobutyrate, cellulose acetopropionate, lacquers, stains.

methylactonitrile. See acetone cyanohydrin.

methyl laurate. (methyl dodecanoate).

$\text{CH}_3(\text{CH}_2)_{10}\text{COOCH}_3$. The methyl ester of lauric acid.

Properties: Water-white liquid. D 0.8702 (20/4C), mp 4.8C, bp 262C (766 mm Hg), 160C (30 mm Hg), refr index 1.4301 (25C). Insoluble in water. Non-corrosive. Combustible.

Derivation: From coconut oil.

Method of purification: Vacuum fractional distillation.

Grade: 69%, 74%, 90%, 96%, 99.8%.

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, lubricants, plasticizers, textiles, flavoring.

methyl lauroleate.

$\text{CH}_3\text{CH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of lauroleic acid.

Properties: Colorless liquid. Insoluble in water; soluble in common organic solvents. Combustible.

Grade: Purified product, 99.5%.

Use: Organic synthesis, reference standard for gas chromatography, biochemical research.

methyl lignocerate. (methyl tetracosanoate).

$\text{CH}_3(\text{CH}_2)_{22}\text{COOCH}_3$. The methyl ester of lignoceric acid.

Properties: Waxlike solid. Mp 57.8C, bp 232C (3.75 mm Hg), refr index 1.4283 (80C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of lignoceric acid with methanol followed by vacuum distillation.

Grade: Purified (99.8%+).

Use: Intermediate in special synthesis, biochemical research, reference standard in gas chromatography.

methyl linoleate. $\text{C}_{19}\text{H}_{32}\text{O}_2$. The methyl ester of linoleic acid (*cis,cis,cis*-octadec-9,12,15-dienoic acid).

Properties: Colorless oil. D 0.8886 (18/4C), fp –35C, bp 212C (16 mm Hg), refr index 1.4593 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Urea fractionation and vacuum distillation of methyl esters of safflower oil.

Grade: Technical, purified (99+%).

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles, reference standard in gas chromatography, biochemical research.

methyl lithium. CH_3Li . Commercially available as a 5% solution in ether.

Hazard: Flammable, dangerous fire and explosion risk, self-ignites in air.

Use: In Grignard-type reactions.

***n*-methylamine.**

CAS: 22143-50-6. mf: $\text{C}_9\text{H}_{16}\text{N}_2\text{O}$.

Hazard: A poison.

Source: Natural product.

methylmagnesium bromide. CH_3MgBr .

Available in solution in ether.

Derivation: Reaction of magnesium and methylbromide.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Alkylating agent in organic synthesis, Grignard reagent.

methylmagnesium chloride. CH_3MgCl .

Available as a solution in tetrahydrofuran.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Alkylating agent in organic synthesis, Grignard reagent.

methylmagnesium iodide. CH_3MgI . Available as solution in ether.

Derivation: Reaction of magnesium and methyl iodide.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Alkylating agent in organic synthesis, Grignard reagent.

methylmaleic anhydride. See citraconic anhydride.

methyl margarate. See methyl heptadecanoate.

methyl mercaptan. Legal label name for methanethiol.

***n*-methyl 3-mercaptopropionamide.**

CAS: 52334-99-3. mf: $\text{C}_4\text{H}_9\text{NOS}$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin and severe eye irritant.

methylmercury acetate. $\text{CH}_3\text{HgOOCCH}_3$.

Hazard: Toxic by ingestion, absorbed by skin. TLV: 0.01 mg(Hg)/m³.

Use: Seed disinfectant.

methylmercury cyanide. (methylmercury nitrile). CH_3HgCN .

Properties: Crystals. Mp 95C. Soluble in water and organic solvents.

Hazard: Toxic by ingestion, absorbed by skin. TLV: 0.01 mg(Hg)/m³.

Use: Fungicide, seed disinfectant.

methylmercury cysteine. See mercurate(1-), (1-cysteinato(2-)-s)methyl-, hydrogen.

methylmercury dicyandiamide. See cyano(methylmercury)guanidine.

methylmercury-2,3-dihydroxypropylmercaptide.

$\text{CH}_3\text{HgSCH}_2\text{CH}_2\text{OCH}_2\text{OH}$.

Hazard: Toxic by ingestion, absorbed by skin. TLV: 0.01 mg(Hg)/m³.

Use: Seed disinfectant.

methylmercury-8-hydroxyquinolate. See methylmercury quinolinolate.

methylmercury quinolinolate. (methylmercury-8-hydroxyquinolate; methylmercury oxyquinolate).

CAS: 86-85-1. $\text{C}_9\text{H}_6\text{NOHgCH}_3$.

Properties: Yellow crystals. Mp 133–137C.

Hazard: Toxic material. TLV: 0.01 mg(Hg)/m³.

Use: Seed disinfectant.

methylmercury toluenesulfonate.

CAS: 63869-06-7.

Properties: IDLH 10 mg/m³ (as Hg).

Hazard: A poison. TWA 0.1 mg(Hg)/m³ (skin)

methyl methacrylate.

CAS: 80-62-6. $\text{CH}_2\text{:C}(\text{CH}_3)\text{COOCH}_3$. Acrylic resin monomer.

Properties: Colorless, volatile liquid. Bp 101C, fp -48.2C, d 0.940 (25/25C), flash p (OC) 50F (10C), autoign temp 790F (421C). Slightly soluble in water; soluble in most organic solvents. Readily polymerized by light, heat, ionizing radiation and catalysts. Can be copolymerized with other methacrylate esters and many other monomers.

Derivation: (1) Acetone cyanohydrin, methanol, and dilute sulfuric acid; (2) oxidation of *tert*-butyl alcohol to methacrolein and then to methacrylic acid, followed by reaction with methanol.

Grade: Technical (inhibited).

Hazard: Flammable, dangerous fire risk, explosive limits in air 2.1–12.5%. TLV: TWA 100 ppm; not classifiable as a human carcinogen.

Use: Monomer for polymethacrylate resins, impregnation of concrete.

See acrylic resin.

methylmethane. See ethane.

methyl (E)-2-methoxyimino-(2-(*o*-tolylloxymethyl)phenyl)acetate.

CAS: 143390-89-0. mf: $\text{C}_{18}\text{H}_{19}\text{NO}_4$.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion and inhalation.
Use: Agricultural chemical.

***N*-methyl methyl anthranilate.** See dimethyl anthranilate.

7-methyl-3-methylene-1,6-octadiene. See myrcene.

2-(*o*-(*n*-methyl-*n'*-(*n'*-methyl-*n'*-ethoxy-carbonylamino)sulfonyl)oximino)-1,4-dithiane.
 CAS: 64029-07-8. mf: C₁₀H₁₇N₃O₄S₃.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

4-methyl- α -(1-methylethyl)benzeneacetic acid, (5-(2-furanylmethyl)-2-thienyl)methyl ester.
 CAS: 51629-74-4. mf: C₂₂H₂₄O₃S.
Hazard: Moderately toxic by ingestion.
Use: Agricultural chemical.

4-methyl- α -(1-methylethyl)benzeneacetic acid, (4,5,6,7-tetrahydrobenzo(b)thien-2-yl) methyl ester.
 CAS: 51629-79-9. mf: C₂₁H₂₆O₂S.
Hazard: Moderately toxic by ingestion.
Use: Agricultural chemical.

methyl (4-(1-methylethyl)phenyl)methyl 3-pyridinylcarbonimidodithioate.
 CAS: 51308-72-6. mf: C₁₇H₂₀N₂S₂.
Hazard: Moderately toxic by ingestion.
Use: Agricultural chemical.

methyl((methyl(((5-methyl-1,3-oxathiolan-4-ylidene)amino)oxy)carbonyl)amino)thio) carbamic acid, ethyl ester.
 CAS: 64029-08-9. mf: C₁₀H₁₇N₃O₅S₂.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

2-methyl-*n*-(*n'*-methyl-*n'*-(4-morpholino-sulfonyl)carbamoxyloxy)thioacetimidate.
 CAS: 62382-21-2. mf: C₉H₇N₃O₅S₂.
Hazard: A poison by ingestion.
Use: Agricultural chemical.

α -(3-methyl-1-(2-methylpropyl)butyl)- ω -hydroxypoly(oxy-1,2-ethanediyl).
 CAS: 132299-20-8. mf: (C₂H₄O)_nC₉H₂₀O
Hazard: Moderately toxic by ingestion. Low toxicity by skin contact. A mild skin and moderate eye irritant.

2-methyl-2-(methylthio)propanol-*o*-(*n*-methyl-*n*-morpholinisulfonyl) carbamoyl)oxime.
 CAS: 62382-23-4. mf: C₁₁H₂₁N₃O₃S₂.

Hazard: A poison by ingestion.
Use: Agricultural chemical.

2-methyl-2-(methylthio)propionaldehyde-*o*-(methyl)(decoxysulfinyl)carbamoyl)oxime.
 CAS: 77248-45-4. mf: C₁₇H₃₄N₂O₄S₂.

Hazard: A poison by ingestion.
Use: Agricultural chemical.

methylmorphine. See codeine.

***N*-methyl morpholine.**
 CAS: 109-02-4.

Properties: Water-white liquid; ammonia odor. D 0.921 (20/20C, bp 115.4C, fp -66C, flash p 75F (23.9C) (TOC). Forms constant-boiling mixture with 25% water and boiling at 97C. Miscible with benzene, water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Skin irritant.

Use: Catalyst in polyurethane foams, extraction solvent, stabilizing agent for chlorinated hydrocarbons, self-polishing waxes, oil emulsions, corrosion inhibitors, pharmaceuticals.

methyl myristate. (methyl tetradecanoate).
 CH₃(CH₂)₁₂COOCH₃. The methyl ester of myristic acid.

Properties: Colorless liquid. Mp 17.8C, bp 186.8C (30 mm Hg), 157.5C (1 mm Hg), refr index 1.4351 (25C). Insoluble in water. Combustible.

Derivation: (1) Esterification of myristic acid with methanol, (2) alcoholysis of coconut oil with methanol.

Method of purification: Vacuum fractional distillation.

Grade: Technical (93%), purified (99.8+%).

Use: Intermediate for myristic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles, animal feeds, standard for gas chromatography, flavoring.

methyl myristoleate.

CH₃(CH₂)₃CH:CH(CH₂)₇COOCH₃. The methyl ester of myristoleic acid (*cis*-tetradec-9-enoic acid).

Properties: Colorless liquid. Bp 108.9C (1 mm Hg). Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Purified product used in medical research and organic synthesis.

α -methylnaphthalene.

CAS: 90-12-0. C₁₀H₇CH₃.

Properties: Colorless liquid. D 1.025, fp -32C, bp 240-243C, refr index 1.6140 (25C), autoign temp 984F (529C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: From coal tar.

Hazard: Moderate fire risk.

Use: Organic synthesis.

β -methylnaphthalene.

CAS: 91-57-6. $C_{10}H_8CH_3$.

Properties: Solid. D 0.994 (40/4C), bp 241–242C, mp 34C, refr index 1.6015 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: From coal tar.

Grade: Technical, 95% min.

Use: Organic synthesis, insecticides.

2-methyl-1,4-naphthoquinone. See menadione.

methyl naphthyl dodecyl dimethylammonium chloride.

$C_{10}H_7HC_2C_{12}H_{25}(CH_3)_2NCl$. Quaternary ammonium salt.

Properties: White to slightly yellow, crystalline powder; mild odor and taste. Mp 159–160C, bulk d 5 lb/gal. Soluble in cold water, lower alcohols, glycerin, and acetone; pH of 5% solution 8.9.

Grade: Min purity 97%.

Use: Germicide.

methyl naphthyl ether. See β -naphthyl methyl ether.

methyl nitrate.

CAS: 598-58-3. CH_3NO_3 .

Properties: Colorless liquid. Bp 66C (explodes), d 1.217 (15C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: By reaction of nitric acid and methanol in the presence of urea.

Hazard: Explodes when heated, severe hazard when exposed to heat or shock. Narcotic, strong irritant to tissue.

Use: Rocket propellant.

methyl nitrite.

CAS: 624-91-9. CH_3NO_2 .

Properties: A gas. Bp $-12C$, fp $-17C$, d 0.991 (15C).

Hazard: Severe explosion risk when shocked or heated. Toxic by inhalation, narcotic.

Use: Synthesis of nitrile and nitroso esters.

methylnitrobenzene. See nitrotoluene.

4-methyl-2-nitrophenol. See 2-nitro-*p*-cresol.

***n*-methyl-4-nitrophthalimide.** See 4-nitro-*n*-methylphthalimide.

***n*-methyl-*n*-nitroso-4-aminopyridine.** See *n*-nitroso-*n*-methyl-4-aminopyridine.

methyl-4-nitrosoperfluorobutyrate. A monomer for a nitroso ester terpolymer, prepared by reacting methyl nitrite with perfluorosuccinic and

perfluoroglutaric anhydrides. The reaction is exothermic and gives high conversion to liquid nitrile esters, which yield nitroso esters on pyrolysis or photolysis.

N-methyl-*N*-nitroso-*p*-toluenesulfonamide.

$CH_3C_6H_4SO_2N(NO)CH_3$.

Properties: Fine, yellow crystals. Mp 56–59C. Soluble in ether and most organic solvents; insoluble in water.

Use: Reagent for the preparation of diazomethane.

methyl nonadecanoate. $CH_3(CH_2)_{17}COOCH_3$. The methyl ester of nonadecanoic acid.

Properties: White, waxy solid. Mp 39.5C, bp 190.5C (3.75 mm Hg). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Purified 96%, 99.5%.

Use: Intermediate in organic synthesis, medical research.

2-methylnonane. (isodecane).

$(CH_3)_2CH(CH_2)_6CH_3$.

Properties: Colorless liquid. D 0.728, fp $-74.7C$, bp 167C. Combustible.

methyl nonanoate. (methyl pelargonate).

$CH_3(CH_2)_7COOCH_3$. The methyl ester of pelargonic acid.

Properties: Colorless liquid; fruity odor. Fp $-35C$, bp 213.5C, d 0.877 (18C), refr index 1.4302 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of nonanoic (pelargonic) acid with methanol followed by fractional distillation.

Grade: Purified (96+%).

Use: Perfumes, flavors, reference standard for gas chromatography, intermediate in organic synthesis, medical research.

methyl-2-nonenoate.

$CH_3(CH_2)_7HC:CHCOOCH_3$.

Properties: Colorless to slightly yellow liquid; strong violet-leaf odor. D 0.893–0.898 (25/25C), refr index 1.4400–1.4440. Stable; soluble in alcohol. Combustible.

Use: Perfumes.

methylnonylacetalddehyde. (aldehyde C-12;

MNA; methylundecanal).

$CH_3(CH_2)_8CH(CH_3)CHO$.

Properties: Colorless liquid; fruity odor. D 0.824–0.828, refr index 1.432–1.435 (20C). Soluble in three volumes of 80% alcohol, in fixed oils, mineral oil. Combustible.

Grade: Technical, FCC (as methylundecanal).

Use: Perfumery, flavoring.

methyl nonyl ketone. (2-undecanone).

CAS: 112-12-9. $CH_3COC_9H_{19}$.

Properties: Oily liquid; strong odor. D 0.822–0.826,

bp 225C, refr index 1.429–1.433, flash p 192F (88.9C). Soluble in two parts of 70% alcohol. Combustible.

Derivation: Oil of rue, also made synthetically.

Use: Perfumery, flavoring, animal repellent.

methyl norbornene dicarboxylic

anhydride. Legal label name for memtetrahydrophthalic anhydride.

methyl octadecanoate. See methyl stearate.

4-methyloctin-4-ol. See 4-methyl-4-hydroxy-1-octyne.

***n*-methyl-*n*-octyl-1-octanamine.**

CAS: 4455-26-9. mf: C₁₇H₃₇N.

Hazard: A severe skin irritant.

methyl-2-octynoate. See methyl heptyne carbonate.

methylolacrylamide. Available in 60% aqueous solution.

Use: Intermediate for copolymerization of vinyl acetate and acrylic acid, polymers for coatings, varnishes, adhesives, crease-proof and wrinkle-resistant fabrics, permanent-press textiles by irradiation bonding.

methylol dimethylhydantoin. (dimethylhydantoin formaldehyde; DMHF).

$(\text{CH}_3)_2\text{CN}(\text{CH}_2\text{OH})\text{CONHCO}$.

Properties: White, odorless, crystalline solid. Mp 110–117C. Soluble in water, methanol, acetone; insoluble in hydrocarbons.

Use: Textile and paper finishing, preservative for cosmetics; source of formaldehyde.

See dimethylhydantoinformaldehyde resin.

methyl oleate.

CAS: 112-62-9. CH₃(CH₂)₇COOCH₃. The methyl ester of oleic acid (*cis*-octadec-9-enoic acid).

Properties: Colorless to amber clear liquid; faint fatty odor. D 0.8739 (20C), fp –19.9C, bp 218.5C (20 mm Hg), refr index 1.4521 (20C). Soluble in alcohols and most organic solvents; insoluble in water. Combustible.

Derivation: Esterification of oleic acid, vacuum fractional distillation, solvent crystallization.

Grade: Technical, purified 99+%.

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, textile treatment, plasticizers for duplicating inks, rubbers, waxes, etc.; biochemical research, chromatographic reference standard.

methylol formaldehyde. See glycolic aldehyde.

methylol imidazolidone. C₃H₄N₂(O)CH₂OH.

Properties: Straw-colored to water-white, clear liquid; mild odor. Bulk d 10 lb/gal (15.5C).

Use: Wash-and-wear fabrics.

methylol riboflavin. A mixture of methylol derivatives of riboflavin exhibiting the same activity.

Properties: Orange to yellow, hygroscopic powder. Nearly odorless. Soluble in water; nearly insoluble in alcohol, benzene, chloroform and ether; dextrorotatory. Dry powder is unstable and on standing loses biological activity by liberation of formaldehyde.

Derivation: Action of formaldehyde on riboflavin in weakly alkaline solutions.

Use: Nutrition, vitamin source.

methylolurea. H₂NCONHCH₂OH.

Properties: Colorless crystals. Mp 11C. Soluble in water and methanol; insoluble in ether; capable of polymerization.

Derivation: Combination of urea and formaldehyde, in the presence of salts or alkaline catalysts.

Use: Urea-formaldehyde resins, molding adhesives, treating textiles and wood.

See A-stage resin; urea-formaldehyde resin.

methyl orange. (*p*-(*p*-dimethylamino phenylazo)-benzene sulfonate of sodium; Helianthine B; orange III; gold orange; tropaeolin D; CI 13025).

CAS: 547-58-0. (CH₃)₂NC₆H₄NNC₆H₄SO₃Na.

Properties: Orange-yellow powder. Soluble in hot water; insoluble in alcohol.

Use: Acid-base indicator; red in acid, yellow-orange in alkali, pH range 3.1–4.4.

See indicator.

methyl orthophosphoric acid. See methylphosphoric acid.

***n*-methyloxazolidine.** See 3-methyl-1,3-oxazolidine.

3-methyl-1,3-oxazolidine.

CAS: 27970-32-7. mf: C₄H₉NO.

Hazard: A poison by ingestion and skin contact. A severe eye irritant.

methyl oxide. See dimethyl ether.

methyl “Oxitol” [Shell]. TM for ethylene glycol monomethyl ether whose ASTM distillation range is 123.5–125.5C.

methyl palmitate. (methyl hexadecanoate).

CH₃(CH₂)₁₄COOCH₃. The methyl ester of palmitic acid.

Properties: Colorless liquid. Mp 29.5C, bp 211.5C (30 mm Hg), 180.5C (10 mm Hg), refr index 1.4310 (45C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of palmitic acid with

methanol or alcoholysis of palm oil plus vacuum distillation.

Grade: 80%, pure (99.8%).

Use: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, animal feeds, medical research.

methylparaben. (methyl-*p*-hydroxybenzoate).

CAS: 99-76-3. $\text{CH}_3\text{OOC}_6\text{H}_4\text{OH}$.

Properties: Colorless crystals or white, crystalline powder; odorless or faint characteristic odor; slight burning taste. Mp 125–128C. Soluble in alcohol, ether; slightly soluble in water, benzene, and carbon tetrachloride.

Grade: USP, FCC.

Hazard: Toxic. Use in foods restricted to 0.1%.

Use: Food additive (preservative), antimicrobial agent.

See "Parabens."

methylparafynol. See 3-methyl-1-pentyn-3-ol.

methyl parathion. (*O,O*-dimethyl-*O-p*-nitrophenylphosphorothioate).

CAS: 298-00-0. $(\text{CH}_3\text{O})_2\text{P}(\text{SO})\text{OC}_6\text{H}_4\text{NO}_2$. The methyl homolog of parathion.

Properties: White, crystalline solid. Mp 35–36C. D 1.358 (20/4C), refr index 1.5515 (35C). Slightly soluble in water; miscible in all proportions with acids and alcohols, esters and ketones. Slightly decomposed by acid solutions; rapidly in dilute alkalis. The commercial product is a tan liquid (xylene solution) with pungent odor, decomposes violently at 248F. It is not classed as a "hard" insecticide, but is relatively biodegradable.

Available forms: Emulsifiable concentrate, wettable powder, dusts, technical (80%), liquid solution, encapsulated.

Hazard: Explosion risk when heated. Toxic by skin absorption, inhalation, and ingestion; cholinesterase inhibitor. Use has been restricted. TLV: TWA 0.2 mg/m³; not classifiable as a human carcinogen.

Use: Insecticide, especially for cotton.

methyl PCT. See *O,O*-dimethyl phosphorochloridithioate.

methyl pelargonate. See methyl nonanoate.

methyl pentadecanoate.

$\text{CH}_3(\text{CH}_2)_{13}\text{COOCH}_3$. The methyl ester of pentadecanoic acid.

Properties: Colorless liquid. D 0.8618 (25/4C), mp 18.5C, bp 199C (30 mm Hg), refractive index 1.4374 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Reagent, 96%, and 99.5%.

Use: Intermediate in organic synthesis, reagent medical research.

methylpentadiene. C_6H_{10} . Numerous isomers are possible. Commercially available mixture contains 2- and 4-methyl-1,3-pentadiene.

Properties: Colorless liquid. D 0.7184 (20/4C), bp 75–77C, flash p –30F (–34.4C). Reactive with halogens, hydrohalogens, sulfur dioxide, and maleic anhydride.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis, alkyd and other polymers.

2-methylpentaldehyde. $\text{C}_3\text{H}_7\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Colorless liquid. D 0.8092, bp 118.3C, fp –100C. Soluble in water 0.42% by wt, flash p 68F (20C) (OC).

Hazard: Flammable, dangerous fire risk. Strong irritant to skin and mucous membranes.

Use: Intermediates for dyes, resins, pharmaceuticals.

2-methylpentamethylenediamine. See "Dytek" [*Du Pont*].

2-methylpentane. (dimethylpropylmethane).

CAS: 107-83-5. $\text{CH}_3(\text{CH}_2)_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Fp –153C, bp 60C, refr index 1.372 (20C), d 0.658 (60/60F), flash p –10F (–23.3C), autoign temp 583F (306C).

Grade: 95%, 99%, research.

Hazard: Flammable, dangerous fire risk, reacts vigorously with oxidizing materials.

Use: Organic synthesis, solvent.

3-methylpentane. (diethylmethylmethane).

CAS: 96-14-0. $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. D 0.6645 (20/4C), bp 64.0C, refr index 1.37662 (20C), flash p approximately 20F (–6.6C). Soluble in alcohol; insoluble in water; slightly soluble in ether.

Grade: Technical (95%), 99%, research.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis, solvent.

2-methyl-1,3-pentanediol.

$\text{C}_2\text{H}_5\text{CH}(\text{OH})\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$.

Properties: Colorless liquid. D 0.9745, bp 220.3C, fp –30C. Freely soluble in water. Combustible.

Use: Solvent, coupling agent.

See hexylene glycol.

2-methyl-2,4-pentanediol. (4-methyl-2,4-

pentanediol). $\text{CH}_3\text{CH}_2\text{OCH}_2\text{COH}(\text{CH}_3)\text{CH}_3$.

Properties: Colorless liquid. D 0.9235 (20/20C), bp 197.1C, viscosity 34 cP (20C), vap press 10.8 mm Hg (95.2C), 334 mm Hg (169.7C), flash p (OC) 201F (93.9C), 7.59 lb/gal (20C). Miscible with water and most organic solvents, including lower aliphatic hydrocarbons. Combustible.

Use: Coupling agent, chemical synthesis.

See hexylene glycol.

4-methyl-2,4-pentanediol. See 2-methyl-2,4-pentanediol.

2-methylpentanoic acid.CAS: 97-61-0. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_3)\text{COOH}$.**Properties:** Water-white liquid. D 0.9242 (20/20C), bp 196.4C, vap press 0.02 mm Hg (20C), fp sets to glass approximately -85C , flash p 225F (107C). Soluble in water 1.3% by wt (20C). Combustible.**Use:** Plasticizers, vinyl stabilizers, metallic salts, alkyd resins.**4-methylpentanoic acid.** $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{COOH}$.**Properties:** Colorless liquid. Bp 197C, d 0.921 (20/4C), bulk d 7.66 lb/gal (20C). Miscible with alcohol, benzene, and acetone; low solubility in water. Combustible.**Use:** Intermediate for plasticizers, pharmaceuticals and perfumes.**2-methyl-1-pentanol.** $\text{C}_3\text{H}_7\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$.**Properties:** Colorless liquid. D 0.8252, bp 148.0C, vap press 1.1 mm Hg (20C), flash p 135F (57.2C) (OC). Solubility in water 0.31% by wt. Combustible.**Hazard:** Moderate fire risk.**Use:** Solvent, intermediate.**4-methyl-2-pentanol.** See methylamyl alcohol.**4-methyl-2-pentanol acetate.** See methylamyl acetate.**4-methyl-2-pentanone.** See methyl isobutyl ketone.**2-methyl-1-pentene.** (1-methyl-1-propylethylene). $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.**Properties:** Colorless liquid. D 0.6820 (20/4C), bp 62.6C, fp -135C , refr index 1.3925 (20C), flash p -15F (26.1C). Soluble in alcohol, acetone, ether, petroleum, coal tar solvents; insoluble in water.**Grade:** 95%, 99%, research.**Hazard:** Flammable, dangerous fire risk.**Use:** Organic synthesis, flavors, perfumes, medicines, dyes, oils, resins.**4-methyl-1-pentene.** $\text{H}_2\text{C}:\text{CHCH}_2\text{CH}(\text{CH}_3)\text{CH}_3$.**Properties:** Colorless liquid. Fp -153C , bp 53.5C, d 0.6640 (20/4C), refr index 1.3826 (20C), flash p -25F (-31.6C).**Grade:** 95%, 99%, research.**Hazard:** Same as for 2-methyl-1-pentene.**Use:** Organic synthesis, monomer for plastics used in automobiles, electronic components, and laboratory ware.**4-methyl-2-pentene.** (1-isopropyl-2-methylene (*cis-trans* mixture)). $\text{CH}_3\text{CH}:\text{CHCH}(\text{CH}_3)_2$.**Properties:** Colorless liquid. D 0.670 (20/4C), bp (mixture) 55C, (*cis*) 56.1C, (*trans*) 58.3C, refr index1.388 (20C), flash p -20F (-28.9C). Soluble in alcohol, acetone, ether, petroleum and coal tar solvents; insoluble in water.**Hazard:** Flammable, dangerous fire risk.**Use:** Organic synthesis.**2-methyl-1-penten-3-one.** See isopropenyl ethyl ketone.**4-methyl-3-penten-2-one.** See mesityl oxide.**3-methyl-1-pentyn-3-ol.** (meparfynol; methylparafynol; methyl pentynol). $\text{HC}\equiv\text{CCOH}(\text{CH}_3)\text{CH}_2\text{CH}_3$ **Properties:** Colorless liquid. Bp 121.4C, fp -30.6C , d 0.8721 (20/20C), refr index 1.4318 (20C), flash p 101F (38.3C) (TOC). Moderately soluble in water; miscible with acetone, benzene, carbon tetrachloride, ethyl acetate. Combustible.**Grade:** High purity 98.5%, technical 95.0% min, pharmaceutical.**Hazard:** Moderate fire risk. Toxic.**Use:** Stabilizer in chlorinated solvents, viscous reducer, electroplating brightener, intermediate in syntheses of hypnotics and isoprenoid chemicals, solvent for polyamide resins, acid inhibitor, prevention of hydrogen embrittlement, medicine (soporific and anesthetic).**methylphenethylamine.** See amphetamine.**methyl phenylacetate.** $\text{C}_6\text{H}_5\text{CH}_2\text{COOCH}_3$.**Properties:** Colorless liquid; honeylike odor. D 1.062–1.066 (25C), refr index 1.506–1.509 (20C), bp 218C. Soluble in five parts of 60% alcohol, in fixed oils; insoluble in water. Combustible.**Grade:** Technical, FCC.**Use:** Perfumery, flavors for tobacco, flavoring.**methylphenylcarbinol.** See α -methylbenzyl alcohol.**methylphenylcarbiny acetate.** See α -methylbenzyl acetate.**methylphenyldichlorosilane.** $\text{CH}_3(\text{C}_6\text{H}_5)_2\text{SiCl}_2$.**Properties:** Colorless liquid. Bp 82C (13 mm Hg), 205C, refr index 1.5199 (25C), d 1.19, flash p 83F (28.3C). Soluble in benzene, ether, methanol.**Derivation:** From chlorobenzene Grignard reagent and methyltrichlorosilane or from benzene and methyldichlorosilane.**Hazard:** Flammable, moderate fire risk, reacts strongly with oxidizing materials. Irritant.**Use:** Manufacture of silicones.**methyl phenyl ether.** See anisole.**2-methylphenyl isocyanate.** See 1-isocyanato-2-methylbenzene.

4-methylphenyl isocyanate. See 1-isocyanato-4-methylbenzene.

3-methylphenylmethyl((2-phenyl-1,3-dioxan-5-yl)methoxy)sulfinyl)carbamate.

CAS: 81862-06-8. mf: $C_{20}H_{23}NO_6S$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

2-methyl-4-phenyl-6h-1,3,5-oxathiazine.

CAS: 58955-85-4. mf: $C_{10}H_{11}NOS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4-(4-methylphenyl)-6h-1,3,5-oxathiazine.

CAS: 58955-82-1. mf: $C_{10}H_{11}NOS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

4-methyl-1-phenyl-2-pentanone. (benzyl

isobutyl ketone). $C_6H_5CH_2C(O)CH_2CH(CH_3)_2$.

Properties: Combustible.

Use: Flavoring.

methyl phenyl phosphate. See methyl diphenyl phosphate.

9-methyl-2-(3-(4-phenyl-1-piperazinylpropyl))-1,2,3,4-tetrahydro- β -carbolin-1-one 2hcl.

CAS: 124824-14-2. mf: $C_{25}H_{30}N_4O \cdot 2ClH$.

Hazard: Moderately toxic by ingestion.

2-methyl-2-phenylpropane. See *tert*-butylbenzene.

3-(4-methylphenyl)-*n*-(4-propylcyclohexyl)-2-propenamide.

CAS: 315706-79-7. mf: $C_{19}H_{27}NO$.

Hazard: A poison by ingestion.

***n*-(2-methylphenyl)-1h-pyrazole-1-acetamide.**

CAS: 302542-40-1. mf: $C_{12}H_{13}N_3O$.

Hazard: Moderately toxic by ingestion.

***n*-(3-methylphenyl)-1h-pyrazole-1-acetamide.**

CAS: 302542-49-0. mf: $C_{12}H_{13}N_3O$.

Hazard: Moderately toxic by ingestion.

***n*-(4-methylphenyl)-1h-pyrazole-1-acetamide.**

CAS: 302542-57-0. mf: $C_{12}H_{13}N_3O$.

Hazard: Moderately toxic by ingestion.

4-methyl-1-phenyl-3-pyrazolidone. See "Phenidone B" [*Charkit*].

3-methyl-1-phenyl-2-pyrazolin-5-one. (3-methyl-1-phenyl-5-pyrazolone; 1-phenyl-3-methyl-5-pyrazolone). $C_6H_5NN:C(CH_3)CH_2CO$.

Properties: White powder or crystals. Bp 287C (205 mm Hg), mp 127C, vap press less than 0.01 mm Hg (20C). Soluble in water; slightly soluble in alcohol or benzene; insoluble in ether.

Derivation: By condensation of phenylhydrazine with ethylacetoacetate.

Hazard: Toxic by ingestion.

Use: Intermediate for dyes and drugs, sensitive reagent for detection of cyanide.

α -(5-methyl-1-phenyl-1h-pyrazol-4-yl)-1-piperidinebutanol.

CAS: 296269-53-9. mf: $C_{19}H_{27}N_3O$.

Hazard: A poison by ingestion.

3-((4-methylphenyl)sulfonyl)-2-propenenitrile. See 3-(*p*-tolylsulfonyl)acrylonitrile.

1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine. See 1,2,3,6-tetrahydro-1-methyl-4-phenylpyridine.

methylphloroglucinol. (2,4,6-trihydroxytoluene). $C_6H_3(OH)_3CH_3$.

Properties: Cream to light tan fine crystals; odorless. Mp 210–214C. Soluble in water, alcohol and ether; insoluble in benzene. Combustible.

Use: Reactive coupling agent, dye and plastic intermediate.

methylphosphonic acid. $CH_3PO(OH)_2$.

Properties: White solid. Mp 103–104C.

Use: Organic synthesis.

methylphosphoric acid. (methyl orthophosphoric acid; methyl acid phosphate). $CH_3H_2PO_4$. **Properties:** Pale-straw-colored liquid. D 1.42 (25C). Can be neutralized with alkalis or amines to give water-soluble salts. Combustible.

Grade: 97% (remainder orthophosphoric acid and methanol).

Use: Textile and paper processing compounds, catalysts in urea-resin formation, polymerizing agent for resins and oils, rust remover, soldering flux, chemical intermediate.

methyl phoxim.

CAS: 14816-16-1. mf: $C_{10}H_{11}N_2O_3PS$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

3'-methylphthalanilic acid. (*N*-*m*-tolylphthalamic acid). $C_{15}H_{13}NO_3$.

Properties: Crystalline solid. Mp 150C. Soluble in alcohol and other polar solvents with decomposition; slightly soluble in water.

Hazard: Toxic. Avoid ingestion.

Use: In agriculture as an antiscission agent for fruits and vegetables.

methyl phthalyl ethyl glycolate.

Properties: Colorless liquid; slight characteristic odor, d 1.217–1.227, flash p 375F (190C). Miscible with most organic solvents; very slightly soluble in water. Combustible.

Use: Plasticizer, solvent.

methyl picrate. See trinitroanisole.

N-methylpiperazine.

CAS: 109-01-3.

Properties: Colorless liquid; aminelike odor. D 0.9038, bp 138.0C, fp –6.4C, hygroscopic, flash p 108F (42.2C). Combustible.

Hazard: Moderate fire risk.

Use: Intermediate for pharmaceuticals, surface agents, synthetic fibers.

2-methylpiperidine. (2-pipecoline).

Properties: Colorless liquid. Bp 118.2C, fp –4.2C, d 0.8401 (20/20C), refr index 1.4457 (20C). Miscible with water at 20C. Combustible.

1-methyl-4-piperidinol. $\text{CH}_3\text{C}_4\text{H}_9\text{NOH}$.

Properties: Colorless to light-amber, oily liquid; aminelike odor. Crystals may be present, or material may be solid, but will melt on slight warming. Refr index 1.4757–1.4777 (25C), congealing temperature 27.5C min. Combustible.

Use: Organic synthesis.

3-(2-methylpiperidino)propyl-3,4-dichlorobenzoate. See piperalin.

methylprednisolone.

CAS: 83-43-2. $\text{C}_{22}\text{H}_{30}\text{O}_5$. A steroid.

Properties: White, crystalline powder; odorless. Mp 240C with decomposition. Sparingly soluble in alcohol; slightly soluble in acetone; insoluble in water.

Grade: NF.

Use: Medicine (hormone).

2-methylpropane. See isobutane.

2-methylpropanenitrile. See isobutyronitrile.

2-methyl-1-propanethiol. (isobutyl mercaptan). $(\text{CH}_3)_2\text{CHCH}_2\text{SH}$.

Properties: Liquid; unpleasant odor. Bp 85–95C d 0.8363 (15.5C), flash p 15F (–9.4C).

Grade: 95%.

Hazard: Flammable, dangerous fire risk.

2-methyl-2-propanethiol. (*tert*-butyl mercaptan). $(\text{CH}_3)_3\text{CSH}$.

Properties: Colorless liquid; strong skunk odor. D

0.79–0.82 (60/60F), distillation range 62–67C, refr index 1.422 (20C), flash p –15F (–26.1C), bulk d 6.71lb/gal.

Hazard: Flammable, dangerous fire risk. Very toxic.

Use: Intermediate, gas odorant for detecting leaks.

2-methylpropanoic acid. See isobutyric acid.

2-methyl-1-propanol. See isobutyl alcohol.

2-methyl-2-propanol. See *tert*-butyl alcohol.

2-methylpropene. See isobutene.

2-methyl-2-propen-1-ol. See methylallyl alcohol.

methyl propionate.

Properties: Colorless liquid. D 0.937 (4C), refr index 1.3769 (20C), boiling range 78.0–79.5C, autoign temp 876F (468C), flash p 28F (–2.2C) (CC), 7.58 lb/gal. Soluble in most organic solvents; somewhat soluble in water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, explosive limits in air 2.5–13%.

Use: Solvent for cellulose nitrate, solvent mixture for cellulose derivative, lacquers, paints, varnishes, coating compositions, flavoring.

1-(1-methylpropoxycarbonyl)-2-(2-hydroxyethyl)piperidine.

Hazard: A reproductive hazard.

Use: Agricultural chemical.

methylpropylbenzene. See cymene.

methyl propyl carbinol. See 2-pentanol.

methyl propyl carbinol urethane. See hexonal.

4-methyl-*n*-(4-propylcyclohexyl)benzamide.

Hazard: A poison by ingestion.

methyl propyl ketone. (ethyl acetone; 2-pentanone; MPK).

Properties: Water-white liquid. The commercial material consists of a mixture of methyl propyl and diethyl ketones in the approximate ratio of 3:1 and contains at least 97% of these ketones, the balance being *sec*-amyl alcohol. D 0.809 (20/20C), fp –77.5C, bp 101.7C, refr index 1.3895 (20C), viscosity 0.473 cP (25C), flash p 45F (7.22C), autoign temp 941F (505C). Soluble in alcohol and ether; slightly soluble in water.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1.6–8.2%. TLV: TWA 200 ppm; STEL 250 ppm.

Use: Solvent, substitute for diethyl ketone, flavoring.

2-methyl-2-*n*-propyl-1,3-propanediol dicarbamate. See meprobamate.

methylprylon. (3,3-diethyl-5-methyl-2,4-piperidinedione).

CAS: 125-64-4. $C_9NH_4(O)_2(C_2H_5)_2(CH_3)$.

Properties: Nearly white, crystalline powder; slight characteristic odor; bitter taste. Melting range 74–77°C. Soluble in water; very soluble in alcohol, chloroform, ether, and benzene.

Grade: NF.

Hazard: Abuse may cause addiction.

Use: Medicine (sedative, hypnotic).

methylpyridine. See picoline.

methyl pyromucate. See methyl-2-furoate.

***N*-methylpyrrole.** $C_4H_4NCH_3$.

Properties: Colorless liquid. Bp 112°C, fp –57°C, d 0.914 (20°C) refr index 1.4898 (17D), flash p 61F (16.1C). Insoluble in water; soluble in alcohol.

Grade: 98% min purity.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

***N*-methylpyrrolidine.**

Properties: Colorless liquid; ammonia-like odor. Refr index 1.4200–1.4230 (25C), bp 80.5C, fp –90C, d 0.805, flash p 7F (–13.9C).

Hazard: Flammable, dangerous fire risk. Irritant to skin and eyes.

***N*-methyl-2-pyrrolidone.**

CAS: 872-50-4.

Properties: Colorless liquid; mild amine odor. Mw 99.1, d 1.027, fp –24C, bp 202C, flash p 204F (95.5C). Miscible with water, various organic solvents, castor oil. Combustible.

Derivation: High-pressure synthesis from acetylene and formaldehyde.

Hazard: Severe skin and eye irritant. Explosive limits 2.2–12.2%

Use: Solvent for resins, acetylene, etc., pigment dispersant, petroleum processing, spinning agent for polyvinyl chloride, microelectronics industry plastic solvent applications, intermediate.

Note: A proprietary adaptation of this solvent to clean-up of vinyl chloride reaction vessels is available under trademark of “M-Pyrol” [GAF].

See “M-Pyrol” [GAF].

methyl 2-pyrrolyl ketone. See 2-acetylpyrrole.

α -methylquinoline. See quinaldine.

γ -methylquinoline. See lepidine.

2-methylquinone. See toluquinone.

6-methyl-2,3-quinoxalinedithiol cyclic carbonate. (6-methyl-2-oxo-1,3-dithio-(4,5-b)quinoxaline). $C_{10}H_8N_2S_2O$.

Properties: Yellow, crystalline powder. Mp 172C. Insoluble in water; slightly soluble in acetone and alcohol; soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Acaricide, insecticide, fungicide.

methyl red. (*p*-dimethylaminoazobenzene-carboxylic acid; CI 13020).

CAS: 493-52-7. $(CH_3)_2NC_6H_4NNC_6H_4COOH$.

Properties: Dark-red powder or violet crystals. Mp 180C. Insoluble in water; soluble in alcohol, ether, glacial acetic acid. Color fades quickly due to reduction.

Use: Acid-base indicator in the range pH 4.2–6.2 (red to yellow).

Note: No longer widely used because of instability.

methylresorcinol. See orcin.

methyl ricinoleate. $C_{19}H_{36}O_3$. The methyl ester of ricinoleic acid.

Properties: Colorless liquid. D 0.9236 (22/4C), fp –4.5C, bp 245C (10 mm Hg), refr index 1.4628. Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of ricinoleic acid or alcoholysis of castor oil, purification by vacuum distillation.

Grade: Technical, purified (99+%).

Use: Plasticizer, lubricant, cutting oil additive, wetting agent.

methylrosaniline chloride. See methyl violet.

methyl salicylate. (gaultheria oil; winter-green oil; betula oil; sweet-birch oil).

CAS: 119-36-8. $C_6H_4OHCOOCH_3$.

Properties: Yellow to red liquid; odor of winter-green. Refr index 1.535–1.538, d 1.180–1.185, fp –8.3C, flash p 214F (101C), autoign temp 850F (454C), bp 222.2C; natural oil optically inactive, synthetic oil, angular rotation not more than –1.5 degrees, soluble in 7 parts of 70% alcohol. Soluble in ether and in glacial acetic acid; sparingly soluble in water. Combustible.

Derivation: By heating methanol and salicylic acid in presence of sulfuric acid or by distillation from leaves of Gaultheria procumbens or bark of Betula lenta.

Method of purification: Rectification.

Grade: Technical, USP, FCC.

Hazard: Toxic by ingestion; use in foods restricted by FDA, lethal dose 30 cc in adults, 10 cc in children.

Use: Flavor in foods, beverages, pharmaceuticals, odorant, perfumery, UV absorber in sunburn lotions.

4-methylsalinomyacin. See narasin.

methyl silicate. (tetramethoxy silane).

CAS: 681-84-5. $(\text{CH}_3\text{O})_4\text{Si}$.

Properties: Colorless needles. Mw 147.18, d 1.0232 at 20C, bp 121C. Soluble in alcohol.

Hazard: TLV: 1 ppm.

Use: Coating inside of TV picture tubes.

methyl silicone. See dimethyl silicone; silicone; siloxane.

methylsilyldynetris(2-ethylhexanoate).

See tris((2-ethylhexanoyl)oxy)methylsilane.

methyl stearate. (methyl octadecanoate).

$\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}_3$. The methyl ester of stearic acid.

Properties: Semisolid. Mp 37.8C, bp 234.5C (30 mm Hg), 204.5C (10 mm Hg), flash p 307F (152C), refr index 1.4328 (50C). Insoluble in water; soluble in ether and alcohol. Combustible. Most technical methyl stearate is 55% stearate and 45% methyl palmitate.

Derivation: Esterification of stearic acid with methanol or alcoholysis of stearin with methanol.

Method of purification: Vacuum fraction distillation.

Grade: Distilled, pressed, technical, pure (99.8+%).

Use: Intermediate for stearic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers.

4- α -methylstyrylphenol. See "Prodox 121" [PMC].

α -methylstyrene.

CAS: 98-83-9. $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)\text{CH}_2$.

Properties: Colorless liquid. Subject to polymerization by heat or catalysts. Bp 165.38C, fp -23.21C, d 0.9062 (25/25C), viscosity 0.940 cP (20C), flash p 129F (53.9C), autoign temp 1065F (573C), refr index 1.5359 (25/25C), insoluble in water. A polymerization inhibitor such as *tert*-butyl catechol is usually present in commercial quantities. Combustible.

Derivation: From benzene and propylene by use of aluminum chloride and hydrochloric acid to yield cumene, which is then dehydrogenated.

Hazard: Moderate fire risk. Explosive limits in air 1.9-6.1%. Avoid inhalation and skin contact. TLV: TWA 50 ppm; STEL 100 ppm.

Use: Polymerization monomer, especially for polyesters.

methyl styryl ketone. See benzylidene acetone.

methylsuccinic acid. See pyrotartaric acid.

methyl sulfate. Legal label name (Rail) for dimethyl sulfate.

methyl sulfide. Legal label name (Rail) for dimethyl sulfide.

3-methylsulfolane. See 3-methyltetrahydrothiophene-1,1-dioxide.

3-methylsulfolene. See 3-methyl-2,5-dihydrothiophene-1,1-dioxide.

methylsulfonic acid. (methanesulfonic acid). $\text{CH}_3\text{SO}_3\text{OH}$.

Properties: Colorless solid. D 1.48, mp 20C, bp 167C (10 mm Hg). Slightly soluble in benzene; almost insoluble in other organic solvents. Attacks iron, copper, and steel.

Derivation: Reaction of methane and sulfur trioxide.

Hazard: Toxic by ingestion, skin irritant, corrosive to tissue.

Use: Polymerization catalyst.

((methylsulfonyl)oxy)tributylstannane.

See tri-*n*-butyltin methanesulfonate.

((methylsulfonyl)oxy)triphenylstannane.

See triphenyltin methanesulfonate.

methyl sulfoxide. See dimethyl sulfoxide.

methylsulfuric acid. (acid methyl sulfate; methyl hydrogen sulfate). $\text{CH}_3\text{OSO}_2\text{OH}$ or CH_3HSO_4 .

Properties: Oily liquid. Bp 188C, d 1.352, fp -27C. Soluble in anhydrous ether; slightly soluble in alcohol and water.

Derivation: Interaction of methanol and chlorosulfonic acid.

Use: Sulfonating agent, specialty solvent.

***N*-methyltaurine.** (sodium-*N*-methyltaurate).

$\text{CH}_3\text{NHCH}_2\text{CH}_2\text{SO}_3\text{Na}$. Available in commercial quantities as an aqueous solution of the sodium salt.

Properties: (solution) Clear, light-colored liquid, approximately 34-36% sodium salt. D 1.21 (25/4C), at fp (-28C average) becomes a suspension of white crystals.

Use: Intermediate for detergents, dyestuffs, pharmaceuticals and other organics.

17-methyltestosterone.

CAS: 58-18-4. $\text{C}_{20}\text{H}_{30}\text{O}_2$. A synthetic androgenic steroid.

Properties: White or creamy-white crystals or crystalline powder; odorless. Stable in air, slightly hygroscopic, affected by light. Mp 163-168C. Soluble

in ethanol; methanol, ether and other organic solvents; insoluble in water.

Derivation: By organic synthesis.

Grade: NF.

Use: Medicine (hormone).

methyl tetracosanoate. See methyl lignocerate.

methyl tetradecanoate. See methyl myristate.

2-methyltetrahydrofuran.

CAS: 96-47-9. C_5H_8O .

Properties: Colorless liquid; etherlike odor. Bp 80.2C, fp -136C, d 0.854 (20/4C), refr index 1.4025 (25C), flash p 12F (-11.1C) (TOC). Soluble in water 15.1 g/100 g water (25C); solubility in water increases with a decrease in temperature. Freely soluble in most organic solvents.

Hazard: Flammable, dangerous fire risk.

Use: Chemical intermediate, reaction solvent.

3-methyltetrahydrothiophene-1,1-dioxide.

(3-methylsulfolane). $CH_3C_4H_7SO_2$.

Properties: Colorless liquid. D 1.194 (20/4C), mp 0C, bp 276C, flash p 325F (162C). Completely soluble in water, acetone, and toluene. Combustible.

Use: Solvent and extractive medium.

methyl-2-thienyl ketone. See 2-acetylthiophene.

m-(methylthio)aniline. $H_2NC_6H_4SCH_3$.

Properties: Pale-yellow oil. D 1.140 (25C), bp 163-165C (16 mm Hg), fp -3.0C. Insoluble in water; soluble in alcohol, benzene, and acetic acid. Combustible.

Hazard: See aniline.

Use: Pharmaceutical intermediate.

6-methyl-2-thio-2h-1,3-benzoxazine-2,4(3h)-dione.

CAS: 23611-64-5. mf: $C_9H_7NO_2S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-(methylthio)-3,5-dimethylphenyl-*n*-methylcarbamate.

[(4-methylthio)-3,5-xylyl methylcarbamate]. $CH_3S(CH_3)_2C_6H_2OOCNHCH_3$.

Properties: Solid. Mp 121C. Insoluble in water; soluble in alcohol and acetone.

Use: Pesticide.

3-methyl-2,5-thiomorpholinedione 2-(*o*)-((methylamino)carbonyloxime).

CAS: 66637-32-9. mf: $C_7H_{11}N_3O_3S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

methylthionine chloride. See methylene blue.

methylthiopropionic cyanohydrin. See 2-hydroxy-4-(methylthio)butanenitrile.

methyltin. See organotin compounds.

methyl-*p*-toluate.

CAS: 99-75-2. $CH_3C_6H_4COOCH_3$.

Properties: White, crystalline solid. Fp 34C, d 1.058 (25/25.6C).

Use: Organic synthesis.

methyl-*p*-toluenesulfonate.

CAS: 80-48-8. $CH_3C_6H_4SO_3CH_3$.

Properties: White, damp crystals. Solidification point 24C; bp 157C (8 mm Hg), decomposes 262C. A vesicant material. Insoluble in water; soluble in alcohol and benzene.

Grade: 97% min.

Hazard: Toxic by ingestion and inhalation, strong irritant to skin and eyes.

Use: Accelerator, methylating agent, catalyst for alkyd resins.

methyl-*p*-tolyl ketone. See methyl acetophenone.

2-((*n*-methyl-*n*-trichloromethanesulfonyl) carbamoyloximino)-1,4-dithiane.

CAS: 55391-23-6. mf: $C_7H_9Cl_3N_2O_2S_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

4-((*n*-methyl-*n*-trichloromethanesulfonyl) carbamoyloximino)-1,3-dithiolane.

CAS: 55391-24-7. mf: $C_6H_7Cl_3N_2O_2S_3$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

methyltrichlorosilane.

CAS: 75-79-6. CH_3SiCl_3 .

Properties: Colorless liquid. Bp 66.4C, d 1.270 (25/25C), refr index 1.4085 (25C), flash p 8F (-13.3C). Readily hydrolyzed by moisture with the liberation of hydrogen chloride.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Hazard: Flammable, dangerous fire risk, may form explosive mixture with air. Strong irritant.

Use: Intermediate for silicones.

methyltrichlorostannane.

CAS: 993-16-8. mf: CH_3Cl_3Sn .

Properties: Crystals from pet ether or C_6H_6 or by sublimation. Mp: 53°.

Hazard: Moderately toxic. Experimental reproductive effects. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

methyl tricosanoate. $CH_3(CH_2)_{21}COOCH_3$. The methyl ester of tricosanoic acid.

Properties: White, waxlike solid. Mp 55-56C. Insol-

uble in water; soluble in alcohol and ether. Combustible.

Grade: Purified 96% and 99.5%.

Use: Intermediate in organic synthesis, biochemical research.

methyl tridecanoate. $\text{CH}_3(\text{CH}_2)_{11}\text{COOCH}_3$.

The methyl ester of tridecanoic acid.

Properties: Colorless liquid. Mp 5.5C, bp 130–132C (4 mm Hg) refr index 1.4327 (25C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of tridecanoic acid with methanol followed by fractional distillation.

Grade: Purified 96% and 99.5%.

Use: Intermediate in organic synthesis, biochemical research, reference standard in gas chromatography.

methyl trimethylmethane. See trimethylol ethane.

methyltris(2-ethylhexyloxycarbonylmethylthio)stannane.

CAS: 57583-34-3. mf: $\text{C}_{31}\text{H}_{60}\text{O}_6\text{S}_3\text{Sn}$.

Hazard: Moderately toxic by ingestion. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg(Sn)/m³ (skin).

β-methylumbelliferone. (7-hydroxy-4-methylcoumarin; BMU). $\text{C}_{10}\text{H}_8\text{O}_3$.

Properties: White to light-tan powder. Mp 186–188C. Soluble in concentrated sulfuric acid; partly soluble in ethanol, isopropanol, 5% aqueous sodium carbonate solution. Very slightly soluble in water. Very dilute aqueous alkaline solutions give a bright blue-white fluorescence in daylight or UV light.

Grade: Technical.

Use: Optical bleach on soaps, starches and laundry products, suntan lotions.

2-methylundecanal. See methylnonylacetaldehyde.

methylundecanoate. $(\text{CH}_3(\text{CH}_2)_9\text{COOCH}_3$.

The methyl ester of undecanoic acid.

Properties: Colorless liquid. Bp 123C (10 mm Hg), refr index 1.4270 (25/4C). Insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Esterification of undecanoic acid with methanol followed by fractional distillation.

Grade: Purified 96%, 99.5%.

Use: Organic intermediate for synthesis, flavoring, biochemical research.

5-methyluracil. See thymine.

n-methylurethanebenzenesulfohydrazine.

CAS: 1879-26-1. mf: $\text{C}_8\text{H}_{11}\text{N}_3\text{O}_4\text{S}$.

Hazard: A poison by ingestion and inhalation.

methylvinylchlorosilane. $(\text{CH}_3)(\text{C}_2\text{H}_5)\text{SiCl}_2$.

Properties: Colorless liquid. Bp 92C, d 1.08 (25C), refr index 1.4270 (25C), flash p 40F (4.4C). Soluble

in benzene and ether. Reacts with methanol and water.

Derivation: From methylchlorosilane and acetylene or vinyl chloride.

Hazard: Flammable, dangerous fire risk. Irritant.

Use: Manufacture of silicones.

methyl vinyl ether. See vinyl methyl ether.

methyl vinyl ketone. Legal label name for vinyl methyl ketone.

methyl vinyl oximino silane.

CAS: 73160-32-4. mf: $\text{C}_{11}\text{H}_{22}\text{N}_2\text{O}_2\text{Si}$.

Hazard: A poison by ingestion and skin contact.

2-methyl-5-vinylpyridine.

$\text{CH}_3\text{C}_5\text{H}_3\text{NCH}=\text{CH}_2$.

Properties: Clear to faintly opalescent liquid. D 0.978–0.982 (20/20C), bp 181C, refr index 1.5400–1.5454 (20C), fp (anhydrous) –14.3C, flash p (TOC) 165F (73.9C). Combustible.

Use: Monomer for resins, oil additive, ore flotation agent, dye acceptor.

methyl violet. (Gentian Violet, USP; hexamethyl-*p*-rosaniline chloride; CI 42555).

CAS: 8004-87-3. $\text{C}_{25}\text{H}_{30}\text{N}_3\text{Cl}$.

Properties: Green powder. Soluble in water and chloroform; partially soluble in alcohol and glycerol.

Use: Medicine (topical antibacterial and antiallergen), acid-base indicator, alcohol denaturant, biological stain, textile dye.

methylviologen dibromide. See paraquat dibromide.

methyl yellow. See dimethylaminoazobenzene.

metiram.

CAS: 12122-67-7. Mixture of (ethylenebis(dithiocarbamate))zinc ammoniates with ethylenebis(dithiocarbamic acid)anhydrosulfides.

Use: Fungicide.

“Met-L-KYL” [Ansul]. TM for a dry chemical that extinguishes fires caused by pyrophoric liquids such as triethylaluminum and adsorbs the spilled metal alkyl to prevent reignition.

“Met-L-X” [Ansul]. TM for a dry chemical based on sodium chloride, approved for use on sodium, potassium, sodium-potassium alloy, and magnesium fires.

metobromuron.

CAS: 3060-89-7. $\text{C}_9\text{H}_{11}\text{BrN}_2\text{O}_2$.

Properties: Colorless crystals. Mp 95C. Soluble in alcohols; slightly soluble in water.

Use: Preemergence herbicide.

metofos.CAS: 67481-15-6. mf: $C_{16}H_{15}Cl_3O_2 \cdot C_{17}H_{14}Cl_3O_4P$.**Hazard:** A poison by ingestion. Moderately toxic by skin contact.**Use:** Agricultural chemical.**metolachlor.** (2-chloro-*N*-(2-ethyl-6-methylphenyl)-*N*-(2-methoxy-1-methylethyl)acetamide).

CAS: 51218-45-2.

Use: A herbicide.**metominostrobin.**CAS: 133408-50-1. mf: $C_{16}H_{16}N_2O_3$.**Hazard:** Moderately toxic by ingestion.**Use:** Agricultural chemical.**metopon hydrochloride.** (6-methyldihydro-morphinone hydrochloride). $C_{18}H_{21}O_3N \cdot HCl$. A morphine derivative.**Properties:** White, odorless, crystalline powder. Very soluble in water; sparingly soluble in alcohol; insoluble in benzene.**Hazard:** Addictive narcotic, prescription only.**Use:** Medicine (analgesic).**metoquinone.** $C_{20}H_{24}N_2O_4$.**Properties:** Colorless crystals. Mp 130C (decomposes). Partially soluble in water; slightly soluble in alcohol and acetone; almost insoluble in benzene.**Use:** Photographic developer.**metribuzin.**CAS: 21087-64-9. $C_8H_{14}N_4OS$.**Properties:** Colorless crystals. Mp 125C. Soluble in alcohols; slightly soluble in water.**Hazard:** Toxic material. TLV: TWA 5 mg/m³; not classifiable as a human carcinogen.**Use:** Herbicide.**MeV.** Abbreviation for million electron-volts.**mevinphos.** (2-carbomethoxy-1-methylvinyl dimethyl phosphate; methyl-3-hydroxy- α -crotonate dimethyl phosphate).

CAS: 7786-34-7.

 $(CH_3O)_2P(O)OC(CH_3)CHCOOCH_3$.**Properties:** Yellow liquid. Bp 99–103C (0.03 mm Hg). Slightly soluble in oils; miscible with water and benzene.**Hazard:** Toxic by ingestion, inhalation, and skin absorption; use may be restricted; cholinesterase inhibitor. TLV: TWA 0.01 ppm; STEL 0.03 ppm.**Use:** Insecticide and acaricide.**mexacarbate.**CAS: 315-18-4. $C_{12}H_{18}N_2O_2$.**Properties:** Colorless crystals. Mp 85C. Soluble in acetone, alcohol, and benzene; insoluble in water.**Hazard:** Toxic by ingestion.**Use:** Insecticide.**mexicain.** Proteolytic enzyme with properties and uses similar to papain.**Meyer reaction.** Preparation of alkylstannonic acids by reacting alkali stannite with an alkyl iodide. When applied to alkali arsenites or plumbites, the reaction yields alkylarsonic and alkylplumbonic acids, respectively.**Meyer-Schuster rearrangement.** Acid catalyzed rearrangement of secondary and tertiary α -acetylenic alcohols to α,β -unsaturated carbonyl compounds: aldehydes when the acetylenic group is terminal, ketones when it is internal.**Meyers aldehyde synthesis.** Synthesis of aldehydes $R-CH_2CHO$ from alkylhalides $R-X$ and 2-lithiomethyl-tetrahydro-3-oxazine.**Meyer synthesis.** Formation of aliphatic nitrites and nitro derivatives by the reaction of aliphatic halides with metal nitrites.**Mg.** Symbol for magnesium.**mg.** Abbreviation for milligram.**MH.** See maleic hydrazide.**“MH-30” [Uniroyal].** TM for a 30% solution of maleic hydrazide.**MHD.** See magnetohydrodynamics.**MIAK.** See methyl isoamyl ketone.**miazine.** See pyrimidine.**MIBC.** Abbreviation for methylisobutyl carbinol. See methylamyl alcohol.**MIBK.** Abbreviation for methyl isobutyl ketone.**mica.**

CAS: 12001-26-2. Any of several silicates of varying chemical composition but with similar physical properties and crystalline structure. All characteristically cleave into thin sheets that are flexible and elastic. Synthetic mica is available. It has electrical and mechanical properties superior to those of natural mica; it is also water-free.

Properties: Soft, translucent solid; colorless to slight red (ruby), brown to greenish yellow (amber). D 2.6–3.2. Mohs hardness 2.8–3.2, refr index 1.56–1.60, dielectric constant 6.5–8.7. Noncombustible. Heat-resistant to 600C.**Derivation:** From muscovite (ruby mica), phlogopite (amber mica), and pegmatite. Synthetic single crystals are “grown” electrothermally.**Occurrence:** U.S., Canada, India, Brazil, Malagasy Republic.

- Available forms:** Block, sheet, powder, single crystals.
- Grade:** Dry-ground, wet-ground.
- Hazard:** (Dust) Irritant by inhalation, may be damaging to lungs. TLV: TWA Respirable Fraction: 3 mg/m³
- Use:** Electrical equipment, vacuum tubes, incandescent lamps, dusting agent, lubricant, windows in high-temperature equipment, filler in exterior paints, cosmetics, glass and ceramic flux, roofing, rubber, mold-release agent, specialty paper for insulation and filtration, wallpaper and wallboard joint cement, oil-well drilling muds.
- “Micarta” [Westinghouse].** TM for a group of laminated plastics composed of paper or fabric made from cellulose, glass, asbestos or synthetic fibers bonded with phenolic or melamine resins and cured at elevated temperature and pressure.
- Use:** Plating barrels, rayon-manufacturing equipment, pickling tanks, electrical and thermal insulation, oil-handling equipment, steel rolling-mill bearings, chemical-handling valve bodies, paper-mill suction box covers and equipment.
- micellar flooding.** See chemical flooding.
- micelle.** An electrically charged colloidal particle, usually organic in nature, composed of aggregates of large molecules, e.g., in soaps and surfactants. The term is also applied to the casein complex in milk.
See colloid chemistry.
- Michaelis-Arbuzov reaction.** Formation of monoalkylphosphonic esters from alkyl halides and trialkyl phosphites, via the intermediate phosphonium salt.
- Michaelis-Menten constant** The substrate concentration at which an enzyme-catalyzed reaction proceeds at one-half its maximum velocity.
- Michaelis-Menten equation.** The equation describing the hyperbolic dependence of the initial reaction velocity, V_0 , on substrate concentration, [S].
- Michaelis-Menten kinetics.** A kinetic pattern observed in enzyme-catalyzed reactions when the initial rate (as a function of substrate concentration) exhibits a hyperbolic shape.
- Michael reaction.** Base catalyzed addition of carbanions to activated unsaturated systems.
- Michel, Hartmut.** (1948–). Awarded Nobel Prize for chemistry in 1988, along with Deisenhofer and Huber, for work that revealed the three-dimensional structure of closely-linked proteins which are essential to photosynthesis. Doctorate awarded in 1977 by University of Wurtzburg, Germany.
- Michler’s hydrol.** See tetramethyldiaminobenzhydrol.
- Michler’s ketone.** See tetramethyldiaminobenzophenone.
- micro-.** Prefix meaning 10⁻⁶ unit (symbol μ), e.g., 1 microgram = 0.000001 g or 1 μ g.
See micron.
- microanalysis.** Analysis of chemicals using miniaturized equipment and microscopic techniques. The sample is in microgram quantities.
See macroanalysis; microchemistry.
- microarray.** Sets of miniaturized chemical reaction areas that may also be used to test DNA fragments, antibodies, or proteins.
- microballoon.** Hollow, finely divided, hole-free, low-density particles of synthetic resins or similar film-forming materials. Glass is one of the materials used.
Use: To form a protecting layer of the tiny spheres over liquid surfaces, such as oils in big tanks, to reduce evaporation; to separate helium from natural gas because of the wide difference in relative rates of diffusion through the spheres; as an extender in plastics to achieve low density.
- microbial genetics.** The study of genes and gene function in bacteria, archaea, and other microorganisms. Often used in research in the fields of bioremediation, alternative energy, and disease prevention.
See model organisms; biotechnology; bioremediation.
- microbody.** Refers to structures less than 1 micron in diameter, delimited by a single membrane and containing a moderately dense matrix in which a crystallike core and other inclusions are sometimes present.
- “Microcel” [World Minerals].** TM for finely divided calcium or magnesium silicate.
Use: For use as a filler in rubber compounding and other purposes.
- “Micro-Chek” [Ferro].** TM for antimicrobials.
- microchemistry.** A branch of analytical chemistry that involves procedures that require handling of very small quantities of materials. Specifically, it refers to carrying out various chemical operations (weighing, purification, quantitative and qualitative analysis) on samples ranging from 0.1 to 10 mg; this often involves use of a microscope, and still more often chromatography.
See microscopy, chemical.

microcrystalline. A form in which a number of high-polymeric substances have been prepared. They include cellulose, chrysotile asbestos, amylose (starch), collagen, nylon, and certain mineral waxes. On the microscopic level, these substances are composed of colloidal microcrystals connected by molecular chains. The process involves breaking up the network of microcrystals (by acid hydrolysis in the case of cellulose) and separating them by mechanical agitation. The size range of the microcrystals is from 2.5 to 500 nanometers (millimicrons). The products form extremely stable gels that have a number of commercial use possibilities. Petroleum-derived waxes of high molecular weight have been available in microcrystalline form for many years. Chlorophyll has a naturally microcrystalline structure.

See cellulose; wax, microcrystalline; "Avicel."

microcrystalline wax. (amorphous or petrolatum wax). A hydrocarbon wax obtained from petroleum that consists of extremely fine crystals. Stickier than paraffin wax and has higher viscosity than paraffin wax when melted.

Properties: Mp 145–190°F.

microCurie. See Curie.

microcystis aeruginosa toxin. See 5-*l*-argininecyanoginosin la.

microencapsulation. Enclosure of a material in hollow spheres or capsules (microspheres) in the micron size range (20–150 μ), they can be made of glass, silica, various high polymers or proteins (gelatin, albumen). The silica type can be incorporated in plastics, elastomers, and metals for weight-saving purposes; they can also be bonded to one another to give extremely thin sheets of silica. Microspheres coated with layers of "Teflon" and beryllium are used to contain the deuterium and tritium used in laser fusion experimentation.

Polymeric or proteinaceous microspheres are used to introduce drugs to specific locations in the body. The coating material acts as a semipermeable membrane, permitting slow release and high concentration of a drug at the desired site. Enzymes, hormones, and other biochemical substances can be temporarily immobilized by this technique.

microfilaments. Thin filaments composed of actin found throughout the cytoplasm of eukaryotic cells. Their function is to give the cell shape and movement.

microfluidics. Study of the behavior of fluids at volumes thousands of times smaller than a common droplet. It is a multidisciplinary field that includes physics, chemistry, engineering, and biotechnology. Microfluidic components form the basis of so-called "lab-on-a-chip" devices that can process microliter

and nanoliter volumes and conduct highly sensitive analytical measurements.

microgram (μ g). One millionth (10^{-6}) gram.

microinjection. A technique for introducing a solution of DNA into a cell using a fine microcapillary pipet.

"Microlith" [Novartis]. TM for organic pigment stir-in dispersions compatible with a broad range of organic solvents and polymers.

micrometer. (μ m). One millionth (10^{-6}) meter, or 1 micron (10,000 Å units).

micron. See micrometer.

micronuclei. Chromosome fragments that are not incorporated into the nucleus at cell division.

micronutrient. See trace element.

microorganism. An organism of microscopic size generally considered to include bacteria, molds (actinomyces), and fungi, but excluding viruses. See bacteria.

microprobe. An instrument for chemical microanalysis of a sample, in which a beam of electrons is focused on an area less than a micrometer in diameter. The characteristic X rays emitted as a result are dispersed and analyzed in a crystal spectrometer to provide a qualitative and quantitative evaluation of chemical composition.

See microanalysis.

microsatellite. A microsatellite is a simple sequence repeat (SSR). It might be a homopolymer ("...TTTTTT..."), a dinucleotide repeat ("...CACACACACACA..."), a trinucleotide repeat ("...AGTAGTAGTAGTAGT..."), etc. Due to polymerase slip (a.k.a. polymerase chatter), during DNA replication there is a slight chance these repeat sequences may become altered; copies of the repeat unit can be created or removed. Consequently, the exact number of repeat units may differ between unrelated individuals. Considering all the known microsatellite markers, no two individuals are identical. This is the basis for forensic DNA identification and for testing of familial relationships (e.g., paternity testing).

microscope. See optical microscope; electron microscope; field-ion microscope; ultramicroscope.

microscopy, chemical. Use of a microscope primarily for study of physical structure and identification of materials. This is especially useful in forensic chemistry and police laboratories. Many types of microscopes are used in industry; most

important are the optical, ultra-, polarizing, stereoscopic, electron, and X-ray microscopes. Organic dyes of various types are used to stain samples for precise identification.

“MicroSelect” [Fluka]. TM for Ultra pure basic reagents for use in biochemistry and the life sciences where relatively large amounts of reagents are required.

“Microsol” [Novartis]. TM for aqueous pigment dispersions for spin-coloring of regenerated cellulose fibers.

microsomes. Membranous vesicles formed by fragmentation of the endoplasmic reticulum (and probably Golgi) of eukaryotic cells. Recovered by differential centrifugation.

microsphere. See microencapsulation.

microtubule organizing center. (MTOC). Bundles of protein tubes which may be found at the base of a eukaryotic flagellum. In animals, they also function in creating the arrays of microtubules that pull the chromosomes apart during mitosis.

microtubules. Type of filament in eukaryotic cells composed of units of the protein tubulin. Among other functions, it is the primary structural component of the eukaryotic flagellum.

microvilli. Thin fingerlike protrusions from the surface of a cell, often used to increase absorptive capacity or to trap food particles. The “collar” of choanoflagellates is actually composed of closely spaced microvilli.

microwave spectroscopy. A type of absorption spectroscopy used in instrumental chemical analysis that involves use of that portion of the electromagnetic spectrum having wavelengths in the range between the far infrared and the radiofrequencies, i.e., between 1 mm and 30 cm. Substances to be analyzed are usually in the gaseous state. Klystron tubes are used as microwave source.

middle oil. A fraction distilled from coal tar. See coal tar.

middlings. The granular part of the interior of the wheat berry obtained in the process of milling. This product, when reduced by grinding to the desired fineness, produces the finest quality of flour.

Midgley, Thomas, Jr. (1889–1944). An American chemist and inventor. One of the most creative and brilliant chemists of his era, Midgley’s early work was in the field of rubber chemistry and technology, especially in the development of synthetic and substitute rubbers that were being introduced in the 1930s. He worked with Kettering at

General Motors and then became vice president of Ethyl Corporation, as well as of the Ohio State University Research Foundation. His innovative genius was responsible for the development of organic lead compounds for antiknock gasoline and later for the discovery of fluorocarbon refrigerants for which he did the basic research. He was recipient of many of chemistry’s highest honors including the Nichols medal, the Perkin medal, and the Priestly medal.

Miescher degradation. Adaptation of the Barbier-Wieland carboxylic acid degradation to permit simultaneous elimination of three carbon atoms, as in degradation of the bile acid side chain to the methyl ketone stage. Conversion of the methyl ester of the bile acid to the tertiary alcohol, followed by dehydration, bromination, dehydrohalogenation, and oxidation of the diene yields the required degraded ketone.

“Miglyol” [Degussa]. TM for fatty acid esters. See “Witepsol.”

Mignonac reaction. Formation of amines by catalytic hydrogenation of aldehydes and ketones in liquid ammonia and absolute ethanol in the presence of a nickel catalyst.

migration. Movement of a substance from one material to another with which it is in intimate contact e.g., from the container into packaged produce. Similarly, a portion of the sulfur in a rubber mixture may migrate into a material to which it is laminated.

migration area. A term used in nuclear technology as a measure of the moderation or slowing down of neutrons. It is one-sixth of the mean square distance a neutron travels before thermal capture.

mike. A term adopted by the American Standards Association for a microinch or 10^{-6} inch.

mil. One-thousandth (0.001) inch.
Use: In reference to surface coatings, metal sheet, films, cable covers, friction tape, etc.

“Milad” [Milliken]. TM for clarifying agents used in polypropylene products.
Use: To prevent haziness and discoloring.

Milas hydroxylation of olefins. Formation of *cis*-glycols by reaction of alkenes with hydrogen peroxide and either a catalytic amount of osmium, vanadium, or chromium oxide or UV light.

mildew preventive. A compound used to prevent the growth of parasitic fungi, usually stain-producing, on such organic materials as textiles, leather, paper, farinaceous products, etc. Compounds used widely include cresols, phenols, benzoic acid, formaldehyde, and organic derivatives or salts of copper, zinc, and mercury.

“**Milestone**” [*Baker Petrolite*]. TM for a multi-component fouling control solution.

milk. A heterogeneous liquid secreted by the mammary gland and composed (for cows' milk) of approximately 87% water, 3.8% emulsified particles of fat and fatty acids, 3% casein, 5% sugar (lactose), serum proteins, calcium, phosphorus, potassium, iron, magnesium, copper, and several vitamins. The fat particles are from 6 to 10 micrometers in diameter, much larger than colloidal size; they are coated with an adsorbed layer of protein (protective colloid), that maintains the emulsion. The casein is closely associated with the calcium, forming micelles of calcium caseinate that are of colloidal dimensions. The white color of milk is largely due to light scattering by these particles, and to some extent by the fat particles, rather than to the presence of a pigment. The casein complex coagulates (1) when high temperature or bacteria convert the lactose to lactic acid, as in souring, or (2) when acid or certain enzymes (rennet) are intentionally added. The serum proteins lactalbumin and lactoglobulin are also colloiddally dispersed. The lactose and mineral salts are in true molecular solution. Thus milk is a complex system exhibiting several levels of dispersion, from the molecular through colloidal and into the microscopic size range. Important processes applied to milk on an industrial scale include pasteurization, homogenization, coagulation, dehydration, and condensation. The milks of animals other than cows show considerable variations in composition, especially fat and protein content.
See colloid chemistry; emulsion; casein.

milk-clotting enzyme from bacillus cereus.
Properties: Derived from *Bacillus cereus* (fam. *Bacillaceae*).
Use: Food additive.

milk-clotting enzyme from endothia parasitica.
Properties: Derived from *Edothia parasitica* (fam. *Diaporthaceae*).
Use: Food additive.

milk-clotting enzyme from mucor miehei.
Properties: Derived from *Mucor miehei* Cooney et Emerson (fam. *Mucoraceae*).
Use: Food additive.

milk-clotting enzyme from mucor pusillus.
Properties: Derived from *Mucor pusillus* Lindt (fam. *Mucoraceae*).
Use: Food additive.

milk of lime. (lime water). Calcium hydroxide suspended in water.

milk of magnesia. (magnesia magma). A white, opaque, more or less viscous suspension of

magnesium hydroxide in water from which varying proportions of water usually separate on standing.
Grade: USP.

Use: Medicine (laxative).

milk sugar. See lactose.

milk thistle extract. See *silybum marianum* (linn.) gaertn., extract.

mill. See ball mill; pebble mill.

“**Millester**” [*Polyurethane Specialties*].

TM for hydroxyl terminated polyesters.

Use: For building blocks for water-based, solvent-based, and 100% active polyurethanes.

milli- Prefix meaning 10^{-3} unit, or 1/1000th part.

milliCurie. See Curie.

milliequivalent. (meq). One-thousandth of the equivalent weight of a substance.

milligram. (mg). One-thousandth gram (10^{-3} gram).

milliliter. (mL). One thousandth liter, the volume occupied by one gram of pure water at 4C and 760 mm Hg pressure. One milliliter (mL) equals 1.000027 cubic centimeters (cc).

millimeter. (mm). One-thousandth meter, about 0.03937 inch.

millimicron. (m μ ; μ m). One-thousandth micron, 10^3 \AA , 1 billionth meter, 1 nanometer.

millirem. One-thousandth rem.
See rem.

Millon's reagent. Solution produced by dissolving mercury in equal weight of nitric acid (d: 1.41), and solution diluted to twice the volume and decanted from the precipitate.
Use: Test for albumin.

“**Milloxane**” [*Polyurethane Specialties*].

TM for thermoplastic polyurethanes.

Use: For coated fabrics such as ski clothing, rainwear, inflatables, tents; adhesives.

Mills-Nixon effect. Selective reactivity of certain substituted aromatic systems suggestive of certain degree of preponderance of one of the tautomeric Kekule forms in the benzenoid nucleus.

“**Milorganite.**” TM for blended fertilizer containing approximately 20% of an activated sludge marketed in dry granular form by the Milwaukee sewage disposal plant. Contains 5–10% moisture, 6.5–7.5% ammonia, 2.5–3.5% available phosphoric

acid, 3–4% total phosphoric acid. Source of vitamin B₁₂.

Milori blue. Any of a number of the varieties of iron blue pigments.
See iron blues.

mineral. A widely used general term referring to the nonliving constituents of the earth's crust that includes naturally occurring elements, compounds, and mixtures that have a definite range of chemical composition and properties. Usually inorganic, but sometimes including fossil fuels (e.g., coal), minerals are the raw materials for a wide variety of elements (chiefly metals) and chemical compounds. Minerals can be and many are synthesized to achieve purity greater than that found in natural products. The term *mineral industry* statistically comprehends the mining and production of metals (ores) fossil fuels, clay, gemstones, cement, glass, rocks, sulfur, sand, etc. Mineralogy is the study and classification of minerals by source, chemical composition, and properties, chiefly physical, such as color, hardness, and crystalline structure. This term was used by early chemists to describe a variety of substances; many of these uses are obsolescent, but a few persist including the following: mineral black: inorganic black pigments mineral blue: varieties of blue pigments mineral dust: industrial dust, nuisance dust mineral green: copper carbonate mineral oil: a liquid petroleum derivative mineral pitch: asphalt mineral red: iron oxide red mineral rubber: blown asphalt mineral spirits: a grade of naphtha mineral water: natural spring water containing sulfur, iron, etc. mineral wax: a wax found in the earth (ozocerite), or derived from petroleum mineral wool: fibers made by blowing air or steam through slag As used by nutritionists the term refers to such components of foods as iron, copper, phosphorus, calcium, iodine, selenium, fluorine, and trace micro-nutrients.

mineral oil. (mineral oil, white; molol; nujol; oil mist, mineral; paraffin oil).
CAS: 8012-95-1.

Properties: Colorless, oily liquid; practically tasteless and odorless. D 0.83–0.86 (light), 0.875–0.905 (heavy), flash p 444°F (OC), ULC: 10–20. Insoluble in water and alcohol Soluble in benzene, chloroform, and ether. A mixture of liquid hydrocarbons from petroleum.

Hazard: TLV: 5 mg/m³; STEL 10 mg/m³. Inhalation of vapor or particulates can cause aspiration pneumonia. Combustible liquid.

Use: As a binder, defoaming agent, fermentation aid, lubricant, coating (protective), and release agent.

minim. In the U.S., a unit of volume equal to approximately 0.06 mL.

Use: Pharmacy.

minium. Pb₃O₄. Natural red oxide of lead.

Occurrence: Found in Colorado, Idaho, Utah, Wisconsin.

See lead oxide, red.

MIPA. Abbreviation for monoisopropanolamine.
See isopropanolamine.

mipafox. See *N,N'*-diisopropyldiamidophosphoryl fluoride.

miracle fruit. (miraculin).
See sweetener, nonnutritive; glycoprotein.

mirbane oil. See nitrobenzene.

mirror-image molecules. See optical isomerism; enantiomer; chiral.

mirror nuclei. A pair of atomic nuclei, each of which would be transformed into the other by changing all its neutrons into protons and vice versa.

misch metal. The primary commercial form of mixed rare-earth metals (95%) prepared by the electrolysis of fused rare earth chloride mixture, d approximately 6.67, mp approximately 648°C. Form: wafflelike plates weighing 40–60 lb packed in oiled paper, immersed in oil, or coated with vinyl paint.

Hazard: Flammable, dangerous fire risk.

Use: Lighter flints, ferrous and nonferrous alloys, cast iron, aluminum, nickel, magnesium and copper alloys, getter in vacuum tubes, magnetic alloys.

miscibility. The ability of a liquid or gas to dissolve uniformly in another liquid or gas. Gases mix with one another in all proportions. This may or may not be true of liquids, whose miscibility properties depend on their chemical nature. Alcohol and water are completely miscible because of their chemical similarity, but some liquids are only partially miscible with others because of their chemical difference, e.g., benzene and water. Many gases are miscible with liquids to a greater or lesser extent, e.g., formaldehyde mixes readily with water; CO₂ is partially miscible with water, and oxygen only very slightly. Liquids that do not mix at all are said to be immiscible, as oil and water. The term *solubility* is often used synonymously with *miscibility* in reference to liquids, but it more properly applies to solids.

“Miscible G-125” [General Graphics].

TM for a complex solvent blend cleaning fluid.

missense mutation. A change in the base sequence of a gene that alters or eliminates a protein.

Mitchell, Peter. D. (1920–1992). A British biochemist who was the recipient of the Nobel Prize for chemistry in 1978 for his work on studies of cellular energy transfer. A graduate of Cambridge and recipient of many awards, he was the Director of Research, Glynn Research Institute.

miticide. A pesticide that kills mites, small animals of the spider class, among them the European red mite and the common red spider which infest fruit trees.

mitochondria. (mitochondrion). Particles of cytoplasm found in most respiring cells. They synthesize most of the cell's adenosine triphosphate and are the chief energy sources of living cells. They are highly plastic, mobile structures that may fragment or fuse together at random. Many enzymes, especially those involved in converting food-derived energy into a form usable by the cell, are located in the mitochondria, and DNA molecules have also been found there. Yeast is a particularly rich source of mitochondria for research purposes. The complex organelle found in most eukaryotes is believed to be descended from free-living bacteria that established a symbiotic relationship with a primitive eukaryote. See double membrane.

mitochondrial DNA. The genetic material found in mitochondria, the organelles that generate energy for the cell. Not inherited in the same fashion as nucleic DNA.

See cell; DNA; genome; nucleus.

mitochondrial matrix. The aqueous portion of a mitochondrion bounded by the inner mitochondrial membrane.

mitomycin C $C_{15}H_{18}N_4O_5$. Antibiotic derived from *Streptomyces*, stated to be effective against tumors.

mitosis. The division of a cell nucleus to produce two new cells, each having the same chemical and genetic constitution as the parent cell. The deoxyribose (nucleic acid) component of the chromosomes is present in duplicate in the original nucleus. The amount of nucleic acid is doubled just before cell division begins; subsequent events (called phases) permit separation of the products of replication to form the new nuclei. Each half-chromosome carries the identical nucleic acids of the original chromosome.

See cell (1).

Mitsunobu reaction. Intermolecular dehydration reaction occurring between alcohols and acidic components on treatment with diethyl azodicarboxylate and triphenyl phosphine under mild neutral conditions. The reaction exhibits stereospecificity and regional and functional selectivity.

mixed acid. (nitrating acid). A mixture of sulfuric and nitric acids used for nitrating, e.g., in the manufacture of explosives, plastics, etc. Consists of 36% nitric acid and 61% sulfuric acid.

Hazard: Spillage may cause fire or liberate dangerous gas. Causes severe burns, irritant by ingestion and inhalation, may cause NO_x poisoning.

mixed-function oxidases. (oxygenases). Enzymes that use O_2 to simultaneously oxidize a substrate and a cosubstrate (commonly NADH or NADPH).

mixing. Effecting a uniform dispersion of liquid, semisolid, or solid ingredients of a mixture by means of mechanical agitation. Low-viscosity liquids and suspensions are mixed with impellers of the turbine or propeller type. The mixing action results both from direct contact of the impeller blades with the liquid and from the turbulence induced by the impeller in the outer portions of the liquid. For this reason the diameter of the impeller need be only from one-fourth to one-half that of the container. For liquids of medium viscosity, revolving paddles of various shapes are used. Thicker mixtures involving volatile solvents are mixed in closed containers (churns) equipped with finlike members mounted on a rotating shaft. For liquids of very high viscosity, helical rotors, sigma blades, and similar devices are necessary. Because turbulence cannot be initiated in such fluids, the blades must fit closely within the walls of the container so as to make contact with every part of the material being mixed. While most industrial mixing of such pasty materials is done batchwise in kneaders, Banbury mixers, etc., continuous mixing of these can also be effectively carried out in horizontal compartments equipped with rotating screws whose pitch and flight are contoured in such a way as to provide both rotary and axial motion. There are a number of ingeniously engineered types of these for mixing plastics, rubber, food products, and similar products. Dry, solid particulates are mixed in rotating cylinders or tumbling barrels. See impeller; agitator; kneading; muller.

mixo-. Prefix indicating mixtures of isomers having the same functional group.

mixture. (mix). A heterogeneous association of substances that cannot be represented by a chemical formula. Its components may or may not be uniformly dispersed and can usually be separated by mechanical means. Liquids that are uniformly dispersed are called solutions. Mixtures may be natural or artificial, as indicated by the following: Natural Artificial air glass petroleum paint milk cement blood perfumes marble plastics wood cermets latex alloys vegetable oils seawater
See compound; blend; solution; mixing.

MKP. Abbreviation for monopotassium phosphate.
See potassium phosphate, monobasic.

mL. Abbreviation for milliliter.

MLA. Abbreviation for mixed lead alkyls.

mm. Abbreviation for millimeter.

MMH. Abbreviation for monomethylhydrazine.

Mn. Symbol for manganese.

Mo. Symbol for molybdenum.

mobile liquid. See mobility.

mobility. The ease with which a liquid moves or flows. Hydrocarbon liquids (nonpolar) that have low viscosity, surface tension, and density respond more readily to an applied force than does water (a polar liquid). For this reason, fires involving hydrocarbon liquids should be extinguished with foam rather than with a direct stream of water.

MOCA. See 4,4'-methylenebis(2-chloroaniline).

modacrylic fiber. A manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of less than 85% but at least 35% by weight of acrylonitrile units, $-\text{CH}_2\text{CH}(\text{CN})-$ (Federal Trade Commission). Other chemicals, such as vinyl chloride, are incorporated as modifiers. Characterized by moderate tenacity, low water absorption, and resistance to combustion; self-extinguishing.

Use: Deep pile and fleece fabrics, industrial filters, carpets, underwear, blends with other fibers.

See acrylonitrile; acrylic fiber.

“Modaflow” [Solutia]. TM for ethyl acrylate.

Available forms: Viscous clear liquid.

Use: It improves flow and leveling in products; eliminates lumpiness.

model. A representation, either abstract or physical, of a system, arrangement, or structure that cannot be perceived objectively. (1) A mathematical model is one in which all or most of the parameters of a complex system such as an ocean are assigned symbolic values that can be utilized to give a theoretical approximation of actuality. Such models are useful in physical chemical analyses. (2) A space-lattice model is a three-dimensional duplication of the shape and structure of a crystal in which the atoms composing the lattice are plastic spheres or balls connected by rods to represent bonds. (3) A molecular model is similar, except that it represents an individual chemical compound rather than a crystal. The spheres are made to scale based on the known diameter of the atoms represented; they are often colored to suggest the nature of the element (black for carbon, white for hydrogen, red for halogens, etc.). In one type, both single and double bonds are plastic rods that join the spheres at appropriate angles; in another the spheres are fused in clusters. The two types are illustrated by the models of isobutane shown; a clustered model of the DNA molecule is shown in the entry on deoxyribonucleic acid. Both

space-lattice and molecular models are useful for classroom demonstration.

modeling. The use of statistical analysis, computer analysis, or model organisms to predict outcomes of research.

model organisms. A laboratory animal or other organism useful for research.

moderator. A substance of low atomic weight, such as beryllium, carbon (graphite), deuterium (in heavy water), or ordinary water, which is capable of reducing the speed of neutrons but that has little tendency toward neutron absorption. The neutrons lose speed when they collide with the atomic nuclei of the moderator. Moderators are used in nuclear reactors, because slow neutrons are most likely to produce fission. A typical graphite-moderated reactor may contain 50 tons of uranium for 472 tons of graphite. Reactors in the U.S. are cooled and moderated with light water.

modification. A chemical reaction in which some or all of the substituent radicals of a high polymer are replaced by other chemical entities, resulting in a marked change in one or more properties of the polymer without destroying its structural identity. Cellulose, e.g., can be modified by substitution of its hydroxyl groups by carboxyl or alkyl radicals along the carbon chain. These reactions are usually not stoichiometric. Their products have many properties foreign to the original cellulose, e.g., water solubility, high viscosity, gel- and film-forming ability. Other polymeric substances that can undergo modification are rubber, starches, polyacrylonitrile, and some other synthetic resins. See cellulose, modified.

modified polyacrylamide resins.

Properties: Produced by copolymerization of acrylamide with not more than 5-mole percent of β -methacryloyloxyethyl trimethylammonium methyl sulfate.

Use: Flocculent; food additive.

modulator. A metabolite that, when bound to the allosteric site of an enzyme, alters its kinetic characteristics; can be homotropic or heterotropic, inhibitor or activator.

modulus of elasticity. (elastic modulus). A coefficient of elasticity representing the ratio of stress to strain as a material is deformed under dynamic load. It is a measure of the softness or stiffness of the material (Young's modulus).

moellon degreas. See degreas.

moexipril hydrochloride.

CAS: 82586-52-5. mf: $C_{27}H_{34}N_2O_4 \cdot ClH$.

Hazard: Moderately toxic by ingestion.

mohair. A natural fiber, similar to wool, obtained from angora goats.

Properties: Tenacity 14 g/denier. Combustible.

Use: Fabrics for outer clothing, draperies, upholstery.

Mohr's salt. See ferrous-ammonium sulfate.

Mohs scale. An empirical scale of the hardness of mineral or mineral-like materials originally consisting of 10 values, ranging from talc, with a rating of 1, to diamond, with a rating of 10—the rating based on the ability of each material to scratch the one directly below it in the series. The number of materials has been expanded from 10 to 15 with the addition of several synthetically produced substances (e.g., silicon carbide) between the original 9 and 10 positions. The scale is named after the German mineralogist, Friedrich Mohs (1773–1839). See hardness (1).

moiety. An indefinite portion of a sample.

Moissan, Henri. (1852–1907). A Native of Paris, Moissan was a professor at the School of Pharmacy from 1886 to 1900 and at the Sorbonne from 1900 to 1907. At the former institution, he first isolated and liquefied fluorine in 1886 by the electrolysis of potassium acid fluoride in anhydrous hydrogen fluoride. His work with fluorine undoubtedly shortened his life as it did that of many other early experimenters in the field of fluorine chemistry. He won great fame by his development of the electric furnace and pioneered its use in the production of calcium carbide, making acetylene production and use commercially feasible in the preparation of pure metals, such as magnesium, chromium, uranium, tungsten etc. and in the production of many new compounds, e.g., silicides, carbides, and refrac-

tories. In 1906, he was awarded the Nobel Prize in chemistry.

“Moisture-Lok” [Advanced Ingredients].

TM for a powder comprised of dextrose, dextrin, and fiber.

Use: Binds moisture to meat products for longer than other ingredients.

molal. A concentration in which the amount of solute is stated in moles and the amount of solvent in kilograms. The unit of molality is moles of solute per kilogram of solvent and is designated by a small *m*, 1 mole of NaCl in 1 kg of solvent is a 1 molal concentration.

Note: Do not confuse with molar.

molar. A concentration in which 1 molecular weight in grams (1 mole) of a substance is dissolved in enough solvent to make one liter of solution. Molarity is indicated by an italic capital *M*. Molar quantities are proportional to the molecular weight of the substances.

molasses. The thick liquid left after sucrose has been removed from the mother liquor in sugar manufacture. Blackstrap molasses is the syrup from which no more sugar can be obtained economically. It contains approximately sucrose 20%, reducing sugars 20%, ash 10%, organic nonsugars 20%, water 20%. Combustible.

Use: Feed, food, raw material for various alcohols, acetone, citric acid, and yeast propagation. Sodium glutamate is made from Steffens molasses, a waste liquor from beet sugar manufacture.

See fermentation.

mold. See fungus.

molding. Forming a plastic or rubber article in a desired shape by application of heat and pressure, either in a negative cavity, usually of metal, or in contact with a contoured metal or phenolic resin surface.

See injection molding; blow molding; compression molding.

molding powder. A mixture in a granular or pelleted form of a plastic base material together with necessary modifying ingredients (filler, plasticizer, pigment, etc.). Such mixtures are normally prepared by resin manufacturers and sold as such to processors ready for use in injection molding or extrusion operations.

molding sand. See foundry sand.

mold preventive. See mildew preventive.

mold release agent. See adherent.

“Moldwiz” [Axel]. TM for external mold release agents that are advanced polymeric formulations.

Use: Permit multiple release from a single application leaving parts clean for secondary process.

mole. The amount of pure substance containing the same number of chemical units as there are atoms in exactly 12 g of carbon-12 (i.e., 6.023×10^{23}). This involves the acceptance of two dictates—the scale of atomic masses and the magnitude of the gram. Both have been established by international agreement. Formerly, the connotation of “mole” was “gram molecular weight.” Current usage tends to apply the term “mole” to an amount containing Avogadro’s number of whatever units are being considered. Thus, it is possible to have a mole of atoms, ions, radicals, electrons, or quanta. This usage makes unnecessary such terms as *gram-atom*, *gram-formula weight*, etc. All stoichiometry essentially is based on the evaluation of the number of moles of substance. The most common involves the measurement of mass. Thus 25.000 g of water will contain $25.000/18.015$ moles of water, 25.000 g of sodium will contain $25.000/22.990$ moles of sodium. The convenient measurements on gases are pressure, volume, and temperature. Use of the ideal gas law constant R allows direct calculation of the number of moles: $n = PV/RT$. T is the absolute temperature, R must be chosen in units appropriate for P , V , and T . The acceptance of Avogadro’s law is inherent in this calculation; so too are approximations of the ideal gas.

See Avogadro’s law.

molecular biology. A subdivision of biology that approaches the subject of life at the molecular level. This applies to phenomena occurring within the cell nucleus, where the chromosomes and genes are located. These structures, which determine heredity, are in turn composed of nucleic acids, which direct the selection and assembly of amino acids in the dividing chromosomes. Much of the essential mechanism of life can be understood by study of specific protein molecules (DNA and RNA) and their determination of the amino acid composition of the genes.

See genetic code; deoxyribonucleic acid; recombinant DNA.

molecular distillation. (high-vacuum distillation). Distillation at low pressures of the order of 0.001 mm Hg. A molecular distillation is distinguished by the fact that the distance from the surface of the liquid being vaporized to the condenser is less than the mean free path (the average distance traveled by a molecule between collisions) of the vapor at the operating pressure and temperature. This distance is usually of the order of magnitude of a few inches. This process is useful in separation of extremely high boiling and heat-sensitive materials such as glycerides and some vitamins.

molecular farming. The development of transgenic animals to produce human proteins for medical use.

molecular formula. See formula, chemical.

molecular gas. A gas composed of a single species, such as oxygen, chlorine, or neon.

molecular genetics. The study of macromolecules important in biological inheritance.

molecular manufacturing. The production of complex structures via nonbiological mechanosynthesis (and subsequent assembly operations).

molecular medicine. The treatment of injury or disease at the molecular level. Examples include the use of DNA-based diagnostic tests or medicine derived from DNA sequence information.

molecular orbital. The wave function of an electron as it moves in the field of all other electrons and the nuclei constituting the molecule. It is usually expressed as a linear combination of atomic orbitals.

molecular rearrangement. See rearrangement.

molecular sandwich. (sandwich molecule). See metallocene.

molecular sieve. A microporous structure composed of either crystalline aluminosilicates, chemically similar to clays and feldspars and belonging to a class of materials known as zeolites, or crystalline aluminophosphates derived from mixtures containing an organic amine or quaternary ammonium salt. Pore sizes range from 5 to 10Å. The outstanding characteristic of these materials is their ability to undergo dehydration with little or no change in crystalline structure. The dehydrated crystals are interlaced with regularly spaced channels of molecular dimensions, that compose almost 50% of the total volume of the crystals.

The empty cavities in activated “molecular sieve” crystals have a strong tendency to recapture the water molecules that have been driven off. This tendency is so strong that if no water is present they will accept any material that can get into the cavity. However, only those molecules that are small enough to pass through the pores of the crystals can enter the cavities and be adsorbed on the interior surface. This sieving or screening action, which makes it possible to separate smaller molecules from larger ones, is the most unusual characteristic of molecular sieves. They are used in many fields of technology; to dry gases and liquids; for selective molecular separations based on size and polar properties; as ion-exchangers; as catalysts; as chemical carriers; in gas chromatography; and in the petrole-

um industry to remove normal paraffins from distillates. See zeolite; gel filtration; pore.

molecular weight. The sum of the atomic weights of the atoms in a molecule. That of methane (CH_4) is 16.043, the atomic weights being carbon = 12.011, hydrogen = 1.008. The chemical formula used in such a calculation must be the true molecular formula of the substance designated. For example, the molecular formula of oxygen is O_2 and its molecular weight is 31.998 (atomic weight of oxygen = 15.999). For ozone the molecular formula is O_3 and the molecular weight is 47.997. The true molecular weight of a gas or vapor is found by measuring the volume of a given weight and then calculating the weight of 22.4 L at 0C and 760 mm Hg. The molecular weight of many complex organic molecules runs as high as a million or more (proteins and high polymers).

See Avogadro; atomic weight; mole.

molecule. A chemical unit composed of one or more atoms. The simplest molecules contain only one atom, for example, helium molecules (1 atom/molecule). Oxygen molecules (O_2) are composed of two atoms, and ozone (O_3) of three. Molecules may contain several different sorts of atoms. Water contains two different kinds, hydrogen and oxygen, and dimethylamine [$(\text{CH}_3)_2\text{NH}$] has three kinds. Molecules of many common gases [hydrogen (H_2), oxygen (O_2), nitrogen (N_2), and chlorine (Cl_2)] consist of two atoms each. The atoms of a molecule are held together by chemical bonds. Molecules vary in size from less than 1 to more than 500 millimicrons and in weight from 4 (He) to 40 million for tobacco mosaic virus.

See macromolecule; bond, chemical; atom.

Molina, Mario, J. (1943–). Mexican who won the Nobel Prize for chemistry along with Paul Crutzen and Frank Sherwood Rowland in 1995 for their work in atmospheric chemistry, particularly concerning the formation and decomposition of ozone. See Crutzen, Paul; Rowland, Frank Sherwood.

molinate sulfoxide.

CAS: 52236-29-0. mf: $\text{C}_9\text{H}_{17}\text{NO}_2\text{S}$.

Hazard: A reproductive hazard.

molten salt. See fused salt.

molybdate chrome orange. See molybdate orange.

molybdate orange. (molybdenum orange; molybdate chrome orange).

CAS: 12656-85-8. A solid solution of lead chromate, lead molybdate and lead sulfate.

Properties: Fine, dark-orange or light-red powder.

Derivation: By adding solutions of sodium chromate, sodium molybdate, and sodium sulfate to a

lead nitrate solution under carefully controlled conditions and filtering off the precipitates.

Hazard: Toxic by ingestion.

Use: Pigment in printing inks, paints, plastics.

molybdenite. (molybdenum glance).

CAS: 1317-33-5. MoS_2 . Natural molybdenum sulfide found in igneous rocks and metallic veins.

Properties: Bluish-gray color, gray-black streak, metallic luster. One perfect cleavage, greasy feel. Mohs hardness 1–1.5, d 4.6–4.8. Similar in appearance to graphite. Soluble in sulfuric and concentrated nitric acids.

Occurrence: Colorado, Utah, New Mexico, Chile.

Use: Principal ore of molybdenum.

molybdenite concentrate. Commercial molybdenite ore after the first processing operations. Contains approximately 90% molybdenum disulfide along with quartz, feldspar, water, and processing oil.

molybdenum.

CAS: 7439-98-7. Mo. Metallic element of atomic number 42, group VIB of the periodic table, aw 95.94, valences = 2, 3, 4, 5, 6. Seven stable isotopes.

Properties: Gray metal or black powder. Does not occur free in nature. D 10.2, mp 2610C, bp 5560C, high strength at very high temperatures, oxidizes rapidly above 1000F in air at sea level, but is stable in upper atmosphere. Insoluble in hydrochloric acid and hydrogen fluoride, ammonia, sodium hydroxide, or dilute sulfuric acid; soluble in hot concentrated sulfuric or nitric acids; insoluble in water. A necessary trace element in plant nutrition.

Derivation: By aluminothermic, hydrogen, or electric furnace reduction of molybdenum trioxide or ammonium molybdate.

Available forms: Ingots, rods, wire, powder, ingots (from powder), high ductility sheets, also as large single crystal.

Grade: Rods and wire 99.9%, powder 99.9%.

Hazard: Flammable in form of dust or powder. TLV: (of molybdenum compounds as Mo) 10 mg/m³ (insoluble); 5 mg/m³ (soluble).

Use: Alloying agent in steels and cast iron; high-temperature alloys, tool steels; pigments for printing inks, paints, and ceramics; catalyst; solid lubricants; missile and aircraft parts; reactor vessels; cermets; die-casting copperbase alloys; special batteries. See ferromolybdenum; heteromolybdates.

molybdenum acetylacetonate. $\text{Mo}(\text{C}_5\text{H}_7\text{O}_2)$.

Properties: Crystalline powder. Slightly soluble in water; resistant to hydrolysis. A chelating nonionizing compound.

Use: Catalyst for polymerization of ethylene and formation of polyurethane foam.

molybdenum aluminide. A cermet that can be flame-sprayed.

molybdenum anhydride. See molybdenum trioxide.

molybdenum boride.

CAS: 12007-97-5. Several borides are known: Mo_2B , mp 2000C; Mo_3B_2 , mp 2070C; MoB (ordinary and β -forms), mp 2180C; Mo_2B_3 , mp 1600C (transforms to MoB_2).

Derivation: By heating molybdenum powder and boron to 1500–1600C in hydrogen.

Use: Brazes to join molybdenum, tungsten, tantalum, and niobium parts, especially electronic components, corrosion and abrasion-resistant parts, cutting tools, refractory cermets.

molybdenum carbonyl. See molybdenum hexacarbonyl.

molybdenum dioxide.

CAS: 18868-43-4. MoO_2 .

Properties: Lead-gray, nonvolatile powder. D approximately 6.4. Insoluble in hydrochloric acid and hydrogen fluoride and alkalis, sparingly soluble in sulfuric acid.

Derivation: Reduction of molybdenum trioxide or molybdates by hydrogen, partial oxidation of metallic molybdenum.

Hazard: Toxic material. TLV: 10 mg(Mo)/m³.

molybdenum diselenide. MoSe_2 . Available as a 40-micron powder.

Use: Solid lubricant.

molybdenum disilicide. MoSi_2 . A cermet.

Properties: Dark-gray, crystalline powder. D 6.31 (20C), mp 1870–2030C. Not affected by air up to 1648C. Not attacked by most inorganic acids including aqua regia, but very soluble in hydrofluoric and nitric acids. Has high stress-rupture strength.

Derivation: By fusion of hydrogen-reduced molybdenum with silicon.

Available forms: Cylinders, lumps, granules, powder, whiskers. May be coated on materials by vapor deposition and by flame-spraying.

Grade: 98%, 99.5%, mesh size 200 and 325.

Hazard: Toxic material. TLV: 5 mg(Mo)/m³.

Use: Electrical resistors, protective coatings at high temperatures, engine parts in space vehicles (molybdenum coated with molybdenum disilicide).

molybdenum disulfide. (molybdic sulfide; molybdenum sulfide).

CAS: 1317-33-5. MoS_2 .

Properties: Black, crystalline powder. D 4.80, mp 1185C Mohs hardness 1, coefficient of friction 0.02–0.06. Soluble in aqua regia, sulfuric acid (concentrated); insoluble in water.

Hazard: Toxic material. TLV: 5 mg(Mo)/m³.

Derivation: Purification of molybdenite, reaction of sulfur or hydrogen sulfide on molybdenus trioxide.

Use: Lubricants in greases, oil dispersions, resin-bonded films, dry powders, etc., especially at ex-

treme pressures and high vacua; hydrogenation catalyst.

See molybdenite.

molybdenum ditelluride. MoTe_2 . Available as a 40-micron powder.

Use: Solid lubricant.

molybdenum glance. See molybdenite.

molybdenum hexacarbonyl. (molybdenum carbonyl). $\text{Mo}(\text{CO})_6$.

Properties: White, shiny crystals. Decomposes at 150C (sublimes), d 1.96, bp approximately 155C, vap press approximately 0.1 mm Hg (20C), approximately 43 mm Hg (101C). Insoluble in water; soluble in ceresin, paraffin oil, benzene, aminoanthraquinone; slightly soluble in ether and other organic solvents.

Derivation: From molybdenum pentachloride by reaction with zinc dust and carbon monoxide in ether at high pressures.

Hazard: Decomposes above 150C to evolve carbon monoxide. TLV: 5 mg(Mo)/m³.

Use: Plating molybdenum, i.e., molybdenum mirrors; intermediate.

molybdenum hexafluoride. MoF_6 .

Properties: White, crystalline solid; hygroscopic. Mp 17.5C, bp 35C, d (liquid) approximately 2.5. Readily hydrolyzed.

Derivation: Action of fluorine on molybdenum powder.

Hazard: Strong irritant. TLV: 5 mg(Mo)/m³.

Use: Separation of molybdenum isotopes.

molybdenum lake. See phosphomolybdic pigment.

molybdenum metaphosphate. $\text{Mo}(\text{PO}_3)_6$.

Properties: Yellow powder. D 3.28 (0C). Insoluble in water and in most acids; slightly soluble in hot aqua regia.

molybdenum naphthalene.

Properties: Dark purple, viscous liquid. Soluble in most hydrocarbons

Hazard: Toxic material. TLV: 5 mg(Mo)/m³.

Use: Catalyst for commercial production of propylene oxide using hydroperoxides.

molybdenum orange. See molybdate orange.

molybdenum (III) oxide. See molybdenum sesquioxide.

molybdenum oxides. See molybdenum sesquioxide, molybdenum dioxide, molybdenum trioxide.

molybdenum pentachloride.CAS: 10241-05-1. MoCl_5 .**Properties:** Green-black solid, dark-red as liquid or vapor. Mp 194C, bp 268C, d 2.9. Hygroscopic, reacting with water and air. Soluble in dry ether, dry alcohol, and other organic solvents.**Derivation:** direct action of chlorine on finely divided molybdenum metal.**Hazard:** Irritant. TLV: 5 mg(Mo)/m³.**Use:** Chlorination catalyst, vapor-deposited molybdenum coatings, component of fire-retardant resins, brazing and soldering flux, intermediate for organometallic compounds, e.g., molybdenum hexacarbonyl.**molybdenum sesquioxide.** (dimolybdenum trioxide; molybdenum (III) oxide). Mo_2O_3 . Known only in the hydrated form, $\text{Mo}(\text{OH})_3$, although commonly assigned the formula Mo_2O_3 . A compound formed by a dry reaction of molybdenum and oxygen which approximates the composition of the sesquioxide is probably a mixture of molybdenum and molybdenum dioxide.**Properties:** Gray-black powder. Slightly soluble in acids; insoluble in alkalis and water.**Derivation:** Zinc reduction of acid solutions of molybdic acids and molybdates, electrolytic deposition from acid solutions of molybdates.**Hazard:** TLV: 10 mg(Mo)/m³.**Use:** Catalyst in organic synthesis, decoration and protection for metal articles, feed additive.**molybdenum silicide.** Alloy of 60% molybdenum, 30% silicon, and 10% iron used as means of introducing molybdenum into steel.**molybdenum sulfide.** See molybdenum disulfide.**molybdenum trioxide.** (molybdenum anhydride; molybdic oxide; molybdic acid hydride). CAS: 1313-27-5. MoO_3 .**Properties:** White powder at room temperature, yellow at elevated temperatures. D 4.69, mp 795C, sublimes starting at 700C, bp 1150C. Sparingly soluble in water; very soluble in excess alkali with formation of molybdates; soluble in concentrated mixture of nitric acid and hydrochloric acid or nitric and sulfuric acids. Two hydrates are known: $\text{MoO}_3 \cdot \text{H}_2\text{O}$ and $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$. Readily combines with acids and bases to form a series of polymeric compounds.**Derivation:** Roasting of molybdenite; by ignition of the metal, sulfides, lower oxides, and molybdic acids.**Method of purification:** Sublimation.**Grade:** Technical, pure, reagent, ACS.**Hazard:** Toxic material. TLV: 5 mg(Mo)/m³.**Use:** Source of molybdenum compounds, agriculture, analytical chemistry, manufacture of metallic molybdenum, introduction of molybdenum in al-

loys, corrosion inhibitor, ceramic glazes, enamels, pigments, catalyst.

molybdic acid. Molybdic acid of commerce is either an ammonium molybdate (molybdic acid 85%) or molybdenum trioxide. The use of the term interchangeably for these compounds has caused confusion. Solutions of molybdic acid are very complex chemically since they show a great tendency to polymerize.**molybdic acid, anhydride.** See molybdenum trioxide.**molybdic oxide.** See molybdenum trioxide.**molybdic sulfide.** See molybdenum disulfide.**molybdophosphates.** See heteromolybdates.**12-molybdophosphoric acid.** See phosphomolybdic acid.**molybdosilicates.** See heteromolybdates.**12-molybdosilicic acid.** (silicomolybdic acid). $\text{H}_4\text{SiMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$ where x is usually 6–8. **Properties:** Yellow, crystalline powder. D 2.82. Soluble in water, ethanol, acetone; insoluble in benzene and cyclohexane; decomposes in strongly basic solutions; thermally stable.**Grade:** Reagent.**Hazard:** Strong oxidizing agent in aqueous solution. TLV: 5 mg(Mo)/m³.**Use:** Catalysts; reagents; photography; precipitants and ion exchangers in atomic energy; additives in plating processes; imparting water resistance to plastics, adhesives, and cement.

See heteromolybdates.

MON. Abbreviation for Motor Octane Number.**monacetin.** See acetin.**“Monacide” [ICI].** TM for a series of insecticides containing 5% DDVP.**“Monafax 1214” [ICI].** TM for deceth-4 phosphate.**Properties:** Hypochloride stable surfactant.**Grade:** 100% active (free acid) liquid.**Hazard:** Neutralize with caustic before contacting hypochloride.**Use:** Wetting agent, surface-tension reduction, detergent.**“Monamate LNT-40” [ICI].** TM for ammonium lauryl sulfosuccinate.**Hazard:** Extremely mild to skin and eyes.**Use:** High-foaming anionic surfactant for use in nonirritating shampoos, soaps, and bubble bath.

“Monamids” [ICI]. TM for a group of dialkylolamides that includes various grades of coconut fatty acid monoethanolamide, coconut fatty acid monopropanolamide, lauric acid monoethanolamide, lauric acid monoisopropanolamide, and stearic acid monoethanolamide.

“Monamines” [ICI]. TM for a group of dialkylolamides used as detergent, detergent additives, foam boosters, wetters, emulsifiers, dispersing agents, thickeners, and conditioners.

“Monastrip” [ICI]. TM for a solvent stripper for uncured and cured epoxy, polyester, and silicone rubber casting and encapsulating compounds.

“Monateric CAB” [ICI]. TM for cocamidopropyl betaine.

Properties: Low color, low pH.

Grade: Liquid.

Use: High-foaming surfactant for viscosity control and detergent action in cosmetic and industrial cleansers.

“Monaterics” [ICI]. TM for a special group of substituted imidazolines classified as amphoteric surfactants. Excellent wetting, emulsifying, penetrating, and spreading properties in systems requiring broad pH ranges.

monatomic. See diatomic.

“Monawets” [ICI]. TM for a group of surfactants of di-octyl, di-hexyl, di-isobutyl, and di-tridecyl sulfosuccinates known for their wetting, spreading, penetrating and emulsifying power.

monazite. A natural phosphate of the rare-earth metals, principally the cerium and lanthanide metals, usually with some thorium. Yttrium, calcium, iron, and silica are frequently present. Monazite sand is the crude natural material and is usually purified from other minerals before entering commerce.

Properties: Yellowish to reddish-brown color, vitreous to resinous luster, white streak. Mohs hardness 5–5.5, d 4.9–5.3.

Occurrence: North Carolina, South Carolina, Idaho, Colorado, Montana, Florida, Brazil, India, Australia, Canada.

Use: Source of thorium, cerium, and other rare-earth metals and compounds.

“Monazolines” [ICI]. TM for a series of cationic imidazolines useful as emulsifiers, antistatic agents, water displacers, and corrosion inhibitors in agricultural sprays, acid and solvent cleaners, cosmetics, and water-oil systems.

Mond process. Mixed ores, obtained from roasting crude ores, are heated from 50 to 80C in a stream of producer gas. Oxides other than nickel are

reduced to the metallic state, whereas nickel forms nickel carbonyl [Ni(CO)₄], which passes off as a vapor. The vapor is subsequently resolved into carbon monoxide and free nickel.

“Mondur” [Bayer]. TM for a series of isocyanates.

Use: Surface coatings; adhesives; chemical intermediate; hydrophobic agent to increase water repellency of textiles, leather, and paper products.

“Monel” [Inco]. TM for a series of corrosion-resistant alloys of nickel and copper.

“Monex” [Uniroyal]. TM for tetramethylthiuram monosulfide.

monhydrin. See propadrine hydrochloride.

mono-. Prefix denoting one, e.g., monochloroacetic acid.

See chloroacetic acid.

monoacetoxyscirpenol. See (3- α)-12,13-epoxytrichothec-9-ene-3,4,15-triol 15.

mono-*o*-acetylsolanoside.

CAS: 4420-65-9. mf: C₃₂H₄₈O₉.

Hazard: A poison.

Source: Natural product.

monoammonium glycyrrhizinate. See ammoniated glycyrrhizin.

monoanhydrosorbitol. See sorbitan.

monoazo dye. See azo dye.

monobasic. Descriptive of acids having one displaceable hydrogen atom per molecule. Acids having two, three, or more displaceable hydrogen atoms are called dibasic, tribasic, and polybasic, respectively.

See acid.

“Monobed” [Rohm & Haas]. TM for intimate mixture of “Amberlite” cation and anion exchange resins.

Use: Complete removal of ionizable impurities from water and other solutions in a one-step treatment.

monocalcium phosphate. See calcium phosphate, monobasic.

monochloroacetic acid. Legal label name (Rail) for solid chloroacetic acid.

monochloroacetone. Legal label name (Rail) for chloroacetone.

monochlorobenzene. See chlorobenzene.

monochlorodifluoromethane. Legal label name (Rail) for chlorodifluoromethane.

monochloroethane. See ethyl chloride.

monochloromethane. See methyl chloride.

monochloropentafluoroethane. Legal label name (Rail) for chloropentafluoroethane.

monochlorophenol. See chlorophenol.

1-monochloropinacoline.

CAS: 13547-70-1. mf: $C_6H_{11}ClO$.

Hazard: A poison by ingestion. Low toxicity by inhalation.

monochlorotetrafluoroethane. Legal label name (Rail) for chlorotetrafluoroethane.

monochlorotriazinyl dye. A fiber-reactive dye for cellulose fibers. See dye, fiber-reactive.

monochlorotrifluoromethane. Legal label name (Rail) for chlorotrifluoromethane.

“Monochrome” [BASF]. (USA). TM for a series of mordant dyestuffs. Characterized by good fastness properties.

Use: Dyeing of wool.

monoclonal antibodies. Substances that can locate and bind to cancer cells wherever they are in the body. They can be used alone, or they can be used to deliver drugs, toxins, or radioactive material directly to the tumor cells.

monocrotalic acid.

CAS: 26543-09-9. mf: $C_8H_{12}O_5$.

Hazard: Moderately toxic.

Source: Natural product.

monocrotophos. See “Azodrin”[Shell].

mono- and diglycerides.

Properties: Yellow liquids to ivory-colored plastics to hard solids; bland odor and taste. Sol in alc, ethyl acetate, chloroform, other chlorinated hydrocarbons; insol in water.

Use: Food additive.

mono and diglycerides, sodium

sulfoacetate derivatives. See sodium sulfacetate derivatives of mono and diglycerides.

mono-, di-, and tripotassium citrate.

Use: Food additive.

mono-, di-, and trisodium citrate.

Use: Curing accelerator; food additive; stabilizer.

mono-, di-, and tristearyl citrate.

Use: Food additive.

monoethanolamine. See ethanolamine.

monoethylamine. Legal label name (Rail) for ethylamine.

monoethyl butylphosphonate anhydride with diethyl phosphate.

CAS: 63886-51-1. mf: $C_{10}H_{24}O_6P_2$.

Hazard: A poison.

monofilament. A single, continuous strand of glass or synthetic fiber as extruded from a spinnerette.

See filament.

monogenic disorder. A disorder caused by mutation of a single gene.

See mutation; polygenic disorder.

monogenic inheritance. See monogenic disorder.

monoglyceride. A glycerol ester of fatty acids in which only one acid group is attached to the glycerol group. A typical formula is $RCOOCH_2CH_2OCH_2OH$. Small amounts of monoglycerides occur naturally.

Derivation: Produced synthetically by the alcoholysis of fats with glycerol, yielding a mixture of mono-, di-, and triglycerides that is predominantly monoglycerides.

Use: Emulsifiers, cosmetics, lubricants.

See glycerol monostearate; glycerol monolaurate.

monoglyceride citrate.

Properties: Soft, white-colored, lard-like, waxy solid; bland odor and taste. Sol in fat solvents, alc; insol in water.

Use: Food additive.

monoglyme. See ethylene glycol dimethyl ether.

monohydric alcohol. An alcohol in which a hydroxyl group (—OH) has replaced one of the hydrogen atoms of a hydrocarbon, for example: C_2H_5H C_2H_5OH

ethane	ethanol
RH	ROH
alkane	alkyl alcohol

There are a number of classifications analogous to those of hydrocarbons: (1) paraffinic or simple alcohols, whose formula may be represented as C_nH_{2n+1} ; (2) olefinic or fatty alcohols that contain one or more double bonds; (3) alicyclic alcohols, closed-ring structures that may or may not contain a double bond, e.g., cyclohexanol; (4) aromatic alcohols in which the hydroxyl group is attached to a benzene

nucleus as in phenol; (5) heterocyclic alcohols, based on the pentagonal furan ring; and (6) polycyclic alcohols of high molecular weight, known collectively as sterols. Any of these types that contain 12 or more carbon atoms are semisolid to solid and have a waxlike consistency; the others are colorless liquids. Monohydric alcohols are also classified as primary, secondary, or tertiary on the basis of the number of alkyl (methyl) groups substituted for the hydrogen atoms on the central or methanol carbon atom.

See primary.

monoisopropyl citrate.

Use: Food additive.

monolayer. A single layer of oriented lipid molecules or cells.

monomer. (momer). A molecule or compound, usually containing carbon and of relatively low molecular weight and simple structure, that is capable of conversion to polymers, synthetic resins, or elastomers by combination with itself or other similar molecules or compounds. Thus, styrene is the monomer from which polystyrene resins are produced and vinyl chloride is the monomer of polyvinyl chloride. Other common monomers are methyl methacrylate, adipic acid, and hexamethylenediamine.

monomethylamine. Legal label name (Rail) for methylamine.

monomethylarsinic acid. See methylarsenic acid.

monomethylolformaldehyde. See glycolic aldehyde.

monomolecular film. See film.

monophyletic. Term applied to a group of organisms which includes the most recent common ancestor of all of its members and all of the descendants of that most recent common ancestor. A monophyletic group is called a clade.

“Monoplex” [Hall]. TM for monomeric liquid plasticizers for polyvinyl chloride and other high polymers. Primarily esters but also some epoxides that impart heat and light stability.

Use: Plasticizers, stabilizers, process aids.

monopropellant. A propellant that combines fuel and oxidizer in one compound or mixture. Gunpowder is an example of a solid monopropellant. Liquid monopropellants, for rockets, include: methyl nitrate, nitromethane, a mixture of hydrocarbons with tetranitromethane, a mixture of methyl nitrate and methanol.

See rocket fuel.

mono-*n*-octyltin trichloride. See octyltrichlorostannane.

monoprotic acid. An acid which has only one proton to lose to a base, HCL, HSO₄.

monosaccharide. Any of several simple sugars having the formula C₆H₁₂O₆; the best-known are glucose, fructose, and galactose. Monosaccharides combine to form more-complex sugars known as oligo- and polysaccharides.

monosodium acid methanearsonate.

monosodium glutamate. See sodium glutamate.

monosodium phosphate derivatives of mono- and diglycerides. See mono- and diglycerides, monosodium phosphate derivatives.

monosomy. Possessing only one copy of a particular chromosome instead of the normal two copies. See cell; chromosome; gene expression, trisomy.

monostearin. See glycerol monostearate.

monostearyl citrate. See “Morflex MSC” [Reilly].

monotonic function. Function that steadily increases or decreases with *x*.

monotrichloro-tetra(monopotassium dichloro)-penta-*s*-triazinetriene.

CAS: 64474-06-2. mf: C₃HCl₂N₃O₃•
1/3C₃Cl₃N₃O₃•K

Hazard: Moderately toxic by ingestion. Low toxicity by skin contact.

monoxchlor. Trichloroethane analog of DDT; less toxic to warm-blooded animals than DDT.

Monsell’s salt. Basic ferric sulfate.

montan wax. (lignite wax).

Properties: White, hard-earth wax; crude product is dark brown. Mp 80–90C. Soluble in carbon tetrachloride, benzene, and chloroform; insoluble in water. Combustible.

Derivation: By countercurrent extraction of lignite. American and German lignite are usual sources.

Method of purification: Distillation with superheated steam.

Grade: Crude, refined.

Use: Substitute for carnauba and beeswax, shoe and furniture polishes, phonograph records, roofing paints, rendering paints waterproof, adhesive pastes, electric insulating compositions, paper-sizing compositions, carbon papers, wire coating, sun-crack preventive in rubber products.

montmorillonite. $\text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$ (approximately). A type of clay. One of the major components of bentonite and fuller's earth.

monuron. (3-(*p*-chlorophenyl)-1,1-dimethylurea; CMU).

CAS: 150-68-5. $\text{C}_6\text{H}_4\text{NHCON}(\text{CH}_3)_2$. A plant growth regulator.

Properties: White, crystalline solid; odorless. Mp 175C. Very low solubility in water and hydrocarbon solvents; slightly soluble in oils; partially soluble in alcohols; stable toward oxidation and moisture.

Use: Herbicide, sugarcane-flowering suppressant.

Moore, Stanford. (1913–1982). An American biochemist who won the Nobel Prize for chemistry in 1972, with Anfinsen and Stein, for enzyme studies. He was involved with the analysis of the action of the complex enzyme deoxyribonuclease. His Ph.D. was granted from the University of Wisconsin.

“Mor-Ad” [Morton]. TM for a series of adhesives consisting of solvent-free-one component urethane, cross-linked water-borne epoxy, and polypropylene bonding adhesives.

Use: Bonding structural panel components such as metal, wood, and plastics to themselves or to polystyrene foam and untreated polypropylene.

morantel tartrate.

CAS: 26155-31-7. mf: $\text{C}_{12}\text{H}_{16}\text{N}_2\text{S} \cdot \text{C}_4\text{H}_6\text{O}_6$.

Use: Drug (veterinary); food additive.

morbid map. A diagram showing the chromosomal location of genes associated with disease.

mordant. A substance capable of binding a dye to a textile fiber. The mordant forms an insoluble lake in the fiber, the color depending on the metal of the mordant. The most important mordants are trivalent chromium complexes, metallic hydroxides, tannic acid, etc. Mordants are used with acid dyes, basic dyes, direct dyes, and sulfur dyes. Premetallized dyes contain chromium in the dye molecule. A mordant dye is a dye requiring use of a mordant to be effective.

See dye, fiber-reactive.

“Mordantine.” TM for liquid antimony lactate containing 11% available antimony oxide. Recommended as a replacement for technical tartar emetic.

mordanting assistant. A chemical such as lactic, oxalic, and sulfuric acids, tartrates, etc.

Use: In conjunction with mordants to bring about a gradual decomposition of the latter and to assist in producing a uniform deposition of the actual mordant on and within textile materials.

mordant rouge. See aluminum diacetate.

“Morestan” [Bayer]. TM for 6-methyl-2,3-quinoxalinedithiol cyclic carbonate.

“Morflex” [Reilly]. TM for specialty plasticizers (including phthalates, adipates, azelates, sebacates, trimellitates, triacetin, and polymeric) for vinyl compounds.

“Morflex 150” [Reilly]. (dicyclohexyl phthalate).

CAS: 84-61-7. TM for adhesives and nitrocellulose lacquers.

“Morflex 190” [Reilly]. (*n*-butyl phthalyl-*n*-butyl glycolate).

CAS: 85-70-1. TM for a plasticizer.

Use: Vinyl.

“Morflex 530” [Reilly]. (tridiisodecyl trimellitate).

CAS: 36631-30-8. TM for a plasticizer.

Use: Vinyl.

“Morflex 560” [Reilly]. (tri-*n*-hexyl trimellitate). TM for a plasticizer.

Use: Vinyl.

“Morflex 1129” [Reilly]. (dimethyl isophthalate).

CAS: 1459-93-4. TM for chemical intermediate.

“Morflex MSC” [Reilly]. (monostearyl citrate). TM for chelating agent, surface lubricant.

“Morflex P-51A” [Reilly]. TM for an acetylated polymeric of mw 2000 with good solvent resistance.

morin. (2',3,4,5,7-pentahydroxyflavone).

CAS: 480-16-0. $\text{C}_{15}\text{H}_{10}\text{O}_7 \cdot 2\text{H}_2\text{O}$. One of the two coloring principles of yellow brazilwood.

Properties: Colorless needles. Mp 285C (decomposes). Soluble in alcohol, alkaline solutions; slightly soluble in boiling water. Combustible.

Use: Mordant dye, spot-test reagent for metal salts, luminescence indicator.

See brasilin.

“Morlex” [Dow]. TM for corrosion inhibitors.

Use: Steam boilers and steam-eating systems, for example, Corrosion Inhibitor A. A mixture of 91% morpholine in water.

“Morosodren” [Morton]. TM for a fungicide concentration containing methylmercury dicyandiamide (2.2%).

Hazard: Toxic by ingestion.

morphine.

CAS: 57-27-2. $\text{C}_{17}\text{H}_{19}\text{NO}_3 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline alkaloid. Bp 254C

(decomposes), d 1.31. Slightly soluble in water, alcohol, and ether.

Derivation: From opium by extraction and crystallization. Opium contains approximately 10% morphine.

Hazard: Narcotic, habit-forming drug, sale restricted by law in the U.S.

Use: Analgesic (in form of acetate, hydrochloride, tartrate, and other soluble salts).

p-morphine. See thebaine.

morpholine. (tetrahydro-1,4-oxazine).

CAS: 110-91-8.

$\text{OCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$ or $\text{C}_4\text{H}_8\text{ONH}$.

Properties: Colorless, hygroscopic liquid; amine-like odor. Bp 128.9C, fp -4.9C, d 1.002 (20/20C), bulk d 8.34 lb/gal (20C), vap press 6.6 mm Hg (20C), viscosity 2.23 cP (20C), flash p (100F) (37.7C OC), autoign temp 590F (310C). Soluble in water and organic solvents.

Derivation: Dehydration of diethanolamine.

Grade: Technical, 98%.

Hazard: Flammable, moderate fire risk. Toxic by ingestion and inhalation, irritant to skin, absorbed by skin. TLV: TWA 20 ppm; Not Classifiable as a Human.

Use: Rubber accelerator, solvent, additive to boiler water, waxes and polishes, optical brightener for detergents, corrosion inhibitor, preservation of book paper, organic intermediate (catalyst, antioxidants, pharmaceuticals, bactericides, etc.).

morpholine borane. $\text{C}_4\text{H}_8\text{ONH}\cdot\text{BH}_3$.

Properties: White, needle-shaped, crystalline compound. Mp 93C. Soluble in hot water and alcohol; insoluble in carbon tetrachloride.

Use: Reducing agent for aldehydes and ketones. Useful in acid media where sodium borohydride is ineffective because of its instability in acid.

morpholine ethanol. (*N*-hydroxyethylmorpholine). $\text{C}_6\text{H}_{10}\text{ONCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. D 1.0724, bp 225.5C, flash p 210F (98.9C). Miscible with water. Combustible.

9-(morpholinoamino)acridine.

CAS: 28846-41-5. mf: $\text{C}_{17}\text{H}_{17}\text{N}_3\text{O}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

9-(morpholinoamino)acridine mono(methyl sulfate).

CAS: 28846-42-6. mf: $\text{C}_{17}\text{H}_{17}\text{N}_3\text{O}\cdot\text{CH}_3\text{O}_4\text{S}$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

2-(morpholiniothio)benzothiazole. (*N*-oxy-diethylene-2-benzothiazolesulfenamamide).

$\text{C}_{11}\text{H}_{12}\text{N}_2\text{OS}_2$.

Properties: Buff to brown flakes; sweet odor. Mp 80C min, d 1.34 (25C). Insoluble in water; soluble in benzene, acetone, methanol.

Use: Delayed-action vulcanization accelerator.

morphology. A term borrowed from the biological sciences by physical chemists to denote the shape, structure, or form of such substances as high polymers, crystals, reinforcing agents, and the like, e.g., the morphology of carbon black in rubber.

morphothion. (generic for *O,O*-dimethyl-*S*-(morpholinocarbonylmethyl)phosphorodithioate).

$(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{C}(\text{O})\text{NCH}_2\text{CH}_2\text{OCH}_2\text{CH}_3$.

Properties: Colorless solid. Mp 65C. Soluble in acetone, dioxane, and acetonitrile.

Hazard: Cholinesterase inhibitor, use may be restricted.

Use: Insecticide.

Morse equation. An equation according to which the potential energy of a diatomic molecule in a given electronic state is given by a Morse potential.

mortar. (1) A type of adhesive or bonding agent that may be either inorganic or organic, soft, and workable when fresh but sets to a hard, infusible solid on standing, either by hydraulic action or by chemical cross-linking. The chief ingredients of inorganic mortars are cement, lime, silica, sulfur, and sodium or potassium silicate. Organic mortars are based on various synthetic resins (epoxy, phenolic, polyester, and furan). All types are resistant to acids. Some (potassium silicate) are useful up to 1600F. Others are used for bonding acid-proof brick, tile, etc.; for masonry construction; and for lining chemical reaction equipment.

See sealant; adhesive; cement. (2) A ceramic receptacle used by pharmacists for preparing mixtures of medicinals and for hand-pulverizing soft solids.

mortar, metallic. A mixture of powdered metal and other ingredients that have been mixed with water. Lead, tungsten, and depleted uranium have been used as the metal component. These mortars resist weathering, mild acids and alkalis, intense radiation, and extreme temperature variation.

Use: Space technology.

"Mortrim" [Morton]. TM for a series of one and two-component solvent-based and water-based polyurethane adhesives.

Use: Manufacture of automotive headliners, door panels, and instrument panels.

morzid. (generic for bis(1-aziridiny)-morpho-
linophosphine sulfide).

Use: Insect chemosterilant.

mosapride.

CAS: 112885-41-3. mf: $\text{C}_{21}\text{H}_{25}\text{ClFN}_3\text{O}_3$,

Hazard: A poison by ingestion.

Moseley curve. See Moseley diagram.

Moseley diagram. (Mosely curve). A graph showing the relationship between atomic numbers of a series of elements and the wavelengths of their corresponding spectral lines.

Moseley, Henry. (1887–1915). A British chemist who studied under Rutherford and brilliantly developed the application of X-ray spectra to the study of atomic structure; his discoveries resulted in a more accurate positioning of elements in the periodic table by closer determination of atomic numbers. Tragically for the development of science, Moseley was killed in action at Gallipoli in 1915.

Moseley's law. The square root of the frequency of a given line of an element in the X-ray spectrum is directly proportional to the atomic number of the element.

Mossbauer effect. A nuclear phenomenon discovered in 1957. Defined as the elastic (recoil-free) emission of a γ -particle by the nucleus of a radioactive isotope and the subsequent absorption (resonance scattering) of the particle by another atomic nucleus. Occurs in crystalline solids and glasses but not in liquids. Examples of γ -emitting isotopes are: iron-57, nickel-61, zinc-67, tin-119. The Mossbauer effect is used to obtain information on isomer shift, on vibrational properties and atomic motions in a solid, and on location of atoms within a complex molecule.

mossy zinc. Zinc powder formed by pouring molten zinc into water.

mother. (1) A mold of bacterial complex containing enzymes that promote fermentation, as in manufacture of vinegar from cider or of cultured dairy products from milk. (2) A substance secreted by epithelial cells of the oyster. (3) A mother liquor is a concentrated solution from which the product is obtained by evaporation and/or crystallization, e.g., in sugar manufacture.
See nacre.

motile. Able to move oneself about, capable of self-locomotion.

Motor Octane Number. (MON).

See octane number.

mountain blue. (copper blue).

Derivation: The mineral azurite in ground form.

Use: Paint pigment.

mouse model. See model organisms.

6-MP. Abbreviation for 6-mercaptopurine.

MPA. Abbreviation for multipurpose additive.

3-MPA. Abbreviation for 3-methoxypropylamine.

MPC black. Abbreviation for medium processing channel black.

See carbon black.

MPK. Abbreviation for methyl propyl ketone.

MPP+. See cyperquat.

“MPS-500” [Occidental]. TM for a stabilized chlorinated ester of a fatty acid. A viscous, light-yellow liquid recommended as a low-cost plasticizer for polyvinyl-chloride formulations.

“M-Pyrol” [International Specialty]. TM for an aprotic solvent, *N*-methyl-2-pyrrolidone. Claimed to be an effective cleaner of vinyl chloride reaction equipment.

See *N*-methyl-2-pyrrolidone

MRI. A procedure using a magnet linked to a computer to create pictures of areas inside the body. Also called magnetic resonance imaging.

mRNA. (Messenger RNA). An RNA which contains sequences coding for a protein. The term mRNA is used only for a mature transcript with poly(A) tail and with all introns removed, rather than the primary transcript in the nucleus. As such, an mRNA will have a 5' untranslated region, a coding region, a 3' untranslated region, and (almost always) a poly(A) tail. Typically about 2% of the total cellular RNA is mRNA.

“MS” [Grace]. TM for microspherical silica alumina.

Use: Cracking catalyst.

MSG. Abbreviation for monosodium glutamate. See sodium glutamate.

MSP. Abbreviation for monosodium phosphate. See sodium phosphate, monobasic.

Mt. Symbol for meitnerium.

MTBE. See methyl *t*-butyl ether.

MT black. Abbreviation for medium thermal black.

MTD. Abbreviation for *m*-tolylenediamine.
See toluene-2,4-diamine.

MTOC. See microtubule organizing center.

mucic acid. (saccharolactic acid; galactaric acid; tetrahydroxyadipic acid).

Properties: White, crystalline powder. Mp approximately 210C (decomposes). Soluble in water; insoluble in alcohol. Combustible.

Derivation: Oxidation of lactose or similar carbohydrates with nitric acid.

Use: Substitute for tartaric acid, sequesterant for metal ions (calcium, iron), retards hardening of concrete intermediate for synthesis of heterocyclic compounds (pyrroles).

mucilage. A plant product obtained from seeds, roots, or other parts of plants by extraction with either hot or cold water. Mucilages give slippery or gelatinous solutions, e.g., those from guar bean, linseed, locust bean, and related leguminous plant seeds. Generally plant mucilates are insoluble in alcohol, but some are partly soluble in water and partly soluble in alcohol. From various types of saltwater algae the so-called seaweed mucilages, such as agar, algin, and carrageenin (sometimes referred to as *algal polysaccharides*) may be obtained by extraction with hot water. Mucilages are closely related to gums, and the distinction between them is not always clear.

See adhesives; gum, natural.

mucopolysaccharide. A polysaccharide composed of alternate units of uronic acids and amino sugars (in which a hydroxyl group is replaced with an amino group, which in turn may be *N*-substituted by other groups). The mucopolysaccharides act as structural support for connective tissue and mucous membranes of animal organisms.

mucronatine. See *trans*-retrorsine.

mud, drilling. See drilling fluid.

muffle furnace. A furnace or kiln in which the materials being heated are kept out of direct contact with the heat source, the combustion being effected by heat reflected from the walls of the furnace. See Mannheim furnace; reverberatory furnace.

muller. A device for uniform mixing of dry and wetted solids by a combined rubbing and smearing action analogous to that of a mortar and pestle. It consists of a stationary circular pan within which two heavy wheel-like members, together with scrapers (plows), revolve. The mulling wheels have flat, wide surfaces (outer rims) that ride on the material and effect the mixing action. Because the inner edges of the wheels travel less distance than the outer edges, a smearing effect is provided across the

surface of the wheels. The plows continually rake the material into the path of the wheels as the unit revolves. Continuous mulling is obtained with two such machines arranged in tandem, space being provided for constant recirculation of the material between them. Mullers are used for fine dispersion and blending of a wide range of products that are dense enough to support the wheels and fluid enough to provide traction, (e.g., putty, explosives, and heavy pastes).

“Mullfrax” [Carborundum]. TM for refractory products made from mullite produced in electric furnaces.

Use: Construction materials for furnaces and kilns.

Mulliken, Robert S. (1896–1986). An American chemist, physicist, and educator who won the Nobel Prize for chemistry in 1961. He did research on isotope separation and on spectroscopy of electrons in molecule formation. After M.I.T. granted his Ph.D., he did postgraduate work before working in industry, government, and academia.

Mullis, Kary Banks. (1944–). An American who won the Nobel Prize for chemistry in 1993 for the invention of the polymerase chain reaction (PCR). In PCR two short oligonucleotides are synthesized so that they are bound correctly to opposite strands of the DNA segment it is wished to replicate. At the points of contact an added enzyme (DNA polymerase) can start to read off the genetic code and link code words through which two new double strands of DNA are formed. The sample is then heated, which makes the strands separate so that they can be read off again. The procedure is then repeated time after time, doubling at each step the number of copies of the desired DNA segment. Through such repetitive cycles it is possible to obtain millions of copies of the desired DNA segment within a few hours.

See Smith, Michael.

mullite. $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$. A stable form of aluminum silicate formed by heating other aluminum silicates (such as cyanite, sillimanite, and andalusite) to high temperatures; also found in nature.

Properties: Colorless crystals. D 3.15, mp 1810C. Insoluble in water.

Use: Refractories, glass.
See aluminum silicate.

multicellular. Any organism which is composed of many cells is termed multicellular.

multienzyme system. A group of related enzymes participating in a given metabolic pathway and often channeling substrates from one to another.

multifactorial. A characteristic influenced in its expression by many factors, both genetic and envi-

ronmental.

See polygenic disorder.

multigenic disorder. See polygenic disorder.

multiple-effect evaporator. A series of evaporator bodies so connected that the vapor from one is the heating medium of the next.

multiple proportions law. See chemical laws (3).

multiplexing. A laboratory approach that performs multiple sets of reactions in parallel (simultaneously), greatly increasing speed and throughput.

“Multisorb” A.R. [Mallinckrodt]. TM for a grade of manganese dioxide used as a solid absorbent for SO₂ and NO₂ in analytical chemistry.

“Multiwax” [Crompton & Knowles]. TM for refined microcrystalline wax obtained from crude petroleum. Composed primarily of alkylated naphthenes and isoparaffins, with small amounts of normal paraffins.

“Multranil 176” [Bayer]. TM for a polymer that in the solid form is similar in appearance to SBR. A base resin of a two-component system that when mixed with the proper curing agents, forms a versatile adhesive.

“Multrathane” [Bayer]. TM for a series of compounds used mainly in formulations for solid urethane elastomers. Some are also used in the formulations of spandex fibers, urethane coatings, and adhesives.

municipal waste. See sewage sludge.

Muntz metal. An alloy containing approximately 60% copper and 40% zinc; a low percentage of lead is sometimes added for free-cutting. It is classified as a brass and used primarily for condenser tube plates and other electrical applications. It is formed by hot-working and is not amenable to cold-working.

See brass.

murexide. C₈H₈N₆O₆.

Properties: Dark-red crystals. Partially soluble in hot water; insoluble in alcohol.

Use: Indicator.

muriatic acid. Obsolete name for hydrochloric acid. The related term, *muriate*, indicating presence of chlorine in an inorganic compound, is also obsolete.

murine. Organism in the genus *Mus*. A rat or mouse.

murotox.

CAS: 116397-83-2.

mf: C₁₅H₁₆O•C₄H₁₀O₃•B₄Na₂O₇•10H₂O.

Hazard: Low toxicity by ingestion, inhalation, and skin contact.

Use: Agricultural chemical.

murvesco. See fenson.

muscone. See musk.

muscovite. (white mica; potassium mica; isinglass). KAl₂(AlSi₃O₁₀)(OH)₂. A natural hydrous potassium aluminum silicate of the mica group.

musk.

CAS: 300-54-9.

Properties: An unctuous, brownish, semiliquid when fresh; dried, in grains or lumps with color resembling dried blood. Strong characteristic odor. The odor-bearing constituent is muscone, C₃C₁₅H₂₇O, a 15-carbon ring with ketone oxygen.

Derivation: (Natural) Secretion from preputial follicles of the musk deer. Synthetic: (1) Ketones and lactones with 15- or 16-carbon rings, structurally resembling the odoriferous principles of natural musk, civet, and musky-type plants. Among these are ambrettolide, civetone, muscone, exaltolide. (2) Nitrated compounds, usually nitrated *tert*-butyl-toluenes or xylenes or related compounds. The three most commonly used in perfumery are musk ambrette, musk ketone, and musk xylene.

Use: Cosmetics and perfumery (fixative), fragrances, mothproofing agent.

musk tonalid. See ethanone, 1-(5,6,7,8-tetrahydro-3,5,5,6,8,8-hexamethyl-2-naphthalenyl)-.

mustard gas. Legal label name (Air) for dichlorodiethyl sulfide.

mustard oil. Any of several organic compounds having the formula R-N=C=S, in which R is an alkyl or aryl radical and -NCS an isothiocyanate group. Its best-known member is allyl isothiocyanate, the characteristic ingredient of mustard oils. See nitrogen mustard.

Hazard: Irritant to mucous membranes.

mustard oil, artificial. See allyl isothiocyanate.

mutagen. See mutagenic agent.

mutagenic agent. (1) Any of a number of chemical compounds able to induce mutations in DNA and in living cells. The alkyl mustards, as well as dimethyl sulfate, diethyl sulfate, and ethylmethane sulfonate, comprise a group of so-called alkylating agents, reacting with the nitrogen atoms of guanine, a constituent of both RNA and DNA. This reaction affects the guanine molecule in such a way

as to ultimately induce a mutation in DNA by depurination. Nitrous oxide can deaminate both guanine and cytosine. If DNA having transforming activity is exposed to such deamination conditions, it is slowly deactivated. Nitrous oxide also produces mutants in whole cells, whole bacteriophage, some viruses, and DNA having transforming ability. (2) Ionizing radiation.

mutagenicity. The capacity of a chemical or physical agent to cause permanent genetic alterations.

See somatic cell genetic mutation.

mutarotation. The change in specific rotation of a sugar, as equilibrium between its alpha- and beta-anomeric and open chain forms occurs.

mutases. Enzymes that catalyze the transposition of functional groups.

mutation. Any heritable change in DNA sequence.

See polymorphism.

mutuality of phases. The rule that if two phases, with respect to a reaction, are in equilibrium with a third phase at a certain temperature, then they are in equilibrium with respect to each other at that temperature.

MVE. Abbreviation for methyl vinyl ether.

See vinyl methyl ether.

mw. Abbreviation for molecular weight.

“MX” [Carborundum]. TM for fiber-bonded abrasives.

Properties: High tensile strength and resistance to impact and heat shock, unusually resilient.

Use: Finishing and polishing flutes of taps, drill end mills, reamers, etc.; removing burrs from milling and drilling operations; breaking edges of cast aluminum parts, etc.; cleaning cast iron molds; removing flash from molded plastics.

MXDA. See *m*-xylene- α,α' -diamine.

myclobutanil.

CAS: 88671-89-0. mf: C₁₅H₁₇ClN₄.

Hazard: Moderately toxic by ingestion, inhalation, and skin contact.

Use: Food additive; fungicide.

“Mycoban” [Pfizer]. TM for sodium and calcium propionates. These salts inhibit the growth of many fungi and of some microorganisms, particularly *Bacillus mesentericus*, for commercially significant periods of time.

Use: Inhibit mold and rope in bakery products.

“Mycostatin” [Bristol-Myers]. TM for nystatin.

mycotoxin. A highly toxic principle produced by molds or fungi. One type, the aflatoxins, is produced by the *Aspergillus flavus* fungus; another is a member of the tricothecene group produced by the fusarium fungus. This has been identified in samples of the so-called “yellow rain” in Southeast Asia, where it is said to have been the cause of many deaths among war refugees. Its presence there is subject to some conjecture, since the fusarium fungus cannot germinate in the humid environment of that area. There is substantial evidence (blood tests, autopsies, and contaminated gas masks) that the former U.S.S.R. have used such lethal agents in Afghanistan also.

myelin. A unique, sheathlike structure that encloses major nerve trunks, somewhat like insulation around a wire. It is composed of approximately 80% lipid, the balance being made up of proteins, polysaccharides, salts, and water. The lipid fraction is composed of sphingolipids and glycerophosphates, which in turn contain long-chain fatty acids. It has a low concentration of polyunsaturated lipids and high concentration of long-chain sphingolipids. Its composition is essentially constant in different species of animals and also between adults and infants. The breakdown of the lipid structure of myelin is a characteristic of multiple sclerosis.

“Mylar” [Du Pont]. TM for a polyester film. Seven available types used for electrical, industrial, and packaging purposes.

Available forms: Roll and sheet.

Mylone. A fungicide.

See “Crag” [Dow].

myofibril. A unit of thick and thin filaments of muscle fibers.

myoglobin. A protein-iron-porphyrin molecule similar to hemoglobin. The chief difference is that myoglobin complexes one heme group per molecule, whereas hemoglobin complexes four heme groups.

See heme.

myo-inositol. See inositol.

myokinase. An enzyme found in muscle and other tissues that catalyzes the reaction 2ADP \leftrightarrow ATP + AMP.

myosin. A protein, of molecular weight above 500,000, that is an essential component of muscular tissue and strongly affects its contractile properties.

myrac aldehyde. See isohexenyl cyclohexenyl carboxaldehyde.

myrcene. (7-methyl-3-methylene-1,6-octadiene). $C_{10}H_{16}$. A triply unsaturated aliphatic hydrocarbon found in oil of bay, verbena, hops, and others.

Properties: Yellow, oily liquid; pleasant odor. Bp 167C, d (80% myrcene) 0.806 (15.5/15.5C), refr index (81% myrcene) 1.471 (20C). Insoluble in water; soluble in alcohol, chloroform, ether, glacial acetic acid. Combustible.

Use: Preparation of perfume chemicals, flavoring.

myrcia oil. (bay oil; bayleaf oil). A yellow essential oil, slightly levorotatory.

Use: Bay rum, fragrances, and flavors.

myricyl alcohol. See 1-triacontanol and 1-hentriacontanol.

myricyl palmitate. $C_{30}H_{61} \bullet C_{16}H_{31}O_2$ (approximately). A wax ester found in beeswax.

myristic acid. (tetradecanoic acid).

CAS: 544-63-8. $CH_3(CH_2)_{12}COOH$.

Properties: Oily, white, crystalline solid. D 0.8739 (80C), bp 326.2C, 204.3C (20 mm Hg), mp 54.4C, refr index 1.4310 (60C). Soluble in alcohol and ether, soluble in water. Combustible.

Derivation: Fractional distillation of coconut acid and other vegetable oils, occurs in sperm oil.

Grade: Technical, 99.8%, FCC.

Use: Soaps, cosmetics, synthesis of esters for flavors and perfumes, component of food-grade additives.

myristin. (glyceryl trimyristate).

$C_3H_5(OOCC_{13}H_{27})_3$. A triglyceride occurring, usually to a small extent, in natural fatty oils.

myristoleic acid. (*cis*-tetradec-9-enoic acid).

$CH_3(CH_2)_3CH:CH(CH_2)_7COOH$.

Properties: Colorless liquid. Mp -4C. Found in fat of some seeds and in fish oil.

myristoyl peroxide. $(C_{13}H_{27}CO)_2O_2$.

Properties: Soft granules, 90% peroxide.

Hazard: Oxidizing materials, dangerous fire and explosion risk.

Use: Catalyst for vinyl type monomers.

myristyl alcohol. (1-tetradecanol).

CAS: 112-72-1. $C_{14}H_{29}OH$.

Properties: White solid. D 0.8355 (20/20C), bp 264.1C (20 mm Hg) 171.5C, mp 38C, flash p 285F (140.5C), bulk d 7.0 lb/gal (20C). Insoluble in water; soluble in ether; partially soluble in ethanol. Combustible.

Grade: Technical.

Use: Organic synthesis, plasticizers, antifoam agent, intermediate, perfume fixative for soaps and cosmetics, wetting agents and detergents, ointments and suppositories, shampoos, toothpaste cold creams, specialty cleaning preparations.

myristyl chloride. See tetradecyl chloride.

myristyldimethylamine. $CH_3(CH_2)_{13}N(CH_3)_2$.

A liquid cationic detergent; acid stable.

Use: Corrosion inhibitor.

myristyldimethylbenzylammonium chloride.

$C_{14}H_{29}(CH_3)_2C_6H_5CH_2NCl$. A quaternary ammonium compound. Free-flowing powder.

Use: Surfactant and detergent.

myristyl lactate. See "Ceraphyl."

myristyl mercaptan. See tetradecyl thiol.

myrrh. Gum resin obtained from various species of *Balsamodendron* and *Cammiphora*.

Use: Perfumery, incense, and toiletries.

"Mytab" [Hexcel].

CAS: 1119-97-7. TM for myristyltrimethylammonium bromide.

Use: Emulsifier; antibacterial.

See myristyltrimethylammonium bromide.

myxin. (6-methoxy-1-phenazolin-5,10-dioxide).

CAS: 13925-12-7. $C_{13}H_{10}N_2O_4$.

Properties: Reddish, acicular crystals. Mp 120C. Evolves heat near 150C and can decompose with explosive violence at this temperature, soluble in acetone.

Use: Bacteriostat and antifungal agent, antibiotic.

N

N. (1) Symbol for nitrogen. The names of certain compounds (such as *N,N*-dibutyl urea) contain this symbol as an indication that the group or groups appearing next in the name (i.e., the butyl groups in the example cited) are joined to the nitrogen atoms in the molecule. The molecular formula is N_2 . (2) Mathematical symbol for Avogadro's number. (3) Abbreviation for normal solution.

See normal (2).

n. Symbol for refractive index: $n_{20/D}$ is refractive index under standard conditions of temperature and wavelength (sodium D line).

n-. Abbreviation for normal.
See normal (1).

Na. Symbol for sodium.

"NA-22" [Du Pont].

TM for 2-mercaptoimidazoline ($CH_2CH_2NC(SH)NH$).

Properties: A white powder. D 1.42, mp above 195C.

Use: To accelerate vulcanization of neoprene.

nabam. (disodium ethylenedisithiocarbamate).
CAS: 142-59-6. $NaSSCNHCH_2CH_2NHCSSNa$.

Properties: Colorless crystals when pure. Easily soluble in water.

Derivation: (a) Addition of carbon disulfide to an alcoholic solution of ethylenediamine followed by neutralization with sodium hydroxide, or (b) by reaction of ethylenediamine with carbon disulfide in aqueous sodium hydroxide.

Grade: 19% aqueous solution.

Hazard: Irritant to skin and mucous membranes, narcotic in high concentrations, use may be restricted.

Use: Plant fungicide, starting material for derivatives that are also pesticides.

NAC. Abbreviation for National Agricultural Chemicals Association.

nacre. (mother of pearl). A form of calcium carbonate secreted by the epithelial cells in the mantle of the oyster. The crystals are bonded by concholin ($C_{32}H_{98}N_2O_{11}$); the layers built up by excretion form pearls.

nacreous pigment. A pigment, containing guanine crystals obtained from fish scales or skin, that produces a pearly luster. May be applied as surface coatings, as in simulated pearls, or incorporated into plastics. The pigment particle is generally a very

thin platelet of high index of refraction. The crystals are readily oriented into parallel layers because of their shape. Being transparent, each crystal reflects only part of the incident light reaching it and transmits the remainder to the crystal below. The nacreous effect is obtained from the simultaneous reflection of light from the many parallel microscopic layers.

NAD. See nicotinamide adenine dinucleotide phosphate.

NADP. See nicotinamide adenine dinucleotide phosphate.

nafidimide.

CAS: 69408-81-7. mf: $C_{16}H_{17}N_3O_2$.

Hazard: A poison.

"Naflon" [Du Pont]. TM for a perfluorosulfonic acid membrane.

Use: Manufacture of chlorine and caustic soda. It is a chemically stable ion-exchange resin.

naja mossambica mossambica α -neurotoxin i.

CAS: 115722-23-1. mf: $C_{48}H_{70}N_{10}O_7$.

Hazard: A poison.

Source: Natural product.

NaK. (sodium-potassium alloy).

Properties: Soft, silvery solid or liquid. (1) 78% potassium, 22% sodium: mp $-11C$, bp $784C$, d 0.847 (100C); (2) 56% potassium, 44% sodium: mp $19C$, bp $825C$, d 0.886 (100C). Must be kept away from air and moisture. The liquid forms come under the class name potassium (or sodium) metallic liquid alloy.

Hazard: Ignites in air; explodes in the presence of moisture, oxygen, halogens, acids. Store under kerosene. Use dry salt or soda ash to extinguish, *not* water or foam.

Use: Heat-exchange fluid, electric conductor, organic synthesis and catalysis.

"Nalan" [Du Pont]. TM for durable water repellents used in the textile industry.

"Nalclean" [Nalco]. TM for cleaning composition.

Use: Removing water and process-formed deposits from industrial equipment.

"Nalclear" [Nalco]. TM for flocculating chemicals.

Use: Treating wastewater.

“**Nalco**” [*Nalco*]. TM for a broad class of chemicals, organic or otherwise, employed in the treatment of water and hydrocarbons; paper-making chemicals; cleaning compounds; combustion aids; weed and brush controls; lubricating and antilubricating compositions; apparatuses; pumps, and mechanisms for proportioning chemicals.

“**Nalcoag**” [*Nalco*]. TM for a colloidal silica available in particle sizes from 4 to 100 m μ .
Use: Reinforcing agent, antiblock agent, and dispersing agent.

“**Nalcolyte**” 671 [*Nalco*]. TM for a synthetic high polymer used for clarifying industrial plant water and municipal water supplies. A coagulant behaving as a polyelectrolyte. Effective at concentrations of less than 1 ppm; also used in still lower concentrations as a filter aid.
Use: Treating water and wastewater.

naled. (1,2-dibromo-2,2-dichloroethyl dimethyl phosphate).
 CAS: 300-76-5. (CH₃O)₂P(O)OC(Br)HCB(Cl)₂.
Properties: Pure compound is a solid. Mp 26C. Technical compound is a moderately volatile liquid. Bp 110C (0.5 mm Hg). Insoluble in water; slightly soluble in aliphatic solvents; very soluble in aromatic solvents; hydrolyzes in water.
Hazard: Cholinesterase inhibitor; use may be restricted. Toxic by skin absorption. TLV: 3 mg/m³; not classifiable as a human carcinogen.
Use: Insecticide, acaricide.

“**Nalgene**” [*Nalge*]. TM for plastic laboratory ware for industry, research, and education. Made of polypropylene, polyethylene, “Teflon,” FEP, polyallomer, and polycarbonate.

“**Nalflote**” [*Nalco*]. TM for flotation reagent.
Use: Handling, processing, and manufacturing of coal.

nalidixic acid. (USAN; 1-ethyl-7-methyl-1,8-naphthyridin-4-one-3-carboxylic acid).
 CAS: 389-08-2. C₁₂H₁₂N₂O₃. An antibacterial compound used in medicine.

“**Nalkat**” [*Nalco*]. TM for cationic polymers.
Use: Manufacture of pulp and paper.

“**Nalmet**” [*Nalco*]. TM for services in the wastewater-treatment chemical industry.
Use: Metals recovery and reclamation.

nalorphine. (*N*-allylnormorphine).
 CAS: 62-67-9. C₁₉H₂₁NO₃. The allyl (-CH₂-CH=CH₂) derivative of morphine. It is able to “antagonize” or neutralize most of the effects of narcotic drugs (morphine, codeine) but not those of other types of depressants.
Use: Biochemical research tool for studying the

mechanism of narcotic action; also as an antidote for acute morphine poisoning.
See narcotic.

“**Nalprep**” [*Nalco*]. TM for corrosion inhibitor.
Use: To protect cooling-water systems.

NaMBT. See sodium MBT.

nameplate. The officially rated capacity of a chemical plant, as opposed to effective or actual maximum; the latter is usually 85–95% of nameplate.

name reaction. A chemical reaction, usually organic, that is commonly identified by the name of its discoverer(s), for example, Friedel-Crafts, Fischer-Tropsch, Claisen, Clemmensen, Willegerodt, Diels-Alder, etc. Many have important industrial applications.

nano-. Prefix meaning 10⁻⁹ unit (symbol n); 1 ng = 1 nanogram = 0.000000001 gram; 1 nanometer = 1 millimicron.

nanoarray. An ultra-sensitive, ultra-miniaturized array for biomolecular analysis.

nanobalance. A nanoscale balance for determining mass; small enough to weigh viruses and other sub-micron scale particles.

nanobeads. (nanodots; nanocrystals; quantum beads). Polymer beads with diameters from 0.1 to 10 micrometers.

nanobiotechnology. Applying the tools and processes of nanotechnology to build devices for studying biosystems.

nanobubbles. Nano-sized air bubbles on colloid surfaces.

nanocantilever. The simplest micro-electro-mechanical system. They are easily machined and mass-produced by the same techniques used to make computer chips. The ability to detect extremely small displacements make nanocantilever beams an ideal device for detecting extremely small forces, stresses and masses.

nanochondria. Nanomachines existing inside living cells and participating in their biochemistry or assembling various structures.

nanocomposite. See nanophase carbon materials.

nanocomputer. A computer made from components (mechanical, electronic, or otherwise) built at the nanometer scale.

- nanocontainers.** Nanoscale polymeric containers that could be used to selectively deliver hydrophobic drugs to specific sites within individual cells.
- nanocrystals.** (nanoscale semiconductor crystals). Aggregates of a few hundred to tens of thousands of atoms combining into a crystalline form of matter known as a cluster. Typically around ten nanometers in diameter, nanocrystals are larger than molecules but smaller than bulk solids.
- nanodiamond.** See nanophase carbon materials.
- nanoelectromechanical systems.** (NEMS). A generic term to describe nano scale electrical or mechanical devices.
- nanoelectronics.** Electronics on a nanometer scale
- nanofabrication.** Construction of items using assemblers and stock molecules.
- nanofluidics.** Controlling nano-scale amounts of fluids.
- nanogate.** A device that precisely meters the flow of tiny amounts of fluid.
- “Nanograde” [Mallinckrodt].** TM for a grade of chemical purity. Impurities guaranteed to be less than ten parts per trillion.
- nanoin imprinting.** (soft lithography). Use of lithographic masters) with nanoscale features.
- nanolithography.** Writing on the nanoscale. Used for etching computer circuits.
- nanomachining.** Involves mechanically changing the structure of nano-scale materials or molecules.
- nanomanipulation.** Manipulating at an atomic or molecular scale in order to produce precise structures.
- nanometer.** (nm). One-billionth (10^{-9}) meter, equal to 1 millimicron or 10 Å units.
- nanoparticle.** A nanoscale spherical or capsule-shaped structure. Many are hollow, which provides a central space that can be filled with substances. Various substances can also be attached to the surface of a nanoparticle for transport and reaction purposes. Most nanoparticles are small enough to pass through blood capillaries and enter cells.
- nanopharmaceuticals.** Nanoscale particles used to modulate drug transport for drug uptake and delivery applications.
- nanophase carbon materials.** (carbon nanotubes, nanodiamond, nanocomposite). Form of matter in which small clusters of atoms form the building blocks of a larger structure.
- nanorods.** Multi-wall carbon nanotubes.
- nanoropes.** Formed by connecting and stringing together nanotubes.
- nanoshell.** A nanoparticle composed of a metallic shell surrounding a semiconductor. These nanoscale metal spheres can absorb or scatter light at virtually any wavelength. When attached to a target cancer cell, they can be irradiated to cause the nanoshell to become hot, killing the cell.
- nanosystem.** A eutactic set of nanoscale components working together to serve a set of purposes; complex nanosystems can be of macroscopic size.
- nanotechnology.** The interactions of cellular and molecular components and engineered materials typically clusters of atoms, molecules, and molecular fragments at the most elemental level of biology. Such nanoscale objects—with dimensions smaller than 100 nanometers—typically, to not exclusively, can be useful by themselves or as part of larger devices containing multiple nanoscale objects.
- nanotubes.** Carbon nanotubes are fullerene-related structures that consist of graphene cylinders closed at either end with caps containing pentagonal rings. They are in the size range of cylinders 10 to 20 nm in diameter.
See: buckminsterfullerene, fullerenes.
- nanowire.** A nanometer-scale wire made of metal atoms, silicon, or other materials that conduct electricity. Nanowires are built atom by atom on a solid surface, often as part of a microfluidic device. They can be coated with molecules, such as antibodies, that will bind to proteins and other substances of interest to researchers and clinicians.
- napalm.** An aluminum soap of a mixture of oleic, naphthenic, and coconut fatty acids.
Properties: Granular powder. Mixed with gasoline it forms a sticky gel that is stable from -40 to 100C .
Hazard: Flammable, dangerous fire risk.
Use: Incendiary agent.
- naphite.** See trinitronaphthalene.
- naphtha.** (benzin).
CAS: 8030-30-6. (1) *Petroleum* (petroleum ether). A general term applied to refined, partly refined, or unrefined petroleum products and liquid products of natural gas, not less than 10% of which distill below 347F (175C) and not less than 95% of which distill below 464F (240C) when subjected to distillation in

accordance with the Standard Method of Test for Distillation of Gasoline, Naphtha, Kerosene, and Similar Petroleum Products (ASTM D86); fp -73C , bp $30\text{--}60\text{C}$, flash p -57F (-50C), autoign temp 550F (287C), d 0.6.

Hazard: Flammable, dangerous fire risk, explosive limits in air 1–6%.

Use: Source (by various cracking processes) of gasoline, special naphthas, and petroleum chemicals, especially ethylene. Cracking for ethylene also produces propylene, butadiene, pyrolysis gasoline, and fuel oil; source of synthetic natural gas.

(a) *VM&P (Varnish Makers and Painters)* (petroleum spirits, petroleum thinner).

CAS: 8032-32-4.

Any of a number of narrow-boiling-range fractions of petroleum with bp of approximately $93\text{--}204\text{C}$, according to the specific use.

Properties: Distillation range $119\text{--}143\text{C}$, d 0.7543, bulk d 6.280 lb/gal, pour p approximately -70F (-56C), flash p 20F (-6.6C) (TCC), autoign temp 450F (232C).

Hazard: Flammable, dangerous fire risk. TLV: 300 ppm; Animal Carcinogen.

Use: Thinners in paints and varnish.

(b) *blending*. A petroleum fraction with volatility similar to the higher boiling fractions of gasoline. It is used primarily in blending with natural gasoline to produce a finished gasoline of specified volatility.

(c) *cleaners*. A dry-cleaning fluid derived from petroleum and similar to Stoddard solvent but not necessarily meeting all its specifications; flash p 100F (37.7C).

(2) *Coal tar*.

(a) *heavy* (high-flash naphtha).

Properties: Deep-amber to dark-red liquid. A mixture of xylene and higher homologs. D 0.885–0.970, bp $160\text{--}220\text{C}$ (approximately 90% at 200C), flash p 100F (37.7C), evaporation 303 min.

Derivation: From coal tar by fractional distillation.

Hazard: Moderate fire risk. Toxic by ingestion, inhalation, and skin absorption.

Use: Coumarone resins; solvent for asphalts, road tars, pitches, etc.; cleansing compositions; process engraving and lithography; rubber cements (solvent); naphtha soaps; manufacture of ethylene and acetic acid.

(b) *solvent* (160-degree benzol).

Properties: A mixture of a small percentage of benzene, toluene, xylene, and higher homologs from coal tar. (1) Crude: dark straw-colored liquid, (2) refined: water-white liquid; d (1) 0.862–0.892, (2) 0.862–0.872; bp (1) approximately 160C (80%), (2) approximately 160C (90%); flash p (1) and (2) approximately 78F (25.5C).

Derivation: From coal tar by fractional distillation.

Grade: Dark-straw, water-white.

Hazard: Flammable, dangerous fire risk.

Use: Solvent; xylene; cumene; nitrated, for incorporation in dynamite.

naphthacene. (tetracene; rubene).

CAS: 92-24-0. $\text{C}_{18}\text{H}_{12}$. The molecule consists of four fused benzene rings.

Properties: Orange solid; slight green fluorescence in daylight. D 1.35, mp approximately 350C . Not easily soluble.

Occurrence: In commercial anthracene and coal tar.

Hazard: Explodes when shocked, reacts with oxidizing materials.

Use: Organic synthesis.

naphthalene. (tar camphor).

CAS: 91-20-3. C_{10}H_8 .

Properties: White, crystalline, volatile flakes; strong coal tar odor. D 1.145 (20/4C), mp 80.2C , bp 217.96C , flash p 176F (80C), sublimates at room temperature, autoign temp 979F (526C). Soluble in benzene, absolute alcohol, and ether; insoluble in water. Combustible.

Derivation: (1) From coal tar oils boiling between 200 and 250C (middle oil) by crystallization and distillation. (2) From petroleum fractions after various catalytic processing operations.

Available forms: Flakes, cubes, spheres, powder.

Grade: By melting point, 74C min (crude) to $<79\text{C}$ (refined); scintillation ($80\text{--}81\text{C}$).

Hazard: Toxic by inhalation. TLV: 10 ppm; STEL 15 ppm; not classifiable as a human carcinogen.

Use: Intermediate (phthalic anhydride, naphthol, "Tertralin," "Decalin," chlorinated naphthalenes, naphthyl and naphthol derivatives, dyes), moth repellent, fungicide, smokeless powder, cutting fluid, lubricant, synthetic resins, synthetic tanning, preservative, textile chemicals, emulsion breakers, scintillation counters, antiseptic.

α -naphthaleneacetic acid. (1-naphthylacetic acid).

CAS: 86-87-3. $\text{C}_{10}\text{H}_7\text{CH}_2\text{COOH}$. A plant growth regulator.

Properties: White crystals; odorless. Mp $132\text{--}135\text{C}$. Soluble in acetone, ether, and chloroform; slightly soluble in water and alcohol.

Grade: Usually supplied in dilute form, either as a powder or liquid solution ready for use.

Hazard: Skin irritant.

Use: Inducing rooting of plant cuttings, spraying apple trees to prevent early drop, fruit thinner.

α -naphthaleneacetic acid, methyl ester.

(MENA). $\text{C}_{10}\text{H}_7\text{CH}_2\text{COOCH}_3$. A plant growth regulator.

Use: Delaying sprouting of potatoes, weed control, thinning of peaches, etc.

naphthalene, chlorinated. See chlorinated naphthalene.

naphthalenediamine. See naphthylenediamine.

1,5-naphthalene diisocyanate. $C_{10}H_6(NCO)_2$. White to light-yellow, crystalline solid; mp 127–131C.

Hazard: Irritant.

Use: Manufacture of polyurethane solid elastomers.

naphthalene-1,5-disulfonic acid. See Armstrong's acid.

naphthalene-2,7-disulfonic acid.

Properties: White, crystalline solid. Soluble in water. Combustible.

Derivation: Sulfonation of naphthalene at high temperature and separation from 2,6-isomer.

Use: Intermediate for dyes.

α -naphthalenesulfonic acid. (1-naphthalenesulfonic acid). $C_{10}H_7SO_3H \cdot H_2O$.

Properties: Deliquescent crystals. Mp 90C. Soluble in water, alcohol, and ether. Combustible.

Derivation: Interaction of naphthalene and sulfuric acid.

Use: Starting point in the manufacture of α -naphthol, α -naphthalene sulfonic acid, α -naphthylaminesulfonic acid; solvent (Na salt) for phenol in the manufacture of disinfectant soaps.

β -naphthalenesulfonic acid. (2-naphthalenesulfonic acid).

CAS: 120-18-3. $C_{10}H_7SO_3H$ or $C_{10}H_7SO_3H \cdot H_2O$.

Properties: Nondeliquescent, white plates. Mp 124–125C. Soluble in water, alcohol, and ether. Combustible.

Derivation: Sulfonation of naphthalene.

Use: Starting point in the manufacture of β -naphthol, β -naphtholsulfonic acid, β -naphthylaminesulfonic acid, etc.

1,3,6-naphthalenetrisulfonic acid, trisodium salt. $C_{10}H_5(SO_3Na)_3$. Fine buff crystals.

Use: Diazo-type stabilizer.

1-naphthalenyl ((hexyloxy)sulfinyl)methylcarbamate.

CAS: 77267-52-8. mf: $C_{18}H_{23}NO_4S$.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

(naphthalenyl)methanone.

CAS: 131543-22-1. mf: $C_{27}H_{26}N_2O_3$.

Hazard: A poison.

1,8-naphthalic acid anhydride. $C_{12}H_8O_3$.

Properties: Light-tan powder. Mp 268–270C.

Use: Dyestuffs, organic synthesis in general.

“Naphthaniil” [Du Pont]. TM for a series of dye bases. Before coupling the bases must first be diazotized to form the diazo salt. Also represents a series of diazo pigments.

Use: Widely used on cotton and rayon textiles.

naphtha, petroleum. See naphtha (1).

1:4-naphthaquinol-bisdisodium phosphate.

CAS: 131-13-5. mf: $C_{11}H_{12}O_8P_2 \cdot 4Na$.

Hazard: A poison.

naphtha, solvent. See naphtha (2b).

naphtha, VM&P. See naphtha (1a).

naphthene. The term *naphthene* is misleading and obsolete.

See cycloparaffin.

naphthenic acid. Any of a group of saturated higher fatty acids derived from the gas-oil fraction of petroleum by extraction with caustic soda solution and subsequent acidification. Gulf and West coast crudes are relatively high in these acids. The commercial grade is a mixture, usually of dark color and unpleasant odor, corrosive to metals. The chief use of naphthenic acids is in the production of metallic naphthenates for paint driers and cellulose preservatives. Other uses are as solvents, detergents, rubber reclaiming agent, etc.

naphthenic oils.

CAS: 67254-74-4.

Hazard: Questionable carcinogen.

naphthionic acid. (1-naphthylamine-4-sulfonic acid; 1-aminonaphthalene-4-sulfonic acid; 4-amino-1-naphthalenesulfonic acid).

Properties: White crystals or powder. Soluble in water; slightly soluble in alcohol and ether.

Derivation: Heating equimolar amounts of α -naphthylamine and sulfuric acid at 10–15 mm Hg (several hours).

Use: Intermediate for azo dyes, e.g., Congo red.

α -naphthol. (1-naphthol; 1-hydroxynaphthalene).

CAS: 90-15-3. $C_{10}H_7OH$.

Properties: Colorless or yellow prisms or powder; disagreeable taste. D 1.224 (4C), 1.0954 (95/4C), mp 96C, bp 278C, volatile in steam, sublimes, refr index 1.6206 (98.7C). Soluble in benzene, alcohol, and ether; insoluble in water. Combustible.

Derivation: By fusing sodium α -naphthalene sulfonate and caustic soda. The melt is decomposed with hydrochloric acid and distilled.

Hazard: Toxic by ingestion and skin absorption.

Use: Dyes, organic synthesis, synthetic perfumes.

β -naphthol. (2-naphthol; 2-hydroxynaphthalene).

CAS: 135-19-3. $C_{10}H_7OH$.

Properties: White, lustrous, bulky leaflets or white powder. Darkens with age; faint phenol-like odor. Stable in air but darkens on exposure to sunlight. D 1.217, mp 121.6C, bp 285C, flash p 307F (152.7C). Soluble in alcohol, ether, chloroform, glycerol, oils, and alkaline solutions; almost insoluble in water. Combustible.

Derivation: By fusing sodium β -naphthalene sulfonate with caustic soda. The product is distilled in vacuo and then sublimed.

Grade: Technical, sublimed, resublimed.

Hazard: See α -naphthol.

Use: Dyes; pigments; antioxidants for rubber, fats, oils; insecticides; synthesis of fungicides; pharmaceuticals; perfumes; antiseptic.

naphthol AS. See β -hydroxynaphthoic anilide.

3-naphthol-2-carboxylic acid. See 3-hydroxy-2-naphthoic acid.

Naphthol Green B. A dye used in crystallizing solar salt, it increases the evaporation rate by added absorption of energy; 5 ppm is said to increase salt production 15–20%.

β -naphthol methyl ether. See β -naphthyl methyl ether.

naphtholsulfonic acid. Any of several sulfonated aromatic acids derived from α - or β -naphthol or naphthalene and used as azo dye intermediates.

1,2-naphthoquinone. (β -naphthoquinone).

CAS: 524-42-5. $C_{10}H_6O_2$.

Properties: Yellow crystals. Mp 120C (decomposes). Soluble in ether, benzene, alcohol.

Hazard: Irritant.

Use: Chemical reagent and intermediate.

1,4-naphthoquinone. (α -naphthoquinone).

CAS: 130-15-4. $C_{10}H_6O_2$.

Properties: Yellow powder; odor like benzoquinone. Mp 123–126C, sublimes at 100C. Slightly soluble in water; soluble in ethanol, ethyl ether, chloroform, benzene, and acetic acid. Combustible.

Hazard: Irritant.

Use: Polymerization regulator for rubber and polyester resins, synthesis of dyes and pharmaceuticals, fungicide, algicide.

naphthoquinone oxime. See 1-nitroso-2-naphthol; 2-nitroso-1-naphthol.

1,2-naphthoquinone-4-sulfonic acid. (β -naphthoquinone-4-sulfonic acid). $C_{10}H_5(O)_2SO_3H$.

Derivation: Oxidation with nitric acid of 2-amino-1-naphthol-4-sulfonic acid or 1-amino-2-naphthol-4-sulfonic acid.

Use: Dye intermediate, identification of sulfonamide derivatives.

naphthoresorcinol. See 1,3-dihydroxynaphthalene.

β -naphthoxyacetic acid. (2-naphthoxyacetic acid).

CAS: 120-23-0. $C_{10}H_7OCH_2COOH$. A plant growth regulator.

Properties: Crystals. Mp 156C. Soluble in water, alcohol, acetic acid.

Use: Rooting clippings, inhibits early fall of fruit, growth promoter.

1-naphthylacetic acid. See naphthaleneacetic acid.

α -naphthylamine. (1-naphthylamine).

CAS: 134-32-7. $C_{10}H_7NH_2$.

Properties: White crystals becoming red on exposure to air. Flash p 157C, d 1.13, mp 50C, bp 301C. Soluble in alcohol and ether; slightly soluble in water. Combustible.

Derivation: Reduction of α -nitro-naphthalene with iron and hydrochloric acid. The mass is then mixed with milk of lime and distilled.

Method of purification: Crystallization.

Hazard: Toxic, especially if containing the β isomer; a carcinogen (OSHA).

Use: Dyes and dye intermediates, agricultural chemicals.

β -naphthylamine. (2-naphthylamine).

CAS: 91-59-8. $C_{10}H_7NH_2$.

Properties: White to reddish, lustrous leaflets. Soluble in hot water, alcohol, ether. Commercial: mp 109.5C, d 1.061 (98.4C), bp 306C. Combustible.

Derivation: From β -naphthol by heating in an autoclave with ammonium sulfite and ammonia (Bucherer reaction).

Method of purification: Distillation.

Hazard: Toxic by ingestion, inhalation, skin absorption; a carcinogen (OSHA) TLV: Confirmed Human Carcinogen.

α -naphthylamine hydrochloride.

Properties: White to gray, crystalline powder. Soluble in water, alcohol, and ether.

Derivation: By the action of hydrochloric acid on α -naphthylamine.

Use: Dyes, organic synthesis.

naphthylaminesulfonic acid. Any of several sulfonated aromatic acids derived from α - or β -naphthylamine and used as azo dye intermediates.

o-2-naphthyl-*m*-*N*-dimethylthiocarbamate.

See tolnaftate.

1,5-naphthylenediamine. (1,5-diaminonaphthalene).

Properties: Colorless crystals. Mp 190C, bp (sublimes). Soluble in alcohol and hot water; very sparingly soluble in cold water. Combustible.

Derivation: (1) By the reduction of α -dinitronaphthalene; (2) by heating dihydroxynaphthalene with aqueous ammonia.

Use: Organic synthesis.

1,8-naphthylenediamine. (1,8-diaminonaphthalene).

Properties: Colorless crystals. Mp 66C, bp 205C (12 mm Hg), d 1.12, refr index 1.68. Soluble in alcohol; slightly soluble in water.

Derivation: Reduction of 1,8-dinitronaphthalene with PI_3 .

Use: Lubricating-oil antioxidant, analytical reagent.

N- α -naphthylethylenediamine dihydrochloride.

Properties: Colorless crystals. Soluble in water.

Use: Reagent for the quantitative determination of sulfa drugs, for the detection of nitrogen dioxide in air.

β -naphthyl ethyl ether. (nerolin).

Properties: White crystals; orange-blossom odor. Congealing p 35C. Soluble in 5 parts of 95% alcohol. Combustible.

Derivation: Interaction of β -naphthol and ethanol in the presence of sulfuric acid.

Use: Perfumes, soaps, flavoring.

1-naphthyl isocyanide. See 1-isocyanonaphthalene.

1-naphthyl-*n*-(2,3,4,5-di-*o*-isopropylidene-1- α -*o*-fructopyranosylsulfinyl)-*n*-methylcarbamate.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

1-naphthyl-*N*-methylcarbamate. See carbaryl.

β -naphthyl methyl ether. (β -naphthol methyl ether; 2-methoxynaphthalene; methyl naphthyl ether).

Properties: White, crystalline scales. Mp 72C, bp 274C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: (1) By heating β -naphthol and methanol in the presence of sulfuric acid. (2) By methylating β -naphthol with dimethyl sulfate.

Use: Perfumery (soaps).

α -naphthylphenyloxazole. (NPO; ANPO; 2-(1-naphthyl)-5-phenyloxazole).

Properties: Fluorescent yellow needles. Mp 104–106C.

Grade: Scintillation.

Use: Scintillation counter or wavelength shifter in solution scintillators.

N-1-naphthylphthalamic acid.

Properties: Crystalline solid. Mp 185C. Almost insoluble in water; slightly soluble in acetone, benzene, and ethanol. Not stable in solutions above pH 9.5 nor at temperatures above 180C. Noncorrosive. Do not store near seeds or fertilizers. Combustible.

Use: Selective preemergence herbicide.

α -naphthylthiourea. (ANTU).

Properties: Odorless, gray powder. Mp 198C. Insoluble in water and only very slightly soluble in most organic solvents.

Derivation: From α -naphthylthiocarbamide and alkali or ammonium thiocyanate.

Hazard: Toxic by ingestion. TLV: 0.3 mg/m³; not classifiable as a human carcinogen.

Use: Rodenticide.

Naples yellow. See lead antimonate.

naptalam. (α -naphthylphthalamic acid).

Properties: Colorless crystals. Mp 203C, d 1.40. Soluble in alkaline solutions; slightly soluble in alcohol, benzene, and acetone.

Use: Analytical reagent (thorium, zirconium); herbicide.

narasin.

Properties: Crystals from Me₂CO (aq). Mp:

98–100°. Sol in alcs, acetone, chloroform, ethyl acetate. Insol in water.

Use: Drug (veterinary); food additive.

narcotic. (1) A natural, semisynthetic, or synthetic nitrogen-containing heterocyclic drug that characteristically effects sleep (coma) and relief of pain but also may result in addiction, i.e., a biochemical situation in which the body tissues become so adapted to the drug that they can no longer function normally without it. Natural narcotics are the plant products morphine and codeine (constituents of opium), both of which are alkaloids. Opium is obtained from the seed of the oriental poppy, *Papaver somniferens*. Semisynthetic narcotics are modifications of the morphine molecule, e.g., diacetylmorphine (heroin), ethylmorphine (“Dionin”), and methyldihydromorphine (metopon). Synthetic narcotics are meperidine, ethadone, and phenazocine (there are other addictive agents that are not narcotics). The sale of narcotics is strictly controlled by law in the U.S. (2) Inducing sleep or coma. Many chemicals that are not narcotics in sense (1) have this property (chloroform, barbiturates, benzene, etc.).

***l*-α-narcotine.** See noscapine.

naringin. (naringenin-7-rhamnoglucoside; naringenin-7-rutinoside; aurantiin). $C_{27}H_{32}O_{14}$. **Properties:** A flavanone glycoside (bioflavonoid), crystals, bitter taste. Mp 171C. Soluble in acetone, alcohol, warm acetic acid, and warm water.

Source: Extracted from flowers and rind of grapefruit and immature fruit.

Use: Beverages, sweetener research.

NAS See the National Academy of Sciences–National Research Council.

nascent. Descriptive of the abnormally active condition of an element, for example, the atomic oxygen released from hydrogen peroxide and sulfur atoms evolved from thiuramsulfide accelerators. The term is now obsolete.

“NA-SUL” [King]. TM for dinonyl naphthalene sulfonates.

Available forms: Liquid.

Use: Corrosion inhibitors for industrial lubricants, rust preventatives, and metalworking specialties.

National Academy of Sciences–National Research Council. (NAS) A private, non-profit organization of scientists devoted to the expansion of science and its use for the general welfare. The Academy was established in 1863, in part to act as adviser to the federal government on scientific matters; the council was established in 1916, its members being appointed by the president of the academy. Its headquarters are located at 2101 Constitution Ave., Washington DC 20418.

Website: <http://www4.nationalacademies.org/nas/nashome.nsf>.

National Fire Protection Association.

(NFPA). An organization devoted to promoting knowledge of fire-protection methods. For many years its publication (the NFPA Handbook) has been the accepted standard for all matters relating to combustion and flammable materials, firefighting methods, safety, and protection of property. Its headquarters are at 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

Website: <http://www.nfpa.org>.

National Institute for Occupational Safety and Health.

(NIOSH). A federal agency under the Department of Health and Human Services, Public Health Service. It is responsible for investigating the toxicity of workroom environments and all other matters relating to safe industrial practice. Its research laboratories are located at Robert A. Taft Laboratories, 4676 Columbia Parkway, Cincinnati, Ohio 45226.

Website: <http://www.cdc.gov/niosh/homepage.html>.

National Institute of Standards and Technology.

(NIST). Founded in 1901, NIST is a non-regulatory federal agency within the U.S. Commerce Department’s Technology Administration. NIST’s mission is to promote U.S. innovation and industrial competitiveness by advancing measurement science, standards, and technology in ways that enhance economic security and improve our quality of life. Its main laboratories are located at 100 Bureau Drive, Stop 1070, Gaithersburg, MD 20899-1070.

Website: <http://www.nist.gov/publicaffairs/general2.htm>.

National Nanotechnology Coordination

Office. (NNCO). The NNCO assists in the preparation of multi-agency planning, budget, and assessment documents. The NNCO is the point of contact on Federal nanotechnology activities for regional, state, and local initiatives, as well as, government organizations, academia, industry, professional societies, foreign organizations, and others to exchange technical and programmatic information. In addition, the NNCO develops and makes available printed and other materials as directed by the NSET Subcommittee. Contact address is 4201 Wilson Blvd., Stafford II Rm 405, Arlington, VA 22230.

Website: www.nano.gov.

National Nanotechnology Initiative.

(NNI). The goals of the NNI are to: (1) maintain a world-class research and development program aimed at realizing the full potential of nanotechnology; (2) facilitate transfer of new technologies into products for economic growth, jobs, and other pub-

lic benefit; (3) develop educational resources, a skilled workforce, and the supporting infrastructure and tools to advance nanotechnology; and, (4) Support responsible development of nanotechnology
Website: <http://www.nano.gov>.

National Research Council. See National Academy of Sciences–National Research Council.

National Science Foundation. (NSF). The National Science Foundation (NSF) is an independent federal agency created by Congress in 1950 “to promote the progress of science; to advance the national health, prosperity, and welfare; to secure the national defense.” With an annual budget of about \$5.5 billion, NSF is the funding source for approximately 20 percent of all federally supported basic research conducted by America’s colleges and universities. In many fields such as mathematics, computer science, and the social sciences, NSF is the major source of federal backing. Contact address is 4201 Wilson Boulevard, Arlington, Virginia 22230.
Website: <http://www.nsf.gov/index.jsp>.

National Science and Technology Council.

(NSTC). A primary objective of the NSTC is the establishment of clear national goals for Federal science and technology investments in a broad array of areas spanning virtually all the mission areas of the executive branch. The Council prepares research and development strategies that are coordinated across Federal agencies to form investment packages aimed at accomplishing multiple national goals. The work of the NSTC is organized under four primary committees: Science, Technology, Environment and Natural Resources, and Homeland and National Security. Each of these committees oversees subcommittees and working groups focused on different aspects of science and technology and the coordination of research and development strategies working to coordinate across the federal government. Contact address is 725 17th Street Room 5228, Washington, DC 20502.
Website: <http://www.ostp.gov/nstc/index.html>.

native conformation. The biologically active conformation of a protein.

“Natralth” [Fanning]. TM for a line of functional additives for ink and coatings.

Use: To improve, add lubricity and wetting/dispersing in both metallic and non-metallic pigments.

natrium. The Latin name for sodium, hence the symbol Na in chemical nomenclature.

“Natrallube” [Fanning]. TM for a line of rust preventatives, lubricity, and anti-wear components.
Use: For metal working, industrial lubricant, and grease formulations.

natrolite. $\text{Na}_2\text{Al}_2\text{Si}_3\text{O}_{10} \cdot 2\text{H}_2\text{O}$. A mineral of the zeolite group.

Properties: Colorless or white to gray, yellow, greenish, or red. D 2.2–2.25, Mohs hardness 5–5.5. See zeolite.

natron. A complex salt found in dry lake beds of Egypt. Originally an ingredient of ceramic glazes. It has the following percentage composition: sodium carbonate 4.9, sodium bicarbonate 12.6, sodium chloride 30.6, sodium sulfate 20.6, silica 10, calcium carbonate 2, magnesium carbonate 1.9, alumina 0.7, iron oxide 0.3, water 4.7, and organic matter 11.7.

“Natrorez” [Natrochem]. TM for coumarone-indene resins plasticized to various softening points or viscosities.

Use: Tackifier, processing aid.

“Natosol” [Aqualon]. TM for hydroxyethylcellulose.

CAS: 9004-62-0.

Grade: 10 viscosity, 4 biostable, 7 cosmetic, 5 NF, 3 European Pharmacopeia.

Available forms: Solid.

Use: Thickening agent.

“Natrulol” [Hercules, Ltd.]. TM for a hydroxyethyl cellulose.

Natta catalyst. A stereospecific catalyst made from titanium chloride and aluminum alkyl or similar materials by a special process that includes grinding the materials together to produce an active catalyst surface.

See Ziegler catalyst.

Natta, Giulio. (1903–1979). An Italian chemist born in Imperia on the Riviera, corecipient (with Karl Ziegler) of the Nobel Prize in 1963 for his fundamental work on catalytic polymerization. In 1954 he developed isotactic polypropylene at his laboratory at the Polytechnic Institute of Milan, which led to wide application of various stereospecific polymers with organometallic catalysts such as triethylaluminum. He was for many years consultant for the Montecatini chemical firm. The researchers of Natta, together with those of Ziegler, made possible the chemical manipulation of monomers to form specifically ordered 3-dimensional polymers having predetermined properties, to which the term *tailor-made* is often applied.

natural. Descriptive of a substance or mixture that occurs in nature; the opposite of synthetic or manufactured. Elements 1–92 are natural substances that may occur in either the free or combined state. The transuranium elements and all artificial isotopes of other elements are synthetic. Many mixtures occur naturally, e.g., petroleum, shale oil, wood, metallic ores, natural gas; others are synthetic

modifications of natural compounds, e.g., glass, cement, paper, gasoline. Such materials may be considered to be semisynthetic. The term *synthetic natural* is often applied to synthesized compounds that are identical with the natural substance; for example, synthetic natural gas and synthetic natural rubber. The term *natural product* is defined as any organic compound formed by living organisms; *natural gasoline* has a specialized meaning. See synthesis; natural gas; biomass; gasoline.

natural gas. A mixture of low molecular weight hydrocarbons obtained in petroleum-bearing regions throughout the world. Its composition is 85% methane 10% ethane, the balance being made up of propane, butane, and nitrogen. In the U.S. it occurs chiefly in the southwestern states and Alaska. An as yet unexploited source of natural gas under extremely high pressure (so-called geopressurized gas) exists in Texas and Louisiana at depths of 15,000–20,000 ft. The tremendous pressures involved present formidable engineering problems. Natural gas is classed as a simple asphyxiant. It should not be confused with natural gasoline. About 3% of the natural gas consumed in the U.S. is used as feedstocks by the chemical industries.

Properties: Colorless, flammable gas or liquid; almost odorless. Autoign temp 900–1100F, heating value 1000 Btu/ft³. A warning odor is added to household fuel gas as a safety precaution.

Hazard: Flammable, dangerous fire and explosion risk; explosive limits in air 3.8–17%.

Use: Fuel and cooking gas, ammonia synthesis, formaldehyde and other petrochemical feedstocks, source of synthesis gas and methanol.

See liquefied petroleum gas; synthetic natural gas.

natural gasoline. See gasoline.

natural product. See natural.

Natural Resources Defense Council.

(NRDC). A private environmental advisory group, founded in 1970, whose function is to point out serious environmental hazards and to oversee the enforcement of regulations pertaining to them. It was influential in postponement of the breeder reactor and in recognition of the chlorofluorocarbon-ozone problem. It operates primarily through the courts. Its main office is at 40 West 20th Street, New York, NY 10011
Website: <http://www.nrdc.org>.

“Naugard PANA” [Uniroyal]. TM for phenyl- α -naphthylamine.

Available forms: Solid.

Grade: Crushed and fused.

Use: Aromatic amine antioxidant for synthetic lubricants, lubricating greases, and industrial oils.

See *N*-phenyl- α -naphthylamine.

“Naugard Q” [Uniroyal]. TM for polymerized 1,2-dihydro-2,2,4-trimethylquinoline.

Use: As an antioxidant that gives good protection against degradation due to heat and oxygen.

“Naugard SP” [Uniroyal]. TM for styrenated phenol (mixture of mono, di, tri).

Use: Antioxidant for nonstaining and nondiscoloring applications.

“Naugawhite” [Uniroyal]. TM for major component 2,2'-methylene bis(4-methyl-6-nonylphenol).

Use: General-purpose antioxidant for nonstaining and nondiscoloring for rubber and latex in foam sponge, tire carcasses, refrigerator gaskets, footwear, proofing, wire insulation, and sundries.

naval stores. Historically, the pitch and rosin used on wooden ships. The term now includes all products derived from pine wood and stumps, including rosin, turpentine, pine oils, and tall oil and its derivatives.

“Navane” [Pfizer]. TM for the *cis* isomer of *N,N*-dimethyl-9[3-4-methyl-1-piperazinyl-propylidene]-thioxanthene-2-sulfonamide. An antipsychotic drug (thiothixene) said to be as effective as most of the phenothiazines. Approved by the FDA.

“NAXONATE” Hydrotropes [Ruetgers].

TM for products used to obtain uniform, clear, and fluid synthetic detergent formulations. Some examples of the chemicals are sodium, potassium, and ammonium salts of xylene, cumene, and toluene.

Available forms: Powder and liquid.

Use: Synthetic detergents.

Nazarov cyclization reaction. Synthesis of cyclopentenones by the acid-catalyzed electrocyclic ring closure of divinyl or allylvinyl ketones available by hydration of divinylacetylenes.

Nb. Symbol for niobium.

NBA. Abbreviation for *N*-bromoacetamide.

NBR. Abbreviation for nitrile-butadiene rubber.

NBS. Abbreviation for *N*-bromosuccinimide.

NC. Abbreviation for nitrocellulose.

NCI. Abbreviation for National Cancer Institute.

NCS. Abbreviation for *N*-chlorosuccinimide.

Nd. Symbol for neodymium.

ND. Abbreviation for new drug.

NDGA. Abbreviation for nordihydroguaiaretic acid.

Ne. Symbol for neon.

neatsfoot oil.

Properties: A fixed pale-yellow oil with a peculiar odor. D 0.916, saponification value 194–199, flash p 470F (243C), autoign temp 828F (442C), iodine value 70. Soluble in alcohol, ether, chloroform, and kerosene. Combustible.

Derivation: By boiling in water the shinbones and feet (without hooves) of cattle and separating the oil from the fat obtained.

Grade: 15, 20, 30, 40F cold test (the temperature in degrees Fahrenheit at which stearin separates).

Hazard: Subject to spontaneous heating.

Use: Leather industry for fat liquoring and softening, lubricant, oiling wool.

Neber rearrangement. Formation of α -amino ketones by treatment of sulfonic esters of ketoximes with potassium ethoxide, followed by hydrolysis.

neburon. (generic name for 1-*n*-butyl-3-(3,4-dichlorophenyl)-1-methylurea.)

nectar. The fabled drink of the gods. The honey-like secretion by the nectar gland of flowers. This material is gathered by bees to make honey and used as food by other insects.

neem extract.

CAS: 116580-64-4.

Hazard: Moderately toxic by skin contact. Low toxicity by ingestion and skin contact.

Use: Agricultural chemical.

Nef reaction. Formation of aldehydes and ketones from primary and secondary nitroparaffins, respectively, by treatment of their salts with sulfuric acid.

Nef synthesis. Addition of sodium acetylides to aldehydes and ketones to yield acetylenic carbinols; occasionally and erroneously referred to as the Nef reaction.

negative cooperativity. A phenomenon of some multisubunit enzymes, or proteins, in which binding of a ligand or substrate to one subunit impairs binding of a second ligand molecule to another subunit.

negative feedback. Regulation of a biochemical pathway achieved when a reaction product inhibits an earlier step in the pathway.

negatol. A condensation product of *m*-cresolsulfonic acid with formaldehyde. A polymerized dihydroxydimethyldiphenylmethanedisulfonic acid. It is dispersible in water, forming very acidic

colloidal solutions. The pH of a 5% dispersion is approximately 1.0.

Use: Medicine (antiinfective).

nematic. A linear molecular structure occurring in some liquid crystals and characterized by a threadlike appearance under a polarizing microscope.

nematocide. An agent that is destructive to soil nematodes (roundworms or threadworms).

NEMS. See nanoelectromechanical systems.

Nencki reaction. The ring acylation of phenols with acids in the presence of zinc chloride, or the modification of the Friedel-Crafts alkylation-acylation procedure by substitution of ferric chloride for aluminum chloride.

Neitescu indole synthesis. Hydrogenative acylation of cycloolefins with acid chlorides in the presence of aluminum chloride; with five- and six-membered rings, no change in ring size occurs, but with seven-membered rings, rearrangement takes place with formation of a cyclohexane derivative.

neo- (1) A prefix meaning new and designating a compound related in some way to an older one, e.g., neoprene. (2) A prefix indicating a hydrocarbon in which at least one carbon atom is connected directly to four other carbon atoms; as in neopentane, neohexane.

“Neobee” [Stepan]. (hydrogenated vegetable oil). TM for oil.

Use: For a flavor carrier, vitamin solubilizer, antibiotic vehicle, nutritional fluid, lubricant, emollient, and medical diluent.

“Neochel” [ATOTECH]. TM for a wetting agent used in copper plating. A liquid replacement for Rochelle salt with proprietary additives.

neocurdione.

CAS: 108944-67-8. mf: C₁₅H₂₄O₂.

Hazard: A poison by ingestion.

neodecanoic acid.

CAS: 26896-20-8. C₉H₁₉COOH. Clear, colorless liquid in 97% purity; available commercially. Its derivatives are especially effective as paint driers and are being widely used. Applications as plasticizers and lubricants are also possible.

“Neodol 25” [Shell]. TM for a C₂–C₁₅ linear, primary alcohol.

Use: Manufacture of biodegradable surfactants, dispersants, solvents, emulsifiers, and chemical intermediates.

neodymia. See neodymium oxide.

neodymium.

CAS: 7440-00-8. Nd. Metallic element having atomic number 60, group IIIB of the periodic table, aw 144.24, valence of 3. A rare-earth element of the lanthanide (cerium) group. There are seven isotopes.

Properties: Soft, malleable, yellowish metal; tarnishes easily. D 7.0, mp 1024C, bp approximately 3030C, ignites to oxide (200–400C). Liberates hydrogen from water; soluble in dilute acids. High electrical resistivity, paramagnetic. Readily cut and machined. Store under mineral oil or inert gas to prevent tarnish and corrosion.

Derivation: Monazite, bastnasite, allanite. Ores are cracked by heating with sulfuric acid.

Available forms: Ingots, rods, sheet, powder to 99.9+% purity.

Hazard: (Salts) Irritant to eyes and abraded skin.

Use: Neodymium salts, electronics, alloys, colored glass, (especially in astronomical lenses and lasers), to increase heat resistance of magnesium, metallurgical research, yttrium-garnet laser dope, gas scavenger in iron and steel manufacture.

See didymium.

neodymium acetate. $\text{Nd}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot x\text{H}_2\text{O}$.

Properties: Pink powder. Soluble in water.

neodymium ammonium nitrate.

Properties: Pink crystals. Soluble in water. Technical grade contains 75% neodymium salt, principal impurities praseodymium and samarium compounds.

neodymium carbonate. $\text{Nd}(\text{CO}_3)_2 \cdot x\text{H}_2\text{O}$.

Properties: Pink powder. Insoluble in water; soluble in acids.

Grade: 75, 95, and 99% neodymium salt.

neodymium chloride. (1) NdCl_3 , (2) $\text{NdCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: (1) Violet crystals. D 4.134 (25C), mp 784C, bp 1600C. Very soluble in water; soluble in alcohol; insoluble in ether and chloroform. (2) Red crystals. Mp 124C, loses $6\text{H}_2\text{O}$ at 160C. Very soluble in water and alcohol.

Grade: 75, 95, 99, and 99.9%.

neodymium fluoride. NdF_3 .

Properties: Pink powder. Mp 1410C, bp 2300C. Insoluble in water.

Grade: 65, 75, 99, and 99.9%.

Hazard: Irritant.

neodymium nitrate. $\text{Nd}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: Pink crystals. Very soluble in water; soluble in alcohol and in acetone.

Grade: 75, 95, 99, and 99.9%.

Hazard: Possible explosion risk.

neodymium oxalate. $\text{Nd}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Pink powder. Insoluble in water; slightly soluble in acids.

Grade: 75, 95, and 99%.

neodymium oxide. (neodymia). $\text{Nd}_2(\text{SO}_4)_{13}$.

Properties: Pure product is a blue-gray powder; technical grade is a brown powder. D 7.24, mp 2270C. Insoluble in water; soluble in acids, hygroscopic. Absorbs carbon dioxide from the air.

Grade: 65, 75, 85, 95, 99, and 99.9% oxide.

Use: (65%) To counteract color of iron in glass. (Purified grade) Ceramic capacitors, coloring glass, refractories, carbon arc-light electrodes, color TV tubes, dehydrogenation catalyst.

neodymium sulfate. $\text{Nd}(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Pink crystals. D 2.85, mp 800C (decomposes). Soluble in cold water; sparingly soluble in hot water.

Grade: 75, 99, and 99.9%.

“Neoflex” [Shell]. TM for a series of linear primary alcohols, from C_6 through C_{11} , including blends.

Properties: (C_7) Colorless liquid. D 0.8217 (25/25C), distillation range 174–182C.

Hazard: Combustible, moderate fire risk.

Use: Solvent, reaction intermediate, esterifying agent.

neohexane. (2,2-dimethylbutane).

CAS: 75-83-2. C_6H_{14} .

Properties: Colorless, volatile liquid. Bp 49.7C, refr index 1.3659 (25C), d 0.6570 (25C), fp -99.7C , flash p -54F (-47C), octane rating 100+, autoign temp 797F (425C).

Derivation: By the thermal or catalytic union (alkylation) of ethylene and isobutane, both recovered from refinery gases.

Grade: 95%, 99%, research.

Hazard: TLV: 500 ppm; STEL 1000 ppm. Highly flammable, dangerous fire and explosion risk, explosion limits 1.2–7%.

Use: Component of high-octane motor and aviation fuels, intermediate for agricultural chemicals.

“Neolyn” [Aqualon]. TM for a series of soft-to-medium hard modifying rosin-derived alkyd resins. Available in solution and/or solid forms of various grades.

Use: Adhesives, lacquers, organosols, plastisols, and floor tile.

neomycin.

CAS: 1404-04-2. An antibiotic complex obtained from *Streptomyces fradiae*; it is soluble in water and

methanol but insoluble in most organic solvents. It consists of three component substances, all of which function as antiinfective agents; some derivatives have fungicidal properties. The three types are A (also called neamine): $C_{12}H_{26}N_4O_6$; B: $C_{23}H_{46}N_6O_{13}$ (also available as hydrochloride and sulfate); and C: $C_{23}H_{46}O_{13}$.

neon.

CAS: 7440-01-9. Ne. Inert element of atomic number 10, noble gas group of the periodic table, aw 20.179. Three stable isotopes.

Properties: Colorless, odorless; tasteless gas. Does not form compounds, but ionizes in electric discharge tubes. Liquefies at $-245.92C$, fp $-248.6C$, d 0.6964 (air = 1), sp vol 11.96 cu ft/lb (21C, 1 atm). Slightly soluble in water. An asphyxiant gas. Non-combustible.

Derivation: By fractional distillation of liquid air. It constitutes 0.0012% of normal air.

Grade: Technical, highest purity.

Hazard: ?TLV: simple asphyxiant.

Use: (Gas) Luminescent electric tubes and photoelectric bulbs, electronic industry, high-voltage indicators, lasers. (Liquid) cryogenic research.

neonicotine. See anabasine.

neopentane. (2,2-dimethylpropane; tetramethylmethane).

CAS: 463-82-1. C_5H_{12} or $C(CH_3)_4$. Present in small amounts in natural gas.

Properties: Colorless gas or very volatile liquid. Bp $9.5C$, d 0.591 (20/4C), fp $-19.5C$, flash p $-85F$ ($-65C$), autoign temp $842F$ (450C). Soluble in alcohol; insoluble in water

Grade: Technical 95%, pure 99%, research 99.9%.

Hazard: Highly flammable, dangerous fire risk, explosive limits in air 1.4–7.5%.

Use: Research, butyl rubber.

neopentanoic acid. See trimethylacetic acid.

neopentyl glycol. (2,2-dimethyl-1,3-propanediol).

CAS: 126-30-7. $HOCH_2C(CH_3)_2CH_2OH$.

Properties: White, crystalline solid. Boiling range 95% between 204–208C, mp 120–130C, d 1.066 (25/4C). Partially soluble in water; miscible with alcohol and ether.

Use: Polyester foams, insect repellent, alkyd modifier, plasticizers, urethanes, synthetic lubricants.

neopinamine.

CAS: 66525-27-7. mf: $C_{19}H_{25}NO_4$.

Hazard: Moderately toxic by ingestion and inhalation. Low toxicity by skin contact.

Use: Agricultural chemical.

neoplasm. An abnormal growth of tissue in the body that may or may not be malignant.

See antineoplastic.

neoprene. (polychloroprene).

CAS: 126-99-8. $(CH_2ClC(CH_3)CHCH_2)_n$. A synthetic elastomer available in solid form, as a latex or as a flexible foam.

Properties: Vulcanized with metallic oxides rather than sulfur. D 1.23; resistant to oils, oxygen, ozone, corona discharge, and electric current. An isocyanate-modified form has high flame resistance. Combustible but less so than natural rubber.

Use: (Solid) Mechanical rubber products, lining oil-loading hose and reaction equipment, adhesive cement, binder for rocket fuels, coatings for electric wiring, gaskets and seals. (Liquid) Specialty items made by dipping or electrophoresis from the latex. (Foam) Adhesive tape to replace metal fasteners for automotive accessories, seat cushions, carpet backing, sealant.

neopyrithiamine. See pyrithiamine.

Neosalvarsan. (sodium 3:3'-diamino-4:4'-dihydroxyarsenobenzene formaldehyde sulfoxylate).

CAS: 457-60-3. $C_{13}H_{14}O_4N_2SAs_2Na$.

Use: Treatment against syphilis.

"Neosol" [Shell]. TM for ethanol based on a formulation approved by the Bureau of Internal Revenue.

"Neosporin" [Pfizer]. Proprietary formulation of polymyxin B sulfate, neomycin sulfate, and gramicidin.

Use: Ocular antibiotic.

neotridecanoic acid. $C_{12}H_{22}COOH$. Colorless liquid of 97% purity. Suggested for plasticizers, lubricants, paint driers, fungicides, cosmetics, alkyd resins.

"Neozone" [Du Pont]. TM for a group of rubber antioxidants. An *N*-phenyl- α -naphthylamine. "D" is *N*-phenyl- β -naphthylamine. "C" is fusion of "Neozone" A and toluene-2,4-diamine.

nephelite. (nepheline). $(Na,K)(Al,Si)_2O_4$. Essentially a silicate of sodium, found in silica-poor igneous rocks.

Properties: Colorless, white, or yellowish; vitreous to greasy luster. Mohs hardness 5.5–6, d 2.55–2.65.

Occurrence: The former U.S.S.R., Ontario, Norway, South Africa, Maine, Arkansas, New Jersey.

Use: Ceramic and glass manufacture, enamels, source of potash and aluminum (the former U.S.S.R.).

nephelometry. Photometric analytical techniques for measuring the light scattered by finely divided particles of a substance in suspension. It is used to estimate the extent of turbidity in such products as beer and wine, in which colloiddally dispersed particles are present.

neptunium. Np. A radioactive transuranic element having atomic number 93, first formed by bombarding uranium with high-speed deuterons aw 237.0482, valences of 3, 4, 5, 6; d 20.45. Neptunium-237, the longest-lived of the 11 isotopes, has been found naturally in extremely small amounts in uranium ores. It is produced in weighable amounts as a by-product in the production of plutonium. Metallic neptunium is obtained by first preparing neptunium trifluoride, which is reduced with barium vapor at 1200C. It is a silvery white metal; mp 640C. Neptunium is similar chemically to uranium; it forms such intermetallic compounds as NpAl₂ and NpBe₁₃, as well as NpC, NpSi₃, NpN, NpF₃, NpF₆, NpF₄, NpNO₂, Np₃O₈, etc; soluble in hydrochloric acid, strong reducing agents.

Use: Np-237 is used in neutron detection instruments.

Hazard: A radioactive poison.

neptunium dioxide. NpO₂.

Properties: Dark-olive, free-flowing powder.

Derivation: Neptunium oxalate is precipitated from solutions containing nitric acid and neptunium. The neptunium oxalate is calcined at 500–550C, producing neptunium dioxide.

Hazard: Toxic. A radioactive poison.

Use: Fabrication by powder metallurgy into target elements to be irradiated to produce Pu-238.

nequinat.

CAS: 13997-19-8. mf: C₂₂H₂₃NO₄.

Properties: Crystals. Mp: 287–288°.

Use: Drug (veterinary); food additive.

Nernst potential. (thermodynamic potential).

(1) The potential that exists between the interiors of the phases of a two-phase system. (2) Potential (E) of a single electrode in a galvanic cell.

Nernst, Walther. (1864–1941). A German chemist who won the Nobel Prize in 1920. He was educated at Zurich and Berlin and received his Ph.D. at Wurzburg. He wrote many works concerning theory of electric potential and conduction of electrolytic solutions. He developed the third law of thermodynamics, which states that at absolute zero the entropy of every material in perfect equilibrium is zero, and therefore volume, pressure, and surface tension all become independent of temperature. He also invented Nernst's lamp, which required no vacuum and little current.

“Neroflex” [Millenium]. TM for floral composition additive.

Use: To insure consistent odor in sweet, floral compositions.

nerol. (*cis*-3,7-dimethyl-2,6-octadien-1-ol).

CAS: 106-25-2.
(CH₃)₂C:CH(CH₂)₂C(CH₃):CHCH₂OH. The *cis* isomer of geraniol.

Properties: Colorless liquid, rose-neroli odor. Soluble in absolute alcohol. Combustible.

Derivation: Iodization of geraniol with hydriodic acid, followed by treatment with alcoholic soda.

Use: Perfumery, flavoring.

nerolidol. (3,7,11-trimethyl-1,6,10-dodecatrien-3-ol).

CAS: 7212-44-4.

(CH₃)₂C:CH(CH₂)₂C(CH₃):CH(CH₂)₃(CH₃)•
(OH)CH:CH₂. A sesquiterpene alcohol.

Properties: Straw-colored liquid; odor similar to rose and apple mixtures. D 0.878, refr index 1.480–1.482, angular rotation (natural) +11 to +14 degrees; (synthetic) optically inactive, stable in air. Soluble in alcohol and most fixed oils; insoluble in glycerol. Combustible.

Derivation: Occurs naturally in Peru balsam and oils of orange flower, sweet orange, and ylang ylang. Also made synthetically.

Grade: FCC.

Use: Perfumery, flavoring.

nerolin. See β-naphthyl ethyl ether.

neroli oil. An essential oil used in perfumery and flavoring.

nerve gas. (nerve poison). One of several toxic chemical warfare agents developed in Germany during World War II. They are organic derivatives of phosphoric acid (principally alkyl phosphates, fluorophosphates, and thiophosphates). They inhibit the enzyme cholinesterase and cause acetylcholine poisoning and cessation of nerve transmission. They are colorless, odorless, tasteless liquids of low volatility and are absorbed rapidly through the eyes, lungs, or skin; they are lethally toxic to higher animals and humans. Many insecticides have the same structure and properties. Antidotes are atropine sulfate and pralidoxime iodide.

See parathion; cholinesterase inhibitor.

Nessler's reagent.

CAS: 7783-33-7. Solution of mercuric iodide in potassium iodide.

Hazard: High toxicity.

Use: Detecting the presence of ammonia, particularly in very small amounts.

Nessler tubes. Standardized glass tubes for filling with standard solution colors for visual color comparison with similar tubes filled with solution samples.

See Nessler's reagent.

neticonazole hydrochloride.

CAS: 130773-02-3. mf: $C_{17}H_{22}N_2OS \cdot ClH$.

Hazard: Moderately toxic by ingestion.

netobimin.

CAS: 88255-01-0. mf: $C_{14}H_{20}N_4O_7S_2$.

Hazard: A reproductive hazard.

Neuberg blue. A mixture of copper blue (powdered azurite) and an iron blue (Prussian blue). It can be more easily ground in oil than pure copper blue.

"Neulon" [Dow]. TM for polyvinyl acetate low-profile additives.

Use: For polyester modifiers, fast cure processes, and pigmentable systems.

Neumann's law. Molecular heat in compounds of analogous constitution is always the same.

Neumann triangle. Graphical representation of equilibrium of three surface tensions at point of contact of two immiscible liquids with air.

neurine. (trimethylvinylammonium hydroxide).

CAS: 463-88-7. $CH_2:CHN(CH_3)_3OH$. A poisonous ptomaine formed during putrefaction by the dehydration of choline.

Properties: Syrupy liquid; fishy odor. Absorbs carbon dioxide from the air; soluble in water and alcohol.

Hazard: Highly toxic.

Use: Biochemical research.

neuron. A cell of nervous tissue specialized for transmission of a nerve impulse.

neurotoxin A (naja naja reduced).

CAS: 11080-14-1. mf: $C_{331}H_{526}N_{98}O_{103}S_{10}$.

Hazard: A poison.

Source: Natural product.

neurotransmitter. A low molecular weight compound (usually containing nitrogen) secreted from the terminal of one neuron and bound by a specific receptor in the next neuron in order to transmit a nerve impulse.

"Neustrene" [ACH]. TM for hydrogenated refined glyceride products from selected animal, vegetable, and marine raw material sources.

Use: Lubricating greases, pharmaceutical intermediates, synthetic waxes, textile lubricants, mold-release agents, buffering compounds, emulsifying agents, adhesives, textile softeners, and lubricants.

"Neustrene 064" [ACH]. (glyceryl tristearate).

CAS: 555-43-1. TM for plastic lubricant and mold-release agent.

Use: Synthetic wax for cosmetic sticks and pencils.

neutral. (1) Of particles, without electric charge. See neutron; atom.

(2) Of solutions, neither acidic nor basic. See pH.

neutral flame. Gas flame produced by a mixture of fuel and oxygen so as to be neither oxidizing nor reducing.

neutralization. A chemical reaction in which water is formed by mutual interaction of the ions that characterize acids and bases when both are present in an aqueous solution, i.e., $H^+ + OH^- \rightarrow H_2O$, the remaining product being a salt. R. T. Sanderson states: "An aqueous solution containing an excess of hydronium ions is called acidic. It readily releases protons to electron-donating substances. An aqueous solution containing an excess of hydroxyl ions is called basic. It readily accepts protons from substances that can release them, and is in general an excellent donor. No aqueous solution can contain an excess of both hydronium and hydroxyl ions, because when these ions collide, a proton is immediately transferred from the hydronium to the hydroxyl ion, and both become water molecules."

Neutralization occurs with both (1) inorganic and (2) organic compounds: (1) $Ca(OH)_2 + H_2SO_4 \rightarrow CaSO_4 + 2H_2O$; (2) $HCOOH + NaHCO_3 \rightarrow HCOONa + CO_2 + H_2O$. It should be noted that neutralization can occur without formation of water, as in the reaction $CaO + CO_2 \rightarrow CaCO_3$. Neutralization does not mean the attaining of pH 7.0; rather it means the equivalence point for an acid-base reaction. When a strong acid reacts with a weak base, the pH will be less than 7.0, and when a strong base reacts with a weak acid, the pH will be greater than 7.0.

neutral oil. A lubricating oil of medium or low viscosity obtained by distillation and dewaxing of crude petroleum or its cracking products.

neutral red. (toluylene red; 3-amino-7-(dimethylamino)-2-methylphenazine monohydrochloride; CI 50040).

$(CH_3)_2NC_6H_2N_2C_6H_2CH_3NH_2 \cdot HCl$ (tricyclic).

Properties: Green powder. Dissolves in water or alcohol to give red color.

Use: Acid-base indicator in the pH range 6.8–8.0 (red in acid, yellow-brown in alkali); biological stain.

neutron. Discovered by Chadwick in 1932, the neutron is a fundamental particle of matter having a mass of 1.009 but no electric charge. It is a constituent of the nucleus of all elements except hydrogen, the number of neutrons present being the difference between the mass number and the atomic number of the element. Neutrons may be liberated from the

nucleus by fission of uranium-235, plutonium, and a few other elements, each nucleus yielding an average of 2.5 neutrons; they can also be produced by bombardment of other elements, e.g., beryllium with positively charged particles.

Because free neutrons are uncharged they have tremendous penetrating power as a result of their electrical neutrality; hence, they have a highly damaging effect on living tissue, requiring the use of shielding of all equipment in which they are produced. Neutrons directly emitted from atomic nuclei are termed fast; these bring about the chain reaction in the atomic bomb. In a nuclear power reactor, where a less rapid reaction is desired, the energy of fast neutrons is partially absorbed by the moderator, and the neutrons so retarded are called slow or thermal.

See electron; proton; fission.

Use: Nuclear fission; manufacture of plutonium and radioactive isotopes; activation analysis.

neutron activation analysis. See activation analysis.

neutron diffraction. See diffraction, neutron.

Neville-Winter acid. (1-naphthol-4-sulfonic acid; α -naphtholsulfonic acid; NW acid).

Properties: Transparent plates. Mp 170C. Soluble in water.

Derivation: From sodium salt of naphthionic acid by hydrolysis of the amino group.

Use: Azo dye intermediate, e.g., Congo Corinth.

“Nevindene” [Neville]. TM for high-melting coumarone-indene resins of extreme hardness.

Use: Dental compounds, fast-drying varnishes, rotogravure inks, aluminum paints, and insulating compounds.

“Nevinol” [Neville]. TM for a series of (alkyl) hydroxy resins.

Use: Adhesives, lacquers, paper coatings, special inks, and varnishes.

Newtonian flow. Flow characterized by a rate of shear that is directly proportional to the shearing force.

See non-Newtonian behavior.

Newtonian liquid. A liquid conforming to the law that the homogeneous shearing stress is the

product of the coefficient of viscosity and rate of shear.

NF. Abbreviation for National Formulary, a compendium of pharmaceutical formulations widely used as a standard reference.

NFPA. Abbreviation for National Fire Protection Association.

Ni. Symbol for nickel.

“Niacide” [FMC]. TM for fungicidal products containing dimethyl dithiocarbamates used mainly for scab control.

niacin. (nicotinic acid; pyridine-3-carboxylic acid).

CAS: 59-67-6.

The antipellagra vitamin, essential to many animals for growth and health. In humans, niacin is believed necessary, along with other vitamins, for the prevention and cure of pellagra. It functions in protein and carbohydrate metabolism. As a component of two important enzymes, coenzymes I and II, it functions in glycolysis and tissue respiration.

Properties: Colorless needles; odorless; sour taste. Mp 236C, sublimes above melting point, d 1.473. Soluble in water and alcohol; insoluble in most lipid solvents, quite stable to heat and oxidation. A vasodilator in high concentration. Amounts of niacin are expressed in milligrams.

Source: Food sources; meat, fish, milk, whole grains, yeast. Commercial sources: synthetic niacin is made by oxidation of nicotine, quinoline, or 2-methyl-5-ethylpyridine (from ammonia and formaldehyde or acetaldehyde).

Grade: NF, FCC, blended with soy flour (animal feeds).

Use: Medicine (cholesterol-lowering agent), nutrition, feeds, enriched flours, dietary supplement. See niacinamide.

niacinamide. (nicotinamide; nicotinic acid amide).

CAS: 98-92-0. $C_5N_4NCONH_2$. Same biological function as niacin.

Properties: Colorless needles; bitter taste. Mp 129C, d 1.40. Soluble in water, ethanol, and glycerol.

Source: Synthetic made by conversion of niacin to the amide.

Grade: USP, FCC, Also commercially available as the hydrochloride.

Use: Medicine, dietary supplement.

niacinamide ascorbate. A complex of ascorbic acid and niacinamide.

Properties: Lemon-yellow powder; odorless or with a very slight odor. May gradually darken upon exposure to air. Soluble in water and alcohol, sparingly soluble in glycerol, practically insoluble in benzene.

Grade: FCC.

Use: Dietary supplement.

nialamide. (1-(2-benzylcarbonyl)ethyl-2-isonicotinoylhydrazine).

CAS: 51-12-7.

$C_5H_4NCO(NH_2)(CH_2)_2CONHCH_2C_6H_5$.

Properties: White, crystalline powder. Low solubility in water; good solubility in slightly acid solution. It is stable in crystalline form, suspension, and solution.

Use: Medicine (as an antidepressant).

Hazard: Toxic in overdose.

“Nialk.” [Occidental]. TM for chlorine, caustic soda, caustic potash, carbonate of potash, paradichlorobenzene, and trichloroethylene.

nicarbazin. Equimolar complex of 4,4'-dinitrocarbanilide and 2-hydroxy-4,6-dimethylpyrimidine.

Properties: Forms crystals. Decomposes at 265–275°C. Insoluble in water.

Use: Coccidiostat.

niccolite. (arsenical nickel). NiAs. An ore of nickel.

Properties: Pale-copper-red mineral with dark tarnish, metallic luster. Contains 43.9% nickel. D 7.3–7.67, Mohs hardness 5–5.5. Soluble in concentrated nitric acid.

Hazard: Toxic by inhalation of dust.

“Nichrome.” TM for an alloy containing 60% nickel, 24% iron, 16% chromium, 0.1% carbon.

Use: It is used principally for electric resistance purposes. It also offers good resistance to mine and seawaters and moist sulfurous atmospheres.

nickel.

CAS: 7440-02-0. Ni. Metallic element of atomic number 28, group VIII of the periodic table, aw 58.70, valences of 2, 4. Five stable isotopes.

Properties: Malleable, silvery metal. Readily fabricated by hot- and cold-working, takes high polish, excellent resistance to corrosion. D 8.908, mp 1455°C, bp 2900°C, electrical resistivity (20°C) 6.844 microhm-cm. Attacked slightly by hydrochloric acid and sulfuric acid, somewhat more by nitric acid, highly resistant to strong alkalis.

Occurrence: Ontario, Cuba, Norway, Dominican Republic.

Derivation: Nickel ores are of two types, sulfide and oxide, the former accounting for two-thirds of the world's consumption. Sulfide ores are refined by flotation and roasting to sintered nickel oxide, and

either sold as such or reduced to metal, which is cast into anodes and refined electrolytically or by the carbonyl process (see Mond process). Oxide ores are treated by hydrometallurgical refining, e.g., leaching with ammonia. Much secondary nickel is recovered from scrap.

Grade: Electrolytic, ingot, pellets, shot, sponge, powder, high-purity strip, single crystals.

Hazard: Flammable and toxic as dust or fume. A carcinogen (OSHA). TLV: (metal) 1 mg/m³; (soluble compounds) (Ni): 0.1 mg/m³.

Use: Alloys (low-alloy steels, stainless steel, copper and brass, permanent magnets, electrical resistance alloys), electroplated protective coatings, electroformed coatings, alkaline storage battery, fuel cell electrodes, catalyst for methanation of fuel gases and hydrogenation of vegetable oils.

See Raney's nickel.

nickel acetate.

CAS: 373-02-4. Ni(OOCCCH₃)₂•4H₂O.

Properties: Green, monoclinic crystals; effloresces somewhat in air. D 1.74, decomposes on heating to 250°C. Soluble in water and alcohol.

Derivation: By heating nickel hydroxide with acetic acid in the presence of metallic nickel.

Hazard: Toxic by ingestion, a carcinogen (OSHA).

Use: Textiles (mordant), catalyst.

nickel acetylacetonate.

CAS: 3264-82-2. (CH₃COCHCOCH₃)₂Ni.

Properties: Green, crystalline solid. Mp 230°C, bp 220°C (11 mm Hg), d 1.45. Soluble in water, alcohol, and benzene; insoluble in ether.

Use: Catalyst for organic reactions.

nickel aluminide. A cermet that can be flame-sprayed.

nickel ammonium chloride. (ammonium nickel chloride). (1) NiCl₂•NH₄Cl, (2) NiCl₂•NH₄Cl•6H₂O. **Properties:** (1) Yellow powder, (2) green crystals, d 1.65, soluble in water, deliquescent.

Hazard: See nickel.

Use: Electroplating, dyeing (mordant).

nickel ammonium sulfate. (nickel salts, double; ammonium nickel sulfate).

CAS: 15699-18-0. NiSO₄•(NH₄)₂SO₄•6H₂O.

Properties: Green crystals. D 1.929. Decomposed by heat. Soluble in water; less in ammonium sulfate solution; insoluble in alcohol.

Derivation: An aqueous solution of nickel sulfate is acidified with sulfuric acid, then an aqueous solution of ammonium sulfate is added. On concentrating, crystals of the double sulfate separate out.

Hazard: See nickel.

Use: Nickel electrolyte for electroplating.

nickel arsenate. (nickelous arsenate).

Ni₃(AsO₄)₂•8H₂O.

Properties: Yellow-green powder. D 4.98. Soluble in acids; insoluble in water.

Hazard: Highly toxic.

Use: Catalyst (hardening fats used in soap).

nickel bromide. (nickelous bromide). (1) NiBr_2 , (2) $\text{NiBr}_2 \cdot 3\text{H}_2\text{O}$.

Properties: (1) Brownish-yellow solid or yellow, lustrous scales. D 5.098, mp 963C. (2) Deliquescent, greenish scales; loses $3\text{H}_2\text{O}$ at 300C. Soluble in water, alcohol, ether, and ammonium hydroxide.

Derivation: Bromination of nickel powder or nickel carbonyl.

Hazard: See nickel.

nickel carbonate, basic.

CAS: 3333-67-3. $\text{NiCO}_3 \cdot 2\text{Ni}(\text{OH})_2 \cdot 4\text{H}_2\text{O}$.

Properties: Light-green crystals or brown powder. D 2.6. Insoluble in water; soluble in ammonia and dilute acids.

Derivation: (1) In nature as the mineral zaraitite. (2) Synthetically, by addition of soda ash to a solution of nickel sulfate.

Hazard: See nickel.

Use: Electroplating, preparation of nickel catalysts, ceramic colors and glazes.

nickel carbonyl. (nickel tetracarbonyl).

CAS: 13463-39-3. $\text{Ni}(\text{CO})_4$. A zero-valent compound. The four carbonyl groups form a tetrahedral arrangement and are linked covalently to the metal through the carbons.

Properties: Colorless liquid. D 1.3185, fp -19C , bp 43C , vap press 400 mm Hg (25.8C). Soluble in alcohol and many organic solvents; soluble in concentrated nitric acid; insoluble in water.

Derivation: By passing carbon monoxide gas over finely divided nickel.

Grade: Technical.

Hazard: Flammable, dangerous fire risk, explodes at 60C (140F). A carcinogen (OSHA). TLV: 0.05 ppm(Ni).

Use: Production of high-purity nickel powder by Mond process, continuous nickel coatings on steel and other metals.

nickel chloride. (nickelous chloride).

CAS: 7718-54-9. (1) NiCl_2 , (2) $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: (1) Brown scales, deliquescent, (2) green scales, deliquescent. Soluble in water, alcohol, and ammonium hydroxide. (1) D 3.55, mp 1001C . Non-flammable.

Derivation: Action of hydrochloric acid on nickel.

Hazard: See nickel.

Use: Electroplated nickel coatings, reagent chemical.

nickel cyanide.

CAS: 557-19-7. $\text{Ni}(\text{CN})_2 \cdot 4\text{H}_2\text{O}$.

Properties: Apple-green plates or powder. Mp loses $4\text{H}_2\text{O}$ at 200C , bp decomposes. Soluble in ammonium hydroxide and potassium cyanide solution; insoluble in water and acids.

Derivation: By adding potassium cyanide to a solution of a nickel salt.

Hazard: Highly toxic. TLV: 0.1 mg(Ni)/m³; 5 mg(CN)/m³.

Use: Metallurgy, electroplating.

nickel dibutyldithiocarbamate.

CAS: 13927-77-0. $\text{Ni}[\text{SC}(\text{S})\text{N}(\text{C}_4\text{H}_9)_2]_2$.

Properties: Dark-green flakes. D 1.26, mp 86C min.

Use: Antioxidant for synthetic rubbers.

nickel dimethylglyoxime. $\text{C}_8\text{H}_{14}\text{N}_4\text{NiO}_4$.

Properties: Bright-red powder. Sublimes at 250C . Insoluble in water; soluble in mineral acids.

Use: Pigment in paints, cosmetics, celluloseics.

nickel formate. $(\text{HCOO})_2\text{Ni} \cdot 2\text{H}_2\text{O}$.

Properties: Green crystals. D 2.15. Partially soluble in water; insoluble in alcohol.

Derivation: (1) Reaction of sodium formate and nickel sulfate, (2) dissolving nickel hydroxide in formic acid.

Hazard: See nickel.

Use: Production of nickel catalysts.

nickel hydroxide. See nickelous hydroxide; nickelic hydroxide.

nickelic hydroxide. (nickel hydroxide).

CAS: 12054-48-7. $\text{Ni}(\text{OH})_2$.

Properties: Black powder. Mp decomposes.

Derivation: By adding a hypochlorite to a solution of a nickel salt.

Use: Nickel salts.

nickelic oxide. (nickel peroxide; nickel(III) oxide; nickel sesquioxide; black nickel oxide).

CAS: 1314-06-3. Ni_2O_3 .

Properties: Gray-black powder. D 4.84, mp (reduced to nickel oxide) 600C . Soluble in acids; insoluble in water.

Derivation: By gentle heating of the nitrate or chlorate.

Hazard: See nickel.

Use: Storage batteries.

nickel iodide. (nickelous iodide). NiI_2 or $\text{NiI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Black, crystalline powder or blue-green crystals; hygroscopic. D 5.834, sublimes at 797C without melting. Soluble in alcohol and water.

Derivation: Direct combination of nickel and iodine.

Hazard: Toxic by ingestion.

See nickel.

nickel-iron alloy. See iron-nickel alloy.

“Nickel-Lume” [ATOTECH]. TM for a bright nickel electroplating process; materials used are nickel sulfate, nickel chloride, boric acid, and organic addition agents.

nickel matte. See matte.

nickel nitrate. (nickelous nitrate).

CAS: 13138-45-9. $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Green, deliquescent crystals. D 2.065, mp 55C, bp 136.7C. Soluble in water, ammonium hydroxide, and alcohol.

Derivation: By the action of nitric acid on nickel, or on nickel oxide.

Grade: Technical, reagent.

Hazard: Dangerous fire risk, strong oxidizing agent. TLV: 0.1 mg(Ni)/m³.

Use: Nickel plating, preparation of nickel catalysts, manufacture of brown ceramic colors.

nickel nitrate, ammoniated. (nickel nitrate tetrammine). $\text{Ni}(\text{NO}_3)_2 \cdot 4\text{NH}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Green crystals. Soluble in water; insoluble in alcohol; decomposes in air.

Derivation: By adding ammonium hydroxide to a nitric acid solution of nickel oxide with subsequent crystallization.

Hazard: See nickel nitrate.

Use: Nickel plating.

nickelocene. (dicyclopentadienylnickel).

$(\text{C}_5\text{H}_5)_2\text{Ni}$.

Properties: Dark-green crystals. Mp 171–173C. Soluble in most organic solvents; insoluble in water. Decomposes in acetone, alcohol, and ether; highly reactive compound that decomposes rapidly in air.

Hazard: Toxic by inhalation and skin contact, a carcinogen (OSHA).

Use: Catalyst, complexing agent.

See metallocene.

nickelous arsenate. See nickel arsenate.

nickelous bromide. See nickel bromide.

nickelous chloride. See nickel chloride.

nickelous hydroxide. (nickel hydroxide).

CAS: 12125-56-3. $\text{Ni}(\text{OH})_2$.

Properties: Fine green powder. D 4.15, mp (decomposes) 230C. Very slightly soluble in water; soluble in acids and ammonium hydroxide.

Derivation: By adding caustic soda to a solution of nickelous salt.

Hazard: See nickel.

Use: Nickel salts.

nickelous iodide. See nickel iodide.

nickelous nitrate. See nickel nitrate.

nickelous phosphate. See nickel phosphate.

nickel oxide. (nickelous oxide; nickel(II) oxide; nickel protoxide; green nickel oxide).

CAS: 1313-99-1. NiO .

Properties: Green powder that becomes yellow. D

6.6–6.8, absorbs oxygen at 400C forming nickelic oxide, which is reduced to nickel oxide at 600C. Soluble in acids and ammonium hydroxide. Insoluble in water and caustic solutions.

Derivation: By heating nickel above 400C in the presence of oxygen.

Hazard: See nickel.

Use: Nickel salts, porcelain painting, fuel cell electrodes.

nickel oxide, black. See nickelic oxide.

nickel oxide, green. See nickel oxide.

nickel peroxide. See nickelic oxide.

nickel phosphate. (nickelous phosphate; trinickelous-orthophosphate). $\text{Ni}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Light-green powder. Soluble in acids and ammonium hydroxide; insoluble in water.

Use: Electroplating.

nickel potassium sulfate. (potassium nickel sulfate). $\text{NiSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Blue-green crystals. D 2.124. Soluble in water.

nickel protoxide. See nickel oxide.

nickel-rhodium. Alloys containing nickel and 25–80% rhodium, but sometimes also some platinum, iridium, palladium, molybdenum, tungsten, copper, iron, or cobalt.

Use: Electrodes, chemical apparatus, reflectors.

nickel salt, double. See nickel ammonium sulfate.

nickel salt, single. See nickel sulfate.

nickel sesquioxide. See nickelic oxide.

nickel-silver. Nonferrous alloy of nickel, copper, and zinc having a silver appearance.

Use: Etching, enameling, silver plating, and chromium plating.

nickel stannate. $\text{NiSnO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Light-colored, crystalline powder. Approximate temperature of dehydration 120C.

Hazard: Toxic by ingestion and inhalation. TLV: 0.1 mg(Ni)/m³.

Use: Additive in ceramic capacitors.

nickel sulfate. (nickel salts, single; blue salt).

CAS: 7786-81-4. (1) NiSO_4 , (2) $\text{NiSO}_4 \cdot 6\text{H}_2\text{O}$, (3) $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: (1) Yellow-green crystals, (2) blue or emerald green crystals, (3) green crystals. D (1) 3.68, (2) 2.031, (3) 1.98; mp (1) 840C (loses SO_3), (2) and (3) loses $6\text{H}_2\text{O}$ at 103C. All the sulfates are

soluble in water; (2) and (3) are soluble in alcohol; (1) is insoluble in alcohol and ether.

Derivation: Action of sulfuric acid on nickel.

Grade: Technical, CP, single crystals.

Hazard: Toxic material. TLV: 0.1 mg(Ni)/m³; confirmed human carcinogen.

Use: Manufacture of nickel ammonium sulfate, nickel catalysts, nickel plating, mordant in dyeing and printing textiles, coatings, ceramics.

nickel tetracarbonyl. See nickel carbonyl.

nick translation. A method for incorporating radioactive isotopes (typically ³²P) into a piece of DNA. The DNA is randomly nicked by DNase I, and then starting from those nicks DNA polymerase I digests and then replaces a stretch of DNA. Radiolabeled precursor nucleotide triphosphates can thus be incorporated.

nicol. An optical material (Iceland spar) that functions as a prism, separating light rays that pass through it into two portions, one of which is reflected away and the other transmitted. The transmitted portion is called plane-polarized light. See calcite; optical isomerism.

“Nicomo-12” [Grace]. TM for a hydrodesulfurization catalyst of nickel, cobalt, and molybdenum on alumina.

“Nicon” [LaMotte]. Brand name for diethyldithiocarbamate used in the colorimetric determination of nickel.

nicotinamide. See niacinamide.

nicotinamide adenine dinucleotide phosphate. (NADP; diphosphopyridine nucleotide; DPN; coenzyme I; Co I; codehydrogenase I). C₂₂H₂₇O₁₄N₇P₂. Entry name is recommended by the International Union of Biochemistry and IUPAC. A coenzyme necessary for the alcoholic fermentation of glucose and the oxidative dehydrogenation of other substrates. It occurs widely in living tissue, especially in liver.

Use: Biochemical research, chromatography.

nicotine. (β-pyridyl-α-n-methylpyrrolidine). CAS: 54-11-5. C₈H₉NC₄H₇NCH₃.

Properties: Alkaloid from tobacco; thick, water-white, levorotatory oil turning brown on exposure to air, also in form of dust or powder. Hygroscopic. Bp 247C, d 1.00924, autoign temp 471F (243C). Solu-

ble in alcohol, chloroform, ether, kerosene, water, and oils. Combustible.

Derivation: By distilling tobacco with milk of lime and extracting with ether.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 0.5 mg/m³.

Use: Insecticide, fumigant; use as insecticide may be restricted. Available as the dihydrochloride, salicylate, sulfate, and bitartrate.

nicotine, compd. with manganese(ii) o-benzoyl benzoate, trihydrate (2:1).

CAS: 64092-22-4. mf: C₄₈H₄₆MnN₄O₆•3H₂O.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

nicotine-n'-oxide.

CAS: 491-26-9. mf: C₁₀H₁₄N₂O.

Hazard: A poison.

nicotine salts. (1) Hydrochloride, C₁₀H₁₄N₂•HCl; (2) salicylate, C₁₀H₁₄N₂•C₇H₆O₃; (3) sulfate, (C₁₀H₁₄N₂)₂•H₂SO₄ (40% solution = “Black Leaf Fort”); (4) tartrate, C₁₀H₁₄N₂•2C₄O₆H₄•H₂O.

Properties: (1) Colorless oil; (2) white crystals. Mp 117.4C; (3) white crystals; (4) white plates. Mp 89C. All the salts are soluble in water, alcohol, and ether.

Derivation: By the action of the respective acid on the alkaloid.

nicotinic acid. See niacin.

nicotinic acid, aluminum salt. See aluminum nicotinate.

nicotinic acid amide. See niacinamide.

Niementowski quinazoline synthesis. Formation of 4-oxo-3,4-dihydroquinazolines by cyclization of the reaction products of anthranilic acid and amides.

Niementowski quinoline synthesis. Formation of γ-hydroxyquinoline derivatives from anthranilic acids and carbonyl compounds.

Nierenstein reaction. Formation of omega-chloroacetophenones by reaction of diazomethane in dry ether with aryl chlorides. Coumaranones are obtained if an ortho-hydroxy group is present.

Nieuland, Father J. A. (1878–1936). A Jesuit whose research on polymers of acetylene formed the basis for the development of polychloroprene (neoprene) in 1931.

See Carothers, Wallace H.

(-)-nigaldipine hydrochloride.

CAS: 189624-85-9. mf: C₃₁H₄₂N₄O₆•2ClH.

Hazard: A poison by ingestion.

nigrescigenin.CAS: 6785-70-2. mf: $C_{25}H_{32}O_7$.**Hazard:** A poison.**Source:** Natural product.**nigrosine.** A class of dark-blue or black dyes, some soluble in water, some in alcohol, and some in oil.**Use:** Manufacture of ink and shoe polish dyeing leather, wood, textiles, etc. It is also used as a shark repellent.**niGRE.** The dark-colored layer containing some soap, as well as salts and impurities, formed in soap manufacture between the layers of soap proper and caustic solution.**NIH.** Abbreviation for National Institutes of Health (Bethesda, MD).**“Nikanol” [Fudow].** TM for a liquid resin.**ninhydrin.** (triketohydrindene hydrate).CAS: 485-47-2. $C_9H_4O_3 \cdot H_2O$.**Properties:** White crystals or powder. Mp 240–245C, becomes red when heated above 100C. Soluble in water and alcohol; slightly soluble in ether and chloroform.**Hazard:** Irritant.**Use:** Chemical intermediate; reagent for determination of amines, amino acids, ascorbic acid.**ninhydrin reaction.** A color reaction given by free amino groups of amino acids and peptides on heating with ninhydrin; widely used for their detection and estimation.**“Ninol” [Stepan].** TM for an emulsifier and lubricant.**Use:** Anti-static properties for textiles.**niobe oil.** See methyl benzoate.**niobic acid.** Any hydrated form of Nb_2O_5 . It forms as a white, insoluble precipitate when a potassium hydrogen sulfate fusion of a niobium compound is leached with hot water or when niobium fluoride solutions are treated with ammonium hydroxide. Soluble in concentrated sulfuric acid, concentrated hydrochloric acid, hydrogen fluoride, and bases. Important in analytical determination of niobium.**niobite.** See columbite.**niobium.** (columbium).CAS: 7440-03-1. Nb. The name *niobium* is officially approved by chemical authorities, but columbium is still used chiefly by metallurgists. Metallic element, atomic number 41, group VB of the periodic table, aw 92.9064, valences of 2, 3, 4, 5; no stable isotopes.**Properties:** Gray or silvery, ductile metal. Does not tarnish or oxidize at room temperature. D 8.57, mp 2468C. Reacts with oxygen and halogens only when heated, less corrosion resistant than tantalum at high temperature. Not attacked by nitric acid up to 100C, but vigorously attacked by a mixture of nitric and hydrofluoric acids. Hot concentrated hydrochloric acid, sulfuric acid, and phosphoric acid attack it, but hot concentrated nitric acid does not. Unaffected at room temperature by most acids and by aqua regia. It is attacked by alkaline solutions to some extent at all temperatures.**Occurrence:** Found in two major ores, columbite and pyrochlore (a carbonate-silicate rock). Chief sources are Brazil, Nigeria, Canada.**Derivation:** Niobium is so closely associated with tantalum that they must be separated by fractional crystallization or by solvent extraction, with subsequent purification.**Grade:** Plates, rods, powder, single crystals.**Use:** Superconducting and magnetic alloys (with tin and titanium), cermets, missiles and rockets, cryogenic equipment, ferroniobium for alloy steels.**niobium carbide.** NbC.**Properties:** Lavender-gray powder. Mp approximately 3500C, d 7.82. Insoluble in water and in all acids except a mixture of nitric acid and hydrogen fluoride.**Derivation:** By direct combination of niobium with carbon or by the reduction of niobium oxide with lampblack.**Use:** Cemented carbide tipped tools, special steels, preparation of niobium metal, coating graphite for nuclear reactors.**niobium chloride.** (niobium pentachloride).CAS: 10026-12-7. $NbCl_5$.**Properties:** Yellow, crystalline solid. Mp 205C, bp 254C, d 2.75. Deliquescent; decomposes in moist air with evolution of hydrogen chloride fumes. Soluble in carbon tetrachloride, hydrochloric acid, concentrated sulfuric acid.**Derivation:** Direct combination of niobium and chlorine, chlorination of niobium oxide in the presence of carbon.**Hazard:** May evolve fumes of hydrogen chloride. Keep dry.**Use:** Preparation of pure niobium; intermediate.**niobium diselenide.** $NbSe_2$.**Properties:** Gray-black solid. Mp >1316C, vacuum stable from -430 to 2400F (-170 to 1315C). Has higher electrical conductivity than graphite.**Use:** Lubricant and conductor at high temperatures and high vacuum.**niobium oxalate.** $NbO(HC_2O_4)_3 \cdot 4H_2O$.**Properties:** White crystals, 99.99% pure. Very soluble in water.**Use:** Intermediate, special catalysts.

niobium oxide. (niobium pentoxide).

CAS: 1313-96-8. Nb₂O₅.

Properties: White powder. D 4.5–5.0, mp 1520C. Insoluble in acids (except hydrofluoric and hot sulfuric acids); insoluble in water; soluble in fused potassium hydrogen sulfate, or carbonates or hydroxides of the alkali metals.

Derivation: Strong ignition of niobic acid.

Use: Intermediate, electronics.

niobium pentachloride. See niobium chloride.

niobium pentoxide. See niobium oxide.

niobium potassium oxyfluoride. (potassium niobium oxypentafluoride; potassium oxyfluoniobate).

CAS: 17523-77-2. K₂NbOF₅•H₂O.

Properties: White, lustrous leaflets; greasy to touch. Soluble in hot water.

Hazard: Toxic by ingestion, strong irritant. TLV: 2.5 mg(F)/m³.

Use: Separation of niobium from tantalum, electrolytic preparation of niobium metal.

niobium silicide. NbSi₂.

Properties: Crystalline solid. Mp 1950C.

Use: Refractory material.

niobium-tin. Nb₃Sn. Alloy used for special wire for superconducting magnets to obtain high magnetic fields for use in communication and containment of thermonuclear fusion plasmas.

niobium-titanium. Alloy used for magnetic devices with fields up to 100,000 gauss.

niobium-uranium. Niobium alloyed with 20% uranium yields a nuclear fuel that maintains tensile strength and hardness at 871C.

NIOSH. Abbreviation for National Institute for Occupational Safety and Health.

“NiPar S-10” [Angus]. TM for 1-nitropropane.

CAS: 108-03-2.

Grade: Industrial.

Available forms: Liquid.

Use: Solvent for inks; chemical intermediate; diesel fuel additive.

See 1-nitropropane.

“NiPar S-20” [Angus]. (2-nitropropane).

CAS: 79-46-9. TM for solvent.

Use: For inks and coatings based on resins of vinyl, epoxy, acrylic, polyurethane, polyamide, nitrocellulose, chlorinated rubber. Also used in automotive finishes, extractions, crystallization, diesel fuel additives, and intermediates.

“Nirez” [Reichhold]. TM for polyterpene, terpene, phenol, and resins used in adhesives, coatings, chewing gums, and printing inks.

NIRMS. Noble gas-ion reflection mass spectroscopy.

nisin. Antibiotic containing 34 amino acid residues, produced by *Streptomyces lactis*.

Use: Food preservative, especially in canned products.

nisin preparation.

CAS: 1414-45-5. mf: C₁₄₃H₂₃₀N₄₂O₃₇S₇.

Properties: Crystals from ethanol. Derived from *Streptococcus lactus* Lancefield Group N.

Use: Food additive.

NIST. See National Institute of Standards and Technology.

nit. Solution of nitric acid in methyl or ethyl alcohol; 1.5% by volume.

Use: Etching agent in ferrous metallography.

niter. (nitre; saltpeter).

CAS: 7757-79-1. KNO₃. A natural potassium nitrate.

niter cake. A common name for sodium bisulfate (NaHSO₄) because it was a product of the reaction by which nitric acid was first made: NaNO₃ + H₂SO₄ → NaHSO₄ + HNO₃. See sodium bisulfate.

niter, Chile. See sodium nitrate.

“Niterox” [Chilean].

CAS: 7631-99-4. TM for sodium nitrate.

Use: Charcoal, glass, explosives, treating metal, anti-freeze, chemical compounding, wastewater treatment, cleaning compounds, and pharmaceuticals.

nitralin. A herbicide used largely to control weeds in cotton and soybeans. Research indicates possible use in plant breeding; treatment of corn roots induces abnormal chromosome formation and cell-wall deterioration.

nitralloy. See nitriding.

nitramine. See tetryl.

“Nitrane” [Grace]. TM for industrial chemicals, mainly nitroparaffin solvents.

nitranilic acid. (2,5-dihydroxy-3,6-dinitroquinone). C₆O₂(NO₂)₂(OH)₂.

Properties: Flat, yellow crystals. Loses H₂O at 100C, decomposes explosively at 170C. Soluble in water and alcohol; insoluble in ether.

Hazard: Fire risk when heated. Evolves toxic fumes on decomposition.

nitraniline. See nitroaniline.

nitrapyrin. (2-chloro-6-(trichloromethyl)pyridine; "N-Serve" [Dow]).

CAS: 1929-82-4. $C_6H_3Cl_4N$.

Properties: Crystals. Mp 62.5–62.9, bp 136–137.5 (11 torr).

Hazard: TLV: 10 mg/m³; STEL; 20 mg/m³; not classifiable as a human carcinogen.

Use: A fertilizer additive.

nitrating acid. Legal label name for mixed acid.

nitration. A reaction in which a nitro group (–NO₂) replaces a hydrogen on a carbon atom by the use of nitric acid or mixed acid. An example is the nitration of cellulose to nitrocellulose. It is widely used in aromatic reactions to form such compounds as nitrobenzene, trinitrotoluene, nitroglycerin, and other explosives. Aromatic nitrations are usually effected with mixed acid, a mixture of nitric and sulfuric acids, at 0–120C. Aliphatic nitration is less common than aromatic, but propane can be nitrated under pressure to yield nitroparaffins.

nitrene. Electron-deficient, uncharged monovalent nitrogen species with either singlet or triplet electronic configurations; analog of carbene.

nitric acid. (aqua fortis; engraver's acid; azotic acid).

CAS: 7697-37-2. HNO₃.

Properties: Transparent, colorless, or yellowish fuming, suffocating, hygroscopic, corrosive liquid. Will attack almost all metals. The yellow color is due to release of nitrogen dioxide on exposure to light; strong oxidizing agent. Bp (decomposes) 78C, fp –42C, d 1.504 (25/4C), vap press 62 mm Hg (25C), refr index 1.3970 (24C), viscosity 0.761 cP (25C). Miscible with water, decomposes in alcohol.

Derivation: (1) Oxidation of ammonia by air or oxygen with platinum catalyst. (Note: A pelleted catalyst not containing platinum or other noble metals is available.) Air oxidation yields 60% acid; concentration is achieved by (a) distillation with sulfuric acid, (b) extractive distillation with magnesium nitrate, or (c) neutralizing the weak acid with soda ash, evaporating to dryness, and treating with sulfuric acid. Method (c) yields synthetic niter cake (NaHSO₄) as a by-product. (2) High-pressure oxidation of nitrogen tetroxide (yields 98% acid). (3) Reaction of nitrogen and oxygen in nuclear reactors; two tons of nitric acid are said to be produced from one gram of enriched uranium. Not in commercial use.

Grade: 36, 38, 40, 42 degrees Bé; 58–63.5%; 95%.

Hazard: Dangerous fire risk in contact with organic materials. Highly toxic by inhalation, corrosive to skin and mucous membranes, strong oxidizing agent. TLV: 2 ppm; STEL 4 ppm.

Use: Manufacture of ammonium nitrate for fertilizer and explosives, organic synthesis (dyes, drugs, explosives, cellulose nitrate, nitrate salts), metallurgy, photoengraving, etching steel, ore flotation, urethanes, rubber chemicals, reprocessing spent nuclear fuel.

nitric acid, fuming. (1) White fuming nitric acid (WFNA) contains more than 97.5% nitric acid, less than 2% water, and less than 0.5% NO_x. It is a colorless or pale-yellow liquid that fumes strongly. It is decomposed by light or elevated temperatures, becoming red in color from nitrogen dioxide.

(2) Red fuming nitric acid (RFNA) contains more than 85% nitric acid, approximately 6–15% NO_x (as nitrogen dioxide), and less than 5% water.

Derivation: From dilute nitric acid, nitrogen dioxide, and oxygen.

Hazard: Toxic by inhalation, corrosive to skin and mucous membranes. Strong oxidizing agent, may explode in contact with strong reducing agents. Dangerous fire risk.

Use: Preparation of nitro compounds, rocket fuels, laboratory reagent.

nitric acid, magnesium salt, hexahydrate.

CAS: 13446-18-9. mf: N₂O₆•Mg•6H₂O.

Hazard: Low toxicity by ingestion. A mild skin and eye irritant.

nitric oxide.

CAS: 10102-43-9. NO.

Properties: Colorless gas (readily reacts with oxygen at room temperature to form nitrogen dioxide, NO₂, a reddish brown gas). Bp –152C, fp –164C, d at bp 1.27. Slightly soluble in water. Noncombustible.

Derivation: Oxidation of ammonia above 500C, decomposition of nitrous acid (aqueous solution). Also from atmospheric oxygen and nitrogen in the electric-arc process for fixation of nitrogen.

Grade: Pure (99%).

Hazard: Supports combustion. Toxic by inhalation, strong irritant to skin and mucous membranes. TLV: 25 ppm.

Use: Intermediate in production of nitric acid from ammonia, preparation of nitrosyl carbonyls, bleaching rayon.

See nitrogen dioxide.

nitride. A compound of metal and nitrogen. As in aluminum nitride.

nitriding. A process of case hardening in which a ferrous alloy, usually of special composition, is heated in an atmosphere of ammonia or in contact with nitrogenous material to produce surface hardening by absorption of the nitrogen without quenching. The alloys used for nitriding are known as nitroalloys. Several types are available, with ranges of composition as follows: aluminum 0.85–11.2%, carbon 0.20–0.45%, chromium 0–8%, Molybde-

num 0.15–1.00%, Maganesen 0.4–0.7%, silicon 0.2–0.4%.

nitrile. An organic compound containing the $-C\equiv N$ grouping, for example, acrylonitrile $H_2C=CHC\equiv N$ and acetonitrile ($CH_3C\equiv N$).

Hazard: Some organic cyanide compounds are flammable (acetonitrile, acrylonitrile). Most organic cyanide compounds are toxic (acetonitrile, acrylonitrile).

nitrile rubber. (acrylonitrile rubber; acrylonitrilebutadiene rubber; nitrile-butadiene rubber; NBR). A synthetic rubber made by random polymerization of acrylonitrile with butadiene by free radical catalysis. Alternating copolymers using Natta-Ziegler catalyst have been developed. Approximately 20% of the total is used as latex; also available in powder form. Its repeating structure may be represented as $-CH_2CH=CHCH_2CH_2CH(CN)-$.

Properties: (Medium acrylonitrile) D (polymer) 0.98, tensile strength (psi) 1000–3000, elongation (%) 100–700, maximum service temperature 121–148C. Combustible.

Use: (High acrylonitrile) Oil well parts, fuel-tank liners, fuel hoses, gaskets, packing oil seals, hydraulic equipment.

(Medium acrylonitrile) General-purpose oil-resistant applications, shoe soles, kitchen mats, sink topping, and printing rolls.

(Low acrylonitrile) Gaskets, grommets, and O-rings (flexible at a very low temperature), adhesives. Fuel binder in solid rocket propellants.

nitrile-silicone rubber. (NSR). Combines the characteristic properties of silicones with the oil resistance of nitrile rubber. Resistant to jet fuels, solvents, and hot oils.

nitrilotriacetic acid. (NTA; triglycine; TGA; triglycolamic acid).

CAS: 139-13-9. $N(CH_2COOH)_3$.

Properties: White, crystalline powder. Mp 240aC (with decomposition). Insoluble in water and most organic solvents; forms mono-, di-, and tribasic salts that are water soluble. Combustible. 70% biodegradable.

Available forms: Di- and trisodium salts.

Use: Synthesis, chelating agent, eluting agent in purification of rare-earth elements, detergent builder.

nitrilotriacetonitrile. (NTAN). $N(CH_2CH_2)_3$.

Properties: White, crystalline solid. Mp 130–134C. Insoluble in water; soluble in acetone.

Hazard: See nitriles.

Use: Intermediate and chelating agent.

2,2',2''-nitrilotris(ethylamine).

CAS: 4097-89-6. mf: $C_6H_{18}N_4$.

Hazard: A poison by ingestion and skin contact.

“Nitrix” [Uniroyl]. TM for synthetic rubber latices of the butadiene-acrylonitrile type.

Use: Paper saturation, leather finishing, plasticizer for resin latices.

p-nitroacetanilide. $NO_2C_6H_4NHCOCH_3$.

Properties: White crystals. Mp 214–216C. Soluble in alcohol and ether; very slightly soluble in cold water; soluble in hot water and in potassium hydroxide solution. Combustible.

Derivation: By acetylating aniline, then nitrating.

Use: Manufacture of nitraniline.

p-nitro-o-aminophenol.

CAS: 99-57-0. $C_6H_3OHNH_2NO_2$.

Properties: Yellow-brown leaflets containing water of crystallization. Melting at 80–90C, anhydrous melts at 154C. Soluble in acid.

Derivation: From dinitrophenol.

Use: Dyes.

m-nitroaniline. (*m*-nitraniline).

CAS: 99-09-2. $NO_2C_6H_4NH_2$.

Properties: Yellow needles. D 1.43, mp 111.8C, bp 306C. Soluble in alcohol and ether; slightly soluble in water.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis; from *m*-nitrobenzoic acid.

Hazard: Moderate fire risk. Toxic when absorbed by skin.

Use: Dry intermediate.

o-nitroaniline. (*o*-nitraniline).

CAS: 88-74-4. $NO_2C_6H_4NH_2$.

Properties: Orange-red needles. D 1.443, mp 69.7C. Not lightfast, flash p 335F (168C), autoign temp 970F (521C). Soluble in alcohol and ether; slightly soluble in water.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis; from *o*-dinitrosobenzene.

Hazard: Explosion risk. Toxic when absorbed by skin.

Use: Dye intermediate, synthesis of photographic antifogging agent, *o*-phenylenediamine, coccidiostats.

p-nitroaniline. (*p*-nitraniline).

CAS: 100-01-6. $NO_2C_6H_4NH_2$.

Properties: Yellow needles. D 1.437, mp 148C, flash p 390F (198C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: (1) From *p*-chloronitrobenzene, (2) from aniline by nitration after acetylation, (3) from acetanilide.

Hazard: Explosion risk. Toxic when absorbed by

skin. TLV: 3 mg/m³; not classifiable as a human carcinogen.

Use: Dye intermediate, especially for *p*-nitraniline red; intermediate for antioxidants; gasoline gum inhibitors; corrosion inhibitors.

o-nitroanisole.

CAS: 91-23-6. C₆H₄OCH₃NO₂.

Properties: Light reddish or amber liquid. D 1.255 (20/20C), fp 9.6C, boiling range 268–271C, refr index 1.5602 (20C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: From *o*-nitrophenol by methylation or from *o*-nitrochlorobenzene by action of methanol and caustic soda.

Grade: Technical.

Use: Organic synthesis, intermediate for dyes and pharmaceuticals.

p-nitroanisole. (1-methoxy-4-nitrobenzene).

CAS: 100-17-4. NO₂C₆H₄OCH₃.

Properties: Colorless crystals. Mp 54C, bp 260C. Insoluble in water; soluble in alcohol and ether. Combustible.

Grade: Technical.

Use: Intermediate for dyes.

5-nitrobarbituric acid. (dilituric acid).

CAS: 480-68-2.

Properties: Prisms and leaflets from water. Mp 176C (decomposes). Slightly soluble in water; soluble in alcohol and sodium hydroxide solution; insoluble in ether.

Use: Microreagent for potassium.

3-nitrobenzaldehyde. (*m*-nitrobenzaldehyde).

NO₂C₆H₄CHO.

Properties: Yellowish, crystalline powder. Mp 58C, bp 164C (23 mm Hg). Almost insoluble in water; soluble in alcohol, chloroform, ether.

Use: Synthesis of dyes, pharmaceuticals, surface-active agents, vapor-phase corrosion inhibitor, antioxidant for chlorophyll, mosquito repellent.

2-nitrobenzaldehyde dimethylacetal.

CAS: 20627-73-0. mf: C₉H₁₁NO₄.

Hazard: Moderately toxic by ingestion and inhalation.

nitrobenzene. (oil of mirbane).

CAS: 98-95-3. C₆H₅NO₂.

Properties: Greenish-yellow crystals or yellow, oily liquid. D 1.19867, mp 5.70C, bp 210.85C, flash p

190F (87.7C), autoign temp 900F (482C). Soluble in alcohol, benzene, and ether; slightly soluble in water. Combustible.

Derivation: From benzene by nitrating with nitric acid–sulfuric acid mix.

Method of purification: By washing and distilling with steam, then redistilling.

Grade: Technical, redistilled, 97%.

Hazard: Toxic by ingestion, inhalation, and skin absorption. TLV: 1 ppm; an animal carcinogen.

Use: Manufacture of aniline; solvent for cellulose ethers; modifying esterification of cellulose acetate; ingredient of metal polishes and shoe polishes; manufacture of benzidine, quinoline, azobenzene, etc.

p-nitrobenzeneazoresorcinol.

NO₂C₆H₄N₂C₆H₃(OH)₂.

Properties: Red crystals. Mp 198C. Slightly soluble in water; soluble in nitrobenzene. Combustible.

Derivation: Diazotized *p*-nitroaniline is coupled with resorcinol.

Grade: Analytical.

Use: Determination of magnesium.

m-nitrobenzenesulfonic acid. (3-nitrobenzenesulfonic acid).

CAS: 98-47-5. C₆H₄NO₂SO₃H.

Properties: Crystals. Mp 70C. Soluble in water and alcohol.

Use: Organic synthesis. The sodium salt is a protective antireduction agent.

6-nitrobenzimidazole.

CAS: 94-52-0.

Properties: Solid. Mp 203C. Very soluble in alcohol; slightly soluble in water, ether, and benzene.

Use: Antifogging agent in photographic developers.

5-nitrobenzimidazole nitrate.

CAS: 27896-84-0. mf: C₇H₅N₃O₂•HNO₃.

Hazard: Moderately toxic by ingestion.

nitrobenzoic acid. (1) *m*-, (2) *o*-, (3) *p*-(nitrodracylic acid).

CAS: (*m*-) 121-92-6; (*p*-) 62-23-7. C₆H₄(NO₂)COOH.

Properties: Yellowish-white crystals. (1) d 1.494, mp 140–141C; (2) d 1.575, mp 147.7C; (3) d 1.5497, mp 238C. (1) Soluble in alcohol and ether; slightly soluble in water; (2) soluble in water, alcohol, and ether; (3) soluble in alcohol, sparingly soluble in water. Combustible.

Derivation: (1) Nitration of benzoic acid; (2) oxidation of *o*-nitrotoluene with MnO₂ and sulfuric acid, (3) oxidation of *p*-nitrotoluene by hot chromic acid mixture.

Use: (1) Dye intermediate, reagent for alkaloids; (2) and (3) organic synthesis.

m-nitrobenzotrifluoride. (3-nitrobenzotrifluoride; *m*-nitrotrifluoromethylbenzene).

CAS: 98-46-4. $\text{NO}_2\text{C}_6\text{H}_4\text{CF}_2$.

Properties: Pale-straw, thin, oily liquid; aromatic odor. Distillation range 200.5–208.5C, fp –5.0C, d 1.437 (15.5C), bp 203C, flash p 214F (101C) (OC), bulk d 11.98 lb/gal (15.5C), viscosity 2.35 cP (37.7C). Soluble in organic solvents; insoluble in water. Combustible.

Hazard: Toxic material.

m-nitrobenzoyl chloride.

CAS: 121-90-4. $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow to brown liquid. Partially crystallized at room temperature. Mp approximately 34C, bp 278C. Soluble in ether; decomposes in water and alcohol. Combustible.

Hazard: Toxic by ingestion.

Use: Manufacture of dyes for fabrics and color photography, intermediate in preparation of pharmaceuticals.

p-nitrobenzoyl chloride.

CAS: 122-04-3. $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow, crystalline solid. Mp 72C, bp 154C (15 mm Hg). Decomposes in water and alcohol; soluble in ether. Combustible.

Use: Intermediate for procaine hydrochloride, dyes-stuffs.

1-(p-nitrobenzoyl)-2-thiobiuret.

CAS: 127019-55-0. mf: $\text{C}_9\text{H}_8\text{N}_4\text{O}_4\text{S}$.

Hazard: A poison.

p-nitrobenzyl cyanide. (*p*-nitro- α -tolunitrile).

CAS: 555-21-5. $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Crystals. Mp 116–118C. Insoluble in water; soluble in alcohol and ether.

Derivation: Action of concentrated nitric acid on benzyl cyanide.

Hazard: Toxic material. TLV: 5 mg(CN)/m³.

Use: Intermediate for dyestuffs and pharmaceuticals; preparation of *p*-nitrophenylacetic acid.

3-nitrobenzylidene ethyl ester. See ethyl

2-(*m*-nitrobenzylidene)acetoacetate.

o-nitrobiphenyl. (ONB; *o*-nitrodiphenyl).

CAS: 92-93-3. $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NO}_2$.

Properties: Light-yellow to reddish solid or liquid. D 1.203 (25/25C), bulk d 10 lb/gal, crystallizing p 34.5C (min), refr index approximately 1.613 (25C), bp approximately 330C, flash p 290F (143C), autoign temp 356F (180C). Soluble in carbon tetrachloride, mineral spirits, pine oil, turpentine, benzene, acetone, glacial acetic acid, and perchloroethylene; insoluble in water. Combustible.

Derivation: By controlled nitration of biphenyl.

Hazard: Toxic by ingestion and skin contact. TLV: confirmed human carcinogen.

Use: Dye intermediate, fungicide, plasticizer for cellulose, wood preservative.

p-nitro blue tetrazolium chloride.

CAS: 298-83-9. mf: $\text{C}_{40}\text{H}_{30}\text{N}_{10}\text{O}_6 \cdot 2\text{Cl}$.

Hazard: Moderately toxic by ingestion.

nitrobromoform. See bromopicrin.

2-nitro-1-butanol. $\text{CH}_3\text{CH}_2\text{CHNO}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Soluble in water (20 g/100 cc at 20C), d 1.133 (20/20C), bp 105C (10 mm Hg), fp –48 to –47C, bulk d 9.44 lb/gal (20C), refr index 1.4390 (20C), pH of 0.1M solution 4.51. Combustible.

Use: Organic synthesis.

nitro carbon nitrate. A blasting agent consisting of ammonium nitrate sensitized with diesel oil. Will burn with explosive violence.

Hazard: Dangerous explosion risk, strong oxidizing agent.

nitrocellulose. (cellulose nitrate; nitrocotton; guncotton; pyroxylin).

CAS: 9004-70-0.

Properties: Pulpy, cottonlike, amorphous solid (dry); colorless liquid to semisolid (solution). Contains from 10 to 14% nitrogen. D 1.66, flash p 55F (12.7C), autoign temp 338F (170C). High-nitrogen form (explosives) is soluble in acetone; insoluble in ether-alcohol mixture. Low-nitrogen form (pyroxylin) is soluble in ether-alcohol mix and acetone (collodion and lacquers).

Derivation: Treatment of cellulose (as cotton linters, wood pulp) with mixture of nitric and sulfuric acids. By varying strength of acids, temperature and time of reaction, and acid/cellulose ratio, widely different products are obtained.

Available forms: Colloided block, colloided flake or granular, flakes, powder, solutions of several viscosities (from 1/4 to 1000 sec). May be dry or wet with alcohol or water.

Hazard: Flammable, dangerous fire and explosion risk. Somewhat less flammable when wet.

Use: Fast-drying automobile lacquers, high explosives, collodion, rocket propellant, printing ink base, flashless propellant powder, coating book-binding cloth, leather finishing, manufacture of "Celluloid."

See Hyatt, John Wesley.

nitrocellulose lacquer. See lacquer.

nitrochlorobenzene. Legal label name (Rail) for chloronitrobenzene.

nitrochloroform. See chloropicrin.

***p*-nitro-*o*-chlorophenyl dimethyl thionophosphate.** See dicapthone.

nitrocobalamin. $C_{62}H_{90}N_{14}O_{16}PCo$. One of the active forms of vitamin B_{12} in which a nitro group is attached to the central cobalt atom.

nitrocotton. See nitrocellulose.

2-nitro-*p*-cresol. (4-methyl-2-nitrophenol). $NO_2(CH_3)C_6H_3OH$.

Properties: Yellow crystals. D 1.24 (38/4C), mp approximately 35C, bp 234C. Slightly soluble in water; soluble in alcohol and ether. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Intermediate.

nitrodichloro derivative. See the corresponding dichloronitro derivative.

8-nitro-dihydro-1,3-benzoxazine-2-thione-4-one.

CAS: 23611-69-0. mf: $C_8H_7N_2O_4S$.

Hazard: A poison by ingestion.

Use: Agricultural chemical.

***o*-nitrodiphenyl.** See *o*-nitrobiphenyl.

***o*-nitrodiphenylamine.** $C_6H_5NHC_6H_4NO_2$.

Properties: Red-brown, crystalline powder. Mp 75–76C. Combustible.

Use: Stabilizer for nitroglycerin; chemical intermediate.

“Nitrodisc” [Searle]. TM for nitroglycerin transdermal patch system.

Use: Drug administered by transdermal patch.

nitrodracylic acid. See *p*-nitrobenzoic acid.

nitro dye. A dye whose molecules contain the NO_2 chromophore group.

nitroethane.

CAS: 79-24-3. $CH_3CH_2NO_2$. A nitroparaffin.

Properties: Colorless liquid. D 1.052 (20/20C), fp –50C, bp 114C, vap press 15.6 mm Hg (20C), flash p 106F (41C), autoign temp 779F (415C), bulk d 8.75 lb/gal (20C), refr index 1.3917 (20C). Solubility in water 4.5 cc/100 cc (20C); solubility of water in nitroethane 0.9 cc/100 (20C).

Derivation: By reaction of propane with nitric acid under pressure.

Hazard: Moderate fire risk. TLV: 100 ppm.

Use: Solvent for nitrocellulose, cellulose acetate, cellulose acetopropionate, cellulose acetobutyrate, vi-

nyl, alkyd and many other resins, waxes, fats, and dyestuffs; Friedel-Crafts synthesis; propellant research; fuel additive.

2-nitro-2-ethyl-1,3-propanediol.

$CH_2OHC(C_2H_5)NO_2CH_2OH$.

Properties: White, crystalline solid. Mp 56–75C, bp (decomposes) (10 mm Hg), pH 0.1M aqueous solution 5.48. Soluble in organic solvents; very soluble in water.

Use: Organic synthesis.

nitrofurantoin. Any of several synthetic antibacterial drugs used to treat mammary gland infections in cows and to inhibit disease in swine, chickens, etc. Among them are nitrofurazone, furazolidone, nihydrazone, and furaltadone. All of the latter have been found to cause cancer in laboratory animals, and their use has been discontinued.

See furazolidone.

nitrofurantoin. (*N*-(5-nitro-2-furfurylidene)-1-aminohydantoin).

CAS: 67-20-9. $C_8H_6N_2O_5$.

Properties: Yellow, bitter powder; slight odor. Mp (decomposes) 270–272C. Very slightly soluble in alcohol; practically insoluble in ether and water.

Grade: USP.

Use: Medicine (antibacterial).

nitrogen.

CAS: 7727-37-9. N. Gaseous element of atomic number 7 of group VA of the periodic table, aw 14.0067, valences of 1, 2, 3, 4, 5. There are two stable and four radioactive isotopes; the molecular formula is N_2 .

Properties: Colorless, diatomic gas; odorless; tasteless; constituting approximately four-fifths of the air. Colorless liquid, chemically unreactive. D 1.251 g/L (0C, 1 atm), d (gas) 0.96737 (air = 1.00), (liquid) 0.804, (solid) 1.0265, fp –210C, bp –195.5C. Slightly soluble in water and alcohol. Noncombustible, an asphyxiant gas.

Derivation: From liquid air by fractional distillation, by reducing ammonia.

Grade: USP, prepurified 99.966% min, extra dry 99.7% min, water pumped 99.6% min.

Use: Production of ammonia, acrylonitrile, nitrates, cyanamide, cyanides, nitrides; manufacture of explosives; inert gas for purging, blanketing, and exerting pressure; electric and electronic industries; in-transit food refrigeration and freeze drying; pressurizing liquid propellants; quick-freezing foods; chilling in aluminum foundries; bright annealing of steel; cryogenic preservation; food antioxidant; source of pressure in oil wells; inflating tires; component of fertilizer mixtures.

nitrogen-15. A stable isotope, with an atomic mass of 15.00011, present in naturally occurring nitrogen to the extent of 0.37%. Many N-15 compounds are commercially available.

nitrogenase. Enzyme that fixes nitrogen and can be isolated from soil bacteria. It is possible to synthesize ammonia from nitrogen and hydrogen without high temperatures and pressures by means of nitrogenase. Pyruvic acid is an adjunct of the reaction.

nitrogenase complex. A system of enzymes capable of anaerobic reduction of atmospheric nitrogen to ammonia in the presence of ATP.

nitrogen, available. Water-soluble nitrogen compounds plus that which is rendered soluble or converted to free ammonia.

nitrogen base. Compound, as in an amine, that could be considered a substitution product of ammonia. A compound containing trivalent nitrogen, as ammonia, capable of combining with acids and forming salts containing pentavalent nitrogen.

nitrogen chloride. See nitrogen trichloride.

nitrogen cycle. The cycling of various forms of biologically available nitrogen (N₂, nitrate, nitrite, ammonia, etc.) through the plant, animal, and microbial worlds and through the atmosphere and geosphere.

nitrogen dioxide.

CAS: 10102-44-0. NO₂.

Properties: Red to brown gas above 21.1°C, brown liquid below 21.1°C; colorless solid approximately -11°C. The pressurized liquid is nitrogen tetroxide (dinitrogen tetroxide) because of admixture of N₂O₄ with NO₂, fp -9.3°C, bp 21.1°C. Noncombustible but supports combustion.

Derivation: By oxidation of nitric acid; an intermediate stage in the oxidation of ammonia to nitric acid.

Grade: Pure, 99.5% min.

Hazard: Inhalation may be fatal. Can react strongly with reducing materials. TLV: 3 ppm; STEL 5 ppm; not classifiable as a human carcinogen.

Use: Production of nitric acid, nitrating agent, oxidizing agent, catalyst, oxidizer for rocket fuels, polymerization inhibitor for acrylates.

nitrogen fixation. Utilization of atmospheric nitrogen to form chemical compounds. In nature, this function is performed by bacteria located on the root hairs of plants; as a result, plants are able to synthesize proteins. Industrial nitrogen fixation is exemplified by the synthesis of ammonia from a gaseous mixture containing carbon monoxide, hydrogen, and nitrogen. Nitrogen can also be fixed by the electric arc process and the cyanamide process. The latter involves reaction of water and calcium cyanamide: $\text{CaCN}_2 + 3\text{H}_2\text{O} \rightarrow \text{CaCO}_3 + 2\text{NH}_3$. See synthesis gas.

nitrogen monoxide. See nitrous oxide.

nitrogen mustard. A class of compounds with fishy odor and lachrymatory properties. They are named from their similarity in structure to mustard gas (dichlorodiethyl sulfide). The sulfur of the mustard gas is replaced by an amino nitrogen. Typical nitrogen mustards are halogenated alkylamines, such as methyl bis(2-chloroethyl)amine: $(\text{ClCH}_2\text{CH}_2)_2\text{NCH}_3$. Other examples are triethylene melamine, triethylene thiophosphoramidate, and triethylene phosphoramidate.

Hazard: Strong irritant to tissues, lachrymatory.

Use: Medicine, military poison gas.

See mechloroethamine hydrochloride.

nitrogenous base. A nitrogen-containing molecule having the chemical properties of a base. DNA contains the nitrogenous bases adenine (A), guanine (G), cytosine (C), and thymine (T).

See DNA.

nitrogen oxides. NO_x. The nitrogen oxides provide an example of the law of multiple proportions and the +1 to +5 oxidation states of nitrogen. They are as follows: N₂O (nitrous oxide), NO (nitric oxide), N₂O₃ (nitrogen trioxide or nitrogen sesquioxide), N₂O₄ (dinitrogen tetroxide or nitrogen peroxide), NO₂ (nitrogen dioxide), N₂O₅ (dinitrogen pentoxide), N₃O₄ (trinitrogen tetroxide), and NO₃, which is unstable.

Hazard: Toxic by inhalation, especially NO₂.

nitrogen solutions. Aqueous solutions of ammonium nitrate, ammonia, and/or urea. They are graded according to total nitrogen content and composition.

Use: Direct application to soil as fertilizer, neutralizing superphosphate fertilizers.

nitrogen tetroxide. See nitrogen dioxide.

nitrogen trichloride. (nitrogen chloride).

CAS: 10025-85-1. NCl₃.

Properties: Yellow oil or rhombic crystals. D 1.653, bp below 71°C, fp below -40°C. Insoluble in cold water; decomposes in hot water; soluble in chloroform, phosphorus trichloride, and carbon disulfide.

Hazard: Explodes when heated to approximately 200°F (93°C) or when exposed to direct sunlight.

Toxic by ingestion and inhalation, strong irritant.

Use: Flour bleach (no longer permitted in U.S.).

nitrogen trifluoride. (nitrogen fluoride).

CAS: 7783-54-2. NF₃.

Properties: Colorless, unstable gas; moldy odor. D 1.537 (-129°C), gas d 0.1864 lb/cu ft (70°F), fp -206.6°C, bp -128.8°C. Very slightly soluble in water. Nonflammable.

Derivation: Electrolysis of ammonium acid fluoride.

Hazard: Severe explosion hazard. Corrosive to tissue. TLV: 10 ppm.

Use: Oxidizer for high-energy fuels, chemical synthesis.

nitrogen triiodide. (nitrogen iodide).

CAS: 13444-85-4. NI_3 .

Properties: Black, unstable crystals.

Hazard: Explodes at slightest touch when dry; when handled it should be kept wet with ether. Too sensitive to be used as explosive, because it cannot be stored, handled, or transported safely.

nitrogen trioxide. (dinitrogen trioxide; nitrogen sesquioxide). N_2O_3 .

Properties: Blue liquid. D 1.447 (2C), bp 3.5C (1 atm), fp -102C (1 atm). Partially dissociated into nitric oxide (NO) and nitrogen dioxide (NO_2).

Derivation: Prepared by passing nitric oxide into nitrogen tetroxide at approximately 0C until the stoichiometric amount has been absorbed.

Hazard: Toxic by inhalation, strong irritant.

Use: Oxidant in special fuel systems, identification of terpenes, preparation of pure alkali nitrites.

nitroglycerin. (glyceryl trinitrate; trinitroglycerin).

CAS: 55-63-0. $\text{CH}_2\text{NO}_2\text{CHNO}_2\text{CH}_2\text{NO}_2$.

Properties: Pale-yellow, viscous liquid. D 1.6009, fp 13.1C, explosion p 424F (218C). Soluble in alcohol and ether; slightly soluble in water.

Derivation: By dropping glycerol through cooled, mixed acid and stirring, followed by repeated washing with water.

Grade: Technical.

Hazard: Severe explosion risk, highly sensitive to shock and heat. Toxic by ingestion, inhalation, and skin absorption. TLV: 0.05 ppm. Toxic by skin absorption.

Use: High explosive, production of dynamite and other explosives, medicine (vasodilator) combating fires in oil wells, rocket propellants.

nitroguanidine.

CAS: 556-88-7. $\text{H}_2\text{NC}(\text{NH})\text{NHNO}_2$. Exists in two forms, α and β .

Properties: (α) Long, thin, flat, flexible lustrous needles; (β) small, thin, elongated plates. Both melting ranges are from 220 to 250C. The β form appears to be more soluble in water.

Derivation: (α) Results when guanidine nitrate is dissolved in concentrated sulfuric acid and the solution is poured into water. (β) Nitration of a mixture of guanidine sulfate and ammonium sulfate that results from the hydrolysis of dicyandiamide by sulfuric acid.

Hazard: May explode when shocked or heated.

Use: High explosives, especially flashless propellant powder (with nitrocellulose), chemical intermediate.

nitrohydrochloric acid. Legal label name for aqua regia.

3-nitro-2-hydroxybenzoic acid. See *m*-nitrosalicylic acid.

4-nitro-3-hydroxymercuri-*o*-cresol anhydride. See nitromersol.

3-nitro-4-hydroxyphenylarsonic acid. See 4-hydroxy-3-nitrobenzenearsonic acid.

nitrolarginine.

CAS: 2149-70-4. mf: $\text{C}_6\text{H}_{13}\text{N}_5\text{O}_4$.

Hazard: A reproductive hazard.

nitromannite. See mannitol hexanitrate.

nitromersol. (4-nitro-3-hydroxymercuri-*o*-cresol anhydride). $\text{C}_6\text{H}_7(\text{CH}_3)(\text{NO}_2)(\text{OHg})$.

Properties: Brownish-yellow or yellow granules or powder; odorless; tasteless. Insoluble in water; almost insoluble in alcohol, acetone, ether; soluble in solutions of alkalis, ammonia, by opening the anhydride ring and salt formation.

Grade: NF.

Hazard: Toxic by ingestion and inhalation.

Use: Disinfectant for skin in extremely dilute solution (1 part in 1000 is maximum strength).

nitrometer. (azotometer). A glass apparatus used to measure and collect nitrogen and other gases evolved by a chemical reaction.

nitromethane.

CAS: 75-52-5. CH_3NO_2 . A nitroparaffin.

Properties: Colorless liquid. D 1.139 (20/20C), bp 101C, vap press 27.8 mm Hg (20C), flash p 95F (35C), bulk d 9.5 lb/gal, refr index 1.3817 (20C), fp -29C , autoign temp 785F (418C). Soluble in water and alcohol; solubility of water in nitromethane 2.2 cc/100 cc (20C).

Derivation: By reaction of methane or propane with nitric acid under pressure.

Hazard: Dangerous fire and explosion risk, lower explosion limit 7.3% in air. Toxic by ingestion and inhalation. TLV: 20 ppm.

Use: Solvent for cellulosic compounds, polymers, waxes, fats, etc.; chemical synthesis; rocket fuel; gasoline additive.

2-nitro-4-methoxyaniline.

$\text{NO}_2\text{C}_6\text{H}_3(\text{OCH}_3)\text{NH}_2$.

Properties: Orange-red powder, mp 118–120C, sparingly soluble in cold water and alcohol, soluble in hot water and dioxane.

Use: Chemical intermediate.

2-(nitromethylene)-1-(phenylmethyl)imidazolidine.

CAS: 61532-76-1. mf: $\text{C}_{11}\text{H}_{13}\text{N}_3\text{O}_2$.

Hazard: A poison.

Use: Agricultural chemical.

4-nitro-*n*-methylphthalimide.

CAS: 41663-84-7. mf: $\text{C}_9\text{H}_6\text{N}_2\text{O}_4$.

Hazard: Moderately toxic by ingestion and skin contact. A mild skin irritant.

2-nitro-2-methyl-1,3-propanediol.

$\text{CH}_3\text{OCH}(\text{CH}_3)\text{NO}_2\text{CH}_2\text{OH}$.

Properties: White, crystalline solid. Mp 147–149C, bp (decomposes) (10 mm Hg), pH 0.1M solution 5.42. Solubility in water 80 g/100 cc (20C).

Hazard: Toxic by ingestion.

Use: Intermediate.

nitromide and sulfanitran.

Use: Drug (veterinary); food additive.

nitron. (1,4-diphenyl-3,5-endo-anilino-4,5-dihydro-1,2,4-triazole). $\text{C}_{20}\text{H}_{16}\text{N}_4$.

Properties: Lemon-yellow, fine, crystalline needles. Soluble in chloroform, acetone, and acetic acid ester; slightly soluble in ether and alcohol; insoluble in water.

Use: Reagent for detection of nitrate, perchlorate, boron, rhodium.

 α -nitronaphthalene. (1-nitroanaphthalene).

CAS: 86-57-7. $\text{C}_{10}\text{H}_7\text{NO}_2$.

Properties: Yellow crystals. D 1.331, mp 55–56C, bp 304C, flash p 327F (164C). Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Action of a mixture of nitric and sulfuric acids on finely ground naphthalene.

Hazard: Irritant. The β -isomer is highly toxic by ingestion.

Use: Dyes, naphthylamine, added to mineral oils to mask fluorescence.

1-nitronaphthalene-5-sulfonic acid. See

Laurent's α -acid.

nitronitramide ammonium salt.

CAS: 140456-78-6. mf: $\text{H}_4\text{N}_4\text{O}_4$.

Hazard: Moderately toxic by ingestion and inhalation.

nitronium perchlorate. NO_2ClO_4 .

Properties: White, crystalline solid. Mp 120–140C, hygroscopic, noncorrosive. Soluble in water to form nitric and perchloric acids. Highly reactive.

Derivation: From ozone, nitrogen dioxide, chlorine dioxide.

Hazard: Strong oxidizing agent, may explode in contact with organic materials. Irritant to skin and mucous membranes.

Use: Suggested as propellant oxidizer.

nitroparaffin. (nitroalkane). Any of a homologous series of compounds whose generic formula is $\text{C}_n\text{H}_{2n+1}\text{NO}_2$, the nitro groups being attached to a carbon atom via the nitrogen.

Properties: Colorless, mobile liquids; pleasant odor. Bp range 101–131C, fp range –18 to –104C, d range: 0.983–1.131, dielectric constant range 23–35, flash p range 75–100F (24–38C). Slightly soluble in water

Hazard: Toxic by inhalation.

Derivation: Nitration of propane and other paraffin hydrocarbons under pressure.

Use: Solvents for dyes, waxes, resins, gums, and various polymeric substances; gravure and flexographic inks; propellants and fuel additives; chemical intermediates.

See nitroethane; nitromethane; nitropropane.

***p*-nitrophenetole.**

CAS: 100-29-8. $\text{NO}_2\text{C}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: Crystals in prisms. Mp 58C, bp 283C. Soluble in alcohol and ether.

Derivation: By ethylation of *p*-nitrophenol with ethyl chloride.

Use: Dyes and other intermediates.

nitrophenide. [bis(3-nitrophenyl)disulfide].

$(\text{NO}_2\text{C}_6\text{H}_4)_2\text{S}$.

Properties: Yellow, rhomboid crystals. Mp 83C. Insoluble in water, soluble in ether; slightly soluble in alcohol.

Derivation: Reduction of *m*-nitrobenzenesulfonyl chloride with hydriodic acid.

Use: Pharmaceutical intermediate.

***m*-nitrophenol.**

CAS: 554-84-7. $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Pale-yellow crystals. D 1.485 (20C), mp 96–97C, bp 194C (70 mm Hg). Slightly soluble in water; soluble in alcohol. Combustible.

Derivation: Diazotized *m*-nitroaniline is boiled with water and sulfuric acid.

Hazard: Toxic by ingestion.

Use: Indicator.

***o*-nitrophenol.**

CAS: 88-75-5. $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Yellow crystals. D 1.295 (45C), 1.657 (20C), mp 44–45C. Soluble in hot water, alcohol, ether.

Derivation: Action of dilute nitric acid on phenol at low temperature; *p*-nitrophenol formed at same time. They are separated by steam distillation.

Hazard: Toxic by ingestion.

Use: Intermediate in organic synthesis, indicator, reagent for glucose.

***p*-nitrophenol.**

CAS: 100-02-7. $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Yellowish, monoclinic, prismatic crystals. D 1.479–1.495 (20C), mp 111.4–114C (sublimes), bp 279C (decomposes). Soluble in hot water, alcohol, ether.

Derivation: (1) From *p*-chloronitrobenzene; (2) as in *o*-nitrophenol.

Hazard: Toxic by ingestion.

Use: Intermediate in organic synthesis, production of parathion, fungicide for leather, indicator.

See *o*-nitrophenol.

***p*-nitrophenol, sodium salt.** (sodium-*p*-nitrophenolate; *p*-nitro sodium phenolate).

NO₂C₆H₄ONa. Yellow, crystalline solid; soluble in water. Intermediate.

Hazard: Toxic by ingestion.

***p*-nitrophenoxytributyltin.**

CAS: 3644-32-4. mf: C₁₈H₃₁NO₃Sn.

Hazard: A poison. TWA 0.1 mg(Sn)/m³; STEL 0.2 mg/m³ (skin)

***p*-nitrophenylacetic acid.** (*p*-nitro- α -toluic acid).

CAS: 104-03-0. NO₂C₆H₄CH₂COOH.

Properties: Yellow needles. Mp 152.3C. Slightly soluble in cold water; soluble in alcohol and chloroform. Combustible.

Derivation: Hydrolysis of *p*-nitrobenzyl cyanide with 50% sulfuric acid.

Use: Intermediate for dyestuffs, pharmaceuticals, penicillin precursors, local anesthetics.

***p*-nitrophenylazosalicylate sodium.** See alizarin yellow R.

***p*-nitrophenylhydrazine.**

CAS: 100-16-3. C₆H₇N₃O₂.

Properties: Reddish to orange crystals. Mp 155C (decomposes). Soluble in hot water, alcohol, and chloroform.

Use: Analytical reagent (aldehydes, ketones).

2-(4-nitrophenyl)imidazo(2,1-a)isoquinoline.

CAS: 61001-13-6. mf: C₁₇H₁₁N₃O₂.

Hazard: A reproductive hazard.

4-nitrophenyl isocyanide. See 1-isocyano-4-nitrobenzene.

***m*-nitrophenyl isocyanide.**

CAS: 2008-59-5. mf: C₇H₇N₂O₂.

Hazard: Low toxicity by ingestion.

Use: Agricultural chemical.

***o*-nitrophenylpropionic acid.** C₉H₇NO₄.

Properties: Yellow to brown crystals. Mp 157C (de-

composes). Partially soluble in hot water and alcohol; insoluble in carbon disulfide.

Hazard: Decomposition may occur with explosive violence.

Use: Analytical reagent (alkaloids).

3-(4-nitrophenyl)-*n*-(4-propylcyclohexyl)-2-propenamide.

CAS: 315706-80-0. mf: C₁₈H₂₄N₂O₃.

Hazard: A poison by ingestion.

***n*-(*p*-nitrophenyl)sulfanilamide.** See sulfantran.

***p*-nitrophenylthiol acetate.**

CAS: 15119-62-7. mf: C₈H₇NO₃S.

Hazard: Moderately toxic by ingestion.

Use: Agricultural chemical.

“Nitrophoska” [BASF]. TM for a group of complete (N-P-K) fertilizers for agricultural and horticultural crops.

nitrophosphate. A nitrogen-phosphorus fertilizer produced by the action of nitric acid or a mixture of nitric and sulfuric or phosphoric acids on phosphate rock. Potassium salts usually are added to produce complete fertilizers. Typical analysis: Available nitrogen 15%, available P₂O₅ 15%, available K₂O 15%.

Use: Fertilizer.

See superphosphate; triple superphosphate.

1-nitropropane.

CAS: 108-03-2. CH₃CH₂CH₂NO₂. A nitroparaffin.

Properties: Colorless liquid. D 1.003 (20/20C), miscible with organic solvents, bp 132C, vap press 7.5 mm Hg (20C), flash p 93F (34C) (TOC), bulk d 8.4 lb/gal (20C), refr index 1.4015 (20C), fp –108C, autoign temp 789F (420C). Soluble in water 1.4 mL/100 mL (20C); solubility of water in 1-nitropropane 0.5 cc/100 cc (20C).

Derivation: By reaction of propane with nitric acid under pressure.

Hazard: Flammable, moderate fire risk, moderate explosion hazard when shocked or heated. TLV: ceiling 25 ppm; not classifiable as a human carcinogen.

Use: Solvent, chemical synthesis, rocket propellant, gasoline additive.

2-nitropropane.

CAS: 79-46-9. CH₃CHNO₂CH₃. A nitroparaffin.

Properties: Colorless liquid. D 0.992 (20/20C), bp 120C, vap press 12.9 mm Hg (20C), flash p 75F (24C) (TOC), bulk d 8.3 lb/gal (20C), refr index 1.3941 (20C), fp –93C, autoign temp 802F (427C). Soluble in water 1.7 mL/100 mL (20C); solubility of water in 2-nitropropane 0.6 cc/100 cc (20C); miscible with organic solvents.

Derivation: By reaction of propane with nitric acid under pressure.

Hazard: Flammable, dangerous fire risk, moderate explosion hazard when shocked or heated. TLV: 10 ppm; animal carcinogen.

Use: Solvent (especially for vinyl and epoxy coatings), chemical synthesis, rocket propellant, gas-line additive.

See "NiPar S-20" [Angus].

5-nitro-2-*n*-propoxyaniline.

CAS: 553-79-7. mf: $C_9H_{12}N_2O_3$.

Properties: Artificial sweetener.

Use: Food additive (prohibited).

4-nitro-*n*-(4-propylcyclohexyl)benzamide.

CAS: 315706-72-0. mf: $C_{16}H_{22}N_2O_3$.

Hazard: A poison by ingestion.

"Nitrorace" [Grace]. TM for liquid fuel for internal combustion engines.

***m*-nitrosalicylic acid.** (3-nitro-2-hydroxybenzoic acid). $C_6H_5COOH(OH)NO_2$.

Properties: Yellowish crystals. Mp 144C. Soluble in benzene and alcohol.

Derivation: Nitration of salicylic acid.

Use: Intermediate, azo dyes.

nitrosamine. Any of a series of organic compounds in which $=N-N=O$ is attached to alkyl or aryl group, e.g., diphenylnitrosamine (C_6H_5)₂NNO or dimethylnitrosamine $(CH_3)_2NNO$. Such compounds are formed by reaction between an amine and NO or nitrites. They occur in many food products, whiskey, herbicides, and cosmetics, as well as in industrial environments such as tanneries, rubber factories, and iron foundries. They are also formed within the body by reaction of amine-containing drugs with the nitrites resulting from bacterial conversion of nitrates. Nitrosamines have been found to be strong carcinogens in laboratory animals.

s-nitrosocaptopril.

CAS: 122130-63-6. mf: $C_9H_{14}N_2O_4S$.

Hazard: Moderately toxic by ingestion.

***N*-nitrosodimethylamine.** (dimethylnitrosamine; DMNA; DMN).

CAS: 62-75-9. $(CH_3)_2NNO$.

Properties: Oily, yellow liquid. Mw 74.08, sp g 1.0048 (20C), bp 151–153C. Soluble in water and ether.

Hazard: Toxic by inhalation and skin contact. TLV: animal carcinogen, often present in fish meal. Combustible.

Use: Intermediate in manufacture of 1,1-dimethylhydrazine for rocket propellants, solvent, rubber accelerator.

***p*-nitrosodiphenylamine.** (diphenylnitrosamine; nitrous diphenylamide).

CAS: 156-10-5. $(C_6H_5)_2NNO$.

Properties: Greenish crystals. Mp 145C. Soluble in alcohol, benzene, ether, sulfuric acid.

Hazard: Carcinogen.

Use: Rubber accelerator.

***p*-nitro sodium phenolate.** See *p*-nitrophenol, sodium salt.

nitroso dyes. (quinone oxime dyes). Dyes whose molecules contain the $-N=O$ or $=N-OH$ chromophore group.

nitroso ester terpolymer. See nitroso polymer.

nitrosoguanidine.

CAS: 674-81-7. $ONNHC(NH)NH_2$. Pale-yellow, crystalline powder.

Derivation: Cooling the reaction products of nitroguanidine, ammonium chloride, and zinc dust.

Hazard: Severe explosion risk.

Use: An initiating explosive.

n-nitroso-*n*-methyl-4-aminopyridine.

CAS: 16219-99-1. mf: $C_6H_7N_3O$.

Hazard: A poison by ingestion.

1-nitroso-2-naphthol. (naphthoquinone oxime; [one of several isomers] α -nitroso- β -naphthol).

CAS: 131-91-9. $C_{10}H_7NO_2$.

Properties: Yellow needles. Mp 110C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Action of nitrous acid on β -naphthol.

Use: Organic synthesis, prevention of gum formation in gasoline, dye intermediate, analytical reagent.

p-nitrosophenol.

CAS: 104-91-6. C_6H_4OHNO .

Properties: Crystals of light-brown leaflets. Mp 140C (decomposes). Soluble in alcohol, ether, and acetone; moderately soluble in water.

Derivation: From phenol by action of nitrous acid in the cold.

Hazard: Dangerous fire and explosion risk, reacts violently with acids and alkalis, may explode spontaneously, intraplant transport must be in tightly covered steel barrels.

Use: Dyes.

nitroso polymer. (nitroso rubber). A flame and heat-resistant copolymer derived from trifluoronitrosomethane (CF_3NO) and tetrafluoroethylene ($F_2C=CF_2$). A third monomer (methyl-4-nitrosoperfluorobutyrate) provides more easily cross-linked functional groups than heretofore available. This terpolymer, called nitroso ester terpolymer (NET), is a notable improvement on the earlier copolymer and is especially effective for fireproof interiors of aerospace vehicles and airplanes. Cross-linking is by a peroxide mechanism. Properties of the terpolymer are a glass transition temperature of

approximately -50°C , decomposition temperature of 275°C , tensile strength 750 psi, elongation 500%, Shore hardness 78. Nonflammable.

nitrostarch. (starch nitrate).

CAS: 9056-38-6. $\text{C}_{12}\text{H}_{12}(\text{NO}_2)_8\text{O}_{10}$.

Properties: Orange-colored powder. Contains 16.5% nitrogen. Soluble in ether-alcohol.

Hazard: Flammable, dangerous fire risk, severe explosion risk when dry.

Use: Explosives.

trans-4-nitrostilbene.

CAS: 1694-20-8. mf: $\text{C}_{14}\text{H}_{11}\text{NO}_2$.

Hazard: A poison.

β -nitrostyrene. $\text{C}_6\text{H}_5\text{CH}:\text{CHNO}_2$.

Properties: Liquid. Mp 58°C . Available as a 30% solution in styrene.

Hazard: Moderate fire and explosion risk.

Use: Chain stopper in styrene-type polymerization.

***p*-nitrosulfathiazole.** $\text{NO}_2\text{C}_6\text{H}_4\text{SO}_2\text{NHC}_3\text{H}_2\text{NS}$.

Properties: Pale-yellow powder; odorless; slightly bitter taste. Mp $258-266^{\circ}\text{C}$. Slightly soluble in alcohol; very slightly soluble in chloroform, ether and water; practically insoluble in benzene.

Use: Medicine (antibacterial).

nitrosyl chloride.

CAS: 2696-92-6. NOCl . One of the oxidizing agents in aqua regia.

Properties: Yellow-red liquid or yellow gas. Bp -5.5°C , fp -61.5°C , d (gas) 2.3 (0C, air = 1), d (liquid): 1.273 (20C). Decomposed by water; dissociates into nitric oxide and chlorine on heating; soluble in fuming sulfuric acid. Nonflammable.

Derivation: By action of chlorine on sodium nitrate, also from nitrosylsulfuric acid and hydrochloric acid.

Grade: Pure, 93% min.

Hazard: Strong irritant, especially to lungs and mucous membranes.

Use: Synthetic detergents, catalyst, intermediate.

nitrosyl fluoride.

CAS: 7789-25-5. NOF .

Properties: Colorless gas. Fp -132°C , bp -60°C , d (liquid): 1.32, (solid) 1.72. Attacks glass severely and corrodes quartz.

Hazard: Toxic by inhalation, irritant to skin and mucous membranes.

Use: Fluorinating agent, rocket fuel oxidizer.

nitrosylsulfuric acid.

CAS: 7782-78-7. HNO_3S .

Properties: Straw-colored, oily liquid; furnished as a 40% solution in 87% sulfuric acid. Stable at room temperature.

Hazard: Strong irritant to skin and mucous membranes.

Use: Diazotizing agent for dyes, chemical intermediate, drugs and pharmaceuticals.

***p*-nitrotetrazolium blue.**

CAS: 298-83-9. mf: $\text{C}_{40}\text{H}_{30}\text{N}_{10}\text{O}_6 \cdot 2\text{Cl}$.

Hazard: Moderately toxic by ingestion.

***m*-nitrotoluene.** (*m*-methylnitrobenzene).

CAS: 99-08-1. $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Yellow liquid. D 1.1571 (20/4C), fp 15°C , bp 232.6°C , refr index 1.5466 (20C), flash p 223F (106). Insoluble in water; soluble in alcohol and ether. Combustible.

Hazard: Toxic by inhalation, ingestion, skin absorption. TLV: 2 ppm.

Use: Organic synthesis.

***o*-nitrotoluene.** (*o*-methylnitrobenzene).

CAS: 88-72-2. $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Yellow liquid. D 1.1629 (20C), fp -9.3°C , bp 220.4°C , refr index 1.544 (25C), flash p 223F (106C). Insoluble in water; miscible with alcohol and benzene. Combustible.

Derivation: From toluene by nitration and separation by fractional distillation.

Hazard: Toxic by inhalation, ingestion, skin absorption. TLV: 2 ppm.

Use: For production of toluidine, tolidine, fuchsin, and various synthetic dyes.

***p*-nitrotoluene.** (*p*-methylnitrobenzene).

CAS: 99-99-0. $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Yellow crystals. D 1.299 (0/4C), mp 51.7°C , bp 238.3°C , refr index 1.5382 (15C), flash p 223F (106C). Insoluble in water; soluble in alcohol, ether, and benzene. Combustible.

Derivation: From toluene by nitration and separation by fractional distillation.

Hazard: Toxic by inhalation, ingestion, skin absorption. TLV: 2 ppm.

Use: For production of toluidine, fuchsin, and various synthetic dyes.

***p*-nitro- α -toluic acid.** See *p*-nitrophenylacetic acid.

***m*-nitro-*p*-toluidine.** (3-nitro-4-toluidine).

$\text{NO}_2\text{C}_6\text{H}_3(\text{CH}_3)\text{NH}_2$.

Properties: Orange-red crystals. Mp 117°C , flash p 315F (157C). Soluble in alcohol and concentrated sulfuric acid. Combustible.

Derivation: From acetyl-*p*-toluidine by nitration.

Hazard: Toxic by ingestion.

Use: Intermediate for dyes and pigments.

***p*-nitro-*o*-toluidine.** (4-nitro-2-toluidine).

$\text{NO}_2\text{C}_6\text{H}_3(\text{CH}_3)\text{NH}_2$.

Properties: Yellow, crystalline solid. Mp 104°C , flash p 315F (157C). Soluble in alcohol and ether. Combustible.

Derivation: From *o*-toluidine by nitration.

Use: Intermediate for dyes and pigments.

p-nitro- α -tolunitrile. See *p*-nitrobenzyl cyanide.

nitrotrichloromethane. See chloropicrin.

m-nitrotrifluoromethylbenzene. See *m*-nitrobenzotrifluoride.

2-nitro-4-trifluoromethylbenzonitrile.

$\text{NO}_2(\text{CF}_3)\text{C}_6\text{H}_3\text{CN}$.

Properties: Liquid. Bp 156–158C (18–19 mm Hg), mp 47–48C.

Derivation: From a cyclic halogen compound by heating with copper cyanide in the presence of amines.

Use: Dyes.

2-nitro-4-trifluoromethyl chlorobenzene.

$\text{NO}_2\text{C}_6\text{H}_3(\text{CF}_3)\text{Cl}$.

Properties: Pale-yellow oil. Fp –6F. Soluble in acetone, alcohol, and other solvents; insoluble in water.

Use: Intermediate for dyes and organic chemicals.

nitrourea.

CAS: 556-89-8. $\text{NH}_2\text{CONHNO}_2$.

Properties: White, crystalline powder. Mp 158–159C. Slightly soluble in water; soluble in alcohol, acetone, and acetic acid.

Derivation: Reaction of urea nitrate and concentrated sulfuric acid.

Hazard: Severe explosion risk.

Use: Explosives.

nitrous acid.

CAS: 7782-77-6. HNO_2 .

Properties: A weak acid occurring only in the form of a light-blue solution.

Derivation: Reaction of strong inorganic acids with nitrites, e.g., hydrochloric acid + NaNO_2 .

Use: Formation of diazotizing compounds by reaction with primary aromatic amines, source of nitric oxide.

nitrous diphenylamide. See *N*-nitrosodiphenylamine.

nitrous oxide. (nitrogen monoxide; laughing gas).

CAS: 10024-97-2. N_2O .

Properties: Colorless, sweet-tasting gas. D 1.52 (air). Liquid D 1.22 (–89C), fp –90.8C, bp –88.5C. Soluble in alcohol, ether, and concentrated sulfuric acid; slightly soluble in water; an asphyxiant, anesthetic gas. Noncombustible.

Derivation: Thermal decomposition of ammonium nitrate, controlled reduction of nitriles or nitrites.

Grade: Pure, 98.0% min, USP (97% min).

Hazard: Supports combustion, can form explosive mixture with air. Narcotic in high concentration. TLV: 50 ppm; not classifiable as a human carcinogen.

Use: Anesthetic in dentistry and surgery, propellant gas in food aerosols, leak detection.

β -nitrovinylfuran. See 2-furyl-1-nitroethene.

nitroxanthic acid. See picric acid.

nitroxylenes. (dimethylnitrobenzene).

CAS: 25168-04-1. $\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NO}_2$. There are three isomers (2,4-; 3,4-; and 2,5-).

Properties: Yellow liquid (2,4- and 2,5-), or crystalline needles (3,4-). D 1.135, fp 2C, bp 246C. Soluble in alcohol and ether; insoluble in water.

Derivation: By nitrating xylene and separating from the resulting mixture by rectification.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Organic synthesis, gelatinizing accelerators for pyroxylin.

nitryl chloride.

CAS: 13444-90-1. ClNO_2 .

Properties: Colorless gas; odor of chlorine; liquid and solutions have yellow tinge. Bp –14C, fp –145C, d (liquid) 1.33.

Derivation: Reaction of chlorosulfonic acid with nitric acid.

Hazard: May explode on contact with organic materials. Corrosive to tissue.

Use: Organic synthesis (nitrating and chlorinating agent).

nitryl fluoride.

CAS: 10022-50-1. FNO_2 .

Properties: Colorless gas. Fp –165C, bp –72C, d (liquid): 1.80. Strong oxidizing agent; hydrolyzes to form nitric and hydrogen fluoride acids.

Derivation: Reaction of fluorine with nitrogen dioxide.

Hazard: Ignites on contact with selenium, iodine, phosphorus, arsenic, antimony, boron, silicon, molybdenum. Corrosive to tissue.

Use: Rocket propellants, fluorinating agent.

“Nivco” [Westinghouse]. TM for a precipitation-hardening cobalt-base alloy with good strength-to-weight ratio for use at temperatures up to 1200F. It contains somewhat greater than 20% nickel and small amounts of titanium, zirconium, and iron. Damping material for steam-turbine blade applications.

nivonorm.

CAS: 90-26-6. mf: $\text{C}_{10}\text{H}_{13}\text{NO}$.

Hazard: Moderately toxic by ingestion.

“Nix-Stix L0-014” [Dwight]. TM for a formulated rust inhibitor film for stored materials.

“Nix-Stix L-806” [Dwight]. TM for a fluorocarbon resin emulsifier in water.

Use: Making a surface paintable and non-flammable.

“Nix-Stix M-301” [Dwight]. TM for a suspension aerosol solvent.

Use: For fast dry, multiple releases.

NK 104 (acid).

CAS: 147526-32-7. mf: $C_{50}H_{46}F_2N_2O_8 \cdot Ca$.

Hazard: A poison by ingestion.

nm. Abbreviation for nanometer.

NMR. Abbreviation for nuclear magnetic resonance.

NNCO. See: National Nanotechnology Coordination Office.

NNI. See: National Nanotechnology Initiative.

No. Symbol for the element nobelium.

Nobel, Alfred B. (1833–1896). A native of Sweden, Nobel devoted most of his life to a study of explosives and was the inventor of a mixture of nitroglycerin and diatomaceous earth, which he called dynamite. He also invented blasting gelatin and smokeless powder. With the fortune he accumulated from his work, Nobel established the foundation that bears his name, which annually recognizes outstanding work in physics, chemistry, medicine, literature, and human relations. The Nobel Prize is still the world’s most valued scientific award.

Nobel Foundation. A private institution established in 1900 based on the will of Alfred Nobel. The Foundation manages the assets made available through the will for the awarding of the Nobel Prize in Physics, Chemistry, Physiology or Medicine, Literature and Peace. It represents the Nobel institutions externally and administers informational activities and arrangements surrounding the presentation of the Nobel Prize. The Foundation also administers Nobel symposia in the different prize areas. Its address is Box 5232, SE-102 45 Stockholm, Sweden.
Website: <http://www.nobel.se>.

nobelium. No. Synthetic radioactive element number 102, aw 254, one of the actinide series of elements; its discovery has been claimed by research groups in Sweden, the former U.S.S.R., and California. It can be produced in a cyclotron by bombarding copper with nuclei of carbon-13 accelerated to high energies. The name nobelium has been accepted by the IUPAC Commission on Nomenclature of Inorganic Chemistry. It has nine isotopes (251–259) that are so short-lived that their chemical properties have not been determined. It has no known uses or compounds.

noble. In chemical terminology, this term describes an element that either is completely unreactive or reacts only to a limited extent with other

elements. Six noble gases constitute group VIIIA in the periodic table that is variously called the zero group (as the first three of its members have a valence of 0), the inert gas group, and the noble gas group. The last is preferable, as three of the gases, though unreactive, are not inert. The gases of this group are helium, neon, argon, krypton, xenon, and radon. The noble metals are generally considered to be gold, silver, platinum, palladium, iridium, rhodium, mercury, ruthenium, and osmium. The term has no reference to their commercial value.
See inert.

noble gas. Inert gas as helium, argon, or neon.
See noble.

noble metals. Refers to the unreactive metals (examples are gold and platinum) that are not readily dissolved by acids and not oxidized by heating in air.

NODA. Abbreviation for *n*-octyl-*n*-decyl adipate.

nodular iron. A ductile form of cast iron.

nodules. Aggregates of ferromanganese occurring in huge quantities on the ocean floors. It has been estimated that they cover approximately 10% of the bottom of the Pacific. They are also present in other oceans and even in large lakes. The size averages approximately 4 cm, varying from small pellets to masses several meters in diameter. Their composition is approximately 55% manganese and 35% iron, the balance being cobalt, copper, and nickel. Their origin has not been definitely established. Proposals for commercial exploitation have been made, but no economically satisfactory method has been developed. Considerations of international law and *ownership* of the sea floor are also involved.

NOLA. See omega-nitrolarginine.

nomenclature, chemical. See chemical nomenclature.

“Nomex” [Du Pont]. TM for an aramid fiber or fabric.

Use: Bag filters for industrial dust control and insulation of spacecraft.
See aramid.

nomograph. A chart in which a straight line, either drawn or indicated by a ruler, intersects three scales at points that represent values that satisfy an equation or a given set of physical conditions. It thus enables one to determine the value of a dependent variable when that of the independent variable is known.

Use: By chemical engineers to determine relationships between the properties of materials.

non- (nona). Prefix meaning nine.

nona. See non-.

nonachloro-4-phenoxyphenol. See 4-hydroxy-nonachlorodiphenyl ether.

nonadecane. $C_{19}H_{40}$ or $CH_3(CH_2)_{17}CH_3$.
Properties: Leaflets. Soluble in alcohol and ether, insoluble in water, d 0.777, mp 32C, bp 330C. Combustible.
Use: Organic synthesis.

***n*-nonadecanoic acid.** $CH_3(CH_2)_{17}COOH$. A saturated fatty acid normally not found in natural vegetable fats or waxes. Combustible.
Properties: Colorless crystals. mp 68.7C, bp 297C (100 mm Hg). Soluble in alcohol and ether; insoluble in water. Synthetic product available 99% pure for organic synthesis.

***trans,trans*-2,4-nonadienal.**

CAS: 5910-87-2. mf : $C_9H_{14}O$.

Properties: Slightly yellow liquid; strong, fatty, floral odor. D : 0.850–0.870, bp : 97–98° @ 10 mm, $refr$ index: 1.522. Sol in alc, fixed oils; insol in water.
Use: Food additive.

***trans,cis*-2,6-nonadienol.**

CAS: 28069-72-9. mf : $C_9H_{16}O$.

Properties: White to yellow liquid; powerful, vegetable odor. D : 0.860–0.880, bp : 98–100° @ 11 mm, $refr$ index: 1.464. Insol in water.
Hazard: Low toxicity by ingestion and skin contact. A skin irritant.
Use: Food additive/ natural product.

γ -nonalactone. See γ -nonyl lactone.

δ -nonalactone. mf : $C_9H_{16}O_2$.

Properties: Colorless to pale yellow liquid; coconut odor. D : 0.980, $refr$ index: 1.452.
Use: Food additive.

nonallyl chloride. See pelargonyl chloride.

nonanal. (pelargonic aldehyde; *n*-nonyl aldehyde; aldehyde C-9).

CAS: 124-19-6. $C_9H_{17}CHO$.

Properties: Colorless liquid with an orange-rose odor. D 0.822–0.830, $refr$ index 1.424–1.429. Soluble in three volumes of 70% alcohol, in mineral oil; insoluble in glycerol. Combustible.
Grade: Technical, FCC.
Use: Perfumery, flavoring agent.

nonane. (nonyl hydride).

CAS: 111-84-2. C_9H_{20} or $CH_3(CH_2)_7CH_3$.

Properties: Colorless liquid. D 0.722, bp 150.7C, fp –54C, $refr$ index 1.40561 (20C), flash p 86F (30C) (CC), autoign temp 403F (206C).
Grade: Technical (95%), 99%, research. Soluble in alcohol; insoluble in water.

Hazard: Flammable, moderate fire risk. Irritant, narcotic in high concentration. TLV: 200 ppm.

Use: Organic synthesis, biodegradable detergents, distillation chaser.

nonane-1,9-dimethanesulfonate. See methanesulfonic acid, nonamethylene ester.

nonanedioic acid. See azelaic acid.

nonane-1,3-diol monoacetate.

$C_9H_{18}OOCCH_3$.

Properties: A mixture of isomers, colorless to slightly yellow liquid. Stable; soluble in alcohol. Combustible.

Use: Perfumery, flavoring.

***n*-nonanoic acid.** See pelargonic acid.

nonanol. See nonyl alcohol.

(nonanoyloxy)tributylstannane. See tributyltin nonanoate.

non-coding DNA. See junk DNA.

non-coding strand. An anti-sense strand.
 See: Sense strand.

noncombustible material. A solid, liquid, or gas that will not ignite or burn, regardless of how high a temperature it is exposed to, e.g., silicon dioxide, water, carbon dioxide.
 See nonflammable material.

noncompetitive inhibition. A type of enzyme inhibition not reversed by increasing the substrate concentration. The inhibitor binds to a site on the enzyme other than the active site.

noncyclic electron flow. The light-induced flow of electrons from water to NADP in oxygen-evolving photosynthesis involving both photosystems I and II.
 See: Cyclic photophosphorylation.

nondestructive testing. A test that does not involve destruction of the sample or material tested. Such tests are usually carried out by radiographic methods on large, finished metal products (castings and machine components) to determine the presence of internal defects likely to cause operational failure. An infrared camera scanning device for detection of internal weaknesses in tires is a recent development in nondestructive testing. X-radiation is used to determine the authenticity of paintings and other objects of art.
 See testing.

nondrying oil. See drying oil.

nonelectrolyte. A compound that resists passage of electricity (nonconductor) both in liquid form and in solution. Included in this classification are most organic compounds, with the exception of acids and amides, and such inorganic compounds as nonmetal halides. Nonelectrolytes are covalently bonded; some inorganic compounds having covalent bonds form electrolytic solutions in aqueous solution. See electrolyte.

nonene. See nonylene.

cis-6-nonen-1-ol. mf: $C_9H_{18}O$.

Properties: White to slightly yellow liquid; powerful, melonlike odor. D: 0.850–0.870, refr index: 1.448. Insol in water.

Use: Food additive.

trans-2-nonen-1-ol. mf: $C_9H_{18}O$.

Properties: White liquid; fatty, violet odor. D: 0.830–0.850, refr index: 1.444–1.448. Insol in water.

Use: Food additive.

nonessential amino acids. Amino acids that can be made by humans and other vertebrates from simpler precursors, and thus, are not required in the diet.

nonheme iron proteins. Proteins, most often acting in redox reactions, which contain iron but no porphyrin groups.

nonmetal. (1) Any of a number of elements whose electronic structure, bonding characteristics, and consequent physical and chemical properties differ markedly from those of metals, particularly in respect to electronegativity and thermal and electrical conductivity. In general, nonmetals have very low to moderate conductivity and high electronegativity. The 25 elements classified as nonmetals may be considered in two groups: (a) those having moderate electrical conductivity (semiconductors), all of which are solids, and (b) those having very low conductivity, many of which are gases. The semiconductors of group (a) were formerly called metalloids since they more nearly resemble metals than those of the group (b), but this term is no longer used by chemists. The nonmetals are given below based on this subgrouping, though any such list is open to challenge:

	(a)	(b)
arsenic	polonium	halogens
antimony	phosphorus	hydrogen
boron	selenium	nitrogen
carbon	silicon	oxygen
germanium	tellurium	noble gases
	sulfur	

(2) Loosely, any material that is not a metal, e.g., petroleum, plastics, waxes, etc. The term is widely

used in this sense by engineers and specification writers.

non-Newtonian behavior. A property possessed by some fluids and many plastic solids, including lubricating grease, of having a variable relationship between shear stress and rate of shear.

n-nonoic acid. See pelargonic acid.

nonoic acid. An acid of the formula $C_8H_{17}COOH$ of which there are many possible isomers. Pelargonic acid is the normal or straight-chain acid. A mixture of various branched-chain nonoic acids is recovered from products of the Oxo process.

nonpolar. A substance whose molecules possess no permanent electric moments. One whose atoms are linked by sharing of an electron pair and that are not electrolytes in the liquid state. They do not ionize, or ionize weakly, in solution.

nonpolar molecule. A molecule with polar bonds that does not have an overall dipole. The vector sum of its dipoles is zero.

nonsense codon. A codon that does not specify an amino acid, but instead signals the termination of a polypeptide chain (UAA, UAG, UGA). See stop codons.

nonsense mutation. A mutation that results in the premature termination of a polypeptide chain.

nonsense suppressor. A mutation, usually in the gene for a tRNA, that causes an amino acid to be inserted into a polypeptide in response to a termination codon.

nonviscous neutral oil. A neutral oil of viscosity less than 135 SUS at 37.7°C.

nonwoven fabric. A fabric made from staple lengths of cotton, rayon, glass, or thermoplastic synthetic fiber mechanically positioned in a random manner and usually bonded with a synthetic adhesive or rubber latex. The sheets thus formed can be pressed together to form porous mats of high absorptivity and good elastic recovery on deformation. Permanent bonds are formed where the fibers touch each other as a result of heat treatment when the fibers are thermoplastic or by use of a high-polymer binder. Disposable filters of polyethylene and polyester can be made without a binder.

A specialty nonwoven (so-called "melded") fabric trademarked "Cambrelle" is a composite of two different polymers; heating the exterior layer to its melting point causes the fibers to fuse into a fabric.

Use: Applications are as a backing for plastic film; padding for surgical dressings, diapers, sanitary napkins; drapes and other decorative textile products; filtration; shoe liners; industrial wiping and

polishing fabrics; disposable clothing; carpet backing.

n-nonyl acetate. (acetate C-9).

CAS: 143-13-5. $\text{CH}_3\text{COO}(\text{CH}_2)_9\text{CH}_3$.

Properties: Colorless liquid; strong pungent odor. D 0.864–0.868, refr index 1.422–1.426. Soluble in four volumes of 70% alcohol, flash p 155F (68.3C), several isomers exist. Combustible.

Use: Perfumery, flavoring.

n-nonyl alcohol. (nonanol; alcohol C-9; octyl carbinol; pelargonic alcohol).

CAS: 143-08-8. $\text{CH}_3(\text{CH}_2)_8\text{CH}_2\text{OH}$.

Properties: Colorless liquid; floral odor. D 0.826–0.829, refr index 1.431–1.435, fp -5C , bp 215C, flash p 165F (73.9C). Soluble in seven volumes of 50% alcohol; insoluble in water. Several isomers exist. Combustible.

Use: Perfumery, flavoring (lemon oil).

n-nonylamine. $\text{C}_9\text{H}_{19}\text{NH}_2$.

Properties: Colorless liquid. Bp 75–85C (20 mm Hg), d 0.798 (25C), refr index 1.4366 (20C). May be prepared from nonyl halides by conventional techniques. Combustible.

Hazard: Moderate fire risk. Skin irritant.

tert-nonylamine. Principally *tert*- $\text{C}_9\text{H}_{19}\text{NH}_2$ and *tert*- $\text{C}_{10}\text{H}_{21}\text{NH}_2$.

Properties: Colorless liquid. Boiling range 160–174C, d 0.789 (25C), refr index 1.428 (25C), flash p 120F (48.9C). Insoluble in water; soluble in common organic solvents; especially in petroleum hydrocarbons. Combustible.

Hazard: Moderate fire risk. Skin irritant.

Use: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

nonylbenzene. (1-phenylnonane). $\text{C}_9\text{H}_{19}\text{C}_6\text{H}_5$.

Properties: Light-straw liquid; aromatic odor. Boiling range 245–252C, d 0.864 (20/20C), refr index 1.488 (20C), viscosity 41.9 cP (20C), flash p (CC) 210F (98.9C). Combustible.

Hazard: Irritant; narcotic in high concentration.

Use: Manufacture of surface-active agents.

nonyl bromide. $\text{C}_9\text{H}_{19}\text{Br}$.

Properties: Liquid. Bp 81–85C (10 mm Hg), d 1.101 (25C), refr index 1.4583 (20C). Nonflammable.

Derivation: High yields of nonyl bromide are obtained by passing hydrogen bromide into the alcohol while heating or by refluxing with aqueous hydrogen bromide in the presence of an acid catalyst.

nonyl chloride. $\text{C}_9\text{H}_{19}\text{Cl}$.

Properties: Liquid. Bp 58–63C (8 mm Hg), d 0.878 (25C), refr index 1.4379 (20C). Nonflammable.

Derivation: Nonyl alcohol reacts with hydrochloric acid at elevated temperatures and pressures to give nonyl chloride. It can also be made by refluxing a

mixture of concentrated hydrochloric acid with alcohol in the presence of zinc chloride.

1-nonylene. (1-nonene). C_9H_{18} or $\text{CH}_3(\text{CH}_2)_6\text{CH}=\text{CH}_2$.

Properties: Colorless liquid. D 0.7433, bp 149.9C. Soluble in alcohol; insoluble in water. Combustible.

Derivation: From propylene.

nonyl hydride. See nonane.

n-nonylic acid. See pelargonic acid.

γ -nonyl lactone. (aldehyde C-18; 4-hydroxy-nonanoic acid, γ -lactone; γ -nonalactone).

$\text{CH}_3(\text{CH}_2)_4\text{CHCH}_2\text{CH}_2\text{C}(\text{O})\text{O}$.

Properties: Yellowish to almost colorless liquid; coconut-like odor. D 0.956–0.963, refr index 1.447. Soluble in five volumes of 50% alcohol; soluble in most fixed oils and mineral oil; practically insoluble in glycerol. Combustible.

Grade: Technical, FCC.

Use: Perfumery, flavors.

nonyl nonanoate. (nonyl pelargonate).

$\text{C}_9\text{H}_{19}\text{OOCC}_8\text{H}_{17}$.

Properties: Liquid; floral odor. D 0.863 (25C), bp 315C, refr index 1.4419 (20C). Combustible.

Use: Flavors, perfumes, organic synthesis.

nonylphenol.

CAS: 25154-52-3. $\text{C}_9\text{H}_{19}\text{C}_6\text{H}_4\text{OH}$. A mixture of isomeric monoalkyl phenols, predominantly *p*-substituted.

Properties: Pale-yellow, viscous liquid; slight phenolic odor. D 0.950 (20/20C), bp 293C, fp -10C (sets to glass below this temperature), viscosity 563 cP (20C), flash p 285F (140.5C). Insoluble in water; soluble in most organic solvents. Combustible.

Grade: Technical.

Use: Nonionic surfactant (nonbiodegradable), lubricating-oil additives, stabilizers, petroleum demulsifiers, fungicides, antioxidants for plastics and rubber.

nonylphenol polyethylene glycol ether.

CAS: 127087-87-0. mf: $\text{C}_{23}\text{H}_{40}\text{O}_5$.

Hazard: A reproductive hazard.

4-nonylphenol polymer with formaldehyde and oxirane. See formaldehyde, polymer with 4-nonylphenol and oxirane.

nonylphenoxyacetic acid.

$\text{C}_9\text{H}_{19}\text{C}_6\text{H}_4\text{OCH}_2\text{COOH}$.

Properties: Light amber liquid. Miscible with organic solvents. D 1.02 (20C), flow p 5C, viscosity 6500 cP (25C). Insoluble in water; soluble in alkali. Combustible.

Use: Corrosion inhibitor for turbine oils, lubricants, fuels, greases; antifoaming agent in gasoline, hydraulic fluids, cutting oils.

1-(4-nonylphenyl)ethanone oxime.CAS: 64128-32-1. mf: $C_{17}H_{27}NO$.**Hazard:** A severe skin irritant. **α -(4-nonylphenyl)-o-hydroxypoly(oxy-1,2-ethanediyl)-branched.**

CAS: 127087-87-0.

Hazard: A reproductive hazard.**nonyl thiocyanate.** $C_9H_{19}SCN$.**Properties:** Bp 84–86.5C (1 mm Hg), d 0.919 (25C), refr index 1.4696 (20C). Nonyl thiocyanate can be made from nonyl chloride by refluxing with alcoholic sodium thiocyanate solution using conventional techniques.**nonyltrichlorosilane.** (trichlorononylsilane). $C_9H_{19}SiCl_3$.**Properties:** Water-white liquid; pungent irritating odor. Fumes readily in moist air.**Hazard:** Strong irritant to skin and mucous membranes.**nopinene.** See β -pinene.**NOPON.** See *p*-bis[2-(5- α -naphthylloxazolyl)-benzene].**(+/-)-noradrenaline bitartrate.**CAS: 3414-63-9. mf: $C_8H_{11}NO_3 \cdot C_4H_6O_6$.**Hazard:** A poison.**norbornide.** (generic name for 5-(α -hydroxy- α -2-pyridylbenzyl)-1-(α -2-pyridylbenzylidene)-5-norbornene-2,3-dicarboximide).

CAS: 991-42-4.

Properties: White solid. Mp 180–190C. Insoluble in water; soluble in dilute acids.**Hazard:** Toxic by ingestion.**Use:** Rodenticide.**5-norbornene-2-methanol.** (2-hydroxymethyl-5-norbornene; "Cyclol"). $C_7H_9CH_2OH$.**Properties:** Stable, colorless liquid. D 1.022–1.024 (25/25C), refr index 1.4985–1.4995 (25C), a high-boiling solvent, bp 192–198C, flash p (TOC) 183F (83.9C). Miscible with most common organic solvents; slightly soluble in hot water. Combustible.**Use:** Monomer for the modification of condensation and addition polymers for coatings.**5-norbornene-2-methyl acrylate.**CAS: 95-39-6. $(C_5H_7O_2)_4$.**Properties:** Colorless liquid. Bp 103–105C, d 1.027–1.031 (25/25C). Soluble in most organic solvents; inhibitor 0.02% MEHQ.**Use:** A difunctional monomer particularly suited for in situ cross-linking of vinyl acetate emulsions and polymer systems.**"Nordel" [Du Pont].** TM for an elastomer based on an ethylene-propylene-hexadiene terpolymer, sulfur curable.**Use:** Automotive and appliance components; wire insulation for electrical accessories, belts, hose, mechanical products.**nordhausen acid.**

CAS: 7664-93-9. Fuming sulfuric acid of d 1.86–1.90.

Hazard: Corrosive to skin and tissue.

See sulfuric acid, fuming.

nordihydroguaiaretic acid. (NDGA; 4,4'-(2,3-dimethyltetramethylene)dipyrrocatechol).CAS: 500-38-9. $[C_6H_3(OH)_2CH_2CH(CH_3)]_2$.**Properties:** Crystals from acetic acid. Mp 184–185C. Soluble in methanol, ethanol, ether; slightly soluble in hot water, chloroform; nearly insoluble in benzene, petroleum ether.**Grade:** Technical, FCC.**Derivation:** Extraction from guaiac, also synthetically.**Hazard:** Use in foods prohibited by FDA.**Use:** Antioxidant to retard rancidity of fats and oils.**noorea.** (3-(hexahydro-4,7-methanoindan-5-yl)-1,1-dimethylurea).CAS: 18530-56-8. $C_{10}H_{14}NHCON(CH_3)_2$.**Properties:** White solid. Mp 168–169C. Very slightly soluble in water; soluble in polar solvents such as cyclohexanone, acetone, alcohol; less soluble in nonpolar solvents such as benzene, xylene, hexane, and kerosene.**Use:** Selective herbicide.**norethisterone oxime.**CAS: 23965-86-8. mf: $C_{20}H_{27}NO_2$.**Hazard:** A reproductive hazard.**Use:** Hormone.**18-norestrone methyl ether.**CAS: 4147-10-8. mf: $C_{18}H_{22}O_2$.**Hazard:** A reproductive hazard.**Use:** Hormone.**dl-norephedrine hydrochloride.** See propridine hydrochloride.**norgestrel.**

CAS: 797-63-7. A synthetic steroid hormone used as an ingredient of oral contraceptives. Approved by FDA.

See "Ovral" [Wyeth].

norflurazon.**Use:** Food additive; herbicide.**"Norkool" [Dow].** TM for inhibited glycol-based coolants, corrosion inhibitors, and cleaners.**Use:** Industrial applications, such as compressor sta-

tions, generators, and high-speed, stationary engines.

norleucine. (α -aminocaproic acid).

CAS: 327-57-1. $\text{CH}_3(\text{CH}_2)_4\text{CH}(\text{NH}_2)\text{COOH}$. A non-essential amino acid found naturally in the L(+)-form.

Properties: Leaflets, crystals from water, *dl*-norleucine. Soluble in water and acids; slightly soluble in alcohol. Decomposes at 327C.

L(+)-norleucine: slightly sweet taste. Sublimes at 275–280C, mp 301C (decomposes).

D(–)-norleucine: bitter taste. Partially sublimes at 275–280C, mp 301C (decomposes).

Derivation: Found in traces in proteins, also synthetically.

Use: Biochemical research.

normal. (1) Of hydrocarbon molecules: containing a single, unbranched chain of carbon atoms, usually indicated by the prefix *n*-, as *n*-butane, *n*-propane, etc. (2) Of solutions: containing one equivalent weight of a dissolved substance per liter of solution; a standard measure of concentration, indicated by *N*, e.g., 2*N*, 0.5*N*, etc.

See molar. (3) Perpendicular or at right angles to, for example, incident light rays normal to a surface.

normalize. To temper steels and other alloys by heating to a predetermined temperature and cooling at a controlled rate to relieve internal stresses and improve strength (analogous to annealing of glass).

Normant reagents. Vinylmagnesium halides that were previously unavailable are now prepared by reacting the parent vinyl halides with magnesium in tetrahydrofuran. These compounds are called Normant reagents and behave like typical Grignard reagents.

norm nicotine. (3-(2-pyrrolidinyl)pyridine).

CAS: 479-97-3. $\text{C}_9\text{H}_{12}\text{N}_2$.

Properties: Moderately thick, hygroscopic liquid. Bp 270C, d 1.07, optical rotation –89 degrees, refr index 1.53. Soluble in water, alcohol, and kerosene.

Hazard: Toxicity about one-third that of nicotine.

Use: Insecticide.

“Norpace” Capsules [Searle]. TM for disopyramide phosphate.

Use: Drug.

norpentazocine.

CAS: 25144-78-9. mf: $\text{C}_{14}\text{H}_{19}\text{NO}\cdot\text{ClH}$.

Hazard: A poison.

norphytane. See pristane.

Norrish, Ronald G. W. (1897–1978). An English physical chemist who was recipient of the Nobel Prize in 1967 with Eigen and Porter. His analysis of reactions of one ten-billionth of a second

were made possible by disturbing the chemical equilibrium with short energy pulses. After receiving a doctorate, he went to the Sorbonne before returning to Cambridge to teach. His career was long and distinguished by many awards.

Norrish-type cleavage. Homolytic cleavage of aldehydes and ketones originating from their excited n!GKp* state. Synthetically useful for the ring cleavage of cyclic ketones.

“Norsolene IR-140” [Hall]. TM for ink additive.

Properties: High softening point for fast solvent release. Soluble and dilutable in aliphatic solvents. High viscosity with infinite dilutability.

Use: Offset inks.

Northern blot. A gel-based laboratory procedure that locates on a gel mRNA sequences that are complementary to a piece of DNA used as a probe. Named after Dr. E. M. Southern, who invented the Southern blot, it was adapted to RNA and named the “Northern” blot.

See DNA.

Northrup, John H. (1891–1987). An American chemist who won a Nobel Prize in chemistry in 1946 along with Sumner and Stanley. His work was primarily concerned with isolation and crystallization of enzymes. Many firsts included the production of the enzyme trypsin in the laboratory and isolation of the first bacterial virus. He was also responsible for producing diphtheria antitoxin in crystalline form. His education was at eastern schools including Harvard, Yale, and Princeton.

noruron.

CAS: 18530-56-8. $\text{C}_{13}\text{H}_{22}\text{N}_2\text{O}$.

Properties: Colorless crystals. Mp 175C. Insoluble in water; soluble in acetone; slightly soluble in benzene.

Hazard: Highly toxic.

Use: Herbicide.

Norway saltpeter. See ammonium nitrate.

Norwegian saltpeter. See calcium nitrate.

NOS. Abbreviation for “not otherwise specified.”

Use: In shipping regulations, for classes of substances to which a restriction applies, individual members of which are not listed in the regulations.

noscapiene. (1- α -narcotine; narcosine).

CAS: 128-62-1. $\text{C}_{22}\text{H}_{23}\text{NO}_7$. An isoquinoline alkaloid of opium.

Properties: Fine, white, crystalline powder. Mp 176C, sublimes at 150–160C. Insoluble in water; practically insoluble in vegetable oils; slightly soluble in hot solutions of potassium hydroxide and sodium hydroxide; soluble in most organic solvents.

Salts formed with acids are dextrorotatory and unstable in water.

Derivation: An opium alkaloid from the seed capsules of *Papaver somniferum*.

Grade: USP.

Hazard: Narcotic, use legally restricted.

Use: Medicine (cough control).

“Nouryset 200” [Akzo].

CAS: 142-22-3. TM for a colorless monomer of diethylene glycol bis(allyl carbonate).

Use: Transparent organic glass in the manufacture of optical corrective lenses.

novobiocin.

CAS: 303-81-1. $C_{31}H_{36}H_2O_{11}$.

Properties: A light-yellow to white antibiotic produced by *Streptomyces niveus*. Available as calcium and sodium salts.

Hazard: May have damaging side effects.

“Novogel” [Morton].

CAS: 1309-42-8. TM for magnesium hydroxide.

Grade: Technical, food, USP, directly compressible powder.

Use: Flame-retardant, smoke suppressant, acid scavenger. USP grade used for tablet and liquid antacids.

“Novol” [Croda]. TM for fatty alcohols.

Use: Thickeners, opacifiers, structural agents for antiperspirant sticks, creams, and lotions.

novolak. (novolac). A thermoplastic phenol-formaldehyde-type resin obtained primarily by the use of acid catalysts and excess phenol. Generally alcohol soluble and requires reaction with hexamethylenetetramine, *p*-formaldehyde, etc. for conversion to cured, cross-linked structures by heating at 200–400F.

Use: Molding materials, bonding materials, bonding agent in brake linings, abrasive grinding wheels, electrical insulation, clutch facings, air-drying varnishes, reinforcing agent and modifier for nitrile rubber.

novoldiamine. (1-diethylamino-4-aminopentane).

CAS: 140-80-7. $C_7H_{12}N_2$.

Properties: Colorless liquid. D 0.82, bp 200C, refr index 1.44. Soluble in water and alcohol.

Derivation: From 2-diethylaminoethanol and ethyl acetoacetate.

Use: Manufacturing antimalarials (quinacrine and related compounds).

noxious gas. Any natural or by-product gas or vapor that has specific toxic effects on humans or animals (military poison gases are not included in this group). Examples of noxious gases are ammonia, carbon monoxide, nitrogen oxides, hydrogen sulfide, sulfur dioxide, ozone, fluorine, and vapors evolved by benzene, carbon tetrachloride, and a

number of chlorinated hydrocarbons. Gases that act as simple asphyxiants are not classified as noxious. See air pollution.

Noyori, Ryoji. (1938–). Born in Kobe (now Ashiya), Japan, Noyori won the Nobel Prize for chemistry in 2001 for his pioneering work concerning chirally catalysed hydrogenation reactions. Awarded a doctorate from Kyoto University in 1967. Noyori is a professor at Nagoya and Harvard Universities. Among many other awards, he received the the Wolf Prize in Chemistry (Wolf Foundation, Israel) 2001, and the Roger Adams Award in Organic Chemistry (ACS), 2001.

Np. Symbol for neptunium.

“NPG” [Eastman]. TM for the glycol of choice for premium-quality gel coats. It reacts rapidly with isophthalic acid to produce low-color gel-coat resins.

NPK mixtures. Fertilizers containing nitrogen, phosphorus, and potassium. These are usually characterized by numbers such as 5–10–10, meaning 5% nitrogen, 10% phosphorus as P_2O_5 , and 10% potassium as K_2O . The percentages refer to the amount of nitrogen, phosphorus, or potassium present in available form rather than to the amount of the compounds.

NPN. Abbreviation for *n*-propyl nitrate.

NPO. See α -naphthylphenyloxazole.

NQR spectroscopy. See nuclear quadrupole resonance.

NR. Abbreviation for natural rubber.

NRC. Abbreviation of Nuclear Regulatory Commission.

NRDC. Abbreviation for National Resources Defense Council.

NSF. See National Science Foundation.

“N-Serve” [Dow]. TM for nitrapyrin.

NSR. Abbreviation for nitrile silicone rubber.

NSTC. See: National Science and Technology Council.

NT. Abbreviation for nucleotide, i.e., the monomeric unit from which DNA or RNA are built. One can express the size of a nucleic acid strand in terms of the number of nucleotides in its chain; hence “NT” can be a measure of chain length.

NTA. Abbreviation for nitrilotriacetic acid.

NTAN. Abbreviation for nitrilotriacetoneitrile.

nuclear chemistry. The division of chemistry dealing with changes in or transformations of the atomic nucleus. It includes spontaneous and induced radioactivity, the fission or splitting of nuclei, and their fusion or union; also the properties and behavior of the reaction products and their separation and analysis. The reactions involving nuclei are usually accompanied by large energy changes, far greater than those of chemical reactions; they are carried out in nuclear reactor for electric power production and manufacture of radioactive isotopes for medical use, also (in research work) in cyclotrons.

See fission; fusion; radiochemistry; nucleus (1).

nuclear energy. The energy liberated by (1) the splitting or fission of an atomic nucleus, (2) the union or fusion of two atomic nuclei, and (3) the radioactive decay of a nucleus (transmutation). For details refer to the following entries; nuclear reaction, fission, fusion, tokamak, radioactivity, ionizing radiation, nuclear chemistry, transmutation, breeder, uranium-235, plutonium, nuclear reactor. See acceptable risk.

nuclear fuel. A fissionable material that is the source of energy in a nuclear reactor, specifically uranium-235, thorium, and plutonium-239. For thermonuclear (fusion) reactions the "fuels" are the hydrogen isotopes deuterium and tritium. See breeder; fission; fusion.

nuclear fuel element. A rod, tube, plate, or other mechanical shape or form into which a nuclear fuel is fabricated for use in a reactor. The word *element* is used here in its electrical engineering rather than its chemical sense. Cladding materials are usually ceramics or zirconium alloys.

nuclear magnetic resonance. (NMR). A type of radio-frequency spectroscopy based on the magnetic field generated by the spinning of electrically charged atomic nuclei. This nuclear magnetic field is caused to interact with a very large (10,000–50,000 gauss) magnetic field of the instrument magnet. The magnetic properties of atomic nuclei are the spin number and the magnetic moment. Hydrogen nuclei, fluorine, phosphorus, boron, nitrogen, carbon-13, and oxygen-17 have distinctive magnetic properties. The molecular or chemical environment of the nucleus produces characteristic shifts and fine structure in the NMR spectra. Because of its dependence on molecular structure, NMR has become a fundamental research tool for structure determinations in organic chemistry. Studies of hydrogen locations in crystals have been useful, as these cannot be determined directly by means of X rays. NMR techniques have been applied to studies of electron densities and chemical bonding, the composition of mixtures, percentage

purity determinations, and elemental hydrogen analyses.

nuclear membrane. The double membrane that surrounds the eukaryotic nucleus. It has many pores in its surface which regulate the flow of large compounds into and out of the nucleus.

nuclear quadrupole resonance. (NQR). A spectroscopic technique related to nuclear magnetic resonance that utilizes the electric fields naturally present in crystals instead of a magnet. It is useful for studies of electrical field gradients around nuclei, chemical bonding, space groupings in crystals, and molecular structure.

nuclear reaction. A reaction that involves a change in the nucleus of an atom, as opposed to a chemical reaction in which only the electrons take part. Nuclear reactions usually result in release of tremendous amounts of energy, while the energy obtained from chemical reactions is slight; e.g., rupture of a chemical bond evolves approximately 5 eV compared with 200 MeV resulting from the fission of an atomic nucleus. There are three types of nuclear reactions: (1) transmutation (radioactive decay), (2) fission, and (3) fusion (thermonuclear).

nuclear reactor. An assembly of fissionable material (uranium-235 or plutonium-239) designed to produce a sustained and controllable chain reaction for the generation of electric power. The first reactor (then called a "pile") was constructed at the University of Chicago in 1942 under the leadership of Enrico Fermi. The essential components of a modern nuclear reactor are (1) The core, composed of metal- or ceramic-clad rods containing enough fissionable material to maintain a chain reaction at the necessary power level; as much as 50 tons of uranium may be required (d 19). (2) A source of neutrons to initiate the reaction, such as a mixture of polonium and beryllium. (3) A moderator to reduce the energy of fast neutrons for more efficient fission (called slow or thermal neutrons); materials such as graphite, beryllium, heavy water, and light water are used. (4) A coolant to remove the fission-generated heat; water is generally used converted to steam in heat exchangers and used to drive turbines. Sodium, helium, and nitrogen may also be used. The heating of streams and estuaries by reactor effluent is a serious environmental problem, which can be surmounted by construction of special cooling towers. (5) A control system such as rods of boron or cadmium that have high capture cross sections, to absorb neutrons rapidly when their concentration becomes too high. (6) Adequate shielding, remote-control equipment, and appropriate instrumentation are essential for personnel safety and efficient operation. The primary use of nuclear reactors is for electric power generation. This has been a reasonably successful endeavor; nuclear energy has made a notable contribution to the overall energy supply situation in

the U.S. But the efficiency of reactors is often reduced far below their potential by failures resulting from the highly corrosive operating conditions to which the materials of construction of the reactor and the associated hardware are exposed. Frequent and extended shutdowns are commonplace. This, together with the environmental radiation hazard and escalating construction costs, has restricted the development of nuclear energy as a power source. Plans for construction of many plants have been delayed or cancelled. A further negative fact is that the estimated safety factor has changed radically since 1975, at which time the risk of serious accident that might result in core meltdown was reported to be 1 in 20,000 years of operation. A study conducted by ORNL based on accident data in the decade 1969–1979 concluded that this risk has risen to 1 in 1000 operating years—a 20-fold decrease in the safety factor. See fission; breeder; acceptable risk.

Nuclear Regulatory Commission. (NRC).

A federal agency established in 1975 to regulate all commercial uses of atomic energy, including construction and operation of nuclear power plants, nuclear fuel reprocessing plants, and research applications of radioactive materials. It is also responsible for safety and environmental protection. Its offices are at One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852-2738. Website: <http://www.nrc.gov>.

nuclear run-on. A method used to estimate the relative rate of transcription of a given gene, as opposed to the steady-state level of the mRNA transcript (which is influenced not just by transcription rates, but by the stability of the RNA). This technique is based on the assumption that a highly-transcribed gene should have more molecules of RNA polymerase bound to it than will the same gene in a less-active state. If properly prepared, isolated nuclei will continue to transcribe genes and incorporate ³²P into RNA, but only in those transcripts that were in progress at the time the nuclei were isolated. Once the polymerase molecules complete the transcript they have in progress, they should not be able to re-initiate transcription. If that is true, then the amount of radiolabel incorporated into a specific type of mRNA is theoretically proportional to the number of RNA polymerase complexes present on that gene at the time of isolation.

nuclear transfer. A laboratory procedure in which a cell's nucleus is removed and placed into an oocyte with its own nucleus removed, so the genetic information from the donor nucleus controls the resulting cell. Such cells can be induced to form embryos. This process was used to create the cloned sheep "Dolly". See cloning.

nuclear waste. See radioactive waste.

nuclease. An enzyme that degrades nucleic acids. A nuclease can be DNA-specific (a DNase), RNA-specific (RNase), or non-specific. It may act only on single stranded nucleic acids, or only on double-stranded nucleic acids, or it may be non-specific with respect to strandedness. A nuclease may degrade only from an end (an exonuclease), or may be able to start in the middle of a strand (an endonuclease). To further complicate matters, many enzymes have multiple functions; for example, Bal31 has a 3'-exonuclease activity on double-stranded DNA, and an endonuclease activity specific for single-stranded DNA or RNA.

nucleases. Enzymes that hydrolyze the phosphodiester linkages of nucleic acids.

nuclease protection assay. See "RNase protection assay."

nucleation. The process by which crystals are formed from liquids, supersaturated solutions, or saturated vapors (clouds). Crystals originate on a minute trace of a foreign substance acting as a nucleus. These are provided by impurities or by container walls in laboratory apparatus. Crystals form initially in tiny regions of the parent phase and then propagate into it by accretion. Rain and snow are formed in this way in moisture-laden air, the moisture condensing on minute particles of dust or ice. Cloud seeding with silver iodide or carbon dioxide is based on this principle. The former has a crystalline structure similar to that of ice, and the latter causes rapid formation of ice nuclei by intense local lowering of temperature.

See crystals; whiskers. There are various methods for growing crystals, including (1) evaporation of a solution; (2) cooling of a saturated solution or melt; (3) condensation of a vapor (plasmas are sometimes used to generate the vapor); (4) electrodeposition; (5) growth in gel media (in order to slow growth). Methods (2) through (5) are particularly suited for the growth of large crystals, which are widely used in modern technology.

nucleation rate The number of crystal nuclei formed per unit volume of reaction phase.

nucleic acid. Any of several complex compounds occurring in living cells, usually chemically bound to proteins to form nucleoproteins. Nucleic acids are of high molecular weight are easily changed by many mild chemical reagents. They contain carbon, hydrogen, oxygen, nitrogen (15–16%), and phosphorus (9–10%).

The fundamental units of nucleic acid, are nucleotides, nucleic acids, and polynucleotides in which the nucleotides are linked by phosphate bridges. Upon extensive heating in the presence of water (hydrolysis), nucleic acids yield a mixture of purines and pyrimidines, *d*-ribose or *d*-deoxyribose, and phosphoric acid. Nucleic acids are subdivided into

two types: ribonucleic acid (RNA), containing the sugar *d*-ribose, and deoxyribonucleic acid (DNA), containing the sugar *d*-deoxyribose. See deoxyribonucleic acid; ribonucleic acid; nucleoside; nucleotide; nucleoprotein. Good sources of nucleic acids are salmon, thymus, yeast, and wheat kernel embryo.

Use: Biochemical and medical research in genetics, virus diseases, and cancer.
